ent-vendid

Enter Vendor ID

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (**vendidlen** parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

Keyword: ent-vendid

Related Commands: dlt-vendid, rtrv-vendid

Command Class: Database Administration

Parameters

:vendid= (optional)

Vendor ID

Range: 1-15 digits

:vendidlen= (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

Range: 0-15

:vendnum= (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

Range: 1-3

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

:vendtype= (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

Range: 1-2

Example

```
ent-vendidvend:len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

Dependencies

The value **none** cannot be specified for the **vendid** parameter.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 200 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the **vendidlen** parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The **vendidlen** parameter cannot be specified in the same command with the **vendid**, **vendidlen**, and **vendtype** parameters. Either the **vendidlen** parameter, or the **vendid**, **vendidlen**, and **vendtype** parameters can be specified in one command.

Notes

None.

Output

The Vendor ID length must be entered first, before any Vendor IDs can be entered.

```

ent-x25-dstn

Enter X.25 Destination

Use this command to associate an X.25 network address with an existing SS7 point code in the routing table, and optionally, a subsystem within that point code. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

Keyword: ent-x25-dstn

Related Commands: chg-x25-dstn, dlt-x25-dstn, rtrv-x25-dstn

Command Class: Database Administration

Parameters

:dpc= (mandatory)

This parameter is the real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity. The value for this parameter is a point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code **000-000-000** is not a valid point code.

:xaddr= (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

Range: 1-15 digits

:ssn= (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

Range: 1-255

Default: 5

Example

ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123

ent-x25-dstn:xaddr=255864567:dpc=033-001-013

Dependencies

Each X.25 address must have at least four digits.

The DPC must exist in the destination table.

The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-ncm*).

The X.25 address cannot exist in X.25 destination table.

The maximum number of X.25 destinations is 1024.

Notes

None

Output

ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123

X.25 DSTN TABLE 45 % FULL

ENT-X25-DSTN: MASP A - COMPLTD

;

ent-x25-rte

Enter X.25 Route

Use this command to define the routing parameters needed by the gateway portion of the LIMs with the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system STP.

Keyword: ent-x25-rte

Related Commands: chg-x25-rte, dlt-x25-rte, rtrv-x25-rte

Command Class: Database Administration

Parameters

:saddr= (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: 1-15 digits

:type= (mandatory)

The type of X.25 connection that the link is expected to maintain.

Range: pvc, svca, svcr

pvc — Permanent virtual circuit

svca — automatic virtual circuit

svcr — remote virtual circuit

:xaddr= (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

:lc= (optional)

The number of the logical channel on the X.25 signaling link to which the PVC connection is assigned.

This parameter is mandatory if the **type=pvc** parameter is specified. If the **type=svca** or **type=svcr** parameters are specified, the logical channel number is arbitrary and cannot be specified.

Range: 1-255

Default: The logical channel is not given.

:lc2nm= (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

Range: yes, no

Default: yes—if **rt=xpc** is specified

no—if **rt=pc** is specified

no—if **rt** is not specified

:loc= (optional)

The card location containing the X.25 signaling link that will maintain the connection. For an automatic virtual circuit, this link is the link on which the system STP initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: The card location is not given

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: a

Default: The port is not given

:rt= (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) Route on X.25 destination point code (XPC) and (2) Route using X.25 origination and destination point code combinations (PC).

Range: xpc, pc

Default: pc

Example

ent-x25-

rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3

ent-x25-rte:xaddr=225255:saddr=133132:type=svca:loc=1201:port=a

ent-x25-rte:xaddr=225255:saddr=133132:type=svcr

ent-x25-rte:xaddr=225255:saddr=133132:type=svcr:rt=xpc:lc2nm=yes

Dependencies

Each X.25 address must have at least four digits.

The **limds0**, **limdscs**, **limocu** and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL type.

The shelf and card must be equipped.

The logical channel number cannot be specified if the connection type is an automatic virtual circuit or a remote virtual circuit (**type=svca** or **type=svcr**).

The logical channel number must be specified if the connection type is PVC (**type=pvc**).

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

The **loc** and **port** parameters cannot be specified if the connection type is a remote switched virtual circuit (**type=svcr**). The far end initiates a remote switched virtual circuit and sends the system the location and port information.

The card location (**loc**) must be specified if the connection type is a permanent virtual circuit or an automatic virtual circuit (**type=pvc** or **type=svca**).

Each X.25 address must exist in X.25 destination table.

The X.25 address must be assigned to a destination in the X.25 domain.

The SS7 address must be assigned to a destination in the SS7 domain.

The combination of the two X.25 addresses must be unique in the X.25 route table.

The combination of point code/SSNs assigned to the two X.25 addresses must be unique in the X.25 route table.

The maximum number of X.25 routes in a system is 1024.

The point codes assigned to each of the X.25 destinations must also be assigned to routes.

The signaling link must be assigned to a LIM with the **ss7gx25** application.

The signaling link assigned to the X.25 route must be in the database and must be assigned to a linkset. The linkset must be assigned to a route associated with an X.25 destination and must contain an APC in the X.25 domain. This can be verified by entering the following commands:

- **rtrv-slk**—Displays the signaling links
- **rtrv-ls**—Displays the linksets
- **rtrv-rte**—Displays the routes
- **rtrv-x25-dstn**—Displays the X.25 destinations
- **rtrv-dstn**—Displays the destination point codes.

The logical channel number cannot be greater than the maximum number of permanent virtual circuits allowed for the signaling link. For example, if the total number of permanent virtual circuits allowed for the signaling link is 15, the logical channel number for this signaling link cannot be greater than 15.

The logical channel of the signaling link cannot already be assigned to an X.25 route.

The number of permanent virtual circuits cannot exceed the maximum number of permanent virtual circuits defined for the signaling link.

The number of automatic virtual circuits cannot exceed the maximum number of switched virtual circuits defined for the signaling link.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

Notes

The connection can be one of three types, a permanent virtual circuit, an automatic virtual circuit, or a remote virtual circuit.

Permanent virtual circuits are permanent X.25 virtual connections between two signaling points established on one of the logical channels of an X.25 signaling link. This connection is setup by the network, therefore no setup is required by the system to establish a permanent virtual circuit connection.

Automatic virtual circuits are essentially the same as permanent virtual circuits, except that the connection must be established by either the system or the X.25 destination entity.

Remote virtual circuits are also essentially the same as automatic virtual circuits, except that the connection can be established only by the X.25 destination entity.

All LIMs with the **ss7gx25** application share this information. Even though these connections apply to only one card, they are used by all cards.

Output

ent-x25-

rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3

;

flash-card**Flash-Card**

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the **init-flash** and the **act-flash** commands.

Keyword: flash-card

Related Commands: act-flash, init-flash

Command Class: System Maintenance

Parameters

:code= (mandatory)

The GPL type to be loaded.

Range: appr, trial

appr— Approved GPL

trial— Trial GPL

:loc= (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

Range: 1101-1112, (1113 and 1115 OAM), 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:force= (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

Range: yes, no

Default: no

Example

flash-card:loc=1105:code=trial

flash-card:loc=1105:code=appr:force=yes

Dependencies

Cards do not have to be provisioned to use the **flash-card** command. However, if the specified card is provisioned and not inhibited, use of the **force** parameter is required.

The specified card locations must be running a flashable software image.

HMUX or HIPR cards are not supported.

If the even-numbered TDM (1114,1116) is specified, the flash occurs on the odd-numbered GPSM-II running OAM (1113,1115).

The specified card location cannot be the active MASP (either the active GPSM-II or the active TDM).

No other action command can be in progress when this command is entered.

The card specified in the location parameter must be present and able to communicate over the IMT. The card do not have to be provisioned in the database.

If the card is already running the specified code load, it cannot be loaded by this command.

Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the **force** parameter. The **act-flash** and **init-flash** commands must then be used to reload the same code level.

Output

```

format-disk**Format Disk**

Use this command to format and initialize a system removable cartridge or standby Terminal Disk Module (TDM).

NOTE: The **format-disk** command leaves the disk unusable until the **chg-db** and **copy-gpl** commands are entered.

Keyword: **format-disk**

Related Commands: **chg-db**, **copy-disk**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**, **rtrv-gpl**

Command Class: System Maintenance

Parameters

:type= (mandatory)

The type of removable cartridge to format.

Range: **fixed**, **meas**, **system**

fixed — The standby fixed disk on the standby TDM

meas — The measurement cartridge

system — The system cartridge

:force= (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

Range: **yes**, **no**

Default: **no**

:low= (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying **low=no** can be used to decrease formatting time.

Range: **yes**, **no**

Default: **yes**

:prtnggrp= (optional)

Partition group. This parameter indicates which disk partition group is to be formatted. Specifying the inactive group is relevant only when **type=fixed** is specified.

CAUTION: Do not enter the **format-disk:prtnggrp=inactive** command unless directed to by Tekelec Technical Services to avoid possible loss of a previously archived software release.

Range: **active**, **inactive**

Default: **active**

Example

format-disk:type=system

format-disk:type=meas:force=yes

Dependencies

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

To format a cartridge that already contains system data, the **force=yes** parameter must be specified.

The **force=yes** parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have a **dms.cfg** file are recognized as system removable cartridges. A removable cartridge must be inserted and made ready before the **type=meas** or **type=system** parameter can be specified in the command.

Measurements collection must be inhibited during execution of the **format-disk** command. If measurements are not inhibited, **format-disk** cannot be executed.

- Do not enter the **chg-measopts:collect=on** command while the **format-disk** command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter **format-disk** until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The **low=no** parameter must be specified when the **prtnggrp** parameter is specified.

Notes

The **low=no** parameter should be specified when upgrading a spare TDM. The **low=yes** parameter should be specified when there is a suspected hardware problem.

When the **type=meas** parameter is specified, a measurements removable cartridge is built.

When the **type=system** parameter is specified, a system removable cartridge is built.

A system removable cartridge can contain only GPLs and the database. Measurement data cannot be placed on a system removable cartridge. After a system removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-gpl** and **chg-db:action=backup:dest=remove** commands. The **copy-gpl** command copies all approved GPLs from the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the approved GPLs. The **chg-db:action=backup:dest=remove** command copies the database from the current partition of the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the database.

A measurements removable cartridge can contain only measurement data. Database information and GPLs cannot be placed on a measurements removable cartridge. After a measurements removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-meas** command. The **copy-meas** command copies all measurement data from the fixed disk on the active TDM to a measurements removable cartridge for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the **format-disk** command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

Standby MASP has not finished initializing - please wait...

Standby MASP initialization timed out - continuing...

The **dms.cfg** file on either the active TDM or a system formatted removable cartridge is used by the **format-disk** command when formatting the target disk. The location of the **dms.cfg** file cannot be specified by the **format-disk** command. The value of the **type** parameter is used to determine the target disk to format and the location of the **dms.cfg** file on which to base the format. Table 5-44 shows the location of the **dms.cfg** file based on the value of the **type** parameter for the **format-disk** command.

Table 5-44. DMS.CFG File Location for format-disk Command

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
fixed	Standby TDM (1114 or 1116)	Removable Cartridge (1117)
system	Removable Cartridge (1117)	Active TDM (1114 or 1116)
meas	Removable Cartridge (1117)	Active TDM (1114 or 1116)

The **format-disk** command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

Table 5-45 shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

Table 5-45. Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of the Partition
SyQuest Removable Cartridge	1117	256 Mbytes	1	256 Mbytes
Magneto-Optical Removable Cartridge	1117	1096 Mbytes*	1	1024 Mbytes
TDM	1114 or 1116	540 Mbytes	1	507 Mbytes
TDM	1114 or 1116	2 Gigabytes	1	2014 Mbytes

Table 5-45. Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of the Partition
TDM	1114 or 1116	4 Gigabytes	2	2047 Mbytes
* The magneto-optical removable cartridge is a double-sided cartridge that contains 2.3 gigabytes of data, but only one side of the disk can be formatted and used when it is inserted into the removable cartridge drive. The target capacity given for the magneto-optical removable cartridge is for one side of the disk in the cartridge and is approximately one half of the total capacity of the magneto-optical removable cartridge.

;

inh-alm**Inhibit Alarm Reporting**

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All **rept-stat-xxx** commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

Keyword: inh-alm

Related Commands: rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log, unhb-alm

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dev= (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be inhibited.

Range: applsock, as, card, cdt, clock, dlk, e1port, ls, lsmsconn, route, seasx25, slk, t1port, trm, rtx, enet
applsock — IP gateway application socket
as — IP gateway application Application Server
card — Cards in the database
cdt — Customer defined troubles
clock — System clock
dlk — TCP/IP data links
e1port — E1 port on E1/T1 MIM or HC MIM cards
ls — Linksets
lsmsconn — Communication link between the LSMS and the EMS
route — Route
seasx25 — The SEAS X.25 links
slk — Signaling links
t1port — T1 port on E1/T1 MIM or HC MIM cards
trm — Terminals
rtx — Exception Route
enet — Ethernet

:asname= (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to inhibit alarms for the named Application Server.

Range: ayyyyyyyyyyyyyy
 Up to 15 alphanumeric characters; the first character must be a letter.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used with the **ecic** parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

Range: 0-16383

:dpc= (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca**Range:** **p-, 000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination Point Code

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—000–255

:dur= (optional)

Duration. The period for which the alarms are inhibited. If the **dur=temp** parameter is specified, the clearing of the event that caused an alarm also clears the alarm inhibit, and the alarms become uninhibited on the device.

Range: **perm, temp, timed**

perm — A permanent inhibition of an alarm.

temp — A temporary inhibition of an alarm.

timed — An inhibition of an alarm for a specified duration.

Default: **perm**

:e1port= (optional)

Port ID. The E1 port on the specified E1 card.

The **e1port** parameter is mandatory if the **dev=e1port** parameter is specified.

Range: **1-8**

Ports **3 - 8** can be specified only for HC-MIM cards and E5-E1T1 cards.

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:edate= (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the **etime** parameter value.

The **edate** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **101-991231**

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yymmdd*).

:etime= (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the **edate** parameter value.

The **etime** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **0-2359**

Specify the time in the format of *hour* followed by *minute* (*hhmm*).

:force= (optional)

Allows critical alarms to be inhibited on a device.

The **force** parameter is mandatory if the **lvl=crit** parameter is specified.

The **criticalminh** STP option must be turned on before the **force** parameter can be specified.

Range: **yes, no**

Default: **no**

:id= (optional)

Identification number of the customer-defined trouble (**5 - 16**). Customer-defined troubles **1 - 4** are generated critical alarms and cannot be specified as values for the **id** parameter.

Range: **5-16**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: `ayyyyyyy`

1 alphabetic character followed by up to 9 alphanumeric characters

:link= (optional)

Signaling link on the card specified in the **loc** parameter.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

a, b—For **dev=dlk, dev=slk** for a two-port LIM

a1, a2, b1, b2—For **dev=ndclk/seasx25/lsmconn**

a, b, a1, b1, a2, b2, a3, b3—For **dev=slk** for a multi-port LIM

a, b, a1-a31, b1-b31—For **dev=slk** for an HC MIM

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

:lsn= (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range: **aaaaaaaa**

1 alphabetic character followed by up to 9 alphanumeric characters.

:lvl= (optional)

The alarm severity level (critical, major, or minor).

Range: **crit, majr, minr**

Default: **majr**

:opc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/open/open24= (optional)

Origination point code.

:opci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range: **0-15**

:sname= (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to inhibit alarms for the named application socket.

Range: *aaaaaaaaaaaaa*

1 to 15 alphanumeric characters.

:t1port= (optional)

Port ID. This parameter is mandatory if the **dev=t1port** parameter is specified.

Range: **1-8**

Ports **3 - 8** can be specified only for HC MIM cards.

:trm= (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

Range: **1-40**

Example

inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes

inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4

inh-

inh-alm:dev=enet:loc=1201:port=a

inh-alm:dev=enet:loc=1101:port=a:dur=temp:lvl=minr

Dependencies

This command is not allowed in upgrade mode.

Table 5-46 shows the valid parameter combinations for the **inh-alm** command. The **dur** and **lvl** parameters are valid with all **dev** parameter values.

Table 5-46. Parameter Combinations for the **inh-alm** command

Value (:dev)	a	a	c	c	d	e	l	l	n	n	r	s	s	t	t	e	r
Device Parameter	p	s	a	d	l	l	s	s	d	d	o	e	l	l	r	n	s
	p	r	t	o	k	p	m	c	c	u	a	k	p	m	e	t	
	l	d	c	o	s	l	q	t	s	o	r	t					
	s		k	r	c	k	3	e	x								
	o			t					2								
	c								5								
	k						n										
No Parameters				x					x								
:asname		x															
:dpc/dpca/dpci/dpcn/dpcn24										x							
:id			x														
:loc			x		x	x						x	x		x		
:lsn						x											
:e1port=1-8					x												
:link=a, b					x							x			x		
:link=a, b, a1, a2, b1, b2, a3, a3												x					
:link=a1, a2, b1, b2							x	x		x							
:sname		x															
:t1port=1-8													x				
:trm														x			
:rsn																	x

No other action command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option **criticalminh** must be enabled. The **chg-stpopts:criticalminh=yes** command enables this option.

Alarms cannot already be inhibited for the specified device.

When the **lvl=crit** parameter is specified, the **force=yes** parameter must be specified.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=seasx25** parameter is specified, the **link** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmt** parameter.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the **dev=rtx** parameter can be specified.

Permanent alarm inhibit is not allowed on the cluster PC because either the cluster or a member PC of the cluster is already alarm inhibited.

When the **dur=timed** parameter is specified, the **edate** and **etime** parameters must be specified.

When a **dur** parameter value other than **timed** is specified, the **edate** and **etime** parameters cannot be specified.

The **edate** parameter value must be a date equal to or later than the current system date. If the current system date is specified, then the **etime** parameter value must be a time later than the current system time. If a date later than the current system date is specified, then the **etime** parameter value can be any valid time in the format *hhmm*.

The **inh-alm** command cannot be used to change the level of inhibition on a device.

If the **dev=enet** parameter is specified, then the **loc** parameter and the **port** parameter must be specified.

The card must be an IPLIMx or IPGWx card.

The value specified for the **port** parameter is out of range.

When the **dev=ndclk** parameter is specified, the **link** parameter must be specified.

The **link** parameter must be valid for the selected device type.

Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The **dur** parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

inh-card

Inhibit Card

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the DCM/LIM/ACM/TSM/DSM/GPSM-II/MIM card or physically remove it from the shelf.

Keyword: inh-card

Related Commands: alw-card, dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:force= (optional)

Force indicator. This parameter is required for the following conditions:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-DSM connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified HC MIM card or E5-E1T1 card is in channel bridging mode
- The specified card has the last in-service SEAS terminal configured.

Range: yes, no

Default: no

Example

inh-card:loc=1101

inh-card:loc=1201:force=yes

Dependencies

No other action commands can be in progress when this command is entered.

The card must be a TSM, ACM, DCM, DSM, LIM, GPSM-II, E1/T1 MIM, HC MIM, E5-E1T1 E5-SM4G, or E5-ATM. The card location cannot be 1114, 1116, or 1117.

If the card is the only linkset, SCCP, or GLS card remaining, the **force=yes** parameter must be specified in the command to inhibit the card.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type **lime1**, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

If the card is type **limt1**, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

The shelf and card must be equipped.

If the specified card is the only in-service MPS-DSM, the **force=yes** parameter must be specified.

If the specified card is the only in-service TSM, LIM, or MCPM, the **force=yes** parameter is required.

If the specified HC-MIM or E5-E1T1 card is in channel bridging mode, the **force=yes** parameter is required.

If inhibiting the VSCCP card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the **force=yes** parameter must be specified.

The card that is specified cannot be running the active OAM.

If the specified card has the last in-service SEAS Terminal configured, then the **force=yes** parameter must be specified to inhibit the card.

The card location (**loc**) must be within the allowed range.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The card cannot be inhibited as the terminals are still in use.

Notes

The function of this command is the same as the **rmv-card** command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

CAUTION: This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the chg-measopts:platformenable=on command. To disable collection, ALL MPCM cards in the system must be inhibited. THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS. Use the alw-card command to enable measurements collection after the MPCM cards have been inhibited.

When an E5-IPSM Card is inhibited, the active SEAS terminals are set to the state OOS-MT/FLT.

Output

```
inh-card: loc=1101
    rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
    Card has been inhibited.
;
```

inh-imt

Inhibit IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

CAUTION: Use this command only when directed by the Tekelec Customer Care Center at (888) FOR-TKLC.

Keyword: inh-imt

Related Commands: alw-imt, clr-imt-stats, conn-imt, disc-imt, rept-imt-lvl1, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt

Command Class: System Maintenance

Parameters

:bus= (mandatory)
IMT bus to be inhibited
Range: a, b

Example

```
inh-imt:bus=a
```

Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.
This command cannot be entered during an IMT Fault Isolation Test.

Notes

Cards not connected to the other IMT bus will reinitialize.
All traffic is rerouted to the alternate IMT bus.
The function of this command is the same as the **rmv-imt** command.

Output

```
inh-imt:bus=a
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit IMT Bus A command issued

rlghncxa03w 04-01-07 13:12:41 EST EAGLE 31.3.0
3116.0098      IMT BUS A          IMT inhibited
;
```

inh-map-ss**Inhibit Mated Application Subsystem**

Use this command to shut down (inhibit) a mated application subsystem. The command requires a parameter specifying the SSN to be inhibited. Currently, the LNPQS, INPQS, and Equipment Identity Register (EIR) subsystems can be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the **force** parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

Keyword: inh-map-ss

Related Commands: alw-map-ss, rept-stat-lnp, rept-stat-sccp

Command Class: System Maintenance

Parameters

:ssn= (mandatory)

This parameter specifies the subsystem number.

Range: 2-255

:force= (optional)

This parameter forces the shutdown of the subsystem.

Range: yes, no

Default: no

Example

```
inh-map-ss:ssn=10
```

```
inh-map-ss:ssn=10:force=yes
```

Dependencies

The LNP feature (see the **enable-ctrl-feat** command) or the INP feature must be turned on, or the EIR feature must be enabled and turned on, before this command can be entered.

No other action command can be in progress when this command is entered.

The specified **ssn** parameter value must represent the LNPQS, INPQS, or EIR subsystem.

The EAGLE 5 ISS must be configured with at least one card running the **sccp** application.

Notes

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE 5 ISS to generate a TFP for the EAGLE 5 ISS CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

Table 5-47. Route Set Test When LNP is Offline

Network Management	Concerned PC	Network Management
RSP	CPC	TFA concerning CPC
RSP	LNP CPC	None
RSP	TPC	TFA concerning TPC
RSR	CPC	TFA concerning CPC
RSR	LNP CPC	TFP concerning LNP CPC
RSR	TPC	TFA concerning TPC

Table 5-48 shows what actions EAGLE 5 ISS takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

Table 5-48. Receiving Messages when LNP is Offline

Routing Indicator in Incoming Message	DPC	Result of GTT	Message Handling	Network Management
rt-on-gt	Capability PC	rt-on-ssn, LNP subsystem	Reroute to mate	TFP concerning CPC
rt-on-gt	True PC	rt-on-ssn, LNP subsystem	Reroute to mate	None
rt-on-gt	Capability PC	Message Relay required	Generate UDTS	TFP concerning CPC
rt-on-gt	True PC	Message Relay required	Generate UDTS	None
rt-on-ssn	Capability PC	Not applicable	Generate UDTS	None
rt-on-ssn	True PC	Not applicable	Generate UDTS	SSP concerning True PC

Output

```

inh-map-ss:ssn=30
  rlghncxa03w 04-02-24 10:37:22 EST  EAGLE5 31.0.0
  Inhibit map subsystem command sent to all SCCP cards.
  Command Completed.
;
inh-map-ss:ssn=30:force=yes
  rlghncxa03w 04-02-24 10:37:22 EST  EAGLE5 31.0.0
  Inhibit map subsystem command sent to all SCCP cards.
  Command Completed.
;

```

inh-slk**Inhibit Signaling Link**

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

NOTE: The signaling link's inhibited status is not preserved across a LIM reboot.

Keyword: inh-slk

Related Commands: act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card that is specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" in Appendix A for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
inh-slk:loc=1307:link=b
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application

- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card. The link parameter values **a4-a15** and **b4-b15** can be specified only for the E5-ENET card.

If an IPSEG-M3UA signaling link is used, then this command cannot be entered.

This command is not valid on TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as IPGWI links).

Notes

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, the inhibit request is denied. If a command request is denied, it is because the SS7 changeover procedure cannot take place.

If the **inh-slk** command is followed by the **init-card** command, the inhibition of the signaling link is not preserved after the **init-card** command completes.

Card locations are illustrated in the *Installation Manual – EAGLE 5 ISS*.

The **inh-slk** command might time out if a far-end remote does not respond to the inhibit message.

Output

```
inh-slk: loc=1301: link=a
    rlgncxa03w 05-01-07 11:11:28 EST  EAGLE5 33.0.0
    Inhibit Link message sent to card
;
```

inh-trm**Inhibit Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD. It sets the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

Keyword: inh-trm

Related Commands: act-echo, alw-trm, canc-echo, chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: System Maintenance

Parameters

:trm= (mandatory)

The ID of serial port to be inhibited

Range: 1-40

:force= (optional)

The parameter forces the removal of a specified terminal, even if it is the last in-service OAP port or last in-service SEAS terminal available.

Range: yes, no

Default: no

Example

inh-trm:trm=5

inh-trm:trm=1:force=yes

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

The **force=yes** parameter must be specified to inhibit the last in-service OAP port.

This command cannot be used to inhibit the terminal from which the command is entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

Output

inh-trm:trm=5

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit message sent to terminal
```

;

inh-trm:trm=17:force=yes

```
tekelecstp 07-01-23 18:46:01 EST EAGLE 37.5.0
Inhibit message sent to terminal
```

;

init-card**Initialize Card**

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued to the OAM software, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

CAUTION: When a LIME1 or LIMT1 card has associated channel cards (LIMCH) with provisioned links, the init-card command entered for the LIME1 or LIMT1 card causes all links on the associated channel cards to go out of service.

Keyword: init-card

Related Commands: dlt-card, ent-card, init-sys, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:appl= (optional)

Application. This parameter specifies the type of application residing on the card.

CAUTION: Because the appl parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.

Range: xxxxyyy

1 alphabetic character followed by up to 6 alphanumeric characters.

atmansi—This application is used by the LIM cards to support the high-speed ATM signaling link feature. It is also used by the E5-ATM card to support T1 functionality.

atmitu—This application is used by the E1-ATM cards to support the high-speed E1 ATM signaling link. It is also used by the E5-ATM card to support E1 functionality.

ccs7itu—This application is used by the LIM cards for ITU-TSS MTP functionality. It is also used for the 2-port E1 card, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card.

eroute—This application is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

gls—This application is used by the TSM cards for downloading gateway screening to LIM cards.

ipgwi—This application is used by the SSEDCEM card and the E5-ENET card for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 64 cards to be assigned the **ipgwi** application.

iplim—This application is used by the SSEDCEM card and the E5-ENET card for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi—This application is used by the SSEDCEM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes.

ips—This application is used by the IPSM card or E5-IPSM card for the IP User Interface feature.

ipsg—This application is used by the E5-ENET card to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—This application is used by the MCPM card for the Measurements Platform feature.

sccp—This application is used by the TSM cards for the global title translation application.

ss7ansi—This application is used by the LIM cards, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card for the MTP functionality.

ss7gx25—This application is used by the LIM cards to support X.25 functionality.

ss7ipgw—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 64 cards to be assigned the **ss7ipgw** application.

stplan—This application is used by the ACM, DCM, and E5-ENET cards to support the STP LAN functionality.

vsccp—This application is used by the DSM card to support the G-Flex, G-Port, INP, and LNP ELAP Configuration features. If the G-Flex, G-Port, INP, or LNP ELAP Configuration feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

Default: The application assigned to the card

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP, G-Flex, G-Port, or INP feature is on. This parameter is applicable only to network cards containing the MPS database (VSCCP).

Range: **refresh, persist**

refresh— Causes data to be reloaded to the specified card.

persist— Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place. The **force** parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

Default: **refresh**

:force= (optional)

Force indicator. Enables the command to be processed under the following conditions:

- If **serial=yes** and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If **initclk=yes** and the TDM card specified in the **loc** parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If **initclk=yes** and **appl=eoam** is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

Range: **yes, no**

Default: **no**

:initclk= (optional)

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

Range: **yes, no**

If **initclk=yes** is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If **initclk=yes** is specified with **appl=eoam** and **force=yes**, the bitfile reloads on both TDMs.

:loc= (optional)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1116, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2301-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

When the **initclk** parameter is not specified, the listed card locations are valid.

When the **initclk** parameter is specified with the **loc** parameter, only card locations **1113**, **1114**, **1115**, and **1116** are valid. Entering locations **1114** and **1116** results in the same action as entering **1113** and **1115**.

Default: All valid card locations are initialized.

:serial= (optional)

Controls the manner in which cards are initialized. If **serial=yes** is specified, cards of the specified GPL type are initialized one at a time. If **serial=no** is specified, cards of the specified GPL type are initialized simultaneously.

Range: **yes, no**

Default: **no**

Example

init-card:loc=1201

init-card:loc=1101:data=persist

init-card:loc=1113:initclk=yes

init-card:appl=eoam:initclk=yes:force=yes

init-card:appl=ipsg

Dependencies

The shelf and card must be equipped.

Either the **loc** or **appl** parameter, but not both parameters, must be specified in the command.

The following card locations (**loc** parameter) are not allowed for this command: **1117**, **1118**, and all xy09 and xy10 card locations (where x is the frame and y is the shelf).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

If TDM reload would cause system clocks to fail that are required to keep links active or TSCSYNC available, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.
- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A&B) are required.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

The **force** parameter must be specified for the cards that are not in the In-service Normal state.

The **serial** parameter is valid only when used with the **appl** parameter.

The **appl=all** parameter can be specified only when the **serial=yes** parameter is also specified.

The following applications are valid for the **appl** parameter: **ss7ansi**, **sccp**, **gls**, **ccs7itu**, **ss7gx25**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vsccp**, **atmitu**, **ipgwi**, **ips**, **eroute**, **ipsg**, or **mcp**.

The **force** parameter can be specified only when the **initclk**, **appl**, and **data** parameters are specified.

The **data** parameter is valid only for SCCP card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

The card location (**loc**) must be within the allowed range.

The specified card does not exist or is not a logical processing element.

The Warm Restart feature must be enabled before this command can be entered.

If the **serial=yes** parameter is specified, the **appl** parameter must specify a network type application value or must be equal to **all**.

Notes

The TDM card has a processor but no application.

The LNP (see the **enable-ctrl-feat** command), G-Flex, G-Port, or INP feature must be turned on before the **data** parameter can be specified.

Output

init-card:loc=1201

Init Card command issued to card 1201

```

init-flash**Initialize Flash**

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

Keyword: **init-flash**

Related Commands: **act-flash**, **clr-imt-stats**, **flash-card**, **init-imt-gpl**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**

Command Class: System Maintenance

Parameters

:code= (mandatory)

The version of the GPL being loaded onto the card.

Range: **appr**, **trial**

appr — The approved GPL version

trial — The trial GPL version

:boot= (optional)

This parameter indicates whether the HC-MIM or EPM based card should boot or not boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the HC-MIM or EPM based card, this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card.

Range: **yes**, **no**

yes — Reboot the card after the command completes successfully

no — Do not reboot the card after the command completes successfully.

Default: **yes**

:eloc= (optional)

End location. Location of the last card of a range of cards to be initialized.

Range: **1101-1113**, **1115**, **1201-1218**, **1301-1318**, **2101-2118**, **2201-2218**, **2301-2318**, **3101-3118**, **3201-3218**, **3301-3318**, **4101-4118**, **4201-4218**, **4301-4318**, **5101-5118**, **5201-5218**, **5301-5318**, **6101-6118**

:force= (optional)

This parameter is required to force the TDM-GTI bitfile reload if a clock outage will occur when **initclk=yes** is specified.

Range: **yes, no**

Default: **no**

:gpl= (optional)

Generic program load. This parameter specifies the flash GPL type that is running on the cards in the specified range of cards.

Range: **xyyyyyy**

1 alphabetic character followed by up to 6 alphanumeric characters.

Valid GPLs are: **blbios, blbepm, blbsmg, blcpld, bldiag, bldiag6, blvxw, blvxw6, bpdcm, bpdcm2, bphcap, bphcapt, bphmux, bpmpl, bpmplt, hipr, imtpci, and pldpmc1.**

:initclk= (optional)

If this parameter is specified for an EOAM card location (1113 or 1115), it determines whether or not the TDM-GTI bitfile should be reloaded, causing a clock initialization.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

Range: **yes, no**

Default: **no**

:loc= (optional)

The location of a single card to be initialized.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

:sloc= (optional)

Start location. Location of the first card of a range of cards to be initialized.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

:appl= (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

Example

```
init-flash:loc=1105:code=trial
init-flash:sloc=1101:eloc=1112:gpl=bpdcm:code=appr
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
```

Dependencies

The specified card for this command must be an HCAP, HCAP-T, DCM, DSM, E1/T1 MIM, HC-MIM, E5-E1T1, E5-ENET, E5-SM4G, GPSM-II, MPL, or MPL-T card. An HMUX card or a HIPR card can be specified, but only for locations xy09 and xy10 (*x* is the frame and *y* is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, the card must be inhibited before this command is entered (unless the card is an HMUX card or a HIPR card).

If the target card is HMUX or HIPR, both of the card locations specified in the **sloc** and **eloc** parameters must contain HMUX cards or HIPR cards on the same IMT bus. For HMUX or HIPR the bus is implicit based on the specified location. Location xy09 specifies HMUX or HIPR A Bus, and location xy10 specifies HMUX or HIPR B Bus (where *x* is the frame and *y* is the shelf). For example, **sloc=1109:eloc=6109** specifies all HMUX cards or HIPR cards on the A Bus only; **sloc=1110:eloc=6110** specifies all HMUX cards or HIPR cards on the B Bus only. HMUX cards or HIPR cards from both the A bus and B bus cannot be flash downloaded simultaneously.

If the target card is an HC-MIM or EPM based card, the **gpl** parameter must be specified when the **loc** parameter is specified.

The **boot** parameter can be specified only if the target is an HC-MIM or EPM based card.

The **boot** parameter cannot be specified for the **blepld** HC-MIM GPL.

The **init-flash** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

A card location that contains the active MASP cannot be specified for the **loc**, **sloc**, or **eloc** parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

If the **eloc** and **sloc** parameters are specified, the **gpl** parameter must be specified. The cards in the locations specified in the **sloc** and **eloc** parameters must be running the specified general program load (**gpl**). Other cards in the range of card locations can be running other GPLs, but will not be initialized. Only the cards within the range that are running the specified GPL will be initialized.

The **sloc** parameter value must be less than the **eloc** parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed.

If **initclk** is specified, the card location parameter value must be **1113** or **1115**.

If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

EPM-based cards cannot support a valid trial version of the **blbepm** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded. The HC-MIM card cannot support a valid trial version of the **blbios** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

No other related command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The **eloc** and **sloc** parameters must be specified together in the command; one parameter cannot be specified without the other parameter.

The cards specified in the **sloc** and **eloc** location parameters must be running the specified general program load (gpl).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

Notes

Card locations **1114**, **1116**, and **1117** are not valid and cannot be specified.

For the HC-MIM or EPM based cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the **boot=no** parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the **init-flash** command with the **boot=yes** parameter or by entering the **init-card** command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

Output

```

```

init-imt-gpl

Initialize IMT GPL

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

Keyword: **init-imt-gpl**

Related Commands: **alw-card, inh-card, init-card, rept-stat-card**

Command Class: System Maintenance

Parameters

:code= (mandatory)

Specifies which IMT GPL to load to the card.

Range: **appr, refresh, trial**

appr — The approved GPL version

refresh — Reload approved GPL version without card reset

trial — The trial GPL version

:loc= (optional)

Specifies the address of the card to be initialized.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,**

4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All locations

Example

```
init-imt-gpl:loc=1201:code=trial
```

```
init-imt-gpl:code=refresh
```

```
init-imt-gpl:code=appr
```

Dependencies

The card location shelf must be within the allowed ranges as specified on the **loc** parameter. The shelf is the first two digits of the **loc** parameter.

The card location slot must be within the allowed ranges as specified on the **loc** parameter. The slot is the second two digits of the **loc** parameter.

The card location cannot contain a card with flash memory (HCAP, HCAP-T, DCM, MPL, HC MIM, HIPR, or HMUX).

When this command is entered, no other action command can be in progress.

If the **code=appr** or **code=trial** parameter is specified, the **loc** parameter must be specified.

If the **code=trial** parameter is specified, the **loc** parameter must be specified, and the specified card location must be equipped and in service.

If the **code=appr** or the **code=refresh** parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

The **init-imt-gpl** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**.

This command must not be entered during IMT statistics collection following an hourly boundary.

A card location that is valid and defined in the database must be specified.

Notes

None

Output

```

;
```

init-mux

Initialize High-Speed Multiplexer

Use this command to reset a single HMUX or HIPR card or all HMUX or HIPR cards on the specified HMUX or HIPR bus.

If the command is entered between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the HMUX or HIPR card or cards come back into service.

If the command entry is not between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor without bringing down the respective IMT bus.

Keyword: **init-mux**

Related Commands: **act-flash**, **init-flash**

Command Class: System Maintenance

Parameters

:bus= (optional)

The HMUX or HIPR bus to be reset. All HMUX or HIPR cards on the specified bus will be reset.

Range: a, b

Default: a

:force= (optional)

Use this parameter to override normal safeguards. The **force=yes** parameter can be used to:

- Reset an entire HMUX or HIPR bus when the alternate bus is non-functional
- Reset one HMUX or HIPR card during a fault isolation test (**tst-imt**) command

Range: yes, no

Default: no

:loc= (optional)

The card location of a single HMUX or HIPR card to be reset.

Range: 1109-1110, 1209-1210, 1309-1310, 2109-2110, 2209-2210, 2309-2310, 3109-3110, 3209-3210, 3309-3310, 4109-4110, 4209-4210, 4309-4310, 5109-5110, 5209-5210, 5309-5310, 6109-6110

Default: If not specified, all HMUX or HIPR cards on bus A or bus B are reset

Example

```
init-mux:bus=a
```

```
init-mux:loc=1109
```

Dependencies

An **act-flash** or **init-flash** command cannot be in progress when this command is entered.

Either the **bus** parameter or the **loc** parameter, but not both, must be specified.

This command is not allowed during an IMT Fault Isolation test (**tst-imt**), unless the **force=yes** parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The STP options **hmuxabus** or **hmuxbbus** must have their value set to **yes** before this command can be executed.

Notes

None

Output

```
init-mux: loc=1109
rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0
Command Completed.
;
```

init-network**Initialize the Network**

Use this command to reset all the network cards. The network cards are ACMs, TSMs, and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

**CAUTION**

CAUTION: Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

Keyword: init-network

Related Commands:

Command Class: System Maintenance

Parameters

:force= (optional)
Force the resetting of all the network cards.
Range: yes, no
Default: no

Example

```
init-network
```

Dependencies

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with either the **ss7ansi** or the **ccs7itu** application installed must exist with an in-service active signaling link.

The **force=yes** parameter must be specified to override the required four-card **ss7ansi** or **ccs7itu** configuration. The system then selects the best available of the remaining **ss7ansi** or **ccs7itu** cards.

Notes**Upgrade Phase 3**

Upgrade Phase 3 mode means that the MASPs are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

Full Function

Full Function mode means that all MASPs are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

Output

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

rlghncxa03w 06-05-27 16:30:02 EST EAGLE 35.0.0
Command Aborted : Card 1206 failed to load.
```

init-oap

Initialize OAP Processor

Use this command to send a hardware signal to the indicated OSS/Application Processor (OAP), causing it to reset and reinitialize its operational software.

NOTE: This command cannot be used for EOAPs (Enhanced Operation System Support Application Processes).

Keyword: init-oap

Related Commands: chg-trm, rept-stat-seas

Command Class: System Maintenance

Parameters

:oap= (mandatory)

The OAP that is to be initialized. Any value (**a**, **b**, or **both**) can be specified, regardless of the actual or intended OAP configuration.

Range: **a, b, both**

:force= (optional)

If the specified OAP is operational (that is, if its state is IS-NR or IS-ANR), and it is the only operational OAP, then the **force=yes** parameter must be specified to reset it. If the specified OAP is not operational, then **force=yes** is not required.

Range: **yes, no**

Default: **no**

Example

```
init-oap:oap=a
```

```
init-oap:oap=both:force=yes
```

Dependencies

The SEAS feature must be turned on before this command can be entered.

No other action command can be in progress when this command is entered.

The **force=yes** parameter must be specified to reset the last OAP.

The SEAS Over IP feature must be turned off before this command can be entered.

Notes

The EAGLE 5 ISS determines the OAP configuration (single vs. dual) by querying the OAP. If one or both of the OAPs are not operational, then the EAGLE 5 ISS might receive incorrect information about the OAP configuration. Furthermore, if no OAP terminals are defined, no OAP queries are sent, the OAM defaults to a single configuration, and this information may be incorrect.

To allow an OAP to be reset by an OAM not configured for it or when no OAP terminals are yet defined, the **init-oap** command can be used to specify either OAP or both OAPs, even if doing so conflicts with the actual OAP configuration.

Output

```
init-oap:oap=a
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Command Completed.
```

```
init-oap:oap=both:force=yes
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

In the following example, assume that the MDAL is malfunctioning when the command is entered.

```
init-oap:oap=b
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Info: MDAL is not operational. OAP initialization may not occur.
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

```
;
```

init-sys**Initialize System**

Use this command to reset all cards in the system (except HMUX and HIPR cards). When you first enter this command, a caution message is displayed in the scroll area requesting that you re-enter the command to confirm the operation. You have 30 seconds to re-enter the command. The only valid commands that you can enter after entering the **init-sys** command the *second* time are the commands **login** and **act-user**.

CAUTION: This command causes a complete system reload, and you should use it only during periods of low traffic. Use this command only when directed by Tekelec Technical Service at (888) FOR-TKLC.

CAUTION: When the **init-sys** command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. You will need to manually put each device back into its previous state after the system is back on line. It is, therefore, advisable to print or electronically capture the output of the **rept-stat-slk**, **rept-stat-card**, and **rept-stat-trm** commands for reference prior to issuing the **init-sys** command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above **rept-stat** commands.

Keyword: **init-sys**

Related Commands: **act-gpl**, **chg-db**, **chg-gpl**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**

Command Class: System Maintenance

Parameters

NOTE: As of EAGLE 5 ISS Release 38.0, the **force** parameter can no longer be used.

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP, G-Flex, G-Port, or INP feature is on. This parameter is applicable only to network cards containing the MPS database (VSCCP).

Range: **refresh**, **persist**

refresh — Causes data to be reloaded to the specified card.

persist — Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

Default: **refresh**

Example

init-sys

init-sys:data=persist

Dependencies

When this command is entered, another **init-sys** command cannot be in progress on another port.

The LNP, G-Flex, G-Port, or INP feature must be turned on before the **data** parameter can be specified,

The value specified for the **data** parameter for the confirmation command must be the same value that was specified the first time.

Notes

When the **init-sys** command is entered the first time, you have 30 seconds to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the **init-sys** command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicate that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the **init-sys** command, the MASP that was active before the **init-sys** command was entered will be the active MASP when the system has finished reinitializing. TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require the TSM cards to be reloaded.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

Output

The following example shows what happens when you enter the **init-sys** command once and enter the **init-sys** command a second time within 30 seconds, causing the system to start resetting all of its cards.

init-sys

```
rlghncxa03w 04-01-07 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-07 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

init-sys

```
rlghncxa03w 04-01-07 07:05:16 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-07 07:05:17 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

The following example shows what happens when you enter the **init-sys** command once and allow more than 30 seconds to pass with no other keyboard entry.

init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3.
```

```
rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when you enter the **init-sys** command once and enter a different command (**rls-alm:lvl=minr**), letting the 30-second timer expire for the second entry of the **init-sys** command.

init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

rls-alm:lvl=minr

```
rlghncxa03w 04-01-05 07:05:10 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:11 EST  EAGLE 31.3.0
All the minor alarms are released
```

```
rlghncxa03w 04-01-05 07:05:12 EST  EAGLE 31.3.0
Command Completed
```

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when the **init-sys** command is entered twice within 30 seconds, and specifies the **data=persist** parameter to perform a warm restart of the requested cards without reloading the database to the cards.

init-sys:data=persist

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and will result in
traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
init-sys:data=persist
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Command entered at terminal #3
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

lock

Lock Keyboard

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the **unlock** command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

Keyword: lock

Related Commands: unlock

Command Class: Basic

Parameters

This command has no parameters.

Example

lock

Dependencies

The terminal cannot be an OAP terminal.

The terminal cannot be an **mgmt** terminal used for Network Surveillance.

The terminal cannot be a **telnet** terminal (terminal IDs 17-40).

Notes

As an alternative, you can unlock a locked terminal by entering the **inh-trm** command, followed by the **alw-trm** command.

Output

lock

```
rlghncxa03w 04-02-17 16:02:05 EST  EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

login

Login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

Keyword: login

Related Commands: act-user, chg-pid, chg-secu-dflt, chg-user, dact-user, dlt-user, ent-user, logout, rept-stat-user, rtrv-secu-dflt, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

:uid= (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

Range: azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Example

login:uid=john

Dependencies

All the following dependencies assume the appropriate features are turned **on**.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the **uout** parameter of the **ent-user** command.

If the OA&M IP Security Enhancements feature is not turned on, you cannot change the password at the prompt from an IP User Interface telnet terminal (IDs 17-40) when:

- It is the first time the user is logging in with the assigned Userid and password
- The password has expired because of aging out.
You must log in with a new Userid and password for the first time or change an expired password from a serial terminal (terminal IDs 1-16).

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that you specify on the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that you specify on the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

Notes

The **act-user** command can be used in place of **login**. The **act-user** command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

Output

Not applicable.

logout

Logout

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** and **canc-user** commands.

Keyword: logout

Related Commands: act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

This command has no parameters.

Example

logout

Dependencies

This command cannot be entered from a terminal that is configured as an OAP terminal.

Notes

The **dact-user** or **canc-user** commands can be used in place of **logout**.

Output

logout

```
rlghncxa03w 06-06-05 07:05:31 EST EAGLE 35.0.0
Command Completed.
```

;

pass

Pass

Use this command to pass a command string to an individual card for processing. This command reduces the reliance on the OAM build for card and on application-specific information.

Keyword: pass

Related Commands:

Command Class: System Maintenance

Parameters

:cmd= (mandatory)

Command string including quotes (" "). The command represented in the quoted string is sent to the specified card. Maximum command string length including quotes is 132 characters.

Range: `////////////////////////////////////`

Any string of characters that represent a pass-through command. The string must be enclosed in double quotation marks.

The valid pass-through commands are **arp**, **aslog**, **asplog**, **assocrtt**, **connmgr**, **drklog**, **ftpctest**, **help**, **linkinfo**, **msucount**, **msuroute**, **msutrace**, **netstat**, **nslookup**, **ping**, **sctp**, **sockrtt**, **sockstate**, **traceroute**, **ualog**, **soipdata**, **soiplog**.

See "Pass-Through Commands" for information on pass-through commands.

NOTE: Pass-through commands shown in online help that are not documented in Chapter 7 are not supported at this time.

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,**

4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
pass:loc=1201:cmd="ping 198.89.1.2"
```

```
pass:loc=1201:cmd="help"
```

```
pass:loc=1111:cmd="soipdata -f"
```

Dependencies

The **loc** parameter value must correspond to a SSEDCM card location for SS7IPGW, IPGWI, IPLIM, E5-IPSM, IPLIMI, EROUTE applications, and STP LAN, a DSM card location for VSCCP that supports the G-Flex, G-Port, INP, LNP ELAP Configuration features, or an E5-ENET card location for IPLHC, IPGHC, SLANHC, and ERTHC GPLs.

The specified card location is out of range.

Syntax error found in the **pass** command.

Card is not in service

Pass command not found.

Notes

See "Pass-Through Commands" for information on pass-through commands.

Output

The following example is not definitive of the output of the **ping** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1201:cmd="ping 198.89.1.2"
    rlgncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
    ping - Command Accepted by 1201.
    PASS: MASP A - COMPLTD
;
    OUTPUT FROM 1201:
    Pinging 192.168.100.4 with 32 bytes of data:
    Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
    Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
    Reply from 192.168.100.3: bytes=32 time=140ms TTL=255
    Reply from 192.168.100.3: bytes=32 time=10ms TTL=255
    ping - Command Completed.
    END OUTPUT FROM 1201.
```

The following example is not definitive of the output of the **soipdata** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1111:cmd="soipdata -f"

rept-ftp-meas

Report Measurements to FTP

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM to the customer's FTP server.

Keyword: rept-ftp-meas

Related Commands: rept-meas

Command Class: Link Maintenance

Parameters

:enttype= (mandatory)

Entity type to report on in the measurements report.

Range: **eir**, **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **origninc**, **stp**, **stplan**, **tt**, **sctpasoc**, **sctpcard**, **ua**
eir — Measurements for Equipment Identity Register
link — Measurements for signaling links
lnkset — Measurements for linksets
lnp — Measurements for local number portability
lsdestni — Measurements for linkset destination network identifiers

lsonismt — Measurements for ISUP message type screening
lsorigni — Measurements for linkset originating network identifiers
mapscrn — Measurements for GSM MAP message screening
np — Measurements for INP, G-Port, A-Port, and IGM
origni — Measurements for originating network identifiers greater than 5
origininc — Measurements for originating network identifiers (less than 5, small networks) for network clusters
stp — Measurements for all nodes
stplan — Measurements for TCP/IP links.
tt — Measurements for translation types
sctpasoc — Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
sctpcard — Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
ua — Measurements per application server/association for the M3UA and SUA protocols

:type= (mandatory)

The measurement report type.

Range: **avl, avld, avldth, comp, gtwy, mtcd, mtcddth, mtch, mtcs, nm, rbase, systot**

avl — Availability measurements

avld — Daily availability measurements

avldth — Day to hour availability measurements.

comp — Component measurements

gtwy — Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd — Daily maintenance measurements

mtcddth — Day-to-hour maintenance measurements

mtch — Hourly maintenance measurements

mtcs — Link/linkset maintenance status

nm — Network management, on-demand

rbase — Schedule-report type record base measurements

systot — STP system totals

:day= (optional)

Day of the week for the specified daily measurement report.

Range: **mon, tue, wed, thu, fri, sat, sun**

Default: If not specified, the previous single day is reported.

:hh= (optional)

The specific half-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **hh=0300** generates a report for the interval 2:30-3:00.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

:period= (optional)

The relative period for the report.

Range: **active, last, specific**

:qh= (optional)

The specific quarter-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **qh=0315** generates a report for the interval **3:00-3:15**.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

Example

```
rept-ftp-meas:type=systot:enttype=stp
rept-ftp-meas:type=mtch:enttype=lnp
rept-ftp-meas:type=mtcd:enttype=sctpasoc
```

Dependencies

The **rept-ftp-meas** command cannot be used to specify a report type if that report type is currently printing.

The Measurements Platform feature must be turned on (**chg-feat** command) before this command can be entered.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (**chg-measopts:collect15min=on** command) must be on before the **qh** parameter can be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before:

- The **mtchlnp=on** parameter or the **mtcdlnp=on** parameter can be specified
- Entity type **lnp** can be specified

The GSM Map Screening feature (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) must be turned on before:

- The **mtcdmap=on** parameter can be specified.
- Entity type **mapscrn** can be specified

The Equipment Identity Register (EIR) feature must be enabled and turned on before the **enttype=eir** parameter can be specified.

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**avld(th)**, **mtcd(th)**, **mtch**, **nm**, **rbase**, and **mtcs** are excluded with message “E2307: QH or HH is not valid for this TYPE”).

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld(th)**, **mtcd(th)**, **mtch**, **nm**, **rbase**, and **mtcs** cannot be specified.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type **mtcd** is specified
- When report type **mtcdth** is specified

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

The **day** parameter can be specified only for report type **mtcd** and entity types **eir**, **lnp**, **np**, and **mapscrn**.

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=active** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch**.

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**.

Table 5-49 indicates with an X valid parameter combinations for measurements reports; invalid combinations will generate an error message.

Table 5-49. rept-ftp-meas Valid and Invalid Parameter Combinations

The G-Port, INP, A-Port, or IS41 GSM Migration feature must be turned on before the **mtchnp=on** parameter, **mtcdnp=on** parameter, or **enttype=np** parameter can be specified.

The G-Flex, G-Port, EIR, A-Port, or IGM feature must be turned on before the **mtchnp=on**, **mtcdnp=on**, or **enttype=np** parameter can be specified.

An hourly boundary must be specified for report type **mtch**.

The Measurements Platform collection function (**chg-measopts:platformenable=on** command) must be enabled before this command can be entered.

Notes

None

Output

```
rept-ftp-meas:type=mtcd:enttype=lnp
rlghncxa03w 04-02-27 12:47:07 EST EAGLE 31.3.0
Measurement Reports will be generated to FTP

rlghncxa03w 04-02-27 12:47:07 EST EAGLE 31.3.0
REPT-FTP-MEAS command was successful.
```

;

rept-imt-info

Display IMT Error and Use Statistics

Use this command to display the following statistics:

- The IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- The current IMT bus use statistics (Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.)
- The HMUX and HIPR card error statistics

Keyword: rept-imt-info

Related Commands: clr-imt-stats, init-imt-gpl, rept-imt-lvl1, rept-imt-lvl2, tst-imt

Command Class: System Maintenance

Parameters

:report= (mandatory)

Type of report to generate.

Range: err, util, hmuxerr, hiprerr

err— Produces a report of the IMT bus error statistics
util— Produces a report of the IMT bus use (utilization) statistics
hmutexerr— Produces a report of the HMUX card error statistics
hiprerr— Produces a report of the HIPR card error statistics

:ebucket= (optional)

End bucket. Specifies the last one-hour time period (*bucket*) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

Range: 0-15

Default: If **sbucket** is specified—current **sbucket** value; information for only that time period is displayed.

If **sbucket** is not specified—**15**, the report includes statistics for all 16 time periods

:eloc= (optional)

End location. Specifies the card location of the last card in the range for the report.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

Default: If **sloc** is specified—current **sloc** value; displays information for one card

If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

:erronly= (optional)

Use this parameter to filter output to display only non-zero counts in the error report.

This parameter can be specified only if **report=err** is specified.

Range: yes, no

Default: yes

:eshelf= (optional)

End shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the last shelf in the range.

This parameter can be specified only if **report=hmutexerr** or **report=hiprerr** is specified.

Range: 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default: If **sshelf** is specified—current **sshelf** value.

If **sshelf** is not specified—**6100**, displays information for entire range of shelves.

:eslot= (optional)

Ending slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

Range: 1-8, 11-18

Default: If **sslot** is specified—current **sslot** value.

If **sslot** is not specified—not used.

:mode= (optional)

Display mode to use for error report.

This parameter can be specified only if **report=err** is specified.

Range: full, stats, summary

full— Displays information for each card along with a summary report

stats— Displays only individual card statistics

summary— Displays the summary portion of the report

Default: summary

:sbucket= (optional)

Start bucket. Specifies the first one-hour time period (bucket) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

Range: 0-15

Default: 0

:sloc= (optional)

Start location. Specifies the card location of the first card in the range for the report.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

Default: If **eloc** is specified—current **eloc** value.
If **eloc** is not specified—**1201**, which corresponds to IMT address 0; displays information for entire range of card locations.

:sshelf= (optional)

Start shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the first shelf in the range.

This parameter can be specified only if **report=hmuxerr** or **report=hiprerr** is specified.

Range: 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default: If **eshelf** is specified—current **eshelf** value.
If **eshelf** is not specified—**1100**, displays information for entire range of shelves.

:slot= (optional)

Starting slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

Range: 1-8, 11-18

Default: If **eslot** is specified—current **eslot** value.
If **eslot** is not specified—not used.

:trm= (optional)

The serial port (printer location) to which the report is to be sent.

Range: 1-16

Default: Report displays on the terminal where the command is issued

Example

```
rept-imt-info:report=err
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no
rept-imt-info:report=util
rept-imt-info:report=hmuxerr
rept-imt-info:report=hiprerr:sbucket=0
rept-imt-info:
rept-imt-info:report=hiprerr:sshelf=1100:slot=1:eslot=2:sbucket=0
```

Dependencies

No related IMT command can be in progress when the **rept-imt-info** command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

The **rept-imt-info** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The following **report** parameter combinations are not valid in the command:

- When the **report=util** parameter is specified, the **ebucket**, **erronly**, **mode**, and **sbucket** parameters cannot be specified.
- When the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified, the **erronly** and **mode** parameters cannot be specified.
- When the **report** parameter values **err**, **util**, and **hmuxerr** are specified, the **sslot** and **eslot** parameters cannot be specified.

The ending hourly time period cannot be less than the starting hourly time period. For example, **rept-imt-info:report=err:sbucket=5:ebucket=3** cannot be specified.

When the **sslot** and **eslot** parameters are specified, the **sshelf** parameter must be specified and the **eshelf** parameter cannot be specified (slot information is reported for a single shelf).

The **sshelf** and **eshelf** parameters can be specified only when the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified.

The HIPR card slots (**09** and **10**) cannot be specified for the **sslot** and **eslot** parameter values.

The STP options **hmuxabus** or **hmuxbbus** must have their value set to **yes** when the **sshelf** and **eshelf** parameters are specified.

A card location that is valid and defined in the database must be specified.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

IMT Bus Error Statistics: Each hourly time period (*bucket*) contains the IMT bus error statistics for a single hour. A total of 16 hourly time periods, numbered **0** to **15**, exist. Hourly time period **0** is the most-recent (current), and hourly time period **15** is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period **0** are now reported in the hourly time period **1**, and so on. The statistics reported in the hourly time period **15** are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period **0** and changes to hourly time period **1** at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

IMT Bus Use Statistics: The statistics are calculated for all cards in the specified range and summarized. Only the summarized statistics are displayed. *IMT bus use* is the percentage of the capacity of the IMT bus that is used for data during a particular time.

HMUX or HIPR Statistics (Bucket Summary): Each hourly time period (*bucket*) contains the HMUX or HIPR statistics for a single hour. A total of 16 hourly buckets, numbered **0** to **15**, exist. Bucket **0** is the most-recent (current) bucket; bucket **15** is the least-recent (oldest).

Each hour on the hour, the least-recent bucket expires and the hourly time periods advance. That is, after the advance, the statistics previously reported in bucket **0** are now reported in bucket **1**, and so on. The statistics that were reported in bucket **15** are no longer available after the change.

If a card booted within the past 16 hours, a message is displayed indicating that no data is available for that card. When a card boots, it starts to collect statistics in bucket **0**. It changes to bucket **1** at the

start of the next hour. Thus, the first bucket of statistics that a card collects after booting might be for part of an hour.

A HIPR card stores the statistics separately for each card on its shelf. When the **sloc** and **eloc** parameters are specified, the HIPR card sends the statistics for each card to the OAM application for display. When the **sloc** and **eloc** parameters are not specified, the HIPR card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

HMUX or HIPR Statistics (Cumulative): HMUX or HIPR cumulative statistics maintain running totals of the error count for each parameter from card initialization. The error counts can be cleared by entering a **clr-imt-stats:all=yes** command to clear all HMUX and HIPR cards, or a **clr-imt-stats** command to clear a specific card.

Table 5-50 explains the **rept-imt-info:report=hmuxerr** statistics.

"Excessive" is primarily determined by the operator, based upon:

- Overall system behavior
- Duration of time since the last statistics were taken
- Statistics of an individual card in relation to other cards

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
LOW SPEED STATS			
IMT Rx Packet CRC Error	Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware.	Card insertion/ removal or boot. May occur infrequently in a normal system.	None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards.
IMT Rx Packet Format Error	Occurs when the Start of Message byte of the IMT packet is followed by unexpected data. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.
IMT Rx Violation Error	Received an illegal character from the IMT. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.
CPU Rx FIFO Full	HMUX's IMT interface is congested. Detected by hardware.	Indicates that data was received at a higher rate than could be processed	Call Tekelec Technical Services if count is excessive in relation to other HMUX cards.

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
CPU Rx FIFO Half Full	HMUX's IMT interface is becoming congested. Detected by hardware.	Indicates that data was received at a higher rate than could be switched for a short period.	None. FIFO half full is just an indication; no action is required.
CPU Rx FIFO Empty Before SOM	Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the beginning (SOM) of the packet before all the data was read.	The SOM was corrupted while being written into the CPU Rx FIFO from the low speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA problem that requires further investigation.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.	The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the low speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, some type of FPGA or high-speed link problem might require further investigation.
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the IMT bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None.
CPU Rx Packet CRC Error	Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA and transferred to the processor memory, and the FPGA calculated CRC does NOT match the CRC word at the end of the packet.	The data was corrupted while being written into the CPU Rx FIFO, or data coming from the low speed link is corrupted.	None. If the problem persists, some type of FPGA or high-speed link problem might require further investigation.
DMA Terminal	Received IMT packet length is longer than the	Card insertion/removal or boot.	None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Count Interrupt	max allowed. Detected by hardware.		count is excessive in relation to other cards.
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, some type of FPGA problem might require further investigation.
CPU Tx Buffer Full	The Tx Buffer has had 512 bytes written to it and can accept no more.	A packet is being sent that is too large.	Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor.
CPU Tx Buffer Half Full	The Tx Buffer has had 256 bytes written to it.	256 bytes have been written to the Tx Buffer.	None.
IMT Bypass FIFO Full	The IMT Bypass FIFO has 32K bytes of data in it.	The low-speed link is experiencing very heavy traffic conditions, or the HMUX IMT Transmitter has been disabled or is not operating correctly.	Determine why IMT traffic is so heavy. Make sure the HMUX IMT Transmitter is enabled.
IMT Bypass FIFO Half Full	The IMT Bypass FIFO has 16K bytes of data in it.	The low-speed link is experiencing very heavy traffic conditions, or the HMUX IMT Transmitter has been disabled or is not operating correctly.	Determine why IMT traffic is so heavy. Make sure the HMUX IMT Transmitter is enabled. Under normal operation this condition should clear itself.
IMT Tx FIFO Full	HMUX's IMT Transmitter FIFO Full	TAXI transmitter logic for this channel is not operating properly.	Reset Tx FIFO. If all channels exhibit this problem, there might be an internal FPGA problem with the 125MHz clock.

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
IMT Tx FIFO Half Full	HMUX's IMT Transmit Half FIFO Full	High burst rate or multiple large packet transmissions from IXP1250.	None
HIGH SPEED STATS			
IMT Rx Packet Format Error	Packet was received with a format error (for example, no EOM)	Packet was transmitted incorrectly or was corrupted by another device in the system.	None
IMT Rx Disparity Error	Fibre Channel transceiver received a disparity error on a character.	Noisy high-speed ring.	This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.
IMT Rx Sync Lost Error	Fibre Channel transceiver is not receiving sync characters	Noisy high-speed ring. High-speed cable was disconnected. One of the HMUXs in the ring was removed.	This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.
IMT Rx Code Word Error	Fibre Channel transceiver has received an invalid code word.	Noisy high-speed ring. Wrong command transmitted.	This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.
CPU Receive FIFO Full	Communication CPU on the card is congested. Detected by hardware	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Call Tekelec Technical Services if count is excessive in relation to other cards.
CPU Receive FIFO Half Full	Communication CPU on the card is becoming congested. Detected by hardware.	Indicates that data was received at a higher rate than could be processed for a short period.	None. FIFO half full is just an indication; no action is required.
CPU Rx FIFO Empty	Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the beginning (SOM) of the	The SOM was corrupted while being written into	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA

Before SOM	packet before all the data was read.	the CPU Rx FIFO from the high speed link.	problem that requires further investigation.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.	The SOM was corrupted while being written into the CPU Rx FIFO, or a partial packet was written into the FIFO from the high speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, some type of FPGA or low-speed link problem might require further investigation.
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the Fibre Channel bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None.
CPU Rx Packet CRC Error	A packet received for this shelf contains a CRC error.	Packet was transmitted incorrectly or was corrupted by another device in the system.	Discard packet. If this problem persists, a more detailed analysis of the system is needed.
DMA Terminal Count Interrupt	Received IMT packet length (on Fibre Channel) is longer than the maximum allowed. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, some type of FPGA problem might require further investigation.
CPU Tx Buffer Full	The Tx Buffer has had 512 bytes written to it and can accept no more.	A packet is being sent that is too large.	Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor.

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
CPU Tx FIFO Half Full	The Tx Buffer has had 256 bytes written to it.	256 bytes have been written to the Tx Buffer.	None.
IMT (High-speed) Bypass FIFO Full	The High-speed Bypass FIFO has 2K bytes of data in it.	The high-speed link is experiencing very heavy traffic conditions, or the HMUX High-speed Transmitter has been disabled or is not operating correctly.	Determine why high-speed traffic is so heavy. Make sure the HMUX High-speed Transmitter is enabled.
IMT (High-speed) Bypass FIFO Half Full	The High-speed Bypass FIFO has 1K bytes of data in it.	The high-speed link is experiencing very heavy traffic conditions or the HMUX High-speed Transmitter has been disabled or is not operating correctly.	Determine why high-speed traffic is so heavy. Make sure HMUX High-speed Transmitter is enabled. Under normal operation this condition should clear itself.
IMT (High-speed) Rx FIFO Full	The High-speed Rx FIFO has 128K bytes of data in it.	The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly.	Determine why high-speed traffic is so heavy. Determine why low-speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled.
IMT (High-speed) Rx FIFO Half Full	The High-speed Rx FIFO has 1K bytes of data in it.	The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly.	Determine why high-speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled. Under normal operation this condition should clear itself.
MISC STATS			
Shelf ID UART Framing Error	UART Framing error received by HMUX in Shelf address data stream received from OAM.	Noisy or bad clock cable from Control Shelf to shelf in which error is reported.	Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.
Shelf ID UART	UART Overrun error received by HMUX in	Noisy or bad clock cable from Control Shelf to	Occasionally happens. This count should be low.

Table 5-50. Explanation of **rept-imt-info:report=hmuxerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action

IMT Bypass FIFO Full	The high-speed shelf bypass FIFO has been overflowed with data.	Fibre Channel transmit logic not operating correctly. Very high simultaneous data traffic rates on the high-speed ring and on the low-speed to high-speed path within the shelf.	System is operating above limits. Reduce data traffic. Reset FIFO.
IMT Bypass FIFO Half Full	The high-speed shelf bypass FIFO is half full.	Data traffic burst on the high-speed bus.	None
IMT Rx FIFO Full	The 128k FIFO has been overflowed with data.	IXP1250 not removing data from FPGA.	Reset FIFO. Determine why IXP1250 not removing data.
IMT Rx FIFO Half Full	The 128k FIFO has gone half full with data.	Large burst of traffic on high-speed ring.	None
IMT Tx FIFO Full	The high-speed transmit FIFO has been overflowed with data.	The Fibre Channel transmit logic is not operating. The 106.25MHz is not operating. The data in the FIFO is incorrectly formatted (no EOM).	Reset Tx FIFO.
IMT Tx FIFO Half Full	The high-speed transmit FIFO is half full with data.	High burst rate or multiple large packet transmissions from IXP1250.	None

Table 5-51. Explanation of **rept-imt-info:report=hiprerr** Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
IXP Rx FIFO Full	IXP1250 FIFO has been overflowed with data.	IXP1250 not removing data from the FPGA. Data coming in faster than IXP1250 can process.	Reset the IXP1250 FIFO.
IXP Rx FIFO Half Full	IXP1250 FIFO is half full with data	Large burst of data on the high-speed ring.	None
MISC STATS			
Shelf ID UART Framing Error	UART Framing error received by HIPR in Shelf address data stream received from OAM.	Noisy or bad clock cable from Control Shelf to shelf in which error is reported.	Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.
Shelf ID UART Overrun Error	UART Overrun error received by HIPR in Shelf address data stream received from OAM.	Noisy or bad clock cable from Control Shelf to shelf in which error is reported.	Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.

Legend

IMT Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.**STATISTIC**—The error statistic type for the IMT buses A and B.

BUS A VALUE—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B VALUE—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTICS—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

BUCKET SUMMARY—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the **rept-imt-info** command.)

CUMULATIVE—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HMUX Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTIC—The miscellaneous error statistic type.

BUS A—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

HIPR Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.

LOC—The card location (shelf and slot) for which information is displayed.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTIC—The miscellaneous error statistic type.

BUS A—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

rept-imt-lvl1

Report IMT Level 1

Use this command to display the IMT level 1 statistics for a card or a range of cards. If more than one card is specified, a summary report of totals for all cards can be generated.

Keyword: rept-imt-lvl1

Related Commands: clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt, tst-imt

Command Class: System Maintenance

Parameters

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-52 to map the values by card location).

Range: 0-251

The value can be specified in decimal (0-251) or hexadecimal (h'00-h'fb).

Default: If the start address (s) value is specified, the e parameter default value is the specified s parameter value.

If the s parameter is not specified, the e parameter is not specified and the sloc parameter must be specified.

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If sloc is specified—current sloc value; displays information for one card

If sloc is not specified—1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

:r= (optional)

Report type value

Range: full, stats, summary

full—Displays information for each card along with a summary report.

stats—Displays only individual card statistics.

summary—Displays the summary portion of the report.

Default: full

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-52 to map the values by card location).

Range: 0-251

The value can be specified in decimal (0-251) or hexadecimal (h'00-h'fb).

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If eloc is specified—current eloc value

If eloc is not specified—1201, which corresponds to IMT address 0 (s=0).

:trm= (optional)

The serial port (printer location) where the report is to be sent.

Range: 1-16

Default: Report displays on the terminal where the command was issued

Example

rept-imt-lvl1:s=00:e=01

Dependencies

Only one report status command can be in progress at a time.

Either the start address (**s** parameter) or the start location (**sloc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The **rept-imt-lvl1** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl2**, **tst-imt**.

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

A card location that is valid and defined in the database must be specified.

Notes

Table 5-52 maps each card location to the decimal and hexadecimal "Converting ITU National Point Code Formats" values that can be specified for the **s** and **e** parameters.

Table 5-52. Hexadecimal/Decimal Values for **s** and **e** parameters

END OF REPORT

;

Legend

CARD—The IMT address of the card in hexadecimal

ELAPSED TIME (day - h:m:s)—The amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the **clr-imt-stats** command. This is shown in the format **day - h:m:s**, where **day** is the number of days that have elapsed, and **h:m:s** is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).

COUNT—The IMT level 1 statistics displayed in this report.

BUS A VALUE and **BUS B VALUE**—The values of the IMT level 1 statistics on IMT bus A and IMT bus B.

Table 5-53 describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Safety Packets are included in the counts:

SAFETY PACKET—When an IMT packet goes around the IMT, a pre determined value in the packet is decremented by each card. When this value reaches zero, the card that receives the value equal to zero logs this as a safety packet and removes the IMT packet from the IMT.

MESSAGE SIGNALING UNIT (MSU)—IMT packet containing data

ACKNOWLEDGEMENT SIGNALING UNIT (ASU)—ack for an MSU that is sent from the destination card back to the originating card.

TEST SIGNALING UNIT (TSU)—Typically used to keep the card on the bus. There are many types of TSU's one of which performs a heartbeat function.

BROADCAST SIGNALING UNIT (BSU)—Function is the same as an MSU except that each card will process the BSU and then copy it to the next card for processing. Used for IMT maintenance functions.

SAFETY SIGNALING UNIT (SSU)—Anytime a packet times out (Safety Packet), the card that logged a safety packet sends an SSU to make sure the originating card is still on the IMT bus.

Table 5-53. rept-imt-lvl1 Statistics Explanation

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Transmit Packet	Number of transmitted IMT packets	N/A	N/A
Transmit Byte	Number of transmitted IMT Bytes	N/A	N/A
Receive Packet	Number of received IMT Packets	N/A	N/A
Receive Byte	Number of received IMT Bytes	N/A	N/A
Receive Packet with CRC Error	Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware	Card insertion, removal, or boot. Might occur infrequently in a normal system.	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
Receive Packet with Format Error	Occurs when the Start of Message byte of the IMT packet is followed by unexpected data. Detected by hardware.	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
Receive Packet with Invalid Length	Card received an IMT packet where the actual length of the packet did not match the length indicated in the length field. Detected by software	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.

Table 5-53. rept-imt-lvl1 Statistics Explanation

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Primary Control Receive Error	Corrupted packet. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
Primary Control Transmit Error	Transmitted IMT packet is greater than allowed size. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
Primary Control Sanity Error	Internal hardware monitoring self check failed. Detected by hardware	Generally indicates Bad hardware or corrupt packets.	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
Violation Error	Received an illegal character from the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
CPU Receive FIFO Full	Communication CPU on the card is congested. Detected by hardware	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Contact Tekelec Technical Services if count is excessive in relation to other cards.
IMT Receive FIFO Half Full	IMT interface on the card is becoming congested. Detected by hardware.	Indicates that data was received at a higher rate than could be switched for a short period.	None. FIFO Half Full is just an indication; no action is required.

Table 5-53. rept-imt-lvl1 Statistics Explanation

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
CPU Receive FIFO Half Full	Communication CPU on the card is becoming congested. Detected by hardware	Indicates that data was received at a higher rate than could be processed for a short period.	None. FIFO Half Full is just an indication; no action is required.
DMA Terminal Count Interrupt	Received IMT packet length is longer than the max allowed. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
MSU Retransmitted	Retransmissions occur typically when an MSU goes around the IMT bus and times out (safety packet issued). Detected by software	Card insertion, removal, or boot. Might occur infrequently in a normal system.	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
MSU Safety Packet	MSU has timed out on the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
ASU Safety Packet	ASU Unit has timed out on the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
TSU Safety Packet	TSU Unit has timed out on the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.

Table 5-53. rept-imt-lvl1 Statistics Explanation

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
BSU Safety Packet	BSU Unit has timed out on the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.
SSU Safety Packet	SSU Unit has timed out on the IMT. Detected by hardware	Card insertion, removal, or boot	• None if card has booted or was just inserted. • Contact Tekelec Technical Services if count is excessive in relation to other cards.

rept-imt-lvl2**Report IMT Level 2**

Use this command to display the IMT level 2 statistics for a card. This report displays IMT traffic statistics for either one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the **loc** or **l** parameters), whose statistics pool is queried for report information, and another card (specified with the **sloc** or **s** parameter).
- Report statistics between the source card and a range of cards (specified with both the **sloc** and **eloc** or the **s** and **e** parameter combinations).

Keyword: rept-imt-lvl2

Related Commands: clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl1, rept-stat-imt, rmv-imt, rst-imt, tst-imt

Command Class: System Maintenance

Parameters

:b= (optional)

IMT bus identification.

Range: a, b, both

a — Displays statistics for IMT bus A.

b — Displays statistics for IMT bus B.

both — Displays statistics for both IMT busses, A and B.

Default: both

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-52 to map the values by card location).

Range: 0-251

The value can be specified in decimal (0–251) or hexadecimal (h'00–h'fb).

Default: If the **s** parameter is specified, the default is the **s** parameter value.
If the **s** parameter is not specified, the default is 251.

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318,
2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108,
3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118,
4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208,
5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If **sloc** is specified—current **sloc** value; displays information for one card
If **sloc** is not specified—1115, which corresponds to IMT address 251 (e=251); displays
information for entire range of locations.

:l= (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for
report information.

Range: 0-251

(See the *Installation Manual – EAGLE 5 ISS* for an illustration of the card locations.)

:loc= (optional)

Source card location. The location of the card whose "statistics pool" is to be queried for report
information.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318,
2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108,
3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118,
4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208,
5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A
decimal value or a hexadecimal value can be specified for this parameter (see Table 5-52 to map
the values by card location).

Range: 0-251

The value can be specified in decimal (0–251) or hexadecimal (h'00–h'fb).

Default: If **e** is specified—current **l** parameter value.
If **e** is not specified—0.

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318,
2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108,
3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118,
4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208,
5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If **eloc** is specified—current **sloc** value.
If **eloc** is not specified—IMT address 0 (s=0).

:trm= (optional)

The serial port (printer location) where the report is to be sent.

Range: 1-40

Default: The report displays on the terminal where the command was issued.

Example

rept-imt-lvl2:l=00:s=00:e=02:b=a

Dependencies

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

The **rept-imt-lvl2** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **tst-imt**.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified; but not both at the same time.

A card location must be specified that is valid and defined in the database.

Notes

None

Output

If the source card location falls within the range of cards specified with the **sloc** and **eloc** parameters or the **s** and **e** parameters, the output report for the source card will show zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports only the values or pegs received or transmitted across the IMT bus.

In the following example, the output for the source card location (**loc=1213**) is shown in column 0a (the equivalent card location expressed as a hexadecimal digit). The 0a column displays zeros because **loc=1213**, falls within the range specified for the start and end card location (**sloc=1211** and **eloc=1215**). (Note that the Receive FSN row displays a value of **1**, which is not a count, but rather the initial sequence number of the FSN that the source card location expects to receive). Columns 09 and 0b display zeros because these slots are not provisioned with any card (the adjacent card slots (08 and 0c) contain DCM cards).

Legend

CARD—The IMT address of the card location specified by the **I** parameter in this command in hexadecimal.

BUS—The IMT bus for which the IMT level 2 statistics are being reported.

FIELD—The IMT level 2 statistics displayed in this report.

00 - EF—The IMT address of the cards on the IMT bus in hexadecimal.

LINK STATUS—The status of the link, either ALGN (aligned) or OS (out of service).

OS COUNT—The number of times the link has cycled between being aligned and being out of service.

TRANSMIT BSN—The number of BSNs transmitted.

TRANSMIT FSN—The number of FSNs transmitted.

RECEIVE BSN—The number of BSNs received.

RECEIVE FSN—The sequence number for the next FSN that the source card location expects to receive.

UNACK MESSAGES—The number of unacknowledged messages received.

INVALID LENGTH—The number of messages received with invalid length indicators.

INVALID RX BSN—The number of invalid BSNs received.

INVALID RX FSN—The number of invalid FSNs received.

INVALID LSSU—The number of invalid LSSUs received.

INVALID ASU—The number of invalid ASUs received.

RTB ADDRESS—The address of the retransmission buffer, in hexadecimal.

AVERAGE ACK TIME—The average amount of time for an acknowledgment, in milliseconds.

MINIMUM ACK TIME—The minimum amount of time for an acknowledgment, in milliseconds.

MAXIMUM ACK TIME—The maximum amount of time for an acknowledgment, in milliseconds.

rept-meas**Report Measurements**

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

ITU gateway measurements are done for **stp** and, on a per-linkset basis, for **lnkset**, **lsonismt**, **lsdestni**, and **lsorigni** entity types.

Keyword: **rept-meas**

Related Commands: **chg-meas**, **copy-meas**, **rept-ftp-meas**, **rtrv-meas-sched**

Command Class: Link Maintenance

Parameters

:enttype= (mandatory)

The entity type to report on.

Range: **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **origninc**, **stp**, **stplan**, **tt**, **setpasoc**, **setpcard**, **ua**
link — Measurements for signaling links
lnkset — Measurements for linksets
lnp — Measurements for local number portability
lsdestni — Measurements for linkset destination network identifiers

lsonismt — Measurements for ISUP message type screening
lsorigni — Measurements for linkset originating network identifiers
mapscrn — Measurements for GSM MAP message screening
np — Measurements for INP, G-Port, A-Port, and IGM
origni — Measurements for originating network identifiers greater than 5
origninc — Measurements for originating network identifiers (less than 5, small networks) for network clusters
stp — Measurements for all nodes
stplan — Measurements for TCP/IP links.
tt — Measurements for translation types
sctpasoc — Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
sctpcard — Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
ua — Measurements per application server/association for the M3UA and SUA protocols

:type= (mandatory)

The type of measurement report.

Range: **avl, avld, avldth, comp, gtwy, mtcd, mtcddth, mtch, mtcs, nm, rbase, systot**

avl — Availability measurements

avld — Daily availability measurements

avldth — Day to hour availability measurements.

comp — Component measurements

gtwy — Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd — Daily maintenance measurements

mtcddth — Day-to-hour maintenance measurements

mtch — Hourly maintenance measurements

mtcs — Link/linkset maintenance status

nm — Network management, on-demand

rbase — Schedule-report type record base measurements

systot — STP system totals

:aname= (optional)

Association name. This parameter specifies the name assigned to the association in the IPAPSOCK table.

Range: **aaaaaaaaaaaaaa**

Up to 15 alphanumeric characters; the first character must be a letter.

:appl= (optional)

The GPL to report measurements on. This parameter can be used only with the **stplan-avl (enttype=stplan:type=avl)** measurement report. The **rtrv-gpl:gpl=all** command can be entered to list all valid applications.

Range: **xyyyyyyy**

Default: No value given.

:asname= (optional)

Application server name. This parameter specifies the name of the application server.

Range: **aaaaaaaaaaaaaa**

Up to 15 alphanumeric characters; the first character must be a letter.

:day= (optional)

The specific day of the week for daily LNP measurement reports.

Range: **mon, tue, wed, thu, fri, sat, sun**
Default: The previous single day report is generated.

:hh= (optional)

The specific half-hour interval. The **hh** parameter implies the ending time for the collection interval; for example, **hh=0300** generates a report for **2:30-3:00**.

Range: **0000-2400**
hhmm where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

Default: The **hh** parameter value is not given.

:link= (optional)

The link on the card specified in the **loc** parameter

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

Default: The **link** parameter value is not given.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: The **loc** parameter value is not given.

:lsn= (optional)

The name of the linkset for which link or linkset measurements are reported.

Range: *ayyyyyyyyy*
 1 alphabetic character followed by up to 9 alphanumeric characters

Default: The **lsn** value is not given.

:nc= (optional)

The network cluster for the specified GTWY measurement report.

Range: **0-255**

Default: The **nc** parameter value is not given.

:ni= (optional)

The network indicator for the specified GTWY measurement report.

Range: **1-255**

Default: The **ni** parameter value is not given.

:nzo= (optional)

Print non-zero measurements only.

Range: **yes, no**

Default: **yes** for types **avl**, **avld**, and **avldth**.
 This parameter is not used with the other report types.

:period= (optional)

The relative time period to report.

Range: **last, specific, active, all**

last — The previous collection interval

specific — A specific half-hourly interval (specified with the **hh** parameter)

active — The current collection interval

all — All collection intervals.

Default: The **period** parameter value is not given.

:qh= (optional)
The specific quarter-hour interval. The **qh** parameter implies the ending time for the collection interval; for example, **qh=0315** generates a report for **3:00-3:15**.

Range: **0000-2400**
hhmm where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

Default: The **qh** value is not given.

:trm= (optional)
The serial port (printer location) where the report is to be sent.

Range: **1-16**

Default: The **trm** value is not given.

:tt= (optional)
A specific translation type to be reported.

Range: **0-255**

Default: The **tt** parameter value is not given.

Example

```
rept-meas:type=comp:enttype=sctpcard:loc=2215
rept-meas:type=comp:enttype=lnkset:lsn=sp1
rept-meas:enttype=link:type=avl:loc=1201:link=a
rept-meas:enttype=lnp:type=mtcd
rept-meas:enttype=lnp:type=mtch:period=last
rept-meas:enttype=lnp:type=mtch:period=specific:hh=1300
rept-meas:enttype=lnp:type=mtcd:period=specific:day=tue
rept-meas:enttype=stplan:type=avl:appl=atmansi
rept-meas:type=systot:enttype=tt:tt=26
rept-meas:type=mtcd:enttype=mapscrn
rept-meas:type=mtch:enttype=mapscrn
rept-meas:type=mtcd:enttype=sctpasoc:aname=assoc01
rept-meas:type=mtcdth:enttype=ua:aname=assoc01:asname=appserv01
```

Dependencies

The **rept-meas** command cannot be used to specify a report type if that report type is currently printing.

The valid parameter combinations depend on the report type specified. These combinations are shown in Table 5-54. An X in a cell indicates that the parameter is valid for the report type shown.

When the Enhanced GSM MAP Screening (EGMS) feature is turned on, this command cannot be used to generate EGMS measurements reports.

The entity specified by the **loc**, **port**, or **lsn** parameter must be in the database.

The link specified by the **loc** and **link** parameters must already be defined in the database.

When **enttype=link** is specified, the card in the location specified by the **loc** parameter must be a LIM.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress when report type **mtcd** or **mtcdth** is specified.

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

When **enttype=lnp**, only **mtcd** and **mtch** can be specified for the **type** parameter.

If the **nc** parameter is specified for origininc reports, then the **ni** parameter must be specified.

If the **ni** parameter is specified for origin reports, then measurements data must be available at the time the command is entered.

The **day** parameter can be specified only for report type **mtcd** and entity types **lnp** and **mapscrn**.

The **period=all** parameter can be specified only for **type=avl** and **enttype=lnp:type=mtcd** reports.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **enttype=lnp** parameter can be specified.

The GSM Map Screening feature must be turned on before the **enttype=mapscrn** parameter can be specified.

The G-Port, INP, A-Port, or IS41 GSM Migration feature must be turned on before the **entity=np** parameter can be specified.

A primary MCPM card must be available when the Measurements Platform collection option is enabled and this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the **qh** parameter can be specified.

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld**, **mtcd**, **nm**, **rbase**, and **mtcs** cannot be specified).

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**mtcd** and **nm** are excluded with message "E2307: QH or HH is not valid for this TYPE").

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter cannot be specified.

When the **period=active** parameter or the **period=all** parameter is specified, the **hh** and **qh** parameters cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified. The **hh**, **qh**, and **day** parameters can be specified only if the **period=specific** parameter is specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only half hours ending in **00**, such as **0100**, **0200** or **0300**).

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only quarter hours ending in **00**, such as **0100**, **0200** or **0300**).

The **hh** parameter and the **qh** parameter cannot be specified when report type **avld**, **mtcd**, **nm**, **rbase**, or **mtcs** is specified.

If the **link** parameter is specified, the **loc** parameter must be specified.

The **lsn** parameter cannot be specified in the same command with the **loc** parameter or the **port** parameter.

When entity type **link** is specified, either the **loc** and **port** parameters or the **lsn** parameter must be specified.

The **appl** parameter can be specified only when the **enttype=stplan** and the **type=avl** parameters are specified.

When the **appl** parameter is specified, the **period=active** parameter and the **period=all** parameter cannot be specified.

The **period=active** parameter cannot be specified when the **enttype=stp** parameter or the **enttype=tt** parameter is specified.

The **lsn** parameter cannot be specified with the following parameters: **enttype=stp/tt/stplan/origni/origininc/lnp/np/mapscrn** or **type=systot**.

For entity type **lnkset**, the **lsn** parameter must be specified, regardless of whether the value of the **lsn** parameter is an ANSI or an ITU linkset.

For entity type **avl**, if **period=all** is specified, the **loc** and **port** parameters must be specified.

The **nzo** parameter is used only for entity types **avl**, **avld**, and **avldth**.

The **loc** and **lnkset** parameters cannot be specified in the same command. Either the **loc** parameter or the **lnkset** parameters can be specified, but not both. For example, the following command is not a valid parameter combination: **rept-meas:type=mtcd:enttype=link:loc=1211:link=a:lnkset=nc2785**

The **appl** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp**, the **trm** parameter cannot be specified because LNP measurements can be written only to the FTA. To retrieve this data, use the procedure described with the **act-file-trns** command information.

For the **stplan-avl** reports (**enttype=stplan** and **type=avl** parameters), if the **appl** parameter is specified, the **period=active** and **period=all** parameters cannot be specified.

The **type=systot** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp** and **type=mtch**, only **last** and **specific** can be specified for the **period** parameter.

When **enttype=lnp**, **nzo=yes** cannot be specified.

When **enttype=lnp**, the **appl**, **loc**, **port**, **lsn**, **ni**, and **nc** parameters cannot be specified.

The **tt** parameter must be specified when **enttype=tt**. The only time the **tt** parameter is valid is when it is specified with **enttype=tt**.

If the **type=gtwy** parameter is specified, and the value of the **enttype** parameter is **lsorigni**, **lsdestni**, or **lsonismt**, then the **ni** parameter cannot be specified for ITU linksets. The **ni** parameter is allowed only for ANSI linksets.

If the **type=gtwy:enttype=stp** parameter combination is specified, no additional parameters may be specified.

If the **type=gtwy:enttype=lsdestni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=lsorigni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=lsonismt** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

Table 5-54. Valid Parameter Combinations for the **type** Parameter

Parameter Value	Report Types (type parameter)												
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase	
enttype=													
stp	X		X	X		X					X	X	
link		X	X	X		X	X	X	X	X		X	
lnkset		X	X	X		X	X				X	X	
lnp			X		X								
tt	X												
stplan	X		X	X				X					
origni											X		
origninc											X		
lsdestni											X		
lsonismt											X		
lsorigni											X		
np			X		X								
mapscrm			X		X								
sctpasoc		X	X	X									
sctpcard		X	X	X									
ua		X	X	X									
period=													
last	X	X	X	X	X		X	X	X	X	X		
specific	X	X			X			X			X		
active		X				X	X	X				X	
all			X					X					
nzo								X	X	X			

If the **enttype=sctpcard** parameter is specified, then the card in the location specified by the **loc** parameter must be an IPLIMx, IPGWx, or IPSG card.

The **enttype=sctpasoc** or **enttype=ua** parameter must be specified before the **aname** parameter can be specified.

The **enttype=ua** parameter must be specified before the **aname** parameter can be specified.

The G-Port, INP, or AINPQ feature must be turned on before the **entitytype=np** parameter can be specified.

If the **enttype=sctpcard** parameter is specified, then the **loc** parameter must be specified.

If the **enttype=sctpcard** parameter is specified, then a card must be installed in the location specified by the **loc** parameter.

The value of the **appl** parameter must apply to the reports specified in the **enttype** and **type** parameters.

The **enttype=link** parameter must be specified before the **link** parameter can be specified.

The linkset specified by the **lsn** parameter must contain the link specified by the **enttype=link** and **type** parameters.

The **type=gtway** parameter and the **enttype=origininc** parameter must be specified before the **nc** parameter can be specified.

The **type=gtway** parameter must be specified, and a value of **lsdestni**, **lsonismt**, **lsorigni**, **origni**, or **origininc** must be specified for the **enttype** parameter before the **ni** parameter can be specified.

The **enttype=tt** parameter must be specified before the **tt** parameter can be specified.

If a value of **sctpasoc** or **ua** is specified for the **enttype** parameter, then the **aname** parameter must be specified.

The association specified by the **aname** parameter must be provisioned in the system.

The card in the location specified by the **loc** parameter must match the type of card specified in the **enttype** parameter.

If the **enttype=ua** parameter is specified, then the **asname** parameter must be specified.

The application server specified by the **asname** parameter must be provisioned in the system.

The association specified by the **aname** parameter must be assigned to the application server specified by the **asname** parameter.

Notes

The *Maintenance Manual* provides a description of all report parameters.

INP, GSM MAP screening, and LNP measurements are sent to the FTA (file transfer area) rather than to the EAGLE 5 ISS terminal. Refer to Chapter 2 of the *Maintenance Manual* for procedural information on accessing the FTA.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The **rept-meas** command must be entered again.

For the entity types **avld** and **avldth**, if no link or linkset is specified, all links are reported.

When the **rept-meas** command is executed, the following warning message may appear:

"Measurement data represents an incomplete interval"

This message indicates that one or more cards did not respond to the request for measurements because the card was Out-Of-Service. The message does not indicate that data was lost.

Output

rept-meas:type=systot:enttype=stp

Legend

TYPE OF REPORT—The type of report, defined by the **type** and **enttype** parameters.

REPORT PERIOD—The date and the time period for which the report is generated.

REPORT INTERVAL—The time period for which the report is generated.

LINK-AVL MEASUREMENTS: LOC—For the link reports (in this example the availability report), the card location, port, and linkset name of the link for which the report is generated.

LINK-COMP MEASUREMENTS: LOC—For the link reports (in this example the components report), the card location, port, and linkset name of the link for which the report is generated.

LNKSET-COMP MEASUREMENTS—For the linkset components report, the name of the linkset for which the report is generated.

SCTPASOC-MTCDTH MEASUREMENTS—For the SCTP day to hour report, the name of the association for which the report is generated.

SCTPCARD-COMP MEASUREMENTS—For the SCTP card components report, the name of the card for which the report is generated.

STPLAN-AVL MEASUREMENTS: LOC—For the STPLAN availability reports, the card location for which the report is generated.

STP-NM MEASUREMENTS—The STPLAN Network Management report (not supported).

STP-SYSTOT MEASUREMENTS—The STP System Total report

<ENTITY>-GTWY MEASUREMENTS—For Gateway Measurements reports, where the **entity** value will be one of the following: STP, LNKSET, LINKSET, ORIGNI, ORIGININC, LSDESTNI, LSONISMT, LSORIGNI, depending on what is being reported.

UA-MTCD MEASUREMENTS

The remainder of the items displayed are the measurements that were made. For more information about these measurements, refer to the *Maintenance Manual*.

rept-stat-alm

Report Status Alarm

Use this command to provide status of all alarms.

Keyword: **rept-stat-alm**

Related Commands: **dact-alm-trns**, **rept-stat-clk**, **rept-stat-trbl**, **rtrv-obit**, **rtrv-trbl**

Command Class: System Maintenance

Parameters

:cli= (optional)

CLLI string. This parameter allows the user to see only alarms that pertain to a particular CLI.

Range: *aaaaaaaaaaaa*

:dev= (optional)

Device. This parameter provides the type of device for which alarms are displayed. The

display=inhb parameter must be specified when this parameter is specified.

Range: **applsock**, **as**, **card**, **cdt**, **clock**, **dlk**, **ls**, **lsmconn**, **route**, **seasx25**, **slk**, **trm**, **rtx**

:display= (optional)

Type of alarms to be displayed. When the **disply=inhb** parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The **dev** parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

Range: **inhb**

:dur= (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the **display=inhb** parameter is specified.

Range: **perm**, **temp**, **timed**

:edate= (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

Range: **101-991231**

Specify the date in the format *year*, followed by *month*, followed by *day*.

Example

rept-stat-alm

rept-stat-alm:display=inhb:dev=card

rept-stat-alm:display=inhb:clli=slkset1:dev=ls

rept-stat-alm:display=inhb

rept-stat-alm:display=inhb:dur=timed

rept-stat-alm:display=inhb:dur=timed:edate=040520

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **edate** parameter can be specified only if the **dur=timed** parameter is specified.

The **dev** parameter can have only the values **slk**, **ls**, or **route** if the **clli** parameter is specified.

The **dur** parameter must be compatible with the specified device.

The **dev** parameter can be specified only if the **display=inhb** parameter is specified.

The specified **clli** parameter value must exist in the DSTN table.

The **dur** parameter value must be **timed** if the **edate** parameter is specified.

Notes

None

Output

The following example shows output when the system is clean and before a maintenance baseline has been established:

Legend

ALARM TRANSFER—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.

ALARM MODE—Displays whether the critical, major, and minor alarms are silent or audible

ALARM FRAME 1—The number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1).

ALARM FRAME 2—The number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2).

ALARM FRAME 3—The number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3).

ALARM FRAME 4—The number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4).

ALARM FRAME 5—The number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5).

ALARM FRAME 6—The number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6).

ALARM FRAME OAP—The number of critical, major, and minor alarms detected in the OAP Frame.

ALARM FRAME GPF—The number of critical, major, and minor alarms detected at the MPS (multi-purpose server). If the LNP ELAP Configuration feature is turned on, the number includes alarms for any applications running on the MPS. If the G-Flex, G-Port, or INP feature is turned on, the number includes alarms for any applications running on the GSM subsystem and the DSM/EPAP links.

PERM. INH. ALARMS—The number of alarms that are permanently inhibited per alarm level.

TEMP. INH. ALARMS—The number of alarms that are temporarily inhibited per alarm level.

TIMED. INH. ALARMS—The number of alarms that are timed inhibited per alarm level.

ACTIVE ALARMS—The number of alarms still active per alarm level.

TOTAL ALARMS—The total number of alarms per alarm level. The inhibited alarm count plus the active alarm count equals the total alarm count.

CRIT—Critical alarms with silent/audible indicator.

MAJOR—Major alarms with silent/audible indicator.

MINOR—Minor alarms with silent/audible indicator.

Alarm Inhibit Report:

DEVICE—The device for which alarms are currently inhibited. Only devices that are alarm inhibited are shown.

ELEMENT—The element of the device for which alarms are inhibited (such as card location, port, routing key, socket or association name)

DURATION—Indicates whether the device is alarm inhibited permanently or temporarily or for a specific length of time

INH LVL—Level in which devices are alarm inhibited (Critical, Major, Minor). The **inh-alm** command defaults the level to Major. Devices cannot be alarm inhibited at a critical level unless the **chg-stpopt** command **critalminh** parameter is turned on.

CUR LVL—Level of the current alarm on the device (Critical, Major, Minor). "None" indicates that there is currently no alarm on the device (DUR should show "PERM." A plus sign (+) seen following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

DATE—The date on which a timed inhibited alarm will automatically clear at the specified time

TIME—The time at which a timed inhibited alarm will automatically clear on the specified date

rept-stat-applsock

Report Status Application Socket

Use this command to display the status of the IP application sockets.

ALMINH—Alarm inhibited
 OOS—Out-of-service

rept-stat-as

Report Status AS Association

Use this command to generate a report of the Application Server (AS) association status.

Keyword: rept-stat-as

Related Commands: chg-as, ent-as, rtrv-as

Command Class: System Maintenance

Parameters

:aname= (optional)

Association name to report on. When the **aname** parameter is specified, the **rept-stat-as** command will report the ASP states for a given association in all of the AS's that it is assigned to.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

:asname= (optional)

Application Server name; the AS name to report on. When the **asame** parameter is specified, the **rept-stat-as** command will report the PST, SST, ASP state, and ASP-ID for each association in the AS.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

Example**rept-stat-as****Dependencies**

If an association is specified in the command, the specified association must exist in the AS table.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

Output**rept-stat-as**

```

rept-stat-assoc**Report Status SCTP Association**

Use this command to generate a report of the SCTP association's status.

Keyword: **rept-stat-assoc**

Related Commands: **chg-assoc, ent-assoc, rtrv-assoc**

Command Class: System Maintenance

Parameters

:aname= (optional)

Name of association to report on.

Range: *aaaaaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter

:lhost= (optional)

The Local Host name as defined in the IP Host table.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*
A string of characters up to 60 characters in length. The first character must be a letter.
Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

:link= (optional)

The signaling link associated with this socket.

Synonym: port

Range: **a, b, a1-a31, b1-b31**
Not all card types support all **link** parameter values.
See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

:rhost= (optional)

Name of Remote Host as defined in the IP Host table.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*
A string of characters up to 60 characters in length. The first character must be a letter.
Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

Example

rept-stat-assoc

rept-stat-assoc:aname= a23456789012345

Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command displays the primary states (PST) and the secondary state (SST).

Primary states are:

IS-NR—In-service normal

IS-ANR—In-service abnormal (congested)

OOS-MT—Out of service

OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Connection states are:

RESTRICTED

OUT-OF-SERVICE

CONNECTING

ESTABLISHED—Valid only for M2PA associations

The **LINK** field values in the output are displayed as:

- **"**"**—If the association is assigned to multiple links.
- **"--"**—If the association is not assigned to any link.
- **Appropriate LINK ID**—If the association is assigned to only one link.

Output

rept-stat-assoc

eagle10212 08-01-29 10:41:52 EST EAGLE 38.0.0

rept-stat-card

Report Status Card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

Keyword: rept-stat-card

Related Commands: dlt-card, ent-card, init-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:appl= (optional)

Application. This parameter is specified to report the status of cards running the specified application.

Range: xxxxxxx

1 alphabetic character followed by up to 6 alphanumeric characters

atmansi—The application is used by the ATM cards to support the ATM high-speed signaling link feature. It is also used by the E5-ATM card to support T1 functionality.

atmitu—The application is used by the E1 ATM cards to support the E1 ATM high-speed signaling link feature. It is also used by the E5-ATM card to support E1 functionality.

ccs7itu—This application is used by the LIM cards, the E1/T1 MIM card, and the HC-MIM card for ITU MTP functionality.

eroute—This application is used by the STC cards for the EAGLE 5 Integrated Monitoring Support functions.

gls—This application is used by the TSM cards for downloading gateway screening to LIM cards.

ipgwi—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 2 cards to be assigned the **ipgwi** application.

iplim—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ANSI point codes. The system allows a maximum of 41 cards to be assigned the **iplim** or **iplimi** application if a maximum of 700 links are assigned in the system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 2000 links are assigned in the system.

iplimi—This application is used by the SSED CM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes. The system allows a maximum of 41 cards to be assigned the **iplimi** or **iplim** application if a maximum of 700 links are assigned in the system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 2000 links are assigned in the system.

ips—This application is used by the IPSM card for the IP User Interface feature.

ipsg—This application is used by the E5-ENET card to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—This application is used by the MCPM card for the Measurements Platform application.

sccp—This application is used by the TSM cards for the global title translation application.

ss7ansi—This application is used by the LIM cards, the E1/T1 MIM card, the HC-MIM card, and the E5-E1T1 card for ANSI MTP functionality.

ss7gx25—This application is used by the LIM cards to support X.25 functionality.

ss7ipgw—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 64 cards to be assigned the **ss7ipgw** application.

stplan—This application is used by the ACM card, the SSED CM card, and the E5-ENET card to support the STP LAN functions.

vsccp—This application is used by the DSM card for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 2 cards to be assigned the **ss7ipgw** application.

:links= (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (**loc**).

Range: **all, equip, unequip**

all — Reports the maximum number of links available on the card in the specified **loc**

equip — Reports only links that are equipped

unequip — Reports only links that are unequipped

Default: **equip**

:loc= (optional)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1117, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

Default: A status of all cards is displayed.

:mode= (optional)

Mode. The type of report to display (full or summary).

Range: **full**

Default: A summary report is displayed.

:stat= (optional)

Primary state filter. This parameter cannot be used with the **loc** or **mode** parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

Range: **all, alminh, anr, dsbld, mt, nr**

all — All of the primary states

alminh — Alarms inhibited

anr — In service abnormal (IS-ANR)

dsbld — Out of service maintenance disabled (OOS-MT-DSBLD)
mt — Out of service maintenance (OOS-MT)
nr — In service normal (IS-NR)

Default: **all**

Example

```
rept-stat-card
rept-stat-card:loc=1201
rept-stat-card:loc=1201:mode=full
rept-stat-card:stat=alminh
rept-stat-card:appl=ss7ansi
rept-stat-card:loc=1205:links=equip:mode=full
```

Dependencies

No other command can be in progress when this command is entered.

The **mode** parameter can be specified only when the **loc** parameter is specified.

Only one of the **loc** parameter, the **stat** parameter, and the **appl** parameter can be specified in the command.

The shelf and card must be equipped.

The card location (**loc**) must be within the allowed range.

The following applications are valid for the **appl** parameter: **ss7ansi**, **sccp**, **gls**, **ccs7itu**, **ss7gx25**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vsccp**, **atmitu**, **ipgwi**, **ips**, **ipsg**, **eroute**, **mcp**.

Notes

ATM, SS7 LIM, and X.25 cards show TVG results for SNM (signaling network management), SCCP, and SLAN traffic. SCCP cards show only SNM traffic statistics for TVG.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The **mode=full** parameter gives more information than the summary report.

In the output, the SCCP service card field shows which TSM is providing the specified card with GTT service.

The group ticket voucher (TVG) status for low-speed signaling links, ATM high-speed signaling links, and TSMs is displayed when the **mode=full** and **loc** parameters are specified. The status displayed is for the previous 5 minutes and the previous 24 hours.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

E1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist, the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the **links** parameter is set to **all**, then 64 links are displayed.

If the **links=unequip** parameter is specified, but the card has not been installed or loaded, then 64 unequipped links are displayed.

If the **links=unequip** parameter is specified, and the card is or has been installed or loaded, then the number of links displayed is equal to 64 minus the provisioned links.

If the **links=equip** parameter is specified, then only provisioned links are displayed.

Output

The clock status fields are reported when the **mode=full** report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are ----, **Idle**, **Active**, and **Fault**. The meanings of these values are:

---- (dashes)—Undefined, card must be OOS

Idle—Clock is available but is not being used by the card

Active—Clock is available and is being used by the card

Fault—Clock is unavailable

Idle and **Active** are shown when the CLK or HS CLK distribution to the card is good. The **Active** value does not denote that the card is actually using the clock source for link alignment. Use the **rt rv-slk**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

"ENET" is displayed as card type if an E5-ENET card is not plugged-in for an IPSG application.

rept-stat-card

Legend

- **CARD**—The location of the card.
- **VERSION**—The version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- **APPL**—The application loaded on this card. **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

The group ticket voucher status is displayed in these fields: SCCP TVG RESULT (for SCCP messages), SLAN TVG RESULT (for STPLAN messages), and SNM TVG RESULT (for SNM messages). Group ticket voucher status output is displayed as a series of these letters:

G—Service Granted. Indicates normal system behavior.

D—Service Denied. Indicates an overload, but the group ticket voucher hardware and software are working correctly.

N—No granter in the system. For GTT or STPLAN traffic, there can be no SCCP cards or STPLAN in the system. If there are SCCP cards or STPLAN in the system, then a serious failure is indicated (hardware or software bug or hardware failure).

H—Hardware time-out. Indicates the hardware timed out waiting for a group ticket voucher packet to return. Group ticket voucher packets can be lost when a card is plugged in or booted. This is a serious condition if cards have not been connecting or disconnecting from the IMT. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced..

S—Software time-out. No result was ever returned from hardware, indicating a probable hardware failure.

I—Invalid result from hardware. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced.

The HW VERIFICATION CODE field is shown only in the mode=full report. ----- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
002*	VSCCP	VSCCP card equipped with non-DSM MPS feature is on	99
003*	VSCCP	VSCCP card equipped with non-DSM LNP and VGTT feature is on	99
004*	VSCCP	VSCCP card equipped with non-DSM XGTT 1,000,000 is on	99
005*	VSCCP	VSCCP card equipped w/non-DSM when EGMS enabled	99
050	VSCCP	VSCCP card equipped with no daughterboards	99
051	VSCCP	VSCCP card equipped with less than 4GB when LNP ported TNs key equal to or greater than 48 million is on	422
052	VSCCP	VSCCP card equipped with less than 3GB when LNP ported TNs key equal to or greater than 36 million is on	422

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
053	VSCCP	VSCCP card equipped with less than 2GB when LNP NPAXXX 150,000 or LNP LRN 100,000 feature key is on	422
058	SCCP	SCCP card equipped with less than 256K or greater than the MAX of extended memory.	422
059	VSCCP	MPS database has been detected to exceed capacity of DSM extended memory (only for GPORT, GFLEX, INP, EIR features). UAMs 281, 283, and 285 are used for LNP and LNP ELAP Configuration features.	422
060	VSCCP	VSCCP card equipped w/< 4GB when the ANSI-41 INP Query feature key is on.	422
100	SS7IPGW, IPGWI	DCM with IP connection on B port only when debug enabled	276
101	SS7IPGW, IPGWI, IPLIM, IPLIMI	DCM only supports SLK link A and B -or- EDCM only supports SLK link A-A3 and B-B3 -or- E5-ENET only supports SLK link A-7 and B-7	276
102*	SS7IPGW, IPGWI	Non-DCM detected in slot	99

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
103	SS7IPGW, IPGWI, IPLIM, IPLIMI	DCM does not support >2 associations (IPLIMx)-OR-DCM does not support >4 associations (IPGWx) -or- EDCM does not support >8 associations (IPLIMx) -or- EDCM does not support >50 associations (IPGWx) -or- E5-ENET does not support >16 associations (IPLIMx) -or- E5-ENET does not support >50 associations (IPGWx)	276
104	SS7IPGW, IPGWI, IPLIM, IPLIMI	DCM does not support >2 sockets (IPLIMx) -or- DCM does not support >50 sockets (IPGWx) -or- EDCM does not support >8 sockets (IPLIMx) -or- EDCM does not support >50 sockets (IPGWx) -or- E5-ENET does not support >0 sockets (IPLIMx) -or- E5-ENET does not support >0 sockets (IPGWx)	276

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
105	SS7IPGW, IPGWI, IPLIM, IPLIMI	DCM does not support >2 (sockets + associations) (IPLIMx) -or- DCM does not support >50 (sockets + assoc*) (IPGWx) -or- EDCM does not support >8 (sockets + associations) (IPLIMx) -or- EDCM does not support >50 (sockets + associations) (IPGWx) Note: *assoc = 8 X associations	276
106	SS7IPGW, IPGWI, IPLIM, IPLIMI	DCM does not support >64Kb SCTP buffers (IPLIMx) -or- DCM does not support >64Kb SCTP buffers (IPGWx) -or- EDCM does not support >1600Kb SCTP buffers (IPLIMx) -or- EDCM does not support >800Kb SCTP buffers (IPGWx) -or- E5-ENET does not support >3200Kb SCTP buffers (IPLIMx) -or- E5-ENET does not support >3200Kb SCTP buffers (IPGWx)	276
110	SS7IPGW, IPGWI	(SRKQ = DRKQ > 1000) not supported on DCM.	276
119	LIME1	2-port E1 card provisioned with signaling link greater than B (A1-B3).	297
120	LIMDS0	2-port LIM card provisioned with signaling link greater than B (A1-B3).	297

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
121	LIME1	2-port LIM card does not support MIM with E1 port AMI encoding provisioned.	297
122	MIM	Card is not a MIM - provisioned as a T1 card or as a T1 channel card associated with a T1 interface.	99
123	MPL	MPL cannot run with port A or B provisioned for speeds not equal to 56K.	297
124	MIM, HC-MIM	Card is not a MIM or HC-MIM and is provisioned as a T1 card.	99
125	MIM, MPL	MIM or MPL card with a signaling link greater than B3 provisioned.	297
126	LIME1	2-port E1 card with a signaling link provisioned on E1/T1 port 2-7.	297
127	MIM	MIM card with a signaling link provisioned on E1/T1 port 2-7.	297
128	HC-MIM	Fan feature bit must be on for HC-MIM cards.	43
129	HC-MIM, E5-E1T1	Card does not support CAS framing.	297
130	LIME1, MIM	Card is not a LIME1 or MIM and is provisioned as an E1 channel card.	99
131	HC-MIM, E5-E1T1	Card has channel bridging mode active but is not running supported high capacity GPL	297
132	MPL	Card is not a LIME1 or MIM and is provisioned as an E1 card.	99
133	LIME1, LIMDS0, MIM, MPL	Card cannot support unchannelized mode.	99
134	E5-E1T1	E5-E1T1 card with SLK provisioned on link greater than 15.	99
135	E5-E1T1	E5-E1T1 card supports only 1 SE-HSL link	276
136	LIM-ATM, LIME1- ATM	Single Port ATM card with SLK provisioned on link B	297

Table 5-55. Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
140	MCP	MCP card not running with D2G memory.	422
141	IPS	IPSM card not running with D2G memory.	422
150	ASM	Card is obsolete.	47
160	MCP	MCP card has incorrect motherboard. The application must run on an EDSM card.	441
165	VSCCP	Hardware configuration does not support configured feature set.	99
170	EROUTE	Non-DCM/Non-E5-ENET card detected in slot provisioned for eroute with card type DCM	99
171	STPLAN	Non-DCM/Non-E5-ENET card detected in slot provisioned for STPLAN with card type DCM	99
180	SCCP, SS7ANSI	SCCP card equipped with DCM with MOBR on -or- SS7ANSI card equipped with one of the following with MOBR on: LIMDS0/LIMV35/LIMOCU/LIM-AINF/ILA/EILA/LIME1	441

rept-stat-cdl**Report Command Driven Loopback Status**

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receive.

Keyword: **rept-stat-cdl**

Related Commands: **act-cdl, dact-cdl**

Command Class: Link Maintenance

Parameters

:link= (optional)

SS7 signaling links. The signaling links that is being tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

Default: All signaling links that are in CDL testing are displayed.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All cards containing signaling links that are in CDL testing are displayed.

:loopback= (optional)

Loopback test type.

Range: **line**, **payload**

The **payload** value is valid only on LIM-ATM and E1-ATM cards.

Default: All loopback tests are displayed.

Example

```
rept-stat-cdl
```

```
rept-stat-cdl:loc=1201
```

```
rept-stat-cdl:loc=1203:link=a
```

```
rept-stat-cdl:loopback=payload
```

Dependencies

If the **link** parameter is specified, the **loc** parameter must be specified.

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

This command is not available during upgrade.

The card location specified in the **loc** parameter cannot be reserved by the system.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information

Output**rept-stat-cdl**

```

tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK        CDL        CDL-TIME
1102,A1    LINE       00:04:01
1201,A     PAYLOAD    01:04:11
1203,A     LINE       00:22:21
1203,B     LINE       20:04:01
1208,A     LINE       01:05:22
1211,A     PAYLOAD    00:14:01
;

```

Legend

SLK—The card and assigned signaling link that is in CDL testing.

CDL—Command Driven Loopback test type (LINE or PAYLOAD).

CDL-TIME—The time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

rept-stat-cdt**Report Status Customer Defined Troubles**

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

Keyword: rept-stat-cdt

Related Commands: act-alm-trns, canc-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit, rtrv-trbl

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
rept-stat-cdt
```

Dependencies

No other status command can be in progress when this command is entered.

Notes

These troubles are customer-defined and configured by the factory.

Output**rept-stat-cdt**

```

rlghncxa03w 04-01-07 20:20:43 EST  EAGLE 31.3.0
ID          ALARM STATUS
1    *C 0058 Critical Customer Trouble detected
2    *C 0050 Critical Holdover Clock trouble detected
3    *C 0058 Critical Customer Trouble detected
4    *C 0058 Critical Customer Trouble detected
5    I ** 0059 Major Customer Trouble detected
6    ** 0052 Major Holdover Clock trouble detected
7    ** 0059 Major Customer Trouble detected
8    ** 0059 Major Customer Trouble detected
9    I * 0060 Minor Customer Trouble detected
10   * 0054 Minor Holdover Clock trouble detected
11   * 0060 Minor Customer Trouble detected
12   * 0060 Minor Customer Trouble detected
13   * 0060 Minor Customer Trouble detected
14   I * 0060 Minor Customer Trouble detected
15   * 0060 Minor Customer Trouble detected
16   * 0060 Minor Customer Trouble detected
;

```

Legend

ID—The customer defined trouble ID number followed by the status of the customer-defined trouble.

ALARM STATUS—The status of the alarm for the specified device.

rept-stat-clk**Report Status Clock**

Use this command to display the clock status summary for cards in the system.

Keyword: **rept-stat-clk**

Related Commands: **rept-stat-card**, **rept-stat-dstn**, **rept-stat-imt**, **rept-stat-ls**, **rept-stat-sccp**, **rept-stat-slk**, **rept-stat-trbl**

Command Class: System Maintenance

Parameters

:mode= (optional)

Display mode. When **mode=full** is specified, the "Cards with bad clock source" section of the report is displayed

Range: **full**

Example

rept-stat-clk

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

Notes

The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1-ATM, and E1/T1 MIM cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I.

The Time Slot Counter Synchronization (TSC) clock is displayed only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the **chg-feat** command.

HS clock sections are displayed only when at least 1 HS clock capable card is provisioned, or when the TDM type is TDM-GTI and the TSC Synchronization feature has been turned on. The HS clock sections of the report are the HS PRIMARY CLK, HS SECONDARY CLK, HS CLK TYPE, and HS CLK LINELEN fields at the top of the report; the HS SYSTEM CLOCK section; and the HS clock columns in the **mode=full** "Cards with bad clock source" section.

HS clock capable cards are those that can support a link provisioned to use HS Master Timing (including ATMANSI, ATMITU, and E1/T1 MIM cards). The clock status values are the same as those listed in the **rept-stat-card:mode=full:loc=xxx** report.

The "Cards with bad clock source" section is displayed when the **mode=full** report is specified. When HS clock A and B status is included in this section, cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status. The valid values for each clock status are:

-----Undefined, card must be OOS

Idle—Clock is available but is not being used by the card

Active—Clock is available and is being used by the card, but does not mean that the card is using the clock for link alignment. Use the **rtrv-sl**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

Fault—Clock is unavailable

The BITS clocks will be reported as Active/Idle in **rept-stat-clk** output and Low Speed clock alarms will be suppressed whenever the system lacks LIM-DS0 links and any of the following conditions are true:

- The High Speed Primary clock input is valid.
- The High Speed Secondary clock input is valid.
- The Time Slot Counter Synchronization (TSCSYNC) feature is off.

Output

The following example shows output when **mode=full** is not specified, with no HS clock sections, and when the TSCSYNC feature is not on:

rept-stat-clk

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )
PRIMARY BITS = Active          PRIMARY BITS = -----
SECONDARY BITS = Fault         SECONDARY BITS = -----

SYSTEM CLOCK                    PST          SST          AST
ALARM STATUS = No Alarms.      00S-MT          Fault      -----
# Cards using CLK A = 4        # Cards with bad CLK A = 0
# Cards using CLK B = 0        # Cards with bad CLK B = 4
# Cards using CLK I = 0

Command Completed.
```

;

The following example shows output when **mode=full** is specified, with no HS clock sections, and the TSCSYNC feature is not on:

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )
PRIMARY BITS = Active          PRIMARY BITS = -----
SECONDARY BITS = Fault         SECONDARY BITS = -----

SYSTEM CLOCK                    PST          SST          AST
ALARM STATUS = No Alarms.      00S-MT          Fault      -----
# Cards using CLK A = 4        # Cards with bad CLK A = 0
# Cards using CLK B = 0        # Cards with bad CLK B = 4
# Cards using CLK I = 0

Cards with bad clock source:
CARD          CLK A      CLK B
1103          Active     Fault
1104          Active     Fault
1106          Active     Fault
1113          Active     Fault

Command Completed.
```

;

If the Time Slot Counter Synchronization feature (TSCSYNC) is turned on, the output includes the TSC clock status.

rept-stat-clk

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )

Legend

CARD LOC—The card location of the TDM and the status of the MASP

PRIMARY BITS—The status of the primary BITS clock

SECONDARY BITS—The status of the secondary BITS clock

HS PRIMARY CLK—The status of the high-speed primary clock

HS SECONDARY CLK—The status of the high-speed secondary clock

Possible values for HS PRIMARY CLK and HS SECONDARY CLK status are:

---- (dashes)—Undefined or not applicable

ACTIVE—High-speed primary clock is valid and is the current reference being distributed by TDMx to all system shelves.

FAULT—High-speed primary clock source from TDMx is currently invalid.

IDLE—High-speed primary clock is valid, the high-speed secondary clock is the current reference being distributed by TDMx to all system shelves.

HS CLK TYPE—HS clock source (see the **chg-stpopts** command)

HS CLK LINELEN—HS clock line length (see the **chg-stpopts** command)

TSC CLOCK—The status of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.

SYSTEM CLOCK—System clock status

PST—The primary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

ALARM STATUS—System clock alarms; "No alarms" is shown when there are no alarms.

CARDS USING CLK A, B, I—The number of cards using clock A, clock B, and clock I.

CARDS WITH BAD CLK A, B—The number of cards using clock A or clock B, when clock A or B is bad.

HS SYSTEM CLOCK—HS system clock status

PST—The primary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the clock. The possible values are described in .

ALARM STATUS—HS System clock alarms; "No alarms" is shown when there are no alarms.

CARDS USING HSCLK A, B, I—The number of cards using high-speed clock A, B, and I.

NOTE: The value for the internal high-speed clock (# Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by TDMx when both BITS clock sources are invalid and then distributed to all system shelves.

The use of HSCLK I is not automatic when both the high-speed primary and secondary clocks are invalid. A LIM-ATM card must be provisioned (with the **ent-slk:atmtsel=internal** parameter) to use the high-speed internal clock.

CARDS WITH BAD HSCLK A, B—The number of cards using high-speed clock A or B, when high-speed clock A or B is bad.

rept-stat-cluster

Report Status Cluster-Related DPC

Use this command to report summary status and statistical information for all provisioned clusters. Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

NOTE: This command does not support 24-bit ITU national point codes.

Keyword: rept-stat-cluster

Related Commands: chg-feat, chg-stpopts, rept-stat-cluster, rtrv-stpopts

Command Class: System Maintenance

Parameters

:dpc= (optional)

ANSI destination point code of the cluster whose status is to be reported, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym: dpca

Range: p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**-

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

Default: Display summary for all provisioned clusters

:mode= (optional)

The type of display. Specify **mode=full** to display additional information for the specified DPC.

Range: **full**

Default: Display summary report

:stat= (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

Range: **all, alminh, anr, dsbld, mt, nr**

all — All of the primary states

alminh — Alarms inhibited

anr — In service abnormal (IS-ANR)

dsbld — Out of service maintenance disabled (OOS-MT-DSBLD)

mt — Out of service maintenance (OOS-MT)

nr — In service normal (IS-NR)

Default: **all**

Example

```
rept-stat-cluster
```

```
rept-stat-cluster:stat=alminh
```

```
rept-stat-cluster:stat=MT
```

```
rept-stat-cluster:dpc=20-2-*
```

```
rept-stat-cluster:dpc=20-2-*:mode=full
```

```
rept-stat-cluster:dpc=20-2-5
```

Dependencies

If the **mode=full** parameter is specified, the **dpc/dpca** parameter must be specified.

The **stat** parameter cannot be specified with the **dpc/dpca** parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC as *ni-nc-*** or *ni-nc-**** cannot be specified for the **rept-stat-cluster** command.

In this command, the point codes support only the private (internal) point code subtype prefix (**p**-).

Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the **dpc/dpca** parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the **mode=full** parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format hh:mm is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "-----" are displayed.

Output

When no parameters are specified, summary information for all of the defined cluster DPCs is shown. Note that the report shows the number of provisioned and x-list members of each cluster.

rept-stat-cluster

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0

Command Completed.

;

If a circular routing alarm is raised for a cluster DPC (that is, no x-list entry could be created for the cluster member), then specifying the **dpc** and **mode=full** parameters displays information pertinent to the cluster member that is experiencing the circular routing condition. This information may be useful in correcting the problem. The value for the MEMBER field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

NOTE: The circular routing member information shown in this output report displays as *-***-*** if the specified destination point code is not a cluster destination point code or the information is not known by maintenance at the time the report is generated.**

Legend

ORIG—Indicates the origination of the destination point code being reported. The possible values that can appear in the column are:

CLUST—Entry is a provisioned cluster (*ni-nc-**) DPC

PROV—Entry is a provisioned cluster member (*ni-nc-ncm*)

X-LIST—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member

PST—The primary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the cluster. The possible values are described in .

X-REASON—Indicates the reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:

RT—X-LIST entry created due to routing

CG—X-LIST entry created due to congestion

CR—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the **mode=full** detailed output report displays as "-----" if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

rept-stat-db

Report Status Database

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

When the G-Flex, G-Port, INP, AINPQ, LNP ELAP Configuration, or Prepaid SMS Intercept Ph1 (PPSMS) feature is turned on, the status of the MPS databases and VSCCP cards is displayed.

Keyword: rept-stat-db

Related Commands: chg-db, copy-meas, disp-disk-dir

Command Class: Database Administration

Parameters

:db= (optional)

The report section or sections to display in the output. The content of each section depends on the specified or default value of the **display** parameter, MPS output appears only if a feature that uses the MPS is turned on in the system (G-Flex, G-Port, INP, PPSMS, or the LNP ELAP Configuration controlled feature).

Range: **all, mps, stp**

all — Displays database and card output for both the STP and MPS report sections.

mps — Displays only the database and card output for the MPS report section.

stp — Displays only the database and card output for the STP report section.

Default: **all**

:display= (optional)

The type of output

Range: **all, brief, except, version**

all — Displays the operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

brief — Displays the operational status of the databases in the active and standby MASP, and of the MPS databases if a feature that uses the MPS is turned on.

except — Displays the operational status information contained in the **display=brief** output along with the cards whose database level does not match the active fixed disk current partition or active MPS database.

version — Displays all of the same information that is displayed with the **display=all** parameter except that the individual database status column is replaced with the database format version and status. In addition, details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the **rept-stat-mps** command.

Default: **brief**

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1114, 1116, 1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
rept-stat-db
```

```
rept-stat-db:display=all
```

```
rept-stat-db:loc=1207
```

```
rept-stat-db:db=stp
```

Dependencies

The **db** and **loc** parameters cannot be specified at the same time.

The following card locations are not valid for this command: 1113, 1115, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

One of the following features must be turned on before the **db=mps** parameter can be specified:

- G-Flex
- G-Port

- INP
- AINPQ
- EIR
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- A-Port

The shelf and card must be equipped.

The card location slot must be between 1 and 18, but not 9 or 10.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

The frame value of the shelf location parameter (**loc**) must be within the valid range.

The **display** parameter can accept a value of **brief**, **all**, **version**, or **except** only.

Notes

If the **display** parameter, the **db** parameter, or the **loc** parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the **rept-stat-db** command with no parameters specified or with the **display=brief** parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable cartridge (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the G-Flex, G-Port, EIR, INP, or PPSMS feature is turned on, EPAP A and EPAP B database status followed by VSCCP card database status
- If the LNP ELAP Configuration controlled feature is turned on, ELAP A and ELAP B database status followed by VSCCP card database status

The output of the **rept-stat-db** command with the **display=except** parameter shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=all** parameter shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=version** parameter shows the coherency and the number of updates for the active and standby databases, along with the database version and the operational status of each of these databases. If the LNP feature is turned on (see the **enable-ctrl-feat** command), the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the **rept-stat-mps** command to display version information for these databases.

The output of the **rept-stat-db** command with the **loc** parameter specifying an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The **db** parameter is used to limit the output of the **rept-stat-db** command to either just the EAGLE STP information or just the MPS information. The information is displayed as indicated by the **display** parameter value (**display=version** is not valid for **db=mps**; the command does not display the MPS database versions). The default **db** parameter value is **all**, which displays the information for the STP and MPS databases and cards as indicated by the **display** parameter value.

Output

The report for the specified card is displayed. The report shows that the disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

rept-stat-db:loc=1114

CARD/APPL	LOC	C	T	LEVEL	TIME LAST UPDATE	EXCEPTION
TDM-CRNT	1114	-	-	-	-	OFF-LINE
TDM-BKUP	1114	-	-	-	-	-

;

The report for the specified VSCCP (DSM) card used for EPAP or ELAP is displayed. The G-Flex, G-Port, EIR, INP, LNP ELAP Configuration, or PPSMS, feature is turned on in the system.

rept-stat-db:loc=1201

CARD/APPL	LOC	C	T	LEVEL	TIME LAST UPDATE	EXCEPTION
VSCCP	1201	Y	N	12	02-01-29 08:53:48	-

EAGLE RTDB REPORT

CARD/APPL	LOC	C	BIRTHDATE	LEVEL	EXCEPTION
VSCCP	1201	Y	02-01-29 16:12:50	12345	-

;

The database in the following example has no errors, as indicated by the OK status. The G-Flex, G-Port, EIR, INP, LNP ELAP Configuration, and PPSMS features are not turned on in the system.

rept-stat-db

```

;

The LNP ELAP Configuration controlled feature is enabled and turned on (see the **enable-ctrl-feat** command) in the system, and ELAP is being used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

Legend

DATABASE STATUS—An indication of any database alarms on the MASPs. This indicator is not used with the **loc** parameter output.

>> **OK**<<—There are no database alarms

>> **NOT OK**<<—Database alarms are present

(ACTV MASP)—The specified MASP is the active processor. This is not used with the **loc** parameter output.

(STDBY MASP)—The specified MASP is the standby processor. This is not used with the **loc** parameter output.

(NOACCS)—The specified processor is not accessible. This is not used with the **loc** parameter output.

C—An indicator of whether the database is coherent.

Y—the database is coherent

N—the database is not coherent

Dash (-)—the database is not accessible.

LEVEL—The number of updates made to the database partitions.

TIME LAST BACKUP—The date and time the last change was performed on the removable cartridges (if inserted) and the backup partition of the fixed disk. This field is not used with the **loc** parameter output.

RD BKUP—Removable cartridge backup partition.

FD BKUP—Fixed disk backup partition.

FD CRNT—Fixed disk current partition. This field is not used with the **loc** parameter output.

DIFF CONTENTS—The specified database's contents are different when compared to the other database in that partition.

DIFF LEVEL—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).

DIFF TIME—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, when compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.

CORRUPTED—The specified database is corrupted.

INCOHERENT—The specified database is incoherent.

EXCEPTION—The following values can appear:

- The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A “-” indicates that the database was not accessible. A blank entry indicates that the database has no problems. This field is used with the **display=except**, **display=all**, and **loc** parameter outputs.
- A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.

IN-SRVC—The length of time that the card has been in service.

CARD/APPL—The card type or the application assigned to the card specified in the **LOC** field. This field is not used with the **display=brief** (default) parameter output.

TDM-BKUP—Backup partition on the fixed disk on the TDM.

TDM-CRNT—Current partition on the fixed disk on the TDM.

LOC—The card location of the database. This field is not used with the **display=brief** (default) parameter output.

T—An indicator of whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM) or TSM is in the process of being loaded with the new screen set information after an update to the database, and the database has not reached the current reported database level. This field is not used with the **display=brief** (default) parameter output.

Y—the database is in transition

N—the database is not in transition.

TIME LAST BACKUP—The date and time the last change was performed on the specified card and its associated database. A dash (–) in this field for the fixed drive (FD) or removable drive (RD) indicates that no backup has been created on that drive. This field is not used with the **display=brief** (default) parameter output.

VERSION—The version number of each database (including the LNP database if the LNP feature is on).

xxx-xxx-xxx—The version number of the database.

UNKNOWN—The **rept-stat-db** command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.

A dash “-” —The database is not available. This field is used only with the **display=version** parameter output.

STATUS—The operational status of the database version. This field is used only with the **display=version** parameter output.

NORMAL—The database version is fully operational.

Blank entry—A blank entry indicates that the database is not available or is unknown. A numeric value indicates that the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.

BIRTHDATE—The date and time of creation for the database.

EPAP A (ACTV)—The active EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, INP, or PPSMS features are turned on.

PDB—The provisioning database status information.

RTDB—The provisioning database status information that was used to create the resident real-time database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

RTDB-EAGLE—The EPAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm. The RTDB database is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires DSM cards to be reloaded.

EPAP B (STDBY)—The standby EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, INP, or PPSMS features are turned on.

PDB—The provisioning database status information.

RTDB—The provisioning database status information that was used to create the resident real-time database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

RTDB-EAGLE—The EPAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm. The RTDB database is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires DSM cards to be reloaded.

ELAP A (ACTV)—The active EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

RTDB-EAGLE—The ELAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm.

TIME LAST UPDATE—The date and time of the last update of the RTDB database from the LSMS.

ELAP B (STDBY)—The standby EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

RTDB-EAGLE—The ELAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm.

TIME LAST UPDATE—The date and time of the last update of the RTDB database from the LSMS.

rept-stat-dlk

Report Status Data Link

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

Keyword: **rept-stat-dlk**

Related Commands: **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rtrv-dlk, tst-dlk**

Command Class: System Maintenance

Parameters

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All data links are shown.

Example

rept-stat-dlk

rept-stat-dlk:loc=1104

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

Only one data link port on the ACM is supported. Reports are generated only on port A of the card.

The card location, frame, shelf, or slot must be within the allowed range.

The data link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

Notes

None

Legend**DLK**—The card location of the TCP/IP data link**PST**—The primary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".**SST**—The secondary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".**AST**—The associated state of the TCP/IP data link. The possible values are described in .**rept-stat-dstn****Report Status Destination**

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-**) or a network destination (*ni-*-**).

Keyword: **rept-stat-dstn****Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-rte, rtrv-dstn, rtrv-rte****Command Class:** System Maintenance**Parameters****NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.**:dpc=** (optional)ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).**Synonym:** **dpca****Range:** **p-, 000-255, *, **, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*- is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:mode= (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

Range: **full, rtx**

full— Comprehensive display of point code status, including rtx. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, the status of all routesets is displayed.

rtx— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default: A summary report is displayed.

:stat= (optional)

The primary state filter. This parameter lets you choose the state of the destination for which you want a report. In other words, if you want a report for all destinations whose state is DSBLD, specify **:stat=dsbld**.

Range: **all, alminh, anr, dsbld, mt, nr**

all— All of the primary states

alminh— Alarms inhibited

anr— In service abnormal (IS-ANR)

dsbld— Out of service maintenance disabled (OOS-MT-DSBLD)

mt— Out of service maintenance (OOS-MT)

nr— In service normal (IS-NR)

Default: **all**

Example

```
rept-stat-dstn
rept-stat-dstn:dpci=2-004-1:mode=full
rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc:9-4-***:stat=alminh
rept-stat-dstn:dpc=9-3-*:mode=rtx
rept-stat-dstn:mode=full
rept-stat-dstn:mode=rtx
rept-stat-dstn:dpc=1-1-1
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

A summary report is displayed if the **stat** parameter is specified.

The **stat** parameter can be specified with the **dpc** parameter only if the **dpc** parameter specifies one of the *ni-nc-** formats.

An x-list DPC cannot be specified in the **dpc** parameter.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

The **mode** parameter cannot be specified with the **dpc** parameter if the **dpc** parameter specifies one of the **ni-nc-*** formats.

When the **mode=full** parameter is specified then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-59 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

Table 5-56. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rept-stat-dstn:dpc=ni-nc-ncm	Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .
rept-stat-dstn:dpc= ni-*-*	Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.
rept-stat-dstn:dpc= ni-**-*	Requests a report for the full network cluster for the specified <i>ni</i> .
rept-stat-dstn:dpc= ni-***-*	Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .
rept-stat-dstn:dpc= ni-nc-*	Requests a report for provisioned cluster destination <i>ni-nc-*</i> .
rept-stat-dstn:dpc= ni-nc-**	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported.
rept-stat-dstn:dpc= ni-nc-***	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those

Table 5-56. Summary of DPC Parameter Syntaxes

DPC format	Meaning
	specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.
rept-stat-dstn:dpcn24=msa-ssa-sp	Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the **mode=full** parameter is specified without a specific DPC, then status provided for all regular and exception route sets.

Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned DPCs (route sets) in the system,
- If the **mode=rtx** parameter is specified, the command output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, and the status of all provisioned exception route sets associated with that DPC.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows a private adjacent point code:

rept-stat-dstn:mode=full:dpc=1-1-2

;

```

The following example shows how **rept-stat-dstn** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for an FPC destination.

rept-stat-dstn:dpc=9-3-*

```

rlghncxa03w 04-07-07 14:59:11 EST EAGLE 31.9.0

Legend

DPC/DPCA—The ANSI destination point code of the route

DPCN—The ITU-TSS national destination point code of the route

DPCN24—The 24-bit ITU national destination point code of the route

DPCI—The ITU-TSS international destination point code of the route

OPC/OPCA—The ANSI origination point code as exception routing criterion of the exception route

OPCN—The ITU-TSS national origination point code as exception routing criterion of the exception route

OPCN24—The 24-bit ITU national origination point code as exception routing criterion of the exception route

OPCI—The ITU-TSS international origination point code as exception routing criterion of the exception route

ILSN—The originating linkset as exception routing criterion of the exception route

CIC—Starting Circuit Identification Code used as the exception routing criterion for this exception route

ECIC—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

PST—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the subsystem. The possible values are described in .

rept-stat-e1**Report Status E1**

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

Keyword: **rept-stat-e1**

Related Commands:

Command Class: System Maintenance

Parameters

:e1port= (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

:loc= (optional)

Card location. The unique identifier of a specific **lime1** card located in the STP.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: Information for all **lime1** cards is reported.

Example

rept-stat-e1

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **e1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

Notes

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the **loc** parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the **loc** and **e1port** parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

Output

When no parameters are specified in the command, E1 port status is displayed for all cards with provisioned E1 ports. Ports 3 through 8 are on HC-MIM cards only.

rept-stat-e1

Legend

LOC—Card location

E1PORT—Number of the E1 port provisioned on the card in the specified location.

PST—The primary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

SST—The secondary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

AST—The associated state of the card. The possible values are described in “Possible Values for PST/SST/AST”. The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

ALARM STATUS—Either "No Alarms" or current alarm number and text

UNAVAIL REASON—Reason for the E1 port being unavailable

SLK—Signaling link assigned to the E1 port

TS—Timeslot assigned to the signaling link

PST—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the signaling link. The possible values are described in .

rept-stat-enet

Report Status Ethernet

Use this command to display a summary report of Ethernet status for all configured Ethernet interfaces on IP⁷ cards in the system.

Keyword: **rept-stat-enet**

Related Commands:

Command Class: System Maintenance

Parameters

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All ENET data for the card location is displayed.

:port= (optional)

Ethernet interface port ID.

Range: a, b

Default: All port data for ENET is displayed.

Example

rept-stat-enet

rept-stat-enet:loc=1101:port=b

Dependencies

Another command is already in progress.

If the **loc** parameter is specified, then the **port** parameter must be specified. If the **port** parameter is specified, then the **loc** parameter must be specified.

The shelf and card must be equipped, and the card table entry **appl** must be IPLIM, IPLIMI, SS7IPGW or IPGW.

Notes

None.

Output

The following example displays a report on the status of all configured Ethernet interfaces on IP⁷ cards in the system.

rept-stat-enet

```
eagle10110 07-02-10 14:50:23 EST EAGLE 35.6.0
```

LOC	PORT	IPADDR	PST	SST	AST
1101	A	1.1.1.1	OOS-MT	Fault	ALMINH
1101	B	123.234.222.111	IS-ANR	Active	-----
1201	A	111.1.24.200	IS-NR	Active	-----
1201	B	2.31.234.1	OOS-MT	Fault	-----

Command Completed.

;

The following example displays the summary for a specific card location and port.

rept-stat-enet:loc=1101:port=b

```
eagle10110 07-02-10 14:54:23 EST EAGLE 35.6.0
LOC  PORT  IPADDR      PST          SST          AST

ALARM STATUS      = ** 0537 Ethernet error threshold exceeded
```

Command Completed.

;

Legend

- CARD—The location of the card.
- VERSION—The version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- TYPE—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- APPL—The application loaded on this card.
- PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- AST—The associated state of the card. The possible values are described in .

rept-stat-eroute**Report Status EROUTE**

Use this command to display the status of STC cards and E5-STC cards (running the **eroute** application) for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Keyword: rept-stat-eroute

Related Commands:

Command Class: System Maintenance

Parameters

:loc= (optional)

Location. This parameter specifies the unique identifier of a specific STC card (STC card or E5-STC card) located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All STC cards are reported.

:mode= (optional)

Mode of reporting for the command. When **mode=perf** is specified, only subsystem performance information is displayed.

Range: perf

Default: None.

Example

```
rept-stat-eroute
```

```
rept-stat-eroute:mode=perf
```

```
rept-stat-eroute:loc=1213
```

Dependencies

The **mode** and **loc** parameters cannot be specified in the same command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one STC card (STC card or E5-STC card running the **eroute** application) must be configured before this command can be entered.

Notes

When the **loc** parameter is specified, only the card information for the specified card is displayed.

When the **mode=perf** parameter is specified, only subsystem performance information is displayed.

Output

If an **eroute** subsystem alarm is raised while the **rept-stat-eroute** command is processing, then the command output may not display the alarm. The alarm is displayed if the command is issued a second time.

When no parameters are specified in the command, the report shows card, subsystem, and alarm information.

Legend

When no parameters are specified in the command, the following information appears in the report:

EROUTE SUBSYSTEM REPORT—State of the subsystem

STC CARDS CONFIGURED—Total number of STC cards and E5-STC cards configured in the system

CARDS IS-NR—Total number of STC cards and E5-STC cards in IS-NR state

EISCOPY BIT—Indicates whether EIS copy function is turned On or Off

SYSTEM THRESHOLD—% of system total capacity being used

SYSTEM PEAK EROUTE LOAD—Current load in Buffers/Sec

SYSTEM TOTAL EROUTE CAPACITY—Total capacity in Buffers/Sec

SYSTEM ALARM STATUS—Either "No Alarms" or current alarm number and text

CARD—Card location

VERSION—The version number of the GPL loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:

- The card does not run a GPL, such as TDM or MDAL cards.
- The card is configured but is not physically present in the system.
- The card is IS-ANR or is in the process of being loaded.

TYPE—The card type entered in the database.

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the card. The possible values are described in .

EROUTE SERVICE AVERAGE TVG CAPACITY—%

AVERAGE CPU CAPACITY—%

TVG Usage —% of system current TVG rate based on the Max TVG capacity of the E5-ENET card

CPU usage—% of system current CPU usage

When **mode=perf** is specified, the following performance statistics are displayed:

STATISTICS

CARD—Card location

CPU USAGE—%

TVG RATE

AVERAGE TVG USAGE—%

AVERAGE CPU CAPACITY—%

TOTAL TVG RATE

When the **loc** parameter is specified in the command, only card information for the specified card is displayed: CARD, VERSION, TYPE, PST, SST, and AST as shown above, and the following information:

CARD ALARM STATUS—Either “No alarms” or current alarm number and text

TOTAL CPU USAGE—%

rept-stat-gpl

Report Status Generic Program Load

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

Keyword: **rept-stat-gpl**

Related Commands: **act-gpl, alw-card, chg-gpl, copy-gpl, init-card, init-sys, rtrv-gpl**

Command Class: Program Update

Parameters

:display= (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

Range: **all, brief**

Default: **brief**

:gpl= (optional)

Generic program load. This parameter specifies the type of GPL to report on.

:loc= (optional)

Location. This parameter specifies the target card address and displays the versions of all GPLs running at the specified card location. For HC-MIM, E5-ENET, or STC cards, this information includes all non-activated flash GPLs. For cards that are not HC-MIM, STC, or E5-ENET or non E5-IPSM cards, there is no additional data: this parameter limits the report to the target card address.

Range: **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=ipsg
```

Dependencies

No other **rept-stat-xxxx** command can be in progress when this command is entered.

None of the following parameters can be specified together in the same command: **display=all** parameter, **loc** parameter, **gpl** parameter.

Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the **chg-gpl** command to turn auditing on and off.

Use the **rtrv-gpl** command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, “ALM” is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and “ALM” is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. If GPL auditing is off, the minor alarm is not activated, but “ALM” is displayed for each GPL that does not match the GPL in the RELEASE column.

If no **gpl** parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of “-----” is displayed. This should happen only for utility and OAM GPLs when the cartridge is not inserted. A utility trial version is never displayed because it can never be run.

If the removable cartridge is inserted, an “*” (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, “-----” is displayed for the running version.

When the **gpl** parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using the **init-flash** command) are not displayed.

When the **gpl=imt** parameter is specified, only the IMT GPLs for each configured card connected to the IMT are displayed.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

When a GPL is specified in the **gpl** parameter, the specified GPL for each card connected to the IMT is displayed.

Output

The output of the **rept-stat-gpl** command is site-specific and configuration-specific. The following output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

The following example shows output that includes an MPL or MPL-T (multi-port LIM) card at location 1105. The GPL column, which displays the GPL running on the card, enables you to differentiate between the two-port LIMDS0 card and the multi-port LIM card. If an MPL or MPL-T card is running in the system, SS7ML appears in the GPL column. If a two-port LIMDS0 card is running in the system, SS7ANSI appears in the GPL column.

This output appears when no parameters are defined. All GPLs for the card are listed.

Command Completed.
```

;

The following example specifies the **display=all** parameter to display both IMT and application GPL information.

The example also contains asterisks with the following meanings:

- * The SS7ML entry in the GPL column at location 1105 indicates that a multi-port LIM, as opposed to a two-port LIM, is running on the system. Both cards are provisioned in the database with the **ss7ansi** application so that the two-port LIM can be replaced without having

to reprovision the database, but the MPL and MPL-T run the **ss7ml** GPL to support 8 signaling link ports.

- ** The OAP entries appear only if an OAP is provisioned and running. Systems that use two OAPs show two entries for the OAP: OAP A and OAP B.

rept-stat-gpl:display=all

The following example shows output when the **loc** parameter is specified for an HC-MIM card.

The following notes explain the last 5 lines of this example:

1. IMTPCI has been downloaded with the **init-flash** command, the card has reset, and IMTPCI was activated normally with the **act-flash** command.
2. BLBIOS has been downloaded with the **init-flash** command, but the card has not been initialized. The inactive version will load when the card is next initialized.
3. BLVXW has been downloaded with the **init-flash** command, the card has been reset. BLVXW was activated with the **act-flash** command, but it is not the approved version on the TDM.
4. BLDIAG has been downloaded with the **init-flash** command, and the card has been reset; the inactive version is running. The ALM indicates that it is not the approved version and the '+' indicates that it has not been activated yet. The '*' next to the active version indicates that if the card resets again, the active version will run.
5. PLDPMC1 has been downloaded with the **init-flash** command and the card has been reset, but the GPL has not been activated yet. This is the same condition as Note 4, except that there is no alarm condition.

Legend

GPL—The type of GPL associated with the cards in the display.

CARD—The card location.

RUNNING—The GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.

APPROVED—The GPL version that is the approved GPL.

TRIAL—The GPL version that is the trial GPL.

ACTIVE—The GPL version that has been downloaded using the **init-flash** command and activated using the **act-flash** command..

INACTIVE—The GPL version that has been downloaded using the **init-flash** command but has not been activated using the **act-flash** command..

----- (dashes)—GPL is not present at the specified location.

*—The trial version will run if the card boots. (Shown to the right of the TRIAL column)

ALM—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

+—The currently running flash GPL has not been activated. (Shown between the RUNNING and APPROVED columns)

rept-stat-imt

Report IMT Status

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

Keyword: **rept-stat-imt**

Related Commands: **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rmv-imt**, **rst-imt**

Command Class: System Maintenance

Parameters

:mode= (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

Range: **full**

Default: **"not full"**

Example

```
rept-stat-imt
```

```
rept-stat-imt:mode=full
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

Notes

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

Output**rept-stat-imt**

```

;

Legend

IMT—IMT bus A or IMT bus B.

PST—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the specified IMT bus.

*—Minor Alarm

**—Major Alarm

*C—Critical Alarm

The states of the IMT bus are combined from the PST and the SST as shown in Table 5-57.

Table 5-57. IMT Bus States

PST	SST	Definition
IS-NR	Active	The IMT bus is operating normally.
IS-ANR	Fault	The IMT bus has had a failure on at least one but not all cards.
IS-ANR	Manual	The IMT bus is inhibited, but some cards have been connected to it.
OOS-MT	Fault	The IMT bus has a failure on all cards.
OOS-MT-DSBLD	Manual	The IMT bus is inhibited and no cards are connected to it.

rept-stat-iptps**Report Status IPGWx TPS Utilization**

Use this command to display current and peak IPTPS usage for each IPSG / IPGWx linkset in the system or for each link in the IPSG / IPGWx linkset.

Keyword: **rept-stat-iptps**

Related Commands: **chg-ctrl-feat**, **chg-ls**, **chg-sg-opts**, **enable-ctrl-feat**, **ent-ls**, **rtrv-ctrl-feat**, **rtrv-ls**, **rtrv-sg-opts**

Command Class: System Maintenance

Parameters

:lsn= (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

Default: All linksets are displayed

:peakreset= (optional)

Reset peak values to the current TPS values.

Range: **yes**, **no**

Default: **no**

Example

```
rept-stat-iptps
```

```
rept-stat-iptps:lsn=lsgw1101
```

```
rept-stat-iptps:peakreset=yes
```

Dependencies

If the linksets are not IPGWx or IPSG, then this command cannot be entered.

The specified linkset name must exist in the database.

Notes

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

IPSG linksets have SLKTPS linksets configured rather than IPTPS linksets. The **rept-stat-iptps** command uses (Number of IS-NR links * SLKTPS) in place of the IPTPS setting for all calculations and alarms.

If the linksets are a mixture of IPLIMx M2PA and IPSEG-M2PA, then the **rept-stat-iptps** command does not report any data or raise alarms.

Output

The **rept-stat-iptps** command reports on IPSG and IPGWx linkset IP TPS. The report includes the following information for the system and for each IPSG or IPGWx linkset:

- Configured IP TPS alarm threshold
- Configured IP TPS
- Current IP TPS transmit and receive usage for 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

If the linkset is specified, then the command reports the same information for the individual links in the linkset.

If the **peakreset=yes** parameter is specified, then the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

If the linkset is specified with the **peakreset=yes** parameter, then the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

NOTE: The peaks for transmit and receive, and for link, and linkset IP TPS may all occur at different times.

NOTE: The IP TPS value shown in the command may contain one extra MSU if the linkset is specified. Because the alarm calculations are implemented using integer math, rounding may occur at each entity (link, linkset) if the IP TPS value for the entity is not evenly divisible by 15. This could occur when performing an IPTPS report for a linkset that has more than one link configured.

NOTE: For mixed IPLIMx-M2PA and IPSG-M2PA linksets, the command does not report any data or raise alarms.

Legend

LSN—THE LINKSET NAME.

THRESH—THE THRESHOLD AT WHICH AN ALARM WILL BE GENERATED TO INDICATE THAT THE ACTUAL LINKSET **TPS** IS APPROACHING THE CONFIGURED LINKSET IPTPS VALUE (LSUSEALM VALUE AS SHOWN IN RTRV-LS OUTPUT).

CONFIG—THE IPTPS VALUE AS SHOWN IN RTRV-LS OUTPUT.

TPS—THE CURRENT TRANSMIT (TX) AND RECEIVE (RCV) TPS FOR 15 SECONDS.

PEAK—THE PEAK TRANSMIT (TX) AND RECEIVE (RCV) TPS USAGE FOR ALL 15 SECOND PERIODS SINCE THE LAST PEAK RESET.

PEAKTIMESTAMP—THE DATE AND TIME THAT THE DISPLAYED TRANSMIT AND RECEIVE TPS PEAKS OCCURRED.

LOC—LOCATION OF THE CARD THAT CONTAINS A DISPLAYED LINK IN THE LINKSET.

PORT—A SIGNALING LINK IN THE LINKSET.

THRESH—THE SLKUSETHRESH VALUE AS SHOWN IN RTRV-LS OUTPUT

CONFIG—DASHES (----). THERE IS NO CONFIGURABLE TPS FOR LINKS.

TPS—THE CURRENT TRANSMIT (TX) AND RECEIVE (RCV) TPS FOR 15 SECONDS.

PEAK—THE PEAK TRANSMIT (TX) AND RECEIVE (RCV) TPS USAGE FOR ALL 15 SECOND PERIODS SINCE THE LAST PEAK RESET.

PEAKTIMESTAMP—THE DATE AND TIME THAT THE DISPLAYED TRANSMIT AND RECEIVE TPS PEAKS OCCURRED.

rept-stat-lfs**Report LFS Test Status**

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

Keyword: **rept-stat-lfs**

Related Commands: **rept-stat-slk**

Command Class: Link Maintenance

Parameters

:link= (optional)

The signaling link port on the card specified in the **loc** parameter.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (optional)

This parameter is mandatory when the **port** parameter is specified.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

rept-stat-lfs

rept-stat-lfs:loc=1201

rept-stat-lfs:loc=1201:link=a1

Dependencies

The LFS feature must be turned on before this command can be entered.

The card location specified in the **loc** parameter must be equipped.

The signaling link that is specified in the **link** parameter must be assigned to the card in the **loc** parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (x is the frame and y is the shelf) cannot be specified in the loc parameter.

The card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

If the **link** parameter is specified, the **loc** parameter must be specified.

This command cannot be entered during upgrade.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

If no parameters are specified, all links that are in LFS test are displayed.

Legend

SLK—The signaling link identifier; same as **loc** and **link** parameters of **act-lbp** command.

LBP—The loopback point of this test; same as **lbp** parameter of **act-lbp** command.

PATTERN—The test pattern; same as **pattern** parameter of **act-lbp** command.

MAX-

ERRORS—The bit-error threshold allowed for this LFS test; same as **maxerr** parameter of **act-lbp** command.

BIT_ERRORS—Number of bit-errors since the beginning of this test.

MAX-TIME—The time window for testing each loop-back point; same as **time** parameter of **act-lbp** command.

TEST-TIME—Amount of time the test has run.

rept-stat-lnp**LNP Status Report**

Use this command to generate a report of the local number portability (LNP) status information.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the **loc** parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS), Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), and Automatic Call Gap (ACG).

When the **card=sccp all** parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

Keyword: **rept-stat-lnp**

Related Commands: **chg-th-alm, rept-stat-sccp, rtrv-th-alm**

Command Class: System Maintenance

Parameters

:card= (optional)

Specify **card=sccp-all** to display a report of the LNP status of all equipped SCCP cards. The **card** parameter is not valid with the **loc** parameter.

Range: **sccp-all**

:loc= (optional)

The card location as stenciled on the shelf of the EAGLE 5 ISS. The **loc** parameter is not valid with the **card** parameter.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: A summary for all cards is displayed.

Example

```
rept-stat-lnp
```

```
rept-stat-lnp:card=sccp-all
```

```
rept-stat-lnp:loc=1106
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Only one optional parameter can be specified in the command. The **card** and **loc** parameters cannot be specified together in the same command.

The only valid value for the **card** parameter is **sccp-all**.

No other **rept-stat-xxx** command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The card location (**loc** parameter) must identify a configured TSM card running the **sccp** application.

Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This

summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The **rept-stat-lnp** command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPMR usage is expressed as the average percentage of LNPMR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMR, LNPQS, WNPQS (if turned on), TLNP (if turned on), and PLNPQS (if turned on) errors for corresponding messages received across all cards.

When the **rept-stat-lnp** command is entered for a specific card (for example, **rept-stat-lnp:loc=xxxx**), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.
- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.
- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.
- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).

- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

NOTE: IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

NOTE: PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

NOTE: The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the **:card=sccp-all** parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the **:loc=xxxx** parameter.

Output

In the following example, the WNP, PLNP, and TLNP features are off.

Legend

CARD—The locations of the SCCP cards.

VERSION—The version number of the GPL the cards are running.

TYPE—The type of SCCP card.

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

AST—The associated state of the card. The possible values are described in in Appendix A.

rept-stat-ls

Report Status Linkset

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC).

NOTE: If the Multiple Linksets to Single Adjacent Point Code (MLS) feature is turned on, and an adjacent destination point code is requested, then the output displays a summary status, including the secondary point codes, of the linksets that use that adjacent point code.

Keyword: rept-stat-ls

Related Commands: chg-ls, dlt-ls, ent-ls, rtrv-ls

Command Class: System Maintenance

Parameters

:apc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:apc/apca/apci/apcn/apcn24= (optional)

Adjacent point code.

:apci= (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:apcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range: **ayyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

Default: All linksets are displayed

:stat= (optional)

The primary state filter. This parameter indicates the state of the linksets for which a report will be displayed. For example, to display a report for all linksets whose state is DSBLD, specify the

stat=dsbld parameter.

Range: **all, alminh, anr, dsbld, mt, nr**
 all — All of the primary states
 alminh — Alarms inhibited
 anr — In-Service-Abnormal (IS-ANR)
 dsbld — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)
 mt — Out-of-Service-Maintenance (OOS-MT)
 nr — In-Service-Normal (IS-NR)
Default: **all**

Example

```
rept-stat-ls  
rept-stat-ls:lsn=lsnstpa
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the **stat** parameter is specified, then the **lsn** parameter cannot be specified and vice versa.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the **apc** parameter can be specified.

The **lsn**, **stat**, and **apc** parameters cannot be specified together in the command.

At least one linkset must be associated with the value of the **apc** parameter.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If no link is equipped for the SLC, the output is “____ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

"ASP-STATE" is shown for only IPSPG-M3UA linksets.

Output

If the Proxy Point Code feature is enabled, then proxy point code information is displayed.

Legend

LSN—The name of the linkset

APCA/APCI/APCN/APCN24—The adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

SPCA/SPCI/SPCN/SPCN24—The secondary point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

PST—The primary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the specified card.

SCRN—The name of the gateway screening screen set associated with the linkset.

GWSA—Shows whether gateway screening is used for the specified linkset.

GWSM—Shows whether gateway screening messaging is turned on for the specified linkset.

GWSD—Shows whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is turned on.

SLC—The signaling link codes associated with the links that are contained in the specified linkset.

SLK—The signaling links that are contained in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link.

PPCA/PPCI/PPCN/PPCN24—The proxy point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

ASP STATE—The state of AS associated with each signaling link of the IPSG-M3UA linkset. The states displayed are: ACTIVE, INACTIVE, or DOWN.

rept-stat-meas**Report Measurement Status**

Use this command to report the status of the Measurements Subsystem (Measurements Platform), including card location and state, alarm level, and subsystem state.

Keyword: **rept-stat-meas**

Related Commands: **rept-stat-card**

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-meas

Dependencies

The Measurements Platform feature must be turned on prior to issuing this command.

At least one MCPM card must be configured in the system.

No other **rept-stat-xxx** commands can be in progress when this command is issued.

Notes

The MCPM card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the MCPM card is in the IS-NR or IS-ANR state. (The **rept-stat-card** command will not show the GPL version if the card is ISANR.)

Output

Output example with one MCP card isolated:

rept-stat-meas

```

MEAS SS          PST          SST          AST
ALARM STATUS =   IS-ANR      Active      -----
                  * 0516 Degraded Mode - 1 card failed

CARD  VERSION    TYPE    PST          SST          AST
1107 P 101-009-000  MCPM    IS-NR      Active      -----
      IP Link A                IS-NR      Active      -----
1109 -----      MCPM    OOS-MT      Isolated    -----
      IP Link A                OOS-MT      Unavail    -----

CARD 1107 ALARM STATUS = No Alarms
CARD 1109 ALARM STATUS = Card is isolated from the system
Command Completed.

```

;

Output example with both MCP cards IS-NR:

rept-stat-meas

```

MEAS SS          PST          SST          AST
ALARM STATUS =   IS-NR      Active      -----
                  No Alarms

CARD  VERSION    TYPE    PST          SST          AST
1107 P 046-010-004  MCPM    IS-NR      Active      -----
      IP Link A                IS-NR      Active      -----
1109 046-010-004    MCPM    IS-NR      Active      -----
      IP Link A                OOS-MT      Unavail    -----

CARD 1105 ALARM STATUS = No Alarms
CARD 1106 ALARM STATUS = No Alarms

Command Completed.

```

;

Legend

VERSION—The version number of the GPL that the specified MCPM card is running. The version is shown if the card is in the IS-NR or IS-ANR state.

TYPE—MCPM; the card that is running the Measurements Subsystem application.

PST—The primary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the Measurements Subsystem or card. The possible values are described in .

MEAS SS—The Measurements Subsystem application running on the MCPM card.

ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the MCPM and the applications running on the MCPM.

CARD—The location of the MCPM card. The MCPM card with the letter “P” to the right of its card location is the primary MCPM. The primary MCPM transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the MCPM is IS-NR, the secondary state (SST) indicates whether the MCPM is active or standby.

CARD XXXX ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the card.

rept-stat-mps

Report the MPS Status

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is turned on, the status of the ELAP (EAGLE LNP Application Processor) subsystem is displayed.
- If the INP or AINPQ feature is turned on, the status of the EPAP (EAGLE Provisioning Application Processor) subsystem is displayed.
- If the G-Port (GSM mobile number portability) feature, G-Flex (GSM flexible numbering) feature or PPSMS (Prepaid SMS Intercept Ph1) feature is turned on, the status of the GSM (Global System for Mobile Telecommunications) and the EPAP (EAGLE Provisioning Application Processor) is displayed.
- If the EIR (Equipment Identity Register) feature is enabled and turned on, the status of the EIR component on the card is displayed.

Keyword: `rept-stat-mps`

Related Commands: `rept-stat-card`, `rept-stat-sccp`

Command Class: System Maintenance

Parameters

:loc= (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE 5 ISS.

Range: 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

`rept-stat-mps:loc=1106`

Dependencies

The card location specified in the **loc** parameter, must contain a VSCCP card.

One of the following features must be turned on before this command can be issued:

- G-Flex
- G-Port
- INP
- AINPQ
- EIR
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1

- A-Port
- MO-based GSM SMS NP
- MO-based IS41 SMS NP

At least one VSCCP card must be configured in the system before this command can be entered.

To specify the **rept-stat-mps** command, no other **rept-stat-xxxx** command can be in progress.

Notes

When the MPS does not have an alarm on it, the **rept-stat-mps** report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

Output

The following example shows the possible system response if the G-Flex, G-Port, or PPSMS feature and the INP or AINPQ feature are turned on:

rept-stat-mps

Legend

CARD—The location of the VSCCP card. The VSCCP card with the designator “P” to the right of its card location is the primary DSM as selected by the active ELAP/EPAP. The primary DSM provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.

VERSION—The version number of the GPL that the specified ELAP/EPAP or card is running.

PST—The primary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the ELAP/EPAP or card. The possible values are described in .

EPAP/ELAP A/B—The application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, or G-Port, is turned on, the output shows EPAP A/B.

ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the EPAP Administration Manual or the *ELAP Administration Manual*. There are 6 categories of MPS alarms:

- Critical platform alarm data
- Major platform alarm data
- Minor platform alarm data
- Critical application alarm data
- Major application alarm data
- Minor application alarm data

GSM STAT—The possible states are either ACT (active) or SWDL (indicates that the GSM component on that card is currently inactive until the software download completes). The GSM STAT information is not displayed if the G-Port, G-Flex and Prepaid SMS Intercept Ph1 features are turned off.

INP STAT—The possible states of INP status include ACT (active), OFFL (offline) and SWDL (indicates that the INP component on that card is currently inactive until the software download completes). The INP STAT information is not displayed if the INP feature is turned off.

LNP STAT—The possible states of LNP status include ACT (active), OFFL (offline) and SWDL (indicates that the LNP component on that card is currently inactive until the software download completes). The LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.

EIR STAT—The possible states of EIR Status include ACT (active), OFFL (offline), and SWDL (Indicates the EIR component on that card is currently inactive until software download completes). The EIR STAT information is not displayed if the EIR feature is not enabled.

DSM MEMORY USAGE—The percentage of DSM memory used to store the ELAP/EPAP database.

For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on a 2G DSM card means that 1G is used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the **rtrv-ctrl-feat** command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.

CARD XXXX ALARM STATUS—A listing of any trouble text alarm messages that have been generated for the card.

DSM PORT A/B—A listing of any trouble text alarm messages that have been generated for the port on the card.

IP CONNECTION UNAVAILABLE—Indicates the failed channels on those ports with IP Connection Unavailable alarms. The possible channels reported are:

- Prov—RTDB Provisioning Channel
- Dnld—RTDB Download Channel
- TCP—Transmission Control Protocol Channel
- UDP—User Datagram Protocol Channel

rept-stat-mux

Report the MPS Status

Use this command to list all the HMUX and HIPR cards, their location, and their status.

Keyword: rept-stat-mux
Related Commands: rept-stat-card
Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-mux

Dependencies

None

Notes

None

Output

```
rept-stat-mux
rlghncxa03w 04-09-07 10:23:93 EST EAGLE 32.0.0

CARD   TYPE      PST        SST        AST
1109   HMUX       IS-NR      Active     ALMINH
1110   HMUX       IS-NR      Active     -----
1209   HIPR       IS-NR      Active     ALMINH
1210   HIPR       IS-NR      Active     -----

Command Completed.
```

;

Legend

CARD—The HMUX or HIPR card location.

TYPE—The type of card (HMUX or HIPR).

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

AST—The associated state of the card. The possible values are described in in Appendix A.

rept-stat-rtd

Report Status RTD

Use this command to report Run Time Diagnostics (RTD) for EAGLE 5 ISS cards, including the status of internal integrity checks and the RTD subsystem alarm. This display can help determine the cause when an RTD subsystem alarm occurs, or when associated issues are reported.

This command is also used to reset MSU validation statistics and clear the RTD subsystem alarm.

Keyword: rept-stat-rtd
Related Commands:
Command Class: System Maintenance

Parameters

:force= (optional)

The **force** parameter is used with the **reset=yes** parameter to clear statistics for a card when the RTD subsystem alarm is present.

Range: **yes**

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

The **loc** parameter can be used to either retrieve or reset statistics for a card location. To reset the statistics, the **loc** parameter and the **reset** parameter must be specified together in the command.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:reset= (optional)

This parameter clears the statistics by setting them to zero and resets the checksum card indicator error and RTD subsystem alarm.

Range: **yes**

yes — Clears the statistics.

If the **reset=yes** parameter is specified with the **loc** parameter, then statistics are cleared for the specified card. If the **reset=yes** parameter is specified, and the **loc** parameter is not specified, then statistics are cleared for all cards in the system.

Example

```
rept-stat-rtd
```

```
rept-stat-rtd:loc=1107
```

```
rept-stat-rtd:reset=yes:force=yes
```

```
rept-stat-rtd:loc=1107:reset=yes
```

Dependencies

If the **reset=yes** parameter is specified, then the **force=yes** parameter must be specified to clear the statistics and checksum failure indicators.

The card specified by the **loc** parameter must be an **IPLIMx**, **IPGWx**, **SCCP**, **DSM**, **E1/T1 MIM**, **HC-MIM**, **E5-E1T1**, **LIMATM**, or **E1 ATM** card.

The card in the specified card location (**loc** parameter) must be in service.

The **reset=yes** parameter must be specified to clear the statistics.

The **force=yes** parameter must be specified.

The **loc** parameter cannot have a non-numeric value.

The card specified by the **loc** parameter must be an **IPLIMx**, **IPGWx**, **SCCP**, **DSM**, **E1/T1 MIM**, **HC-MIM**, **E5-E1T1**, **LIMATM**, or **E1 ATM** card.

The card slot must be equipped and in service.

Notes

The statistics from internal integrity checks are displayed for all in-service LIM and SCCP cards. The reported statistics are dynamic and are not maintained when a card is re-initialized.

The displayed reports contain message validation totals since the last time the diagnostic information for the cards was reset.

The individual statistics that are reported re-start at zero after the maximum values are reached and are cleared when reset by the **rept-stat-rtd** command.

The report displayed shows the summary statistics or overall totals for MSU validation statistics for all LIM and SCCP cards in the system. It also includes the status for the RTD subsystem and the RTD subsystem alarm.

When the **loc** parameter is specified in the **rept-stat-rtd** command, the report displayed shows the detailed MSU validation statistics report for the specified card. The report shows statistics from integrity checks performed by the specified card on MSUs transferred to and from LIM/SCCP cards and includes the timestamp when the card last detected an error during integrity checks. The statistics are only displayed for cards with non-zero totals.

The integrity checks are performed on a subset of the MSUs transferred between cards. When card(s) report errors during the integrity checks, the RTD subsystem alarm is activated. The error statistics reported should be used along with the UIMs or alarms to help identify the source of the problem.

The RTD subsystem alarm is triggered when a card reports that a checksum error was detected during internal card integrity checks.

The RTD subsystem alarm remains active in the system until the statistics are reset using the **rept-stat-rtd** command, and no further indications of checksum errors are reported during internal card integrity checks.

Output

If the **rept-stat-rtd** command is entered with no parameters, then a summary status for the RTD subsystem and alarm and summary statistics for all of the LIM/SCCP cards in the system are displayed.

If the **loc** parameter is specified in the **rept-stat-rtd** command, then detailed statistics are displayed for the specified card location. Only cards with non-zero totals are reported in the location specific report.

The following example displays a summary report on the status of the RTD subsystem and RTD subsystem alarm with MSU validation statistics for all LIM/SCCP cards in the system.

Legend

This section defines the fields of the **rept-stat-rtd** reports.

PST—The possible values are described in "Possible Values for PST/SST/AST". For this command, IS-NR specifically means no checksum errors were found during the last reporting period; IS-ANR specifically means that a card or cards reported checksum errors during MSU integrity checks when the RTD status was previously IS-NR, and the RTD System Alarm(s) was raised.

TOTAL RX ERROR (for a Summary Report)—Total MSUs received with checksum errors, including MSUs with checksum errors received from all cards in the system.

TOTAL RX ERROR (for a Location-Specified Report)—Total MSUs with checksum errors received at the card specified by the **loc** parameter from SRC/DEST CARD.

TOTAL RX VALIDATED (for a Summary Report)—Total MSUs with checksum received and validated from all cards in the system.

TOTAL RX VALIDATED (for a Location-Specified Report)—Total MSUs with checksum received and validated at the card specified by the **loc** parameter from SRC/DEST CARD.

TOTAL Tx (for a Summary Report)—Total MSUs with checksum applied and transmitted to all cards in the system.

TOTAL TX (for a Location-Specified Report)—Total MSUs with checksums transmitted from the card specified in the **loc** parameter to SRC/DEST CARD.

LAST ALARM TIMESTAMP—Timestamp for last reported checksum error for the card specified in the **loc** parameter.

SRC/DEST CARD—Source card transmitting MSUs with checksums received by the card specified in the **loc** parameter. Destination card receiving MSUs with checksums transmitted from card specified in LOC parameter.

RTD SUBSYSTEM—Indicates RTD Device Status (IS-NR, etc).

RTD ALARM STATUS—Indicates whether an alarm is present for the RTD Device. The possible values are described in .

rept-stat-rte

Report Status Route

Use this command to display the signaling route status for a particular destination.

Keyword: rept-stat-rte

Related Commands: chg-dstn,, chg-rte, dlt-dstn,, dlt-rte, ent-dstn,, ent-rte, rept-stat-dstn,, rtrv-dstn,, rtrv-rte

Command Class: System Maintenance

Parameters

:dpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpc

Range: p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-*- is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpc= (optional)

Range: p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpci= (optional)

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn= (optional)

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s**-, **p**-, **ps**-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p**-, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**-

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:dpcn24= (optional)

Range: **p**-, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**-

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:mode= (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

Range: **full**, **rtx**

full— Comprehensive display of point code status, including **rtx**. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, status of all routesets is displayed.

rtx— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default: The point code's subsystem status is not displayed.

:mode= (optional)

This parameter specifies the type of display to produce.

Range: **full**, **rtx**

full— Comprehensive display of point code status, including **rtx**. If specified with a point code, then the status for that point code is displayed. Routes from the associated routeset and destination table (historic routes) are displayed. If specified without a point code, then the status of all routesets is displayed.

rtx— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default: A summary report is displayed.

:rsn= (optional)

Routeset name. This parameter specifies the name of the routeset.

Range: *aaaaaaaa*
 1 alphabetic character followed by up to 9 alphanumeric characters

:stat= (optional)

The primary state filter. This parameter displays all entries with the specified primary state filter.

Range: **nr, anr, mt, dsbld, all**
 nr — In service normal
 anr — In service abnormal
 mt — Out of service maintenance
 dsbld — Out of service maintenance disabled
 all — All primary states
Default: All primary states are displayed.

:stat= (optional)

This parameter specifies the primary state filter.

Range: **all, alminh, anr, dsbld, mt, nr**
 all — All of the primary states
 alminh — Alarms inhibited
 anr — In service abnormal (IS-ANR)
 dsbld — Out of service maintenance disabled (OOS-MT-DSBLD)
 mt — Out of service maintenance (OOS-MT)
 nr — In service normal (IS-NR)
Default: **all**

Example

```
rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25-**
rept-stat-rte:rsn=rsf
```

Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

An x-list DPC cannot be specified in the **dpc** parameter.

The **mode** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameters cannot be specified together in the command if the point code parameter specifies one of the *nnn-ccc-*** or *nnn-ccc-**** formats.

The **stat** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified together in the command only if the point code parameter specifies one of the *nnn-ccc-*** or *nnn-ccc-**** formats.

The **mode** parameter can be specified only if a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified.

No other **rept-stat-xxxx** command can be in progress when this command is entered.

If a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified, the value must be the true point code of the destination and the value must already be defined in the database.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

An x-list DPC cannot be specified in the **dpc** parameter.

If the **mode=full** parameter is specified, then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

If the **dpc** parameter specifies an *ni-nc-** format, then the **mode** parameter cannot be specified.

The **dpc** parameter must specify an *ni-nc-** format before the **stat** parameter can be specified with the **dpc** parameter.

If the **rsn** parameter is specified, then the **dpc**, **mode**, and **pst** parameters cannot be specified. The **pst** and **mode** parameters cannot be specified together in the command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, then the value must be the true destination point code (not an alias) and the value must be defined in the database.

The Origin-Based MTP Routing feature must be turned on before the **mode=rtx** parameter can be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

The RSET feature must be turned on (see the **chg-feat** command) before the **rsn** parameter can be specified.

The value specified for the **rsn** parameter must already exist in the RSET table.

Notes

Each DPC can have up to six routes associated with it.

This command's functions are now performed by **rept-stat-dstn** and this command will be deleted in a future software release.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-58 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

Table 5-58. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rept-stat-rte:dpc=ni-nc-ncm	Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .
rept-stat-rte:dpc= ni-_*-*	Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.
rept-stat-rte:dpc= ni-**-*	Requests a report for the full network cluster for the specified <i>ni</i> .
rept-stat-rte:dpc= ni-***-*	Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .
rept-stat-rte:dpc= ni-nc-*	Requests a report for provisioned cluster destination <i>ni-nc-*</i> .

Table 5-58. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rept-stat-rte:dpc= ni-nc-**	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported.
rept-stat-rte:dpc= ni-nc-***	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.
rept-stat-rte:dpcn24=msa-ssa-sp	Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-59 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

Table 5-59. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rept-stat-rte:dpc=ni-nc-ncm	Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .
rept-stat-rte:dpc= ni-**-*	Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.
rept-stat-rte:dpc= ni-**-*	Requests a report for the full network cluster for the specified <i>ni</i> .
rept-stat-rte:dpc= ni-***-*	Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .
rept-stat-rte:dpc= ni-nc-*	Requests a report for provisioned cluster destination <i>ni-nc-*</i> .

Table 5-59. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rept-stat-rte:dpc= <i>ni-nc-**</i>	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported.
rept-stat-rte:dpc= <i>ni-nc-***</i>	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.
rept-stat-rte:dpcn24= <i>msa-ssa-sp</i>	Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the destination is attached with a routeset and has historic routes, then information on all of the routes is displayed. If the **mode=full** parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the **mode=rtx** parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the **mode=full** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all routes from destination table (historic routes), the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows how, when no parameters are specified, summary information for all provisioned cluster and noncluster DPCs is reported.

rept-stat-rte

```

The following example shows how specifying either an FPC or cluster destination for which circular routing has been detected, along with the **mode=full** parameter, displays the name of the linkset on which the circular routing test message was transmitted. It also displays the linkset on which the circularly routed message was received. This information may be useful in correcting the circular routing situation.

rept-stat-rte:dpc=9-3-6:mode=full

```

The following example shows how **rept-stat-rte** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

rept-stat-rte:dpc=9-3-*

```

rlghncxa03w 04-01-07 14:59:11 EST  EAGLE 31.3.0

;

The following example shows how the circular routing alarm for a cluster destination is displayed. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

rept-stat-rte:dpc=9-3-*

```

Legend

DPC/DPCA—The ANSI destination point code of the route

DPCN—The ITU-TSS national destination point code of the route

DPCN24—The 24-bit ITU national destination point code of the route

DPCI—The ITU-TSS international destination point code of the route

OPC/OPCA—The ANSI origination point code as exception routing criterion of the exception route

OPCN—The ITU-TSS national origination point code as exception routing criterion of the exception route

OPCN24—The 24-bit ITU national origination point code as exception routing criterion of the exception route

OPCI—The ITU-TSS international origination point code as exception routing criterion of the exception route

ILSN—The originating linkset as exception routing criterion of the exception route

CIC—Starting Circuit Identification Code used as the exception routing criterion for this exception route

ECIC—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

RSN—The name of the routeset

PST—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the subsystem. The possible values are described in .

rept-stat-rtkey**Report the Status of Routing Keys**

Use this command to generate a summary report of the status of the system routing keys.

Keyword: **rept-stat-rtkey**

Related Commands: **chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey, rtrv-appl-rtkey**

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-rtkey

Dependencies

None

Notes

The report generated by the **rept-stat-rtkey** command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table
- The current number of static routing key entries in the routing key table
- The percentage of the static routing key table entries that is provisioned

Output**rept-stat-rtkey**

```
rlghncxa03w 04-02-17 14:59:11 EST EAGLE 31.3.0
SRKQ = 250
```

```
Static Route Key table is (50 of 250) 20% full
1105 Route Key table is (25 of 250) 10% full
1107 Route Key table is (25 of 250) 10% full
```

```
Static Route Key Socket Association table is (80 of 4000) 2% full
1105 Route Key Socket Association table is (40 of 4000) 1% full
1107 Route Key Socket Association table is (40 of 4000) 1% full
```

```
Command Completed.
```

```
;
```

rept-stat-rtx**Report Status Exception Route**

Use this command to display the signaling route status for one or more exception routes to a particular destination.

Keyword: **rept-stat-rtx**

Related Commands: **dlt-rtx, ent-rtx, rtrv-rtx**

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:dpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255, *, **, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk values *****, ******, and ******* are not valid for the *ni* subfield.

If ****** or ******* is specified for the *nc* subfield, either *****, ******, or ******* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-***** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Origination point code.

:opci= (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opc= (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: **0-15**

Example

```
rept-stat-rtx
```

```
rept-stat-rtx:dpc=1-101-1
```

```
rept-stat-rtx:dpc=1-101-1:opc=1-2-1
```

Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The following table provides a summary description of the reports that are produced by specifying various **rept-stat-rtx** parameters.

Format	Meaning
rept-stat-rtx:dpc=ni-nc-ncm:si=n	Requests a status report of the exception route set for fully provisioned destination <i>ni-nc-ncm</i> , which uses the specified value <i>n</i> of the exception route class si as criterion.
rept-stat-rtx:dpc= ni-nc-ncm	Requests a status report of all exception route sets for fully provisioned destination <i>ni-nc-ncm</i> , regardless of the exception route class(es) used as criterion.
rept-stat-rtx:dpc= ni-nc-*	Requests a status report of all exception route sets for provisioned cluster destination <i>ni-nc-*</i> , regardless of the exception route class(es) used as criterion.
rept-stat-rtx	Requests a status report of all exception route sets for provisioned destinations, regardless of the exception route class(es) used as criterion

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

The following command provides the status of all exception route sets provisioned in the system, sorted by DPC.

rept-stat-rtx

```
stdcfg2b 06-03-24 01:54:32 EST EAGLE 35.0.0
```

DPCA	PST	SST	AST
001-101-001	IS-NR	Allowed	ACCESS
OPCA			
001-002-001	IS-ANR	Restrict	ACCESS

;

Legend

DPC/DPCA—The ANSI destination point code of the exception route

DPCN—The ITU-TSS national destination point code of the exception route

DPCN24—The 24-bit ITU national destination point code of the exception route

DPCI—The ITU-TSS international destination point code of the exception route

OPC/OPCA—The ANSI origination point code as exception routing criterion of the exception route

OPCN—The ITU-TSS national origination point code as exception routing criterion of the exception route

OPCN24—The 24-bit ITU national origination point code as exception routing criterion of the exception route

OPCI—The ITU-TSS international origination point code as exception routing criterion of the exception route

ILSN—The originating linkset as exception routing criterion of the exception route

CIC—Starting Circuit Identification Code used as the exception routing criterion for this exception route

ECIC—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

SI—Service Indicator used as the exception routing criterion for this exception route

PST—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

rept-stat-sccp

Report Status SCCP

Use this command to display the following types of reports:

- **rept-stat-sccp** (with no parameters)—displays the status of the SCCP and VSCCP cards and the GTT (Global Title Translation), G-Flex (GSM Flexible Numbering), G-Port (GSM Mobile Number Portability), INP (INAP-based Number Portability), EIR (Equipment Identity Register), A-Port (IS41 Mobile Number Portability), and IGM (IS41 GSM Migration) services executing on those cards. This command also displays any cards that are denied SCCP service.
- **rept-stat-sccp:mode=perf**—targets the general SCCP traffic performance for both SCCP and VSCCP cards. The report supplies message rates for group ticket voucher (TVG) performance.
- **rept-stat-sccp:loc=nnnn**—provides a detailed view of the status of SCCP services provided by a specific SCCP or VSCCP card. Fields are omitted if an associated feature is not turned on.

NOTE: The **rept-stat-sccp** and **rept-stat-sccp:mode=perf** reports include the status of TSM and DSM cards but do not differentiate between these card types.

NOTE: To retrieve traffic statistics for the LNP feature, use the **rept-stat-lnp** command.

NOTE: When turned on, the A-Port, IS41 GSM Migration (IGM) and Prepaid SMS Intercept Ph1 (PPSMS) features share statistic status with the G-Port feature. If only the PPSMS feature is on, the display title for the statistic status is SMSMR. If the G-Port feature is on, with or without the PPSMS feature, the display title for the statistic status is GPORT. If the A-Port or IGM feature is on, with or without the G-Port and PPSMS features, the display title for the statistic status is MNP.

Keyword: **rept-stat-sccp**

Related Commands: **chg-th-alm, rtrv-th-alm**

Command Class: System Maintenance

Parameters

:loc= (optional)

Card Address. Use this parameter to specify the location of the SCCP/VSCCP card to be reported on.

Range: 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: Report a summary of all cards.

:mode= (optional)

Use this parameter to provide extended performance information, including output about group ticket voucher (TVG) performance and message rates for direct assignments.

Range: **perf**

Default: No extended performance information is displayed.

:peakreset= (optional)

Reset all Peak values to zero.

Range: **yes**

Example

rept-stat-sccp

rept-stat-sccp:mode=perf

rept-stat-sccp:loc=1106

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one SCCP or VSCCP card must be configured in the system before this command can be entered.

Only one optional parameter at a time can be specified in the command.

If the **loc** parameter is specified, the **loc** parameter value must be the card location of a VSCCP card.

Notes

None

Output

The following example shows the output of the **rept-stat-sccp** command with the G-Flex, G-Port, INP, A-Port, and Prepaid SMS Intercept Ph1 features are on. The EIR feature is not enabled, and the **ansigflex** system option is disabled:

Legend

This section defines the fields of the three **rept-stat-sccp** reports:

- **rept-stat-sccp** with no parameters
- **rept-stat-sccp:mode=perf**
- **rept-stat-sccp:loc=nnnn**

A dash (-) in an output field indicates that the statistic does not apply.

NOTE: The ERRORS and TOTAL ERRORS fields indicate that errors have occurred for SCCP cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the *Maintenance Manual* for error explanations and recovery procedures.

Report Type: rept-stat-sccp with no parameters

SCCP SUBSYSTEM REPORT, INPQ/EIR/VFLEX SUBSYSTEM REPORT—The summaries of the SCCP subsystem, INPQ (INP Query) subsystem, and EIR subsystem status. Information about the status of GSM, INPMR (INP Message Relay), and EIR services is provided in the SCCP subsystem status summary report. The INPQ subsystem status is displayed only if the INP feature bit is turned on. The EIR subsystem status is displayed only if the EIR feature key is enabled and turned on. The ALARM STATUS for the SCCP and INPQ/EIR Subsystems is displayed in this section of the report.

SCCP CARDS CONFIGURED—The number of SCCP/VSCCP cards provisioned.

CARD IS-NR—The number of SCCP/VSCCP cards that can be used by the system (status is in-service normal, IS-NR).

SYSTEM TPS ALARM THRESHOLD—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-alm** command.

SYSTEM PEAK SCCP LOAD—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

SYSTEM TOTAL SCCP CAPACITY—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP cards. When the ansigflex system option is enabled in an ANSI system, the maximum capacity of each DSM is 1700 TPS.

CARD—The card location of the TSMs running the SCCP application and of the DSMs running the VSCCP application.

P—When G-Flex, G-Port, INP, A-Port, EIR, or IGM is turned on, a P indicates the primary DSM. The primary DSM provides the MPS status to the EAGLE 5 ISS. This indicator is displayed between the card location and the GPL version.

VERSION—The version number of the SCCP/VSCCP GPL the card is running.

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

MSU USAGE—The percentage of the maximum number of MSUS (850 MSUS per second) received by each card during the last 30 seconds.

CPU USAGE—The percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks.

SCCP SERVICE AVERAGE MSU CAPACITY—The average MSU capacity used over the last 30-second interval. This field includes all services provided by the SCCP/VSCCP cards.

AVERAGE CPU CAPACITY—The average CPU capacity used over the last 30-second interval. This field includes all services provided by the SCCP/VSCCP cards.

AVERAGE CPU USAGE PER SERVICE—A system-wide view of the service traffic composition. This report is available only if the G-Flex, G-Port, INP, A-Port, EIR, or IGM feature is turned on. Fields are omitted if the associated feature is not turned on. The services include GTT, EIR, G-Flex, INPQ, G-Port, INPMR, and MNP.

TOTAL SERVICE STATISTICS—A system-wide view of per-service statistics. This report is available only if the G-Flex, G-Port, INP, A-Port, EIR, or IGM feature is turned on. Fields are omitted if the associated feature is not turned on.

An "A" in the field indicates that the statistic does not apply.

The report tracks the following information:

SERVICE—The services are GTT, EIR, G-Flex, INPQ, G-Port, INPMR, and MNP.

SUCCESS—The total number of successful messages processed by the specified card for each service. Applies to all services.

ERRORS—The total number of messages with errors for each service. Applies to all services.

WARNINGS—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, G-Port, INPMR, A-Port, and IGM.

FORWARD TO GTT—The total number of messages that could not find a match in the MPS (Multi-Purpose Server) database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, G-Port, INPMR, A-Port, and IGM.

Report Type: **rept-stat-sccp:mode=perf**

The report displays general SCCP traffic performance for both SCCP and VSCCP cards and supplies message rates for TVG.

NOTE: This report includes the status of TSM and DSM cards, but does not differentiate between these card types.

SCCP SUBSYSTEM REPORT—The summary status of the SCCP subsystem, and the SCCP Alarm Status.

SCCP CARDS CONFIGURED—The number of SCCP/VSCCP cards provisioned.

CARD IS-NR—The number of SCCP/VSCCP cards that can be used by the system (status is in-service normal, IS-NR).

SYSTEM TPS ALARM THRESHOLD—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-alm** command.

SYSTEM PEAK SCCP LOAD—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

SYSTEM TOTAL SCCP CAPACITY—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP cards.

TPS STATISTICS—The section of the report that provides TPS statistics on each SCCP or VSCCP card.

CARD—The card location of the TSM cards running the SCCP application and of the DSMs running the VSCCP application.

CPU USAGE—The percentage of the amount of CPU used to process messages by each card during the last 30 seconds.

TOTAL MSU RATE—The total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the SCCP or VSCCP card for the last 30-second period.

CLASS 0 AND CLASS 1 TVG RATE—The number of messages per second received.

The next section of the **rept-stat-sccp:mode=perf** report provides system-wide SCCP traffic statistics.

AVERAGE MSU USAGE—The total of the MSU usage fields from each SCCP card divided by the number of active SCCP cards.

AVERAGE CPU USAGE—The total of the CPU usage fields from each SCCP card divided by the number of active SCCP cards.

TOTAL MSU RATE—The sum of all GTT, EIR, G-Flex, G-Port, INP, A-Port, and IGM MSUs processed by all active SCCP cards.

STATISTICS FOR PAST 30 SECONDS—statistics that represent the last 30-second period.

TOTAL MSUS—The sum of all transactions on all active SCCP cards.

TOTAL ERRORS—The sum of all errors on all active SCCP cards.

Report Type: **rept-stat-sccp:loc=nnnn**

CARD—The card location of the TSM running the SCCP application or of the DSM running the VSCCP application.

VERSION—The version number of the GPL the card is running.

TYPE—The type (TSM/DSM) of the card.

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the card. The possible values are described in .

CARD ALARM STATUS—If there are no card alarms present, this field displays No Alarms.

The next section of the **rept-stat-scep:loc=nnnn** report supplies the status of the individual services provided by the card and the associated CPU usage for the service. Fields are omitted if the associated feature is not turned on.

GTT: STAT—Possible values are ACTIVE and SWDL (software loading).

GFLEX: STAT—Possible values are ACTIVE and SWDL (software loading).

GPORT or MNP: STAT—Possible values are ACTIVE and SWDL (software loading).

INPMR: STAT—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

INPQ: STAT—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

EIR: STAT—Possible values are ACTIVE, OFFLINE and SWDL (software loading).

TOTAL—The sum of the CPU usage for the services running over the previous 30-second period.

CARD SERVICE STATISTICS—The card service statistics for the specified card. This report is available only if the G-Flex, G-Port, INP, A-Port, EIR, or IGM feature is turned on. Fields are omitted if their associated feature is not turned on. The report tracks the following:

SERVICE—The services are GTT, EIR, G-Flex, G-Port, INPQ, INPMR, and MNP.

SUCCESS—The total number of successful messages processed by the specified card for each service. Applies to all services.

ERRORS—The total number of messages with errors for each service. Applies to all services.

WARNINGS—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for EIR, G-Flex, G-Port, INPMR, A-Port, and IGM.

FORWARD TO GTT—The total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for EIR, G-Flex, G-Port, INPMR, A-Port, and IGM.

rept-stat-seas

Report Status SEAS Command

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE 5 ISS. This command reports single OSS/Application Processor (OAP) or dual OAP configuration status, depending on the OAP hardware configuration used. See the *Maintenance Manual* for information about the SEAS alarms.

NOTE: If the SEAS Over IP feature is turned on, then the status of the CCS MR connections is displayed. If the SEAS Over IP feature is turned off, then the X.25 connection status is displayed.

Keyword: rept-stat-seas

Related Commands: alw-trm, chg-trm, inh-trm, rept-stat-sys, rept-stat-trbl, rept-stat-trm

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-seas

Dependencies

At least one OAP terminal or one SEAS terminal must be defined using the **chg-trm** command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

Notes

None

Output

The following example shows the output of command when the SEAS feature is turned on and the SEAS Over IP feature is turned off.

rept-stat-seas

rept-stat-seculog

Display Security Log Status Information

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries
- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

Keyword: `rept-stat-seculog`

Related Commands: `chg-attr-seculog`, `rtrv-attr-seculog`

Command Class: Security Administration

Parameters

This command has no parameters.

Example

rept-stat-seculog

Dependencies

No other security log command can be in progress when this command is entered.

Notes

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are not *necessarily* displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format of *hh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

Output

The following example shows the normal security log state. All of the un-uploaded records appear in the log on the active OAM.

rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84   No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0   No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows an abnormal situation. The active security log is full and has overflowed.

rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active 10000    100  Yes  No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0   No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows what happens when both logs contain un-uploaded entries. The standby log on 1116 should be uploaded.

rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84   No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 693       7   No   No   96-09-12 05-07-30 05-07-30

1116 Standby ----- --- --- --- -----
```

;

Legend

LOC—The address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.

ROLE—The current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: **active** or **standby**.

-- **SINCE LAST UPLOAD**—This heading applies to the four columns directly below it on the output. It indicates that the fields below display information obtained since the last upload.

ENTRIES—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using **copy-seculog**.

%FULL—Shows, as a percentage, how much space in the log the ENTRIES field value occupies.

OFLO—The overflow indicator. Overflow is what happens if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. This field displays **No** if no overflow has occurred and **Yes** if overflow has occurred.

FAIL—The failed indicator. This field displays **No** if no logging failure has occurred. It displays **Yes** to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

NOTE: Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a **copy-disk** command is processing, the system sets the flag when the **copy-disk** command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

OLDEST RECORD/NEWEST RECORD—The date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The **NEWEST RECORD** for the active log is the current date, because the log will have recorded the **rept-stat-seculog** command that was just entered to produce the report.

LAST UPLOAD—The date and time when the log was last uploaded successfully. That is, the **copy-seculog** command successfully copied the log to the FTA.

rept-stat-slan

Report Status of the STPLAN

Use this command to generate a summary report of the status of the ACM, DCM, and E5-ENET cards that make up the STPLAN subsystem.

Keyword: **rept-stat-slan**

Related Commands: **rept-stat-alm**, **rept-stat-card**, **rept-stat-dlk**, **rept-stat-imt**, **rept-stat-sys**, **rept-stat-trbl**

Command Class: System Maintenance

Parameters

:mode= (optional)

Use this parameter to provide extended performance information, including group ticket voucher (TVG) message rates.

Range: **perf**

Default: No extended performance information is displayed

Example

```
rept-stat-slan
```

```
rept-stat-slan:mode=perf
```

Dependencies

No other **rept-stat-xxx** commands can be in progress when this command is entered.

At least one ACM, DCM, or E5-ENET card that makes up the STPLAN must be configured.

Notes

The HOST CAP. field value is obtained by averaging the usage percentages for the data links from each ACM, DCM, and E5-ENET card to the host.

The EAGLE CAP. field value is obtained by averaging the usage percentages for the ACM, DCM, and E5-ENET traffic received from LIMs.

The system level usage for host capacity (the AVERAGE USAGE PER HOST CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the data links to the host from each ACM, DCM, and E5-ENET card.

The EAGLE 5 ISS level usage for ACM, DCM, and E5-ENET cards capacity (the AVERAGE USAGE PER EAGLE CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the ACM, DCM, and E5-ENET traffic received from LIMs.

Output

The following example shows output with at least one ACM in an IS-NR state:

rept-stat-slan

```
rlghncxa03w 04-02-27 16:53:22 EST EAGLE 31.3.0

1102 55% 33% 435
1103 47% 28% 435
-----
AVERAGE USAGE per HOST CAPACITY = 51%
AVERAGE USAGE per EAGLE CAPACITY = 30%
Command Completed.
```

;

Legend

SLAN SUBSYSTEM REPORT—The status of the STPLAN subsystem.

STPLAN CARDS CONFIGURED—The number of ACM, DCM, and E5-ENET cards used by the STPLAN contained in the system.

CARDS IS_NR—The number of ACM, DCM, and E5-ENET cards contained in the system whose status is in service normal (IS-NR).

CARD—The locations of the ACM, DCM, and E5-ENET cards.

VERSION—The version number of the STPLAN GPL the cards are running.

PST—The primary state of the ACM, DCM, and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the ACM, DCM, and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the ACM, DCM, and E5-ENET cards. The possible values are described in .

HOST CAP—The amount of traffic being sent to the host from each ACM, DCM, and E5-ENET card, expressed as a percentage of the total amount of traffic that can be sent to the host.

EAGLE CAP—The amount of traffic being sent to each ACM, DCM, and E5-ENET card, that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to the ACM, DCM, and E5-ENET card.

AVERAGE USAGE PER HOST CAPACITY The amount of traffic being sent to all hosts from all ACM, DCM, and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACM, DCM, and E5-ENET cards.

AVERAGE USAGE PER EAGLE CAPACITY—The amount of traffic being sent to all ACM, DCM, and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACM, DCM, and E5-ENET cards.

CARDS DENIED SLAN SERVICE—The card locations that cannot use the STPLAN application.

CARDS DISABLED COPY SERVICE—The card locations that cannot use the stop and copy action of the gateway screening feature.

Instead of displaying the VERSION , PST , SST , AST , HOST CAP , EAGLE CAP, and CARDS DENIED SLAN SERVICE fields, the report displayed with the **rept-stat-slan:mode=perf** command shows these fields:

HOST CAP—The average of the usage percentages for the TCP/IP data links to the host from each ACM, DCM, and E5-ENET card.

EAGLE CAP—The average of the usage percentages for the ACM, DCM, and E5-ENET traffic that is received from the LIMs.

TVG RATE—The number of messages per second received from all SS7 links, and any other group ticket voucher paced message source. It is obtained from statistics maintained by the ACM, DCM, and E5-ENET cards for the last 30-second period.

AVERAGE USAGE PER HOST CAPACITY—The amount of traffic being sent to all hosts from all ACM, DCM, and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACM, DCM, and E5-ENET cards.

AVERAGE USAGE PER EAGLE CAPACITY—The amount of traffic being sent to all ACM, DCM, and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACM, DCM, and E5-ENET cards.

rept-stat-slk

Report Status Signaling Link

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the **e1loc** parameter (card location of the E1 card) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the **t1loc** parameter (card location of the T1 card) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is generated.

Keyword: **rept-stat-slk**

Related Commands: **act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk**

Command Class: System Maintenance

Parameters

:l2stats= (optional)

Report L2 status

Range: **align, both, brief, no, service**

align — Display alignment data only

both — Display alignment and service data
brief — Display up to 10 alignment events only
no — Do not display level 2 status information
service — Display service data only

Default: **no**

:link= (optional)

The signaling link on the card specified in the **loc** parameter. The linkss can be specified in any sequence or pattern.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

Default: Display all

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: All cards containing signaling links are displayed.

:stat= (optional)

A report on cards whose status is the same as the state indicated by the parameter

Range: **all, alminh, anr, dsbld, mt, nr**

all — All of the primary states

alminh — Alarms inhibited

anr — In-Service-Abnormal (IS-ANR)

dsbld — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

mt — Out-of-Service-Maintenance (OOS-MT)

nr — In-Service-Normal (IS-NR)

Default: Display all

Example

```
rept-stat-slk
```

```
rept-stat-slk:loc=1201:link=a
```

```
rept-stat-slk:stat=alminh
```

```
rept-stat-slk:loc=1203:link=b:l2stats=both
```

```
rept-stat-slk:loc=1203:link=b:l2stats=brief
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If the **loc** parameter or the **link** parameter is specified, then the **stat** parameter cannot be specified.

When the **loc** parameter is specified, the **link** parameter must be specified.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application

- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The location specified by the **loc** parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (**l2stats**).

On TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as SS7IPGW or IPGWI links), **l2stats** output is not available.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

The card in the specified card location (**loc** parameter) must be in service.

The **link=b** parameter cannot be specified for ss7ipgw TCP/IP links.

Neither the **stat** or **loc** and **port** parameters can be specified with this command.

Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

Output

;

Legend

SLK—The card location and the signaling link.

LSN—The name of the linkset that contains the signaling link.

CLLI—The CLLI code of the destination STP of the signaling link.

PST—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the signaling link. The possible values are described in .

ALARM STATUS—The trouble text alarm message that was generated for the specified signaling link.

UNAVAIL REASON—The reason that the signaling link is unavailable. More than one unavailable reason may be listed:

BSNR—The signaling link received 2 of 3 invalid BSNs.

CNGT—The signaling link has a remote congestion time-out.

COO—A changeover order was received.

FC—The signaling link is unavailable because of false congestion restart.

FE—The signaling link is in far end loopback mode.

FIBR—The signaling link received 2 of 3 invalid FIBs.

INTR—Too many link interrupts were received.

LB—The signaling link has been blocked locally.

LD—The signaling link received incomplete data.

LI—The signaling link has been inhibited locally.

NA—The signaling link is not aligned.

PF—The signaling link failed the proving period.

RB—The signaling link has been blocked remotely.

RD(xx.xxx)—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.

RL—The signaling link is in remote near end loopback mode.

RMI—The signaling link has been inhibited remotely.

SIE—An unexpected SIE was received.

SIN—An unexpected SIN was received.

SIO—An unexpected SIO was received.

SIOS—An unexpected SIOS was received.

SLTF—Link test failed.

T1NR—The level-2 T1 (not ready) timer expired.

T1R—The level-2 T1 (ready) timer expired.

T2—The level-2 T2 timer expired.

T3—The level-2 T3 timer expired.

X25FL—An X25 link failed.

XDA—The signaling link did not receive an acknowledgment in time.

XER—The SUERM threshold was exceeded.—

—The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

TNC—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.

TNR—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.

LPO—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.

RPO—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.

ROOS—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.

RPE—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.

RMIR—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.

LCD—Level 1 facility outage: Loss of Cell Delineation

LOF—Level 1 facility outage: Loss of Frame

LOS—Level 1 facility outage: Loss of Signal

EVENT TYPE—The type of event being logged:

RECEIVE—When a signal unit is received.

TRANSMIT—When a signal unit is transmitted.

STATE—When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail.

EVENT—The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

SERVICE EVENT—The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

TIMESTAMP—The time event processed by the system as follows:

YY-MM-DD HH:MM:SS.TTT, where

YY—The last 2 digits of the year (range 00–99)

MM—The month (range 01–12)

DD—The day of month (range 00–31)

HH—The hour of day (range 00–59)

MM—The minute of the hour (range 00–59)

SS—The seconds of the minute (range 00–59)

TTT—Milliseconds of the second (range 000–995 in increments of 5)

E1 STATUS—The status of the E1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is displayed.

T1 STATUS—The status of the T1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is displayed.

rept-stat-sys

Report Status System

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

NOTE: VSCCP cards are included in SCCP card status.

Keyword: rept-stat-sys

Related Commands: rept-stat-alm, rept-stat-card, rept-stat-clk, rept-stat-cluster, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-meas, rept-stat-mps, rept-stat-seas, rept-stat-slk, rept-stat-trbl, rept-stat-xlist

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-sys

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

Notes

None

Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.
- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.
- When the Measurements Platform collection function has been enabled (chg-measopts=platformenable=on), the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.
- When the MTP Origin Based Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.

;

Legend

INH—The number of devices within each device type that have their alarms inhibited.

ALARMS—The number of critical (**CRIT**), major (**MAJR**), and minor (**MINR**) alarms on the system when this command was executed and the count of alarm inhibited (**INH**) devices for cards, links, linksets, terminals, and SEAS X.25 links and terminals.

OAM—The status of each of the cards that are running the OAM (1113 and 1115).

LIM CARD—The status of the LIM cards.

X25 CARD—The status of the SS7GX25 cards.

SCCP CARD—The status of the SCCP subsystem cards. VSCCP cards are included in the SCCP card status.

GLS CARD—The status of the GLS subsystem cards.

SLAN CARD—The status of the STPLAN subsystem cards.

VXWSLAN CARD—The status of the VXW STPLAN subsystem cards.

SS7IPGW CARD—The status of the SS7IPGW cards.

IPGWI CARD—The status of the IPGWI cards.

IPLIM CARD—The status of the IPLIM cards.

IPLIMI CARD—The status of the IPLIMI cards.

IPSG CARD—The status of the IPSG cards.

HMUX CARD—The status of the HMUX cards.

HIPR CARD—The status of the HIPR cards.

MCPM CARD—The status of the MCPM cards.

EROUTE CARD—The status of the EROUTE cards.

CLOCK—The status of the system clocks.

HS CLOCK—The status of the high-speed clocks.

IMT—The status of the IMT system.

SLK—The status of the SS7, IPGWI, and X.25 signaling links in the system.

DLK—The status of the TCP/IP data links in the system.

LINK SET—The status of the linksets in the system.

NDC IP LK—The status of the NDC IP linksets.

DSM IP LK—The status of the DSM IP linksets.

MCPM IP LK—The status of the MCPM IP links.

APPLSOCK—The status of the application sockets.

SCTP ASSOC—The status of the SCTP associations.

APPL SERVER—The status of the Application Servers.

SS7 DPC—Summary information only for provisioned DPCs that are not in clusters.

X25 DPC—The status of the destination point codes in the X.25 domain.

CLUST DPC—Summary information for provisioned cluster DPCs only.

RTX—Summary information for provisioned exception routes only.

XLIST DPC—Summary information for X-LIST DPC entries only.

DPC SS—Summary information for the DPC subsystem.

SCCP SS—The status of the SCCP subsystem.

XLIST SS—Summary information for SEAS Subsystem X.25 Links to SEAC.

SEAS SS—The status of the SEAS subsystem.

LSMS SS—The status of the LSMS subsystem.

MEAS SS—The status of the Measurements subsystem (for Measurements Platform).

SEAS X25—The status of the SEAS X.25 signaling links.

LSMS CONN—Summary information on the communication link between the LSMS and the EMS.

NDC SS—The status of the NDC subsystem.

NDC Q3—Summary information on Q.3 association status.

MPS—Summary information on the MPS.

TERMINAL—The status of the terminals.

SECURITY SS—EAGLE OA&M IP Security subsystem status.

EIR SS—Equipment Identity Register subsystem status.

rept-stat-t1

Report Status T1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

Keyword: **rept-stat-t1**

Related Commands:

Command Class: System Maintenance

Parameters

:loc= (optional)

Card address. The unique identifier of a specific **limt1** card located in the STP.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: Information for all **limt1** cards is reported.

:t1port= (optional)

The T1 port number. When this parameter is specified, information is displayed only for the specified T1 port on the card in the specified card location.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

Example

```
rept-stat-t1
```

```
rept-stat-t1:loc=1203
```

```
rept-stat-t1:loc=1203:t1port=1
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **t1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

Notes

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the **loc** parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the **loc** and **t1port** parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

Output

When no parameters are specified in the command, T1 port status is displayed for all cards with provisioned T1 ports. Ports 3 through 8 are on HC-MIM cards only.

rept-stat-t1

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0

Command Completed.
```

;

Legend

LOC—Card location

T1PORT—Number of the T1 port provisioned on the card in the specified location.

PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST". The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

ALARM STATUS—Either "No Alarms" or current alarm number and text

UNAVAIL REASON—Reason for the T1 port being unavailable

SLK—Signaling link assigned to the T1 port

TS—Timeslot assigned to the signaling link

PST—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the signaling link. The possible values are described in .

rept-stat-trbl

Report Status Trouble

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

Keyword: **rept-stat-trbl**

Related Commands: **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

Command Class: System Maintenance

Parameters

:display= (optional)

Display type of alarms to be reported.

Range: **act**, **all**, **inhb**, **timestamp**

act— Display only active alarms

all— Display all alarms with no timestamps

inhb— Display only inhibited alarms

timestamp— Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the **display=timestamp** parameter is specified.

Default: **all**

:level= (optional)

The alarm level of the alarms to be displayed

Range: **crit**, **majr**, **minor**

Default: All alarms are displayed

Example

```
rept-stat-trbl
```

```
rept-stat-trbl:level=majr
```

```
rept-stat-trbl:display=inhb
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

Notes

None

Output

The following example lists all devices that could appear. Your output will not be exactly the same; all devices and alarms cannot coexist in the system.

rept-stat-trbl

```

Legend

TRM—The ID of the terminal port.

PST—The primary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

SST—The secondary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

AST—The associated state of the terminal ports. The possible values are described in .

rept-stat-tstslk**Report Signaling Link Test Status**

Use this command to generate a report of the status of the MTP signaling links currently under test.

Keyword: rept-stat-tstslk

Related Commands: tst-slkl

Command Class: Link Maintenance

Parameters

:link= (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:loopback= (optional)

Loopback test type.

Range: sltc, lxvr, oam, line, payload

Example

```
rept-stat-tstslk
rept-stat-tstslk:loc=1201
rept-stat-tstslk:loc=1203:link=a
rept-stat-tstslk:loopback=lxvr
```

Dependencies

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

If the **link** parameter is specified, the **loc** parameter must be specified.

The signaling link specified in the **link** parameter must be an SS7 signaling link.

This command cannot be entered for SSEDCM or E5-ENET cards that are running the **ss7ipgw**, **ipgwi**, or **ipsg** application, or that have SS7IPGW, IPGWI, or IPSG-M3UA links.

This command cannot be entered for cards with **ipgwi** signaling links.

The card location specified in the **loc** parameter cannot be reserved by the system.

This command cannot be entered during upgrade.

Notes

None

Output

If no parameters are specified, all links in test are displayed.

If only the **loc** parameter is specified, all links in test on the specified card are displayed.

If the **loc** and **link** parameters are specified, the specified link on the specified card is displayed.

If the **loopback** parameter is specified, all links in the specified type of loopback test are displayed.

rept-stat-tstslk

```
tekelecstp 04-01-07 10:05:28 EST EAGLE 31.3.0

1211,A   LINE     21:30:00  00:14:01
;
```

Legend

SLK—Card and signaling link that are being tested.

LOOPBACK—Type of loopback test being run.

MAX-TIME—Maximum length of time for the test to run, as specified in the **tst-slk** command **time** parameter.

TEST-TIME—The length of time that the test has been running when this command was entered.

rept-stat-user**Report Status User**

Use this command to show which users are logged into the system. The command shows user names, terminal identification numbers, the time that the last valid command was issued, and the current state of the last command entered.

Keyword: `rept-stat-user`

Related Commands: `act-user`, `chg-pid`, `chg-user`, `dact-user`, `dlt-user`, `ent-user`, `login`, `logout`, `rtrv-secu-user`, `rtrv-user`

Command Class: Basic

Parameters

This command has no parameters.

Example

rept-stat-user

Dependencies

None

Notes

None

Output

rept-stat-user

```
rlghncxa03w 04-01-07 09:12:15 EST EAGLE 31.3.0
REPT-STAT-USER COMPLTD
USER ID   TERM#  IDLE SINCE      COMMAND      STATE
frodo      3    04-01-07 08:12:23  rept-stat-card  IDLE
jethro     5    04-01-07 09:15:14  rtrv-bip       IDLE
obadiah    7    04-01-07 10:06:22  rept-stat-user  PROCESSING
;
```

Legend

USER ID—The user ID of the users logged onto the system.

TERM #—The OAP terminal that the user's terminal is connected to.

IDLE SINCE—The date and time of day that the user last entered a command.

COMMAND—The last command the user entered.

STATE—The state of the command the user last entered.

rept-stat-xlist**Report Status X-List Storage Area Statistics**

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries

- The percentage of space in the x-list reserved area currently in use
- The percentage of x-list space that must be in use before an alarm is issued

Keyword: `rept-stat-xlist`

Related Commands: `chg-stpopts`, `rept-stat-cluster`, `rtrv-stpopts`

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

rept-stat-xlist

Dependencies

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

Notes

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:

$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated *X-LIST* space (for example, 99.1% is not rounded up to 100%).

Output

rept-stat-xlist

```
rlghncxa03w 04-02-18 03:32:42 EST   EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries      = 156
Current X-LIST occupancy    = 31 %(see "Notes")
X-LIST occupancy threshold = 80 %
```

;

rept-x25-meas

Report X.25 Measurements

Use this command to display the X.25 signaling link measurements. The X.25 signaling link is used in cellular networks to transport TCAP signaling messages from one mobile switching center (MSC) to another.

Keyword: `rept-x25-meas`

Related Commands: `rept-stat-alm`, `rept-stat-dstn`, `rept-stat-imt`, `rept-stat-ls`, `rept-stat-slk`, `rept-stat-sys`, `rept-stat-trbl`

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

(Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.)

:action= (optional)

This parameter is used to reset the measurements counters for an X25 link.

Range: reset, none

Default: none

:port= (optional)

The port on the card specified in the **loc** parameter

Range: a

Example

```
rept-x25-meas:loc=1211:port=a
```

```
rept-x25-meas:loc=1211:port=a:action=reset
```

Dependencies

No other action command can be in progress when this command is entered.

The specified signaling link must be equipped and assigned to a LIM configured with the ss7gx25 GPL.

The card location cannot be out of range - **loc**.

Location invalid for hardware configuration.

The card type must be valid.

The specified location of the card is not valid.

The card must be in service.

Notes

None

Output**rept-x25-meas: loc=1211:port=a**

```
rlghncxa03w 04-02-18 03:32:42 EST   EAGLE 31.3.0

T1 = 0   T2 = 0   T4 = 2   T5 = 0   T6 = 0 T7 = 0   T8 = 100
Command Completed.
```

```
;
```

Legend**Link Counts**

HARDWARE ERRORS—The number of signaling link hardware errors.

CRC ERRORS—The number of signaling link CRC errors.

INITS—The number of signaling link initializations.

Level 2 Counts

TOTAL RECVD—The total number of frames received.

FRMR RECVD—The number of frame reject frames received.

DISC RECVD—The number of disconnect frames received.

TOTAL XMIT—The total number of frames transmitted.

RE-XMIT—The number of frames re-transmitted.

Level 3 Counts

TOTAL RECVD—The total number of packets received.

RESTART RECVD—The number of restarts received.

DIAG/INT/REJ RECVD—The number of diagnostic, interrupt, or reject packets received.

TOTAL XMIT—The total number of packets transmitted.

RE-XMIT—The number of packets retransmitted.

DISCARDED—The number of messages discarded because the transmit queue is full.

Logical Channel Status and Counts

#SVC DEFINED—The total number of switched virtual circuits (SVCs).

#SVC IN USE—The number of SVCs being used.

SVCs ALL IN USE—The number of times that all SVCs have been in use.

#PVC DEFINED—The total number of permanent virtual circuits (PVCs).

#PVC IN USE—The number of PVCs being used.

Number of times SVC control timers have expired

T1—SVC control timer T1

T2—SVC control timer T2

T4—SVC control timer T4

T5—SVC control timer T5

T6—SVC control timer T6

T7—SVC control timer T7

T8—SVC control timer T8

rls-alm

Release Alarm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

Keyword: **rls-alm**

Related Commands: **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rept-stat-trbl**, **rtrv-obit**, **rtrv-trbl**

Command Class: System Maintenance

Parameters

:lvl= (optional)

The alarm level

Range: **crit**, **majr**, **minor**

Default: All alarms are cleared

Example

```
rls-alm
```

```
rls-alm : lvl = crit
```

Dependencies

No other action command can be in progress when this command is entered.

Notes

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

Output

```
rls-alm
```

```
rlghncxa03w 04-01-07 09:27:24 EST EAGLE 31.3.0
```

```
rls-alm
```

```
Command entered at terminal #8.
```

```
;
```

rmv-card**Remove Card**

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM, TSM, or ACM, or physically remove it from the shelf.

Keyword: **rmv-card**

Related Commands: **dlt-card, ent-card, init-card, rept-stat-card, rst-card, rtrv-card**

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.

:force= (optional)

This parameter is required if the card is the last GLS or SCCP card.

Range: yes, no

Default: no

Example

rmv-card:loc=1101

rmv-card:loc=1201:force=yes

Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The **force** parameter is required to force the last GLS or SCCP out of service.

If the card is an ACM, all TCP/IP data links assigned to it must be placed out of service.

Notes

The function of this command is the same as the **inh-card** command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the **dact-slk** command, before the command is accepted.

Inhibiting an TSM running the SCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit an ACM that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the **canc-dlk** command, before the command is accepted.

Output

```
rmv-card:loc=1101
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  Card has been inhibited.
;
```

rmv-imt

Remove IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

CAUTION

CAUTION: Use this command only when directed by Tekelec Technical Services at (888) FOR-TKLC.

Keyword: **rmv-imt**

Related Commands: **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rst-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)
The IMT bus to be inhibited.
Range: **a, b**

Example

```
rmv-imt:bus=a
```

Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.
This command cannot be entered during an IMT Fault Isolation Test.

Notes

Cards that are not connected to the other IMT bus will reinitialize.
All traffic is rerouted to the other IMT bus.
The function of this command is the same as the **inh-imt** command.

Output

```

rmv-imt:bus=a

rmv-trm**Remove Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (OUT-OF-SERVICE-MAINTENANCE-DISABLED), and to set the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

Keyword: **rmv-trm**

Related Commands: **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rst-trm, rtrv-trm**

Command Class: System Maintenance

Parameters

:trm= (mandatory)

The ID of the serial port to be inhibited.

Range: **1-40**

:force= (optional)

This parameter forces the removal of the terminal, even if it is the last in-service OAP terminal or last in-service SEAS terminal available.

Range: **yes, no**

Default: **no**

Example

```
rmv-trm:port=5
```

rmv-trm:trm=1:force=yes

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

To inhibit the last in-service OAP terminal, the **force=yes** parameter must be specified.

You cannot inhibit the terminal from which this command was entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

Output

```
rmv-trm
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  Inhibit message sent to terminal
;
rmv-trm:trm=17:force=yes
  tekelecstp 07-01-11 13:42:16 EST  EAGLE 37.5.0
  Inhibit message sent to terminal
;
```

rst-card

Reset Card

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful. If the loading fails, the card status is OOS-MT (Out-of-Service-Maintenance).

Keyword: **rst-card**

Related Commands: **dlt-card**, **ent-card**, **init-card**, **rept-stat-card**, **rmv-card**, **rtrv-card**

Command Class: System Maintenance

Parameters

NOTE: As of EAGLE 5 ISS Release 38.0, the **data** parameter can no longer be used.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:code= (optional)

The GPL type to be loaded.

Range: **appr, trial, utility**

appr — Approved GPL

trial — Trial GPL

utility — Utility GPL, used primarily by the factory for loading special GPLs for testing purposes

Default: No GPL type is given.

Example

```
rst-card:loc=2301:code=trial
```

```
rst-card:loc=1101:data=persist
```

Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, it must have a signaling link assigned to it before it can be allowed.

No other action command can be in progress when this command is entered.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **data** parameter can be specified.

Notes

The function of this command is the same as the **alw-card** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of the warm restart feature.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```

                                rlgncxa03 03-07-11 07:05:00 EST  EAGLE 30.2.0
                                0021.1493   CARD 1111      INFO   SSH Host Keys

Regenerated

                                DSA Server Host Key FTRA-formatted Fingerprint=
                                84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
                                Report Date:03-07-11   Time:22:27:36

```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```

                                rlgncxa03 01-07-11 07:05:00 EST  EAGLE 30.2.0

```

rst-dstn**Reset Destination Circular Routing Status**

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

NOTE: This command does not support 24-bit ITU national point codes.

Keyword: **rst-dstn**

Related Commands: **chg-stpopts**, **rept-stat-cluster**, **rept-stat-dstn**, **rtrv-stpopts**

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpc=**

Range: **p-, 000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Example

rst-dstn:dpc=1-2-*

rst-dstn:dpc=20-2-5

rst-dstn:dpc=p-20-2-5

Dependencies

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC as *ni-nc-*** or *ni-nc-**** cannot be specified for the **rst-dstn** command.

Notes

In this command, the point codes support only the private (internal) point code subtype prefix (**p-**).

Output

```

rst-dstn:dpc=1-2-*
  rlghncxa03w 04-01-05 06:52:20 EST  EAGLE 31.3.0
  Destination reset command sent to SNM (scroll area)

  rlghncxa03w 04-01-05 06:52:20 EST  EAGLE 31.3.0
  Command Completed.
;

rst-dstn:dpc=20-2-5
  rlghncxa03w 04-02-29 16:40:40 EST  EAGLE 31.3.0
  Destination reset command sent to SNM (scroll area)

  rlghncxa03w 04-01-05 16:40:40 EST  EAGLE 31.3.0
  Command Completed.
;

```

rst-imt**Reset IMT**

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

Keyword: **rst-imt**

Related Commands: **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)
The IMT bus to be returned to service.
Range: **a, b**

Example

```
rst-imt:bus=a
```

Dependencies

None

Notes

The function of this command is the same as the **alw-imt** command.

This command returns an inhibited IMT bus to service.

Output

```

rst-imt:bus=a
  rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
  Allow IMT Bus A command issued.

  rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
  0100.0097   IMT   BUS A           IMT allowed
;

```

rst-trm**Reset Terminal**

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

Keyword: **rst-trm**

Related Commands: **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rtrv-trm**

Command Class: System Maintenance

Parameters

:trm= (mandatory)
ID of the serial port to be put into service.
Range: **1-40**

Example

rst-trm:trm=5

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

An E5-IPSM card must be provisioned for the specified SEAS terminal before this command can be entered.

The SEAS Over IP feature must be turned on before this command can be entered for a SEAS terminal.

If the SEAS terminal is auto-inhibited, then this command cannot be entered.

Notes

The function of this command is the same as the **alw-trm** command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

Output

```
rst-trm:trm=12
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Allow message sent to terminal

rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
;
```

rtrv-acg-mic**Display ACG Manually Initiated Control**

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A set of controls is selected

to be displayed by specifying the type of controls (**type** parameter), the service (**serv** parameter), and the digits (**dgts** parameter).

Keyword: rtrv-acg-mic

Related Commands: chg-acg-mic, dlt-acg-mic, ent-acg-mic, rept-stat-lnp

Command Class: Database Administration

Parameters

:dgts= (optional)

Digits

Range: 3 digits, 6-10 digits

Valid values are **000-999, 000000-9999999999**

:serv= (optional)

Query service

Range: **ain, in**

:type= (optional)

Type of control

Range: **all, sd**

Example

Display all MICs:

rtrv-acg-mic

Display the MIC(s) that apply to particular services and digits:

rtrv-acg-mic:type=sd

Display the MIC(s) that apply to AIN queries:

rtrv-acg-mic:serv=ain

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

rtrv-acg-mic:serv=in:dgts=919460

Dependencies

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** cannot be specified.

The **dgts** parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-acg-mic** command can be entered.

Notes

None

Output

```

rtrv-acg-mic:type=sd
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0

rtrv-acg-noc**Display ACG Node Overload Control**

Use this command to display the definitions of node overload levels. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the overload level.

Keyword: **rtrv-acg-noc**

Related Commands: **chg-acg-noc, dlt-acg-noc, ent-acg-noc, rept-stat-lnp**

Command Class: Database Administration

Parameters

:lvl= (optional)
 Overload level
Range: 1-10

Example

```
rtrv-acg-noc
rtrv-acg-noc:lvl=3
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

None

Output

The following example displays all defined overload levels:

```
rtrv-acg-noc
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
LVL QR          AND  IND  INTVL DRTN

INTVL—Interval index
DRTN—Duration index

rtrv-appl-rtkey**Retrieve Application Route Key Table**

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 2500 routing keys per system (if there are SSED CMs).

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Keyword: rtrv-appl-rtkey

Related Commands: chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The following parameters are no longer available: loc, mode, norm, pstncat, pstnid, sname

:asname= (mandatory)

Application Server (AS) name assigned to this routing key.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

:cice= (optional)

The end range of circuit identification codes assigned to the routing key.

Range: See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The start range of circuit identification codes assigned to the routing key.

Range: See Table A-4 for valid CIC values for specified SI and MSU types.

:display= (optional)

This parameter specifies the type of output to display.

The output includes the type of card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

Range: all, brief

all— The KEY and the ATTRIBUTE sections of the routing key are displayed

brief— Only the KEY section of the routing key is displayed

Default: brief

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:num= (optional)

The number of entries to display.

Range: **1-10000**

Default: **50**

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/open24= (optional)

Originating point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:rcontext= (optional)

Routing Context. The **rcontext** parameter is used to display the routing key with the specified routing context.

Range: **0-4294967295**

:si= (optional)

Service indicator.

Range: 0-15

The following equivalent text values can be specified:

Number = Text—Description

0 = snm—Signaling network management messages

1 = regtest—Signaling network testing and maintenance regular

2 = spltest—Signaling network testing and maintenance special

3 = sccp—SCCP

4 = tup—Telephone user part

5 = isup—ISDN user part

13 = qbicc

:ssn= (optional)

Subsystem number.

Range: 0-255

:type= (optional)

The type of routing key.

Range: all, full, partial, default

Default: all

Example

```
rtrv-appl-rtkey
```

```
rtrv-appl-rtkey:dpc=123-234-255:si=3
```

```
rtrv-appl-rtkey:dpc=123-234-255
```

```
rtrv-appl-rtkey:cics=1:cice=1000:num=3
```

```
rtrv-appl-rtkey:cice=19
```

```
rtrv-appl-rtkey:opc=122-124-125
```

```
rtrv-appl-rtkey:type=partial
```

```
rtrv-appl-rtkey:display=all
```

```
rtrv-appl-rtkey:rcontext=7
```

Dependencies

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. If the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value specified for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

The **ssn** parameter cannot be specified when **opc**, **cics**, and **cice** are specified. See Table 5-5 for valid parameter combinations.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are allowed with the **si** parameter only when **si** equals **4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**). Table A-4 shows valid CIC values for SI types 4, 5, and 13.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The **display=all** parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (**s-**).

Output

rtrv-appl-rtkey

rlghncxa03w 08-04-11 13:17:09 EST EAGLE 38.0.0

ANAMES

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

Default: Retrieve all

:rhost= (optional)

Remote host name. The logical name assigned to the remote host device.

[illegible]

a-z, A-Z, 0-9, -, . (any string of characters beginning with a letter and comprising up to 60 characters in length)

Default: Retrieve all

:sname= (optional)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

Default: All information for all sockets is retrieved

Example

```
rtrv-appl-sock:sname=swbel32
```

Dependencies

The **lhost**, **rhost**, and **sname** parameters must conform to the specified naming conventions.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

rtrv-appl-sock:sname=swbel32

Legend

ALW—Whether or not to the socket is allowed to carry SS7 traffic, **YES** or **NO**.

DCMPS—The parameter set used by this socket, 1 to **10**.

LHOST—The local host name.

LINK—The signaling link associated with this socket.

LPORT—The local port name.

OPEN—Whether or not the connection manager is to open this socket if the socket is operational, YES or NO.

REXMIT—Retransmission mode to use on socket when packet loss is detected; BSD, FIXED or MOD.

RHOST—The remote host name.

RPORT—The remote port name.

RTT—Expected Round Trip Time for socket when REXMIT is FIXED or MOD.

SERVER—The role of the local socket in the client/server relationship. If YES, the server is the local side. If NO, the client is the local side.

SNAME—The socket name.

rtrv-as

Retrieve Application Server

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

Keyword: rtrv-as

Related Commands: chg-as, dlt-as, ent-as, rept-stat-as

Command Class: Database Administration

Parameters

:aname= (optional)

Name of the association.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

Default: Retrieve all

:asname= (optional)

Name of the Application Server.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

Example

```
rtrv-as
```

```
rtrv-as:aname=as1
```

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

```
rtrv-as
rlghncxa03w 05-06-05 08:40:18 EST EAGLE5 34.0.0
AS Name      Mode      Tr ms    Association Names
m3ua_as1     LOADSHARE 2000     m3ua_assoc1
              m3ua_assoc1
sua_as1      OVERRIDE 200      sua_assoc1
              sua_assoc2
AS Table is (2 of 250) 1% full
;
```

rtrv-assoc

Retrieve Association

Use this command to retrieve the configuration data from the IP Socket/Association (IPAPSOCK) table.

Keyword: rtrv-assoc

Related Commands: `chg-assoc`, `dlt-assoc`, `ent-assoc`, `rept-stat-assoc`

Command Class: Database Administration

Parameters

:adapter= (optional)

The adapter layer for this association.

Range: m3ua, sua, m2pa

Default: Retrieve all

:alhost= (optional)

Alternate local host name as defined in the IP Host table.

[illegible]

a-z, A-Z, 0-9, -, . —any string of characters beginning with a letter and comprising up to 60 characters in length.

Default: Retrieve all

:aname= (optional)

Name assigned to this association (in IPAPSOCK table).

Range: ayyyyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

Default: Retrieve all

:display= (optional)

An optional display parameter can be specified in order to display either all or brief reports for associations. The default mode is “brief” if this parameter is not entered at the command line.

Range: **brief, all**

:lhost= (optional)

The local host name as defined in the IP Host table.

[illegible]

a-z, A-Z, 0-9, -, . —any string of characters beginning with a letter and comprising up to 60 characters in length

Default: Retrieve all

:link= (optional)

The signaling link for this association.

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (optional)

Card location that is stenciled on the shelf of the EAGLE 5 ISS..

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Output

AS names are displayed for IPGWx-M3UA and SUA linksets.

LS names are displayed for IPSG linksets.

The following example with the **aname** parameter shows buffer usage (used and total buffer space) and card location information.

rtrv-atm-lps

Retrieve ATM Link Parameter Set

Use this command to display the parameter values for the ATM link parameter sets in the database configured with the **chg-atm-lps** command, along with the non-configurable ATM parameters.

Keyword: rtrv-atm-lps

Related Commands: chg-atm-lps

Command Class: Database Administration

Parameters

:lpset= (optional)

The ATM link parameter set to be displayed.

Range: 1-30

Default: All ATM link parameter sets are displayed

Example

```
rtrv-atm-lps:lpset=5
```

```
rtrv-atm-lps
```

Dependencies

None

Notes

None

Output

NOTE: Dashes (--) in the FC NR and FC BC fields indicate that this implementation is not supported on ATM high-speed signaling links.

rtrv-atm-lps:lpset=5

Legend

LPSET—The link parameter set being changed, **1** to **30**. The system default value for this parameter is **1** for ANSI and **21** for ITU.

ACTION—Copy a set of ATM signaling link parameters from one parameter set to another. The value of this parameter is **copy**. If this parameter is not specified, then the copy action cannot take place.

SCRLPSET—The ATM signaling link parameter set used as a source for the **action=copy** parameter. This parameter can only be specified with the **action=copy** parameter.

MAXCC—The maximum number of transmissions of a BGN, END, ER, or RS PDU. The value of this parameter is from 1 to 10 PDUs. The system default value is 4 PDUs.

MAXPD—The maximum number of SD PDUs that can be sent before a POLL is sent. The value of this parameter is from 5 to 2120 PDUs. The system default value is 500 PDUs.

MAXSTAT—The maximum number of list elements in a STAT PDU. The value of this parameter is from 3 to 67 PDUs. The system default value is 67 PDUs.

TMRCC—The timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs. The value of this parameter is from .1 to 2 seconds. The system default value is .2 seconds.

TMRKALIVE—The timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

TMRNOSP—The timer, in seconds, used to check that STAT PDUs are arriving often enough. The value of this parameter is from .5 to 2 seconds. The system default value is 1.5 seconds.

TMRPOLL—The timer, in seconds, used to guarantee that POLL PDUs are sent often enough. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

TMRIDLE—The timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase. The value of this parameter is from .025 to 1 seconds. The system default value is .1 seconds.

TMRT1—The time, in seconds, between a link release action and the next link reestablish action during alignment. The value of this parameter is from 1 to 15 seconds. The system default value is 5 seconds.

TMRT2—The total time, in seconds, that SSCF will attempt alignment. The value of this parameter is from 15 to 180 seconds. The system default value is 120 seconds for ANSI and 30 seconds for ITU.

TMRT3—The time, in seconds, between proving PDUs. The value of this parameter is from .00045 to .023 seconds. The system default value is .000925 seconds.

N1—The number of PDUs sent during proving. The value of this parameter is from 500 to 64552 PDUs. The system default value is 64552 PDUs for ANSI and 1000 PDUs for ITU.

MAXNRP—The maximum number of retransmitted PDUs during proving. The value of this parameter is from 1 to 10 PDUs. The system default value is 1 PDU for ANSI and 0 PDUs for ITU.

TMRSREC—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring. The value of this parameter from is 60 to 10800 seconds. The system default value is 3600 seconds.

TMRNOCRED—The timer, in seconds, used when the no credit exists and PDUs are available to be sent. The value of this parameter is from 1 to 6 seconds. The system default value is 1.5 seconds.

TMRERM—The error rate monitor interval, in seconds. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

NBLK—The number of monitoring intervals per block. The value of this parameter is from 1 to 10. The system default value is 3.

TMRPROV—The timer, in seconds, used to monitor the status of a link after it is placed into service. The value of this parameter from 60 to 1200 seconds. The system default value is 600 seconds.

SDU SIZE—The SSCOP SDU size (set to 272 octets).

UU SIZE—The SCOP UU size (set to 4 octets).

N—The monitoring intervals spanning a .4 second error event (set to 9).

FC NR—The fixed credit increment value.

FC BC—The fixed credit allocation frequency.

TSUP—The superblock timer for layer management, in seconds.

TLOSS—The loss timer for layer management, in seconds.

ERMSM—The error rate monitor smoothing factor.

THRES—The error rate monitor threshold.

rtrv-atm-prm

Retrieve ATM Parameters

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

Keyword: **rtrv-atm-prm**

Related Commands: **rtrv-atm-lps**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-atm-prm

Dependencies

None

Notes

None

Output**rtrv-atm-prm**

```

tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
3622 3622 4528 4528 210 100 3 0 1 16 12
;

```

Legend

The ATM traffic descriptors are displayed in the following fields:

BT—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.

CDVT—The amount of cell delay variation for the VCL in the network ingress direction.

PCR—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.

QOS—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.

SCR—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.

The ATM interface parameters are displayed in the following fields:

MAX VCCs—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.

MAX VPCs—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).

VCI BITS—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.

VPI BITS—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

rtrv-attr-seculog**Display Security Log Characteristic**

Use this command to display security log attributes that were configured using the **chg-attr-seculog** command.

Keyword: **rtrv-attr-seculog**

Related Commands: **chg-attr-seculog**

Command Class: Security Administration

Parameters

This command has no parameters.

Example

```
rtrv-attr-seculog

;

rtrv-bip**Retrieve Board Identification PROMs**

Use this command to show the board identification PROM (BIP) data for a specified card (main assembly or applique) and location.

The following information is displayed for both main assemblies and appliques: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing date, and the software match ID.

For main assemblies, the port A ethernet address (if ENT01 record exists) and port B ethernet address (if ENT02 record exists) are also displayed.

For appliques, the applique type and ethernet address (if the applique type is ENET and ENT01 record exists) are also displayed.

CAUTION: To have the **rtrv-bip** command display MAC addresses, the daughterboard must have a type of ENET.

Keyword: **rtrv-bip**

Related Commands: **chg-bip-fld**, **chg-bip-rec**, **disp-bip**, **tst-bip**

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118
HMUX and HIPR locations are not valid.

:type= (mandatory)

The type of board at the specified location whose BIP information is to be displayed.

Range: **mbd**, **dbd**
mbd — main assembly
dbd — applique

:dbdloc= (optional)

Applique location. This parameter specifies the location of the applique.

This parameter can be specified only for cards that support multiple appliques.

Range: 1–2

Example

The following example displays the BIP data for the main assembly.

rtrv-bip:loc=1201:type=mbd

The following example displays the BIP data for all appliques that are supported by the card.

rtrv-bip:loc=1201:type=dbd

The following example displays the BIP data for the first applique.

rtrv-bip:loc=1103:type=dbd:dbdloc=1

Dependencies

The card location frame, shelf, and slot must be within the allowed range.

The card location must be valid for the command.

The **type=dbd** parameter cannot be specified for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

The **dbdloc** parameter can be specified only for the cards that support multiple appliques.

If the **type=mbd** parameter is specified, then the **dbdloc** parameter cannot be specified.

Notes

The **tst-bip** command verifies that the PROM is good by writing to and reading from the PROM. The **rtrv-bip** command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communication to the card has failed, and you might need to replace the card. Contact Tekelec Technical Service at (888) FOR-TKLC to find out if the card can be reprogrammed.

Output

The Max Power Rating is displayed only if the **type=mbd** parameter is specified. If the Card Power value is not present in BIP data, then the Max Power Rating is displayed as **Undef**.

The location of the applique is displayed only if the card supports multiple appliques.

The following example displays the 7-digit serial number of a main assembly card manufactured on the eleventh week of 1993).

```

```
-----
;END OF REPORT
```

;

The following example displays the BIP data for all appliques that are supported by the card, if card BIP data is from an earlier EAGLE 5 ISS release that did not support the **dbdloc** parameter.

NOTE: This case is for backward compatibility. Although the card contains two daughterboards, the card BIP data is from a release (prior to EAGLE 5 ISS Release 37.0) that does not support BIP records for multiple DBDs. The Ethernet Addresses for both DBDs are shown as part of the BIP data for the first DBD.

rtrv-bip:loc=1106:type=dbd

Legend

LOCATION—The card location and board type for the BIP information.

DBD LOCATION —The location of the applique.

PART NUMBER—The part number of the card in the specified card location.

REVISION—The hardware version of the card.

SERIAL NUMBER—The serial number (7, 8, 11, 12, or 14 digits) of the card. Table 5-60 shows the serial number formats.

Table 5-60. Serial Number Formats

Serial Numbers	Formats
7-digit serial number	ywwxxxx
8-digit serial number	yywwxxxx
11-digit serial number	nnnyywwxxxx
12-digit serial number	nnnyyww*xxxx
14-digit serial number	nnnyyyww*xxxx
Legend y = year digit (0–9) w = week digit (0–9) n = product identifier digit (0–9) x = serial number digit (0–F hexadecimal) * = special character (0–9, a–z, or A–Z, alphanumeric characters)	

SOFTWARE MATCH ID—This field is used to check hardware and software compatibility.

DBD TYPE—Type of daughterboard applique.

MAX POWER RATING—The maximum power rating of the card.

WEEK/YEAR—The week (1–52) and the year (4 digits) that the card was manufactured.

rtrv-card

Retrieve Card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined by the **ent-card** command. If the **loc** parameter is specified, the command displays information for the specified card only.

Keyword: rtrv-card

Related Commands: dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: Retrieve all

:links= (optional)

Links Provision Status. For the card in the location specified by the **loc** parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

Range: **all, equip, unequip, ipsg**

all — Display all possible links for the card.

equip — Display links that are equipped on the card.

unequip — Display links that are allowed but not equipped on the card.

ipsg — Display the SLKTPS and total card TPS used for a particular card or for all cards configured with the **ipsg** GPL.

Default: **equip**

Example

```
rtrv-card
```

```
rtrv-card:loc=1205
```

```
rtrv-card:links=ipsg
```

```
rtrv-card:loc=1111:links=ipsg
```

Dependencies

The card location slot must be between **1** and **18** and not **9** or **10**.

The card location cannot be **1114**, **1116**, **1117**, or **1118**.

The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

The specified card location must be equipped in the database.

Notes

The provisioning method of an MPL (multi-port LIM) and a two-port LIM running the **ss7ansi** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** application to allow the MPLs to replace a two-port LIM without having to reprovision the LIM in the database. The MPLs support only the LIMDS0 interface, and the **appl** value must be **ss7ansi**. The MPLs run the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the MPL cards to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the MPL card and displays its application as **ss7ansi**.

The provisioning method of an E1/T1 MIM (Multi-Channel Interface Module) and a two-port E1 card running the **ss7ansi** or **ccs7itu** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** or **ccs7itu** application to allow the E1/T1 MIM card to replace a two-port E1 card without having to reprovision the E1 card in the database. The **appl** value can be **ss7ansi** or **ccs7itu**. The E1/T1 MIM runs the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the card to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the E1/T1 card and displays its application as **ss7ansi** or **ccs7itu**.

Legend**CARD**—The card location as stenciled on the shelf of the system.**TYPE**—The type of card. (The DCM and SSEDCCM cards are card type DCM).**APPL**—The application associated with each card in the display.**LSET NAME**—The linkset name associated with the cards in the display.**LINK**

—The signaling link associated with the linkset. If the card is an MPL or MPL-T (TYPE is **limds0**, APPL is **ss7ansi**) or an E1/T1 MIM (TYPE can be **lime1**, **limt1**, or **limch**; APPL can be **ss7ansi** or **ccs7itu**), the card can support 8 ports (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, and **b3**).

SLC—The signaling link code.**UNEQUIPPED LINKS**—Signaling links that are unequipped on the provisioned card.**SLKTPS**—Transactions Per Second configured for signaling links provisioned on the card.

rtrv-cmd

Retrieve Command Attributes

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

Keyword: rtrv-cmd

Related Commands: `chg-cmd`

Command Class: Basic

Parameters

:class= (optional)

The command class whose attributes are to be retrieved.

Range: *ayyyyyy*

One alphabetic character followed by up to 5 additional alphanumeric characters.

:cmd= (optional)

The command whose attributes are to be retrieved.

Range: zzzzzzzzzzzzzzzzzzzzzz

One alphabetic character followed by up to 19 additional alphanumeric characters, enclosed in double quotes.

Example

```
rtrv-cmd:cmd="ent-rte"
```

```
rtrv-cmd:class=dab
```

rtrv-cmd

Dependencies

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before a command from the LNPBAS class can be specified in the **cmd** parameter or before the **class=lnpbas** parameter can be specified.

The value of the **cmd** parameter must be a valid system command.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

The Command Class Management feature must be enabled before CHG-CMD or CHG-CMDCLASS command can be entered.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

The following example shows the command classes to which the **rept-stat-slk** command is assigned (non-configurable class **sys** and user-configured classes **u01**, **u02**, **krb**, and **u11**):

```
rtrv-cmd:cmd="rept-stat-slk"
  eagle10404 04-01-22 16:30:56 EST  EAGLE 31.3.0
  cmd          CLASS
  rept-stat-slk sys, u01, u02, krb, u11
```

;

The following example shows the commands assigned to user-configured command class **krb**:

```
rtrv-cmd:class=krb
  eagle10404 04-01-22 16:30:56 EST  EAGLE 31.3.0
  CMD          CLASS
  rept-stat-slk sys, u01, u02, krb, u11

rtrv-cmdclass**Retrieve Command Class**

Use this command to retrieve the name and description of one command class or all command classes.

Keyword: **rtrv-cmdclass**

Related Commands: **chg-cmdclass**

Command Class: Basic

Parameters

:class= (optional)

The command class whose name and description are to be retrieved.

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters

Example

```
rtrv-cmdclass: class=krb
```

```
rtrv-cmdclass
```

Dependencies

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **class=lnpbas** parameter can be specified.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

Notes

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before class LNPBAS will appear in the command output.

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

Output

In the following examples, the classes u01, u03, u05, and u32 are default configurable command class names. The classes krb and dab are user-assigned configurable command class names; the user changed default configurable command class name u02 to krb and changed default configurable command class name u04 to dab. The descriptions of classes krb and dab were entered with the **descr** parameter when the class names were changed with the **chg-cmdclass** command.

```
rtrv-cmdclass: class=krb
    eagle10404 04-01-22 16:30:56 EST  EAGLE 31.3.0
    class          descr
    krb            my command class description
;

rtrv-cmdclass
    eagle10404 04-01-22 16:30:56 EST  EAGLE 31.3.0
    class          descr
    link           link maintenance commands
    sa             security administration commands
    sys            system maintenance commands
    .
    .
    .
    u01            configurable command class 1
    krb            my command class description
    u03            configurable command class 3
    dab            your command class description
    u05            configurable command class 5
    .
    .
    .
    u32            configurable command class 32
;

```

rtrv-csl

Retrieve Common Screening List

Use this command to retrieve all Common Screening List (CSL) entries for a specified feature, a list of screening entries for the specified feature and screening list name, or a specific DS or PC value for a particular feature and screening list name. The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: rtrv-csl

Related Commands: dlt-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

NOTE: Either the ds parameter or the pc parameter must be specified. Both parameters cannot be specified in the same command.

Range: 1-15 digits

Valid digits are 0-9, a-f, A-F.

- 1-15 digits—Prepaid IDP Query Relay **ccnc** list
- 1-5 digits—Prepaid IDP Query Relay **delpfx** list
- 1-6 digits—Prepaid IDP Query Relay **gta** list
- 1-4 digits—Prepaid IDP Query Relay **skbcsn** list
- 4 digits—IDP Screening for Prepaid **skts** list
- 1-15 digits—IDP Screening for Prepaid **insl** list
- 1-6 digits—TINP **acscode** and **esccode** lists
- 1-8 digits—MO-based GSM SMS NP **delpfx** list
- 1-8 digits—MO-based IS41 SMS NP **delpfx** list

:feature= (optional)

Feature name. This parameter specifies the name of the screening feature for which the command is entered.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range:

abcdefghijklmnopqrstuvwxyz

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym. The following feature names are valid for this command:

- Prepaid IDP Query Relay
- IDP Screening for Prepaid
- TINP
- MO-based GSM SMS NP
- MO-based IS41 SMS NP

:list= (optional)

The name of the Common Screening List that is associated with the feature.

The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

Range:

gt, skbcsn, ccnc, skts, insl, acscode, esccode, npflgrst

gt—Global Title List

skbcsn—SK+BCSM List

ccnc—CC+NC List

skts—SK+TS List

insl—In Network Subscriber List

acscode—Access Code List

esccode—Escape Code List

npflgrst—NP Flag Reset List

The following screening lists are valid for the indicated features:

- **ccnc, gt, skbcsn**—Prepaid IDP Query Relay feature
- **skts, insl**—IDP Screening for Prepaid feature
- **acscode, esccode, npflgrst**—TINP feature

- **delpfx**—Prepaid IDP Query Relay feature, MO-based GSM SMS NP feature, and MO-based IS41 SMS NP feature

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the *ds* or *pc* parameter must be specified for the command. Currently, there are no common screening list features that use point codes.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—000–255

sp—000–255

:pn= (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: 893000000-893999999

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- **893016001**—Prepaid IDP Query Relay feature
- **893015501**—IDP Screening for Prepaid feature
- **893018901**—TINP feature
- **893019401**—MO-based GSM SMS NP feature
- **893019501**—MO-based IS41 SMS NP feature

Example

rtrv-csl

rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789

rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc

**rtrv-csl:feature="IDP Screening for
Prepaid":list=insl:ds=123456789abcdeF**

rtrv-csl:feature="MO-based IS41 SMS NP"

Dependencies

The value specified for the **feature** parameter must be a valid feature name for a feature that uses a Common Screening List. The feature must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The specified feature name must be valid for a feature that uses a Common Screening List.

The value specified for the **list** parameter value must be valid for the specified screening feature.

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccndc—ds** parameter
- **list=delpfx—ds** and **p1** parameters
- **list=skbcm—ds** parameter
- **list=skts—ds** parameter
- **list=insl—ds** parameter
- **list=acscod—ds** parameter
- **list=escodc—ds** parameter
- **list=npflgrst—pc/pca/pci/pcn/pcn24** parameter

The **pc** and **ds** parameters cannot be specified together in the command.

rtrv-cspc**Retrieve Concerned Signaling Point Code**

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

Keyword: **rtrv-cspc**

Related Commands: **dlt-cspc**, **ent-cspc**

Command Class: Database Administration

Parameters

:grp= (optional)

Group name

Range: *yyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

Default: Retrieve all.

Example

rtrv-cspc

rtrv-cspc:grp=grp01

Dependencies

If specified, the group name must exist in the database.

Notes

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

Output

When the ANSI-ITU-China SCCP Conversion feature is on, point codes from mixed domains are allowed in a group.

rtrv-cspc

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp02 ANSI, ITU, ITU-N24 3%
Grp03 ITU 2%
;
```

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-** prefix. The ANSI-ITU-China SCCP Conversion feature is on in this example.

rtrv-cspc:grp=grp02

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PC Type
GRP02 001-012-123 A
      001-012-124 A
      7-089-0 I
      s-2-021-4 I
      s-00789 N
;
```

When the ANSI-ITU-China SCCP Conversion feature is not on, point codes from only one domain are allowed in a group.

rtrv-cspc

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp03 ITU 2%
;
```

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-** prefix. The ANSI-ITU-China SCCP Conversion feature is not on in this example.

rtrv-cspc:grp=groupi

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PCI
groupi 7-089-0
      s-2-021-4
;
```

Legend

CSPC PC TABLE IS 15% FULL—The relative size of the CSPC point code tables.

CSPC GRP—The name of the CSPC broadcast group.

NETWORK—The network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The **grp** parameter must be specified to list the point codes in the specified group.)

PERCENT FULL—The relative size of the CSPC broadcast group.

PC—The point codes that make up the CSPC broadcast group.

TYPE—The network type of the point code in the group. (The **grp** parameter is specified in the command to list the point codes in the specified group.)

rtrv-ctrl-feat**Retrieve Controlled Feature**

Use this command to retrieve the status of feature access key controlled features that are purchased and enabled in the system.

Keyword: **rtrv-ctrl-feat**

Related Commands: **chg-ctrl-feat, enable-ctrl-feat**

Command Class: Database Administration

Parameters

:enable= (optional)

Retrieve controlled features that are enabled with either temporary feature access keys or permanent feature access keys.

Range: **temp, perm**

Default: Retrieve controlled features for both temporary and permanent feature access keys

:expired= (optional)

Retrieve controlled features with expired temporary feature access keys.

Range: **yes, no**

Default: **no**

:partnum= (optional)

The Part Number to retrieve or the command.

Range: **893000000 - 893999999**

Do not include dashes in the 9-digit number.

Default: Retrieve all controlled features

:status= (optional)

Retrieve features with the specified status (On or Off).

Range: **on, off**

Default: Retrieve features with On and Off status

Example

rtrv-ctrl-feat

rtrv-ctrl-feat:partnum=893000110

rtrv-ctrl-feat:enable=perm

Dependencies

None

Notes

When the **enable=perm** parameter is specified, the **expired** parameter value is understood to be **no**.

The product right-to-use features (EAGLE5, EAGLE, and IP⁷) are not mutually exclusive. The hierarchy for product right-to-use features is EAGLE5, then EAGLE, then IP⁷. This means that if the EAGLE5 feature is on, the product is EAGLE5 regardless of the setting of the other product right-to-use features. Some EAGLE 5 ISS features require that a specific product right-to-use feature is enabled and turned on.

For systems being upgraded, the product right-to-use feature for the specific product is turned on. For example, upgrading from an EAGLE 5 ISS release in a system that uses no EAGLE 5 features to a release that uses at least one EAGLE 5 feature causes the EAGLE 5 product right-to-use feature to be enabled and turned on during the conversion.

For new installation, no product right-to-use features are on. The appropriate product right-to-use feature for the highest required product in the hierarchy must be enabled and turned on.

Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. A feature must be purchased before you can enable the feature and turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

If a Part Number (**partnum** parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part Number is for a different quantity. The output will also include the temporary enabled information, if applicable.

rtrv-data-rtddb**Retrieve Data RTDB**

This command retrieves data from the RTDB on an active DSM card. If the **loc** parameter is specified and the target card is an active DSM card, the RTDB data is retrieved from that card. If the **loc** parameter is not specified, the data is retrieved on the active DSM card that has the lowest IMT address. The RTDB status on the active DSM card can be coherent or incoherent.

For LNP database items (TN) all DSM cards are queried for the existence of the specified item. Either the DSM specified by the **loc** parameter or the DSM card with the lowest IMT address returns full item information. Any remaining DSM cards return either COHERENT or INCOHERENT if the item is found in the RTDB on the card.

Keyword: **rtrv-data-rtddb**

Related Commands:

Command Class: Database Administration

Parameters

- :dn=** (optional)
Dialled Number.
Range: 5-15 digits
- :entity=** (optional)
Network Entity.
Range: 5-15 digits
- :entitytype=** (optional)
Entity Type.
Range: **sp, rn**
sp — Service Provider: Any 10-digit TN
rn — Routing Number: Any 10-digit TN
- :imei=** (optional)
International Mobile Equipment Identity.
Range: 14 digits
- :imsi=** (optional)
International Mobile Subscriber Identity.
Range: 5-15 digits
- :loc=** (optional)
The card location as stenciled on the shelf of the system.
Range: 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118
- :lrn=** (optional)
Location Routing Number.
Range: 10 digits
- :npanxx=** (optional)
Numbering Plan Area.
Range: 6 digits
- :tn=** (optional)
Telephone Number.
Range: 10 digits

Example

```

rtrv-data-rtdb:tn=9194663133
rtrv-data-rtdb:npanxx=919466
rtrv-data-lrn=9194460000
rtrv-data-rtdb:imsi=12345
rtrv-data-rtdb:dn=12345
rtrv-data-rtdb:entity=abcdefabcdefabc
Retreive DN information from a specific DSM.
rtrv-data-rtdb:dn=19195554444:loc=1107

```

Retrieve entity data from a specific DSM card.

rtrv-data-rtdb:entity=12345:loc=1107

Dependencies

At least one of the following parameters must be specified: **imsi**, **dn**, **entity**, **imei**, **entitytype**, **npanxx**, **lrn**, **tn**.

Only one of the **tn**, **lrn**, or **npanxx** parameters can be specified in the command.

If the **npanxx**, **lrn**, or **tn** parameter is specified, the LNP ELAP Configuration feature must be on.

If the G-Flex, G-Port, INP, AINPQ, EIR, Prepaid IDP Relay (IDPR), or Prepaid SMS Intercept Ph1 (PPSMS) feature is on, then the **imsi**, **dn**, **entity**, **imei**, or **entitytype** parameter must be specified.

If the **imsi** parameter is specified, then the G-Flex feature or the EIR feature must be turned on.

If the **entity** parameter is specified, then the G-Flex or G-Port feature must be turned on.

If the **entitytype** parameter is specified, the **entity** parameter must be specified.

If the **imei** parameter is specified, the EIR feature must be turned on.

The destination specified by the **loc** parameter must correspond to a DSM card running the VSCCP application.

The destination specified by the **loc** parameter must correspond to a DSM/VSCCP card that is IS-NR.

A primary DSM card must be provisioned.

The G-Flex, G-Port, Prepaid SMS Intercept Ph1, or INP feature must be turned on before the **dn** parameter can be specified.

Output

Retrieve LRN Data.

NOTE: A value of "---" in the TT column indicates that the service does not have a translation type defined in the EAGLE 5 ISS and that call processing will ignore the override data displayed.

Legend

CARD LOC—Location of the card that contains the retrieved information.

STATUS—RTDB database status; Coherent or Incoherent.

IMSI—International Mobile Subscriber Identity.

ENTITY INDEX—The hexadecimal index at which the Network Entity data is stored in the Entity Bucket on the DSM card.

IMEI INDEX—The hexadecimal index at which the IMEI data is stored in the IMEI Bucket on the DSM card.

ENTITY ADDRESS—Hexadecimal Network Entity address.

Type—Network Entity type; Service Provider (SP) or Routing Number (RN).

PC (type of PC)—Point code and type of point code (ANSI; NATL - ITU National with or without group code (-gg)).

RI—Routing Indicator

SSN—Subsystem Number.

TT—Translation Type.

NP—Numbering Plan

DA—Digits action (Prefix, Suffix, or none)

SRFIMSI—Signaling Relay Function IMSI

IMSI—International Mobile Subscriber Identity.

NSSN—New Subsystem Number (yes or no)

CCGT—Cancel GT (yes or no)

NTT—New Translation Type

NNP—New Numbering Plan

NNAI—New Nature of Address Indicator.

IMEI—International Mobile Equipment Identity.

VERSION—IMEI data version.

BLACK, WHITE, GRAY—Equipment Identity Register search lists.

DN—Dialed Number.

PORTABILITY TYPE (number)—

- 0—Not known to be ported
- 1—Own number ported out
- 2—Foreign number ported to Foreign network
- 3—Prepaid Short Message Service (PPSMS) subscriber on server #1
- 4—Prepaid Short Message Service (PPSMS) subscriber on server #2
- 5—IS41 to GSM migrated subscriber with only GSM handset active
- 6—Prepaid Short Message Service (PPSMS) subscriber on server #3
- 7—Prepaid Short Message Service (PPSMS) subscriber on server #4
- 8—Prepaid Short Message Service (PPSMS) subscriber on server #5
- 9—Prepaid Short Message Service (PPSMS) subscriber on server #6
- 10—Prepaid Short Message Service (PPSMS) subscriber on server #7
- 11—Prepaid Short Message Service (PPSMS) subscriber on server #8

rtrv-dcmps

Retrieve Database Communication Module Parameter Set

Use this command to retrieve the sets of generic timers and parameters that can be used by any system application.

NOTE: This command is obsolete.

Keyword: rtrv-dcmps

Related Commands: chg-dcmps

Command Class: Database Administration

Parameters

:set= (optional)

The set number.

Range: 1-10

Default: All parameter sets are displayed

Example

```
rtrv-dcmps:set=1
```

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output**rtrv-dcmps:set=1**

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

SET	TIMER	TVALUE	PARM	PVALUE
1	1	1200	1	1200
1	2	1400	2	1200
1	3	1400	3	4800
1	4	1400	4	12000
1	5	1600	5	1200
1	6	1800	6	1200
1	7	2000	7	1200
1	8	4000	8	1200
1	9	4294967295	9	4294967295
1	10	6000	10	1200

TIMER 1: TALI T1 Timer, time (mS) between sending of TEST msgs by NE
TVALUE : Valid Range: 32-bits

TIMER 2: TALI T2 Timer, time (mS) to wait for response to TEST msg
TVALUE : Valid Range: 32-bits

TIMER 3: TALI T3 Timer, time (mS) to continue processing rcv'd service
msgs after NE is prohibited
TVALUE : Valid Range: 32-bits

TIMER 4: TALI T4 Timer, time (mS) between sending of MONI msgs by NE
TVALUE : Valid Range: 32-bits

PARM 1: Type of Service (TOS), IP header socket option
PVALUE : Valid Range: lowest 8-bits

PARM 2: Nagle's Algorithm, TCP socket option
PVALUE : Valid Range: lowest bit: 0 = Disable Nagle, 1 = Enable Nagle

PARM 3: Default SORP Flags socket option. Each bit is used as an
enabled/disabled flag for a particular socket option.
PVALUE : Valid Range: 32-bits

BIT	BIT VALUE
0=Broadcast Phase MTPP Primitives;	0=Disabled , 1=Enabled
1=Response Method MTPP Primitives;	0=Disabled , 1=Enabled
2=SCCP with MTP;	0=Disabled , 1=Enabled
3=ISUP via MTP;	0=Disabled , 1=Enabled
4=Group Code in MTPP;	0=Disabled , 1=Enabled
5=Use XSRV;	0=Disabled , 1=Enabled
6-31=Reserved	

;

rtrv-dlk**Retrieve Data Link**

Use this command to show the parameters of a TCP/IP data link.

Keyword: rtrv-dlk

Related Commands: act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, tst-dlk

Command Class: Database Administration

Parameters

:ipaddr= (optional)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: 1-223, 0-255
4 numbers separated by dots
1-223—first number
0-255—the other three numbers
Default: Display all.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118
Default: All TCP/IP data links are shown.

Example

```
rtrv-dlk
rtrv-dlk:loc=1201
rtrv-dlk:ipaddr=193.4.201.34
```

Dependencies

This command can be entered with no parameters or with one of the optional parameters **loc** or **ipaddr**; however, both **loc** and **ipaddr** cannot be specified in the same command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If the **ipaddr** parameter is specified, the IP address must be assigned to a TCP/IP data link.

Notes

None

Output

In the following example, cards at location 1201 and 1203 are ACMENET cards running the **stplan** application. For these cards, the value of the auto parameter is defaulted to no, and the value of the duplex parameter is defaulted to half.

The cards at location 1101, 1103 and 1107 are DCM or E5-ENET cards running the **stplan** application. For these cards, if the **auto=yes** parameter is specified, then the values of **speed** and **duplex** parameters are not shown.

rtrv-dlk

```
tekelecstp 07-02-06 11:12:47 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit FULL    NO
1103 192.168.63.11    10Mbit  HALF    NO
1107 192.168.63.12    ----- ----    YES
1201 192.168.63.13    10Mbit  HALF    NO
1203 192.168.63.14    10Mbit  HALF    NO
```

;

rtrv-dlk:loc=1101

```
tekelecstp 07-02-01 14:09:13 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit FULL    NO
```

;

rtrv-dlk:ipaddr=192.168.63.11

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1103 192.168.63.11    10Mbit  HALF    NO
```

;

In the following example, the specified IP address is not assigned to a TCP/IP data link.

rtrv-dlk:ipaddr=193.4.201.28

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR not assigned to a TCP/IP Link.
```

;

In the following example, there are no TCP/IP data links in the database.

rtrv-dlk

```
tekelecstp 07-02-02 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
No TCP/IP Links are defined in the database.
```

;

In the following example, the specified IP address is assigned to a TCP/IP node instead of a TCP/IP data link.

rtrv-dlk:ipaddr=193.4.201.63

```
tekelecstp 07-02-01 12:12:10 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR assigned to a TCP/IP Node.
```

;

Legend

IPADDR—The IP address associated with the interface on the data link.

LOC—The card location containing the data link.

LINK SPEED—The bandwidth for the interface in megabits per second, **10** or **100**.

AUTO—Whether or not to automatically determine duplex and speed. If the value is **yes**, then duplex and speed are automatically determined. If the value is **no**, then duplex and speed are not automatically determined.

DUPLEX—The mode of operation of the interface. Possible values are **half** and **full**.

rtrv-dstn

Retrieve Destination

Use this command to show the destination point code entries in the Destination point code table.

Keyword: rtrv-dstn

Related Commands: chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:aliasa= (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:aliasa/aliasi/aliasn/aliasn24= (optional)

Alias point code.

:aliasi= (optional)

ITU international alias point code with subfields *zone-area-id*. This parameter is not valid if an ITU international (**dpci**) point code is entered. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:aliasn= (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible

point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:aliasn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:clli= (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

Range: *ayyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

Default: **none**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dPCA**

Range: **p-, 000-255, *, **, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dPCA/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—**s-, p-, ps-**

nnnnn—**0-16383, ***

gc—**aa-zz, ***

m1-m2-m3-m4—**0-14** for each member; values must sum to 14; or ***-*-*-*** when the point code includes a group code.

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:msar= (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The **summary** report or the **detail** report appears following the destination information that is requested by entering the command with or without other parameters. The **only** parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

Range: **detail, only, summary**

Default: **detail**—if **rtrv-dstn** is entered with no parameters

summary—if **rtrv-dstn** is entered with parameters

:ncai= (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes (**ncai=yes**), or clusters that do not allow nested cluster point codes (**ncai=no**) are displayed.

Range: **yes, no**

yes — Display clusters with the **ncai** set to **yes**

no — Display clusters with the **ncai** set to **no**

:pcst= (optional)

Point code subtype. If selected, this parameter causes the command to display only point codes with no subtype prefix or only point codes of a specified subtype.

Range: **none, p, ps, s**

none — Display only point codes without subtype prefixes

p — Display only private point codes (subtype prefix **p-**)

ps — Display only private and spare point codes (subtype prefix **ps-**)

s — Display only spare point codes (subtype prefix **s-**)

:pctype= (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

Range: **ansi, itui, itun, itun24**

ansi — Display only ANSI point codes

itui — Display only ITU International point codes

itun — Display only ITU National point codes

itun24 — Display only 24-bit ITU National point codes

:ppc= (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:ppc/ppca/ppci/ppcn/ppcn24= (optional)

Proxy Point Code.

The proxy point code must be a full point code.

:ppci= (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:ppcn= (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ppcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:prx= (optional)

Proxy point code indicator.

Range: **yes**, **no**

yes — Will be used as a proxy point code

no — Will not be used a proxy point code.

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **spca**

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

The following example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

rtrv-dstn:dpca=20-2-***

The following example displays the destination with an ANSI alias of 222-200-200:

rtrv-dstn:aliasa=222-200-200

The following example displays all encountered ANSI alias destination point codes that have a network indicator (ni) of 222 and a network cluster (nc) of 200:

rtrv-dstn:aliasa=222-200-**

The following example displays the destination with a CLLI of rlghncbb001:

rtrv-dstn:clli=rlghncbb001

The following example displays the secondary point code 6-6-6:

rtrv-dstn:spc=6-6-6

The following example displays the retrieval of clusters with ncai set to yes:

rtrv-dstn:ncai=yes

The following example displays a single cluster (the NRT feature must be turned on):

rtrv-dstn:dpc=010- *- *

The following example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr

The following example displays all ITU national group codes by duplicate point code:

rtrv-dstn:dpcn=2050- *

The following example displays all ITU national point codes within a group code:

rtrv-dstn:dpcn=*-fr

The following example displays 24-bit ITU national point code 15-100-10:

rtrv-dstn:dpcn24=15-100-10

The following example displays 24-bit ITU national secondary point code 99-99-99:

rtrv-dstn:spcn24=99-99-99

The following example displays 24-bit ITU national alias point code 4-4-4:

rtrv-dstn:aliasn24=4-4-4

The following example displays a private point code:

rtrv-dstn:dpca=p-12-12-12

The following examples display a private and spare point code:

rtrv-dstn:dpcn=ps-123

rtrv-dstn:dpci=ps-1-234-1

The following example displays all ANSI private point codes:

rtrv-dstn:pctype=ansi:pcst=p

The following example displays all ITU international spare point codes:

rtrv-dstn:pctype=itui:pcst=s

The following example displays all ITU national private and spare point codes:

rtrv-dstn:pctype=itun:pcst=ps

The following example displays all 24-bit ITU national private point codes:

rtrv-dstn:pctype=itun24:pcst=p

The following example displays all ANSI point codes that do not have point code subtype prefixes:

rtrv-dstn:pctype=ansi

The following example displays all ITU international point codes that do not have point code subtype prefixes:

rtrv-dstn:pctype=itui

The following example displays all ITU national point codes that do not have point code subtype prefixes:

rtrv-dstn:pctype=itun

The following example displays all 24-bit ITU national point codes that do not have point code subtype prefixes:

rtrv-dstn:pctype=itun24

The following example displays all point codes that do not have point code subtype prefixes:

rtrv-dstn:pcst=none

The following example displays all private point codes:

rtrv-dstn:pcst=p

The following example displays all spare point codes:

rtrv-dstn:pcst=s

The following example displays all private and spare point codes:

rtrv-dstn:pcst=ps

The following example displays all proxy destinations.

rtrv-dstn:prx=yes

The following example displays all destinations using a specified proxy point code.

rtrv-dstn:ppc=1-1-1

Dependencies

NOTE: A *full point code* contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLLI parameter can be specified in the command; these parameters cannot be specified together in the command.

The specified destination address must already be defined in the Destination point code table.

If the **dpcn** parameter or the **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

If specified (except when **spc=none**), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

If specified, the **clli** parameter value must already be defined in the Route table.

When the **msar=only** parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*-***).

The **pcst** parameter value **s** or **ps** cannot be specified when the **pctype** value **ansi** or **itun24** is specified.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters.

The **clli** parameter value cannot be **none**.

DPC must be a valid point code.

The Proxy Point Code feature must be enabled before the **prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The **prx** parameter can be specified with only the **pctype**, **pcst**, or **msar** parameter.

The **ppc** parameter can be specified with only the **msar** parameter.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Table 5-61 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

Table 5-61. Summary of DPC Parameter Syntaxes

DPC format	Meaning
rtrv-dstn:dpc=ni-nc-ncm	Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .
rtrv-dstn:dpc= ni-*-*	Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.
rtrv-dstn:dpc= ni-**-*	Requests a report for the full network cluster for the specified <i>ni</i> .
rtrv-dstn:dpc= ni-***-*	Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .
rtrv-dstn:dpc= ni-nc-*	Requests a report for provisioned cluster destination <i>ni-nc-*</i> .
rtrv-dstn:dpc= ni-nc-**	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported.
rtrv-dstn:dpc= ni-nc-***	Requests a report showing all destinations whose network (<i>ni</i>) and cluster (<i>nc</i>) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.
rtrv-dstn:dpcn24= msa-ssa-sp	Requests a report for fully provisioned 24-bit ITU-N destination <i>main signaling area-sub signaling area-signaling point</i> .

Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-****). This does not include the specified cluster point code (for example, **20-2-***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-*****) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-***).
- An asterisk (*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, ***-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-***).
- An asterisk (*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, ***-*-*-*ab** is valid; ***-15-*-*ab** is not valid).

If the Proxy Point Code feature is enabled, then the values specified for the **ppc** and **dpc** parameters must be full point codes. Cluster point codes and private point codes are not supported.

Output

Destination Table Memory Space Accounting Information

Each output example for this command shows the display of destination table memory space accounting information. The **msar** parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

Summary Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the **msar** parameter values. The detail report cannot be displayed. The summary information appears at the end of the requested destination information, or appears without any other destination information when the **msar=only** parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The **msar=summary** parameter value is the default in this case.)
- When the command is entered with only the **msar=summary** parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The **chg-stpopts** command **mtpdpcq** parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the value *x*, the allowed maximum is the value *y*, and the table percent full is the value *z* shown in the following first line of the summary report:

Destination table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, or 8000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The number currently provisioned is the *x* value, the allowed maximum is the *y* value, and the table percent full is the *z* value shown in the following second line of the summary report:

Alias table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.
- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.

- When the 7000, or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.

Detail Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The **msar=detail** parameter value is the default in this case.)
- When the **msar=detail** parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.
- When the **msar=only** parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat dstn5000** entry and the **rtrv-ctrl-feat Routesets** entry). The **chg-stpopts mtpdpcq** parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the DESTINATION ENTRIES ALLOCATED value. The list of values under the allocated value includes the TOTAL DPCs currently provisioned and the Destination table CAPACITY (% FULL).

The allowed maximum number of aliases is the ALIASES ALLOCATED value. The list of values under the allocated value include the current number of ALIASES USED and the Aliases table CAPACITY (% FULL). The possible maximum numbers of aliases are described in the *Summary Report* section.

The output for the **rtrv-dstn** command does not change when the Proxy Point Code feature is on.

The following example shows destination table memory space accounting information contained in a summary report. In the example, the **msar=only** parameter is specified and the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

rtrv-dstn:msar=only

```
rlghncxa03w 06-06-01 16:02:05 EST EAGLE 35.0.0

rtrv-e1

Retrieve E1 Information

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the **ent-e1** command for a 2-port E1 card, an E1/T1 card, an HC-MIM card, an E5-E1T1 card that is used as an E1 card, or an HC-MIM card or E5-E1T1 card used as an SE-HSL card. The following information can be retrieved: card location, E1 port number, CRC4, CAS/CCS, encoding/decoding, channel bridging, timing source, international NFAS data, and national NFAS data.

Keyword: **rtrv-e1**

Related Commands: **chg-e1**, **dlt-e1**, **ent-e1**, **tst-e1**

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If not specified, all E1 card locations are listed.

:e1port= (optional)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card.

Range: 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

Default: If not specified, all E1 ports are listed.

Example

rtrv-e1

rtrv-e1:loc=1307:e1port=2

rtrv-e1:loc=1311:e1port=1

Dependencies

The **loc** and **e1port** parameters must both be specified if any parameters are specified for the command.

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **lime1** card type.

The port specified by the **e1port** parameter must be already equipped with an E1 interface.

Notes

None.

Output

The following example shows HC-MIM cards used as E1 cards. Cards with CHANBRDG=MASTER or CHANBRDG=SLAVE have 2 ports configured in channel bridging mode to allow non-signaling data pass-through.

rtrv-e1

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 33.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MIMSU
1307  7      ON   OFF  HDB3    LINE     0  0  -----  CHAN  ----
1307  8      ON   OFF  HDB3    LINE     0  0  -----  CHAN  ----

1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
```

;

The following example shows HC-MIM cards used as E1 cards. Cards with LINKCLASS=UNCHAN have SE-HSL links.

rtrv-e1

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 34.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MINSU
1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
1307  8      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 2000
1311  1      OFF  ON   AMI     LINE    1  1  -----  CHAN   ----
```

;

Legend

LOC—E1 card location in an EAGLE 5 ISS shelf.

E1PORT—E1 port number on an E1 card.

CRC4—CRC4 indicator.

CAS—CAS/CRC indicator (**on** = CAS is used; **off** = CRC is used).

ENCODE—Indicator for use of HDB3 or AMI encoding/decoding.

E1TSEL—E1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair.)

SI—Value of two Spare International bits of NFAS data.

SN—Value of five Spare National bits of NFAS data.

CHANBRDG—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

LINKCHAN—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN).

MINSURATE—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCHAN field value is UNCHAN.

TSx—Timeslot.

rtrv-eisopts**Retrieve EAGLE Support for Integrated Sentinel Options**

Use this command to retrieve the status (on or off) of the copy function for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Keyword: rtrv-eisopts
Related Commands: chg-eisopts
Command Class: Security Administration

Parameters

This command has no parameters.

Example

rtrv-eisopts

Dependencies

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

Notes

None

Output

rtrv-eisopts

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
EISOPTION
-----
EISCOPY                ON
;
```

rtrv-feat**Retrieve Feature**

Use this command to show the status of optional features in the system that are controlled with the **chg-feat** command.

Keyword: rtrv-feat
Related Commands: chg-feat
Command Class: Program Update

Parameters

This command has no parameters.

Example

rtrv-feat

Dependencies

None

Notes

None

Output

CAUTION: The following output example may differ from the output shown at your terminal and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative. After you turn on a feature with the **chg-feat** command, you cannot turn it off.

rtrv-frm-pwr

Retrieve Frame Power Threshold

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

Keyword: **rtrv-frm-pwr**

Related Commands: **chg-frm-pwr**, **dlt-frm-pwr**, **ent-frm-pwr**, **rtrv-stp**

Command Class: Database Administration

Parameters

:frm= (optional)

Frame ID. The command displays the FPT table entry for the specified provisioned frame.

Range: **cf00, ef00, ef01, ef02, ef03, ef04**

cf00 — Control frame

ef00 — First extension frame

ef01 — Second extension frame

ef02 — Third extension frame

ef03 — Fourth extension frame

ef04 — Fifth extension frame

Example

Retrieve all provisioned Frame Power Threshold table entries.

rtrv-frm-pwr

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00)..

rtrv-frm-pwr :frm=cf00

Dependencies

The **frm** parameter value must specify a provisioned frame.

The **frm** parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

Output

Retrieve all Frame Power Threshold table entries.

rtrv-frm-pwr

tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0

Frame	Power Threshold (Amps)

rtrv-ftp-serv**Retrieve FTP Server Entry**

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

Keyword: rtrv-ftp-serv

Related Commands: chg-ftp-serv, dlt-ftp-serv, ent-ftp-serv

Command Class: Database Administration

Parameters

:app= (optional)

The FTP Client application that interfaces with the FTP Server.

Range: meas, user

meas — the Measurements Platform application

user — the FTP-based Table Retrieve Application (FTRA)

:ipaddr= (optional)

IP Address of the FTP Server.

Range: 4 numbers separated by dots, with each number in the range of 0-255.

:mode= (optional)

Full or brief report indicator.

Range: full, brief

Default: brief

Example

rtrv-ftp-serv

rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100

rtrv-ftp-serv:mode=brief

```
rtrv-ftp-serv:app-meas  
rtrv-ftp-serv:ipaddr=1.255.0.100  
rtrv-ftp-serv:mode=full
```

Dependencies

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **mode** parameter allows you to display either the full 100 characters of the path string for each entry (**mode=full**), or the first 29 characters of the path string for each entry (**mode=brief**). The default is **brief**.

Notes

The LOGIN and PATH are displayed in mixed case.

Output

The following examples show output when the EAGLE OA&M IP Security feature is not enabled:

rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100

rtrv-gpl

Retrieve Generic Program Load

Use this command to show the version numbers of the GPLs stored on each fixed disk (TDM) or removable cartridge (MDAL, if available) and the system release table stored on each fixed disk

Keyword: **rtrv-gpl**

Related Commands: **act-gpl**, **chg-gpl**, **copy-gpl**, **rept-stat-gpl**

Command Class: Program Update

Parameters

:gpl= (optional)

Generic program load. This parameter specifies the GPL for which to retrieve information.

:appl= (obsolete)

This parameter is obsolete. Use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value

Example

```
rtrv-gpl
rtrv-gpl:gpl=ipshc
rtrv-gpl:gpl=ipsg
```

Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

If no application is specified, the approved and trial versions for all GPLS are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the utility and OAM GPL trial versions on the fixed disk and for all GPLs on the removable when the removable cartridge is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the **rept-stat-gpl** command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

Output

The following example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

* The entries marked with an asterisk appear in the output only if an OAP is provisioned and running. Systems that use two OAPs will show two entries for the OAP: OAP A and OAP B.

Legend

GPL—The type of GPL associated with each card in the display

APPROVED—The GPL version that is the approved GPL.

CARD—The card location.

RELEASE—version number of each GPL that is required to be installed and approved for a specific release of software for the system.

REMOVE TRIAL—The GPL version that is on the removable cartridge.

TRIAL—The GPL version that is the trial GPL.

-----GPL is not present at the specified location.

ALM—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

CORRUPTED—Data audit has determined that the GPL is corrupted.

rtrv-gserv-data

Retrieve G-Port Query for Prepaid Service Data

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

Keyword: rtrv-gserv-data

Related Commands: dlt-gserv-data, ent-gserv-data

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:display= (optional)

Use this parameter to display a specified category of entries in the GSERV table.

Range: **all, gta, opc, tt**

all— Display all entries in the GSERV table.

gta— Display all calling party (CgPA) global title addresses in the GSERV table.

opc— Display all message transfer part (MTP) originating point codes in the GSERV table.

tt— Display all called party (CdPA) translation types in the GSERV table.

:gta= (optional)

Global title address. Use this parameter to specify a CgPA global title address.

Range: 1-21 digits

:opc= (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym: **opca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/open24= (optional)

Originating point code. Use these parameters to specify MTP originating point codes.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tt= (optional)

Translation type. Use this parameter to specify a CdPA translation type.

Range: **0-255**

Example

rtrv-gserv-data:display=all

rtrv-gserv-data:tt=26

rtrv-gserv-data:display=opc

Dependencies

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The **gta**, **opc/opca/opci/opcn/opcn24**, **tt**, or **display** parameter must be specified.

Output

```

rtrv-gserv-data:display=all

rtrv-gsmmap-scrn**Retrieve GSM MAP Screening Entry**

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

Keyword: rtrv-gsmmap-scrn

Related Commands: chg-gsmmap-scrn, dlt-gsmmap-scrn, ent-gsmmap-scrn

Command Class: Database Administration

Parameters**:opname=** (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command.

Range: ayyyyyyy

Up to 8 alphanumeric characters

:action= (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

Range: pass, discard, atierr, route, forward, duplicate, dupdisc**pass**—Route the message as normal to the destination.**discard**—The MSU is to be discarded.**atierr**—An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.**route**—Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.**forward**—Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.**duplicate**—Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.**dupdisc**—Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.**Default:** Display all screening actions**:cdsr=** (optional)

CdPA Screening Reference.

Range: ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:cgsr= (optional)

CgPA Screening Reference.

Range: ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:eaddr= (optional)

The ending origination address, in association with **npv** and **naiv** for the CGPA address to be screened.

Range: 1-15 digits

1–15 hexadecimal digits. Valid digits are 0–9, a-f, A-F

:forbid= (optional)

The forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter.

Range: all, location, none, state**all**—All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.**location**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **location** as the forbidden parameter value for the entered address/operation code combination. Note: The **location** value is valid only for GSM ATI messages.

none—None of the parameters are forbidden. Route the message to its destination.
state—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **state** as the forbidden parameter value for the entered address/operation code combination. Note: The **state** value is valid only for GSM ATI messages.

Default: Display all forbidden parameter values

:mapset= (optional)

The MAP set ID.

Range: 1-36000 dflt

dflt—Default MAP set

:naiv= (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. When this parameter is specified, the **npv** parameter must be specified.

Range: 0-127 *

:npv= (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

When this parameter is specified, the **naiv** parameter must be specified.

Range: 0-15 *

:saddr= (optional)

The starting origination address. in association with **npv** and **naiv** for the single entry or range of entries of the CGPA address to be screened.

Range: 1-15 digits, *

1-15 hexadecimal digits. Valid digits are 0-9, a-f, and A-F

Default: *

Example

The following example retrieves all CgPA entries for the specified opname:

rtrv-gsmmap-scrn:opname=ati

The following example retrieves the specified CgPA range entry for the specified opname:

rtrv-gsmmap-scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000

The following example retrieves all CdPA entries for the specified cgsr:

rtrv-gsmmap-scrn:opname=xyz:cgsr=fela

The following example retrieves the specified cdsr entry for the specified cgsr:

rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4

The following example retrieves a MAP set when the Flexible GTT Load Sharing feature is on.

rtrv-gsmmap-scrn:opname=abc:mapset=9

Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The **cgsr** parameter can be specified.
- The **cdsr** parameter can be specified.
- The **saddr=*** parameter can be specified.

- The **saddr** and **eaddr** parameters can contain hexadecimal digits.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

If the **eaddr** parameter is specified, its value must contain the same number of digits as the **saddr** parameter value.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **saddr=*** parameter is specified, then the **eaddr** parameter cannot be specified.

If the **saddr** parameter is specified, the **cgsr** and **cdsr** parameters cannot be specified.

The **saddr**, **npv**, and **naiv** parameters must be specified together in the command.

If any of the **saddr/eaddr/npv/naiv** and **cdsr** parameters are specified, then the **forbid** and **action** parameters cannot be specified.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code referenced by the **opname** parameter is **71**. The **forbid** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The **action=atierr** parameter cannot be specified unless the operation code referenced by the **opname** parameter is **71**. The **atierr** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If the **cdsr** parameter is specified, then the **cgsr** parameter must be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

Notes

None

Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

Legend

SINGLE ENTRIES/RANGE ENTRIES—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.

CgPA—Calling Party Address entry

CdPA—Called Party Address entry

OPNAME—User-defined MAP operation code name.

SADDR—Start origination address.

EADDR—End origination address. This column is displayed for range entries only.

NPV—Numbering plan value.

NAIV—Nature of address indicator value.

FORBID or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter. (Some values are abbreviated; for example, locat means **location**.)

ACTION or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atierr, route, forward, duplicate (dupl), and dupdisc.

PC or **PCA**—ANSI Point Code
PCI—ITU International Point Code
PCN—ITU National Point Code
PCN24—24-bit ITU National Point Code
SSN—Subsystem Number
CGSR—CgPA Screening Reference
CDSR—CdPA Screening Reference
MAPSET—MAP set

rtrv-gsmopts

Retrieve GSM System Options

Use this command to display all GSM (Global System for Mobile Telecommunication) system options from the database.

Keyword: **rtrv-gsmopts**

Related Commands: **chg-gsmopts**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-gsmopts

Dependencies

The G-Flex feature must be enabled and turned on, or the G-Port, EIR, or IGM feature must be enabled before this command can be entered.

Notes

None

Output

The following example shows the output if the G-Flex feature is turned on.

rtrv-gsmopts

```
rlghncxa03w 04-04-20 09:04:14 EST EAGLE 31.6.0
```

GSM OPTIONS

Legend

DEFMCC—E212 default mobile country code.

DEFMNC—E212 default mobile network code.

CCNC —E214 country code and network code.

MCCMNC—E212 mobile country code and mobile network code.

SRFADDR—Entity address of the MNP_SRF node.

SRFNAI—The nature of address indicator value of the MNP_SRF.

SRFNP—The numbering plan value of the MNP_SRF.

MSRNDIG—The routing number to be used as is or to be concatenated with the MSISDN.

MSRNNAI—The nature of address indicator value for the MSRN.

MSRNNP—The numbering plan value for the MSRN.

SRIDN—Send Routing Information Dialed Number location.

IS412GSM—IS41 to GSM Migration prefix.

EIRGRSP—Equipment Identity Register Global Response status.

EIRRSPTYPE—Equipment Identity Register Global Response Type.

EIRIMSICHK—Equipment Identity Register IMSI Check status.

MULTCC—Multiple country code list entry.

MSISDNTRUNC—Number of digits to delete from the beginning of the National MSISDN (MSISDN without Country Code) before formulating the MSRN parameter of the SRI-ack response.

SERVERPFX—Server prefix for IS41 to GSM Migration SRI Redirect.

GSM2IS41— GSM to IS41 Migration prefix.

MIGRPFX— Migration prefix (has values of SINGLE.(the default that indicates disabled) or MULTIPLE, and is supported only by the **rtrv-gsmopts** command).

GFLEXMAPLAYERRTG—G-Flex MAP Layer Routing status.

MOSMSNAI—This specifies the number conditioning that is performed on the SMS message destination address before lookup in the number portability database is performed.

MTSMSIMSI—Format of IMSI digits in SRI_SM_ACK response message.

MTSMSNNI—Format of NNI digits in SRI_SM_ACK response message.

MTSMSTYPE—Type of Network entity indicating successful NP DB lookup for MT-Based GSM SMS NP feature.

MTSMSACKN—Type of response (ACK or NACK) for SRI_SM messages.

MTSMSDLTR—Specifies whether delimiter digit string is inserted before or after RN, if required, in SRI_SM response messages.

MTSMSDLTRV—Delimiter digit string that is inserted before or after RN, if required, in SRI_SM response messages.

MTSMSNAKERR—Specifies the error code to be used in the NACK response message for SRI_SM messages.

MTSMSCHKSRC—Specifies whether the SCCP CgPA GTA of SRI_SM message is validated.

MTMSGTA—GTA used in MT-Based GSM MMS NP feature to determine whether the originator of SRI_SM message is a Home MMSC.

MTMMSTYPE—Type of Network entity indicating successful NP DB lookup for MT-Based GSM MMS NP feature.

MTMMSACKN—Type of response (ACK or NACK) for SRI_SM messages in MT-Based GSM MMS NP feature.

rtrv-gsms-opcode**Retrieve GSM MAP Screening Operation Code**

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

Keyword: **rtrv-gsms-opcode**

Related Commands: **chg-gsms-opcode**, **dlt-gsms-opcode**, **ent-gsms-opcode**

Command Class: Database Administration

Parameters

:mapset= (optional)

The MAP set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

:opcode= (optional)

MAP operation code.

Range: **0-255 ***

Default: Display all MAP operation codes

:opname= (optional)

The user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

Range: **aaaaaaaa**

Up to 8 alphanumeric characters

Default: Display all operation code names

Example

rtrv-gsms-opcode

rtrv-gsms-opcode:opname=ati

Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The **opcode=*** can be specified.
- An **opname** parameter can be specified that refers to an **opcode=*** parameter.

The **opcode** parameter and the **opname** parameter cannot be specified together in the same command.

The specified **opname** parameter must exist in the GSM MAP Op-Code table.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

Notes

None

Output

rtrv-gsmssn-scrn

Retrieve GSM Subsystem Number Screening Entry

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

Keyword: rtrv-gsmssn-scrn

Related Commands: dlt-gsmssn-scrn, ent-gsmssn-scrn

Command Class: Database Administration

Parameters

:ssn= (optional)

Subsystem number.

Range: 000-255

Default: Display all

:type= (optional)

Subsystem type.

Range: orig, dest

orig—The origination SSN

dest—The destination SSN

Default: Display all

Example

```
rtrv-gsmssn-scrn
```

```
rtrv-gsmssn-scrn:ssn=0:type=dest
```

Dependencies

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

If specified, the **ssn/type** parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
```

```
No matching entries with the specified criteria found.
```

Output**rtrv-gsmssn-scrn:ssn=2:type=dest**

RTRV-GSMSSN-SCRN: MASP A - COMPLTD

```

;

Legend

SSN—Subsystem number.

ORIG—Specifies whether the subsystem type is origination (yes) or not (no).

DEST—Specifies whether the subsystem type is destination (yes) or not (no).

rtrv-gta**Retrieve Global Title Address Information**

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

NOTE: When the ANSI-ITU-China SCCP Conversion feature is enabled, entries that are provisioned with the **xlat=dpc** parameter, and that have specified the **ntt** parameter, are displayed with a **xlat** parameter value of **dpcngt**.

Keyword: **rtrv-gta**

Related Commands: **chg-gta**, **dlt-gta**, **ent-gta**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cggtmod= (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range: **yes, no**

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **cgpa**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields main signaling *area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgssn= (optional)

Starting CgPA subsystem number.

Range: **0-255**

:ecgssn= (optional)

Ending CgPA subsystem number.

Range: **0-255**

:cgta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: The first **gta** entry for the given GTT selector

:force= (optional)

Display more than 1000 entries.

Range: **yes, no**

Default: **no**

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: The first **gta** entry for the given GTT selector

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

:loopset= (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

Range: aaaaaaaa, **none**

1 alphabetic character followed by up to 7 alphanumeric characters.

none—Translation entries with no association to any loopset.

:mapset= (optional)

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

Range: 1-36,000 **dflt**
dflt—Default MAP set
Default: Retrieves GTA information for the default MAP set.

:mrnset= (optional)

MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.

Range: 1-3000 **none**, **dflt**
dflt—Default MRN set
none—The GTA translation does not participate in any loadsharing.

:num= (optional)

Number of entries to display.

Range: 1-65535
Default: 1—if **gta** is specified
 20—if **gta** is not specified

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **opca**

Range: 000-255, *
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 The asterisk (*) value is not valid for the *ni* subfield.
 When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.
 When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.
 When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = 006-255.
 The point code 000-000-000 is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-
zone—0-7
area—000-255
id—0-7
 The point code 0-000-0 is not a valid point code.

:open= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU originating point code with subfields main signaling *area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pc= (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym: **pca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pci= (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255

ssa—000-255

sp—000-255

:pctype= (optional)

Point code type. This parameter can be specified only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

Range: **ansi, itui, itun, itun24, ituis, ituns**

Default: Display all point code types

:ssn= (optional)

Subsystem number.

Range: **002-255**

Default: Display all

Example

```
rtrv-gta:gttsn=t800:num=65535:force=yes
```

```
rtrv-gta:gttsn=t800:pc=8-1-1:ssn=222:gta=9195551212
```

```
rtrv-
```

```
gta:gttsn=t800:ssn=222:gta=9000000000:egta=9762429999:num=65535:force=yes
```

```
rtrv-gta:gttsn=ntoa23:pctype=ansi
```

```
rtrv-gta:gttsn=setnat003:pcn=s-129-aa
```

```
rtrv-gta:gttsn=setnat003:gta=987658321198765432101:pcn=s-128-aa
```

```
rtrv-gta:gttsn=tbla
```

```
rtrv-gta:gttsn=tbla:pc=1-1-1
```

```
rtrv-gta:gttsn=setssn:mapset=6
```

```
rtrv-gta:gttsn=setans006:mrnset=1
```

```
rtrv-gta:gttsn=setans004:cggmod=yes
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

The **ssn**, **cgssn**, and **ecgssn** parameters cannot have a wildcard (*) value.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, and **opc/opca/opci/opcn/opcn24** parameters must be full point codes and must have valid values within the range for each subfield.

If the ANSI-ITU-China SCCP Conversion feature is not turned on, and the specified GTT set is an ANSI set, then the value specified for the **pc/pca** parameter must be a valid ANSI point code.

If the ANSI-ITU-China SCCP Conversion feature is not turned on, and the specified GTT set is an ITU set, then the value specified for the **pci/pcn/pcn24** parameter must be a valid ITU point code.

If the **egta** parameter is specified, the **gta** parameter must be specified. The **gta** and **egta** parameters must be the same length, and the value for the **egta** parameter must be greater than the value for the **gta** parameter.

If the specified **num** parameter value is greater than **1000**, the **force=yes** parameter must be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the specified GTT set (**gttsn**). If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per GTT set. When the **ent-gta** command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

The **(e)gta**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, and **opc/opca/opci/opcn/opcn24**, and **(e)cgssn** parameters are mutually exclusive.

If the **ecgssn** parameter is specified, the **cgssn** parameter must be specified, and the **ecgssn** parameter must be greater than the **cgssn** parameter.

The Origin-based SCCP Routing feature must be enabled when specifying the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters or when specifying the **xlat** parameter with a value of **udts** or **discard**.

The **gta** parameter can be specified only if the GTTSN set type has a value of **cdgta** or **cggta**.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter may be specified only if the GTTSN set type has a value of **cgpc**.

The **opc/opca/opci/opcn/opcn24** parameter may be specified only if the GTTSN set type has a value of **opc**.

The **cgssn** parameter may be specified only if the GTTSN set type has a value of **cgssn**.

If the specified GTT Set is an ANSI set, the **cgpc/cgpca** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT Set is an ITU set, the **cgpci/cgpcn/cgpcn24** and **opci/opcn/opcn24** parameters must be valid ITU point codes.

The range specified by the **(e)cgssn** parameters must exist for the specified GTT set. An exact match is not required.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggtmod** parameter can be specified.

The **mapset** parameter and the **mrnset** parameter cannot be specified together in the command.

Notes

The percentage full and number of cells used report that is provided with a **rtrv-gta** command reflects the total entries in the GTA table without regard to the selector specified.

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gtt sel**), GTT Set (**ent/dlt/rtrv-gtt set**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the **rtrv-gta** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if **gta=8005556666** is specified, the six-digit GTT set **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Output

NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.

Retrieve all GTAs for the specified GTT Set:

NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next.

Legend

GTTSN—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

NETDOM—The network domain.

NDGT—The number of digits required for GTAs associated with this set.

START GTA—The start global title address.

END GTA—The end global title address.

XLAT—The translate indicator.

RI—The routing indicator.

PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC—Translated point code.

SSN—The translated subsystem number.

CCGT—The cancel called global title indicator.

NNP—New Numbering Plan.

NNAI—New Nature of Address Indicator.

NPDD—New Prefix Digits to be Deleted.

NPDS—New Prefix Digits String.

NTT—The new translation type.

MRN—Mated Relay Node.

MRNSET—MRN set ID.

MAPSET—MAP set ID.

CGGTMOD—Calling Party Global Title Modification Indicator.

rtrv-gtcnv**Retrieve Global Title Conversion**

Use this command to display entries in the Default Global Title Conversion table.

Keyword: **rtrv-gtcnv**

Related Commands: **chg-gtcnv, dlt-gtcnv, ent-gtcnv**

Command Class: Database Administration

Parameters

:dir= (optional)

Direction of conversion.

Range: **atoi, itoa, both**

atoi—ANSI to ITU conversion

itoa—ITU to ANSI conversion

both—Conversion in both directions

:gtixlat= (optional)

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range: **22, 24**

22—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

:nai= (optional)
Nature of address indicator.
Range: **0-63 ***

:np= (optional)
Numbering plan.
Range: **0-15 ***

:tta= (optional)
ANSI translation type.
Range: **0-255 ***

:tti= (optional)
ITU translation type.
Range: **0-255 ***

Example

rtrv-gtcnv

Dependencies

The ANSI-ITU-China SCCP Conversion feature must be enabled before the command can be entered.

Notes

None

Output

The following example displays output containing decimal global title digits.

rtrv-gtcnv

```
tekelecstp 06-11-07 13:44:12 EST EAGLE 35.3.0
```

DIR	GTIXLAT	TTA	TTI	NP	NAI	DEL	POS	ADD
atoi	22	10	5	---	---	10	pfx	123

```
GTCNV      table is (1 of 1000) 1% full.
```

```
;
```

The following example shows output containing hexadecimal global title digits.

rtrv-gtcnv

```
tekelecstp 06-11-07 11:52:58 EST EAGLE 35.3.0
```

DIR	GTIXLAT	TTA	TTI	NP	NAI	DEL	POS	ADD
atoi	22	1	3	---	---	---	pfx	abcdef0123456789abcdf
itoa	24	5	6	2	1	---	sfx	abcdef0123456789abcef

```
GTCNV      table is (2 of 1000) 1% full.
```

```
;
```

Legend

DIR—The direction of the translation: ANSI to ITU or ITU to ANSI.

GTIXLAT—The GTI translation.

TTA—The ANSI translation type

TTI—The ITU translation type

NP—The numbering plan

NAI—The nature of address indicator

DEL—The deletion status, listing the number of incoming MSUs that will be deleted prior to translation.

POS—The prefix or suffix.

ADD—The global title address

rtrv-gtt**Retrieve Global Title Translation**

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the **type** parameter specified.

If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept **-gtt** (Global Title Translation) and **-tt** (Translation Type) commands. Refer to the new command sets that replace the **-gtt** and **-tt** commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gttset**)
- GTT Set commands (**ent/dlt/rtrv-gttset**)
- GTA commands (**ent/chg/dlt/rtrv-gta**)

Keyword: rtrv-gtt

Related Commands: chg-gtt, dlt-gtt, ent-gtt

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **ttn**, **type/typea/typei/typen/typen24**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cggtmod= (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range: yes, no

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: If the **gta** parameter is specified, the **egta** parameter default value is the specified **gta** parameter value.

:force= (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

Range: yes, no

Default: no

:gta= (optional)

Global title start address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: The first GTT entry for the given translation type.

:loopset= (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

Range: ayyyyyyy, none

1 alphabetic character followed by up to 7 alphanumeric characters.

none—Translation entries with no association to any loopset.

:mapset= (optional)

MAP set ID.

Range: 1-36000 dflt

dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

Range: **1-3000 none, dflt**
 dflt—Default MRN set
 none—The GTA translation does not participate in any loadsharing.

:num= (optional)

This parameter specifies the number of entries to be shown.

Range: **1-65535**
 1-1000—If **force=yes** is not specified
 1-65535—If **force=yes** is specified
Default: **1** (if **gta** is specified),
 20 (if **gta** is not specified).

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 prefix—**p-**
 When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.
 When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.
 When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.
 The point code **000-000-000** is not a valid point code.

Default: Display all

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 prefix—**s-, p-, ps-**
 zone—**0-7**
 area—**000-255**
 id—**0-7**
 The point code **0-000-0** is not a valid point code.

Default: Display all

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**, **p-**, **ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: Display all

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm(prefix-ni-nc-ncm)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: Display all

:pctype= (optional)

Point code type. This parameter can be specified, only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

Range: **ansi, itui, itun, itun24**

Default: Display all

:ssn= (optional)

Subsystem number. This parameter specifies the subsystem address that is to receive the message.

Range: **002-255**

Default: Display all

:ttn= (optional)

Translation name.

Range: **ayyyyyyy**

1 alphabetic character followed by up to 7 alphanumeric characters

Default: None given

:type/typea/typei/typen/typen24= (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value can be entered as ANSI (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **0-255**

Default: None given

Example

```

rtrv-gtt:type=5:ttn=lidb1:gta=919555
rtrv-gtt:type=5:gta=919555
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
rtrv-gtt:typen24=0
rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui
rtrv-gtt:type=55:pctype=itun
rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:ttn=tbla
rtrv-gtt:ttn=tbla:mapset=1
rtrv-gtt:type=4:cggmod=yes

```

Dependencies

If the EGTT feature is turned on, then the **rtrv-gtt** command cannot be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

The value of the **tt** parameter must exist in the Translation Type table.

The value of the **tt** parameter must correspond to a value of the **type/typea/typei/typen/typen24** parameter.

If the value of the **num** parameter exceeds **1000**, then the **force=yes** parameter must be specified.

Either the **type** parameter or the **ttn** parameter must be specified.

The **ssn** parameter cannot have a value of *.

The value of the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

If the **egta** parameter is specified, the **gta** parameter must be specified.

If the system is defined as an ANSI system, the **pc/pca** parameter must be specified as a valid ANSI point code.

The **tt** parameter and the **pc/pca/pci/pcn/pcn24** parameter must have matching network types.

The ANSI-ITU-China SCCP Conversion feature must be on before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the **tt** parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The value of the **num** parameter must not exceed the maximum table size.

The length of the **egta** parameter must equal the length of the **gta** parameter.

The value of the **egta** parameter must be greater than the value of the **gta** parameter.

If the **tt** parameter is not specified, then the value of the **ttn** parameter must match the value of a **tt** parameter in the STP database.

The value of the **typen** parameter must exist in the Translation Type table.

The value of the **typei** parameter must exist in the Translation Type table.

The value of the **gta** parameter must exist.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

The **mapset** parameter and the **mrnset** parameter cannot be specified together in the command.

Notes

If the **rtrv-gtt** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if **gta=8005556666** is specified, the six-digit translation type **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If you do not know either the translation type or the translation type name, use the **rtrv-tt** command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The number of entries to be shown (the **num** parameter) can be specified for any valid combination of parameters.

If the **gta** parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the **num** and **gta** parameters are not specified, then up to 20 entries are shown.

If the **gta** parameter is specified, but the **num** parameter is not specified, then only one entry is shown.

If the **num** parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the **num** parameter.

If the **gta** and **egta** parameters are specified, then the entry that matches the **gta** parameter, or is the nearest entry below the **gta** parameter, is the first entry shown for the specified range.

Output

rtrv-gtt:type=10:num=65535:force=yes

Legend

TYPE/TYPEA/TYPEI/TYPEN /TYPEN24—The translation type.

TTN—The translation name.

NDGT—The number of digits.

GTT TABLE IS 10% FULL—The relative size of the GTT table.

x OF y—Number of entries in the table (x) and the maximum number of entries configured for the table (y)

START GTA—Global title start address.

END GTA—Global title end address.

XLAT—Translate indicator.

RI—Route indicator.

PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC—Point code.

SSN—Subsystem number.

NGT—New global title translation type. This field identifies the type of global title translation that replaces the original type.

NNP—New Numbering Plan.

NNAI—New Nature of Address Indicator.

NPDD—New Prefix Digits to be Deleted.

NPDS—New Prefix Digits String.

NSDD—New Suffix Digits to be Deleted.

NSDS—New Suffix Digits String

NGTI—New GTI code. When the ANSI-ITU-China SCCP Conversion and AMGTT features are on and the Translated Point Code is of a different network type, the *NGTI* value indicates whether the new GTI translation format is GTI type 2 or GTI type 4.

MRN—Mated Relay Node.

MRNSET—MRN set ID.

MAPSET—MAP set ID.

CGGTMOD—Calling Party GT Modification Indicator.

rtrv-gttsel

Retrieve GTT Selectors

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

Keyword: rtrv-gttsel

Related Commands: chg-gttsel, dlt-gttsel, ent-gttsel

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin /gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry of **gtin=2** and **tt=4** cannot be entered.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii=2, 4** and **gtin /gtin24=2, 4**

Default: Display all

:cdgtasn= (optional)

CdPA GTA GTT set name.

Range: ayyyyyyyy
1 leading alphabetic character and up to 8 following alphanumeric characters.

:cggtasn= (optional)

CgPA GTA GTT set name.

Range: ayyyyyyyy
1 leading alphabetic character and up to 8 following alphanumeric characters.

:cgpcsn= (optional)

CdPA PC GTT set name.

Range: ayyyyyyyy
1 leading alphabetic character and up to 8 following alphanumeric characters.

:cgssn= (optional)

CgPA subsystem number.

Range: 0-255

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned. The **gttsn** parameter can only be specified if the Origin-based SCCP Routing feature is off.

Range: *aaaaaaaa*

1 leading alphabetic and up to 8 following alphanumeric characters.

Default: Display all

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **sub, rsvd, natl, intl, dflt**

Default: Display all

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **0-127**

Default: Display all

:np= (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **e164, generic, x121, f69, e210, e212, e214, private, dflt**

Default: Display all

:npv= (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **0-15**

Default: Display all

:selid= (optional)

Selector ID.

Range: **0-65534**

:tt= (optional)

Translation type.

Range: **0-255**

Default: Display all

Example

rtrv-gtttsel

rtrv-gtttsel:gtii=2

rtrv-gtttsel:tt=0:np=e164

rtrv-gtttsel:gti=2:tt=10

rtrv-gttset:gttsn=setint000**Dependencies**

The EGTT feature must be turned on before this command can be entered.

An entry that matches exactly the specified combination of **gti**, **tt**, **np/npv**, **nai/naiv**, and **gttsn** must be specified. If no match is found, the following message is displayed in the scroll area of the terminal:
No GTT Selectors matching the specified criteria were found.

The specified **gttsn** value must exist for the specified **gtin24**, **tt**, **np/npv/nai/naiv** parameter combination.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The parameter values **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** cannot be specified.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np/npv** and **nai/naiv** parameter combinations cannot be specified.

If the **cgssn** parameter and/or the **selid** parameter is specified, neither the **cggtasn** parameter nor the **cgpcsn** parameter can be specified.

The Origin-based SCCP Routing feature must be enabled if the **cggtasn**, **cgpcsn**, **cgssn**, **cdgtasn**, or **selid** parameters are specified.

The GTT set specified by the **cggtasn** or **cgpcsn** parameter must exist in the database before it is assigned to a GTT selector.

The set type of the **cggtasn** parameter or the **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggt**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The **cdgtasn** parameter cannot be specified if the **gti=2** and **tt** parameters are specified, or if the **gti=4** and the **tt**, **np/npv**, and **nai/naiv** parameters are specified.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

Output

Retrieve all GTT selectors:

rtrv-gttset

```

      2      0  --      --- gtti00001  cgpa001  -----  120   65534
;

```

Legend

GTI/GTIA/GTII/GTIN/GTIN24—The global title indicator.

TT—The translation type.

NP—The number plan.

NAI—The nature of address indicator.

GTTSN—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

rtrv-gttset

Retrieve GTT Set

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

Keyword: **rtrv-gttset**

Related Commands: **chg-gttset, dlt-gttset, ent-gttset**

Command Class: Database Administration

Parameters

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *ayyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

:netdom= (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

Range: **ansi, itu, cross**

Default: Display all

:settype= (optional)

GTT set type.

Range: **cdgta, cggta, cgpc, cgssn, opc**

Default: Display all

Example

```
rtrv-gttset
```

```
rtrv-gttset:netdom=ansi
```

```
rtrv-gttset:gttsn=t800
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

If the **gttsn** parameter is specified, it cannot have a value of **none**, and must match an existing **gttsn**.

If the **netdom** parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

```
No GTT Sets matching the specified criteria were found.
```

The **netdom=cross** parameter is valid only if the **settype=cdgta** parameter is specified.

If the **gttsn** parameter is specified, the **settype** and **netdom** parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the **settype** parameter is **cggta, cgssn, opc, or cgpc**.

The ANSI-ITU-China SCCP Conversion feature must be turned on before the **netdom=cross** parameter can be specified.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-**

tt) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

When the Origin-based SCCP Routing feature is turned on, the **settype** parameter is displayed regardless of feature key status. If the feature key is not enabled, the **settyp=cdgta** parameter (default value) is displayed.

Output

Retrieve all GTT sets:

rtrv-gttset

```
rlghncxa03w 04-02-19 08:16:15 EST EAGLE 31.3.0
GTTSN      NETDOM      NDGT

imsi       itu       15
abcd1234   cross     12
;

```

Legend

GTTSN—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

NETDOM—The network domain.

SETTYPE—The GTT set type.

NDGT—The number of digits required for GTAs associated with this set.

rtrv-gtw-stp**Retrieve Gateway STP Parameters**

Use this command to display the level 3 ANSI transfer control status (TFCSTAT) parameter. This value is the level 3 control status used on a TFC message received from an ITU node destined for an ANSI node.

Keyword: **rtrv-gtw-stp**

Related Commands: **chg-gtw-stp**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

```
rtrv-gtw-stp
```

Dependencies

None

Notes

None

Output

```

rtrv-gtw-stp
rlghncxa03w 03-03-11 11:34:04 EST  EAGLE 31.3.0
TFCSTAT
1
;

```

rtrv-gtwy-acthresh**Retrieve the Gateway Screening Activity Threshold**

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

Keyword: rtrv-gtwy-acthresh

Related Commands: set-gtwy-acthresh

Command Class: Database Administration

Parameters

:lsn= (optional)

Linkset name.

Range: aaaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

Default: Display all

Example

rtrv-gtwy-acthresh: lsn=wy644368

rtrv-gtwy-acthresh

Dependencies

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

Notes

None

Output

The following example shows the display of the thresholds of all linksets:

rtrv-gtwy-acthresh

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0

LSN	REJ	RECV	INTRVL
WY644368	10	1000	10
WY234456	25	2000	20
LN123445	-	-	-
LN123556	25	2500	30
OP239900	-	5	5

;

The following example shows the display of the linkset **wy644368** rejection thresholds:

rtrv-gtwy-acthresh: lsn=wy644368

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0

LSN	REJ	RECV	INTRVL
wy644368	10	1000	10

:

Legend

LSN—Linkset name.

REJ—Reject threshold.

RECV—Received message threshold.

INTRVL—Monitor interval.

rtrv-gtwy-prmtrs**Retrieve Gateway Parameters**

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the **set-scrrej-prmtrs** command are displayed.

Keyword: **rtrv-gtwy-prmtrs**

Related Commands: **set-scrrej-prmtrs**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-gtwy-prmtrs

Dependencies

None

Notes

None

Output

rtrv-gtwy-prmtrs

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LIMIT INTRVL
1000 15
;
```

Legend

LIMIT—The threshold not to be exceeded.

INTRVL—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

rtrv-gws-actset**Retrieve Gateway Screening Stop Action Sets**

Use this command to display the values defined for gateway screening stop actions.

Keyword: **rtrv-gws-actset**

Related Commands: **chg-gws-actset**

Command Class: Database Administration

Parameters

:actid= (optional)

The identification number of the gateway screening stop action.

Range: **4-16**

Default: Display all

:actname= (optional)

The name of the gateway screening stop action set.

Range: *ayyyy*

One alphabetic character followed by up to five alphanumeric characters.

Default: Display all

Example

```

rtrv-gws-actset
rtrv-gws-actset:actname=cr
rtrv-gws-actset:actid=6

```

Dependencies

Either **actname** or **actid** can be specified, but not both.

Notes

If neither **actname** nor **actid** are specified with the **rtrv-gws-actset** command, all gateway screening stop actions are displayed.

Output

The following example displays output when 7 gateway screening stop action sets are defined.

rtrv-gws-actset

```

rlghncxa03w 03-03-07 00:57:31 EST EAGLE 37.2.0

;

rtrv-gws-redirect**Retrieve Gateway Screening Redirect**

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

Keyword: **rtrv-gws-redirect**

Related Commands: **chg-gws-redirect, dlt-gws-redirect, ent-gws-redirect**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-gws-redirect

Dependencies

None

Notes

None

Output**rtrv-gws-redirect**

```
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA          RI  SSN  TT   GTA

on        001-030-001 SSN  10   25   1800833
;
```

In the following example, the gateway screening redirect function is not enabled.

rtrv-gws-redirect

```
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA          RI  SSN  TT   GTA
Redirect function data is not provisioned.
;
```

Legend

ENABLED—Indicates whether the gateway screening redirect function is on or off

DPCA/DPCI/DPCN/DPCN24—The destination point code that the message is being redirected to.

RI—The routing indicator for the redirected message

SSN—The subsystem to which the redirected message is bound for.

TT—The translation type of the global title translation

GTA—The global title translation address

rtrv-home-smsc**Retrieve HOME SMSC Address**

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

Keyword: **rtrv-home-smsc**

Related Commands: **dlt-home-smsc**, **ent-home-smsc**

Command Class: Database Administration

Parameters

:force= (optional)

Display more than 50 entries.

Range: **yes, no**

Default: **no**

:num= (optional)

Number of entries to display. The **force** parameter must also be specified to display more than 50 entries.

Range: **0-500**

Default: **50**

:smc= (optional)

Short Message Service Center address.

Range: 1-21 digits

1-21 hexadecimal digits

Example

rtrv-home-smsc

rtrv-home-smsc:smc=552611646

rtrv-home-smsc:num=100:force=yes

Dependencies

The Portability Check for Mobile Originated SMS (MNP SMS), MO-based GSM SMS NP, MO-based IS41 SMS NP, MT-Based GSM SMS NP, or the MT-Based IS41 SMS NP feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered. (MNP SMS feature can be turned off with the **chg-ctrl-feat** command and the **rtrv-home-smsc** command will still execute.)

When the specified **num** parameter value is greater than 50, the **force=yes** parameter must also be specified.

Notes

None

Output**rtrv-home-smsc**

```

rlghncxa03w 03-03-28 08:50:12 EST  EAGLE 31.3.0
SMSC ADDRESS

13214564894498

;
```

rtrv-homern**Retrieve Home Routing Number Prefix List**

Use this command to retrieve a list of routing number prefixes that belong to the operating network.

Keyword: rtrv-homern

Related Commands: dlt-homern, ent-homern

Command Class: Database Administration

Parameters

This command has no parameters.

Example

```
rtrv-homern
```

Dependencies

The INP feature or the G-Port feature must be turned on, or the TINP feature must be enabled before this command can be entered.

Notes

None

Output**rtrv-homern**

```

rlghncxa03w 03-03-28 08:50:12 EST  EAGLE 31.3.0

rtrv-inpopts**Retrieve INP Options**

Use this command to retrieve INP-specific options.

Keyword: rtrv-inpopts

Related Commands: chg-inpopts

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-inpopts

Dependencies

The INP feature or the ANSI-41 INP Query (AINPQ) feature must be turned on before this command can be entered.

Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

If no NEC value has been provisioned, a value of **none** is displayed.

Output

The following example shows output with default INP options.

rtrv-inpopts

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE 34.1.0
INP OPTIONS
```

```

```

Legend

DRANAI—The nature of address indicator for the destination routing address.

NEC—The National Escape Code

DRANPV—The numbering plan value for the destination routing address.

DRA—The destination routing address.

CDPNPFX—The Called Party Number Prefix.

DLTPFX—The Delete Prefix

CDPNNAI—The Called Party Number Nature of Address Indicator.

SNAI—The Service Nature of Address Indicator

SPRESTYPE —The INP option to send a "Connect" message or a "Continue" message when IDP messages are received for INP services, the DN digits match, and the HLR ID is present.

rtrv-ip-card**Retrieve Internet Protocol Card**

Use this command to retrieve IP networking parameters for a given card.

Keyword: **rtrv-ip-card**

Related Commands: **chg-ip-card**

Command Class: Database Administration

Parameters

:loc= (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
rtrv-ip-card:loc=1211
```

```
rtrv-ip-card
```

Dependencies

The **loc** parameter value must correspond to a DCM card in the card table.

Notes

None

Output

```

Legend

LOC—The card location.

SRCHORDR—The Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVRONLY indicates that only the Domain server is searched.

DNSA—The IP address of Domain Server A.

DNSB—The IP address of Domain Server B.

DEFROUTER—The IP address for the default router.

DOMAIN—The Domain name of the Domain server.

SCTPCSUM—The SCTP checksum algorithm type.

rtrv-ip-host**Retrieve Internet Protocol Hostname**

Use this command to retrieve the IP Host table. The Host table defines local host names for IP addresses.

Output

```

rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1

rtrv-ip-lnk**Retrieve Internet Protocol Link**

Use this command to retrieve the IP link table.

Keyword: rtrv-ip-lnk

Related Commands: chg-ip-lnk

Command Class: Database Administration

Parameters

:loc= (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All card location link data are displayed.

:port= (optional)

Ethernet interface port ID.

Range: a, b

Default: All IP link port data associated with all ports on the card are displayed.

Example

```
rtrv-ip-lnk:loc=1211:port=a
```

```
rtrv-ip-lnk:loc=1211
```

```
rtrv-ip-lnk
```

Dependencies

The **loc** parameter value must correspond to a DCM card in the card table.

Notes

None

Output

```

;

Legend

LOC—The card location.

PORT—The Ethernet interface port ID, **A** or **B**.

IPADDR—The IP address for the specified port.

SUBMASK—The subnet mask of the IP interface.

DUPLEX—The mode of operation of the interface, **HALF** or **FULL**.

SPEED—The bandwidth for the interface in megabits per second, **10** or **100**.

MACTYPE—The Media Access Control Type of the interface, **802.3** or **DIX**. **802.3** indicates the IEEE standard number 802.3 for Ethernet 1, and **DIX** indicates the Digital/Inter/Xerox *de facto* standard for Ethernet 2.

AUTO—Whether or not to automatically determine duplex and speed. If **YES**, duplex and speed are automatically determined. If **NO**, duplex and speed are not automatically determined.

MCAST—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the DSM card to the MPS system.

rtrv-ip-node**Retrieve IP Node**

Use this command to display one or more nodes that are directly connected to a TCP/IP data link. A particular connection can be displayed, a particular application on a node can be displayed, or an entire node can be displayed. If an entire node is displayed, no parameters are required to perform this action. A particular application can be specified by giving either the application's name or its IP port on the node.

Keyword: **rtrv-ip-node**

Related Commands: **dlt-ip-node**, **ent-ip-node**

Command Class: Database Administration

Parameters

:ipaddr= (optional)

The remote host's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Default: Display all

:ipappl= (optional)

The IP application supported by the node.

Range: **stplan**

:ipport= (optional)

The logical IP port that addresses the application on the node.

Range: **1024-5000**

Default: Display all

:iprte= (optional)

The default router's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Default: Display all

:loc= (optional)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: Display all

Example

```
rtrv-ip-node
rtrv-ip-node:ipappl=stplan
rtrv-ip-node:ipaddr=193.4.201.50
rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024
rtrv-ip-node:loc=1201
```

Dependencies

If the **ipappl**, **ipport**, or **loc** parameter is specified, the others cannot be specified.

The **ipport** parameter can be specified only if the **ipaddr** parameter is specified.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

If the **loc** parameter is specified, the card location must be equipped with a TCP/IP data link.

If the **ipaddr** parameter is specified, that IP address must be in the TCP/IP data link table.

If the **ipappl** parameter is specified, that IP application must be in the TCP/IP data link table.

If the **iprte** parameter is not specified, then all TCP/IP nodes meeting the display criteria are displayed. If the TCP/IP node has no TCP/IP router assigned to it, dashes are displayed in the IPRTE field.

Notes

None

Legend

IPADDR—The remote host's IP address.

IPPORT—The logical IP port to address the application on the node.

IPAPPL—The IP application supported by the node.

LOC—The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

CAP—The maximum percentage of ethernet capacity for this node connection.

IPRTE—The default router's IP address.

rtrv-ip-rte

Retrieve IP Route

Use this command to display all static IP route entries in the Static IP Route table, or the entries for a specific card (destination IP addresses, subnet masks, and gateway IP addresses), or the entries for a specific destination IP address, or the entries for a specific gateway IP address.

Keyword: **rtrv-ip-rte**

Related Commands: **, ent-ip-rte**

Command Class: Database Administration

Parameters

:dest= (optional)

Destination IP Address. The IP Address of a remote destination host or network.

Range: 4 numbers separated by dots, with each number in the range of **0–255**.
The IP address **0.0.0.0** is not valid.

:gtwy= (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

Range: 4 numbers separated by dots, with each number in the range of **0–255**.
The IP address **0.0.0.0** is not valid.

:loc= (optional)

Card location. The unique identifier of a specific IP card in the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
rtrv-ip-rte
rtrv-ip-rte:loc=1301
rtrv-ip-rte:dest=128.252.10.5
rtrv-ip-rte:gtwy=140.190.15.3
```

Dependencies

Only one optional parameter can be specified in a single command.

The **loc** parameter value must correspond to a SSED CM card in the card table that is running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application. The B network is used only on SSED CM cards.

The specified destination IP address (**dest** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

rtrv-is41opts

Retrieve IS41 Options

Use this command to retrieve the IS41 option indicators maintained in the IS41OPTS table.

Keyword: rtrv-is41opts

Related Commands: chg-is41opts

Command Class: Basic

Parameters

This command has no parameters.

Example

rtrv-is41opts

Dependencies

The APORT, IGM, or MO-based IS41 SMS NP feature must be enabled before this command can be entered.

Output

The following example shows the output if the MO-based IS41 SMS NP feature is enabled.

rtrv-is41opts

tekelecstp 07-06-15 10:33:44 EST EAGLE 37.5.0

Legend

- **SMSREQBYPASS**—A-Port Bypass Indicator that indicates whether SMSREQ message will undergo A-Port message processing, if needed.
- **LOCREQDN**—Nature of called party obtained from received LOCREQ message.

- **IEC**—International Escape Code that LOCREQ message can contain and have lookup performed.
- **NEC**—National Escape Code that LOCREQ message can contain and have lookup performed.
- **RSPCGPARI**—Response Calling Party Routing Indicator of LOCREQ response message.
- **RSPCGPAPCP**—Response Calling Party Point Code Present of LOCREQ response message.
- **RSPCDPARI**—Response Called Party Routing Indicator of LOCREQ response message.
- **RSPCDPAPCP**—Response Called Party Point Code Present of LOCREQ response message.
- **RSPCGPANAI**—Response Calling Party Nature of Address Indicator of LOCREQ response message.
- **RSPCGPANP**—Response Calling Party Numbering Plan of LOCREQ response message.
- **RSPCGPATT**—Response Calling Party Translation Type of LOCREQ response message.
- **MTPLOCREQNAI**—MTP-Routed LOCREQ Nature of Address Indicator.
- **RSPPARM**—This specifies TCAP parameter that encodes RN and/or DN for a LOCREQ response message.
- **RSPDIG**—Digit Outgoing Format of the TCAP Outgoing Called Party parameter for a LOCREQ response message.
- **RSPNON**—MSRN Nature of Number of LOCREQ response message.
- **RSPNP**—MSRN Numbering Plan of LOCREQ response message.
- **RSPMIN**—Response LOCREQ MIN parameter encoding.
- **MSCMKTID**—Market ID of MSCID parameter for LOCREQ response message.
- **MSCSWITCH**—Market ID Switch of MSCID parameter for LOCREQ response message.
- **ESNMFG**—ESN Manufacture's Code of TCAP LOCREQ message.
- **ESNSN**—ESN Serial Number of TCAP LOCREQ message.
- **RSPDIGTYPE**—Response Digit Type of LOCREQ response message.
- **LOCREQRMHRN**—This specifies whether to remove HOMERN from TCAP Outgoing Called Party for a relayed LOCREQ message.
- **TCAPSNAI**—TCAP Service Nature of Address Indicator of LOCREQ message.
- **MOSMSNAI**—This specifies the number conditioning that is performed on the SMS message destination address before lookup in the number portability database is performed.
- **MTSMSDNFMT**—Format of digits in SMS_Address parameter of SMSREQ_ACK response message.
- **MTSMSTYPE**—Type of Network entity indicating successful NP DB lookup for the MT-based IS41 SMS NP feature.
- **MTSMSPARM**—Format of SMS_Address parameter in SMSREQ_ACK response message.
- **MTSMSDLTR**—This specifies whether delimiter digit string needs to be inserted before or after RN, if required, in SMSREQ response message.
- **MTSMSDLTRV**—Delimiter digit string which is inserted before or after RN, if required, in SMSREQ response message.

- **MTSMSACKN**—Type of response (ACK or NACK) for SMSREQ messages.
- **MTSMSESN**—This specifies whether the ESN parameter is encoded while generating SMSREQ_ACK response message.
- **MTSMSSSN**—This specifies the SSN to be encoded if MTSMSPARM is set to PCSSN.
- **MTSMSNAKERR**—This specifies the TCAP access denied reason to be included in the NACK response message.
- **MTSMSDIGTYPE**—This specifies the value that is used to encode "Type of digits" field in the SMS_Address parameter of SMSREQ_ACK message.
- **MTSMSCHKSRC**—This specifies whether the SCCP CgPA GTA of a SMSREQ message should be validated or not.

rtrv-isupvar-attrb**Retrieve ISUP Variant Attribute**

Use this command to retrieve the attributes of ISUP variant table entries.

NOTE: This command is obsolete.

Keyword: rtrv-isupvar-attrb

Related Commands: chg-isupvar-attrb, copy-isupvar-attrb, rtrv-pstn-pres

Command Class: Database Administration

Parameters

:display= (optional)

Display indicates which information in the variant entry will be displayed.

Range: brief, full

Default: brief

:msgcode= (optional)

The ISUP message type code entered to identify a specific ISUP message that is going to have its attributes changed.

Range: 0-255

The value can be specified in decimal (0-255) or hexadecimal (h'00-h'ff).

:parmcode= (optional)

The ISUP parameter code entered to identify a specific ISUP parameter that is going to have its attributes changed.

Range: 0-255

The value can be specified in decimal (0-255) or hexadecimal (h'00-h'ff).

:pstncat= (optional)

The PSTN category assigned to the variant entry being retrieved.

Range: 0-65535

:pstnid= (optional)

The PSTN ID identifying the sourcevariant table entry being copied.

Range: 0-65535

Example

rtrv-isupvar-attrb:pstncat=65535:pstnid=65535:msgcode=4

rtrv-isupvar-attrb:pstncat=1:pstnid=5:parmcode=h'20

Dependencies

The **pstncat=1** and **pstnid=2** parameter combination is invalid.

Required controlled features must be enabled.

- ISUP Normalization controlled feature
- ON/OFF controlled feature for Tekelec-defined Variant

The Tekelec-defined Variants are listed in .

- Quantity controlled feature for user-defined Variant

The **pstncat** and **pstnid** values must have been previously defined with **ent-pstn-pres**.

The **dpstncat** and **dpstnid** values must have been previously defined with **ent-pstn-pres**.

Notes

The **copy-isupvar-attrb** command provides the user with an easy way to provision a new ISUP variant table entry by copying all the data from another entry. Then the user changes the entry with the **chg-isupvar-attrb** command.

An ISUP variant table entry exists for each variant defined in the SG. Each entry contains ISUP message and parameter data specific to the ISUP protocol that variant uses. A variant is uniquely defined by its PSTN presentation value, consisting of a PSTN category and a PSTN ID.

The PSTN presentation is used to identify both the source and destination table entries. Both entries **must** be previously defined PSTN presentation values, such as either a Tekelec-defined PSTN or a user-defined PSTN by the **ent-pstn-pres** commands. Use the **rtrv-pstn-pres** command to display the **only** allowed values for the source and destination PSTNs.

If the source or destination variant is a Tekelec-defined PSTN value, then its associated ON/OFF control feature must be ENABLED.

The following is an example of a possible output displaying all supported parameters for a specified message in a variant.

```
PSTNCAT PSTNID MSGCODE ATTRIB ACTION 00001 00005 04h DEFINED CONVERT
MSGCODE PARMCODE TYPE ORDER ACTION 04h --- --- - CONVERT 10h MF 1 NONE 08h
MF 2 NONE 09h MV 1 CONVERT FEh MV 2 NONE 00h OPT - NONE 01h OPT - NONE 04h
OPT - NONE 0Fh OPT - PASSTHRU
```

Output

The following example displays one message in the specified variant.

rtrv-isupvar-attr:pstncat=65535:pstnid=65535:msgcode=4

PSTNCAT	PSTNID	MSGCODE	ATTRIB	ACTION
65535	65535	04h	DEFINED	PASSTHRU

ISUP variant table is (5 of 20) 25% full

;

Legend

PSTNCAT—The PSTN category identifying the source variant table entry being copied.

PSTNID—The PSTN ID identifying the source variant table entry being copied.

DPSTNCAT —The PSTN category identifying the destination variant table entry where the source variant table is being copied.

DPSTNID—The PSTN ID identifying the destination variant table entry where the source variant table is being copied.

rtrv-l2t

Retrieve Level 2 Timers

Use this command to display the values of the SS7 MTP Level 2 timers. The SS7 MTP level 2 timers are organized in 30 timer sets of 8 timer values each. The 30 timer sets have been grouped and system default values have been initialized by specification (ANSI, ITU, High Speed for China, and High Speed for Q.703 Annex A). Each timer set is administered individually by the **chg-l2t** command. The **ent-slk** command associates links with timer sets. Each assigned link is associated with one of the 30 timer sets.

Keyword: **rtrv-l2t**

Related Commands: **rtrv-slk**

Command Class: Database Administration

Parameters

:l2set= (optional)

Level 2 timer set identifier, or timer set number. Up to 30 different sets of SS7 MTP Level 2 timer sets can be defined. The **ent-slk** command can be used to assign an SS7 signaling link to any one of the 30 timer sets.

Range: **1-30**

Default: Display all timer sets.

Example

rtrv-l2t

rtrv-l2t:l2tset=3

Dependencies

None

Notes

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the **chg-l2t** command.

Output**rtrv-l2t**

rlghncxa03w 05-02-07 09:50:17 EST EAGLE5 34.0.0

rtrv-l3t**Retrieve Level 3 Timers**

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

Keyword: **rtrv-l3t**

Related Commands: **chg-l2t, chg-l3t, ent-ls, rtrv-l2t, rtrv-ls**

Command Class: Database Administration

Parameters

:l3set= (optional)

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the **ent-ls** or **chg-l3t** command.

Range: **1**

Default: Display table

Example

rtrv-l3t:l3tset=1

Dependencies

Only one timer set is supported in this release.

Notes

The timer output for this command is in seconds, even though it could have been entered in milliseconds on the **chg-l3t** command.

Output**rtrv-l3t:l3tset=1**

Legend**L3TSET**—The level 3 timer set table.**T1**—The delay, in seconds, to avoid message missequencing on changeover. Also used as the ITU MTP restart isolation timer.**T2**—The amount of time, in seconds, to wait for changeover acknowledgment.**T3**—Time controlled diversion – the delay, in seconds, to avoid missequencing on changeback.**T4**—The amount of time, in seconds, to wait for changeback acknowledgment, first attempt.**T5**—The amount of time, in seconds, to wait for changeback acknowledgment, second attempt.**T6**—The delay, in seconds, to avoid message missequencing on controlled rerouting.**T7**—The amount of time, in seconds, to wait for signaling data link connection acknowledgment.**T8**—The transfer-prohibited inhibited timer (transient solution).**T10**—The amount of time, in seconds, to wait before repeating the signaling-route-set-test message.**T11**—The transfer-restricted timer.**T12**—The amount of time, in seconds, to wait for uninhibit acknowledgment.**T13**—The amount of time, in seconds, to wait for force uninhibit.**T14**—The amount of time, in seconds, to wait for inhibition acknowledgment.**T15**—The amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test.**T16**—The amount of time, in seconds, to wait for route-set-congestion status update.**T17**—The delay, in seconds, to avoid oscillation of initial alignment failure and link restart.**T18**—The repeat TFR once by response method timers.**IT18**—The timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.**T19**—The failed link craft referral timer.

IT19—The amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages.

T20/IT22—The amount of time, in seconds, to wait before repeating the local inhibit test.

IT20—The amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts.

T21/IT23—The amount of time, in seconds, to wait before repeating the remote inhibit test.

IT21—The overall MTP restart timer at a signaling point adjacent to one whose MTP restarts.

T22—The timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available.

T23—The timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.

T24—The timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.

T25—The timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).

T26—The timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.

T28—The timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.

T29—The timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.

T30—The timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message.

T31—The false link congestion detection timer.

T32—The link oscillation timer—Procedure A.

rtrv-lbp

Retrieve Loopback Point Attributes

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

Keyword: rtrv-lbp

Related Commands: act-lbp, chg-lbp, dact-lbp, dlt-lbp, ent-lbp

Command Class: Database Administration

Parameters

:lbp= (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range: 1-32

Default: Display all

:link= (optional)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: Display all

:loc= (optional)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All card locations.

Example

```
rtrv-lbp
```

```
rtrv-lbp:loc=1202
```

```
rtrv-lbp:loc=1202:link=a
```

```
rtrv-lbp:loc=1202:link=a:lbp=3
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the **loc** parameter cannot be reserved by the system.

If the **link** parameter is specified, the **loc** parameter must be specified. If the **lbp** parameter is specified, both the **loc** parameter and the **link** parameter must be specified.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

The following example displays the attributes for all the loopback points for SS7 links assigned to the STP:

rtrv-lbp

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  PORTLINK  LBP  RLE  REP  CLLI  LFST
1101  A      1   DS0  0  -----  LLT
      7   OCU  0  -----  NLT
      9   NEI  0  -----  LLT

1102  A      2   DS0  0  -----  LLT
      3   DS0  4  -----  LLT
      4   NEI  0  -----  LLT

1102  B      1   DS0  0  -----  LLT
      6   NEI  0  -----  LLT

1215  A      1   DS0  0  -----  LLT
      3   DS0  4  -----  LLT
      5   DS0  5  -----  LLT
      7   DS0  8  -----  LLT
      9   NEI  0  -----  LLT
;
```

The following example displays the attributes for all the loopback points for the SS7 links A and B of the LIM card residing in the first frame, first shelf, and second slot of the STP:

rtrv-lbp:loc=1202

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST
1102  A      2   DS0  0  -----  LLT
      3   DS0  4  -----  LLT
      4   NEI  0  -----  LLT

1102  B      1   DS0  0  -----  LLT
      6   NEI  0  -----  LLT
;
```

The following example displays the attributes for all the loopback points for the SS7 link A of the LIM card residing in the first frame, first shelf, and second slot of the STP:

rtrv-lbp:loc=1202:link=a

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST

rtrv-lnp-serv

Retrieve LNP Service

Use this command to retrieve all LNP services. This command displays the assigned translation type, translation type name, service type, LNP digit validity indication, and TT aliases.

Keyword: rtrv-lnp-serv

Related Commands: chg-lnp-serv, dlt-lnp-serv, ent-lnp-serv

Command Class: Database Administration

Parameters

This command has no parameters.

Example

```
rtrv-lnp-serv
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

None

Output**rtrv-lnp-serv**

```

rlghncxa03w 02-11-28 14:42:38 EST EAGLE 30.0.0
SERV  TT  TTN      DV  ALIAS

Legend

SERV—Reserved service type name.

TT—Translation type

TTN—Translation type name

DV—Digits valid

ALIAS—Alias translation type

rtrv-lnp-ttmap**Retrieve LNP Translation Type Mapping**

Use this command to retrieve all LNP MRGTs or all LNP MRGTs for a given TT, TT-PC-SSN, or TT-DPC combination.

NOTE: This command does not support 24-bit ITU national point codes.

Keyword: rtrv-lnp-ttmap

Related Commands: chg-lnp-ttmap

Command Class: LNP Basic

Parameters

:force= (optional)

Forcible value.

Range: yes, no

Default: no

:num= (optional)

Number of entries to be displayed. This parameter specifies how many records you want to display (potentially within a given range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

Range: 1-52, 000

Default: 50

:pc= (optional)

ANSI destination point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: Display all

:tt= (optional)

The translation type.

Range: 0-255

Default: Display all

Example

```
rtrv-lnp-ttmap:tt=16:pc=100-100-100
```

```
rtrv-lnp-ttmap
```

```
rtrv-lnp-ttmap:tt=15:num=20
```

```
rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

If the **pc/pca** parameter is specified, the **tt** parameter must be specified.

The translation type must be in the LNP database.

If the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

Translation type values associated with AIN or IN LNP queries are not allowed for retrievals.

The **tt** parameter cannot be specified if the value has already been specified as an alias for another translation type.

Notes

Use the **tt** and **dpc** parameters to limit the displays to LNP MRGT records found matching their specified values. Combinations of these parameters are allowed.

Output

The following example shows how to retrieve an LNP GT:

```
rtrv-lnp-ttmap:tt=16:pc=100-100-100
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
TT PCA          NGT  RGTA
16 100-100-100  28   YES

Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 50 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA          NGT  RGTA
16 001-001-001  0    YES
16 100-100-100  28   YES
.
.
18 002-002-002  10   NO
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 20 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap:tt=15:num=20
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA          NGT  RGTA
15 001-001-002  10   NO
.
.
15 001-001-005  10   YES
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 100 LNP GTs assigned to the specified DPC value:

```
rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA          NGT  RGTA
16 001-001-001  0    NO
18 001-001-001  10   NO
.
.
.
Message Relay Table is 75% full
;
```

Legend

TT—The translation type.

PCA—The ANSI point code.

NGT—The new global title translation type.

RGTA—The replacement GTA treatment.

rtrv-lnpopts**Retrieve LNP System Options**

Use this command to display all the LNP-specific system options from the database.

Keyword: **rtrv-lnpopts**

Related Commands: **chg-lnpopts**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-lnpopts

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

None

Output

The following example shows the JIPPROV and JIPDIGITS fields that appear when the Triggerless LNP feature is turned on.

The WSMSC10DIG field appears when the LNP SMS feature is turned on.

rtrv-lnpopts

```

    AMASLPID      = 123456789
    INCSLP        = yes
    AMATYPE       = 003
    AMAFEATID     = 010
    CIC           = 1369
    AUD           = on
    SP            = a123
    FRCSMPLEX     = no
    ADMHIPRI      = yes
    GTWYSTP       = yes
    JIPPROV       = yes
    JIPDIGITS     = 919460
    CCP           = no
    SERVPORT      = no
    WQREDRCT      = off
    WSMSC10DIG    = yes
;

```

Legend

AMASLPID—AMA slip ID

INCSLP—Whether the AMA slip ID included in the response

AMATYPE—AMA call type

AMAFEATID—AMA feature ID

CIC—Carrier identification code

AUD—Audit indicator

SP—Service provider ID

FRCSMPLEX—Allow simplex database updates indicator

ADMHIPRI—Indicator that LNP database administration has the highest priority of all administration

GTWYSTP—Indicator that LNP system is also configured as a Gateway STP

JIPPROV—Indicator of whether a Jurisdictional Information Parameter (JIP) value is to be added to the IAM

JIPDIGITS—The Jurisdictional Information Parameter value

CCP—Copy Charge Parameters

SERVPORT—Service Portability

WQREDRCT—Wireless queries directed to default GTT

WSMS10DIG—SCCP GTA length indicator for 10 or 11 digits

rtrv-log**Display Records from the Log**

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

Keyword: rtrv-log

Related Commands:

Command Class: System Maintenance

Parameters

:dir= (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

Range: **fwd, bkwd**

fwd—Display entries from nearer the beginning of the log toward entries at the end of the log

bkwd—Display entries from nearer the end of the log toward entries at the beginning of the log

Default: **fwd**

:edate= (optional)

End date. Report only log entries that were created on or *before* the specified date (when **dir=fwd**), or only log entries that were created on or *after* the specified date (when **dir=bkwd**). See the Notes section for usage information.

Range: **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default: Report log entries regardless of their creation date

:enum= (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

Range: **1-1499**

1-999—Alarms (UAMs)

1000-1499—UIMs

Default: If **enum** is not specified and:

If **snum** is specified, the default **enum** value is the same as the specified **snum** value.

If **snum** is not specified and **type** is **alarm** or not specified, **enum= 999**.

If **snum** is not specified and **type** is **all** or **uim**, **enum= 1499**.

:etime= (optional)

End time. Report only log entries that were created on or *before* the specified time (when **dir=fwd**), or only log entries that were created on or *after* the specified time (when **dir=bkwd**). See the Notes section for usage information.

Range: **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default: Report log entries regardless of their creation time

:mode= (optional)

Log display mode; display all information or just summary information from each log entry.

NOTE: If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.

Range: **brief, full**

brief—Display only the first “Summary” line of the log entry

full—Display all information available in the log entry

Default: **full**

:next= (optional)

Number of additional records to display using the same direction (**dir**) and filtering criteria of **outgrp**, **type**, **slog**, and **mode** that were used for the previous successful **rtrv-log** command at the same terminal. This parameter cannot be specified with any other parameters in the command. See the Dependencies and Notes sections for usage information.

Range: 1-65500

:num= (optional)

Number of records that can be displayed before the report is stopped.

Range: 1-65500

Default: 15

:outgrp= (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on. This parameter cannot be specified when the **snum** parameter is specified.

Range: **all**, **appserv**, **appss**, **card**, **clk**, **db**, **dbg**, **gtt**, **gws**, **link**, **meas**, **mon**, **mps**, **pu**, **sa**, **seas**, **slan**, **sys**, **traf**

all— Retrieve information for all Output Groups

appserv— Application Server

appss— Application Subsystem

card— Card

clk— Clock

db— Database

dbg— Debug

gtt— GTT Maintenance

gws— GWS Maintenance

link— Link Maintenance

meas— Measurements Maintenance

mon— Monitoring (Sentinel or IMF) Maintenance

mps— MPS Maintenance

pu— Program Update

sa— System Administration

seas— SEAS (Sentinel or IMF)

slan— SLAN Maintenance

sys— System Maintenance

traf— Traffic

Default: If the **next** parameter is not specified, the default is **all**.

If the **next** parameter is specified, the output is the same as the immediately previous successful **rtrv-log** command that was entered at the same terminal (and no **rtrv-log** command was entered at another terminal).

:sdate= (optional)

Start date. Report only log entries that were created on or *after* the specified date (when **dir=fwd**), or only log entries that were created on or *before* the specified date (when **dir=bkwd**). See the Notes section for usage information.

Range: 000101-991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default: Report log entries regardless of their creation date

:slog= (optional)

Source of log. Which OAM's Maintenance log to access: active or standby.

Range: **act**, **stb**

act—Active OAM

stb—Standby OAM

Default: act

:snum= (optional)

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the **outgrp** parameter is specified.

Range: 1-1499

1-999—Alarms (UAMs)

1000-1499—UIMs

Default: All entries for the specified **type** are displayed.

If **type** is **all**, **alarm**, or not specified, **snum=1**.

If **type** is **uim**, **snum=1000**.

:stime= (optional)

Start time. Report only log entries that were created on or *after* the specified time (when **dir=fwd**), or only log entries that were created on or *before* the specified time (when **dir=bkwd**). See the Notes section for usage information.

Range: 000000-235959

hhmmss—hh=hours (00-23), mm=minutes (00-59), ss=seconds (00-59)

Default: Report log entries regardless of their creation time

:type= (optional)

Type of Maintenance log to access for the report: alarms (UAMs), UIMs, or both logs (**all**).

Range: all, alarm, uim

Default: alarm

Example

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

Dependencies

No other **rtrv-log** command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the **rtrv-log** command can be entered.

If both the **sdate** and **edate** parameters are specified,

- In the forward direction, the **sdate** value must be less than or equal to the **edate** value.
- In the backward direction, the **sdate** value must be greater than or equal to the **edate** value.

The month component of the **sdate** and **edate** parameters must be in the range 1–12.

The day component of the **sdate** and **edate** parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the **stime** and **etime** parameters must be in the range 00–59.

The minutes component of the **stime** and **etime** parameters must be in the range 00–59.

If the **sdate** parameter value is equal to the **edate** parameter value,

- In the forward direction, the **stime** value must be less than or equal to the **etime** value.
- In the backward direction, the **stime** value must be greater than or equal to the **etime** value.

The **sdate** parameter value plus the **stime** parameter value must be less than the current time and date combination.

If **dir=bkwd** is specified with a date and time range, **sdate/stime** must be greater than **edate/etime**.

When the **enum** parameter is specified, the **snum** parameter must be specified with a value less than or equal to the specified **enum** value.

The specified **enum** parameter value and the specified **snum** value must be within the same range: **1-999** for Alarms (UAMs) and **1000-1499** for UIMs.

The **type** parameter and the **snum/enum** parameters cannot be specified together in the command.

The **rtrv-log:next=** command must be entered on the same terminal where the previous successful **rtrv-log** command was entered in the system. No other parameters can be entered with the **next** parameter in the command.

The **rtrv-log:next=** command cannot be entered following a **rtrv-log** command that contained the **type=all** parameter. A **rtrv-log** command without the **type=all** parameter must be entered before the **rtrv-log::next=** command can be entered.

Because entries can be overwritten between the entry of a **rtrv-log** command without the **next** parameter and the entry of a **rtrv-log:next=** command, the **rtrv-log:next:** command might not execute successfully. Another **rtrv-log** command without the **next** parameter must be entered before the **rtrv-log:next:** command can be entered again,

The values specified for the **edate** with the **stime** parameter combination is not valid.

The values specified for the **edate** with **stime** and **etime** parameter combination is not valid.

When an **enum** parameter is specified, it requires an **snum** as its mated parameter.

No other parameters can be entered with the **next** parameter in the command.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999
years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any **sdate/edate** value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of two other parameters: **num** and **dir**. The **num** parameter determines the maximum number of entries to display, and the **dir** parameter determines whether entries are displayed from the oldest end (**dir=fwd** or not specified) or the newest end (**dir=bkwd**).

When **sdate** is specified and **edate** is not specified in the forward direction, **edate** is defaulted to be the end of the log.

When **edate** is specified and **sdate** is not specified in the forward direction, **sdate** is defaulted to be the beginning of the log.

When **sdate** is specified and **edate** is not specified in the backward direction, **edate** is defaulted to be the beginning of the log.

When **edate** is specified and **sdate** is not specified in the backward direction, **sdate** is defaulted to be the end of the log.

When **stime** is specified and **etime** is not specified in the forward direction, **etime** is defaulted to **235959**.

When **etime** is specified and **stime** is not specified in the forward direction, **stime** is defaulted to **000000**.

When **stime** is specified and **etime** is not specified in the backward direction, **rtime** is defaulted to **000000**.

When **etime** is specified and **stime** is not specified in the backward direction, **stime** is defaulted to **235959**.

When **stime** or **etime** is specified but neither the **sdate** or **edate** parameters are specified, **sdate** and **edate** are each defaulted to the value **today**.

The **num** parameter is used to control the maximum number of entries to be displayed by one command.

The **dir** parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the **dir** parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (**outgrp**) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group (**outgrp**) is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When **outgrp=all** is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The **next** parameter is used to display a specified number of additional log records after the previous **rtrv-log** entry at the terminal. New records that are logged after the previous **rtrv-log** command was entered will not be displayed when the **rtrv-log:next=** command is entered. The **next** parameter is valid only under the following conditions:

- The **rtrv-log:next=** command is entered at the same terminal from which the previous **rtrv-log** command was entered. The previous **rtrv-log** command must not include the **type=all** parameter.
- No other terminal has issued a **rtrv-log** command after the **rtrv-log** command entered at the terminal from which the **rtrv-log:next=** command is entered.
- The **next** parameter is the only parameter specified in the **rtrv-log** command.
- There are still logs present that match the conditions (except **time/date/num**) specified in the previous **rtrv-log** command.

When either a single **snum** or range of **snum/enum** is specified, only those Alarms or UIMs within the specified range are displayed.

When **snum** is specified and **enum** is not specified, the **enum** value defaults to the specified **snum** value.

When **enum** is specified, an **snum** value must be specified that is less than or equal to the specified **enum** value.

If an **snum** is specified within the range **1-999**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1-999**.

If an **snum** is specified within the range **1000-1499**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1000-1499**.

When **enum** is not specified and the specified **snum** Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the **snum** value is out of range.

If **snum** and **enum** are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

Output

In the following example, the sequence numbers that are replaced by the dashes (---) represent the UIMs that were discarded due to the UIM thresholding feature.

rtrv-log:type=uim:sdate=960715:stime=220000:num=50

rtrv-loopset**Retrieve Loop Set Command**

Use this command to retrieve loopset data from the database.

Keyword: rtrv-loopset

Related Commands: chg-loopset, dlt-loopset, ent-loopset

Command Class: Database Administration

Parameters

:disp= (optional)

Display method. This parameter specifies the manner in which the retrieved data is displayed.

Range: detail, list

detail— Provides detailed information for a loopset entry.

list— Provides a list of loopset entries.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

Default: detail

:force= (optional)

The **force=yes** parameter must be specified if the value of the **num** parameter is greater than **50**.

Range: yes

:mode= (optional)

Mode of operation. This parameter retrieves loopset entries that have been assigned the specified mode.

Range: notify, discard

notify— Generates a UIM without discarding the message.

discard— Generates a UIM and discards the message.

:name= (optional)

Loopset name. This parameter retrieves a specified loopset.

The **name=none** parameter cannot be specified.

Range: ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters.

:num= (optional)

Number. This parameter specifies the number of entries to be retrieved.

If the value of the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

Range: 1-1000

Default: **50**

Example

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

rtrv-loopset

This example provides detailed information for the loopset entry rtp1.

rtrv-loopset:name=rtp1

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

rtrv-loopset:num=100:force=yes

This example provides a list of the first 100 valid loopset entries in the loopset table.

rtrv-loopset:force=yes:num=100:disp=list

This example provides detailed information for the first 100 valid loopset entries set to discard mode in the loopset table.

rtrv-loopset:force=yes:num=100:mode=discard

This example provides a list of the first 100 valid loopset entries set to notify mode in the loopset table.

rtrv-loopset:force=yes:num=100:mode=notify:disp=list

Dependencies

If the value of the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

The value of the **name** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The **name=none** parameter cannot be specified.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

Output

The following example displays the loopset entry details for loopset **rtp1**.

rtrv-loopset:name=rtp1

rlghncxa03w 07-02-10 08:52:38 EST EAGLE Rel 35.6.0

LoopSet	Mode	Point Codes

rtrv-ls**Retrieve Linkset**

Use this command to show the linkset information.

Keyword: **rtrv-ls**

Related Commands: **chg-ls**, **chg-lsopts**, **dlt-ls**, **ent-ls**, **rept-stat-ls**

Command Class: Database Administration

Parameters

:apc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:apc/apca/apci/apcn/apcn24= (optional)

Adjacent point code.

:apci= (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:apcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible

point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The prefix indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cggtmod= (optional)

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

Range: **yes, no**

:itutfr= (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the **itutfr** parameter.

This parameter is valid for ITU national linksets only.

Range: **on, off**

Default: Display all link sets

:lsn= (optional)

Linkset name

Range: **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

Default: Display all link sets

:lst= (optional)

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

Range: **prx**

prx— Display proxy links.

:mtprese= (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range: **yes, no**

yes— equipped

no— not equipped

Default: Display all link sets

:ppc= (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

Synonym: **ppca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:ppc/ppca/ppci/ppcn/ppcn24= (optional)

Proxy Point Code.

The proxy point code must be a full point code.

:ppci= (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:ppcn= (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ppcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:randsls= (optional)

Random SLS (signaling link selection). This parameter is used to display linksets that have the specified value of the **randsls** parameter.

Range: **off, class0, all**

off— Displays all linksets where random SLS is disabled.

class0— Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

all— Displays linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled.

Default: **off**

:slsocbit= (optional)

Other CIC (Circuit Identification Code) Bit. This parameter displays all the linksets that have the **slsocbit** parameter set to a value from **5** to **16**.

Range: *****

*****— Specifies all possible values (**5–16**)

Default: Display all link sets

:slsrsb= (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

Range: **1–4**

Default: Display all link sets

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range: **000–255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0–255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Example

Display the attributes of all link sets:

rtrv-ls

Retrieve link set ls1:

rtrv-ls:lsn=ls1

Retrieve all link sets with the mtpsrse parameter set to yes:

rtrv-ls:mtpsrse=yes

Retrieve all link sets that use the slsocbit parameter with a value from 5 to 16:

rtrv-ls:slsocbit=*

Display a specified ITU linkset to view the settings for the slsrbs or slsocbit parameters:

rtrv-ls:lsn=lsitu

Retrieve all ITU national linksets that have the itutfr parameter set to on:

rtrv-ls:itutfr=on

Retrieve the specified ITU national linkset and display its setting for the itutfr parameter:

rtrv-ls:lsn=lsitun

Retrieve all ITU linksets where random SLS generation is enabled for Class0 SCCP traffic.

rtrv-ls:randsls=class0

Display all proxy linksets.

rtrv-ls:lst=prx

Display all linksets using a specified proxy point code.

rtrv-ls:ppc=11-11-11

Display all linksets using a specified secondary point code.

rtrv-ls:spc=2-2-2

Display all linksets using a specified adjacent point code.

rtrv-ls:apc=1-1-2

Retrieves all linksets where calling party global title modification is requested:

rtrv-ls:cggmod=yes

Dependencies

The specified linkset must be in the database.

All optional parameters, except for the combination of the **slsochbit** and **slsrsb** parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the **apcn** parameter is specified as the Adjacent Point Code, then the format of the **apcn** parameter must match the format dictated by the **chg-stpopts:npcfmti** parameter.

The SLSOCB feature must be enabled before the **slsochbit** parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the **apc** and **spc** parameters can be specified.

At least one linkset must be associated with the value of the **apc** parameter.

The Proxy Point Code feature must be enabled before the **lst=prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The value specified for the **ppc** parameter must be a full point code.

The value specified for the **ppc** parameter must already exist in the Destination table, and the **prx=yes** parameter must have been specified.

The value specified for the **apc** parameter must be a full point code.

The value specified for the **spc** parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The CLLI, TFATCABMLQ, MTPRSE, and ASL8 fields are displayed only when a specific linkset is specified. The SLSOCBIT and SLSRSB fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the **tfatcabmlq** parameter database value is **0** for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or **1** if there are 2 or fewer links in the linkset).

If the **tfatcabmlq** parameter database value is **0**, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be a minimum of **1** for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the **rtrv-ls** command output.

If the **tfatcabmlq** parameter value is set to a specific value greater than **0**, then the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the **rtrv-ls** command output.

The EAGLE 5 ISS **ent-ls** command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE 5 ISS command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS **vfy-ls** command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS **vfy-ls** output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The value specified for the **ppc** parameter must be a full point code. Cluster point codes and private point codes are not supported.

Output

The **randsls** parameter is displayed only for ITU linksets.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

In Release 37.5.0, if information is requested for a linkset, then the secondary point code field is displayed in the output. If the MLS feature is not enabled, or if the linkset was not created with a secondary point code, the field contains dashes.

In Release 38.0, headings for unequipped cards are not displayed.

The following example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic:

rtrv-ls:randsls=all

tekelecstp 06-09-05 15:11:49 EST EAGLE 36.0.0

Link set table is (18 of 1024) 2% full.

;

Legend

LSN—The name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the **apctype=itunchina** parameter specified.

APC/APCI/APCN/APCN24—The adjacent DPC of the linkset.

SPC/SPCI/SPCN/SPCN24—The secondary PC of the linkset.

SCRN—The screen set assigned to the linkset.

L3TSET—The level 3 timer set value assigned to the linkset.

SLTSET—The SLTM record associated with the linkset.

BEI—The broadcast exception indicator. This field indicates whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

LST—The type of links in the linkset (access links, bridge links, etc.).

LNKS—The number of links in the linkset.

GWSA—Shows whether gateway screening is used on the specified linkset.

GWSM—Shows whether the display of messages generated for each screened message is turned on or off.

GWSD—Shows whether the gateway screening message discard function is turned on or off.

SLSCI—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset.

NIS—Shows whether the Network Indicator Spare option is on or off for the specified linkset.

CLLI—The far end Common Language Location Identifier (CLLI).

TFATCABMLQ—Displays the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted.

MTPRSE—Shows whether the adjacent node is equipped with MTP restart.

ASL8—Shows whether the adjacent node is sending MSUs with 8-bit SLSs.

MULTGC—Shows whether multiple group codes are allowed.

IPGWAPC—Shows whether the adjacent point code is an IP Gateway adjacent point code.

MATELSN—The name of the mate IP Gateway linkset.

IPTPS—Provisioned or default TPS for the specific IPGWx linkset. This value is a user-defined or default portion of the total enabled system IP Signaling TPS.

LSUSEALM—The percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

SLKUSEALM—The percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

LOC—The location of the card containing the signaling links that make up the linkset.

PORT—The port on the card containing the signaling link.

SLSOCBIT—The setting of the Other CIC (Circuit Identification Code) Bit.

SLSRSEB—The setting of the Rotated SLS (Signaling Link Selection) Bit.

GSMSCRN—Shows whether the GSM MAP screening indicator is turned on or off.

ITUTFR—Shows whether the ITU TFR procedure indicator is turned on or off.

L2TSET—The level 2 timer set value associated with the signaling link.

SLC—The signaling link code of the signaling link.

TYPE—The type of card.

BPS—The transmission rate for the link in bits per second.

L1MODE—The mode of operation used to select the link clocking source at layer 1.

TSET—An indicator of whether the transmitter signal element timing is on or off.

E1PORT—The E1 port with the E1 interface that services the link.

E1LOC—The card location of the E1 card with the E1 interface that services the link.

T1PORT—The T1 port with the T1 interface that services the link.

T1LOC—The card location of the T1 card with the T1 interface that services the link.

TS—The timeslot assigned to the link that is serviced by the E1 or T1 interface.

E1ATMCRC4—The indicator of whether CRC4 multi-frame structure is enabled or disabled.

E1ATMSI—Value of two Spare International bits of NFAS data.

E1ATMSN—Value of five Spare National bits of NFAS data.

RANDSLS—The setting of linkset for Random SLS generation.

ADAPTER —Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset.

RCONTEXT —The routing context id of IPSP M3UA linkset.

ASNOTIF —Shows whether AS notifications will be generated for IPSP M3UA linkset.

ANAME —The association name configured for signaling link of IPSP linkset.

SLKTPS —The provisioned TPS for concerned signaling link of the specified IPSP linkset.

CGGTMOD— Shows whether calling party global title modification indicator is yes or no for the linkset.

PPC/PPCI/PPCN/PPCN24 —The proxy point code of the linkset.

NUMSLKALW—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state.

NUMSLKRSTR—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state.

NUMSLKPROH—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state.

rtrv-m2pa-tset

Retrieve M2PA Timer Set

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

Keyword: rtrv-m2pa-tset

Related Commands: chg-m2pa-tset

Command Class: Database Administration

Parameters

:tset= (optional)

The name of the M2PA timer set to be retrieved.

Range: 1-20

:ver= (optional)

The M2PA version supported by the association.

Range: d6, rfc

Example

```
rtrv-m2pa-tset
```

```
rtrv-m2pa-tset:tset=1
```

Dependencies

None

Notes

If a timer set is not specified in the command, all timer sets are retrieved.

Output

rtrv-m2pa-tset:tset=1:ver=d6

rtrv-map**Retrieve Mate Applications**

Use this command to show the mated application relationship information maintained by the system. This information is used to support the routing of SCCP management SSP/SSA messages.

Keyword: rtrv-map

Related Commands: chg-map, dlt-map, ent-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:mapset= (optional)

The MAP set ID.

Range: 1-36000 dflt

dflt—Default MAP set

Default: **dflt** - The default value of the **mapset** parameter is **dflt** only when the Flexible GTT Load Sharing feature is not enabled.

:pc= (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

:pci= (optional)

ITU international point code in the form of *zone-area-id*.

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ssn= (optional)

Subsystem number

Range: **2-255**

Default: All subsystem numbers and their mates are shown for the given point code.

Example

rtrv-map:pc=10-10-10:ssn=10

rtrv-map:pcn=12345:ssn=5

rtrv-map:pcn=12345:ssn=5

rtrv-map:pcn24=12-12-12

rtrv-map

rtrv-map:mapset=dflt

rtrv-map:pc=1-1-3

rtrv-map:pc=1-1-3:ssn=10

rtrv-map:pc=1-1-1:ssn=10:mapset=362

rtrv-map:pc=1-1-2:ssn=10:mapset=dflt

rtrv-map:mapset=2

rtrv-map:pc=1-1-3:mapset=12

Dependencies

The value of the **pc/pca/pci/pcn/pcn24** parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See the **canc-cmd** command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

When the Flexible GTT Load Sharing feature is enabled, MAP Load Sharing sets are supported. Each set is identified by a MAPSET field.

When the Flexible GTT Load Sharing feature is not enabled, the MAP set is not displayed and the display remains unchanged.

Output

All subsystem numbers for the specified point code and its mates are shown.

If no parameters are entered, all defined remote point codes (up to 1024) are shown.

rtrv-map

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

Legend

PC/PCA/PCI/PCN/PCN24—This field identifies the point code of the SCP where the primary application resides.

MATE PC/PCA/PCI/PCN/PCN24—This field identifies the point code of the SCP where the mate application resides.

SSN—This field identifies the applications subsystem number.

RC—This field identifies the relative cost of the point code/subsystem.

MUL —Multiplicity mode (Solitary, Loadsharing, Dominant, Combined) See the "Notes" section in the **chg-map** command description for an explanation of multiplicity modes.

MPC —This field identifies the multiplicity mode when the Flexible GTT Loadsharing feature or the Weighted GTT Loadsharing feature are on. The field can show SOL (Solitary), SHR (Load sharing), COM (Combined Load Sharing and Dominant), or DOM (Dominant). See the **ent-map** command "Notes" section for a definition of the multiplicity modes.

SRM—This field specifies whether subsystem routing messages are transmitted.

MRC—This field specifies whether message routing under congestion is on (YES) or off (NO).

GRP NAME—This field identifies the name of a group of point codes (the broadcast list group name) that should be notified of the subsystem status.

SSO—Subsystem Status Option. Indicates the subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.

WT—This field specifies the weight assigned to the PC.

%WT—This field specifies the relative percentage, according to weight, of an in-service PC within an RC group.

THR—This field specifies the service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.

MAPSET ID—This field specifies the MAP set.

rtrv-meas-sched

Retrieve Measurements Schedule

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for EOAM based measurements.

NOTE: This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see rtrv-measopts).

NOTE: Refer to the *Maintenance Manual* for specific details on measurement reports.

Keyword: rtrv-meas-sched

Related Commands: chg-meas, rept-meas, rtrv-measopts

Command Class: Link Maintenance

Parameters

This command has no parameters.

Example

```
rtrv-meas-sched
```

Dependencies

None

Notes

None

Output

Output with measurement collection on.

rtrv-meas-sched

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = on
GTWYLSFLTR   = both
-----
SYSTOT-STP   = on
SYSTOT-TT    = off
SYSTOT-STPLAN = off
COMP-LNKSET  = on
COMP-LINK     = on
GTWY-STP     = on
GTWY-LNKSET  = on
MTCD-STP     = on
MTCD-LINK    = on
MTCD-STPLAN  = on
MTCD-LNKSET  = on
;
```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

rtrv-meas-sched

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = off
GTWYLSFLTR   = (both)
-----
SYSTOT-STP   = (off)
SYSTOT-TT    = (off)
SYSTOT-STPLAN = (off)
COMP-LNKSET  = (off)
COMP-LINK     = (off)
GTWY-STP     = (off)
GTWY-LNKSET  = (off)
MTCD-STP     = (on)
MTCD-LINK    = (on)
MTCD-STPLAN  = (on)
MTCD-LNKSET  = (on)
;
```

Legend

COLLECT—Shows whether measurement collection is on or off.

GTWYLSFLTR—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:

both—Only gateway linksets are included in the report to the terminal and SEAS.

stp—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.

seas—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.

none—All defined linksets are included in the report to the terminal and SEAS.

SYSTOT-STP—System total–STP measurement collection is on or off.

SYSTOT-TT—System total–translation type measurement collection is on or off.

SYSTOT-STPLAN—System total–STP LAN measurement collection is on or off.

COMP-LNKSET—Component-linkset measurement collection is on or off.

COMP-LINK—Component-link measurement collection is on or off.

GTWY-STP—Gateway administration-STP measurement report is on or off.

GTWY-LNKSET—Gateway administration-LNKSET measurement report is on or off.

MTCD-STP—Maintenance daily-STP measurement collection is on or off.

MTCD-LINK—Maintenance daily-link measurement collection is on or off.

MTCD-STPLAN—Maintenance daily-STP LAN measurement collection is on or off.

MTCD-LNKSET—Maintenance daily-LNKSET measurement report is on or off.

rtrv-measopts

Retrieve Measurement Options

Use this command for the following functions:

- Show the enabled/disabled status of all FTP scheduled measurements reports
- Verify that the Measurements Platform has been enabled (PLATFORMENABLE setting)
- Verify that the 15 Minute Measurements collection option has been turned on (COLLECT15MIN setting)
- Verify that the CLI-based report file name option is turned on or off (CLLIBASEDNAME setting)

Keyword: rtrv-measopts

Related Commands: chg-measopts

Command Class: Link Maintenance

Parameters

This command has no parameters.

Example

rtrv-measopts

Dependencies

The Measurements Platform feature must be on before this command can be entered.

This command cannot be entered while in upgrade mode.

Notes

None

Legend

PLATFORMENABLE—Indicator that measurements collection is enabled or disabled when the Measurements Platform feature is turned on. See the **chg-measopts** command.

COLLECT15MIN—Indicator that 15 Minute Measurements collection is enabled or disabled when the 15 Minute Measurements feature is turned on. See the **chg-measopts** command **collect15min** parameter.

CLLIBASEDNAME—Indicator that the CLI-based file name option is turned on or off.

SYSTOTSTP—System Total measurements report for the entire STP.

SYSTOTTT—System Total report for Translation Type measurements.

SYSTOTSTPLAN—System Total report STP LAN measurements.

COMPLINK—Component measurements report for links.

COMPLNKSET—Component measurements report for link sets.

COMPSCTPASOC—Component measurements report for SCTP associations.

COMPSCTPCARD—Component measurements report for SCTP cards.

COMPUA—Component measurements report for M3UA and SUA application server/association pairs.

GTWYORIGNI—Gateway Administration measurements report per originating network (large network uniquely identified by NI only).

GTWYORIGNINC—Gateway Administration measurements report per originating network (small network identified by NI-NC).

GTWYLSORIGNI—Gateway Administration measurements report per link set and originating network.

GTWYLSDESTNI—Gateway Administration measurements report per link set and destination network.

GTWYLSONISMT—Gateway Administration measurements report per link set, per originating network, per ISUP message type.

MTCHEIR—Maintenance Hourly (marginal) measurements report for Equipment Identity Register

MTCHNP—Maintenance Hourly (marginal) measurements report for INP or G-Port.

MTCHLNP—Maintenance Hourly (marginal) measurements report for LNP.

MTCHMAP—Maintenance Hourly (marginal) measurements report for GSM Map Screening.

MTCDEIR—Maintenance Daily measurements report for Equipment Identity Register

MTCDSTP—Maintenance Daily measurements report for STP.

MTCDLNK—Maintenance Daily measurements report for links.

MTCDLNKSET—Maintenance Daily measurements report for linksets.

MTCDSCTPASOC—Maintenance Daily measurements report for SCTP associations.

MTCDSCTPCARD—Maintenance Daily measurements report for SCTP cards.

MTCDUA—Maintenance Daily measurements report for M3UA and SUA application server/association pairs.

MTCDSTPLAN—Maintenance Daily measurements report for STPLAN.

MTCDLNP—Maintenance Daily measurements report for LNP.

MTCDNP—Maintenance Daily measurements report for INP or G-Port.

MTCDMAP—Maintenance Daily measurements report for GSM Map Screening.

NMLINK—Network Management measurements report for links.

NMLNKSET—Network Management measurements report for link sets.

NMSTP—Network Management measurements report for the entire STP.

AVLINK—Hourly Availability report for links.

AVLSTPLAN—Hourly Availability report for STP LAN.

AVLDLINK—Daily Availability report for links.

rtrv-mrn

Retrieve Mated Relay Node

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE 5 ISS. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing Feature and the Flexible GTT Load-Sharing feature are enabled, use this command to retrieve MRN set information.

Keyword: rtrv-mrn

Related Commands: chg-mrn, dlt-mrn, ent-mrn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:mrnset= (optional)

The MRN set ID.

Range: 1-3000 dflt

dflt—Default MRN set

:pc= (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Post-GTT-translated point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

rtrv-mrn

rtrv-mrn:pc=1-1-2

rtrv-mrn:pci=s-2-2-1

rtrv-mrn:pcn=s-1-1-1-123-aa

rtrv-mrn:mrnset=dflt

rtrv-mrn:pc=1-1-3:mrnset=dflt

rtrv-mrn:pc=1-1-3:mrnset=111

Dependencies

A point code that is specified in the command must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

In the following example, the MRN table limit is 3000 entries; 768 entries are used as Mated Relay Nodes and 12 entries are used for SCCP-SERV reroute.

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP Service Reroute service. For this example, only a few of the 768 entries are reported to conserve space.

```

Legend

- **MRNSET**—MRN set ID
- **PC/PCI/PCN**—Point Code
- **RC**—Relative Cost
- **WT**—PC Weight
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group.
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within a RC group falls below the in-service threshold, that RC group is considered out-of-service, and traffic is routed to the next lowest RC group.

rtrv-na**Retrieve Network Appearance**

Use this command to display the configured network appearances.

Keyword: rtrv-na

Related Commands: dlt-na, ent-na

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-na

Dependencies

None

Notes

None

Output

```

rtrv-na
rlghncxa03w 05-01-20 09:07:58 EST EAGLE 31.12.0
TYPE      GC      NA
ANSI      --      0
ITUI      --      1
ITUN      aa      2
ITUN24    --      3
ITUIS     --      4
ITUNS     bb      5
;

```

rtrv-netopts**Retrieve Network Options**

Use this command to retrieve the user-specified options for the IP networks used by the EAGLE 5 ISS. This command displays the Private Virtual Network (PVN) IP address and PVN subnet mask.

Keyword: rtrv-netopts

Related Commands: chg-netopts

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-netopts

Dependencies

None

Notes

None

Output

```
rtrv-netopts
rlghncxa03w 03-03-20 09:07:58 EST EAGLE 31.3.0
NET OPTIONS
-----
PVN          172.20.50.0
PVNMASK      255.255.252.0
;
```

rtrv-oap-config**Retrieve OAP Configuration**

Use this command to display the OAP configuration information in the EAGLE 5 ISS database configured with the **chg-oap-config** command.

Keyword: **rtrv-oap-config**

Related Commands: **chg-oap-config**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-oap-config

Dependencies

The SEAS feature must be on (**seas=on** in the **rtrv-feat** command output) before this command can be entered.

Notes

None

Output

In the following example, the SEAS feature is on.

rtrv-oap-config

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
OAP CONFIGURATION REPORT
DATA
OAP A
OAP B
Hostname tekelec-8 tekelec-9
IP Address 128.132.064.015 128.132.064.016
IP Netmask 255.255.255.000 255.255.255.000
Default Router 128.132.064.001 128.132.064.001
Config dual dual
SEAC CLLI SEASNJPYRRC SEASNJPYRRC
X25 Packet Size 7 7
X25 Mode DTE DTE
;
```

Legend

HOSTNAME—Host name of OAP A or OAP B.

IP ADDRESS—IP address of OAP A or OAP B.

IP NETMASK—The netmask for OAP A or OAP B.

DEFAULT ROUTER—The IP address of the default router assigned to OAP A or OAP B.

CONFIG—The number of OAPs configured (single or dual).

SEAC CLLI—The common language location identifier (CLLI) of the SEAC to which the OAP connects.

X25 PACKET SIZE—The X.25 package size for the link to the SEAC (7 or 8).

X25 MODE—The mode of the X.25 link to the SEAC (DTE or DTC).

rtrv-obit**Retrieve Obituary Report**

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

Keyword: rtrv-obit

Related Commands: act-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-trbl

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

Range: 1113,1115

:mode= (optional)

Display mode

Range: **c, m**
 c—Continuous mode; shows obituaries already logged and new obituaries as they occur.
 m—Manual mode; shows obituaries on demand only, when this command is entered.
Default: **c**

:num= (optional)

This parameter indicates how many obituaries to display.

Range: **1-150**

Default: **150**

Example

rtrv-obit:loc=1115:num=2

Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

Only one **rtrv-obit** or **rtrv-trbl** command at a time can be in progress throughout the entire system.

The card location specified by the **loc** parameter must be either **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

The **num** parameter value must be between **1** and **150**.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command when the command is entered for the active OAM. See **canc-cmd** for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the **mode=m** parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which include HIPR and HC MIM cards) contains significantly more information than an obituary from an x86-based processor card. The data in an IXP obituary will be spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

Output

The following example shows output for two obituaries from an x86-based card.

rtrv-obit:loc=1115:num=2

```

rtrv-ppsopts**Retrieve Prepaid SMS Options**

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

Keyword: rtrv-ppsopts

Related Commands: chg-ppsopts

Command Class: Database Administration

Parameters

:ppt= (optional)

Prepaid portability type. This parameter specifies an IN platform.

Range: 1-32

Example

rtrv-ppsopts

rtrv-ppsopts:ppt=2

Dependencies

The Prepaid SMS Intercept Ph1 feature must be turned on before this command can be entered.

Output

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.
The following example displays Prepaid SMS options for a specific Prepaid Type.

rtrv-ppsopts:ppt=1

```
tekelecstp 06-11-29 15:07:01 EST EAGLE 37.0.0
```

```
Prepaid SMS Options
```

```

Legend

- **PPT**—Prepaid Portability Type
- **PCI**—An ITU international point code for an IN platform
- **PCN**—An ITU national point code for an IN platform
- **RI**—A routing indicator for an IN platform
- **SETID**—Specifies the MAP Set ID or MRN Set ID based on the RI value

- **GTA**—Entity addresses for up to 32 IN platforms. An unprovisioned GTA has a value of **none**.

rtrv-prefix

Retrieve Prefix

Use this command to retrieve provisioned prefix information for all supported features or for a specified feature.

Keyword: **rtrv-prefix**

Related Commands: **chg-prefix**, **dlt-prefix**, **rtrv-ctrl-feat**

Command Class: Database Administration

Parameters

:feature= (optional)

Feature Name. This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtrv-ctrl-feat** command output.

Range: *abcdefghijklmnopqrstuvwxyz*

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with "GSM MAP." Enough additional characters to identify which GSM MAP feature is being entered (at least "GSM MAP SR" to identify the "GSM MAP SRI Redirect" feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

Example

Retrieve provisioned prefix information for all supported features.

rtrv-prefix

Retrieve prefix information for the GSM MAP SRI Redirect feature.

rtrv-prefix:feature="GSM MAP SRI Redirect"

Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output; The specified feature must be one of the following features that are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

Notes

None

Output

For all features, retrieve the provisioned prefix information. There is additional information displayed in the function column for prefix numbers 6 and 7 of the “ISUP NP with EPAP” feature and for all prefix numbers for the “Prepaid IDQ Query Relay” feature.

rtrv-prefix

rlghncxa03w 04-09-20 09:04:14 EST EAGLE 34.1.0

Feature	NUM	Prefix	Function

GSM MAP SRI Redirect	1	1a1a	
GSM MAP SRI Redirect	2	ffff	
GSM MAP SRI Redirect	3	1234	
ISUP NP with EPAP	1	3b4c	
ISUP NP with EPAP	6	886	Insertion Country Code
ISUP NP with EPAP	7	0	Deletion Condition
Prepaid IDQ Query Relay	1	123	Intl Insert Prefix
Prepaid IDQ Query Relay	2	456	Natl Insert Prefix
Prepaid IDQ Query Relay	3	1	CDPN NAI Incoming
Prepaid IDQ Query Relay	4	1	CGPA DEF CC Check On

FEATPFX table is (6 of 256) 2% full

;

For the “GSM MAP SRI Redirect” feature, retrieve the provisioned prefix information. The table capacity for the total number of entries in use is reported, not just the number of entries displayed. There is no additional information displayed in the Function column for this feature.

rtrv-prefix:feature="GSM MAP SRI Redirect"

rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0

Feature	NUM	Prefix	Function

GSM MAP SRI Redirect	1	1a1a	
GSM MAP SRI Redirect	2	ffff	
GSM MAP SRI Redirect	3	1234	

FEATPFX table is (6 of 256) 2% full

;

rtrv-pstn-pres**Retrieve PSTN Presentation Parameters**

Use this command to display PSTN Presentation parameters supported by the IP⁷ Secure Gateway. This command provides a summary of the available values for the PSTNCAT and PSTNID parameters used in SS7 routing key commands and ISUP Normalization Administration commands.

NOTE: This command is obsolete.

Keyword: rtrv-pstn-pres

Related Commands: chg-appl-rtkey, chg-isupvar-attrib,, dlt-pstn-pres, ent-pstn-pres, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-pstn-pres

Dependencies

The ISUP Normalization controlled feature must be enabled.

Notes

All the *Tekelec-defined* and *user-defined* PSTNs will be displayed.

An asterisk (*) will be displayed next to the PSTN Category for the following reasons:

- The ETSIV3 Variant before it has its controlled feature enabled
- Variants that are no longer useable. These are Variants that are disabled because their temporary feature key expired. The user should either get a permanent feature key for the Variant or use the **dlt-pstn-pres** command to remove the Variant.

Output**rtrv-pstn-pres**

rlghncxa03w 03-03-07 12:05:33 EST EAGLE 31.3.0

PSTNCAT Value(s)	PSTNCAT Description	Valid PSTNID Value(s) in PSTNCAT

Point code subtype prefixes—

s- Spare point code**p-** Private point code**ps-** Private and spare point code**rtrv-rte****Retrieve Route**

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

Keyword: rtrv-rte

Related Commands: dlt-rte, ent-rte, rept-stat-dstn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:clli= (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

Range: ayyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default: No value given

:dpc= (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:dpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—**s-, p-, ps-**

nnnnn—**0-16383, ***

gc—**aa-zz, ***

m1-m2-m3-m4—**0-14** for each member; values must sum to 14; or ***-*-*-*** when the point code includes a group code.

:dpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (optional)

Linkset name

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

Range: **none, s, p, ps**

none— Display all point codes that do not have subtype prefixes

s— Display only spare point codes

p— Display only private point codes

ps— Display only private and spare point codes

:pctype= (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

Range: **ansi, itui, itun, itun24**

Example

```

Dependencies

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must exist in the Destination Point Code table.

If the **dpc** and **lsn** parameters are specified, the linkset name must be defined as a route.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts** command **npcfnti** parameter.

If the **pctype** parameter has a value of **ansi** or **itun24**, then the **pcst** parameter cannot have a value of **s** or **ps**.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters. If the **rset** parameter is specified, then the **rsn**, **dpc**, **clli**, **pctype**, and **pcst** parameters cannot be specified.

The NRT feature must be turned on before the **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the destination point code has a value of * in the NC field, the NCM field must also be * (for example, **dpc=21-*-***).

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must be a valid point code.

If the **clli** parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The Route table is corrupt or cannot be found.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-***). This does not include the specified cluster point code (for example, **20-2-***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-*****) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-***).
- An asterisk (*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, ***-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-***).
- An asterisk (*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, ***-*-*-*-ab** is valid; ***-15-*-*-ab** is not valid).

Output

In the **rtrv-rte** command output examples, the point code prefixes **s-**, **p-**, and **ps-** indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

Legend

DPC, DPCA, DPCI, DPCN, DPCN24—The destination point code to be reached through this route.

ALIAS, ALIASA, ALIASI, ALIASN/N24—The alias associated with the route.

CLLI—The CLLI associated with the route.

LSN—The name of the linkset assigned to this route.

RC—The relative cost (priority) assigned to the route.

APC, APCA, APCI, APCN, APCN24—The point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

rtrv-rtx**Retrieve Exception Route**

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the **cic** and **ecic** parameters are displayed.

Keyword: **rtrv-rtx**

Related Commands: **dlt-rtx, ent-rtx**

Command Class: Database Administration

Parameters

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:class= (optional)

Exception routing class. This parameter causes all exception route sets provisioned for the specified class to be displayed.

Range: **opc, ilsn, cic, si**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255, *, **, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpci= (optional)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—**s-, p-, ps-**

nnnnn—**0-16383, ***

gc—**aa-zz, ***

m1-m2-m3-m4—**0-14** for each member; values must sum to 14; or *-*-*-* when the point code includes a group code.

:dpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:lsn= (optional)

Link Set Name. The linkset associated with the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255, *, **, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk values *****, ******, and ******* are not valid for the *ni* subfield.

If ****** or ******* is specified for the *nc* subfield, either *****, ******, or ******* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-***** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—**s-, p-, ps-**

nnnnn—**0-16383, ***

gc—**aa-zz, ***

m1-m2-m3-m4—**0-14** for each member; values must sum to 14; or ***-*-*** when the point code includes a group code.

:open24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: **3-15**

Example

rtrv-rtx:dpca=1-1-1

rtrv-rtx:opca=6-*-*

rtrv-rtx:ilsn=lset4

rtrv-rtx:si=5

rtrv-rtx:cic=0:ecic=16383

Dependencies

Only one of the **opc**, **ilsn**, **cic**, **si**, or **class** parameters can be specified.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

Notes

** can be used in the network cluster member (*ncm*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

** can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network (*ni*).

*** can be used in the network cluster member (*ncm*) subfield of **dpc/dpca/opc/opca** to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*), and the network cluster address (if any).

*** can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

* is allowed only for retrieves (for example, **rtrv-rtx:dpcn=-aa** or **rtrv-rtx:open=-xy**) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on. ** and *** is not allowed for ITU-N DPCs and OPCs (for example, **dpcn=-*-xy** is rejected). The node and group code cannot both be * (**dpcn=-*-*** is rejected).

Output

Retrieve all provisioned exception routes.

rtrv-rtx

rtrv-sccp-serv**Retrieve SCCP Service**

Use this command to display the SCCP Service application relationship information maintained by the EAGLE 5 ISS.

Keyword: rtrv-sccp-serv

Related Commands: chg-sccp-serv, dlt-sccp-serv

Command Class: Basic

Parameters

:serv= (optional)

Name of the service to be retrieved.

Range: **gflex**, **gport**, **mnf**

gflex — G-Flex (GSM Flexible Numbering)

gport — G-Port (GSM Mobile Number Portability)

mnf — Mobile Number Portability

Dependencies

- The A-Port or IGM feature must be enabled before the **serv=mnf** parameter can be specified.
- The G-Flex feature must be enabled before the **serv=gflex** parameter can be specified.
- The G-Port feature must be enabled before the **serv=gport** parameter can be specified.

Notes

Point codes are grouped by service in the output.

Output

The number of entries that is reported in use for the SCCPSRV table includes an entry for each point code network type. This entry is not displayed with the point code entries in the output. For example, if 3 ANSI point codes are used, the reported number of ANSI entries is 4.

The following example displays output when no supporting features are turned on, and the SCCP Service table is empty.

rtrv-sccp-serv

```
tekelecstp 06-10-30 09:26:14 EST  EAGLE 36.0.0

rtrv-sccpopts

Retrieve SCCP Options

Use this command to display the current value of one or more of the SCCP option indicators maintained in the STP options table.

Keyword: rtrv-sccpopts

Related Commands: chg-sccpopts

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-sccpopts

Dependencies

None

Notes

None.

Output

The following example displays output when the Origin-based MTP Routing feature is enabled and turned on.

rtrv-sccopts

```
tekelecstp 06-03-16 14:07:11 EST EAGLE 35.0.0
```

SCCP OPTIONS

```
-----
CLASS1SEQ          off
MOBRSCCP0PC        MTP
```

```
;
```

The following example displays output that results when the Transaction-based GTT Loadsharing feature is enabled.

rtrv-sccopts

```
tekelecstp 06-09-11 15:18:41 EST EAGLE 36.0.0
```

SCCP OPTIONS

```
-----
class1se1          on

```

rtrv-scr-aftpc**Retrieve Allowed Affected Point Code**

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

Keyword: rtrv-scr-aftpc

Related Commands: chg-scr-aftpc, dlt-scr-aftpc, ent-scr-aftpc

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all AFTPC screening references.

Range: yes, no

Default: no

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383 ***

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **stop**

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:sr= (optional)

The AFTPC screening reference name

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ssn= (optional)

Subsystem number. An asterisk (*) indicates the full range of values from **0–255**.

Range: **1-255**

Default: Display all.

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Example

```

rtrv-scr-aftpc
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012
rtrv-scr-aftpc:sr=iec
rtrv-scr-aftpc:all=yes
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy
rtrv-scr-aftpc:sr=aft1
rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s

```

Dependencies

If the **nsfi** parameter is specified, the parameter value must be **stop**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **nc=*** is specified, **ncm=*** must be specified. If **ni=*** is specified, **nc=*** and **nc=*** must be specified. If **zone=*** is specified, **area=*** and **id=*** must be specified. If **area=*** is specified, **id=*** must be specified. If **msa=*** is specified, **ssa=*** and **sp=*** must be specified. If **ssa=*** is specified, **sp=*** must be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **nep**, **nsfi**, and **nsr** parameters must already exist in the AFTPC entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

The Gateway Screening Stop Action table must be accessible.

Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If no parameters are specified, a list of allowed AFTPC references is produced indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every allowed AFTPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output**rtrv-scr-aftpc**

```

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED AFTPC—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NI-NC-NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

SSN—The subsystem number associated with the point code identified by *ni-nc-ncm*.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR—up to four characters) or action to be taken (ACT—up to six characters), if the message passes this screen.

rtrv-scr-blkdpc

Retrieve Blocked DPC

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

Keyword: **rtrv-scr-blkdpc**

Related Commands: **chg-scr-blkdpc**, **dlt-scr-blkdpc**, **ent-scr-blkdpc**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *aaaaaa*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all blocked DPC screening references.

Range: **yes**, **no**

Default: **no**

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7**, *

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *, C

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *
Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C
Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from 00000-16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: 00000-16383 *, C

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cgpa, destfld, fail, isup, stop

cgpa—Allowed calling party address is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

fail—The received message should be discarded.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: ayyy
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:sr= (optional)

The BLKDPC screening reference name

Range: ayyy
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Example

```
rtrv-scr-blkdpc
rtrv-scr-
blkdpc:sr=iec:ni=240:nc=001:ncm=010&&018:nsfi=stop:actname=rdct
rtrv-scr-blkdpc:sr=iec
rtrv-scr-blkdpc:all=yes
rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s
```

Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the value of the **nsfi** parameter is **stop** or **fail**, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

The value of the **sr** parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **id** or **sp** parameter must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **nc** parameter must already exist in the database

Any specified **ncm** parameter must already exist in the database

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database

Any specified **nsr** parameter must already exist in the database

Any specified **nsfi** parameter must already exist in the database

Any specified **npc** parameter must already exist in the database

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database

The Gateway Screening Stop Action table must be accessible.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

Notes

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code has the value **c-c-c**.

If the character **c** is specified for any subfield of a three-subfield point code, all three subfields must have the value **c**. No other values can be used. For example, a point code **c-c-255** is not allowed. The

point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

In all cases, if **c** for "continue" is entered for the first subfield in the point code, the other subfields default to **c** in the database.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = BLOCKED DPC—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NI - NC - NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-blkopc

Retrieve Blocked OPC

Use this command to show the blocked originating point code (BLKOPC) screening references in the BLKOPC entity set.

Keyword: **rtrv-scr-blkopc**

Related Commands: **chg-scr-blkopc, dlt-scr-blkopc, ent-scr-blkopc**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all blocked OPC screening references.

Range: **yes, no**

Default: **no**

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *, C

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *, C

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383** *, C

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cgpa, stop, fail, sio, dpc, blkdp**

cgpa—Allowed calling party address is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

fail—The received message should be discarded.

sio—Allowed SIO is the next screening category.

dpc—Allowed DPC is the next screening category.

blkdp—Blocked DPC is the next screening category.

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pct= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:sr= (optional)

The BLKOPC screening reference name

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Example

rtrv-scr-blkopc

rtrv-scr-blkopc:sr=iec:ni=240:nc=001:ncm=010&&018:actname=copy

rtrv-scr-blkopc:sr=iec

rtrv-scr-blkopc:all=yes

rtrv-scr-blkopc:sr=bop1:npc=128:nsfi=fail

rtrv-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s

Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **npc**, **nsfi**, and **nsr** parameters must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the value of the **nsfi** parameter is **stop** or **fail**, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the value **c** is specified for any subfield of a three-subfield point code, then all three subfields must have a value of **c** (**c-c-c**). No other values, including asterisks can be used. If the value of the first subfield is **c**, then the other subfields default to **c** in the database.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nc=*** parameter is specified, then the **ncm=*** parameter must be specified.

The Gateway Screening Stop Action table must be accessible.

If the **ni**=* parameter is specified, then the **nc**=* and the **ncm**=* parameters must be specified.

If the **zone**=* parameter is specified, then the **area**=* and the **id**=* parameters must be specified.

If the **msa**=* parameter is specified, then the **ssa**=* and the **sp**=* parameters must be specified.

If the **ssa**=* parameter is specified, then the **sp**=* parameter must be specified.

Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of blocked OPC references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked OPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

For point codes with three subfields, the value **c** (continue) is used as a place holder. In the event the point code is not found in this screen set, the continue value points to the **nsfi** and **nsr** to be applied next.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code **c-c-c**.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkopc:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = BLOCKED OPC—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NI - NC - NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-cdpa**Retrieve Allowed Called Party Address**

Use this command to show the allowed called party address (CDPA) screening references in the CDPA entity set.

Keyword: rtrv-scr-cdpa

Related Commands: chg-scr-cdpa, dlt-scr-cdpa, ent-scr-cdpa

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed CDPA screening references.

Range: yes, no

Default: no

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383 ***

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **aftpc, stop**

aftpc — Allowed affected point code is the next screening category

stop — The gateway screening process ends and the message proceeds through normal routing

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:scmgfid= (optional)

The SCCP management (SCMG) format ID, which consists of a 1-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1-255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS

Range: **1-255 ***

Default: All SCMG format IDs are shown.

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:sr= (optional)

Displays all allowed CDPA screening references.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ssn= (optional)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **1-255**

Default: Display all.

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

rtrv-scr-cdpa

rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ncm=010:ssn=001

rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ssn=002&&005

rtrv-scr-cdpa:sr=iec

rtrv-scr-cdpa:sr=iec:actname=copy

rtrv-scr-

cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s

rtrv-scr-cdpa:sr=cdp1

Dependencies

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified when **nsfi=stop**.

If **zone=*** is specified, **area=*** and **id=*** must be specified. If **area** is specified or respecified as an asterisk, **id** must also be an asterisk. If **msa=*** is specified, **ssa=*** and **sp=*** must be specified. If **ssa=*** is specified, **sp=*** must be specified.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **nep**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

The specified screening function identifier(**nsfi**) must be in the allowed CDPA entity set.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cdpa:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED CDPA—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NI - NC - NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

SSN—The subsystem number associated with the point code identified by the **ni-nc-ncm**.

SCMGFID—The SCMGFID format ID.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-cgpa**Retrieve Allowed Calling Party Address**

Use this command to show the allowed calling party address (CGPA) screening references in the CGPA entity set.

Keyword: **rtrv-scr-cgpa**

Related Commands: **chg-scr-cgpa**, **dlt-scr-cgpa**, **ent-scr-cgpa**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed CGPA screening references.

Range: **yes**, **no**

Default: **no**

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 0-255 *

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 0-255 *

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 0-255 *

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from 00000–16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: 00000-16383 *

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop, tt

cdpa—Allowed called party address point code is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

tt—Allowed translation type point code is the next screening category.

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:ri= (optional)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: **gt, dpc, ***
gt—Allow a called party address with a routing indicator value of "global title."
dpc—Allow a called party address with a routing indicator value of "DPC/SSN."
*****—Allow both routing indicator values.

Default: Display all

:sccpmt= (optional)

The SCCP message type. An asterisk (*) indicates all possible allowed values; that is, **9, 10, 17, and 18**.

Range: **9, 10, 17, 18, ***
9—UDT
10—>UDTS
17—XUDT
18—XUDTS

Default: Display all SCCP message types

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:sr= (optional)

The CGPA screening reference name

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ssn= (optional)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255**

Default: Display all.

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:ssn=012

rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:actname=copy

rtrv-scr-cgpa:sr=cgp1

```
rtrv-scr-  
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

Dependencies

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **zone=*** is specified, **area=*** and **id=*** must be specified. If **area=*** is specified, **id=*** must be specified. If **msa=*** is specified, **ssa=*** and **sp=*** must be specified. If **ssa=*** is specified or re-specified, **sp=*** must also be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **ncp**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

The specified screening reference (**sr**) must be in the allowed CGPA entity set.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

The Gateway Screening Stop Action table must be accessible.

Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cgpa:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED CGPA—This is the screen type.

SR —This is used to identify the various screen sets being used. It can be up to four characters in length.

NI - NC - NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

SSN—The subsystem number associated with the point code identified by the *ni-nc-ncm* .

RI—The routing indicator in the called party address.

SCCPMT—The SCCP message type.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-destfld

Retrieve Allowed DESTFLDs

Use this command to show the attributes of one or more allowed affected destination field (DESTFLD) screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

Keyword: **rtrv-scr-destfld**

Related Commands: **chg-scr-destfld, dlt-scr-destfld, ent-scr-destfld**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy, none*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed DPC screening references.

Range: **yes, no**

Default: **no**

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

Default: Display all

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Default: Display all

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383 ***

:nsfi= (optional)

This parameter indicates that the gateway screening process should stop. If specified for this command, the parameter must have the value of **stop**. The value of **stop** means that the gateway screening process ends and the message proceeds through normal routing.

Range: **stop**

Default: Display all screening references

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:sr= (optional)

The name of the individual DESTFLD screen to be displayed.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 0-255 *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7 *, C

Example

```
rtrv-scr-destfld
```

```
rtrv-scr-destfld:sr=iec:ni=240:nc=001:ncm=010&&018
```

```
rtrv-scr-destfld:sr=iec:id=4:actname=cncf
```

```
rtrv-scr-destfld:all=yes
```

```
rtrv-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s
```

```
rtrv-scr-destfld:sr=dst1
```

Dependencies

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified in the command.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

The specified screening reference (**sr**) must be in the allowed DESTFLD entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **id** or **sp** parameter must already exist in the database.

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **nc** parameter must already exist in the database.

Any specified **ncm** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database.

Any specified **npc** parameter must already exist in the database.

Any specified **nsfi** parameter must already exist in the database.

Any specified **nsr** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The Gateway Screening Stop Action table must be accessible.

Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-destfld:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED DESTFLD**—This is the screen type.
- **SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.
- **NSFI**—The next screening category to be used.
- **NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-dpc**Retrieve Allowed DPC**

Use this command to show the attributes of one or more allowed DPC screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

Keyword: **rtrv-scr-dpc**

Related Commands: **chg-scr-dpc, dlt-scr-dpc, ent-scr-dpc**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed DPC screening references.

Range: **yes, no**

Default: **no**

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 *, C**

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383 ***

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cgpa, destfld, isup, stop**

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed calling party address is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all screen references

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if

nsfi is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:sr= (optional)

The allowed DPC screening reference name

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

Example

```
rtrv-scr-dpc
rtrv-scr-dpc:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-dpc:sr=iec:id=4
rtrv-scr-dpc:all=yes
rtrv-scr-dpc:all=yes:actname=cncf
rtrv-scr-dpc:sr=dpc1:npc=128:nsfi=stop:pcst=s
```

Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The specified screening reference (**sr**) must be in the allowed DPC entity set.

Any specified **ni** parameter must already exist in the allowed DPC entity for the screening reference.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If **ni=*** is specified, **nc=*** and **ncm=*** must be specified.

If **nc=*** is specified, **ncm=*** must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the value of the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

Any specified **npc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **pcst** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed DPC entity for the screening reference.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **ncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

If no parameters are specified, a list of allowed DPC references is displayed indicating whether they are referenced or not.

If a single allowed DPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed DPC entity set are shown.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-dpc:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED DPC—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NI - NC - NCM—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-isup

Retrieve Allowed ISUP Screening Reference

Use this command to display one allowed ISUP screening reference or all allowed ISUP screening references in the Allowed ISUP entity set.

Keyword: rtrv-scr-isup

Related Commands: chg-scr-isup, dlt-scr-isup, ent-scr-isup

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:all= (optional)

This parameter is specified to display all allowed ISUP screening references in the Allowed ISUP entity set.

Range: yes, no

Default: no

:isupmt/tupmt= (optional)

ISUP message type or TUP message type in the specified entry. The **tupmt** parameter is not valid for SEAS. A single value or range of values can be entered. An asterisk (*) indicates the entire range of 0-255.

Range: 000-255 *

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter must have the value of **stop**.

Range: **stop**

stop—The gateway screening process ends and the message proceeds through normal routing.

:nsr= (optional)

Next screening reference. The **nsr** parameter cannot be specified if **nsfi=stop** is specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:sr= (optional)

The individual ISUP screen to be displayed.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Example

rtrv-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2

rtrv-scr-isup:sr=tu01:tupmt=0&&255

Dependencies

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

If **sr** is specified, the value must exist in the database.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

Notes

A range of values for the **isupmt** parameter or **tupmt** parameter can be specified by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk can be used for a parameter value in the **chg-scr-isup**, **rtrv-scr-isup**, and **rtrv-scr-isup** commands only if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

If no parameters are specified, a list of allowed ISUP references is produced indicating whether they are referenced or not.

Output

rtrv-scr-isup

Legend

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-isup:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED ISUP— This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

ISUPMT/TUPMT—The ISUP message type or TUP Message type in the entry.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-opc

Retrieve Allowed OPC

Use this command to show an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference).

Keyword: **rtrv-scr-opc**

Related Commands: **chg-scr-opc, dlt-scr-opc, ent-scr-opc**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed OPC screening references.

Range: **yes, no**

Default: Display all

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: Display all

:ncm= (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: Display all

:ni= (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: Display all

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.

Range: **00000-16383 ***

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkopc, sio, dpc, blkdpc, cgpa, stop**

blkopc—Blocked OPC is the next screening category.

sio—Allowed SIO is the next screening category.

dpc—Allowed DPC is the next screening category.

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed calling party address is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all screening referenes

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

Range: a yyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:sr= (optional)

The allowed OPC screening reference name

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all.

:ssa= (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 0-255 *

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7 *, C

Example

```
rtrv-scr-opc
```

```
rtrv-scr-opc:sr=iec:ni=240:nc=001:ncm=010&&018
```

```
rtrv-scr-opc:sr=iec:id=4
```

```
rtrv-scr-opc:all=yes
```

```
rtrv-scr-opc:sr=opc1:actname=cr
```

```
rtrv-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
```

Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **ni=*** parameter is specified, the **nc=*** and the **ncm=*** parameters must be specified.

If the **nc=*** parameter is specified, then the **ncm=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the value of the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The specified screening reference (**sr**) must be in the allowed OPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **ni** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **npc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **pcst** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed OPC entity for the screening reference.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The Gateway Screening Stop Action table must be accessible.

Notes

If no parameters are specified, a list of allowed OPC references is produced indicating whether they are referenced or not.

If a single allowed OPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed OPC entity set are shown.

If **all** is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk specified as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-sio

Retrieve Allowed SIO

Use this command to show the attributes of one or more **nic/si/h0/h1** combinations that are allowed for SS7 messages from another network.

Keyword: rtrv-scr-sio

Related Commands: chg-scr-sio, dlt-scr-sio, ent-scr-sio

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed SIO screening references.

Range: yes, no

Default: no

:h0= (optional)

H0 heading code. A single value or a range of values can be specified. An asterisk (*) indicates all possible values; that is, the entire range of **0–15**.

Range: **0-15 ***

Default: Display all

:h1= (optional)

H1 heading code. A single value or a range of values can be specified. An asterisk (*) indicates all possible values; that is, the entire range of **0–15**.

Range: **0-15 ***

Default: Display all

:nic= (optional)

The network indicator code. An asterisk (*) indicates all possible values; that is, the entire range of **0–3**.

Range: **0-3 ***

Default: Display all

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cgpa, cdpa, destfld, dpc, isup, stop**

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed calling party address is the next screening category.

cdpa—Allowed called party address is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

dpc—Allowed DPC is the next screening category.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all screening references

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

(optional; mandatory if **nsfi** is other than **stop**; cannot be entered if **nsfi=stop**)

Range: `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:pri= (optional)

Message priority. A single value or a range of values can be specified. An asterisk (*) indicates all possible values; that is, the entire range of **0–3**.

Range: **0-3 ***

Default: Display all

:si= (optional)

The service indicator.

Range: **0-15, * ****

Default: Display all

:sr= (optional)

The allowed SIO screening reference name

Range: `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

Example

```
rtrv-scr-sio
rtrv-scr-sio:sr=iec:nic=1:si=3:pri=2&&3
rtrv-scr-sio:sr=sio1:nic=1:si=1
rtrv-scr-sio:sr=sio1:nic=1:si=1:h0=1:h1=*
rtrv-scr-sio:sr=sio1:si=1:h0=1:h1=1
rtrv-scr-sio:all=yes
rtrv-scr-sio:sr=iec:nic=1:si=1:actname=crncf
```

Dependencies

If the **si** parameter is not equal to **00**, **01**, or **02**, the **h0** and **h1** parameters cannot be specified.

If the **nic**, **si**, and **h0/h1** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The network indicator code (**nic**) must be specified if the service indicator is specified.

The network indicator code (**nic**) and the service indicator (**si**) must be specified if the **h0** and **h1** parameters are specified.

If an asterisk value is specified for the **h0** parameter, the **h1** parameter cannot be specified.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **sr** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The Gateway Screening Stop Action table must be accessible.

Invalid **ent-scr-sio nsfi** and **si** parameter combinations specified.

Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed SIO references is output indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed SIO screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

Output

rtrv-scr-sio

```

SCREEN = ALLOWED SIO

Legend

For a summary report:

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-sio:all=yes** command, or specify the specific screening reference.

RULES—The number of screening rules in that screening table.

For a detailed report:

SCREEN = ALLOWED SIO—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

NIC—The network indicator code in the service information octet.

PRI—The priority of a single message or the beginning message priority in a range of priorities in the service information octet.

SI—The service indicator for the service information octet, which are the last two bits of the subservice field.

H0—The H0 heading code.

H1—The H1 heading code.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (**NSR** - up to four characters) or action to be taken (**ACT** - up to six characters), if the message passes this screen.

rtrv-scr-tt**Retrieve Allowed Translation Type**

Use this command to show the allowed translation type (TT) screening reference in the TT entity set.

Keyword: **rtrv-scr-tt**

Related Commands: **chg-scr-tt**, **dlt-scr-tt**, **ent-scr-tt**

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*
1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all allowed TT screening references.

Range: **yes, no**

Default: **no**

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cdpa, stop**

cdpa—Allowed called party address is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Display all screening references

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**, or the **copy=yes** parameter is specified.

Range: `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:sr= (optional)

The TT screening reference name

Range: `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:type= (optional)

The translation type. The translation type identifies the global title translation type value in the called party address. It is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified.

Range: **1-255 ***

Default: Display all.

Example

```
rtrv-scr-tt
```

```
rtrv-scr-tt:sr=iec
```

```
rtrv-scr-tt:all=yes
```

```
rtrv-scr-tt:sr=iec:type=1&&15:actname=copy
```

Dependencies

If the **nsr** parameter is specified, **nsfi=stop** cannot be specified.

If the **actname** parameter is specified and **nsfi** is specified, the value specified for **nsfi** must be **stop**.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The **copy** parameter is obsolete. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

The specified value for the **nsfi** parameter is not valid for TT screen.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The screening reference and translation type for which the attributes are to be retrieved must exist.

Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed TT references is produced indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed TT screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

Output**rtrv-scr-tt**

Legend

SCREEN = ALLOWED TT—This is the screen type.

SR—This is used to identify the various screen sets being used. It can be up to four characters in length.

REF—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If a more detailed output is needed, the **rtrv-scr-tt:all=yes** command should be used, or specify the specific screening reference.

TYPE—The translation type of that is allowed for global title translation.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scrset**Retrieve Screen Set**

Use this command to show the attributes of one or more screen sets in the screen set entity set.

Keyword: rtrv-scrset

Related Commands: chg-scrset, dlt-scrset, ent-scrset

Command Class: Database Administration

Parameters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

:all= (optional)

Displays all screen sets (except “placeholder” screen sets that contain only one rule with **nsfi=stop** specified in the rule).

Range: yes, no

Default: no

:destfld= (optional)

This parameter displays the indicator that specifies whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on in the screen set rule, the automatic screening is applied at the end of the provisioned screen set.

Range: yes, no

Default: Display all

:nsfi= (optional)

The values of this parameter indicate in the screen set rules the next screening category that is used in the gateway screening process, or that the gateway screening process should stop. In this command, information is displayed for one or more screen sets containing rules with the specified **nsfi** parameter value.

NOTE: When **nsfi=stop** is specified for this command, the command displays only the “placeholder” screen sets that have only one rule, with **nsfi=stop** specified in the rule. This is a way to locate those “placeholder” screen sets, so that you can add or change the rules to accomplish appropriate screening.

Range: opc, blkopc, sio, dpc, blkdpc, stop

opc—Display rules with Allowed OPC as the next screening category.

blkopc—Display rules with Blocked OPC as the next screening category.

sio—Display rules with Allowed SIO as the next screening category.

dpc—Display rules with Allowed DPC as the next screening category.

blkdpc—Display rules with Blocked DPC as the next screening category.

stop—Display only “placeholder” screen sets that have only one rule in the screen set, with **nsfi=stop** specified as the next screening category.

Default: Display all

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. In this command, the **nsr** parameter is used to display information for one or more screen sets with rules that have the specified **nsr** parameter value.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

:scrn= (optional)

The screen set name. When this parameter is specified, the information for only the specified screen set is displayed.

Range: xyyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Display all

Example

```
rtrv-scrset
```

```
rtrv-scrset:scrn=scr1
```

```
rtrv-scrset:nsr=opc4
```

```
rtrv-scrset:nsfi=dpc
```

```
rtrv-scrset:actname=copy
```

Dependencies

The screen set name must already exist.

The **nsfi=stop** parameter must be specified before the **actname** parameter can be specified.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screen set name parameter, the specified value for the **actname** parameter must be assigned to that screen set name.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The **nsr** parameter cannot be entered if the **nsfi** parameter value equals **stop**.

Notes

If no parameters are specified for the **rtrv-scrset** command, the output shows all the screen sets, the screening function identifier of the root screening table, the screening reference of the root screening table, the memory usage (percentage), the number of entries in the screen set and the overall gateway screening statistics, followed by a summary of statistics for each screen set.

For the **rtrv-scrset:all=yes** command, the output consists of every screen set and every screening reference in each screen set (except “placeholder” screen sets that have only one rule with **nsfi=stop** specified in the rule). The **all=yes** and **nsfi=stop** parameters cannot be specified in the same command.

If the **scrn**, **nsfi**, or **nsr** parameter is entered, summary information for all screens that match the specified parameters is shown.

When the % FULL is over 100%, the screen is inaccessible. A screenset over 100% capacity size will not bind correctly. A screenset can become provisioned over capacity when linking one screen reference to another causes the size to become too large. To reduce a screenset that is over 100% capacity, screen rules must be deleted (see the **dlc-scr-xxx** commands)

Output

In the following example the % full is over 100% and the screen is inaccessible.

rtrv-scrset

```
rlghncxa03w 03-03-14 16:37:05 EST EAGLE 31.3.0

Legend

SCRN—The name of the screen set.

NSFI—The next screening category to be used.

NSR/ACT—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

FULL—The capacity of allowed memory a given screen set occupies, expressed as a percentage.

RULES—The number of entries in the screen set.

TABLES—The number of tables in the screen set.

DESTFLD—Displays whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on, the automatic screening is applied at the end of the provisioned screen set.

rtrv-seas-config

rtrv-seas-config

Use this command to retrieve configuration information for the CCS Message Router (CCS MR) and the name of the EAGLE 5 ISS source node for the SEAS Over IP interface.

Keyword: **rtrv-seas-config**

Related Commands: **chg-seas-config**

Command Class: Database Administration

Parameters

Example

```
rtrv-seas-config
```

Dependencies

The SEAS Over IP feature must be enabled before this command can be entered.

Output**rtrv-seas-config**

```
tekelecstp 07-01-23 18:46:01 EST EAGLE 37.5.0

IPMR2	33	128.96.75.46	4011	ccscoor	tcpipmr2

rtrv-secu-dflt**Display System-Wide Security-Related Defaults**

Use this command to display the current values of the various security-related parameters that have been configured with the **chg-secu-dflt** command.

Keyword: **rtrv-secu-dflt**

Related Commands: **chg-pid, chg-secu-dflt**

Command Class: Security Administration

Parameters

:msg= (optional)

Use this parameter to specify whether the text of the login warning message is to be displayed also.

Range: **yes, no**

Default: **no**

Example

```
rtrv-secu-dflt
```

```
rtrv-secu-dflt:msg=yes
```

Dependencies

None

Notes

None

Output

```

Legend

PAGE—The default password aging interval for newly created user IDs

UOUT—The number of successive days a user ID can go unused (no successful login) before the system denies login.

MULTLOG—Indicates whether users can be logged on to multiple terminals at the same time

MINLEN—The minimum password length.

ALPHA—The minimum number of alphabetic characters (a–z) required in a new password.

NUM—The minimum number of numeric characters (0–9) required in a new password.

PUNC—The minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character.

WARNING MESSAGE—The message displayed when a user has successfully logged in.

rtrv-secu-trm

Display Terminal Access Rights

Use this command to display the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system.

Keyword: **rtrv-secu-trm**

Related Commands: **chg-secu-trm**

Command Class: Security Administration

Parameters

:trm= (optional)

Specifies the port about which information will be displayed.

Range: **1-16**

Default: Display all

Example

```
rtrv-secu-trm
```

```
rtrv-secu-trm:trm=9
```

Dependencies

None

Notes

None

Output

The following example shows attributes of all terminals when the Command Class Management feature is off.

rtrv-secu-trm

```
rlghncxa03w 08-03-15 12:31:04 EST EAGLE 38.0.0
```

Legend

TRM—The ID number of the terminal whose characteristics are to be changed.

LINK—Shows whether the Link Maintenance class of commands is allowed for this terminal.

SA—Shows whether the Security Administration class of commands is allowed for this terminal.

SYS—Shows whether the System Maintenance class of commands is allowed for this terminal.

PU—Shows whether the Program Update class of commands is allowed for this terminal.

DB—Shows whether the Database class of commands is allowed for this terminal.

DBG—Shows whether the Debug class of commands is allowed for this terminal.

*******—Denotes a Security Administration port whose port type has been configured with a value of **oap**, **none**, or **printer**. These terminal types do not allow you to enter commands.

LNPBAS—Shows whether the LNP BASIC class of commands is allowed for this terminal.
(Appears only if LNP is turned on.)

U01 - U32—Configurable command class default names. (If configured with a user-specified name, that name appears.)

rtrv-secu-user

Retrieve Security User

Use this command to show the security information for all users in the system.

Keyword: rtrv-secu-user

Related Commands: act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-user

Command Class: Security Administration

Parameters

:uid= (optional)

User ID

Range: azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Default: Display all

Example

rtrv-secu-user : uid = rogers

Dependencies

If a user ID is specified, the user ID must exist in the UserID table.

Notes

Only the system administrator should have access to this command.

Passwords cannot be shown.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

The following example shows a display when the LNP feature is turned on and the Command Class Management feature is not enabled:

rtrv-secu-user

Legend

USER-ID—The name of the user

AGE—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.

PAGE—Shows the maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

UOUT—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (*) displayed after the value indicates that the system-wide default **uout** parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

REV—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.

LINK —Shows whether the user has access to all commands in the Link Maintenance command class.

SA—Shows whether the user has access to all commands in the Security Administration command class.

SYS—Shows whether the user has access to all commands in the System Maintenance command class.

PU—Shows whether the user has access to all commands in the Program Update command class.

DB—Shows whether the user has access to all commands in the Database Administration command class.

DBG—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled, the following fields appear:

U01 - U32—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following field is displayed:

LNPBAS—Shows whether the user has access to all commands in the LNP Basic command class.

rtrv-seculog

Generate Report from Security Log Contents

Use this command to retrieve the contents of a security log and display it to the user in the scroll area. Various reports can be produced by varying the values of the command parameters. By default, the report is generated from the log on the active fixed disk, although the **slog** parameter can be used to generate the report from the log on the standby fixed disk.

Keyword: rtrv-seculog

Related Commands:

Command Class: Security Administration

Parameters

:edate= (optional)

End date. Use this parameter to report log entries only if they were created on or before the specified date. If the **sdate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

Range: 000101-991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

Default: Report log entries regardless of their creation date

:etime= (optional)

End time. Use this parameter to report log entries only if they were created between midnight (00:00:00) and the time specified on this parameter. If the **stime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

Range: 000000-235959

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as **130503**.

Default: Report log entries regardless of their creation time

:mode= (optional)

Use this parameter to produce a either full log report or an abbreviated log report.

Range: **brief**, **full**

brief—Causes only one line of output to be generated for each log entry reported. Some information in each reported log entry is not shown.

full—Produces a report showing multiple lines of output for each log record that is reported. This report displays more information from each log record (including the entire command) than the **mode=brief** report.

Default: **brief**

:num= (optional)

Maximum number of records to be displayed. This parameter specifies how many records are to be displayed before the report is terminated.

Range: 1-50000

Default: **500**—if **mode=brief** is specified
 250—if **mode=full** is not specified

:rectype= (optional)

Use this parameter to specify whether you want all records in the log to be considered for reporting or only new (that is, un-uploaded) records.

Range: **new, both**

new—The report generator scans only new (that is, un-uploaded) records when generating the report. Old records are not considered for reporting, even if they match the reporting criteria.

both—All records in the log are considered for reporting.

Default: **new**

:sdate= (optional)

Start date. Use this parameter to report log entries only if they were created on or after the specified date. If the **edate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

Range: **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

Default: Report log entries regardless of their creation date

:slog= (optional)

Source log indicator. This parameter specifies which log is to be copied to the FTA.

Range: **act, stb**

act—Specify **act** to produce the report from the log on the active MASP

stb—Specify **stb** to produce the report from the log on the standby MASP

Default: **act**

:stime= (optional)

Start time. Use this parameter to report log entries only if they were created between the time specified on this parameter and the end of the day (23:59:59) inclusive. If the **etime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

Range: **000000-235959**

The time must be specified with 6 digits in a 24-hour format (*hhmmss*). For example, enter 1:05:03 p.m. as **130503**.

hhmmss—*hh*=hours (**00-23**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

Default: Report log entries regardless of their creation time

:trm= (optional)

Terminal ID. Use this parameter to report only those log entries created by the specified terminal.

Range: **1-16**

Default: Report log entries regardless of the associated terminal

:uid= (optional)

User ID. Use this parameter to report only those log entries created by the specified user ID. Specify **uid=seas** to report only those commands received on a SEAS terminal. Specify **uid=none** to report only those commands not associated with a user ID. For example, commands issued prior to login.

Range: **azzzzzzzzzzzzzzz**

1 alphabetic character followed by up to 15 alphanumeric characters

Default: Display all

Example

rtrv-seculog:sdate=021496:edate=021596:num=7

```
rtrv-  
seculog:mode=full:sdate=021496:edate=021496:stime=062900:etime=06  
3200
```

Dependencies

If both the **sdate** and **edate** parameters are specified, the date that is specified for the **sdate** parameter must be earlier than or equal to the date specified for the **edate** parameter.

If both the **stime** and **etime** parameters are specified, the time that is specified for the **stime** parameter must be earlier than or equal to the time specified for the **etime** parameter.

The month component of the **sdate** and **edate** parameter combination must be specified in the range **1–12**.

The day component of **sdate** and **edate** parameter combination must be specified in the range **1–31**. This value must accurately reflect the number of days in the month and year indicated. For example, **sdate=960631** is not a valid parameter value because June has only 30 days.

The second component of the **stime** and **etime** parameter combination must be specified in the range **00–59**.

The minute component of the **stime** and **etime** parameter combination must be specified in the range **00–59**.

No other security log command can be in progress when this command is entered.

Notes

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999

years 00–36 = 2000 through 2036

A consequence of this is that date 000101 (Jan 1, 2000) is greater than 991231 (December 31, 1999).

If the **mode=brief** parameter is specified and the output report has a plus (+) symbol appearing at the end of the command, the plus symbol indicates that more command characters are available to be displayed. Specify the **mode=full** parameter to see these additional characters.

In the **mode=full** output report, a plus (+) symbol appearing at the end of the command indicates the command is longer than 150 characters. Note that even in the uploaded log, each record in the log has room to record only 150 characters of the entered command. If the command is longer than 150 characters, then only the first 149 characters of the command and the plus symbol (to indicate that truncation has occurred) are recorded.

Security log size is limited to 50,000 records. Data from a query that exceeds the size limit of the security log cannot be displayed.

The system checks to ensure that the day portion of any **sdate/edate** value entered is in agreement with the month and year. It issues error message E2252 if the day is found to be invalid (for example, **960631** is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

The system uses the **sdate/edate** and **stime/etime** parameters to select log records for reporting as follows:

- If the date on which the log record was created is not in the date range specified by the **sdate/edate** parameters, the record is not reported. The default **sdate** is the date of the oldest record in the log, and the default **edate** is the current date.

- If the time of day at which the log record was created is not in the time range specified by the **stime/etime** parameters, the record is not reported. The default **stime** is 00:00:00 (midnight), and the default **etime** is 23:59:59.
- Otherwise, the log record is reported, unless it is disqualified by other parameters such as **uid** or **trm**.

As an example, if the following command is entered, records are displayed for October 10, 1996 from 2:00 p.m. until 4:00 p.m., for October 11, 1996, from 2:00 p.m. until 4:00 p.m., and for October 12, 1996, from 2:00 p.m. until 4:00 p.m.

rtrv-seculog:sdate=961010:edate=961012:stime=140000:etime=160000

It takes the system approximately one minute to display 500 lines of data in the scroll area. To output a complete **mode=full** report (150,000 lines maximum) takes approximately 300 minutes. For this reason, the **num** parameter defaults to either **125 (mode=full)** or **500 (mode=brief)**, to prevent an excessively long process time, unless you deliberately choose a longer report.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The following message appears in the scroll area if the **slog=stb** parameter is specified (either explicitly or by default) and the standby fixed disk is not available (for example, simplex mode).

Command Failed - unable to read security log

When the **rtrv-seculog** command is entered, one of the first things that the reporting function does is to examine the log overflowed and logging failure flags in the header of the specified log.

Depending on the nature of the information found, one of the following notices is displayed in the output:

Notice: Log overflow has occurred -- report may be incomplete.

Notice: Logging failure -- report may be incomplete.

Output

The following example shows how all records in the log created between 2/14/96 and 2/15/96 are to be displayed, up to a maximum of 9 records.

rtrv-seculog:sdate=960214:edate=960215:num=9

rlghncxa03w 96-02-14 06:32:20 EST EAGLE Release 34.0

10 records reported of 240 records scanned.

END OF SECURITY LOG REPORT.

Legend

UID—The user ID that issued the command. The value **SEAS** appears if the command was received on a SEAS port. The value **NONE** appears if no user ID was associated with the port at the time the command was logged.

TRM—The terminal ID of the terminal where the command was received.

DATE—The date when the log entry was made; that is, the date on which the command was received for execution.

TIME—The time when the log entry was made; that is, the time the command was received for execution. A 24-hour time format is used (for example, 1:00 p.m. = 130000).

ST—The two-letter shorthand notation of the command's status. The complete status can be obtained by re-entering the **rtrv-seculog** command and specifying the **mode=full** parameter. The status abbreviations are as follows:

- **AB**—Command aborted. Displayed when the **canc-cmd:trm** command is issued to abort the following commands: **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-slk**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-ls**, **rtrv-map**, **rtrv-rte**, **rtrv-seculog**, and **rtrv-slk**. An AB status indicates that processing and output of the command have been halted. This status is also displayed for SEAS flow-thru commands that are canceled with the **canc-cmd** (without the **trm** parameter).
- **RJ**—Command rejected. Displayed whenever the results value that would be displayed in the **mode=full** report would be one of the following:

Edddd
FAILED
rrrrrr/mmmmm

- **RL**—Retry later. The system is busy.
- **IP**—In Progress

- **OK**—Command successfully executed
- **TO**—Timed out.

CMD—The command that was recorded. In the **mode=brief** report, if the length of the recorded command is greater than or equal to 35 characters (as this much as can be displayed on a single line of the output report), then only the first 34 characters of the command are displayed, and the 35th character is displayed as a plus symbol (+) to indicate that more information is available in the log. Re-enter the **rtrv-seculog** command with the **mode=full** parameter to see the additional information. In the **mode=full** report, a plus symbol at the end of a command indicates that the command is longer than 150 characters.

rtrv-serial-num

Retrieve Serial Number

Use this command to retrieve the NT serial number for the system.

Keyword: **rtrv-serial-num**

Related Commands: **ent-serial-num**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-serial-num

Dependencies

None

Notes

None

Output

Dashes appear if the serial number has not yet been entered into the database.

rtrv-serial-num

```
rlghncxa03w 03-03-29 16:40:40 EST  EAGLE 31.3.0
System serial number = nt00001231
```

System serial number is locked.

```
rlghncxa03w 03-03-29 16:40:40 EST  EAGLE 31.3.0
Command Completed
```

;

rtrv-sg-opts

Retrieve IP7 Secure Gateway Options

Use this command to retrieve information about the currently chosen IP⁷ Secure Gateway protocol options.

Keyword: **rtrv-sg-opts**

Related Commands: **chg-sg-opts**, **rtrv-appl-rtkey**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-sg-opts

Dependencies

None

Notes

None

Output**rtrv-sg-opts**

```
rlghncxa03w 08-02-07 09:50:17 EST EAGLE 38.0.0
SRKQ:                250
SNMPCONT:             john doe 555-123-4567
GETCOMM:              public
SETCOMM:              private
TRAPCOMM:             public
SCTPCSUM:             adler32
IPGWABATE:            NO
UAMEASUSEDFTAS:      YES
;
```

Legend

SRKQ—The static routing key quantity. The maximum number of routing key entries in the Static Routing Key table.

SNMPCONT—The system contact information for each SSED CM SNMP agent.

GETCOMM—The community name used for messages sent by SS7IPGW cards (SNMP Get and GetNext request validations).

SETCOMM—The community name used for SNMP set request validation. This value applies for each SSED CM SNMP agent in the system.

TRAPCOMM—The community name used when SNMP traps are generated. This value applies for each SSED CM SNMP agent in the system.

SCTPCSUM—The SCTP checksum algorithm type.

IPGWABATE—The IPGWx SS7 congestion abatement procedures.

UAMEASUSEDFTAS—The UA measurements are generated.

rtrv-shlf**Retrieve Shelf**

Use this command to display the frames and shelves that are currently provisioned in the system. The type of shelf is also shown.

Keyword: **rtrv-shlf**

Related Commands: **dlt-shlf**, **ent-shlf**

Command Class: Database Administration

Parameters

:loc= (optional)

The shelf location.

Range: 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default: Display all configured locations

Example

```
rtrv-shlf
```

```
rtrv-shlf:loc=1300
```

```
rtrv-shlf:loc=2100
```

Dependencies

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

Notes

None

Output

The following example displays all configured STP equipment shelves.

rtrv-shlf

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY
FRAME SHELF      TYPE
  1      1      CONTROL
  1      2      EXTENSION
  1      3      EXTENSION
  2      3      EXTENSION
```

;

The following example displays a specific STP equipment shelf.

rtrv-shlf: loc=1300

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=1300
FRAME SHELF      TYPE
  1      3      EXTENSION
CARD  TYPE      APPL      LSET NAME      PORT SLC LSET NAME      PORT SLC
1301  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1302  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1303  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1304  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1305  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
```

;

The following example displays a specific STP equipment shelf that is not configured (unequipped).

rtrv-shlf: loc=2100

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=2100
FRAME SHELF      TYPE
```

This shelf is UNEQUIPPED in the database.

;

Legend

FRAME—The frame location of the shelf.

SHELF—The location of the shelf within the frame.

TYPE—The type of shelf.

CARD—Card location in the specified shelf.

TYPE—Card type

APPL—Application running on the card.

LSET NAME—Linkset name defined for the port on the card.

PORT—Port used by the linkset defined on the card.

SLC—Signaling link code for the linkset.

rtrv-sid**Retrieve Self Identification**

Use this command to retrieve site identification characteristics of the system. It shows the point code assigned to this system, the CLLI code of the system, the capability code of the STP, and the type of point codes supported by the system.

Keyword: rtrv-sid

Related Commands: chg-sid, ent-sid

Command Class: Security Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cpc= (optional)

ANSI capability point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: cpc

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: Display all

:cpc/cpc/cpci/cpcn/cpcn24= (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

:cpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

Default: Display all

:cpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: Display all

:cpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: Display all

:cpctype= (optional)

Capability point code type. Use this parameter to specify whether the CPC is for the STP, LNP, INP, EIR, GPort, GFlex, or MNP service.

Range: stp, lnp, inp, eir, gport, gflex, mnp

Default: stp

Example

```
rtrv-sid
rtrv-sid:cpc=3-3-3
rtrv-sid:cpcn24=001-001-001
rtrv-sid:cpctype=inp
rtrv-sid:cpci=2-100-4
rtrv-sid:cpcn24=33-33-33
rtrv-sid:cpcn=s-00456
```

Dependencies

The STP destination point codes and capability point codes can be specified only as full point codes.

The ANSI point code 0-0-0 and the ITU-I point code 0-000-0 are invalid for STP capability point codes.

The LNP feature must be turned on before the **cpctype=lnp** parameter can be specified.

The INP feature must be turned on before the **cpctype=inp** parameter can be specified.

The EIR feature must be turned on before the **cpctype=eir** parameter can be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be retrieved.

If the **cpcn** parameter is specified, the format of the specified point code must match the format that was assigned with the **chg-stpopts** command **npcfnti** parameter.

Notes

If the **cpc/cpca/cpci/cpcn/cpcn24** parameter is not specified, all site identification characteristics are displayed.

If the STP capability point code is specified and not provisioned, the report contains only the PCA, PCI, PCN or PCN24, CLLI, and PCTYPE fields, with the message:

Compatibility Point Code specified is not provisioned.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

The **rtrv-sid** command CPC output is sorted using three sort keys.

- The first sort key is by the **cpctype** service, ordered by: **stp** (own STP, unlabeled), **inp**, **eir**, **gflex**, and either **gport** or **mnp** depending on whether G-Port or A-Port are enabled.
- The second sort key is by network type, ordered by: ANSI, ITU-I, ITU-N, then ITU-N24.
- The third sort key is by point code value, ordered low to high.

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The **s-** point code prefix indicates an ITU national or international spare point code or spare capability point code.
- INP, LNP, EIR, G-Flex, and G-Port capability point codes are indicated in parentheses after the capability point code header.
- STP capability point codes have no parentheses after the header.

The examples show all site identification characteristics provisioned in the system at the time the command was entered.

The following example includes a 24-bit ITU-N site ID and a 24-bit ITU-N capability point code.

Legend

PCA—The ANSI point code of the STP.

PCI—The ITU-TSS international point code of the STP.

PCN—The ITU-TSS national point code of the STP.

PCN24—The 24-bit ITU national point code of the STP.

CPCA—The ANSI capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

CPCN—The ITU-TSS national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

CPCI—The ITU-TSS international capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

CPCN24—The ITU-TSS 24-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

(EIR)—The identified point code is an Equipment Identity Register (EIR) point code.

(INP)—The identified point code is an INAP Number Portability (INP) point code.

(LNP)—The identified point code is a local number portability (LNP) point code.

(GFLEX)—The identified point code is a G-Flex (GFLEX) point code.

(GPORT)—The identified point code is a G-Port (GPORT) point code.

(MNP)—The identified point code is an MNP(MNP) point code.

CLLI—The common language location identifier of the STP

PCTYPE—The type of point code used by the STP. There are two types of point codes that the EAGLE 5 ISS STP can use, ANSI and OTHER. The value ANSI means the EAGLE 5 ISS STP supports point codes that meet the ANSI standard. The value OTHER means that the EAGLE 5 ISS STP supports point codes that do not meet the ANSI standard.

rtrv-slk

Retrieve Signaling Link

Use this command to show the parameters for low-speed signaling links, ATM high-speed signaling links, or both.

Keyword: rtrv-slk

Related Commands: act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Database Administration

Parameters

As of EAGLE 5 ISS Release 38.0, the **class** parameter can no longer be used.

:aname= (optional)

Association name. This parameter specifies the name of the association assigned to the links to be displayed.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

:link= (optional)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: Display all

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All signaling links are shown.

Example

```
rtrv-slk:loc=1302:link=a
```

```
rtrv-slk:loc=1302:link=b2
```

rtrv-slk:loc=1303:link=a31

rtrv-slk:aname=asocm2pa

rtrv-slk:loc=1305

Dependencies

If the **link** parameter is specified, the **loc** parameter must be specified. The **loc** parameter can be specified without the **link** parameter.

The **loc** parameter or the **class** parameter, but not both, can be specified in the command.

The slot portion of the specified **loc** parameter must be **01** through **18**, except **09** and **10** cannot be specified (**loc**= xyss, where x is the frame, y is the shelf, and ss is the slot).

Card locations **1113** through **1118** cannot be specified for the **loc** parameter.

The frame and shelf portion of the specified **loc** parameter must be **11**, **12**, **13**, **21**, **22**, **23**, **31**, **32**, **33**, **41**, **42**, **43**, **51**, **52**, **53**, or **61** (**loc**= xyss, where x is the frame, y is the shelf, and ss is the slot).

The **limatm**, **lime1atm**, **limds0**, **limocu**, **limv35**, **lime1**, **limt1**, **limch**, and **dcm** card types are the only valid card types for this command.

The card must be a LIM, an E1/T1 MIM, or an HC-MIM.

The specified card location must be equipped.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The **link** parameter values **a4-a31** and **b4-b31** can be specified only for the HC-MIM card that is used as an E1 card or a T1 card. The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for Channel cards.

The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for even-numbered card locations.

If the card application is **ss7gx25**, **link=a** must be specified.

The associated location must be empty, or an E5-ATM card must be provisioned in the location before the **link=b** parameter can be specified. Upon initialization, the E5-ATM card is in **boot phase-0** for up to 30 secs. During this period, the E5-ATM hardware is not detected, which may result in a lack of support for signalling link **b**.

If an E5-ATM card is used, then the value specified for the **link** parameter must be **a** or **b**.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of the card locations.

Output

rtrv-slk

Legend

LOC—The location of the card containing the signaling link.

LINK—The signaling link assigned to the card.

LSN—The name of the linkset containing the signaling link.

SLC—The signaling link code of the signaling link.

TYPE—The type of card.

L2TSET—The number of the level 2 timer set associated with the signaling link.

BPS—The transmission rate of the signaling link in bits per second.

L1MODE—The mode of operation used to select the link clocking source at layer 1.

TSET—An indicator of whether the transmitter signal element timing is on or off.

ECM—The basic of PC for transmission.

PCRN1—The MSU number.

PCRN2—The octet number.

LPSET—The ATM link parameter set identifier.

ATMTSEL—The ATM timing selector. Possible values are as follows:

INTERNAL—Derived from an internal clock source operating at 1.544 MHz $\pm$ 200 Hz (ANSI) or 2.048 MHz $\pm$ 103 Hz (ITU).

EXTERNAL—Derived from the High-Speed Master Clock (T1 or E1).

LINE—Derived from its received data stream, if present.

VCI—The ATM virtual channel identifier.

VPI—The ATM virtual path identifier.

LL—The ATM line length.

E1PORT—The E1 card port that has an E1 interface assigned to it.

E1LOC—The card location of an E1 card with an E1 interface assigned to it.

T1PORT—The T1 card port that has a T1 interface assigned to it.

T1LOC—The card location of a T1 card with a T1 interface assigned to it.

TS—The timeslot associated with the signaling link that is serviced by the E1 or T1 interface.

E1ATMCRC4—E1 ATM card CRC4 multi-frame structure enable/disable indicator.

E1ATMSI—Value of two Spare International bits of NFAS data for the E1 ATM card.

E1ATMSN—Value of five Spare National bits of NFAS data for the E1 ATM card.

IPLIML2—IPLIM Level 2 stack (M2PA)

rtrv-slt

Retrieve Signaling Link Test Message

Use this command to display the fields of an SLTM (signaling link test message) record in the SLTM table.

Keyword: rtrv-slt

Related Commands: chg-l3t, chg-slt, ent-ls, rtrv-ls

Command Class: Database Administration

Parameters

:enabled= (optional)

Displays the SLTM records that are either enabled (**on**) or disabled (**off**).

Range: on, off

Default: All SLTM records with the specified value for the enabled parameter are shown.

:sltset= (optional)

The signaling link test message (SLTM) record number in the SLTM table.

Range: 1-20

Default: Display all

Example

```
rtrv-slt
```

```
rtrv-slt:sltset=1
```

```
rtrv-slt:enabled=off
```

Dependencies

None

Notes

;

Legend

SLTSET—The signaling link test message record number in the SLTM table.

T1—The T1 timer value for the SLTM record. After an SLTM test fails, this parameter specifies the amount of time, in seconds, to wait before running the SLTM test again.

T2—The T2 timer value for the SLTM record. This parameter specifies the amount of time, in seconds, to wait between running SLTM tests for a normally functioning signaling link.

MODE—The SLTM mode to be used when sending test messages.

ENABLED—Indicates whether the signaling link test message is enabled.

PATTERN—The test pattern to be sent with a signaling link test message.

rtrv-spc**Retrieve Secondary Point Code**

Use this command to retrieve an SPC (secondary point code) from the active database.

Keyword: **rtrv-spc**

Related Commands: **dlt-spc, ent-spc**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:spc= (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **spca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

The secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

rtrv-spc

rtrv-spc:spc=5-3-3

rtrv-spc:spcn24=98-98-98

rtrv-spc:spcn=s-00345

Dependencies

The MPC feature must be turned on before this command can be entered.

The value of the **spc** parameter must be a full point code.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

The following example shows the output for all provisioned secondary point codes. (SPC-N is a flexible point code format as defined with the **chg-stpopts:npcfmt** parameter).

rtrv-srvsel

Retrieve Service Selector

Use this command to display a list of administered service selector combinations. The list can be filtered using various parameter combinations.

NOTE: The rtrv-srvsel operation may be lengthy because the service selector table can contain over 1,000 entries.

Keyword: rtrv-srvsel

Related Commands: chg-srvsel, dlt-srvsel, ent-srvsel

Command Class: Database Administration

Parameters

:force= (optional)

The **force=yes** parameter must be specified when a **num** parameter value greater than **50** is specified to display more than 50 entries.

Range: yes, no

Default: no

:gti/gtia/gtii/gtin/gtin24= (optional)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national) and **gtin24** (24-bit ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2, 4; gtin=2, 4, gtin24=2, 4**

Default: Display all

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: sub, rsvd, natl, intl

Default: Display all

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: 0-127

Default: Display all

:np= (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: e164, generic, x121, f69, e210, e212, e214, private

Default: Display all

:npv= (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: 0-15

Default: Display all

:num= (optional)

Number of entries to display. The **force=yes** parameter is required when this parameter value is specified greater than 50 entries.

Range: 1-20992

Default: 50

:serv= (optional)

The DSM service.

Range: **eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp**

eir— Equipment Identity Register

gflex— GSM flexible numbering

gport— GSM number portability

inpq— INP query

inpmr— INP message relay

smsmr— Prepaid SMS Intercept Phase 1

idps— IDP Screening for Prepaid

idpr— Prepaid IDP Query Relay

mnp— mobile number portability

Default: Display all

:snai= (optional)

The service nature of address indicator.

Range: **sub, natl, intl, rnidn, rncdn, rnsdn, ccrndn**

sub—Subscriber number

natl—National significant number

intl—International number

rnidn—Routing number prefix and international dialed/directory number

rncdn—Routing number prefix and national dialed/directory number

rnsdn—Routing number prefix and subscriber dialed/directory number

ccrndn—Country code, routing number, and national directory number

Default: Display all

:snp= (optional)

The service numbering plan.

Range: **e164, e212, e214**

e164—E.164 numbering plan

e212—E.212 numbering plan

e214—E.214 numbering plan

Default: Display all

:ssn= (optional)

Subsystem number.

Range: 0-255 *

:tt= (optional)

Translation type.

Range: 0-255

Default: Display all

Example

```
rtrv-srvsel
rtrv-srvsel:gtii=2
rtrv-srvsel:tt=0:np=e164
```

Dependencies

The GFLEX, INP, or AINPQ feature must be turned on, or the G-Port, Equipment Identity Register (EIR), Prepaid SMS Intercept Ph1 (PPSMS), Prepaid IDP Relay, or IDP Screening for Prepaid feature must be enabled before this command can be entered.

The INP feature must be turned on before the **serv=inp** or **serv=inpq** parameter can be specified.

The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

The value **4** is not valid for the **gti/gtia** parameters.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, then no **np(v)** and **nai(v)** parameter combinations can be specified.

If the value specified for the **serv** parameter is **inp**, **inpq**, **gport**, **eir**, **smsmr**, or **mnpsms**, then the **gtia** and **gti** parameters cannot be specified.

If the **serv=inp** parameter is specified, then the value of the **snp** parameter must be **e164** if specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the value of the **serv** parameter must be **inp**, **gport**, **smsmr**, or **mnpsms** if it is specified.

If the **serv=inpq** parameter is specified, then the **gtii** parameter cannot be specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the **serv=gflex** parameter cannot be specified.

When a **serv** parameter value of **inpq** or **eir** is specified, the **snp** and **snai** parameters cannot be specified.

If the **snai=ccrndn** parameter is specified, then the value specified for the **serv** parameter must be **gport**, **smsmr**, or **mnpsms**.

If the value specified for the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

If the **serv=idpr** parameter is specified, then the only valid mandatory service parameters are **tt**, **ssn** and **gti/gtia/gtin/gtii**. If the **serv=idpr** parameter is specified, then the only valid optional parameters are **np** and **nai**.

The IDP Screening for Prepaid feature must be turned on before the **serv=idps** parameter can be specified.

The Prepaid SMS Intercept Ph1 feature must be turned on before the **serv=smsmr** parameter can be specified.

rtrv-stp**Retrieve STP Information**

Use this command to retrieve information related to the STP at which the command is entered.

The command can retrieve frame and card power consumption and threshold values (in Amps or milliAmps and Watts) for all provisioned frames or for a specified frame. (See the **ent-frm-pwr** command.)

The command can retrieve hardware configuration information (card location, board part number, revision, serial number, card type, card memory, APPL, and GPL version):

- For all provisioned STP frames and shelves
- For a specific provisioned frame
- For a specific provisioned shelf
- For a specific equipped card
- For all cards of the specified card type
- For all cards that contain the specified Board Part Number
- For all cards that are running the specified GPL or GPL version.

Keyword: **rtrv-stp**

Related Commands: **chg-frm-pwr, dlt-frm-pwr, ent-frm-pwr, rtrv-frm-pwr**

Command Class: Database Administration

Parameters

:display= (optional)

Display the power consumption and power threshold value for all provisioned frames or for one specific provisioned frame.

This parameter must be specified when the **frm** parameter is specified, to display the power information for one frame.

Range: **power**

power — Display frame power information in the command output.

:frm= (optional)

Frame ID. The command displays information for the specified provisioned frame.

Range: **cf00, ef00, ef01, ef02, ef03, ef04**

cf00 — Control Frame identifier

ef00 — Identifier for the first Extension Frame

ef01 — Identifier for the second Extension Frame

ef02 — Identifier for the third Extension Frame

ef03 — Identifier for the fourth Extension Frame

ef04 — Identifier for the fifth Extension Frame

:gpl= (optional)

Generic program load. The parameter is specified to display hardware configuration information for all card locations equipped with cards that are running the specified GPL.

This parameter must be specified when the **ver** parameter is specified, to display information for a specific version of the GPL.

Range: **ayyyyyy**

1 alphabetic character followed by up to 6 alphanumeric characters. Valid GPLs are:

atmansi—The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

atmhc—This GPL is used to support the functionality for the E5-ATM card. The E5-ATM card runs either the ATMANSI or ATMITU application. The **atmhc** GPL allows the card to support up to 2 signaling links.

atmitu—The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

blbepm—A flash GPL containing the BIOS ROM image on E5-E1T1 cards and E5-ENET cards.

blbios—A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

blbsmg—A flash GPL containing the BIOS ROM image on E5-SM4G cards.

blepld—A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag—A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag6—A flash GPL containing the diagnostic code on E5-E1T1 cards and E5-ENET cards.

blvxw—A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

blvxw6—A flash GPL containing the VxWorks operating system on E5-E1T1 cards and E5-ENET cards.

bpdcn—This GPL is used in support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design.

bpdcn2—This GPL is used in support the flash memory Board PROM for DCM and GPSM boards, revised design.

bphcap—This GPL is used to support Board PROM for HCAP flash memory.

bphcapt—This GPL is used to support Board PROM for HCAP-T flash memory.

bphmux—This GPL is used to support Board PROM for HMUX flash memory.

bpmpl—This GPL is used to support Board PROM for MPL flash memory.

bpmplt—This GPL is used to support Board PROM for E1/T1 flash memory and Board Prom for MPL-T flash memory.

ccs7itu—This GPL is used by the LIM cards for ITU-TSS MTP functionality.

eoam—This GPL is used by the GPSM-II card for enhanced OAM functions.

eroute—This GPL is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

erthe—This GPL is used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

gls—This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

hipr—The communication software used on the High Speed IMT Packet Router (HIPR) card.

imt—This GPL is the communication processor on the logical processing element (LPE).

imtpci—The communication software that operates the IMT bus on HC-MIM cards.

ipghc—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

ipgwi—This GPL is used by the SSEDCEM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes.

iplhc—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

iplim—This GPL is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi—This GPL is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes.

ips—This GPL is used by the IPSM card for the IP User Interface feature.

ipsg—This GPL is used by the E5-ENET card to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

ipshc—This GPL is used by the E5-IPSM card to support the IPS application.

mcp—This GPL is used by the MCPM card for the Measurements Platform feature.

pldpmc1—A flash GPL that is used on HC-MIM cards for E1 and T1 signaling links.

sccp—This GPL is used by the TSM cards for the global title translation application. E5-SM4G card is present, the **sccphc** GPL processes normal GTT traffic.

sccphc—This GPL is used by the E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and the E5-SM4G card is present, the **sccphc** GPL processes normal GTT traffic.

ss7ansi—This GPL is used by the LIM cards for the MTP functionality.

ss7epm—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications. The **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

ss7gx25—This GPL is used by the LIM cards to support X.25 functionality.

ss7hc—This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the SS7ANSI or CCS7ITU application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

ss7ipgw—This GPL is used by the system to support TCP/IP point-to-multipoint connectivity.

ss7ml—This GPL is used to support the functionality for the multi-port LIM (MPL) card and the E1/T1 MIM (Multi-Channel Interface Module) card. The MPL cards run only the SS7ANSI application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the **ss7ml** GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. The MPL cards support only the DS0 interface. The E1/T1 MIM card runs either the SS7ANSI or CCS7ITU application; the **ss7ml** GPL allows the card to support 8 signaling links for E1 and T1 functions.

stplan—This GPL is used by the ACM card to support the STP LAN application.

utility—This GPL is used by the factory for testing, and when directed by your Customer Care Center.

vcdu—This GPL is used in the card manufacturing process.

vsccp—This GPL is used by DSM cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a DSM card is present, then the **vsccp** GPL processes normal GTT traffic.

vxwslan—This GPL is used by the SSEDCCM card to support the STP LAN application.

:partnum= (optional)

Display the hardware configuration for all card locations that contain a card with the specified Board Part Number.

Range: *zzz-zzzz-zz*

Specify the Board Part Number in the format *xxx-xxxx-xx*. See the Hardware Baseline appendix in the *Feature Notice* for a list of Board Part Numbers that are supported for the EAGLE 5 ISS release.

:shelf= (optional)

Display the hardware configuration information for all card locations in the specified EAGLE shelf.

Range: **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

:type= (optional)

Display the hardware configuration information for all card locations that contain cards of the specified card type.

Range: **acmenet, dcm, dsm, ipsm, limatm, limatm, limch, limds0, lime1, lime1atm, limocu, limt1, limv35, mcpm, stc, tsm, enet**

:ver= (optional)

Display the hardware configuration information for all the card locations that have cards with the specified GPL Type and the specified GPL Version. The version format is *major-minor-fix*.

Range: *major-minor-fix*

major—Range **0-255**

minor—Range **0-255**

fix—Range **0-255**

Example

Retrieve the frame power information for all provisioned frames of the STP.

rtrv-stp:display=power

Retrieve the card level power information for the control frame in the STP.

rtrv-stp:display=power:frm=cf00

Retrieve the hardware configuration information for the STP control shelf (shelf 1100).

rtrv-stp:shelf=1100

Retrieve the hardware configuration information for all cards equipped in the STP that have the specified Board Part Number.

rtrv-stp:partnum=870-1275-01

Retrieve the hardware configuration information for all provisioned TSM cards in the STP.

rtrv-stp:type=tsm

Retrieve the hardware configuration information for all cards in the STP that are running the imt communication GPL with GPL version 126-039-043.

rtrv-stp:gpl=imt:ver=126-039-043

Retrieve the hardware configuration information for all provisioned frames in the STP.

rtrv-stp

Retrieve the hardware configuration information for all cards in the STP that are running the atmhc GPL.

rtrv-stp:gpl=atmhc

Dependencies

The **display** parameter must be specified when the **frm** parameter is specified.

The **gpl** parameter must be specified when the **ver** parameter is specified.

Only one optional parameter can be specified in the command, except for the following parameter combinations:

- The **display** parameter must be specified when the **frm** parameter is specified.
- The **gpl** parameter must be specified when the **ver** parameter is specified.

The **frm** parameter value must specify a provisioned frame.

Notes

When the power threshold value has not been provisioned for a provisioned frame, the default frame power threshold value is displayed and prefixed with a plus sign (+).

For an un-provisioned card that is present in the frame, the card power consumption value is displayed prefixed with a plus sign (+).

For the TDM and MDAL cards in the Control Frame and for the MUX cards in all the frames, "TDM", "MDAL", or "MUX", respectively, is displayed as the Part Number of the card.

If the Board Part Number received in the BIP response from a card is not present in the Assembly Power table, then the Part Number for the card is displayed with a prefix of a plus sign (+).

If the Card power value is not present in the BIP data and the Assembly Power table, then the default card power value of **1563 milliAmps** is displayed for the card.

If board information is not available from a card,

- **BIP Data inv** is displayed as the Part number for the card.
- The default card power value of **1563 milliAmps** is displayed for the card.

If a card location is empty (no card is present in that slot),

- **Empty** is displayed as the Part Number for the card
- A card power value of **0** is assumed and displayed.

For Standby GPSM and TDM cards, "Unavailable" is displayed as the Part Number if either the Standby GPSM card or TDM card is absent. In this case, the card power of the Active GPSM card is shown for the card power of the Standby GPSM card also.

If a flash or communication GPL is specified with the **rtrv-stp** command, then the GPL output displays the version of the application GPL that is running on the card and not the version of the specified flash or communication GPL.

Output

If a flash or communication GPL is specified, then the output displays the GPL version of the application GPL running on the card instead of the GPL version of the specified flash or communication GPL.

The power consumption values that are displayed in the **rtrv-stp:display=power** or the **rtrv-stp:display=power:frm=** commands indicate the maximum calculated power for the frame. The calculation is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

The following example retrieves the hardware configuration information for a specific shelf.

rtrv-stp:shelf=1100

```
tekelecstp 07-03-30 11:07:17 EST EAGLE 37.0.0
```

Legend

FRAME—Frame ID for the control shelf or an extension shelf

POWER THRESHOLD—The power threshold (in Amps or Milliamps and Watts) at which an alarm is generated to indicate that power consumption is approaching a maximum allowed level. (See the **ent-frm-pwr** command.)

POWER CONSUMPTION—The current calculated power consumption (in Amps or Milliamps and Watts) of the frame or card

CARD—Card Location

PART NUMBER—Board Part Number

REV—Board Part Number revision

SERIAL NUMBER—Card serial number

TYPE—Card type

DB—Daughterboard memory

APPL—Application that has been provisioned on the card

GPL VERSION—GPL version of the Application GPL being used by the card

rtrv-stpopts**Retrieve STP Options**

Use this command to retrieve the current value of the system's node-level processing option indicators maintained in the system's options table.

Keyword: **rtrv-stpopts**

Related Commands: **chg-stpopts**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-stpopts

Dependencies

None

Notes

The timer output for this command is in milliseconds, even though the timer could have been entered in seconds on the **chg-stpopts** command.

Output

The following example displays MTP STP options with no affecting features on. Certain features that are shown in other examples control changes and additional options in this option list:

rtrv-stpopts

```
rlghncxa03w 08-02-17 16:02:05 EST EAGLE 38.0.0
STP OPTIONS
-----
MTPT31CTL          1
MTPLTI             yes
MTPLTCTDPCQ        3

;
```

The following example displays all MTP STP options. The following list indicates which options appear in the output when the associated features are on:

NOTE: All options will not appear in actual output, because all features that cause these options to appear cannot be on in the system at the same time.

- Cluster Routing and Management Diversity (CRMD) feature—MTPXLQ, MTPXLET, MTPXLOT
- MTP Restart (MTPRS or ITUMTPRS) feature—MTPRSI, MTPRSIT
- 6000, 7000, or 8000 Routesets feature—MTPDPCQ=6000 or 7000 or 8000
- GSM MAP Screening (GSMSCRN) feature—GSMDFLT, GSMDECERR
- GSM Mobile Number Portability (G-Port) feature, INAP Number Portability (INP) feature, GSM Flexible Numbering (G-Flex) feature, or Prepaid SMS Intercept (PPSMS) Ph1 feature—DEFCC, DEFNDC, DSMAUD
- GSM Flexible Numbering (G-Flex) feature—ANSIGFLEX
- Network Security (NSE) feature—SECMTPMATE, SECMTPSID, SECMTPSNM, SECSCCPSCMG
- ANSI-ITU-China SCCP Conversion (SCCP Conversion) feature—CNVCGDA, CNVCGDI, CNVCGDN, CNVCGDN24, GTCNVDFLT

Legend

MTPT31CTL—MTP T31 congestion trigger level. The signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.

MTPLTI—MTP loop test indicator. Specifies whether the MTP loop detection procedures are enabled or disabled at the system.

MTPLTCTDPCQ—MTP loop test congestion trigger DPC quantity. The number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

MTPLTST—MTP loop test supervision timer. The amount of time, in milliseconds, that the MTP loop test detection procedures run when started.

MTPXLQ—MTP x-list quantity. The number of dynamic status exception list (x-list) entries the system maintains.

MTPXLET—MTP x-list expiration time. The maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.

MTPXLOT—MTP x-list occupancy threshold. The dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

MTPDPCQ—MTP destination point code quantity. The maximum number of DPCs that can be provisioned in the system.

TFATFRPR—TFA/TFR pacing rate. The amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly-recovered linksets.

MTPRSIT—MTP Restart isolation timer. The minimum duration of node isolation, in milliseconds, before the MTP Restart procedure is deemed necessary.

MTPRSI—MTP Restart indicator. Specifies whether ANSI or ITU MTP Restart procedures are enabled or disabled at the STP.

MTPLPRST—MTP low priority route set test. Specifies whether low priority route set polling is enabled or disabled at the STP.

MTPT10ALT—MTP T10 alternate timer. Specifies the interval at which the STP performs a route set test on low priority routes.

SLSCNV—Per node SLS conversion indicator. Specifies whether SLS conversion is on, off, or performed per linkset (perls).

UIMRD—Unsolicited Information Message (UIM) redirect. Specifies whether specific UIMs are redirected to this output group.

CRITALMINH—Indicates whether the option that allows the inhibiting of critical alarms is enabled (yes) or disabled (no).

DISPACTALMS—Indicates whether to display active or total alarms in the alarm status area of the VT320 screen.

NPCFMTI—Defines how the ITU national point code is entered into the database and how it is displayed in any outputs from the system.

GSMDFLT—Indicates whether the GSM MAP screening default action is set to pass or discard.

GSMDECERR—Indicates whether the GSM MAP screening decode error action is set to pass or discard.

DEFCC—Defines the default country code.

DEFNDC—Defines the default network destination code.

DSMAUD—Indicates whether the DSM audit is running (on) or disabled (off).

RANDSLS—Displays the Random SLS setting.

RTPLNPMRSS—Displays the setting for reporting or suppressing UIM 1049 for LNP MR with missing subsystems.

RSTRDEV—Allow or disable restoration of device states when an **init-sys** command is executed, an OAM role changes, or a card reload occurs.

SECMTPMATE—Indicates Network Security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.

SECMTPSID—Indicates Network Security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the **chg-sid** command) that is not a route-set-congestion-message. The EAGLE 5 ISS should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked.)

SECMTPSNM—Indicates Network Security screening for MTP SNM messages. The EAGLE 5 ISS should not receive an MTP network management message unless:

- The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)

- The EAGLE 5 ISS has a route to the OPC of the MTP network management message on the linkset which the message was received.
- The EAGLE 5 ISS has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule is not applicable to RST messages.)

SECSCCPSCMG—Indicates Network Security screening for SCCP SCMG messages. This value applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected. The EAGLE 5 ISS should not receive an SCCP network management message unless:

- The EAGLE 5 ISS has a route to the OPC of the SCMG message on the linkset on which the message was received.
- The EAGLE 5 ISS has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE 5 ISS) in the message on the linkset on which the message was received.

CNVCGDA—Indicates whether or not to discard the CGPA PC in ANSI SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

CNVCGDI—Indicates whether or not to discard the CGPA PC in ITU-I SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

CNVCGDN—Indicates whether or not to discard the CGPA PC in ITU-N SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

CNVCGDN24—Indicates whether or not to discard the CGPA PC in 24-bit ITU-N SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

ANSIGFLEX—Indicates enable or disable of ANSI G-Flex to execute at 1700 TPS per DSM card

GT CNVDFLT—Indicates enable or disable of routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion table.

HSCLKLL—High speed master clock line length option (SHORTHAUL, LONGHAUL)

HSCLKSRC—High speed master clock source

rtrv-subnetid

Retrieve Subnet ID

Use this command to retrieve a list of Subnet ID entries from the SUBNETID table, for the ISUP NP with EPAP feature.

Keyword: rtrv-subnetid

Related Commands: dlt-subnetid, ent-subnetid

Command Class: Database Administration

Parameters

:subnetnum= (optional)

Subnet Number

Range: 1-5

Example

```
rtrv-subnetid
```

```
rtrv-subnetid : subnetnum = 1
```

Dependencies

The ISUP NP with EPAP feature must be enabled before this command can be entered.

Notes

None.

Output

When the command is entered with no parameter, the Subnet IDs for Subnet number 1 are listed in numerical order, followed by the Subnet IDs for Subnet number 2 in numerical order, and so on.

rtrv-subnetid

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
```

ID	Subnet Number

886932	1
886936	1
886935	2
886938	2
886939	2

886932	1
886936	1
886935	2
886938	2
886939	2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;

When a Subnet number is specified, the Subnet IDs for the specified Subnet number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

rtrv-subnetid:subnetnum=2

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0
```

ID	Subnet Number

886935	2
886938	2
886939	2

886935	2
886938	2
886939	2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;

rtrv-t1**Retrieve T1 Information**

Use this command to retrieve information for a specified T1 interface or for all T1 interfaces that have been defined by the **ent-t1** command for an E1/T1 card, an HC MIM card, or an E5-E1T1 card that is used as a T1 card. The following information can be retrieved: T1 port number, encoding/decoding, timing source, framing, channel bridging, and line length.

Keyword: rtrv-t1

Related Commands: chg-t1, dlt-t1, ent-t1, tst-t1

Command Class: Database Administration

Parameters

:loc= (optional)

The card location of a T1 card, as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118,

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,
4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If not specified, all T1 card locations are listed.

:t1port= (optional)

T1 port number. The value must be a T1 port that has already been configured on the T1 card specified in the **loc** parameter.

Range: 1-8

Ports 3-8 are valid only for HC-MIM and E5-E1T1 cards.

Default: If not specified, all T1 ports are listed.

Example

rtrv-t1

rtrv-t1:loc=1307:t1port=2

rtrv-t1:loc=1311:t1port=1

Dependencies

The **loc** and **t1port** parameters must be specified together, if any parameters are specified for the command.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The specified port (**t1port** parameter) on the card in the specified card location (**loc** parameter) must already have a defined T1 interface.

Notes

None.

Output

rtrv-t1

```

;

The following example shows information for port 6 on the card in location 1311. Port 6 is channel bridged with port 5 for data pass-through.

rtrv-t1:loc=1311:t1port=6

```

rlghncxa03w 05-04-20 09:07:58 EST EAGLE5 33.0.0
LOC  T1PORT ENCODE T1TSEL FRAMING LL  CHANBRDG
1311  6      B8ZS   recovered SF       135  SLAVE

```

Card 1311, port 6 is channel bridged with port 5 for data pass through.

;

Legend

LOC—T1 card location in an EAGLE 5 ISS shelf.

T1PORT—T1 port number on an T1 card.

ENCODE—Indicator for use of B8ZS or AMI encoding/decoding.

T1TSEL—T1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair).

FRAMING—Framing format (SF or ESF).

LL—Line length; T1 cable length in feet between the EAGLE 5 ISS and the connecting node

CHANBRDG—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

TSx—Timeslot.

rtrv-tbl-capacity**Retrieve Table Capacity**

Use this command to retrieve table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value.

Keyword: **rtrv-tbl-capacity**

Related Commands: **rept-stat-xlist**, **rtrv-appl-rtkey**, **rtrv-appl-sock**, **rtrv-as**, **rtrv-assoc**, **rtrv-dstn**, **rtrv-gta**, **rtrv-ls**, **rtrv-map**, **rtrv-scrset**, **rtrv-slk**, **rtrv-spc**, **rtrv-x25-dstn**, **rtrv-x25-slk**

Command Class: Database Administration

Parameters

This command has no parameters.

Example

rtrv-tbl-capacity

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

XLIST table information is shown only if the CRMD feature is ON.

Secondary Point Code (SPC) table information is shown only if the MPC feature is ON.

If the EGTT feature is ON then table name is GTA instead of GTT.

Additional information for each listed table can be displayed using the commands listed in Table 5-62.

Though the ASP table entries are now part of the IPAPSOCK table, EAGLE 5 ISS command entry and output still appear as though they are separate tables. The **rtrv-tbl-capacity** command shows the number of ASPs in the 4000-entry IPAPSOCK table.

Table 5-62. Retrieve Commands for Additional Table Information

Command	Table name	Description of table
rept-stat-xlist	XLIST	Destination - Routeset Extension
rtrv-appl-sock	IPAPSOCK	IP Socket/Association
rtrv-appl-rtkey	IPRTKEY	IP Routing Key
rtrv-as	AS	Application Server
rtrv-assoc	IPAPSOCK	IP Socket/Association
rtrv-dstn	DSTN	Destination Routeset, Exception Routeset
rtrv-gta	GTA	Global Title Address
rtrv-gtt	GTT	Global Title Translation

Table 5-62. Retrieve Commands for Additional Table Information

Command	Table name	Description of table
rtrv-ip-lnk	IP-LNK	Internet Process Link
rtrv-ls	LS	Link Set
rtrv-map	MAP	Mated Application
rtrv-mrn	MRN	Mated Relay Node
rtrv-scrset	SCRSET	Gateway Screening Screen Set
rtrv-slk	SLK	Signal Link
rtrv-spc	SPC	Secondary Point Code
rtrv-x25-dstn	X25-DSTN	X.25 Destination
rtrv-x25-slk	X25-SLK	X.25 Signal Link

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service.

Output

The following example shows the output for the minimum table sizes in the system:

rtrv-tbl-capacity

tekelecstp 04-04-02 07:35:33 EST EAGLE 31.6.0

DSTN	table is (	200 of	2000)	10% full
XLIST	table is (	0 of	500)	0% full
X25-DSTN	table is (	0 of	1024)	0% full
SPC	table is (	0 of	40)	0% full
LS	table is (	512 of	1024)	50% full
SLK	table is (	48 of	1200)	4% full
X25-SLK	table is (	0 of	256)	0% full
IP-LNK	table is (	10 of	500)	2% full
MAP	table is (	256 of	1025)	25% full
GTT	table is (	2700 of	270000)	1% full
SCRSET	table is (	50 of	255)	20% full
AS	table is (	5 of	250)	2% full
ASP	table is (	5 of	4000)	2% full
RTEKEY	table is (	2 of	2500)	1% full
IPAPSOCK	table is (	324 of	4000)	8% full

;

The following example shows the output for the maximum table sizes in the system. For the DSTN, SLK, GTT, and MAP tables, maximum values depend on the enabled feature quantity value applicable to the table in the system.

rtrv-tbl-capacity

tekelecstp 04-04-02 07:35:33 EST EAGLE 31.8.0

DSTN	table is (	600 of	8000)	10% full
XLIST	table is (	0 of	500)	0% full
X25-DSTN	table is (	0 of	1024)	0% full
SPC	table is (	0 of	40)	0% full
LS	table is (	512 of	1024)	50% full
SLK	table is (	1501 of	1500)	75% full
X25-SLK	table is (	0 of	256)	0% full
IP-LNK	table is (	10 of	500)	2% full
MAP	table is (	1500 of	3000)	50% full
GTT	table is (	1000000 of	1000000)	100% full

```

;

rtrv-trbl**Retrieve Trouble**

Use this command to display detailed information for one or more troubles that are currently logged into the system.

Keyword: rtrv-trbl

Related Commands: act-alm-trns, dact-alm-trns, rept-stat-alm, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The address of the card that is running the OAM from which logged trouble reports are to be displayed.

Range: 1113, 1115

:mode= (optional)

Display mode

Range: c, m

c—Continuous mode; shows troubles already logged and new troubles as they occur.

m—Manual mode; shows troubles on demand only

Default: c

:num= (optional)

Indicates how many troubles to display.

Range: 1-99

Example

rtrv-trbl:loc=1113:num=2

Dependencies

At least one trouble must be in the trouble log, or the command is rejected.

Only one **rtrv-trbl** or **rtrv-obit** command can be in progress at a time.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

The card specified by the **loc** parameter must be **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available. The **num** parameter must be between **1** and **99**.

Notes

When a trouble is generated in the system, it is logged into the RAM storage area of the active OAM. Each OAM can store up to 99 troubles in a queue. If the OAM resets, logged troubles are lost.

Output

The output from this command should be reviewed with a member of the Tekelec Technical Services Team. You can contact Tekelec Technical Services at (888) FOR-TKLC.

```

;
```

rtrv-trbltx

Retrieve Trouble Text Table Entries

Use this command to retrieve Alarm and UIM message information including MRN (message reference number), level (for Alarms), Output Group, and text.

The default report displays all Alarms (in numerical order) and then all UIMs.

The optional parameters can be used to:

- Display a range of Alarms or UIMs (ranges spanning both Alarms and UIMs are not supported)
- Search for Alarms, UIMs, or both message types matching a specific Output Group
- Sort all entries by Output Group

Keyword: **rtrv-trbltx**

Related Commands:

Command Class: Database Administration

Parameters

:enum= (optional)

The ending Message Reference Number (MRN) when specifying a range.

Range: **1-999** for Alarms, **1000-1499** for UIMs

Default: when **enum** is not specified,

If **snum** is specified, the **enum** value defaults to the specified **snum** value.

If **snum** is not specified and **type=all**, **type=uim**, or **type** not specified, the **enum** value defaults to **1499**

If **snum** is not specified and **type=alarm**, the **enum** value defaults to **999**

:outgrp= (optional)

The Output Group to sort or filter the Alarm/UIMs on.

Range: appserv, appss, card, clk, db, dbg, gtt, gws, link, meas, mon, mps, pu, sa, seas, slan, sys, traf
 appserv — Application Server
 appss — Application Subsystem
 card — Card
 clk — Clock
 db — Database
 dbg — Debug
 gtt — GTT Maintenance
 gws — GWS Maintenance
 link — Link Maintenance
 meas — Measurements Maintenance
 mon — Monitoring (Sentinel or IMF) Maintenance
 mps — MPS Maintenance
 pu — Program Update
 sa — System Administration
 seas — SEAS (Sentinel or IMF)
 slan — SLAN Maintenance
 sys — System Maintenance
 traf — Traffic
 all—retrieve information for all Output Groups

Default: No sorting or filtering is done on Output Groups.

:snum= (optional)

A single Message Reference Number (MRN), or the starting MRN when specifying a range.

Range: 1-999, 1000-1499

1-999—For Alarms (UAMs)

1000-1499—For UIMs

Default: All message entries for the specified **type** are displayed.
 For **type=all**, **type=alarm**, or **type** not specified—**snum** Default: 1
 For **type=uim**—**snum** Default: 1000

:type= (optional)

The type of trouble text entry—Alarm, UIM, or both types—to display.

Range: all, alarm, uim

all — Both types are displayed

alarm — Only Alarm entries are displayed

uim — Only UIM entries are displayed

Default: all

Example

```
rtrv-trbltx
rtrv-trbltx:type=alarm
rtrv-trbltx:outgrp=sys
rtrv-trbltx:type=alarm:outgrp=all
rtrv-trbltx:snum=1002
```

Dependencies

If **enum** is specified, **snum** must be specified in the command.

The specified **enum** value must be greater than or equal to the specified **snum** value.

The specified **enum** value must be in the same range as the specified **snum** value (**1-999** for Alarms and **1000-1499** for UIMs). The range cannot span both types.

The specified **snum** and **enum** values must be in the range of the specified **type** (**1-999** for Alarms and **1000-1499** for UIMs).

When the **outgrp** parameter is specified, the **snum** and **enum** parameters cannot be specified.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To display a single Alarm or UIM, enter the Alarm or UIM MRN as the value of the **snum** parameter. Either do not specify the **enum** parameter or specify the **enum** parameter with the same value as the **snum** value.

If an unused MRN is specified as an **snum** parameter value, the header information is displayed without any Output Group header or MRN information.

If an **snum/enum** range is specified, and there are unused MRNs within that range, only the used MRNs are displayed.

Output

The following example shows output when the command has no parameters. All entries are not shown; the list is long:

rtrv-trbltx

rtrv-trm

Retrieve Terminal

Use this command to show the port configuration for all TDM terminals or a specified terminal. These ports are used to connect modems, printers, and terminals to the system. This command displays the following information: device type, data transmission rate, parity, type of flow control used, number of stop bits, number of data bits, and the type of unsolicited messages to be received.

Keyword: rtrv-trm

Related Commands: act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm

Command Class: Database Administration

Parameters

:trm= (optional)

Specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

Range: 1-40

Default: Display all

Example

```
rtrv-trm
```

```
rtrv-trm:trm=17
```

Dependencies

The IP User Interface feature must be enabled and turned on, and at least one IPSM card must be equipped, before **telnet** or **emsalm** type terminals with IDs 17 - 40 can be specified.

The specified terminal must be equipped.

Notes

None

Output

The following example, with the LNP feature turned on, shows the display of the terminal settings for terminal port 3, which is configured for a terminal:

rtrv-trm:trm=3

```

;

Legend

Part one of the **rtrv-trm** report contains these fields:

TRM—The TDM terminal port number associated with the output device.

TYPE—The type of output device that is connected.

COMM—This field is composed of four communication attributes in the format *baud-dbts-prty-sb*. The parts are:

BAUD—The serial port baud rate of the output device

DBTS—The number of data bits used by the output device

PRTY—The parity of the output device

SB—The number of stop bits used in communications with the output device

FC—The type of protocol used between the system and the output devices.

TMOUT—Shows the maximum amount of time (in minutes) that a login session can remain idle.

MXINV—Shows the login/unlock failure threshold.

DURAL—Shows the length of time (in seconds, minutes, and hours) the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured with the **mxinv** parameter.

SECURE—Indicates whether the OA&M IP Security Enhancements feature is turned on or off for Telnet terminals.

Part two of the **rtrv-trm** report contains these fields:

TRM—The TDM terminal associated with the output device.

TRAF—Shows whether traffic-related unsolicited messages are received by the output device.

LINK—Shows whether link-related unsolicited messages are received by the output device.

SA—Shows whether security administration-related unsolicited messages are received by the output device.

SYS—Shows whether system maintenance-related unsolicited messages are received by the output device.

PU—Shows whether program update-related unsolicited messages are received by the output device.

DB—Shows whether database-related unsolicited messages are received by the output device.

UIMRD—Shows whether Unsolicited Information Messages (UIMs) specific to the group are received by the output device.

Part three of the **rtrv-trm** report contains these fields:

APP SERV—Shows whether Application Server unsolicited messages are received by the output device.

APP SS—Shows whether Application Subsystem unsolicited messages are received by the output device.

CARD—Shows whether Card unsolicited messages are received by the output device.

CLK—Shows whether Clock unsolicited messages are received by the output device.

DBG—Shows whether Debug unsolicited messages are received by the output device.

GTT—Shows whether GTT unsolicited messages are received by the output device.

GWS—Shows whether GWS unsolicited messages are received by the output device.

MEAS—Shows whether Measurements Maintenance unsolicited messages are received by the output device.

MON—Shows whether Monitor unsolicited messages are received by the output device.

MPS—Shows whether MPS unsolicited messages are received by the output device.

SEAS—Shows whether SEAS Maintenance unsolicited messages are received by the output device.

SLAN—Shows whether STP LAN unsolicited messages are received by the output device.

rtrv-tt

Retrieve Translation Type

Use this command to show the translation types that are currently defined in the system database for global title translations.

NOTE: If the EGTT (Enhanced Global Title Translation) feature is turned on in your system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).

Keyword: rtrv-tt

Related Commands: dlt-tt, ent-tt

Command Class: Database Administration

Parameters

:alias= (optional)

The alias of the global title translation type

Range: 0-255

Default: Display all

:ttn= (optional)

Translation type name.

Range: *ayyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

Default: Display all

:type/typea/typei/typen/typen24= (optional)

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

Range: **0-255**

Default: No translation type is specified

Example

rtrv-tt

rtrv-tt:type=230

rtrv-tt:ttn=lidb

rtrv-tt:type=230:ttn=lidb

rtrv-tt:type=230:ttn=lidb:alias=012

Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (*) parameter values are not allowed for this command.

The translation type must exist in the translation table. If either or both parameters are given, they must be the same as the values entered with the **ent-tt** command. If the translation name is specified, it must be associated with a translation type.

If a translation type is specified, it must already exist in the database for the network type and cannot be an alias.

If both translation type and translation type name are specified, the translation type name must correspond to the specified translation type.

If an alias is specified with a translation type and/or translation type name, the alias must exist in the database for the specified network type, and it cannot be a translation type.

If an alias is specified without a translation type or translation type name, the alias must exist in the database for at least one of the network types. If it exists, the entries and the mapped translation type entries that exist in the database for all network types are displayed.

Notes

If a translation type, translation type name, or both, are specified, the translation type entry and all aliases mapped to that translation type are displayed.

Output

rtrv-tt

Legend

TYPEA/TYPEI/TYPEN/TYPEN24—The global title translation type.

TTN—The name of the global title translation type.

NDGT—The number of digits in the global title translation type

ALIAS—The alias global title translation type.

rtrv-ttmap**Display Translation Type Mapping**

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. This command can be used to display the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping, see which linkset the mapping applies to, and see whether the mapping applies to incoming or outgoing messages.

Keyword: **rtrv-ttmap**

Related Commands: **chg-ttmap, dlt-ttmap, ent-ttmap**

Command Class: Database Administration

Parameters

:ett= (optional)

Translation type before mapping. The identification of the type of allowed global title translation in the SS7 message *prior to* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: **0-255**

Default: Display all types allowed

:io= (optional)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: **i, o**

i—incoming

o—outgoing

Default: Both incoming and outgoing

:lsn= (optional)

Linkset name

Range: **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

Default: Display all

Example

```
rtrv-ttmap
rtrv-ttmap:lsn=nc001
rtrv-ttmap:lsn=nc001:io=i:ett=128
rtrv-ttmap:io=i:ett=128
rtrv-ttmap:ett=128
rtrv-ttmap:ett=40
```

Dependencies

The linkset must be defined.

The memory space accounting report (MSAR) is not produced when the **io** parameter, **ett** parameter, or both are specified, because the statistics presented may be misleading.

Notes

The order of display is by linkset index + I/O + ETT.

Output

rtrv-ttmap

```

rtrv-uaps**Retrieve UA Parameter Set**

Use this command to retrieve one UA parameter set or all UA parameter sets.

Keyword: **rtrv-uaps**

Related Commands: **chg-uaps**

Command Class: Database Administration

Parameters

:set= (optional)

This parameter specifies the UA parameter set to be displayed.

Default: Display all

Example

```
rtrv-uaps
```

```
rtrv-uaps:set=1
```

Dependencies

None

Notes

This command can be canceled using the F9 function key or the **canc-cmd** command. See **canc-cmd** for more information.

Output

rtrv-uaps:set=1

eagle10213 08-04-17 14:01:00 EST EAGLE 38.0.0

SET	TIMER	TVALUE	PARM	PVALUE
1	1	0	1	3
1	2	3000	2	0
1	3	10000	3	0
1	4	5000	4	0
1	5	0	5	0
1	6	0	6	0
1	7	0	7	0
1	8	0	8	0
1	9	0	9	0
1	10	0	10	0

TIMER 2: False IP Connection Congestion Timer, max time an association can be congested before failing due to false congestion. SS7IPGW and IPGWI applications enforce 0-30000(ms). Not supported on IPSP application.

TVALUE : Valid range = 32-bits

TIMER 3: UA HeartBeat Period Timer T(beat), time (ms) between sending of BEAT msgs by NE. IPSP, SS7IPGW and IPGWI applications enforce 100(ms)-60000(ms).

TVALUE : Valid range = 32-bits

TIMER 4: UA HeartBeat Received Timer T(beat ack), timeout period for response BEAT ACK msgs by NE. IPSP, SS7IPGW and IPGWI applications enforce 100(ms)-10000(ms).

TVALUE : Valid range = 32-bits

PARM 1: ASP SNM options. Each bit is used as an enabled/disabled flag for a particular ASP SNM option. Not supported on IPSP application.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=Broadcast	0=Disabled , 1=Enabled
1=Response Method	0=Disabled , 1=Enabled
2-5=Reserved	
6=Broadcast Congestion Status Change	0=Disabled , 1=Enabled
7-31=Reserved	

PARM 2: ASP/AS Notification options. Each bit is used as an enabled/disabled flag for a particular ASP/AS Notification option. Not supported on IPSP application.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=ASP Active Notifications	0=Disabled , 1=Enabled
1=ASP Inactive Notifications	0=Disabled , 1=Enabled
2=ASP AS State Query	0=Disabled , 1=Enabled
3-31=Reserved	

PARM 3: UA Serviceability Options. Each bit is used as an enabled/disabled flag for a particular UA Serviceability option. Supported on IPSP, SS7IPGW, and IPGWI applications.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=UA Heartbeats	0=Disabled , 1=Enabled
1-31=Reserved	

rtrv-uim-acthresh**Retrieve Activity Level Threshold for STP UIM
Activity Reporting**

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

Keyword: **rtrv-uim-acthresh**

Related Commands: **dlt-uim-acthresh**, **set-uim-acthresh**

Command Class: Database Administration

Parameters

:uimn= (optional)

The UIM number.

Range: **1000-1499**

Default: Display all

Example

Display UIM number 1333 threshold:

rtrv-uim-acthresh:uimn=1333

Display the threshold for all UIMs that have been set:

rtrv-uim-acthresh

Dependencies

If specified, the **uimn** parameter value must be four numeric characters in the range **1000–1499**.

The **uimn** parameter value, if specified, must exist in the system Trouble Text Table.

Notes

None

Output

rtrv-uim-acthresh:uimn=1333

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100        5
The UIM Threshold Table is (1 of 499) 1% full.
```

rtrv-uim-acthresh

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100        5
1444      200       15
1155      50         30
The UIM Threshold Table is (3 of 499) 1% full.
```

rtrv-user**Retrieve User**

Use this command to show the information about the user currently logged on to the terminal from which this command was entered.

Keyword: **rtrv-user**

Related Commands: **act-user**, **chg-pid**, **chg-user**, **dact-user**, **dlt-user**, **ent-user**, **login**, **logout**, **rept-stat-user**, **rtrv-secu-user**

Command Class: Basic

Parameters

This command has no parameters.

Example

rtrv-user

Dependencies

This command cannot be entered from a SEAS terminal, because a SEAS terminal has no user ID associated with it.

Notes

The password is not shown.

This command shows the command class privileges for the user logged onto the system. No other users are shown.

All users have access to this command.

Output

The following example shows the display when the LNP feature is turned on and the Command Class Management feature is turned on:

rtrv-user

```
rlghncxca03w 03-11-07 09:50:17 EST EAGLE 31.3.0
user id      age page uout rev link sa sys pu db dbg
manny        36 60 60 NO YES YES YES YES YES YES YES

u01 u02 u03 u04 u05 u06 u07 u08 u09 u10 u11 u12 u13 u14 u15 u16
NO NO NO NO YES YES YES YES YES YES YES YES YES YES YES YES

u17 u18 u19 u20 u21 u22 u23 u24 u25 u26 u27 u28 u29 u30 u31 u32
YES YES YES YES YES YES YES YES YES YES YES NO NO NO NO YES
```

;

The following example shows the display when the LNP feature is not turned on and the Command Class Management feature is not turned on:

rtrv-user

```
rlghncxca03w 03-11-07 09:50:17 EST EAGLE 31.3.0
USER ID      LINK SA SYS PU DB DBG
eagle        YES YES YES YES YES YES

USER ID      AGE PAGE UOUT REV
eagle        750 0 0 NO
```

;

Legend

USER ID—The name of the user.

AGE—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.

PAGE—Shows the maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

UOUT—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (*) displayed after the value indicates that the system-wide default uout parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

REV—Shows whether the user ID is denied login (revoked). **YES** indicates that the user ID is revoked, **NO** indicates that the user ID is not revoked.

LINK—Shows whether the user has access to all commands in the Link Maintenance command class.

SA—Shows whether the user has access to all commands in the Security Administration command class.

SYS—Shows whether the user has access to all commands in the System Maintenance command class.

PU—Shows whether the user has access to all commands in the Program Update command class.

DB—Shows whether the user has access to all commands in the Database Administration command class.

DBG—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled and turned on, the following fields are displayed:

U01 - U32—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following field is displayed:

LNPBAS—Shows whether the user has access to all commands in the LNP Basic command class.

rtrv-vendid

Retrieve Vendor ID

Use this command to retrieve a list of Vendor ID entries from the VENDID table, for the GSM MAP SRI Redirect to Serving HLR feature.

Keyword: rtrv-vendid

Related Commands: dlt-vendid,

Command Class: Database Administration

Parameters

:vendnum= (optional)

Vendor Number

Range: 1-3

Example

rtrv-vendid

rtrv-vendid:vendnum=1

Dependencies

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

Notes

None.

Output

When the command is entered with no parameter, the Vendor Types are listed in numerical order. The Vendor Numbers for each Vendor Type are listed in numerical order, followed by the Vendor ID for each Vendor Number.

rtrv-vendid

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
Vendor      Vendor      Vendor
Type        Number      ID
-----
1           1           123123123456789
1           1           1234567890abcde
1           2           112233445566778
1           2           214365870912543
2           3           098765432112345
2           3           098767890143251
```

VENDID table is (5 of 200) 3% full

;

When a Vendor number is specified, the Vendor Type and Vendor IDs for the specified Vendor number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

rtrv-vendid:vendnum=2

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0

```

VENDID table is (5 of 200) 3% full

;

rtrv-x25-dstn**Retrieve X.25 Destination**

Use this command to show the associations between X.25 network addresses and SS7 point codes. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address. X.25 destinations are shown in order of entry.

Keyword: rtrv-x25-dstn

Related Commands: chg-x25-dstn, dlt-x25-dstn, ent-x25-dstn

Command Class: Database Administration

Parameters

:dpc= (optional)

Specifies the value used to set the destination point code field in the routing label of the MSU. The point code is an ANSI point code in the format of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:xaddr= (optional)

The X.25 network address of the X.25 destination entity or the SS7 node

Range: 1-15 digits

Default: Display all

Example

rtrv-x25-dstn

rtrv-x25-dstn:xaddr=220525586456772

rtrv-x25-dstn:dpc=133-13-1

Dependencies

If an X.25 address is specified, it must contain a minimum of four digits and must be in the X.25 destination table.

If a destination point code is specified, it must be assigned to at least one X.25 address.

The X.25 SS7 ANSI destination point code must be a full point code (ni-nc-ncm).

Notes

None

Output

rtrv-x25-dstn

```

Legend

X25 ADDR—The X.25 address of the X.25 destination or the SS7 node

SS7 DPC—The SS7 destination point code.

SSN—The subsystem number associated with the SS7 DPC.

rtrv-x25-rte**Retrieve X.25 Route**

Use this command to show the routing parameters needed by the gateway portion of the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system.

Keyword: **rtrv-x25-rte**

Related Commands: **chg-x25-rte**, **dlt-x25-rte**, **ent-x25-rte**

Command Class: Database Administration

Parameters

:lc= (optional)

The number of the logical channel on the X.25 signaling link that the PVC connection is assigned to. For automatic virtual circuits and remote virtual circuits, the logical channel number is arbitrary and cannot be specified.

Range: **1-255**

Default: Display all

:lc2nm= (optional)

Generates network management for failures and recoveries of logical channels. When the logical channel being used to carry data fails, the Database Transport Access (DTA) feature requires that traffic be diverted to alternate routes. The Logical Channel to Network Management Mapping (LC2NM) feature handles this process.

Range: **yes, no**

Default: Display all

:loc= (optional)

The card location containing the X.25 signaling link that will sustain the connection. For an automatic virtual circuit, this link is the link on which the system initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: All card locations are shown.

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: **a**

Default: **a**

:rt= (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) route on X.25 destination point code (XPC), and (2) route using X.25 origination and destination point code combinations (PC).

Range: **xpc, pc**

Default: Display all

:saddr= (optional)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: **1-15 digits**

Default: All X.25 addresses assigned to the SS7 destination entity are shown.

:type= (optional)

The type of X.25 connection that the link is expected to maintain.

Range: **pvc, svca, svcr**

pvc—Permanent virtual circuit

svca—automatic virtual circuit

svcr—remote virtual circuit

Default: Display al

:xaddr= (optional)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

Default: All X.25 addresses assigned to the SS7 destination entity are shown.

Example

```
rtrv-x25-rte
```

```
rtrv-x25-rte:xaddr=345454
```

```
rtrv-x25-rte:saddr=4545434
```

```
rtrv-x25-rte:xaddr=345454:saddr=4545434
```

```
rtrv-x25-rte:loc=1201:port=a:lc=2
```

```
rtrv-x25-rte:loc=1201:port=a
```

```
rtrv-x25-rte:type=avc
```

```
rtrv-x25-rte:rt=xpc
```

```
rtrv-x25-rte:lc2nm=no
```

Dependencies

Each X.25 address must have at least four digits.

If the **port** parameter is specified, the **loc** parameter must be specified.

If the **lc** parameter is specified, both the **loc** and **port** parameters must be specified.

The **limds0**, **limocu**, and **limv35** card types are the only valid card types for this command. These card types must be running the ss7gx25 GPL type.

The shelf and card must be equipped.

If **lc2nm=yes** is specified, **rt=pc** cannot be specified.

Notes

None

Output

rtrv-x25-rte

```

Legend

X25 ADDR—The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

SS7 ADDR—The dummy X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

TYPE—The X.25 connection type.

LOC—The card location of the X.25 signaling link.

PORT—The signaling link port on the card.

LC—The number of the logical channel on the X.25 signaling link that the PVC connection is assigned to.

RT—The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain.

LC2NM—Whether the logical channel-to-network management function is enabled (**YES**) or disabled (**NO**).

rtrv-x25-slk**Retrieve X.25 Signaling Link Parameters**

Use this command to display the X.25 signaling link parameters.

Keyword: rtrv-x25-slk

Related Commands: chg-x25-slk

Command Class: Database Administration

Parameters

:loc= (optional)

The card location containing the X.25 signaling link.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All card locations are displayed.

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: a

Example

```
rtrv-x25-slk
```

```
rtrv-x25-slk:loc=1204
```

```
rtrv-x25-slk:loc=1204:port=a
```

Dependencies

The **limds0**, **limocu**, and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL.

The shelf and card must be equipped.

The **port** parameter and the **loc** parameter must be specified together in the command.

Notes

None

Output**rtrv-x25-slk**

Legend

LOC—The card location containing the X.25 signaling link.

PORT—The port on the card containing the X.25 signaling link.

T1—The amount of time to wait before retransmitting a frame.

N1—The maximum number of bits in a frame.

N2—The maximum number of retransmission attempts to complete a transmission.

K—The maximum number of outstanding I frames.

L3MODE—The logical layer 3 address of the connection

PVC—The total number of permanent virtual circuits (PVCs) available on this X.25 signaling link.

SVC—The total number of switched virtual circuits (automatic virtual circuits and remote virtual circuits) available on this X.25 signaling link.

WIN—The number of packets allowed for a window on this X.25 signaling link.

MPS—The maximum packet size (in bytes) allowed on this X.25 signaling link.

set-date**Set Date**

Use this command to set the date in the system.

Keyword: set-date

Related Commands: set-time

Command Class: Security Administration

Parameters**:date=** (mandatory)

The system date, to be reflected on all reports and output messages.

Range: **000101-991231**(in the form *yymmdd*, where *yy*=year, *mm*=month, *dd*=day)**Example****set-date : date = 010307****Dependencies**

None

Notes

None

Output**set-date : date = 010307**

```
rlghncxa03w 03-11-07 11:11:28 EST EAGLE 31.3.0
Date set complete.
```

;

set-gtwy-acthresh**Set Gateway Thresholds**

Use this command to set or change the level of activity thresholds to be used when reporting gateway screening activity. The STP reports screening activity only if the threshold is set and only if the threshold is reached. The thresholds are set on a linkset basis.

Keyword: **set-gtwy-acthresh****Related Commands:** **rtrv-gtwy-acthresh****Command Class:** Database Administration**Parameters****:intrvl=** (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

Range: **5, 10, 15, 20, 30**System Default: **0** (this value indicates that thresholds are not set)**:lsn=** (mandatory)

Linkset name

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

:recv= (optional)

Received message threshold. The threshold for MSUs received on the gateway linkset.

Range: **0-999999****Default:** The current value**System****Default:** **0 - 0****:rej=** (optional)

Reject threshold. The threshold for MSUs rejected on the gateway linkset because of screening.

Range: **0-999999**

Default: The current value
System
Default: 0 - 0

Example

The following example shows how to set the linkset wy644368 rejection threshold to 100, with a 15 minute interval.

set-gtwy-acthresh: lsn=wy644368:rej=100:intrvl=15

The following example shows how to set the linkset wy644368 message threshold to 1000 and the rejection threshold to 300, with an interval of 20 minutes.

set-gtwy-acthresh: lsn=wy644368:intrv=20:rej=300:recv=1000

The following example shows how to set the linkset wy644368 so that no activity messages are produced.

set-gtwy-acthresh: lsn=wy644368:intrv=5:rej=0:recv=0

Dependencies

At least one optional parameter must be specified.

The linkset specified must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

The value specified for INTRVL parameter is not one of 5, 10, 15, 20 or 30 minutes.

Notes

None

Output

set-gtwy-acthresh: lsn=wy644368:rej=100:intrvl=15

```
rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-GTWY-TRHSHLD: MASP A - COMPLTD
;
```

set-scrrej-prmtrs

Set Parameters for SS7 Message-Rejection Reporting

Use this command to change the STP values that limit the display of MSUs rejected because of gateway screening notification messages that could become excessive. The new values overwrite the existing values.

Keyword: set-scrrej-prmtrs

Related Commands: rtrv-gtwy-acthresh, rtrv-gtwy-prmtrs, set-gtwy-acthresh

Command Class: Database Administration

Parameters

:intrvl= (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

Range: 5, 10, 15, 20, 30

System

Default: 5

:limit= (mandatory)

Threshold not to be exceeded.

Range: 0-999999
System
Default: 9999

Example

```
set-scrrej-prmtrs:limit=200:intrvl=10
```

Dependencies

The value specified for INTRVL parameter is not one of 5, 10, 15, 20 or 30 minutes.

Notes

None

Output

```
set-scrrej-prmtrs:limit=200:intrvl=10

rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-SCRREJ-PRMTRS: MASP A - COMPLTD
;
```

set-time**Set Time**

Use this command to set the system clock. The clock is used to determine when measurements collection takes place as well as several other time-driven events.

Keyword: set-time

Related Commands: set-date

Command Class: Security Administration

Parameters

:time= (mandatory)

The system time that is to be reflected on all reports and output messages.

Range: 0000-2359

hhmm where *hh* = 00-23 (hour) and *mm* = 00-59 (minute)

:tz= (optional)

The time zone

Range: est, edt, cst, cdt, mst, mdt, pst, pdt, hst, hdt, ast, adt, gmt, wet, west, utc, bst, cet, cest, met, mest, fwt, fst, eet, eest, sast, msk, msd, ist, idt, cct, awst, awdt, rok, acst, acdt, aest, aedt, nzst, nzdt, akst, akdt, nst, ndt, bra

The time zones are described in Table 5-63.

Default: Current value

Table 5-63. Time Zones Set by the set-time command

Abbreviation	Time Zone	Abbreviation	Time Zone
est	Eastern Standard Time	edt	Eastern Daylight Time
cst	Central Standard Time	cdt	Central Daylight Time
mst	Mountain Standard Time	mdt	Mountain Daylight Time
pst	Pacific Standard Time	pdt	Pacific Daylight Time

Table 5-63. Time Zones Set by the **set-time** command

Abbreviation	Time Zone	Abbreviation	Time Zone
hst	Hawaiian Standard Time	hdt	Hawaiian Daylight Time
ast	Atlantic Standard Time	adt	Atlantic Daylight Time
gmt	Greenwich Mean Time	wet	Western European Time
west	Western European Summer Time	utc	Universal Time Coordinated
bst	British Summer Time	cet	Central European Time
cest	Central European Summer Time	met	Middle European Time
mest	Middle European Summer Time	fwt	French Winter Time
fst	French Summer Time	eet	Eastern European Time
eest	Eastern European Summer Time	sast	South African Standard Time
msk	Moscow Time	msd	Moscow Summer Time
ist	India Standard Time	idt	India Daylight Time
cct	China Coast Time	awst	Australian Western Standard Time
awdt	Australian Western Daylight Time	rok	Republic of Korea
acst	Australian Central Standard Time	acd	Australian Central Daylight Time
aest	Australian Eastern Standard Time	aedt	Australian Eastern Daylight Time
nzst	New Zealand Standard Time	nzdt	New Zealand Daylight Time
akst	Alaska Standard Time	akdt	Alaska Daylight Time
nst	Newfoundland Standard Time	ndt	Newfoundland Daylight Time
bra	Brazil Standard Time		

Example

```
set-time:time=1432:tz=est
```

Dependencies

None

Notes

None

Output

```
set-time:time=1432:tz=est
rlghncxa03w 02-11-07 14:32:28 EST EAGLE 30.0.0
Time set complete.
;
```

set-uim-acthresh**Set Activity Level Thresholds for STP UIM
Activity Reporting**

Use this command to set or change the level-of-activity threshold for reporting UIM messages. The system suppresses the generation of UIM messages when message generation exceeds the threshold that was defined for the interval period. The values are set within five seconds after the command was entered. Any previous count is cleared and the new or changed threshold and limit is enforced. Refer to “Configuring the UIM Threshold” in the *Database Administration Manual – System Management* for more information about UIM threshold configuration.

Keyword: set-uim-acthresh

Related Commands: dlt-uim-acthresh, rtrv-uim-acthresh

Command Class: Database Administration

Parameters

:intrvl= (mandatory)

The monitor interval in minutes.

Range: 5, 10, 15, 20, 25, 30

Default: Current value

:uimn= (mandatory)

The UIM number.

Range: 1000-1499

:force= (optional)

Required to set the **limit** parameter to 0 for a given interval.

CAUTION: Setting the limit to 0 turns off all occurrences of the specified UIM. Use this manner of creating thresholds only if you are certain you have specified the correct UIM.

Range: yes, no

Default: no force specified

:limit= (optional)

The message threshold.

CAUTION: Setting the limit to 0 will turn off all occurrences of the specified UIM. This can be dangerous if the wrong UIM number is specified by mistake. It is highly recommended that thresholds for UIMs are not set in this manner, but the ability is provided for certain extreme cases. The force parameter must be specified to set the limit to 0, and an additional scroll area message is issued.

Range: 0-9999

Default: Current value

Example

Sets UIM number 1333 threshold to 100 in a 5-minute interval:

set-uim-acthresh:uimn=1333:limit=100:intrvl=5

Sets UIM number 1444 threshold to 200 in a 15-minute interval:

set-uim-acthresh:uimn=1444:limit=200:intrvl=15

Dependencies

At least one optional parameter must be specified.

The **uimn** parameter value must be a numeric value in the range **1000–1499**.

The **limit** parameter value must be a numeric value in the range **0–9999**.

The **intrvl** parameter value must be one or two numeric characters with the following values: **5, 10, 15, 20, 25, 30**.

The **force=yes** parameter must be specified to set the **limit** parameter to **0** for a given interval. Setting the **limit** to **0** turns off all occurrences of the specified UIM. See the cautions under the **force** and **limit** parameters.

When creating a new UIM threshold, both the **limit** and **intrvl** parameters must be specified.

The specified **uimn** parameter value must exist in the system Trouble Text table.

Notes

None

Output

set-uim-acthresh:uimn=1333:limit=100:intrvl=5

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
SET-UIM-ACTHRESH: MASP A - COMPLTD
```

;

tst-bip

Test Board Identification PROM

Use this command to test each byte of the specified board identification PROM (BIP) by reading and writing to the PROM. The test is performed for both the main assembly and applique BIPs.

Keyword: **tst-bip**

Related Commands: **chg-bip-fld, chg-bip-rec, rtrv-bip**

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118,**

4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208,
5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118
HMUX and HIPR locations are not valid.

Example

tst-bip:loc=1211

Dependencies

The card location, frame, shelf, or slot must be within the allowed range.

The card location must be valid for the command.

The board type **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM.
HMUX and HIPR cards do not contain BIP information.

The card specified by the **loc** parameter must be equipped in the database.

The card specified by the **loc** parameter must be in the OOS-MT-DSBLD state prior to BIP testing.

Notes

The specified card must be inhibited.

The **tst-bip** command verifies that the PROM is good by writing and reading to the PROM. The **rtrv-bip** command show the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communications to the card has failed, and the card should be replaced.

Output

tst-bip:loc=1211

```

BIP Passed
;
```

tst-disk

Test Disk

Use this command prior to an upgrade, or as a diagnostic tool, to test the integrity of an EAGLE 5 ISS disk, fixed (TDM) or removable (MDAL), at the specified location. The test is non-intrusive and non-destructive to the disk. A read-only test is executed for all logical blocks (LBAs) used on the specified target disk and a report identifying any bad or questionable LBAs is output.

Keyword: **tst-disk**

Related Commands: **copy-disk**

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The location of the disk to be tested.

Range: 1114, 1116, 1117

:partition= (optional)

Portion of disk to be tested. This parameter specifies the individual physical disk partition (1, 2, 3, or 4) or all defined partitions for a given disk size up to a maximum of 4 partitions.

Range: **1, 2, 3, 4, all**

1, 2, 3, 4—Tests the specified existing partition on the disk. Only the number or numbers for the partition or partitions that exist on the disk are valid. (For example, if the disk size allows only 2 partitions, **partition=3** and **partition=4** are invalid for that disk.)

all—Tests all existing partitions on the fixed disk or on one side of the removable disk

Default: **all**

Example

tst-disk:loc=1116

Dependencies

The card in the specified location (**loc**) must be a TDM or MDAL card.

The disk to be tested must be in service.

If a TDM location is specified, the TDM cannot be reserved (as when a copy-disk command is running).

The target drive must have low level format.

The **tst-disk** command can be run simultaneously on both TDMs, if entered from different terminals.

The removable disk can be tested simultaneously with the standby TDM but not with the active TDM.

To test the removable disk when **loc=1117** is specified, the disk must be inserted in the removable cartridge drive on the MDAL card.

The **partition=3** and **partition=4** values are invalid for a 4GB fixed drive. The only valid value for the 2.3 GB and 4.1 GB removable disks is **partition=1**. An error message will be generated for a disk that has been Formatted (**format-disk** command) but does not yet contain a DOS directory structure (created with the **copy-disk** command) when **partition= 1, 2, 3, 4, or all** is specified.

Notes

A physical fixed (TDM) or removable (MDAL) disk is formatted and given a DOS directory structure to define the number of physical partitions that the disk size can accommodate. (The logical partitions that contain database, backup, GPL, and measurements files are placed in these physical partitions, with no correlation between the physical numbers and the logical contents.)

For a fixed TDM disk, the **partition** parameter specifies the individual partition (1, 2, 3, or 4) or all existing partitions to be tested.

- One partition = 2 GB.
- The 4 GB drive contains two 2 GB partitions.
- The 9 GB drive and the 18 GB drive each contain four 2 GB partitions.
- The 9 GB drive contains four 2 GB partitions.
- Any disk space beyond the four 2 GB partitions is unused disk space (and always has been due to EAGLE DISK FAT structure used).

For a removable MDAL disk, each side of the disk will contain the maximum number of partitions (up to 4) that the disk size can accommodate. Only one side of the disk is tested with one **tst-disk** command. For example, a 2.3 GB removable disk has one partition on each side that is slightly larger than 1 GB. A 4.1 GB removable disk has one 2 GB partition on each side. Only **tst-disk:partition=1** is valid for either of these disks.

The **partition=all** value implies that testing starts with the first partition, then second, and so on, until the last existing disk partition is detected without skipping any non-existing or defined partitions.

Table 5-64 outlines execution time estimates based on disk capacity.

Table 5-64. Test Disk Execution Times

Capacity	Nominal Execution Time	Maximum Execution Time for 100% Errors
4.0 GB	40 minutes	27.5 hours
9.0 GB	1 hour 45 minutes	(Not determined)
18 GB	30 minutes (partition=1) 5 hours (partition=disk) depending on amount of disk tested and EAGLE 5 ISS provisioning/ activity	(Not determined)
2.3 GB Magneto Optical Removable	18 minutes	7.4 hours
4.1 GB Magneto Optical Removable	25 minutes (requires 806 MDAL)	7.4 hours
507 MB	5 minutes	3.4 hours
2.0 GB	20 minutes	13.5 hours
4.0 GB	40 minutes	27.5 hours
Magneto Optical Removable	20 minutes	7.4 hours
SyQuest Removable	10 minutes	2 hours

Nominal times for **tst-disk** command execution depend on the capacity of the disk being tested and assume that few or no errors are found. Maximum execution times are based on disk capacity, retry count, and retry delay. Each read error and retry may cause a delay of up to three seconds. If a TDM has 100% error sectors, the MASP will likely reset, terminating the disk test. A termination and reset will not occur, however, when testing the removable cartridge.

Because of the intense, sustained disk activity created when **tst-disk** is executed, concurrently performing other disk-based activities, such as prolonged LNP command entry or database backups, will result in performance degradation up to twice the usual execution time.

Because of the extended processing time required for large disks, a progress message is displayed every five minutes providing the current LBA and the total LBA count for the partition.

Specific errors are reported for the first 10 error occurrences. Thereafter, only the error count is tracked and summary results are reported upon completion.

tst-dlk**Test Data Link**

Use this command to test the specified TCP/IP data link. The TCP/IP data link is tested with an ethernet test that is an echo test type called ping.

Keyword: **tst-dlk**

Related Commands: **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk**

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:type= (mandatory)

The type of test to run.

Range: ping

:ipaddr= (optional)

The IP address of the remote host. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Default: Host IP

:rc= (optional)

The number of times the test is repeated.

Range: **1-15**

Default: **1**

Example

tst-dlk: loc=1206:type=ping

Dependencies

No other action command can be in progress when this command is entered.

The card location must contain an ACM card.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If a test repeat count (**rc**) is not entered, the test is not repeated.

If a data link test is in progress, another data link test cannot be started.

The card location, frame, shelf, or slot must be within the allowed range.

A card location that is valid and defined in the database must be specified.

The **ipaddr** parameter must specify a valid IP address.

tst-e1

Test E1 Port

Use this command to test HC-MIM and E5-E1T1 E1 ports. The loopback parameter provides the ability to select local transceiver (**lxvr**) and line loopback tests.

The **tst-e1** command is rejected if a loopback test is not compatible with the port type.

Keyword: **tst-e1**

Related Commands: **chg-e1, dlt-e1, ent-e1, rtrv-e1**

Command Class: System Maintenance

Parameters

:e1port= (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified HC-MIM or E5-E1T1 E1 card.

Range: **1-8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

:loc= (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:action= (optional)

Indicator of command action to stop or start a test.

Range: **start, stop**

Default: **start**

:loopback= (optional)

Select loopback test type.

Range: **line, lxvr**

Default: **lxvr**

Example

tst-e1:e1port=1:loc=1203:loopback=lxvr

tst-e1:e1port=1:loc=1203:action=stop

Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **lime1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified E1 port (**e1port** parameter) on the card (**loc** parameter) must have a defined E1 interface.

All signaling links that provide timeslots serviced by E1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl**) when this command is entered.

Only one port test can be running on an E1 port (**e1port** parameter) at one time.

When the **action=stop** parameter is specified, the **loopback** parameter cannot be specified.

The **action=stop** parameter can be specified only when a port test is running.

Notes

This command can be used for only HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on an E1 port. When a port test is in progress on an E1 port, subsequent test requests are rejected.

Output

tst-e1:e1port=1:loc=1203:loopback=lxvr

tst-imt**Test IMT Bus**

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to determine the location of faults on a failed or abnormal IMT bus. The alternate bus state must be IS-NR. The target bus state must be OOS-MT-DSBLD. Notice: IMT Fault test terminated. Non-Standard cabling or IMT Bus-X state change detected.

NOTE: At least one card must be populated in each EAGLE 5 ISS shelf to allow **tst-imt** the opportunity to successfully execute. The card does not need to be a provisioned card; the card must be in IS-NR state on both IMT busses before the **tst-imt** command is entered. If an empty shelf does exist in the EAGLE 5 ISS, the following text is displayed when you try to run **tst-imt**:

Keyword: **tst-imt**

Related Commands: **clr-imt-stats**, **init-imt-gpl**, **rept-imt-lvl1**, **rept-imt-lvl2**

Command Class: System Maintenance

Parameters

:bus= (mandatory)

The IMT bus to test.

Range: a, b

Example

tst-imt:bus=a

tst-imt:bus=b

Dependencies

A related IMT command must not be in progress. Only one fault isolation test can be active at a time.

This command cannot be entered if the alternate bus is other than in-service normal (IS-NR).

This command cannot be entered if the target bus is other than out of service - maintenance disabled (OOS-MT-DSBLD).

This command cannot be entered during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

Notes

Probable causes are listed in order of most probable to least probable. The listed components should be replaced in order listed by the output of the **tst-imt** command.

Multiple, masking points of failure can occur in the same bus segment. Such faults are reported as a single bus segment fault. Because running this command on a system with no IMT bus faults prints an indication that no faults were found, you can iteratively replace components and run this test until all components in the segment are ruled out.

A detection of an IMT address mismatch indicates a faulty backplane or card.

A detection of an inconsistency with a particular card's IMT card list indicates an error of unknown origin, probably due to one or more lost messages.

When the **tst-imt** command completes, either through normal termination of the command or because the command was ended for another reason, you must administratively enable the target bus. If all faults have meanwhile been isolated and corrected, the target bus becomes operational.

When a fault is detected, the possible error sources are listed in order from the most likely to the least likely. This ordering is based on operational experience.

Output

Connectivity test fails

tst-imt:bus=a

```

;

tst-slk**Test Signaling Link**

Use this command for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select from among the following loopback tests: local transceiver (**lxvr**), **oam**, **line**, **payload**, and either low-speed signaling links or ATM high-speed signaling links (**sltc**).

- The **tst-slk** command is not valid on TCP/IP point-to-multipoint links (SSEDCM cards or E5-ENET cards equipped as SS7IPGW and IPGWI links).
- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- On LIM-ATM cards, the **lxvr**, **sltc**, **payload**, **line**, and **oam** tests are allowed.
- On TCP/IP point-to-point links (SSEDCM cards or E5-ENET cards equipped as IPLIM or IPLIMI links), **sltc** is the only supported test. The **sltc** test is allowed only for links configured with **ipliml2=m2pa**.
- On E1/T1 MIM cards, the **sltc** test is the only supported test.

- On E1 ATM cards (**atmitu** application), the **lxvr**, **oam**, and **sltc** tests are allowed.
- On E5-ENET cards running the **ipsg** application, the command is only supported for IPSP-M2PA signaling links, and only the **sltc loopback** test is allowed.

See "Summary of Loopback Testing Commands and Functions" in Appendix A.

Keyword: **tst-slk**

Related Commands: **act-lpo**, **act-slk**, **blk-slk**, **canc-lpo**, **canc-slk**, **dact-slk**, **inh-slk**, **rept-stat-tstslk**, **rtrv-slk**, **ublk-slk**, **unhb-slk**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:action= (optional)

Indicator of command action to stop or start a test.

Range: **start, stop**

Default: **start**

:force= (optional)

The **force=yes** parameter must be specified to start a test when there are 256 or more tests already running.

Range: **yes, no**

Default: **no**

:loopback= (optional)

Specifies the type of loopback test to run.

Range: **line, lxvr, oam, payload, sltc**

line — This test is similar to the payload loopback test, but the data transmitted to the remote system is received by the remote system's ATM driver. This test is prohibited for the E1 ATM card.

lxvr — Loopback at the local transceiver without involving the remote STP. For the ADS0, AINF, AOCU, and AV35 appliques, the MTP-2 protocol stack and ISCC hardware are tested. For AATM applique and DS1 interface, the AATM hardware, ATM level 2 protocol stack, and AAL5CP portion of ATM driver are tested.

oam — Messages are passed between local and remote systems to guarantee that the ATMM portion of ATM driver is functioning.

payload — This test is similar to the local transceiver loopback test. The wire is also tested because the loopback is at the remote's DS1 interface instead of the local's DS1 interface. This test is prohibited for the E1 ATM card.

sltc— This test can be run on either the low-speed signaling links or the ATM high-speed signaling links. This is the only test that is supported for links on the E1/T1 MIM card, and for **m2pa** links on IPLIMx cards.

Default: **sltc**

:time= (optional)

The time duration for testing the link.

Range: **1-240000**

hhmmss—*hh*=hours (**00-24**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

For example, **time=1** or **time=000001** is one second; **time=240000** is 24 hours;

time=200 or **time=000200** is 2 minutes.

Default: **1**

Example

```
tst-slk:loc=1203:link=a
```

```
tst-slk:loc=1203:link=a:loopback=lxvr
```

```
tst-slk:loc=1205:link=b:time=000200:force=yes:action=start
```

```
tst-slk:loc=1205:link=b:action=stop
```

```
tst-slk:loc=1205:link=b:time=200
```

Dependencies

A card location that is valid and defined in the database must be specified.

The card must be equipped and in service, and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

If the signaling link is an ATM HSL signaling link, only the **link=a** parameter can be specified.

This command is not supported for cards running the **ss7ipgw** application.

If IPSPG-M2PA signaling links or IPLIMx signaling links are used, and the **ipliml2=m2pa** parameter is specified, then only the **loopback=sltc** test is allowed.

The **payload** and **line** values are not valid for the **loopback** parameter when the card is an E1 ATM.

Only the **sltc** test can be run on card types **lime1**, **limt1**, and **limch**.

The card must contain the specified signaling link.

The specified signaling link must be provisioned in the database.

The specified signaling link must be an SS7 signaling link.

The signaling link that is used for LFS (Link Fault Sectionalization) testing cannot be active.

A command is already in progress. The previously entered command for a link test must be accepted before another link test command can be entered.

This command cannot be entered if the LFS test is running on the specified link.

The specified link cannot be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link. (See the **act-cdl** and **dact-cdl** commands).

The **force=yes** parameter must be specified to start a test when 256 or more tests are already running in the system.

This command cannot be entered if the maximum number of LFS or link tests are already running in the system. At least one active test must complete before the command can be entered again.

Only one link test can be running on a signaling link at one time.

The **action=stop** parameter cannot be specified when there is no active link test running on the specified link.

When the **action=stop** parameter is specified, the **loopback**, **time**, and **force** parameters cannot be specified.

If an IPSPG-M3UA signaling link is used, then this command cannot be entered.

If an IPSPG-M2PA signaling link is used, the **loopback=sltc** parameter must be specified.

The card must be equipped and in service, and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

Notes

The **lxvr** and **sltc** loopback tests can be run on low-speed signaling links. All the loopback tests can be run on the ATM high-speed signaling links.

This command cannot be used with X.25 signaling links.

Output

If the card is inhibited, not in service, the following message appears when you try to test the links on the card:

```

tst-slk:loc=1203:link=a

;

```

Legend

LOC—Card location that contains the signaling being tested.

LINK—Signaling link being tested on the card.

LSN—Name of the linkset that contains the link being tested.

START TIME—Time that the test started.

LOOPBACK—Type of loopback test being run.

TIME—Length of time that the test ran. This value can exceed the value that was specified in the **time** parameter if the test requires more than the specified time to complete.

TEST STATUS—

- When a **tst-slk** command with **action=start** (specified or default) is entered, any one of the following *TEST STATUS* values can appear:
 - Loopback success
 - Loopback failed
 - Loopback aborted
 - Loopback in-progress
 - Loopback prevented
 - Loopback invalid
- When a **tst-slk** command with **action=stop** is entered, any one of the following *TEST STATUS* values can appear:
 - Loopback cleared
 - Loopback could not be cleared

tst-t1

Test T1 Port

Use this command to test T1 Ports on the HC-MIM and E5-E1T1 cards. The loopback parameter provides the ability to select local transceiver (**lxvr**) and line loopback tests.

The **tst-t1** command is rejected if a loopback test is not compatible with the port type.

Keyword: **tst-t1**

Related Commands: **chg-t1, dlt-t1, ent-t1, rtrv-t1**

Command Class: System Maintenance

Parameters

:loc= (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:t1port= (mandatory)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified HC-MIM or E5-E1T1 T1 card.

Range: **1-8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

:action= (optional)

Indicator of command action to stop or start a test.

Range: **start, stop**

Default: **start**

:loopback= (optional)

Select loopback test type.

Range: **line, lxvr**

Default: **lxvr**

Example

```
tst-t1:t1port=1:loc=1203:loopback=lxvr
```

```
tst-t1:t1port=1:loc=1203:action=stop
```

Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **limt1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified T1 port (**t1port** parameter) on the card (**loc** parameter) must have a defined T1 interface.

All signaling links that provide timeslots serviced by T1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl** commands) when this command is entered.

Only one port test can be running on a T1 port (**t1port** parameter) at one time.

When the **action=stop** parameter is specified, the **loopback** parameter cannot be specified.

The **action=stop** parameter can be specified only when a port test is running.

Notes

This command can be used only for HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on a T1 port. When a port test is in progress on a T1 port, subsequent test requests are rejected.

Output

```
tst-t1:t1port=1:loc=1203:loopback=lxvr

ublk-slk

Unblock Signaling Link

Use this command to cancel a local processor outage (LPO) and restore the link to its previous state. Link status signal units (LSSU) with status of processor outage are stopped, and the link begins

sending MSUs again. IPSP-M3UA signaling links are allowed to enter service by allowing received AS-ACTIVE messages to be accepted.

NOTE: The blocked status of the signaling link is not preserved across a LIM reboot.

Keyword: ublk-slk

Related Commands: act-lpo, blk-slk, canc-lpo

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

ublk-slk: loc=2311: link=b

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- An E1/T1 MIM card or an HC-MIM card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim**, **iplimi**, or **ipsg** application
- An E1/T1 MIM, an HC-MIM or and E5-E1 T1 card running the **ss7ansi** or **ccs7itu** application

This command can be entered only for IPLIMx signaling links that have an **ipliml2** parameter setting of **m2pa**.

The **ublk-slk** command is not valid for SSEDCCM cards or E5-ENET cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

This command is not valid for links belonging to proxy linksets.

Notes

Unblocking a signaling link removes a Level 2 failure resulting from a **blk-slk** of an ATM high-speed signaling link.

The function of this command is the same as the **canc-lpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

Output

```

ublk-slk:loc=2311:link=b
    rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
    Local processor outage being cleared.
;
ublk-slk:loc=1113:link=a
    rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
    Command Rejected : Location is not valid for command.
;

```

unhb-alm

Restore Alarm Reporting

Use this command to restore the reporting of alarms for the given device.

Keyword: unhb-alm

Related Commands: inh-alm, rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls,, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dev= (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be restored.

Range: **applsock, as, card, cdt, clock, dlk, e1port, ls, lmsconn, route, seasx25, slk, t1port, trm, rtx**
applsock— IP gateway application socket
as— IP gateway application Application Server
card— Cards in the database
cdt— Customer defined troubles
clock— System clock

dlk— The IP ports on the VSCCP, EROUTE, SLAN, VXWSLAN and MCP application cards.

e1port— E1 port on E1/T1 MIM or HC-MIM cards

ls— Linksets

lsmsconn— Communication link between the LSMS and the EMS

route— Route

seasx25— SEAS X.25 links

slk— Signaling links

t1port— T1 port on E1/T1 MIM or HC-MIM cards

trm— Terminals

rtx— Exception Route

:asname= (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to uninhibit alarms for the named Application Server.

Range: *ayyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

Range: **0-16383**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpc**

Range: **p-, 000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code for inhibiting alarms for routes.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:e1port= (optional)

Port ID. This parameter specifies the E1 port on the specified HC-MIM card. This parameter is mandatory if **dev=e1port** is specified.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

:ecic= (optional)

Ending Circuit Identification Code. This parameter is used with the **cic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

Range: **0-16383**

:id= (optional)

Customer Defined Trouble (CDT) ID. Customer Defined Trouble IDs 1 through 4 are generated critical alarms. Because critical alarms cannot be turned off, Customer Defined Trouble IDs 1 through 4 cannot be specified as values for the **id** parameter. This parameter is mandatory if **dev=cdt** is specified.

Range: **5-16**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

:link= (optional)

Signaling link on the card specified in the **loc** parameter.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**
a, b—For **dev=dlk, dev=slk** for a two-port LIM
a1, a2, b1, b2—For **dev=seasx25/lsmconn**
a, b, a1, b1, a2, b2, a3, b3—For **dev=slk** for a multi-port LIM
a, b, a1-a31, b1-b31—For **dev=slk** for an HC-MIM

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318,**
3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118,
5201-5218, 5301-5318, 6101-6118

:lsn= (optional)

Linkset name. The name of the linkset containing the device where alarm reporting is to be restored.

Range: [ayyyyyyyyy](#)
1 alphabetic character followed by up to 9 alphanumeric characters

:opc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Origination point code

:opci= (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national origination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**, **p-**, **ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc**n24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range: **0-15**

:sname= (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to uninhibit alarms for the named IP⁷ application socket.

Range: *ayyyyyyyyyyyyyyy*

1 to 15 alphanumeric characters

:t1port= (optional)

Port ID. T1 port on the specified HC-MIM card. This parameter is mandatory if **dev=t1port** is specified.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

:trm= (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose alarms are to be uninhibited.

Range: **1-40**

Default: Report displays on the terminal where the command was issued.

Example

unhb-alm:dev=route:dpc=1-1-1

unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx

Dependencies

This command is not allowed in the upgrade mode.

No other action command can be in progress when this command is entered.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=seasx25** parameter is specified, the **link** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

The STP Options table must be accessible.

Table 5-65 shows the valid parameter combinations for the **unhb-alm** command.

Table 5-65. Parameter Combinations for the **unhb-alm** command

Value (:dev)	a	a	c	c	d	e	l	l	n	n	r	s	s	t	t	r
Device Parameter	p	s	a	d	l	l	s	s	d	d	o	e	l	l	r	s

	s		k	r	c	k	3	e	x							
	o			t	o				2							
	c				n				5							
	k				n											
No Parameters				x					x							
:asname		x														
:dpc/dpca/dpci/dpcn/dpcn24										x						
:id				x												
:loc			x		x	x						x	x			
:lsn							x									
:e1port=1-8						x										
:link=a, b					x							x				

Table 5-65. Parameter Combinations for the **unhb-alm** command

Value (:dev)	a	a	c	c	c	d	e	l	l	n	n	r	s	s	t	t	r
Device Parameter	p	s	a	d	l	l	l	s	s	d	d	o	e	l	l	r	s
	p	r	t	o	k	p	m	c	c	u	a	k	p	m			
	l	d	c	o	s	l	q	t	s								
	s		k	r	c	k	3	e	x								
	o				t	o			2								
	c					n			5								
	k					n											
:link=a, b, a1, a2, b1, b2, a3, a3													x				
:link=a1, a2, b1, b2								x	x			x					
:link=a, b, a1-a31, b1-b31						x									x		
:sname	x																
:t1port=1-8															x		
:trm																x	
:rsn																	x

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be enabled and turned on before specifying the **dev=rtx** parameter.

When the **dev=ndclk** parameter is specified, the **link** parameter must be specified.

The **link** parameter must be valid for the selected device type.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

unhb-slk**Uninhibit Signaling Link**

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

NOTE: The inhibited status of the signaling link is not preserved across a LIM reboot.

Keyword: unhb-slk

Related Commands: act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
unhb-slk:loc=1301:link=a
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application

- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The inhibit and uninhibit actions are valid for links on IPLIMx SSEDCCMs that have **ipliml2=m2pa**.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL),
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HPR card, or the cards running the OAM application.

This command is not valid on TCP/IP point to multipoint links (DCM cards equipped as SS7IPGW links).

If an IPSG-M3UA signaling link is used, then this command cannot be entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

Notes

This command is not valid on TCP/IP point to multipoint links (SSEDCCM cards or E5-ENET cards equipped as SS7IPGW or IPGW1 links or E5-ENET cards equipped as IPSG-M3UA links). TCP/IP point to point links (IPLIM and IPLIMI) can be uninhibited.

The function of this command is the same as the **canc-lpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

Output

```
unhb-sl k: loc=1301: link=a
    rlghncxa03w 03-03-23 13:20:59 EST  EAGLE 31.3.0
    Allow Link message sent to card
;
```

unlock

Unlock Keyboard

Use this command to unlock a previously locked terminal keyboard. Anyone attempting to use the keyboard is prompted to enter the password of the currently logged-in user.

Keyword: unlock

Related Commands: lock

Command Class: Basic

Parameters

This command has no parameters.

Example

```
unlock
```

Dependencies

You must enter the password of the logged in user to unlock the keyboard.

This command is valid only if the keyboard is locked.

Debug Commands

Introduction

This chapter contains information about debug commands used in troubleshooting and debugging the system. These commands are intended only for Tekelec Technical Services personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to personnel who have access to the command class Debug.

CAUTION: These commands are to be used precisely as they are described in this chapter, and only under the direction of Tekelec Technical Services personnel. Any other use of these commands can result in a system failure.

This chapter contains the debug commands in alphabetical order.

act-upgrade

Activate Upgrade

Use this command to perform a software upgrade from a source release to the target release on an in-service system.

CAUTION: It is strongly recommended that this command be used only in conjunction with the system Upgrade Procedure for your target release. The Upgrade Procedure provides step-by-step information on performing an upgrade.

Keyword: act-upgrade

Related Commands: rept-stat-db

Command Class: Debug

Parameters

:action= (mandatory)

This parameter specifies the action to be performed for the upgrade process.

Range: **converttoam**, **convertnet**, **convertstp**, **dbstatus**, **netcomplete**, **oamcomplete**

converttoam— Converts the standby OAM database. Sets the disk's upgrade phase number to 1.

convertnet— Performs an inhibit/allow sequence for each network card. This sequence effects the controlled loading of the new release generic program load (GPL) and of the converted database. Requires upgrade phase indicator of 3.

convertstp— Performs all OAM and network conversions necessary for an upgrade. This command transitions through all of the upgrade phases to upgrade completion. If measurement collection is turned on, this command automatically inhibits measurements during the upgrade. Upon completion of the upgrade, this command returns the MASP's to full-function mode with measurement collection turned back on.

dbstatus— Reports the status of all database partitions on the TDM fixed disks and the MDAL removable disk (similar to the **rept-stat-db:display=version** command).

netcomplete— Indicates upgrade completion and places the system in a fully functional mode.

oamcomplete— Sets the upgrade phase number to 3, enables the beginning of controlled card loading, and allows OAP terminals to be attached.

:appl= (optional)

This parameter specifies the name of the GPL on which to perform the network upgrade.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Use the **rept-stat-gpl** command or the **rtrv-gpl** command to obtain the valid GPLs.

Default: **all**

:disk= (optional)

This parameter specifies the disk to be used as the work area that is required for the conversion of the database.

Range: **fixed, remove**

fixed— The TDM fixed disk

remove— The removable disk

Default: **fixed**—if the TDM has available partitions

remove—if the TDM does not have available partitions

:force= (optional)

This parameter forces a command to be executed if the **action=convertnet** parameter is specified.

If the **action=convertnet** parameter is specified, and if all cards of the specified GPL type are not in the In-Service Normal state or Out-Of-Service Maintenance-Disabled state, then the **force** parameter must be specified. In this case, minimum service may not be maintained when the command is executed with the **force** parameter.

If the **action=convertnet** parameter is not specified, then the **force** parameter is ignored.

Range: **yes, no**

Default: **no**

:thres= (optional)

Network Threshold value. This parameter specifies the percentage of signaling links that are to remain in service (IS) during the network conversion phase and enables SCCP thresholding and flashing on non-provisioned cards during the upgrade.

Range: **50 - 90**

Default: The network cards are updated serially.

Example

act-upgrade:action=convertstp

act-upgrade:action=converttoam

act-upgrade:action=oamcomplete

act-upgrade:action=convertnet:appl=gls:force=yes

act-upgrade:action=convertnet:appl=sccp

act-upgrade:action=netcomplete

act-upgrade:action=dbstatus

act-upgrade:action=convertstp:disk=remove

act-upgrade:action=convertstp:thres=75

Dependencies

Table 6-1 lists the actions (**action** parameter values) that correspond to a given upgrade mode. An action is accepted only when the system is in the corresponding upgrade mode.

Table 6-1. Actions with Corresponding Upgrade Phase

Action	Corresponding Upgrade Phase
action=converttoam	0 and 1
action=oamcomplete	2
action=convertnet	3
action=netcomplete	3
action=convertstp	0 through 3

If measurement collection is enabled, the **act-upgrade:action=convertstp** command automatically inhibits measurement collection during the upgrade. Before returning to full function mode, measurements are turned back on. The following actions require that you manually inhibit measurements: **converttoam**, **oamcomplete**, **convertnet**, and **netcomplete**.

The valid release upgrade disk must be inserted in the MDAL drive.

The standby OAM database must be the source release.

The current OAM database must be the source release.

The database partition must be coherent.

The database partition must be in the correct functional mode.

If the **appl** parameter is specified, then the **action=convertnet** parameter must be specified. If the **action=convertnet** parameter is specified, then the **appl** parameter must be specified.

If the **force** parameter is specified, then the **action=convertnet** parameter must be specified.

If the **action=convertnet** parameter is specified, and if all cards of the specified GPL type are not in the In-Service Normal state or Out-Of-Service Maintenance-Disabled state, then the **force** parameter must be specified. In such cases, minimum service may not be maintained.

The MTP Restart Indicator STP option must be set to **no** (see the **chg-stpopts** command) before the **act-upgrade** command can be entered.

If the **thres** parameter is specified, then the **action=convertnet** and **action=convertstp** parameters must be specified.

The destination of a static IP route or the local interface network address of an IP card cannot be the same as the EAGLE 5 ISS PVN network address.

Upgrade conversion cannot be initiated from a telnet-type terminal (terminal IDs 17-40).

TALI sockets cannot be configured in the system.

ISUP Normalization feature-related configuration cannot be present in the system.

The dual-slot DCM card (card type **dcm**) is obsolete for **ss7ipgw**, **ipgwi**, **iplim**, and **iplimi** applications.

TALI links cannot be configured in the system.

Notes

For the **appl** parameter, the list of valid GPLs varies from release to release. The **rtrv-gpl** command can be used (when in full function mode) to obtain a list of the GPLs currently resident on the TDMs. The **rept-stat-gpl** command can be used to obtain a list of the GPLs currently active on provisioned network cards.

The **disk** parameter is to be used to override the decision logic of the upgrade processing that selects the disk to be used in the database conversion. The parameter is intended to be used in the command re-issue scenario where a problem was encountered using the disk chosen by the upgrade process and you want to attempt to execute the upgrade using the alternate disk.

Each upgrade phase will only accept the next upgrade phase command. There are four phases. For example, the command **act-upgrade:action=converttoam** (phases 0 and 1) can be followed only by the command **act-upgrade:action=oamcomplete** (phase 2). The **act-upgrade:action=oamcomplete** command can be followed only by **act-upgrade:action=netcomplete** (phase 3).

The **act-upgrade:action=convertstp** command executes all four upgrade phases consecutively.

If the **act-upgrade:action=convertstp** command is entered following a command abort, the upgrade processing determines the last upgrade phase that was successfully completed. The upgrade processing then attempts to restart from that point to successful completion. Re-entering the **act-upgrade:action=convertstp** command following a command abort is the recommended method for recovery.

The TDMs and removable cartridge have upgrade phase indicators. The upgrade command expects the disks to be in certain phases before executing a specific action. If the disks are not in the correct phases, an error is generated.

The command **act-upgrade:action=dbstatus** generates output similar to that provided by the command **rept-stat-db:display=version**.

The parameter **action=convertnet** results in the following actions:

- The sequential canceling of any assigned links
- The inhibiting of each card
- The allowing of each card
- The activating of the canceled links

The **convertnet** action proceeds to the next card after the current card has returned to the in-service normal (IS-NR) state or a timeout is reached. If 10% of the cards initially IS-NR are in an abnormal state, the command is aborted. Cards that do not return to the IS-NR state are left inhibited (OOS-MT-DSBLD). Cards that are not in the IS-NR or OOS-MT-DSBLD state when the **convertnet** action is issued are allowed during execution of the command. If such cards do not return to the IS-NR state, they are inhibited and left in the OOS-MT-DSBLD state when **force=yes** is specified.

For the **convertnet** action, if all cards of the specified GPL type are not in the IS-NR or OOS-MT-DSBLD state, the **force** parameter is required. In such case minimum service may not be maintained, and execution of the command must be forced by the craftsperson. The **force** parameter is ignored for actions other than **convertnet**.

The **convertnet** action completes with no action performed if there are no cards of the specified GPL type defined in the database.

The **thres** parameter is used for the following purposes:

- Allows for multiple cards to be upgraded together, as long as the specified percentage of links remain in service. If no **thres** parameter is specified, the cards are upgraded serially. The value is applied to groups of links based upon the link-supporting GPL being upgraded.
- Enables SCCP thresholding, which allows multiple SCCP or VSCCP cards to be upgraded together. The specified **thres** parameter value is not used to determine the number of SCCP cards to upgrade. The peak SCCP load since the last OAM boot is used to determine the number of cards that must remain in service (at least half of the cards must remain in service).
- Enables the non-provisioned flash function, which flash-downloads any boot-prom type card if the card is in the system but not provisioned.

The **appl=all** parameter initiates the **action=convertnet** sequence on all GPL types in the order defined in Table 6-2 on page 6-6. The actions performed are subject to the conditions of the above notes.

Controlled Card Loading: During upgrade phase 3 (after **action=oamcomplete** and before **action=netcomplete**), card loading is controlled by a card's GPL type to prevent service interruption of the node. shows the dependencies in card loading.

Table 6-2. Dependencies in Card Loading

Prior to Loading This Card . . .	These Cards Must Be Loaded
GLS	None
SCCP	All GLS cards
SS7	All GLS and SCCP cards
CCS7ITU	All GLS, SCCP, and SS7 cards
ATMANSI	All GLS, SCCP, SS7, and CCS7ITU cards
X.25 LIM	All GLS, SCCP, SS7, CCS7ITU, and ATMANSI cards
STPLAN	All other card types

Output

The **act-upgrade:action=convertstp** command performs the OAM conversion and the network conversion. During the conversion, it broadcasts the current activity in the scroll area. This example shows some, but not all, of the messages that might appear.

cdu

CAP Downloadable Utility

The CAP Downloadable Utility (CDU) is a diagnostic program that can be downloaded to any card including the DSM/DCM cards on the system by entering the **alw/rst-card:loc=xxxx :code=utility** command.

This command is used to enter commands to perform diagnostic functions. The command syntax is as follows:

cdu:loc=xxx:cmd="command string"

where the **loc** and **cmd** parameters are mandatory parameters for the **cdi** command. The command string, which is enclosed in double quotes (“ ”), specifies the diagnostic function to perform and includes any optional or mandatory parameters for the specified **cmd** keyword.

The **cd** command uses the VCDU or CDU GPL. The DSM board can hold up to 4 GB of memory. The CDU or the VCDU utility is downloaded automatically depending on the type of the board. For the DSM the VCDU utility is downloaded; for the TSM the CDU utility is downloaded.

Keyword: `cdu`

Related Commands:

Command Class: Debug

Parameters

:cmd= (mandatory)

The commands that are used to perform diagnostic functions. The command string contains a keyword (listed in the following Range section) and one or more parameters (listed in the Subrange section that follows the Range section). The command string must be enclosed in double quotes (“”).

Range: zzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz

The keywords used in the command strings are:

- **act-memtest**—Starts the memory test.
- **canc-memtest**—Stops the memory test. This command has no parameters.
- **dump-memtest**—Displays the memory test results continuously without any other output messages. This command has no parameters.
- **rtrv-memtest**—Displays the memory test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.
- **act-qcktest**—Implements a quick go/no-go test to check the basic integrity of the memory within ten minutes. The VDCU utility verifies the address, the data lines to memory, and the accessibility of each memory chip of 4 GB. This command applies to the DSM card only.

- **canc-qcktst**—Aborts the quick test. This command applies to the DSM card only and has no parameters.
- **rtrv-qcktst**—Displays the quick test results. This command applies to the DSM card only and has no parameters.
- **fill-mempat**—Fills a section of memory with a specific data pattern.
- **tst-mempat**—Tests the memory pattern that was initialized by the fill-mempat command.
- **dump-mempat**—Displays the memory pattern test results continuously without any other output messages. This command has no parameters.
- **rtrv-mempat**—Displays the memory pattern test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.
- **act-checkbit**—Tests the M256 checkbit DRAM.
- **rtrv-checkbit**—Displays the M256 checkbit test results. This command has no parameters.
- **act-memflt**—Tests M256 error detection and correction capabilities (fault insertion test).
- **rtrv-memflt**—Displays the fault insertion test results. This command has no parameters.
- **act-cachetst**—Starts the cache test on the specified memory range.
- **dump-cachetst**—Displays the results of the cache test. This command has no parameters.
- **act-pingtst**—Implements a network test in the VCDU utility only. The ping test is applicable to DCM/DSM cards only and will not work in the other cards.
- **canc-pingtst**—Aborts the ping test. This command has no parameters.
- **rtrv-pingtst**—Displays the results of the ping test. This command has no parameters.

Subrange: The keywords used in the command strings use the following parameters.

Table 6-3. Subrange Parameters for cmd Keywords

:beg=(mandatory) The start address of the physical memory range to be tested. The value is a hexadecimal number. This parameter is used with the keywords act-cachetst, act-checkbit, act-memtst, fill-mempat, and tst-mempat. Range: • For cards other than the DSM—h'00100000–h'bffffffe • For act-checkbit only—h'80000000–h'bffffffc • For act-cachetst only—h'01400000–h'ffd40000 • For 1GB DSM card only—h'01400000–h'3ffffffc • For 2GB DSM card only—h'01400000–h'7ffffffc

Table 6-3. Subrange Parameters for cmd Keywords

• For 3GB DSM card only—h'01400000–h'bfffffff • For 4GB DSM card only—h'01400000–h'ffffffff
:end= (mandatory) The first address beyond the last address of the physical memory range to be tested. The value is a hexadecimal number. This parameter is used with the following keywords: act-checkbit, actcachetst, act-memtst, fill-mempat, and tst=mempat. Range: • For cards other than the DSM—h'00100002–h'c0000000 • For act-checkbit only—h'80000004–h'c0000000 • For act-cachetst only—h'01440000–h'ffffffff • For act-memtst on 1GB DSM card only—h'01400000–h'40000000 • For act-memtst on 2GB DSM card only—h'01400000–h'80000000 • For act-memtst on 3GB DSM card only—h'01400000–h'c0000000 • For act-memtst on 4GB DSM card only—h'01400000–h'fe000000
:loop= (optional) The number of times a test is performed. The value is a hexadecimal or a decimal number. This parameter is used with the following keywords: act-memtst, act-cachetst, act-memflt, actcheckbit, act-qcktst, and act-pingtst. Range: h'0–h'ffff The value h'0 indicates that an infinite number of tests is performed. Default: h'1
:data= (mandatory) The hexadecimal of the data pattern. This parameter is used only with the keywords act-cachetst, fill-mempat, and tst-mempat. Range: h'0000–h'ffff
:port=(mandatory) The port address from which to start the ping. This parameter is used only with the keyword act-pingtst. Range: a, b
:dest= (mandatory) The destination IP address to be pinged. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the

Table 6-3. Subrange Parameters for cmd Keywords

machine's host number. This parameter is used only with the keyword act-pingtst. Range: 4 numbers separated by dots, with each number in the range of 0–255.
:router=(optional) The router through which the network interface can be tested. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number. This parameter is used only with the keyword act-pingtst. Range: 4 numbers separated by dots, with each number in the range of 0–255.
:type=(optional) Indicates the type of memory test to perform: a comprehensive high-memory test or a fast high-memory test. The fast test performs two tests: the Write/Read block and the Address Write/Read. The comprehensive test performs the fast test as well as a Write/Read Walking 1/0s. This parameter is used only with the act-memtst keyword. Range: full, fast Default: full
:addr= (mandatory) Indicates the physical address to test. This parameter must be dword aligned and must not be the first or last dword of the installed M256 expansion DRAM. This parameter is used only with the act-memflt keyword. Range: h'80000004–h'bffffff8

:loc= (mandatory)

The card location of the card as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1113, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1115

checkbit:beg=h'80000000:end=h'80000004:loop=h'2"
cdu:loc=1215:cmd="rtrv-checkbit"
cdu:loc=1215:cmd="act-memflt:addr=h'80000004:loop=h'3"
cdu:loc=1215:cmd="rtrv-memflt"

```

Dependencies

If the **act-cachetst** keyword is entered, the address range should not be less than 256 KB.

The **fill-mempat** keyword must be entered before the **act-cachetst** keyword can be entered.

The quick memory test commands can be entered only on DSM cards.

The ping test commands can be entered only on DSM or DCM cards.

Notes

The **act-memtst:type=full** test takes approximately 21 hours to run on a 1 GB TSM. The **actmemtst:type=fast** test takes approximately 1 hour. The VCDU utility has the capability to test the 4 GB of memory in 4 hours if the **act-memtst** command is entered with the **type** parameter set to **fast**.

Output

chg-bip-fld

Change Board Identification Field

Use this command to manually update the board identification PROM (BIP) data during an upgrade in the field.

NOTE: Initial programming of the BIP data occurs during manufacturing.

Keyword: chg-bip-fld

Related Commands: chg-bip-rec, disp-bip, rtrv-bip, tst-bip

Command Class: Debug

Parameters

:data= (mandatory)

Board Identification (BID) record field data.

[illegible]

A character string, specifying board identification field data based on the value of the **fld** parameter.

:fld= (mandatory)

Board identification field.

Range: rev, sm

rev—revision

sm—software match

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:type= (mandatory)

This parameter specifies the type of board.

Range: **mbd, dbd**

mbd — main assembly

dbd — applique

:dbdloc= (optional)

Applique location. This parameter specifies the location of the applique.

This parameter is valid only with cards that support multiple appliques.

Range: **1-2**

Default: **1**

Example

The following example changes the rev field in the BIP data for the first applique of a card that supports multiple appliques.

chg-bip-fld:loc=1106:type=dbd:fld=rev:data="B":dbdloc=1

The following example changes the rev field in the BIP data for the applique of a card that supports only one applique.

chg-bip-fld:loc=1103:type=dbd:fld=rev:data="C"

The following example shows changing of sm (Software MatchID) field in BIP data of Main assembly.

chg-bip-fld:loc=1102:type=mbd:fld=sm:data="001"

The following example changes the rev field in the BIP data for the first applique of a card that supports multiple appliques, without specifying the dbdloc parameter.

chg-bip-fld:loc=1206:type=dbd:fld=rev:data="B"

Dependencies

The value of the **loc** parameter cannot specify a location for a fixed disk or removable cartridge.

The **type=dbd** parameter cannot be specified for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

If the **type=mbd** parameter is specified, then the **dbdloc** parameter cannot be specified.

The card at the location specified by the **loc** parameter must support multiple appliques before the **dbdloc** parameter can be specified.

Notes

The card in the specified location must be inhibited.

Output

chg-bip-fld:loc=1103:type=mbd:fld=rev:data="B"

tekelecstp 07-01-01 12:05:44 IST EAGLE 37.0.0

Board ID Prom updated.

;

chg-bip-rec

Change Board Identification PROMs Record

Use this command to manually update the Board Identification PROM (BIP) data during an upgrade in the field.

chg-bip-rec: loc=1101: type=dbd: data="BBT01, eg.004, cs146"

The following example displays the programming of the DCM Ethernet Addresses for Port A (ENT01).

chg-bip-rec: loc=1102: type=mbd: data="ENT01, AD00001704000D, cs104"

The following example displays the programming of the BIP data for the first applique of a card that supports multiple appliques, without specifying the dbdloc parameter.

chg-bip-rec: loc=1206: type=dbd: data="BID01, PN850-0666-04.A, SMEG.001, DS2007.11 .C.10207115240, CS157"

Dependencies

The value of the **loc** parameter cannot specify a location for a fixed disk or removable cartridge.

The **type=dbd** parameter cannot be specified for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

If the **type=mbd** parameter is specified, then the **dbdloc** parameter cannot be specified.

If the card at the location specified by the **loc** parameter does not support multiple appliques, then the **dbdloc** parameter cannot be specified.

If the **init=yes** parameter is specified, then the value of the **data** parameter must be a Board IDentification (BID) record.

Notes

The card in the specified location must be inhibited.

Output

```
chg-bip-rec: loc=1107: type=mbd: data=xxx: init=yes
tekelecstp 07-01-01 12:05:44 IST EAGLE 37.0.0
Board ID Prom updated.
;
```

chg-tbl

Change Table

Use this command to create, rename, or reset any table on a fixed disk or removable cartridge.

Keyword: chg-tbl

Related Commands: disp-disk-dir

Command Class: Debug

Parameters

:action= (mandatory)

This parameter specifies the desired action to perform on the table.

Range: create, rename, reset

create— Creates a DOS entry in the FAT table and updates the DOS directory table.

rename— Changes the name of an existing system table to a new DOS file name (does not update the **dms.cfg** file).

reset— Initializes an existing table to the value designated by the **resetchar** parameter.

:disk= (mandatory)

Target disk. This parameter specifies the disk that contains the file.

Range: remove, fixed

remove— Removable cartridge

fixed— Fixed disk

:ext= (optional)

Extension. This parameter specifies the three character DOS filename extension.

Range: *azz*
0–3 ASCII characters

Default: No file name extension is specified

:filelength= (optional)

This parameter specifies the amount of space the file occupies on the disk, in bytes.

Range: **1-31**
1-7.75 (removable cartridge)
1-31 (fixed disk)

Default: The file length is not specified

:id= (optional)

This parameter specifies the table identification number.

Range: **0-499**
Default: No table identification number is specified

:name= (optional)

This parameter specifies the name of the file.

Range: *azzzzzzz*
1–8 ASCII characters.
Default: No file name is specified

:prtnggrp= (optional)

Partition group. This parameter specifies the disk partition group to be changed.

Range: **active, inactive**
Default: **active**

:resetchar= (optional)

Reset character. This parameter specifies the table reset character that is written to every byte of the table.

Range: **0-255**

Example

chg-

tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000

chg-tbl:action=reset:disk=remove:id=0

chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old

Dependencies

If the **action=create** parameter is specified, then the **name**, **ext**, and **filelength** parameters must be specified.

If the file type is a directory, the **filelength** parameter is not required. The directory entry file length is always 1 cluster in length.

The attributes used during file creation are: current date and time of the active MASP, readable/writable, files are allocated contiguously from the last free FAT cluster.

If the **action=reset** parameter is specified, then the **id** parameter must be specified.

If the **action=rename** parameter is specified, then the **id**, **name**, and **ext** parameters must be specified.

This command cannot be used to modify the security log.

Notes

None

Output

```

chg-
tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000

chg-tbl: CREATE OK : filename = test.sys, byte length = 150000
chg-tbl: command complete
;

chg-tbl:action=reset:disk=remove:id=0

chg-tbl: RESET OK : Table 0, DMS.CFG
chg-tbl: command complete
;

chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old

chg-tbl: RENAME OK : Table 0, DMS.CFG to DMS.OLD
chg-tbl: command complete
;

```

clr-disk-stats**Clear Disk Statistics**

Use this command to clear the disk performance statistics. All associated disk statistics are zeroed.

Keyword: clr-disk-stats

Related Commands: disp-disk-stats

Command Class: Debug

Parameters

:loc= (mandatory)

Location. This parameter specifies the location of the card.

Range: 1113, 1115

Default: None

Example

```
clr-disk-stats:loc=1113
```

Dependencies

The specified card location must contain a card that is running an OAM (1113 or 1115).

A related command must not be in progress.

Notes

None

Output

```

clr-disk-stats:loc=1113

rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0
Disk performance statistics cleared.
;

```

copy-tbl

Copy Table

Use this command to copy a single table from one source to another. A table can be copied to any verifiable location in the system; however, the source and destination tables must have identical configurations (same number of entries, same entry size, both 1- dimensional and 2-dimensional).

NOTE: A table cannot be copied onto itself.

Keyword: copy-tbl

Related Commands:

Command Class: Debug

Parameters

:dloc= (mandatory)

Destination location. This parameter specifies the fixed disk or removable cartridge card location of the destination table.

Range: 1114, 1116, 1117
1114 — TDM
1116 — TDM
1117 — MDAL

:sloc= (mandatory)

Source location. This parameter specifies the fixed disk or removable cartridge card location of the source table.

Range: 1114, 1116, 1117
1114 — TDM
1116 — TDM
1117 — MDAL

:stbl= (mandatory)

Source table. This parameter specifies the identifying number of the source table.

Range: 0-511

:ddrv= (optional)

Disk drive. This parameter specifies the disk drive that contains the destination table.

Range: fixed, remove
Default: fixed

:dprtgrp= (optional)

Disk partition group. This parameter specifies the disk partition group of the destination table.

Range: active, inactive
Default: active

:dtbl= (optional)

Destination table. This parameter specifies the identifying number of the destination table.

Range: 0-511
Default: The stbl parameter value

:sdrv= (optional)

Source drive. This parameter specifies the disk drive that contains the source table.

Range: fixed, remove
Default: fixed

:sprtgrp= (optional)

Source partition group. This parameter specifies the disk partition group of the source table.

Range: active, inactive

Default: active

Example

copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed

Dependencies

Only one table copy command can be executed at a time.

The source and destination tables must exist and be compatible.

This command cannot be used to modify the security log.

Notes

None

Output

copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed

```
rlghncxa03w 01-03-04 16:11:53 EST Rel 28.1.0
Table copy command complete.
;
```

disp-bip

Display Board Identification PROM

Use this command to display the Board Identification PROM (BIP) hex and ASCII data for the specified card type and location. The PROM data consists of the board ID, part number, revision, date of manufacture, power, serial number, software match ID, and check sums.

Keyword: disp-bip

Related Commands: chg-bip-fld, chg-bip-rec, rtrv-bip, tst-bip

Command Class: Debug

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:dbdloc= (optional)

Applique location. This parameter specifies the location of the applique.

This parameter is valid only with the cards that support multiple appliques.

Range: 1-2

:type= (optional)

This parameter specifies the board type to be displayed.

Range: mdb, dbd, both

mdb — Displays the main assembly.

dbd — Displays the applique.

both — Displays the main assembly and the applique.

Default: both

Example

The following example displays the BIP data for all appliques that are supported by the card.

disp-bip:loc=1105:type=dbd

The following example displays the BIP data for the second applique.

disp-bip:loc=1103:type=dbd:dbdloc=2

Dependencies

The value of the **loc** parameter cannot specify the location of a fixed disk or removable cartridge.

The **type=dbd** parameter cannot be specified for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

If the **type=mdb** parameter is specified, then the **dbdloc** parameter cannot be specified.

If the card at the location specified by the **loc** parameter does not support multiple appliques, then the **dbdloc** parameter cannot be specified,

Output

The following example displays the BIP data for the main assembly.

disp-bip: loc=1105: type=mbd

disp-bp**Display Breakpoint**

Use this command to display currently active breakpoints in the communication and application processors.

Keyword: disp-bp

Related Commands: dlt-bp, ent-bp

Command Class: Debug

Parameters

:card= (optional)

This parameter specifies the card location, in the form of *GPLID-Subsystem ID*.

Range: *GPLID-Subsystem ID*

GPLID—atmansi, atmitu, atmhc, bphcap, bpdcm, bpdcm2, bphcap, bphcapt, bpmpl, bpmplt, ccs7itu, eoam, eroute, erthc, gls, hipr, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, pktgen, sccp, sccphc, slanhc, ss7ansi, ss7epm, ss7gx25, ss7hc, ss7ipgw, ss7ml, stplan, utility, vsccp, vxutil, vxwslan

Subsystem ID—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs. For all other GPLs, only the **all** subsystem ID is valid.

:imt= (optional)

This parameter specifies the IMT address of the card.

Range: 0-255

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1113, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3111-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118, 1115

The command is not valid for HMUX cards in locations xy 09 and xy 10 (x = the frame, y = the shelf).

:proc= (optional)

This parameter specifies the processor type.

Range: appl, com

appl—Application processor

com—Communication processor

Default: appl

:ueng= (optional)

This parameter specifies the microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

Range: 0-5

Example

```
disp-bp:card=ss7ansi-all
```

```
disp-bp:loc=1214
```

```
disp-bp:loc=1109
```

```
disp-bp:loc=1109:ueng=3
```

Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

The **ueng** parameter can be specified only for IXP-based cards (such as HIPR cards).

The **eoam** GPLID accepts all subsystem values; all other GPLIDs accept only the **all** subsystem value.

The card location specified by the **loc** parameter must be in the database.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the HMUX locations (xy **09** and xy **10** where x is the frame and y is the shelf) are not valid for break point commands.

Notes

Card locations (**loc** parameter) xy09 and xy10 (x is the frame and y is the shelf) for HMUX cards are not valid for break point commands.

Output

The following examples are for x86-based cards:

disp-disk-dir**Display Disk Directory**

Use this command to display the DOS directory on the specified disk. This command can display the creation date for each file or for selected files and applies to fixed disks and removable cartridges.

NOTE: This command can be used to verify that the correct version of a file is on the disk.

Keyword: disp-disk-dir

Related Commands: act-gpl, chg-db, chg-gpl, copy-gpl, copy-meas, init-sys, rept-stat-db

Command Class: Debug

Parameters

:file= (optional)

This parameter specifies the name of the file to be displayed.

Range: *zzzzzzzzzzzz*

1–12 ASCII characters

Default: All files are displayed

:loc= (optional)

This parameter specifies the card location in the system.

A fixed disk or removable cartridge location must be specified.

Range: **1114 , 1116, 1117**

1114 — TDM

1116 — TDM

1117 — MDAL

:prtnggrp= (optional)

Partition group. This parameter specifies the disk partition group to be displayed.

Range: **active, inactive**

Default: **active**

:src= (optional)

Source. This parameter specifies the identification of the disk containing the files to be displayed.

Range: **fixed, remove**

fixed — The fixed disk

remove — The removable cartridge

Default: The fixed disk

Example

disp-disk-dir:loc=1117:file="dms.cfg"

disp-disk-dir:src=remove:file="fta"

disp-disk-dir:src=remove:file="*.*"

Dependencies

Valid filenames must be in the format, *filename.extension*, with the following requirements:

File name—1–8 ASCII Characters

Extension—0–3 ASCII Characters

Wildcards (asterisks) are allowed when the wildcard pattern is enclosed in parentheses.

*—Matches all characters in either filename or extension

?—Matches one character in either filename or extension

file="*.*"—Matches all files on disk

file="*.tbl"—Matches all files on disk with **.tbl** as a extension

Notes

None

Output

;

Legend

FILENAME—The name of the file in the directory

EXT—The extension of the file name (for example, for the file MFC.BIN, MFC is the file name and BIN is the extension of the file name).

LENGTH—The amount of space, in bytes, the file occupies on the disk.

LAST MODIFIED—The data and time the file was changed.

CLUSTER—A 2-byte, 16-digit binary number that represents the first section of the disk occupied by the file.

LBA—The starting logical block address that corresponds to the **CLUSTER**.

FILE(S)—The number of files on the disk that match the search criteria.

BYTES—The amount of space, in bytes, the displayed files occupy on the disk

VOLUME—An 11-character name for the disk.

BYTES FREE—The number of bytes that are available on the disk for file storage.

DISK SIZE—The total capacity of the specified disk.

disp-disk-stats

Display Disk Performance Statistics

Use this command to display the disk performance statistics.

NOTE: The OAMs maintain disk read/writer access times as well as per table and per application statistics on the number of disk accesses and cache accesses. Per application and per table statistics that have zero values are not displayed if an application ID or table ID is not specified; only nonzero statistics are displayed in the default report.

Keyword: disp-disk-stats

Related Commands: clr-disk-stats

Command Class: Debug

Parameters

:loc= (mandatory)

Location. This parameter specifies the card location in the system. A fixed disk or removable cartridge location must be specified.

Range: 1113, 1115

:applid= (optional)

Application ID. This parameter specifies the application IDs that are used to define tasks.

Range: 0-255

Default: all

:tblid= (optional)

Table ID. This parameter specifies the table IDs that are used to define tables.

Range: 0-511

Default: all

Example

disp-disk-stats:loc=1113:applid=29

disp-disk-stats:loc=1113:applid=93

disp-disk-stats:loc=1113

Dependencies

The specified card location must contain a card that is running an OAM (**1113** or **1115**).

Notes

None

disp-lba**Display Logical Block Access**

Use this command to display the contents of a logical block of data at a specified logical block address of a fixed disk or removable cartridge.

Keyword: disp-lba

Related Commands:

Command Class: Debug

Parameters

:lba= (mandatory)

This parameter specifies the logical block address.

Range: **0-1953125**

:loc= (mandatory)

Location. This parameter specifies the card location in the system. A fixed disk or removable cartridge location must be specified.

Range: **1114, 1116, 1117**

1114 — TDM

1116 — TDM

1117 — MDAL

Default: Active fixed disk

Example

disp - lba : lba=676 : loc=1117

Dependencies

The requested disk must be available.

The logical block address specified must be within the valid range for the disk specified.

Notes

None

Output

disp - lba: lba=676: loc=1117

```

disp-mem

Display Memory

Use this command to display memory in communication and application processors. This display is in byte format.

Keyword: disp-mem

Related Commands: set-mem

Command Class: Debug

Parameters

:addr= (optional)

This parameter specifies the address in the form of *segment-offset*.

Range: *segment-offset*
 segment—h'00–h'ffff
 offset—h'00–h'ffff

:bc= (optional)

Byte count. This parameter specifies the number of data bytes to display.

Range: **0-65535**

Default: **96**

:card= (optional)

Card location. This parameter specifies the card location in the form of *GPLID-Subsystem ID*.

Range: *GPLID-Subsystem ID*

GPLID—**atmansi**, **atmitu**, **atmhc**, **bphcap**, **bpdcm**, **bpdcm2**, **ccs7itu**, **eoam**,
eroute, **erthc**, **gl**, **hipr**, **ipghc**, **ipgwi**, **iplhc**, **iplim**, **iplimi**, **ips**, **ipsg**, **ipshc**, **mcp**,
pktgen, **sccp**, **sccphc**, **slanhc**, **ss7ansi**, **ss7epm**, **ss7gx25**, **ss7hc**, **ss7ipgw**, **ss7ml**,
stplan, **utility**, **vsccp**, **vxutil**, **vxwslan**

Subsystem ID—**a**, **b**, **act**, **stby**, **all**

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

:dformat= (optional)

This parameter specifies the memory dump format.

Range: **byte**, **word**, **dword**

Default: **byte**

:imt= (optional)

This parameter specifies the IMT address.

Range: **0-255**

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: **1101-1108**, **1111-1113**, **1201-1208**, **1211-1218**, **1301-1308**, **1311-1318**, **2101-2108**,
2111-2118, **2201-2208**, **2211-2218**, **2301-2308**, **2311-2318**, **3101-3108**, **3111-3118**,
3201-3208, **3211-3218**, **3301-3308**, **3311-3318**, **4101-4108**, **4111-4118**, **4201-4208**,
4211-4218, **4301-4308**, **4311-4318**, **5101-5108**, **5111-5118**, **5201-5208**, **5211-5218**,
5301-5308, **5311-5318**, **6101-6108**, **6111-6118**, **1115**

:paddr= (optional)

This parameter specifies the physical offset of the memory address.

Range: **h'00-h'ffffff**

:proc= (optional)

This parameter specifies the processor type.

Range: **appl**, **com**

appl—Application processor

com—Communication processor

Default: **appl**

Example

disp-mem:card=ss7ansi-all:addr=h'03a-h'001:bc=8

disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word

disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=dword

Dependencies

Either the **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **addr** and **paddr** parameters cannot be specified together in the command.

The value of the **bc** parameter cannot exceed **2000**.

The card location specified by the **loc** parameter must be in the database.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the **HMUX** and **HIPR** locations (xy **09** and xy **10** where x is the frame and y is shelf) are not valid for memory commands.

Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Output

disp-mem:card=psm-a:addr=h'03a-h'001:bc=8

disp-trace

Display Trace

Use this command to display trace entries.

Keyword: disp-trace

Related Commands: dlt-trace, ent-trace

Command Class: Debug

Parameters

:traceid= (optional)

Trace ID. Identifier of the trace entry to be displayed.

Range: 1-10

Example

disp-trace

disp-trace:traceid=5

Dependencies

None

Output

disp-trace

stdcfq2b 07-10-05 12:55:32 EST EAGLE 37.5.0

Trace Request 1:

CARD= SS7ANSI OPC= 001-001-001

TRACE DISPLAY COMPLETE.

;

dlt-bp**Delete Breakpoint**

Use this command to delete breakpoints in the communication or application processors.

Keyword: **dlt-bp**

Related Commands: **disp-bp**, **ent-bp**

Command Class: Debug

Parameters

:addr= (optional)

This parameter specifies the address in the form of *segment–offset*.

Range: *segment–offset*
segment—h'00–h'ffff
offset—h'00–h'ffff

:card= (optional)

Card location. This parameter specifies the card location in the form of *GPLID–Subsystem ID*.

Range: *GPLID–Subsystem ID*
GPLID—atmansi, atmitu, atmhc, bphcap, bpdcm, bpdcm2, ccs7itu, eoam, eroute, erthc, gls, hipr, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, mplga, mplgi, pktgen, sccp, sccphc, slanhc, ss7ansi, ss7epm, ss7gx25, ss7hc, ss7ipgw, ss7ml, stplan, utility, vscpp, vxutil, vxwslan
Subsystem ID—a, b, act, stby, all
 The **oam** GPL can be specified with any of the subsystem IDs. For all other GPLs, only the **all** subsystem ID is valid.

:imt= (optional)

This parameter specifies the IMT address of the card.

Range: **0-255**

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: **1101-1113, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3111-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118, 1115**
 The command is not valid for HMUX cards in locations xy09 and xy10 (x = the frame, y = the shelf).

:paddr= (optional)

This parameter specifies the physical offset of the memory address.

Range: **h'00–h'ffffff**

:proc= (optional)

This parameter specifies the processor type.

Range: **appl, com**
appl—Application processor
com—Communication processor
Default: **appl**

:ueng= (optional)

This parameter specifies the microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

Range: **0-5**

Example

```
dlt-bp:card=ss7gx25-all
dlt-bp:loc=1109
dlt-bp:loc=1209:ueng=2
dlt-bp:card=hipr-all
```

Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

Either the **addr** or **paddr** parameter, but not both, must be specified in the command.

The **ueng** parameter can be specified only for IXP-based cards (such as HIPR cards).

The card location specified by the **loc** parameter must be in the database.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the HMUX locations (xy **09** and xy **10** where x is the frame and y is the shelf) are not valid for break point commands.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Output

```
dlt-bp:card=oam-all:proc=com
Command Accepted - Processing

tekelecstp 97-01-20 19:21:10 EST Rel 37.0.0
dlt-bp:card=oam-all:proc=com
Command entered at terminal #1.
;
```

dlt-trace**Delete Trace**

Use this command to delete provisioned MSU tracing criteria from the database.

Keyword: **dlt-trace**

Related Commands: **disp-trace**, **ent-trace**

Command Class: Debug

Parameters

:traceid= (optional)
Trace ID. Identifier of the trace entry to be deleted.
Range: **1-10**

Example

```
dlt-trace:traceid=5
dlt-trace
```

Dependencies

None

Output

```

dlt-trace:traceid=1
stdcfg2b 07-10-05 13:03:29 EST EAGLE 37.5.0
dlt-trace:traceid=1
Command entered at terminal #4.

```

```
;
```

ent-bp**Enter Breakpoint**

Use this command to add breakpoints in communications and application processors in the system.

Keyword: ent-bp

Related Commands: disp-bp, dlt-bp

Command Class: Debug

Parameters

:access= (optional)

This parameter specifies the access type, in the form of *access type-format*.

Use the **data** parameter to set the format on IXP-based cards (such as HIPR cards).

Range: *access type-format*
access type—**r**, **w**, **rw** (read, write, read-write)
format—**byte**, **word**, **dword**, **any**

Default: For x86-based cards—**rw-byte**
 For IXP-based cards—**rw-any**

:addr= (optional)

This parameter specifies the memory location in the form of *segment-offset*.

Range: *segment-offset*
segment—**h'00–h'ffff**
offset—**h'00–h'ffff**

:bc= (optional)

This parameter specifies the number of data bytes to display.

For IXP-based cards, **bc** represents the number of bytes of memory. The number of bytes of stack to be displayed will be 256 – **bc**. For example, if **bc=128**, 128 bytes of memory and 128 bytes of stack will be displayed. If **bc=0**, 0 bytes of memory and 256 bytes of stack will be displayed. The exception to this rule is that 1 byte of stack will never be displayed.

Range: **0-256**
 For x86-based cards, the maximum number of bytes is **96**.
 For IXP-based cards, the maximum number of bytes is **256**.

:ca= (optional)

This parameter specifies condition “a” in the form of *register-condition-integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

Range: *register-condition-integer*
register—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r1-r15**
condition—**eq, neq, gt, lt, gte, lte**
integer—**h'00–h'ffffff**

:card= (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

Range: *GPLID–Subsystem ID*
GPLID—**atmansi, atmitu, atmhc, bpdcm, bpdcm2, bphcap, bphcapt, bpmpl, bpmplt, ccs7itu, eoam, eroute, erthc, gls, hipr, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, pktgen, mcp, oam, sccp, sccphc, slanhc, ss7ansi, ss7epm, ss7gx25, ss7hc, ss7ipgw, ss7ml, stplan, utility, vscpp, vxutil, vxwslan**
Subsystem ID—**a, b, act, stby, all**

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

:cb= (optional)

This parameter specifies condition “b” in the form of *register–condition–integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

Range: *register-condition-integer*
register—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r0-r15**
condition—**eq, neq, gt, lt, gte, lte**
integer—**h'00–h'ffffff**

:ctx= (optional)

This parameter specifies the bit-mapped microengine context mask.

Range: **1-15**

:da= (optional)

This parameter specifies the dump address, in the form of *segment–offset*.

Range: *segment–offset*
segment—**h'00–h'ffff**
offset—**h'00–h'ffff**

:data= (optional)

Instructs a data breakpoint to qualify on a match of the data. This parameter is valid only on IXP-based cards (such as HIPR cards).

Range: *value-mask*
value—**0-0xFFFFFFFF**
mask—**0-0xFFFFFFFF**

Default: **0-0**

:dformat= (optional)

Memory dump format (byte, doubleword, word).

Range: byte, dword, word
Default: byte

:dpaddr= (optional)

Memory dump address (physical offset).

Range: h'00–h'ffffff

:dr= (optional)

The data register indirect memory dump, in the form *register-register-integer*.

The *register-register* value is the CPU internal register.

The *integer* value is the offset value.

Range: *register-register-integer*

register—sp, bp, ss, ds, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx

register—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx

integer—h'00–h'ffffff

:drarm= (optional)

ARM register indirect memory dump.

Range: *ARM register-integer*

ARM register—r0-r15, sp, lr, pc

mask—0-65535

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

Default: 0-0

:dur= (optional)

Breakpoint duration.

Range: temp, perm

Default: temp

:imt= (optional)

IMT address of the card.

Range: 0-255

:ind= (optional)

Indirection count.

Range: 0-3

Default: 0

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

The command is not valid for HMUX cards in locations xy09 and xy10 (*x* = the frame, *y* = the shelf).

:paddr= (optional)

The physical offset of the memory address.

Range: **h'00–h'ffffff**

:proc= (optional)
 Processor type.

Range: **appl, com**
 appl — Application processor
 com — Communication processor

Default: **appl**

:rep= (optional)
 Repetitions for this breakpoint.

Range: **0-255**

Default: **0**

:type= (optional)
 Breakpoint type in the form of processor type-breakpoint type

Range: *processor type-breakpoint type*
 processor type—**p186, p286, p486, arm, ixp**
 breakpoint type—**code, codehw, codesw, data**

Default: For x46-based cards—**p486-code**
 For IXP-based cards—**arm-codesw**

:ueng= (optional)
 Microengine number. This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

Range: **0-5**

Example

```
ent-bp: loc=1113: addr=h'03a-0001
ent-bp: loc=1204: paddr=h'27c3c: type=p486-data: access=rw-word
ent-bp: loc=1109: paddr=h'401000: type=arm-codesw: access=rw-
any: ca=r7-eq-0
ent-bp: loc=1209: paddr=h'402000: type=arm-data: access=w-
any: data=h'1111-h'ff
ent-bp: loc=1309: paddr=h'403000: type=ixp-codesw: ueng=2: ctx=1
ent-bp: card=hipr-all: paddr=h'404000: type=arm-
codehw: drarm=r3-0: bc=64
```

Dependencies

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, and **1118** are not valid for break point commands.

The **loc** parameter, the **imt** parameter, or the **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **dr** parameter and the **da** parameter cannot be specified together in the command.

The **dur=perm** parameter and the **rep** parameter cannot be specified together in the command.

The **dur=perm** parameter cannot be specified when the value of the processor type portion of the **type** parameter is **p186** or **p286**.

Either the **addr** parameter or the **paddr** parameter, but not both, must be specified in the command.

When the **da** parameter, the **dr** parameter, or the **drarm** parameter is specified, the **dpaddr** parameter cannot be specified.

When the **paddr** parameter and the **bc** parameter are specified, either the **dpaddr** or **dr** parameter must be specified in the command.

The **access** parameter can be specified only when the **type** parameter value is **p486-data** or **arm-data**.

The **bc** parameter value cannot be greater than **96** for x86-based cards.

The **ind** parameter value cannot be greater than **3**.

The specified card must be in use.

For 80286 processors, registers for 80386 processors cannot be specified.

For 80286 processors, **integer** values for registers and conditions must be less than **65535**.

The **ueng** parameter is valid only on IXP-based cards (the value **ixp** is specified for the processor type portion of the **type** parameter).

The **cts** parameter is valid only on IXP-based cards (the value **ixp** is specified for the processor type portion of the **type** parameter).

The **data** parameter is valid only on IXP-based cards.

The **data** parameter is valid only when the value is **data** for the breakpoint type portion of the **type** parameter.

The register values **sp**, **lr**, **pc**, and **r0-r15** for the **ca**, **cb**, and **drarm** parameters are valid on an IXP-based card ARM processor.

The **ca** and **cb** parameters cannot be specified when the value **ixp** is specified for the processor type portion of the **type** parameter.

The **drarm** parameter can be specified only on IXP-based cards.

The **drarm** parameter can be specified only when the value **arm** is specified for the processor type portion of the **type** parameter.

The **dr** parameter cannot be specified for IXP-based cards.

The **data** and **codesw** values for the breakpoint type portion of the **type** parameter cannot be specified when the value **ixp** is specified for the processor type portion of the **type** parameter.

The **arm** and **ixp** values for the processor type portion of the **type** parameter are valid only on IXP-based cards.

The value **any** for the format portion of the **access** parameter can be specified only on IXP-based cards. The format value must be set to **any** on IXP-based cards.

When the value **ixp** is specified for the processor type portion of the **type** parameter, the **ueng** and **cts** parameters must be specified.

The **addr** parameter can be specified only when the **proc=com** parameter is specified for DS0 cards with PROM-based COM processors (such as TSMs).

When the **ca**, **cb**, and **dr** parameters are used with 80186 and 80286 processors, the register values **ip**, **fs**, **gs**, **esi**, **edi**, **ebp**, **esp**, **eip**, **efl**, **eax**, **ebx**, **ecx**, and **edx** cannot be specified. These registers can be used only with 80486 processors. The integer values for these parameters when used with 80186 and 80286 processors must be less than **h'ffff (65535)**.

The **data** value for the breakpoint type portion of the **type** parameter cannot be specified with the values **p186**, **p286**, and **ixp** for the processor type portion of the **type** parameter.

The **da** parameter cannot be specified for IXP-based cards.

An ARM register value must be specified for an IXP-based card with an ARM processor.

Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Output

```
ent -bp:loc=1113:addr=h'03a-0001
rlghncxa03w 04-08-22 21:14:41 EST EAGLE 33.0.0
SDS Response Code 22 from IMT Address H'00f6 - command complete.

rlghncxa03w 04-08-22 21:14:41 EST EAGLE 33.0.0
SDS Response from IMT Address H'000a - command complete.
;
```

ent-trace**Enter Trace**

Use this debug command to trace MSUs sent to SCCP, VSCCP, or SS7 cards running the following applications: **ss7ansi**, **ccs7itu**, **sccp**, **vsccp**, **atmitu**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw** or **ipgwi**.

The EAGLE 5 ISS traps MSUs that meet the provisioned tracing criteria, and the MSU remains in the trapped state for the life span of that MSU. This life span varies depending on the type of MSU. For MTP-Routed or GTT MSUs, the life span lasts until the MSU travels out of the EAGLE 5 ISS or is discarded. For LNP MSUs, the life span lasts until the request is processed. The response is not part of the LNP MSU. Trapping a response requires the provisioning of another MSU trace.

Table 6-4 lists by card type the parameters that can be used to filter an MSU.

Table 6-4. Parameter/Card Type Filters for MSUs

An MSU for this card type...	Can be filtered using one or more of the following parameters...
SCCP	error , gt , lrn , tn , ssp , sspa
VSCCP	error , gt , lrn , tn , ssp/sspa/sspi/sspn/sspn24 , dn , entityid , imei , imsi
ANSI SS7	error , ssp/sspa , opc/opca , dpc/dpca , tlnpisuptype , gt
ITU SS7	error , sspi/sspn/sspn24 , opci/opcn/opcn24 , dpci/dpcn/dpcn24 , gt

The following parameters are mutually exclusive: **lrn**, **tn**, **dn**, **entityid**, **imsi**, **imei**, **error**.

The following parameters can be used once in a single MSU trace request with ONE of the mutually exclusive parameters specified above: **opc**, **dpc**, **ilsn**, **si**, **gt**, **ssp**, **h0h1**, **cpc**, **cic/ecic**.

The **cic/ecic** parameters can be used only for ISUP traffic. The **ecic** parameter must be specified with the **cic** parameter.

For all cards supported by the **ent-trace** command, the **error** parameter can be provisioned as the only optional parameter or in addition to any other optional parameter to trace any messages that fail verification or processing. If the **error** parameter not specified, the default value is **error=no**.

CAUTION: If your system's configuration approaches the maximum number of provisioned SCCP cards, entering this command might cause an OAM to reset because of the amount of information that may be returned.

Keyword: ent-trace

Related Commands:

Command Class: Debug

Parameters

:card= (mandatory)

This parameter specifies the card location in the form of *APPL CLASS-Subsystem ID*.

Range: *APPL CLASS-Subsystem ID*
APPL CLASS—atmansi, atmitu, ccs7itu, iplim, iplimi, sccp, ss7ansi, ss7ipgw, ipgwi, vsccp
Subsystem ID—all

:cic= (optional)

This parameter specifies the beginning value for a CIC range.

Range: **0-16383**

:dn= (optional)

Directory Number. The **dn** parameter is used for INP, G-Port, and G-Flex; and the **tn** parameter is used for LNP.

Range: 5-15 digits
 Valid digits are **0-9, a-f, A-F**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-nm)*

Synonym: **dpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ecic= (optional)

This parameter specifies the end value for a CIC range.

Range: **0-16383**

:entityid= (optional)

This parameter specifies the entity ID.

Range: 1-15 digits

1-15 digits; valid digits are **0-9, a-f, A-F**

:error= (optional)

This parameter specifies whether to perform a trace on any message verification error and message processing error

Range: **yes, no**

Default: **no**

:gt= (optional)

Global title. This parameter specifies the global title digits.

Range: 1-21 digits

Valid digits are **0-9, a-f, A-F**

:ilsn= (optional)

This parameter specifies the incoming linkset name.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:imei= (optional)

This parameter specifies the International Equipment Identifier.

Range: 14 digits

Exactly 14 digits; valid digits are **0-9, a-f, A-F**.

:imsi= (optional)

This parameter specifies the International Mobile Station Identifier.

Range: 5-15 digits
Valid digits are **0-9, a-f, A-F**.

:loc= (optional)

Location. This parameter specifies the card location of the card as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115**

:lrn= (optional)

The local routing number.

Range: *Exactly 14 digits*
Valid digits are **0-9**.

:opc= or :opca= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-ncnm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.
When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.
When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.
The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix subfield* indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:open24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:rep= (optional)

The number of MSUs to trap.

Range: 0-255

:si= (optional)

The service indicator value.

Range: 0-15

:ssp= or :sspa= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:sspi= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:sspn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on

(nnnnngc, m1-m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnnngc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:sspn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:tlnpisuptype= (optional)

The ISUP message type.

Range: 0-255

:tn= (optional)

The directory number.

Range: 10 digits

Exactly 10 digits. Valid digits are 0-9.

Example

```
ent-trace:gt=919460:card=SCCP-ALL
```

```
ent-trace:gt=919460:lrn=9105551234:ssp=10-10-10:card=SCCP-ALL:rep=2
```

```
ent-trace:opc=1-1-1:card=SS7ANSI-ALL:rep=2
```

```
ent-trace:tlnpisuptype=01:card=SS7ANSI-ALL
```

```
ent-trace:dn=12345:card=VSCCP-ALL
```

```
ent-trace:imsi=c122d:card=VSCCP-ALL
```

```
ent-trace:card=ccs7itu-all:dpc=2-7-5:error=no
```

```
ent-trace:card=vscpp-all:error=yes
```

```
ent-trace:card=ccs7itu-
```

```
all:sspn24=10-11-12:opc24=10-10-10:dpc24=10-101-11
```

```
ent-trace:imei=123456789101234:card=VSCCP-ALL
```

```
ent-trace:entityid=c123:card=VSCCP-ALL
```

Dependencies

The **card** parameter or the **loc** parameter must be specified.

At least one optional parameter must be specified. The **error** parameter can be specified as the only optional parameter or with any of the other optional parameters in the command.

The following parameters cannot have a value of **none**: **gt**, **entityid**, **dn**, **imei**, and **imsi**.

For the **card** parameter, only the following values are allowed: **sccp**, **vsccp**, **ss7ansi**, **atmitu**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, or **ccs7itu**.

The only qualifier allowed for the **card** parameter is **-all**.

The following parameters are invalid for SCCP cards: **entityid**, **dn**, **imei**, **imsi**, **opc**, **dpc**, **tlnpisuptype**, **sspi**, **sspn**, and **sspn24**.

The following parameters are invalid for ANSI SS7 cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, and **tn**.

The following ITU point code parameters are invalid for ANSI SS7 cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **opci**, **open**, **open24**, **dpci**, **dpcn**, **dpcn24**, **sspi**, **sspn**, and **sspn24**.

The following parameters are invalid for ITU SS7 cards running the **ccs7itu**, **atmitu**, or **iplimi** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, **tn**, and **tlnpisuptype**.

The following ANSI point code parameters are invalid for ITU SS7 cards running the **ccs7itu** or **iplimi** GPLs: **opca**, **dpc**, **dpcn**, **sspi**, and **sspa**.

The following parameters are invalid for VSCCP cards: **opc**, **dpc**, and **tlnpisuptype**.

The G-Flex, G-Port, or INP feature must be turned on before the **dn** and **entityid** parameters can be specified.

The G-Flex feature or the Equipment Identity Register feature must be turned on before the **imsi** parameter can be specified.

If the ITU Duplicate Point Code (ITUDUPPC) feature is turned on, the ITU national point code must be specified as a full point code.

The Equipment Identity Register (EIR) feature must be turned on before the **imei** parameter can be specified.

The G-Flex, INP, AINPQ, A-Port, G-Port, PPSMS, IS41 GSM Migration, or IDP Relay feature must be turned on before the **dn** parameter can be specified.

Only one of the following parameters can be specified in a single MSU trace request: **lrn**, **tn**, **dn**, **entityid**, **imsi**, **imei**, or **error**.

Output

The following example displays output for an MTP trace.

ent - trace: loc=1101:dpc=7-1-0

send-msg

Send Message

Use this debug command to manually simulate a system generated message from a user terminal. The parameters (not entered by the user) are defaulted to:

- Origination subsystem = **cam_active**
- Destination subsystem = **orig application ID=appl_ID_ui**
- Violation= **no report**
- Bus = **imt choice**
- Message length = **computed**

Keyword: send-msg

Related Commands:

Command Class: Debug

Parameters

:da= (mandatory)

This parameter specifies the destination application ID.

Range: 0-255

:ds= (mandatory)

This parameter specifies the destination subsystem.

Range: 0-255

:f= (mandatory)

This parameter specifies the function ID.

Range: 0-255

:loc= (mandatory)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318,
2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108,
3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118,
4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208,
5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:alt= (optional)

This parameter specifies whether to use the alternate bus bit.

Range: on, off

Default: on

:bus= (optional)

This parameter specifies the IMT bus.

Range: a, b

Default: a

:d0= (optional)

This parameter specifies the application data.

Range: 0-255

:d1= (optional)

This parameter specifies the application data.

Range: 0-255

:d2= (optional)

Application Data.

Range: 0-255

:d3= (optional)

This parameter specifies the application data.

Range: 0-255

:d4= (optional)

This parameter specifies the application data.

Range: 0-255

:d5= (optional)

This parameter specifies the application data.

Range: 0-255

:d6= (optional)

This parameter specifies the application data.

Range: 0-255

:d7= (optional)

This parameter specifies the application data.

Range: 0-255

:d8= (optional)

This parameter specifies the application data.

Range: 0-255

:d9= (optional)

This parameter specifies the application data.

Range: 0-255

:len= (optional)

This parameter specifies the message length in bytes.

Range: 0-65535

Default: Calculated

:oa= (optional)

This parameter specifies the originating application ID.

Range: 0-255

Default: 2

:os= (optional)

This parameter specifies the originating subsystem.

Range: 0-255

Default: 0

:sut= (optional)

This parameter specifies the signal unit type.

Range: 0-9

Default: 2

Example

send-msg: loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7

send-msg: loc=1113:ds=2:oa=h'17:da=h'30:f=11

send-msg: loc=1116:ds=2:oa=h'17::da=h'30:f=12

Dependencies

The value of the **da** parameter must be valid.

The destination location must be equipped to receive messages.

Card locations xy **09** and xy **10** cannot be used with bus **b** and bus **a**, respectively.

The value of the **ds** parameter must be valid.

Notes

Both the **bus** and **sut** parameters must be used when sending a message to an HMUX or HIPR card.

If the **bus** parameter is not specified with an HMUX or HIPR card location on **imt b** (such as xy **10**), the bus **b** parameter value is used instead of the bus **a** parameter value.

Output

```

set-mem**Set Memory**

Use this command to set values in memory in the communication and application processors. If a card is reloaded, these memory changes are lost.

Keyword: set-mem

Related Commands: disp-mem

Command Class: Debug

Parameters

:addr= (optional)

This parameter specifies the address, in the form of *segment–offset*.

Range: *segment–offset*
 segment—h'00–h'ffff
 offset—h'00–h'ffff

:byte= (optional)

This parameter specifies the number of data bytes to display.

Range: 0–h'00–h'ff

:card= (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

Range: *GPLID–Subsystem ID*
 GPLID—atmansi, atmitu, atmhc, bphcap, bpdcm, bpdcm2, ccs7itu, eoam,
 eroute, erthc, gls, hipr, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshe, mcp,
 mplga, mplgi, pktgen, sccp, sccphc, slanhc, ss7ansi, ss7epm, ss7gx25, ss7hc,
 ss7ipgw, ss7ml, stplan, utility, vsccp, vxutil, vxwslan

Subsystem ID—**a, b, act, stby, all**

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

:dword= (optional)

This parameter specifies a double word value.

Range: **0–h'00–h'ffffff**

:fill= (optional)

This parameter specifies the number of times that the value is to be written to successive addresses.

Range: **0-65535**

Default: **1**

:imt= (optional)

This parameter specifies the IMT address.

Range: **0-254**

:loc= (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1113, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1115**

:mask= (optional)

This parameter specifies the mask that selects the bits that are to be included in the operation (op).

Range: **0-0xFFFFFFFF**

Default: **0xFFFFFFFF**

:op= (optional)

Operation. This parameter specifies the operation that is performed in order to arrive at the final value in the memory location.

Range: **replace, and, or, x**

Default: **replace**

:paddr= (optional)

This parameter specifies the physical offset of the memory address.

Range: **h'00–h'ffffff**

:proc= (optional)

This parameter specifies the processor type.

Range: **appl, com**

appl—Application processor

com—Communication processor

Default: **appl**

:word= (optional)

This parameter specifies a word value.

Range: **h'00–h'ffff**

Example

set-mem:card=ss7ansi-all:addr=h'03a-h'001:byte=4

set-mem:loc=1109:paddr=h'201000:byte=0:fill=1024

set-mem:card=hipr-all:paddr=h'202000:word=h'2a:op=and:mask=h'fff

Dependencies

Either the **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

Either the **addr** or **paddr** parameter can be specified, but not both, in the command.

The value of the **bc** parameter must not exceed 2000.

The card location specified by the **loc** parameter must be in the database.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the **HMUX** and **HIPR** locations (xy **09** and xy **10** where x is the frame and y is shelf) are not valid for memory commands.

Either the **byte**, **word**, or **dword** parameter must be specified.

Only one of the **byte**, **word**, and **dword** parameters can be specified in the command.

The **paddr** parameter cannot be specified for an SS7 LIM card.

Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Output

set-mem:card=ss7ansi-all:addr=h'03a-h'001:byte=4

rlghncxa03w 01-03-22 21:14:03 EST Rel 28.1.0

SDS Response Code 22 from IMT Address H'00f6 - command complete.

;

Pass-Through Commands

This chapter introduces the pass-through commands and describes the command conventions. The pass-through commands are listed in alphabetical order starting on page 7-2.

Introduction

The pass-through commands are used within the **pass** command (see Chapter 5). Pass-through commands are passed through the OAM and sent to individual cards for processing. Pass-through commands reduce the need to add card-specific and application-specific code to the OAM build.

Command Conventions

The following is an example of a **pass** command:

```
pass:loc=1201:cmd="connmgr -c"
```

The **cmd** parameter contains the pass-through command (**connmgr -c**) within the double quotes.

Pass-through commands consist of two types of tokens: command name and command options. Tokens are whitespace-delimited and null-terminated. The generalized format of a pass-through command is:

```
command_name option1 option2....option n-1.... option n
```

In the example, the *command_name* is '**connmgr**' and the option is '-c'.

Options and option parameters are made up of a specific character string or a variable. The variable is to be replaced with a value selected from a range of values. Option variables and option parameter variables are underlined. For example, the **arp** command option **-d** has the parameter variable **IP address**. Specify the IP address as in the command **arp -d 192.9.200.44**. Do not enter the underlined text; enter a value instead.

Help information for each pass-through command can be obtained by using the option **-h** on any command.

arp**Address Resolution Protocol**

This command is used to display and modify the internet to ethernet address translation tables used by the address resolution protocol.

Keyword: arp

Command Class: IP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the arp command option **-d** has the parameter IP address. The IP address must be specified for which an ARP entry will be deleted, as in the command **arp -d 192.9.200.44**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a

This option displays all entries in the ARP table.

-d IP address

This option deletes an ARP entry for the specified IP address.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of **0-255**.

-f

This option flushes all entries from the ARP table.

-h

This option displays help (usage) information for the command.

-s IP address MAC address

This option creates an ARP entry for the specified IP address and ethernet address.

Range:

4 numbers separated by dots, with each number in the range of **0-255**.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. For example, **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

Range:

6 hexadecimal numbers separated by colons; each number in the range **0 - FF**.

The MAC (media access control) address is an ethernet address with the format **x:x:x:x:x:x**, where **x** is a hexadecimal integer from **0** to **FF**. For example, **08:00:20:1b:0f:f2**.

Example

arp -a

arp -s 192.9.200.44 08:00:20:1b:0f:f2

arp -d 192.9.200.44

arp -f

Dependencies

Only one of the options can be specified at a time.

The **arp** command with no options displays all of the current ARP cache entries.

Notes

The **arp** command is executed through the **pass** command.

Output

pass:loc=1105:cmd="arp" or

pass:loc=1105:cmd="arp -h"

```

aslog

SCTP Application Server Log

This command is used to display the state changes for a specified Application Server (AS).

Keyword: aslog

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **aslog** command has the parameter asname. The Application Server name must be specified for which the log will be displayed, as in the command **aslog as1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asname

This option specifies the Association Server name for the display.

-h

This option displays help (usage) information for the command.

Example

```
aslog as1
```

Dependencies

None

Notes

None

Output

```

pass:loc=1105:cmd="aslog as1"

Command Accepted - Processing

    rlgncxa03w 00-01-27 08:10:00 EST  EAGLE5 31.6.0

asplog**SCTP Application Server Process Log**

NOTE: This command is obsolete. The functions have been updated and moved to the ualog command.

This command is used to display the UA state history for a specified Application Server Process (ASP).

Keyword: asplog

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **asplog** command has the parameter asp name. The Application Server Process must be specified for which the log will be displayed, as in the command **asplog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asp name

This option specifies the Application Server Process name for the display.

-h

This option displays help (usage) information for the command.

-i event group

This option includes groups of events in the state machine history.

Range: service, ua

-x event group

This option excludes groups of events from the state machine history.

Range: service, ua

Example

asplog s7000

Dependencies

None

Notes

None

Output

In this example, transmitted notification, ASP Inactivation (RFC Extension) , ASP Activation (RFC Extension) and ASP Failure Notification events are shown.

pass:loc=1105:cmd="asplog s7000"

Error Codes

NOTE: The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18

The following error codes can appear in the error messages:

0x01—Invalid Version

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

0x03—Unsupported Message Class

A message was received with an unexpected or unsupported Message Class.

0x04—Unsupported Message Type

A message was received with an unexpected or unsupported Message Type.

0x05—Unsupported Traffic Handling Mode

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic

Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

0x06—Unexpected Message

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

0x07—Protocol Error

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

0x09—Invalid Stream Identifier

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

0x0d—Refused - Management Blocking

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

0x0e—ASP Identifier Required

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

0x0f—Invalid ASP Identifier

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier.

0x11—Invalid Parameter Value

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

0x12—Parameter Field Error

A message is received with a parameter that has a wrong length field.

0x13—Unexpected Parameter

A message contains an invalid parameter.

0x14—Destination Status Unknown

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

0x15—Invalid Network Appearance

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

0x16—Missing Parameter

A message is received, and a mandatory parameter is not included in the message.

0x19—Invalid Routing Context

A message is received from a peer with an invalid (unconfigured) Routing Context value. The invalid Routing Context is included in the error message.

0x1a—No Configured AS for ASP

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

assocrtt

SCTP Association Round Trip Time

This command is used to display the SCTP round trip times for a specified association. Minimum, maximum, and average times are kept for each open association. The Retransmission Mode (RFC or LIN) and the configured Minimum and Maximum Retransmission Timeout limits are also displayed.

Keyword: `assocrtt`

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `assocrtt` command has the parameter aname. The association name must be specified for which the information will be displayed, as in the command `assocrtt c7000`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

-r

This option resets all statistics for the specified association name.

Example

```
assocrtt c7000
```

```
assocrtt c7000 -r
```

Dependencies

None

Notes

This command does not indicate whether or not the socket is congested.

Output**pass:loc=1105:cmd="assocrtt" or****pass:loc=1105:cmd="assocrtt -h"**

connmgr

Connection Manager

This command is used to generate reports about the status of the connection manager.

Keyword: connmgr

Command Class: Application Maintenance

Options

-d

This option displays a connection manager data summary. For IPSG cards, this report contains summary information and does not contain information for individual signaling links.

-h

This option displays help (usage) information for the command.

-i

This option displays SCTP instance and association data.

-l

This option displays the connection manager event log.

-n

This option displays the SCTP notification log.

-r

This option resets the connection manager event log.

Example**connmgr -r****connmgr -c****connmgr -s****Dependencies**

Only one of the options can be specified at a time.

If no options are specified, usage information is displayed.

Notes

The **connmgr** command is executed through the **pass** command.

Output**pass:loc=1107:cmd="connmgr" or****pass:loc=1304:cmd="connmgr -h"**

Command Accepted - Processing

```

rlghncxa03w 08-01-21 15:29:46 EST  EAGLE5 38.0.0
pass:loc=1304:cmd="connmgr -h"
Command entered at terminal #1.
;
rlghncxa03w 08-01-21 15:29:46 EST  EAGLE5 38.0.0
PASS: Command sent to card
;
rlghncxa03w 04-07-02 15:29:46 EST  EAGLE5 31.6.0
Usage: CONNMGR [-d] [-h] [-i] [-l] [-n] [-r]
Options:
  -d    Display connection manager data summary
  -h    Displays this message
  -i    Displays instance data
  -l    Display the connection manager event log
  -n    Display the SCTP notification log
  -r    Reset the connection manager event log
;

```

pass:loc=1107:cmd="connmgr -d"

The Connection Manager Data Summary displays all provisioned signaling link ports.

In the following example, signaling link port (slk) B is valid only for IPLIMx cards.

Command Accepted - Processing

```

rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
pass:loc=1107:cmd="connmgr -d"
Command entered at terminal #1.

ftptest

FTP Test

Use this command to send a test file to a configured FTP server that is used for the Measurements Platform feature

Keyword: **ftptest**

Command Class: System Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ftptest** command option **-a** has the parameter appl. The FTP registered application to be tested can be specified, as in the command **ftptest -a meas**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-h

This option provides help information for the command.

-a appl

This option specifies the FTP registered application to be tested.

Range: meas

meas—The Measurements Platform application

Example

```
ftptest
```

```
ftptest -h
```

```
ftptest -a meas
```

Dependencies

None

Notes

The **ftptest** command is executed through the **pass** command.

The specified card location must have an IP port configured to an FTP server using the **ent-ftp-serv** command, and the card must have its IP port configured using the **chg-ip-lnk** command.

Output

```
pass:loc=1105:cmd="ftpptest-h"
```

or

```
pass:loc=1105:cmd="ftpptest"
```

Command Accepted - Processing

```

linkinfo

Link State and Event Log

This command is used to display the state of a signaling link and to retrieve/clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card. For IPLIMx cards, the following signaling links are supported: **a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, or **b3**. For the IPSG cards, the following signaling links are supported: **a:a15-b:b15**

Keyword: **linkinfo**

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **linkinfo** command option **-i** has the parameter event. The event to be included in the report can be specified, as in the command **linkinfo a -a -i m2pa**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-h

This option provides help information for the command.

port

This option specifies the signaling link port.

Range: **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, **b3**

-a

This option displays the adapter layer interface (ALI) log for the specified signaling link. For M3UA associations the **link -a** option is used to display the UA event log. This command logs information on an association basis. The **link** parameter is used to obtain this report on IPSG instead of the association name. This information is currently provided by the ualog command on IPGWx cards.

-c

This option displays congestion tuning parameters for M3UA and M2PA links. The report is enhanced to include card level congestion thresholds and the high-water mark for IPSG cards.

-i event

This option includes (does not filter) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are **ua, service**

Range: **ali, all, data, l2l3, l3l2, m2pa, state, ua, service**

all—include all events

-l

This option displays the IPLIM ALI event log for the specified signaling link

-m

This option displays acknowledgment times on an M2PA connection (minimum, maximum, weighted average, last recorded). For IPSPG cards, this measurement is supported for only IPSPG-M2PA links.

-r

This option resets (clears) the event log for the specified signaling link. This option is valid only with the **-a** option or **-l** option.

-s

This option displays the state information for the specified signaling link. For the IPSPG cards, this option is enhanced to display M3UA signaling link status.

-v

This option displays the link event filter configuration.

-x event

This option excludes (filters) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are **ua, service**

Range: **ali, all, data, l2l3, l3l2, m2pa, state, ua, service**

all—exclude all events

Example

Provide help information for the command.

pass:loc=1301:cmd="linkinfo -h"

Set the filter to include ua events in the ua log report.

pass:loc=1304:cmd="linkinfo a -i ua"

Set the filter to include service events in the ua log report.

pass:loc=1304:cmd="linkinfo a -i service"

Display the ua log report for signaling link **a**.

pass:loc=1304:cmd="linkinfo a -a"

Display the ALI event log for signaling link **a1**.

pass:loc=1301:cmd="linkinfo a1 -a"

Display the IPLIM application event log for signaling link **a1**.

pass:loc=1301:cmd="linkinfo a1 -l"

Reset/clear the link event log for signaling link **a1**.

pass:loc=1301:cmd="linkinfo a1 -l -r"

Clear the ua log report for signaling link **a**.

pass:loc=1304:cmd="linkinfo a -a -r"

Display the state information for signaling link **a1**.

pass:loc=1301:cmd="linkinfo a1 -s"

Display acknowledgement times for an M2PA connection on signaling link **b1**.

pass:loc=3315:cmd="linkinfo b1 -m"

Display congestion tuning information for an IPSG-M3UA signaling link.

pass:loc=1301:cmd="linkinfo a -c "

Dependencies

None

Notes

None

Output

Example of help for using the command:

pass:loc=1301:cmd="linkinfo" or

pass:loc=1301:cmd="linkinfo -h"

```

rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0

LINKINFO: Command Complete

;

msucount

Message Signaling Unit (MSU) Count

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and IP connections. These counts can be reported and reset at the same time to get accurate counts for longer periods of time. In addition to MSUs transmitted and received, the **msucount**

command also reports statistics on packets related to MTP Primitives and on discarded transmit and receive data.

Keyword: **msucount**

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msucount** command option **-l** has the parameter port. The link for which counts will be displayed can be specified, as in the command **msucount -l a1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a

This option is used to display IP connection statistics for a specific association. When **-a aname** is specified on the same line as **-k rtkey**, the output is assumed to be routing key output. When **-a aname** is specified on the command line without **-k rtkey**, association statistics output is generated. For IPSG cards, this option is enhanced to include receive and transmit counts for M3UA SSNMs (DAUD messages and M3UA SSNM PDUs) and replicated M3UA PDUs.

-b

This option is used to display signaling link bytes statistics. The signaling link bytes report displays data for measurements on a per-signaling-link basis for both the transmit and receive directions. The report can display link statistics for a specified signaling link number. If a link is not specified, the report displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx and IPSG cards. If a signaling link is valid for the card and application type, but is unequipped, then the report displays all zeros.

-h

This option is used to provide help information for the command.

-d

This option is used to report dynamic routing keys (IPGWx application only). This option is not supported for the IPSG application.

Default: Static

-f

This option is used to display a full report (IPGWx application only).

-k rtkey

This option is used to specify the routing key for which the counts will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

This option is not supported for the IPSG cards.

The **-p** modifier can be specified to identify the point code type of the routing key that follows the **-k** option in the command.

The rtkey variable is optional when used with **-t default**, and mandatory for all other cases.

If the same routing key exists as both a static and dynamic routing key, the **-k** option will report the counts associated with the dynamic entry in the Routing Key table only.

The following formats are valid for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (**n-c-m**) are in the range **0-255**. The service indicator (s) is **3** or **sccp**. The subsystem (**n**) is in the range **0-255**.

- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (s) is in the range **0-2, 4, or 6-15**. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (s) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range **0** to **16363**.

-l

For IPSG cards, this option displays the link report for all equipped signaling links on the card.

-l link

This option is used to display counts for links. The link report optionally allows display of link statistics for a specified port.

The link report contains data, per link, for MSUs (tx/rcv), MSU bytes (tx/rcv), MGMT msgs (tx/rcv), and discarded data (tx/rcv).

For the IPSG card, the M2PA link report is the same as the IPLIMx M2PA report. The M3UA link report contains an additional detail line for non-discard pegs for SS7 SNM and Replicated M3UA PDU counts.

Range: a, b, a1, b1, a2, b2, a3, b3 a:a15-b:b15

Ports **a1, b1, a2, b2, a3, and b3** are allowed only on SSED CM IPLIMx cards.

If a port is not specified, **msucount** displays link statistics for port **a** for IPGWx links, and port **a** and port **b** for IPLIMx links.

The **msucount** link statistics report contains all zeros for a port that is valid for the card and application type but is unequipped.

The range a:a15-b:b15 is valid for IPSG cards.

-l

link -f

This option displays the full link report. For IPSG-M2PA links, this option displays the same report as the **-l <link>** option. For IPSG-M3UA links the report includes the data from the **-l <link>** report and includes an additional detail line displaying tx/rx discards counts and discard data.

-p point code type

This option modifier can be specified along with the **-k** option to identify the point code type (ANSI, ITU international, ITU-national, 24-bit ITU national, ITU international spare, and ITU national spare) in the routing key that follows the **-k** option in the command.

Range: ansi, itui, itun, itun24, ituis, ituns**-r**

This option is used with other options to reset counts at the same time of reporting them.

-s name

This option is used to display socket reports for the specified IP connection. This option is not supported for IPSG cards.

Range:

Up to 15 alphanumeric characters

Default: Counts for all IP connections within the option combination

-t keytype

This option is used to display the routing key type (IPGWx only).

-x

The routing context is an index that uniquely defines a routing key associated with an SUA or M3UA AS. For the IPSG card, the option displays a link report for all signaling links on the card that are

members of the linkset that contains the specified routing context value (equivalent to the **msucount -lreport -x** option is used as an alternative to the **-k** option to identify the routing key by specifying its routing context in the command line.

NOTE: The -x rc option can only be used to specify routing keys containing M3UA/SUA associations.

Example

Link counts only. Displays brief count for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

msucount -l

Link counts only, for signaling link port **a1**.

msucount -l a1

Full/detail report for signaling link **a** for IPGWx.

msucount -l -f

Counts for the specified socket only.

msucount -s socyellow

Counts for the specified association only.

msucount -a association name

Counts for first matching routing key

msucount -k 10-10-10:3:16

Counts for matching dynamic routing key

msucount -k 10-10-10:3:16 -d

Counts for the routing key report using the routing context.

msucount -x 5

Counts for the first matching routing key and an associated socket

msucount -s socket name -k rtkey

Counts for first matching routing key and an associated association.

msucount -a association name -k rtkey

Counts for the default routing key

msucount -k -t default

Counts for a matching partial routing key.

msucount -k 3-3-3 -t partial

Counts for counts for link only. Displays brief report for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

msucount

Full/detail report for signaling link A for IPGWx.

msucount -h full

Resets the signaling link count measurements.

msucount -r

Brief version of help text.

msucount -h

Full version of help text.

msucount -h full

Counts for link and first matching routing key

msucount -b

Byte report for signaling link A for IPGWx cards. Byte report for all equipped signaling links for IPLIMx cards.

msucount -b -link

Byte report for specified signaling link.

msucount -l -k 10-10-10:3:16

Counts for first matching routing key and an associated IP connection

msucount -s socyellow -k 10-10-10:3:16

Use with other parameters to display and reset counts. Valid with the above combinations.

msucount -l -r**msucount -r****msucount -s sock1 -r****msucount -x 5 -r**

The following examples provide a correct syntax to specify partial or default keys, or to specify a key by routing context.

pass:loc=1105:cmd="msucount -k 5-5-1:5:6-6-6 -t partial

pass:loc=1105:cmd="msucount -k 5-5-1:5 -t partial"

pass:loc=1105:cmd="msucount -k 5-5-1:3 -t partial

pass:loc=1105:cmd="msucount -p ITUI -t partial -k 1-235-1"

pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351"

pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351-gr

pass:loc=1105:cmd="msucount -t partial -k :2 "

pass:loc=1105:cmd="msucount -k -t default"

pass:loc=1105:cmd="msucount -d -k -t default "

pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"

pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"

Examples of other valid routing key inputs:

pass:loc=1105:cmd="msucount -r -k 5-5-6:5:5-5-7:1:1000"

pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:4:5-5-7:1:1000"

pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:5:5-5-7:1:1000"

```

pass:loc=1105:cmd="msucount -p ITUI -k 5-5-1:3:5 -s c7000 -r"
pass:loc=1105:cmd="msucount -r -s c7050 -p ITUN -k 2860:3:5 -l"
pass:loc=1105:cmd="msucount -k 5-5-1:3:5 -a assoc1"
pass:loc=1105:cmd="msucount -p ITUN -k 3838:3:5 -s c7000"
pass:loc=1105:cmd="msucount -p ITUI -k 1-34-4:3:105 -s c7001"
pass:loc=1105:cmd="msucount -r -p ITUN24 -k 15-105-16:5:15-105-17:1:1000"

```

Dependencies

At least one option must be specified.

Notes

The **msucount** command is executed through the **pass** command.

Combinations of the **-l**, **-a**, **-s**, **-k**, **-t**, **-x** and **-b** options provide count information based on the entered combination.

If no parameters are specified, then the **-l** brief report is output.

Multiple reports are not supported with the IP Signaling Serviceability feature.

For the SS7IPGW and IPGWI GPLs, 4 types of reports can be generated: the link report, the routing key report, the IP connection statistics report, and the signaling link bytes report. For the IPLIM/IPLIMI card, the routing key report is not supported.

The 4 reports are the following:

1. The link report (**-l** option) contains statistics per link—data about MSUs (transmit/receive), MSU bytes (transmit/receive), MGMT messages (transmit/receive), and discarded data (transmit/receive).
2. The routing key report (**-k** option) contains statistics for a specific routing key—data about MSUs (transmit), MSU bytes (transmit), and discards on the transmit path for the routing key. A list of one or more IP connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also displayed. If **-s sname** or **-a aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. When **-s sname** and **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed.
The **-p** (point code type) modifier option can be used with the **-k** option to specify the point code type of the routing key that follows the **-k** option in the command.
For the **-k** options, the routing key must be an exact match of a routing key that exists in the static or dynamic Routing Key tables. If the same routing key exists in both the static and dynamic Routing Key tables, the **-k** option displays the counts associated with the entry in the dynamic Routing Key table only.
3. The IP connection statistic report (**-s sname** or **-a aname** option) contains statistics for a specified IP connection—data about MSUs (transmit/receive), MSU bytes (transmit/receive), and discarded data (transmit/receive).
When the **-s sname** or **-a aname** option is specified in the command with the **-k** option, the output type is assumed to be routing key output.
When the **-s sname** option is specified in the command without the **-k** option, the IP connection statistic report is generated.
When **-a aname** is specified on the command line without **-k**, association statistics output is generated.

4. The signaling link bytes report (**-b** option) provides the following information for both IPGWx and IPLIMx cards: bytes/sec for the last second, average MSU size during the last second, and maximum one-second average MSU size since card load time or reset. For the IPLIMx cards, the report also provides the following information: sum of bytes/sec for the last second for all signaling link, average MSU size for last second for all signaling links, maximum average MSU size since load time or reset for all signaling links, and maximum MSU size since load time or reset for all signaling links.

The link report, routing key report, and IP connection statistic report (IPGWx only) can display individual transmit MSUs that were discarded at layer 2. The first 32 bytes of the MSU transmit data that is discarded is stored beginning at the SIO bytes. If the MSU is not 32 bytes long, the remaining bytes are set to 0.

The signaling link bytes report optionally allows display of link statistics for a specified signaling link number. If a link is not specified for the bytes report, the *msucount* command displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx cards.

The signalling link bytes report contains all zeros for a signaling link that is valid for the card and application type but that is unequipped.

The link and IP connection statistics reports can display individual receive packets that were discarded at layer 2. Portions of the TALI packets for the receive MSUs that the SS7IPGW application discards are stored beginning with the 12 bytes of the TALI header., and followed by the service data. If the storage space is larger than the service data, the extra bytes are set to 0. The TALI packet is stored instead of the MSU so that it is not necessary to construct an MTP3 header for packets that are discarded for reasons such as bad link state, bad SCCP message type, no calling or called party, or bad SIO for an ISUP message.

The reset option (**-r**) resets the specified measurements. This option can be added to any command.

Output

In the examples that follow, the hexadecimal output for discarded *transmit* data represents data stored beginning at the SIO bytes through the first 32 bytes of the MSU. If the MSU was less than 32 bytes, the remaining bytes are represented by zeros.

Hexadecimal output for discarded *receive* data represents data stored beginning at the TALI header. (A TALI header can have a sync code of either TALI or SASI). This data is used to store portions of the TALI packets for received MSUs that the SS7IPGW APPL layer decides to discard.

Stored *receive* data takes the following format:

First 12 bytes = TALI header.

Bytes 13-x = Service data, beginning with the first byte of service data based on the received TALI operations code. If the storage space is greater than the size of the service data, the remaining bytes are zeroed.

Output Specific to SS7IPGW and IPGWI

Either brief or full help reports can be displayed. A full help report is generated by adding the **full** (**-f**) option to the command line.

Example of a brief help report:

```
pass:loc=1105:cmd="msucount -h"
```

```
Usage: msucount [ [-l [link]] | [-b [link]] ] |
               [[-a aname] | [-s sname]]
               [[-x rc] | [-k [rtkey]] [-p pctype] [-t keytype] [-d]] ]
               [-f] [-r] [-h [full]]
```

```
Options: -l display signaling link report
         -b display signaling link bytes report
         -a display association report
         -s display socket report
         -x routing key report using routing context
         -k routing key report using MTP3 parameters
            rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
         -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
         -t routing key type
            keytype :: (<full>, partial, default)
         -d display dynamic routing key
         -f display full report
         -r resets the specified counts
         -h display command help (brief or full)
```

Example of a full help report.

pass:loc=1105:cmd="msucount -h full"

```
Usage: msuaccount [ [-l [link]] | [-b [link]] |
                  [[-a aname] | [-s sname]]
                  [[-x rc] | [-k [rtkey] [-p pctype] [-t keytype] [-d]]] ]
                  [-f] [-r] [-h [full]]
```

```
Options: -l display signaling link report
          -b display signaling link bytes report
          -a display association report
          -s display socket report
          -x routing key report using routing context
          -k routing key report using MTP3 parameters
             rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
          -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
          -t routing key type
             keytype :: (<full>, partial, default)
          -d display dynamic routing key
          -f display full report
          -r resets the specified counts
          -h display command help (brief or full)
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWl default pctype is ITUI.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

SS7 Traffic Partition	RTKEY Parameter	Example
Any User Part to DPC 1-1-1	-k 1-1-1	-t partial
SCCP to DPC 1-1-1	-k 1-1-1:3	-t partial
ISUP to DPC 1-1-1	-k 1-1-1:5	-t partial
TUP to DPC 1-1-1	-k 1-1-1:4	-t partial
QBICC to DPC 1-1-1	-k 1-1-1:13	-t partial
SI [0-2,6-12,14,15] to DPC 1-1-1	-k 1-1-1:SI	
SCCP SSN 5 to DPC 1-1-1	-k 1-1-1:3:5	
ISUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:5:2-2-2	-t partial
TUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:4:2-2-2	-t partial
QBICC to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:13:2-2-2	-t partial
ISUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:1	
TUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:1	
QBICC CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:1	
ISUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:0:5	
TUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:0:5	
QBICC CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:0:5	
Default Routing Key	-k	-t default

A brief version for the link measurement report can be specified for IPGWx. If no parameters are specified for a link measurements report, then a brief report is displayed. The brief report does not display the transmit/receive discard counts.

Example of a brief link measurements report:

pass:loc=1305:cmd="msucount"

or

pass:loc=1305:cmd="msucount -l"

Routing Key Report Output Examples

The routing key report contains data about MSUs (tx), MSU bytes (tx), and discards on the transmit path for the routing key. A list of one or more connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also presented. If **-s sname** or **-a aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. When **-s sname** and **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed.

NOTE: For IPGWx, -k rtkey is optional when used with -t default, and mandatory for all other cases.

The report output itself does not display the routing key that was entered, other than an exact copy of the command line being generated as part of the output. The only indication in the output as to which key was found is the indication as to whether the key was in the dynamic Routing Key table or the static Routing Key table.

Partial routing keys (where some fields in the MSU are ignored with respect to finding a routing key to use for the MSU) and default keys can be specified in the command. The output does not change for these key types; the only difference is the routing key syntax (**-p**, **-d**) that must be processed as part of identifying the partial and default keys. (See the Example section of this command description for syntax examples.)

Example of a routing key report for an ANSI routing key that specifies the dynamic Routing Key table:

pass:loc=1105:cmd="msucount -k 5-5-1:3: -t partial -d"

or

pass:loc=1105:cmd="msucount -k 5-5-1:3 -p ANSI -t partial -d"

```

MSUCOUNT: command complete

Output Specific to IPLIM and IPLIMI

NOTE: The routing key report is not supported for IPLIMx applications. The -k, -t, -p, -d, -x options are not supported because the IPLIMx card does not use routing keys and does not support dynamic routing key registration.

NOTE: The IPLIMx reports include all equipped signaling links instead of just ports A and B. These reports include the transmit/receive counts alongside each other for the link case.

Example of help for using the command:

pass:loc=1103:cmd="msucount -h" or

pass:loc=1103:cmd="msucount"

```

Usage: msucount [ [-l [link]] | [-b [link]] ] |
               [[-a aname] | [-s sname]] ]
               [-r] [-h]

Options: -l  display signaling link report
         -b  display signaling link bytes report
         -a  display association report
         -s  display socket report
         -r  resets the specified counts
         -h  display command help

```

MSUCOUNT command complete

;

Example of a link report for an IPLIMx card with 2 SAALTALI or M2PA links:

The report does not contain MTPP or RKRPMGMT statistics, because those capabilities are not supported on the IPLIMx applications. The report also does not contain tx/rcv discard data, because there are no discards performed at layer 2 of the IPLIMx applications. The IPLIMx card can also contain 2 links per card; the output contains link data for each link.

pass:loc=1301:cmd="msucount"

or

pass:loc=1301:cmd="msucount -l"

MSUCOUNT: MSU Count Report

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
A	2000	4294967295	4294967295	2000	4294967295	4294967295
B	2000	4294967295	4294967295	2000	4294967295	4294967295
A1	2000	4294967295	4294967295	2000	4294967295	4294967295
B1	2000	4294967295	4294967295	2000	4294967295	4294967295
A2	0000	0000000000	0000000000	0000	0000000000	0000000000

MSUCOUNT: command complete

The following is an output example for signaling link **a1** on an IPLIMx card:

pass:loc=1103:cmd="msucount -l a1"

MSUCOUNT: MSU Count Report

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
A1	2000	4294967295	4294967295	2000	4294967295	4294967295

MSUCOUNT: command complete

Example of an IP connection statistics report. The IPLIMx IP connection report does not contain **tx/rev** discard data, because there are no discards performed at layer 2 of the IPLIMx applications.

pass:loc=1105:cmd="msucount -s c7050"

or

pass:loc=1105:cmd="msucount -a c7050"

MSUCOUNT: Command In Progress

MSUCOUNT: MSU Count Report

IP Connection Measurements

Transmit Counts		Receive Counts

280000	140	2048	2048	total		280000	140	2048	2048		

MSUCOUNT: command complete

Example signaling link bytes report for a specified link on an IPLIMx card.

pass:loc=1303:cmd="msucount -b a"

MSUCOUNT: SLK Bytes Report

SLK Transmit						SLK Receive					
max	avg	max				max	avg	max			
slk	bytes/sec	msu	msu	msu		slk	bytes/sec	msu	msu	msu	
A	35000	140	273	273		A	35000	140	273	273	

MSUCOUNT: command complete

Enhanced Reset Option

The reset option resets the specified measurements without displaying **msucount** output. The default is to reset the link measurements report.

Example displays resetting link measurements:

pass:loc=1305:cmd="msucount -l -r"

or

pass:loc=1305:cmd="msucount -r"

eagle10212 06-06-01 08:50:47 EST EAGLE 35.0.0

MSUCOUNT: MSU Count Report

Link measurements have been reset.

MSUCOUNT: command complete

Example displays resetting IP connections:

pass:loc=1305:cmd="msucount -s - sock1 -r"

```
eagle10212 07-05-05 08:50:47 EST EAGLE 37.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
IP Connection measurements have been reset.
```

```
MSUCOUNT: command complete
```

Example displays resetting Routing Key measurements:

pass:loc=1305:cmd="msucount -x -5 -r"

```
eagle10212 06-01-05 08:50:47 EST EAGLE 35.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Routing Key measurements have been reset.
```

```
MSUCOUNT: command complete
```

Example displays resetting link byte measurements

pass:loc=1305:cmd="msucount -b -r"

```
eagle10212 07-05-01 08:50:47 EST EAGLE 37.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Link byte measurements have been reset.
```

```
MSUCOUNT: command complete
```

Output specific to IPSG Cards

The option to display a full help report is not supported for IPSG cards.

pass:loc=1304:cmd="msucount -h"

```

rlghncxa03w 08-01-29 11:31:09 EST  EAGLE 38.0.0

MSUCOUNT: command complete

```

For link reports on IPSP signaling links, if a specific link is not requested, then counts for all equipped signaling links on the card are displayed. The report includes counts for up to 32 links per card. The **-l <link>** report adds counts for *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, and *SS7 SNM Counts sent* for M3UA links.

Example of a brief measurements report:

pass:loc=1303:cmd="msucount -l"

```

rlghncxa03w 08-01-29 11:31:09 EST  EAGLE 38.0.0
pass:loc=1303:cmd="msucount -l"

MSUCOUNT: MSU Count Report

```

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
A	0	3	72	0	0	0
B	0	62	1916	0	62	1916
A1	0	2	48	0	0	0
A2	0	1	24	0	0	0
A3	0	0	0	0	0	0
A4	0	0	0	0	0	0
-----				-----		
	0	68	2060	0	62	1916
-----				-----		

MSUCOUNT: command complete

Example of a measurement report for an IPSPG-M3UA signaling link:

❑ **pass:loc=1303:cmd="msucount -l a"**

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
MSUCOUNT: MSU Count Report
```

SLK Transmit counts				SLK Receive counts

slk	rate	msus	bytes	rate	msus	bytes
A	0	3	72	0	0	0
	0	3	72	0	0	0

```
MSUCOUNT: command complete
```

```
;
```

IP Connection Report

The IP connection statistic report for an IPSG card contains data regarding MSUs (tx/rcv), MSU bytes (tx/rcv), and discarded data (tx/rcv) for a specific socket or an association. The **-a <aname>** report for M3UA links adds the *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, *SS7 SNM sent*, *Discarded rcv due to SS7 SNM not supported*, and *Discarded rcv due to no SS7 SNM capacity*.

The existing *Discarded rcv due to M3UA PDU error* and *Invalid rcontext counts* are also supported.

Example of an aname report:

```
pass:loc=1303:cmd="msucount -a a1303a"
```

rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

msuroute

Message Signaling Unit (MSU) Routing Information

This command is used to provide a list of all routing keys currently configured on an SS7IPGW/ IPGWI card that could be used to route a particular MSU. With 3 types of routing keys (fully specified, partial and default) and 2 types of routing key tables (static and dynamic) the complexity associated with figuring out how a particular MSU would be routed at any point in time is not trivial. This command provides output to help determine how MSUs will be routed based on current conditions.

Keyword: **msuroute**

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msuroute** command option **-k** has the parameter **rtkey**. The *full routing key* must be specified for the MSU for which the summary will be displayed, as in the command **msuroute -k 5-5-5:5:6-6-6:1100**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-d

This option is used to report dynamic routing keys.

-h

This option is used to provide help information for the command.

-k rtkey

This option is mandatory in the command to specify the full routing key for the MSU for which the summary will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to **3**.

The **-p point code type** modifier is used to identify the format of the routing key that follows the **-k** option in the command.

The following are valid formats for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **3** or **sccp**. The subsystem (n) is in the range **0-255**.
- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is in the range **0-2**, **4**, or **6-15**. There is no subsystem.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (no-co-mo) are in the range **0-255**. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range **0** to **16363**.

-p point code type

This option modifier is used to identify the point code type (ANSI, ITU international, ITU national, ITU international spare, ITu national spare) in the routing key that follows the **-k** option in the command.

Range: ansi, itui, itun, itun24. ituis, ituns

Default: ansi

-x routing context

This option modifier is used to display the routing key report using routing context.

Example

```
msuroute -h
msuroute -p ansi -k 5-5-5:5:6-6-6:1100
msuroute -p ansi -k 5-5-5:5:6-6-6:1100:1100
msuroute -k 5-5-5:5:6-6-6:1100
msuroute -k 5-5-5:5:6-6-6:1100:1100
msuroute -p ansi -k 5-5-5:8
msuroute -p itun -k 345:5:678:100:200
msuroute -p itun -k 345-gr:5:678-gr:100:200
msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100
```

Dependencies

The **-k** option must be specified in the command, and must specify a full routing key.

This command is not supported for IPLIM/IPLIMI cards.

Notes

The **msuroute** command is executed through the pass command.

The **-p point code type** modifier option can be used with the **-k** option to specify the format of the routing key that follows the **-k** option in the command.

Output

The output for each **msuroute** command consists of a list of all of the routing keys that exist on the IPGWx card that could be used to route the MSU. The list of routing keys is presented in the hierarchical search order in which the keys would be used. The list of routing keys indicates keys that have IP connections available for traffic, and indicates which routing key would currently be used to route the MSU (marked with ***).

For the routing key that is selected to route the MSU, the list of IP connections associated with the key is also displayed.

NOTE: Most of the following output examples show command entries for ANSI MSUs. Because, other than echoing the input command back to the screen, there is nothing in the output that contains specific fields from any configured keys. The output would not be different if the user entered ITUI MSUs instead of ANSI MSUs.

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h full** option to the command line.

Example of a brief help report:

```
pass:loc=1105:cmd="msuroute -h"
```

Command Accepted - Processing

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] [-d]] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
        -d display dynamic routing key
        -h display command help (brief or full)
```

;

Example of a full help report:

pass:loc=1305:cmd="msuroute -h full"

```
0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] [-d]] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: dpc:si:opc:cics:cice | dpc:si:ssn | dpc:si
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
        -d display dynamic routing key
        -h display command help (brief or full)
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGW default pctype is ITUI.

Network	PC Format	Notes
-----	-----	-----
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

SS7 Traffic Partition	RTKEY Parameter Example
-----	-----
SCCP SSN 5 to DPC 1-1-1	-k 1-1-1:3:5
ISUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:1
TUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:1
QBICC CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:1
ISUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:0:5
TUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:0:5
QBICC CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:0:5

msutrace

MSU Trace

This command provides filter and trace capability for MSUs passing through the IP⁷ GPLs. This command provides a view of MSU data as it exists in the PSTN network and its corresponding format as it exists in the IP network.

Keyword: **msutrace**

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msutrace** command option **-a** has the parameter **action**. The action that the command is to take can be specified, as in the command **msutrace -a acttrace**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a action

Action option.

Range: acttrace, clrtrace, dacttrace, chgfilter**acttrace**—Activate (turn on) MSU tracing**clrtrace**—Clear all data from trace buffers**dacttrace**—Deactivate (turn off) MSU tracing**chgfilter**—Change filter used to indicate which MSUs are placed in the trace buffers**-g get option**

The get option.

Range: config, trace**config**—Displays the current **msutrace** settings: trace ON/OFF status, filter settings, and trace buffers used/available**trace**—Displays contents of trace buffers containing captured MSU data**-h help**

This option is used to display help information about this command.

Range: fullIf **full** is specified, the detailed version of the help information is displayed.If **full** is not specified (just **-h**), the simple version of the help information is displayed.**-m mode**

This option is used to indicate which MSUs are captured.

Range: normerr, all**normerr**—trace only MSUs with normalization errors**all**—trace all MSUs regardless of MSU contents**-p point code type**

This option is used to specify which type of point code (ANSI, ITU international, ITU national, 24-bit ITU national, ITU-I spare, or ITU-N spare) is contained in the filter key, when the key contains a DPC or OPC.

Range: ansi, itui, itun, itun24, ituis, ituns**Default: ansi****-k filter key**The **-k**, **-c**, and **-p** options are used to specify the filter key used to determine which MSUs will have data placed in the trace buffers.**Range:****-k filter key [-p] [-c pcType]**The syntax for the **filter key** portion of the **-k filter key** option is specified as a single string parameter with up to five colon-separated fields. The **filter key** can contain one or more of the following fields:*n-c-m*—represents an ANSI DPC in the format *network-cluster-member**no-co-mo*—represents an ANSI OPC in the format *network-cluster-member**z-a-i*—represents an ITU-I DPC in the format *zone-area-id**zo-ao-io zone-area-id*—represents an ITU-I OPC in the format*msa-ssa-sp*—represents a 24-bit ITU-N DPC in the format *main sigaling area-sub signaling area-signaling point**nnnnn*—represents an ITU-N DPC*nnnnn-gc*—represents an ITU-N DPC with Group Code when the Duplicate Point Code feature is ON*no*—represents an ITU-N OPC*no-gc*—represents an ITU-N OPC with Group Code when the Duplicate Point Code feature is ON*s*—represents an SI (Service Indicator)*cs*—represents a CIC Start value (start of the CIC range)*ce*—represents a CIC End value (end of the CIC range)

n—represents an SSN (Subsystem Number)

The following examples show valid formats:

- *n-c-m:s:n*—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.
- *n-c-m:s*—For DPC, SI type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is in the range **0-2**, **4**, or **6-15**. There is no subsystem number. As a default, counts for all routing keys within the option combination are displayed.
- *n-c-m:s:no-co-mo:cs:ce*—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range **0** to **16363**.
- *z-a-i*—For DPCN and DPCI routing keys, the zone, area and ID (*z-a-i*) are in the range of **000-007** (zone and ID) and **000-255** (area).
- *msa-ssa-sp*—For 24-bit DPCN routing keys, the main signaling area, sub signaling area and signaling point (*msa-ssa-sp*) are in the range of **000-255**.

-t

This option is used to denote the routing key type (IPGWx only).

-x rc

This option is used to generate a routing key report using routing context.

Example

```
pass:loc=1105:cmd="msutrace -h"
pass:loc=1105:cmd="msutrace -h full"
pass:loc=1105:cmd="msutrace -g config"
pass:loc=1315:cmd="msutrace -g trace"
pass:loc=1105:cmd="msutrace -a clrtrace"
pass:loc=1105:cmd="msutrace -a acttrace"
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -t partial -k 1-3-3:5:2-4-4"
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -t partial -k 1536:5"
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
pass:loc=1105:cmd="msutrace -a chgfilter -m all"
```

Dependencies

If no options are specified, the simple version of the help information is displayed.

The point code type defaults to ANSI when the **-p** option is not specified.

The **-p** option is allowed only on key types that contain a DPC or OPC.

Notes

The **msutrace** command is executed through the **pass** command.

The **msutrace** command captures the data portion of the PSTN packet, starting at the SIO bytes.

The **msutrace** command captures the entire TALI, M3UA, or SUA packet. This includes the TALI, M3UA, or SUA header and additional data stored inside system buffer chain elements. The **msutrace** command currently does not support the trace and capture of TALI MTP Primitives or M3UA / SUA SSNM (Class 2) messages.

The **msutrace** command captures data in trace buffers. If the set of trace buffers becomes full with captured MSU data after MSU tracing is activated, no more data capturing will take place. The **-a clrtrace** option must be specified to reset (clear) the content of the trace buffers. After the trace buffers are empty again, **msutrace** will restart capturing qualified MSUs.

If MSU tracing is activated with the **-a acttrace** option before a properly formatted filter key is entered, **msutrace** will not capture any data due to lack of a proper filter. When the **-a chgfilter** option is specified to enter a properly formatted filter, **msutrace** will start capturing qualified MSUs.

Output

NOTE: The msutrace pass command exists on the IPLIM/IPLIMI cards as a debug-only pass command. All command syntax and output are identical to the SS7IPGW and IPGWI commands described in this section.

Both brief and full versions of IPGW reports can be requested. A full report is requested by including the **-f** in the command line.

Example of a brief help report:

```
pass:loc=1305:cmd="msutrace -h"
```

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
  Usage: msutrace [-a action_cmd] [-g get_cmd]
                [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
                [-m mode] [-h [full]]

```

Options:

```

-a  action_cmd: an Action Command
-g  get_cmd: a Get Command
-x  routing key report using routing context
-k  routing key report using MTP3 parameters
    rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
-p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t  routing key type
    keytype :: (<full>, partial, default)
-m  mode: mode for qualifying MSUs captured=[normerr | all]
-h  displays this message (brief or full)

```

```

get_cmd:      [config | trace]
config        config
trace         trace

```

```

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
acttrace      acttrace
chgfilter     chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
clrtrace      clrtrace
dacttrace     dacttrace

```

```

<fltrkey>:    [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              (see 'msutrace -h full' for complete description)

```

```
MSUTRACE command complete
```

```
;
```

Example of a full help report:

pass:loc=1305:cmd="msutrace -h full"

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: msutrace [-a action_cmd] [-g get_cmd]
               [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
               [-m mode] [-h [full]]

```

Options:

```

-a  action_cmd: an Action Command
-g  get_cmd: a Get Command
-x  routing key report using routing context
-k  routing key report using MTP3 parameters
    rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
-p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t  routing key type
    keytype :: (<full>, partial, default)
-m  mode: mode for qualifying MSUs captured=[normerr | all]
-h  displays this message (brief or full)

```

```

get_cmd:      [config | trace]
config        Display the current MSUTRACE settings:
               trace On/Off status, filter settings, and
               trace buffers used/available.
               ex: msutrace -g config

trace         Display content of trace buffers containing captured
               MSU data
               ex: msutrace -g trace

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
acttrace      Activate (turn-on) MSU-tracing.
               ex: msutrace -a acttrace

chgfilter     Change filter used to qualify which MSUs are placed in
               trace buffers:
               ex: To only trace MSUs with Normalization errors.
                   msutrace -a chgfilter -m normerr
               ex: To trace all MSUs regardless of error conditions:
                   msutrace -a chgfilter -m all
               ex: To trace MSUs based on MSU content:
                   msutrace -a chgfilter <fltrkey>

clrtrace      Clear all data from trace buffers.
               ex: msutrace -a clrtrace

dacttrace     Deactivate (turn-off) MSU-tracing.
               ex: msutrace -a dacttrace

```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

SS7 Traffic Partition	RTKEY Parameter Example
Any User Part to DPC 1-1-1	-k 1-1-1 -t partial
SCCP to DPC 1-1-1	-k 1-1-1:3 -t partial
ISUP to DPC 1-1-1	-k 1-1-1:5 -t partial
TUP to DPC 1-1-1	-k 1-1-1:4 -t partial
QBICC to DPC 1-1-1	-k 1-1-1:13 -t partial
SI [0-2,6-12,14,15] to DPC 1-1-1	-k 1-1-1:SI
SCCP SSN 5 to DPC 1-1-1	-k 1-1-1:3:5
ISUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:5:2-2-2 -t partial
TUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:4:2-2-2 -t partial
QBICC to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:13:2-2-2 -t partial
ISUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:1
TUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:1
QBICC CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:1
ISUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:0:5
TUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:0:5
QBICC CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:0:5
Default Routing Key	-k -t default

            ex: msutrace -a dacttrace

```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW and IPLIM default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

For IPSG both ANSI and ITU network point code formats are eligible for trace when the default filter or an SI only filter is specified. The IPSG default pctype is ANSI when the filter contains OPC or DPC and the -p option is not specified.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code

ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key or LS.

SS7 Traffic Partition	RTKEY/MTP3 Parameter Example
Any User Part to DPC 1-1-1	-k 1-1-1 -t partial
SCCP to DPC 1-1-1	-k 1-1-1:3 -t partial
ISUP to DPC 1-1-1	-k 1-1-1:5 -t partial
TUP to DPC 1-1-1	-k 1-1-1:4 -t partial
QBICC to DPC 1-1-1	-k 1-1-1:13 -t partial
SI [0-2,6-12,14,15] to DPC 1-1-1	-k 1-1-1:SI
SCCP SSN 5 to DPC 1-1-1	-k 1-1-1:3:5
ISUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:5:2-2-2 -t partial
TUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:4:2-2-2 -t partial
QBICC to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:13:2-2-2 -t partial
ISUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:1
TUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:1
QBICC CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:1
ISUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:0:5
TUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:0:5
QBICC CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:0:5
Default Routing Key	-k -t default
Any User Part to DPC=LS APC	-x LS RCONTEXT (IPSG Only)

Examples for Entering a Filter Key

The output shown at the end of the following command examples is the same for each example, except for the echo of the entered command.

Command with the **-a chgfilter** option to insert a fully specified ANSI PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 5
- OPC = 4-4-4 (ANSI)
- CIC = [10..1000]

pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"

Command with the **-a chgfilter** option to insert a fully specified ANSI SCCP filter.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 3
- SSN = 230

pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:3:230"

Command with the **-a chgfilter** option to insert a fully specified ANSI DPC SI filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 6

pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:6"

Command with the **-a chgfilter** option to insert a fully specified ITUN24 PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-103-3 (ITUN24)

- SI = 5
- OPC = 14-104-4 (ITUN24)
- CIC = [10..1000]

pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-103-3:5:14-104-4:10:1000"

Command with the **-a chgfilter** option to insert a partial ITUI DPC SI OPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1-3-3 (ITUI)
- SI = 5
- OPC = 2-4-4 (ITUI)

pass:loc=1105:cmd="msutrace -a chgfilter -p itui -k 1-3-3:5:2-4-4"

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned off:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536 (ITUN)
- SI = 5

pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536:5"

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned on:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536-bb (ITUN)
- SI = 5

pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536-bb:5"

Command with the **-a chgfilter** option to insert a partial ANSI DPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3"

Command with the **-a chgfilter** option to insert a partial SI filter key. Because no DPC or OPC field is specified, point code type does not have to be indicated.

This filter key qualifies for capture MSUs with the following properties:

- SI = 5

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-113-3 (ITUN24)

pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-113-3"

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:57 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
Command entered at terminal #1.
;

MSUTRACE command completed
;
```

The following commands include the **-m mode** option to change the trace capture mode.

Mode to have a 'capture-on-normalization error' property such that only MSUs with normalization processing errors are traced:

pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"

Set a default filter key and the filter's mode at the same time:

pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"

Command Accepted - Processing

```
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
Command entered at terminal #1.

MSUTRACE command completed
;
```

The following commands insert a partial DPC-SI filter key with ITU-I spare point code and show the **msutrace getfilter** command output with the filter key after the **chgfilter** command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPCI = (ITU-I Spare) 2-11-1
- SI=5

pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:03 EST EAGLE5 35.5.0

netstat

Network Statistics

This command is used to display network statistics from the TCP/IP stack. This command allows troubleshooting of network interface and routing configuration problems within the private EPAP-DSM IP network.

Keyword: netstat

Command Class: IP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **netstat** command option **-m** has the parameter buffer pool. The pool for which information will be displayed can be specified, as in the command **netstat -m sys**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a

This option displays socket information for all protocols.

-d

This option displays driver measurement data.

The *-m* modifier displays multicast information. The *-p* modifier displays PHY registers. The *-z* modifier clears driver measurements. The *-h* modifier displays history measurements for the past 24 hours or the measurements collected a user defined hour ago. The *-f* modifier displays driver measurement data in full format (for GPLs that are loaded on E5-based cards only).

The *-m*, *-p*, and *-h* modifiers are not supported for GPLs that are loaded on E5-based cards.

-e

This option displays DPL driver measurement data. This option is supported only for GPLs that are loaded on E5-based cards.

-f

-h

This options provides help information for the command.

-i

This option displays interface information for all interfaces.

-m buffer pool

This option displays buffer pool information for the specified pool.

Range: data, sys, dd

data—SENS protocol stack data buffer pool

sys—system buffer pool

dd—Ethernet device driver buffer pool

Default: All three buffer pools are displayed.

-p protocol

This option displays information for the specified protocol.

Rnage: tcp, udp, ip, icmp, sctp

tcp—transmission control protocol

udp—user datagram protocol

ip—internet protocol

icmp—internet control message protocol

sctp—stream control transmission protocol

Default: None

-r

This option displays the Route table.

Example

pass:cmd="netstat -i":loc=1105

pass:cmd="netstat -a":loc=1111

pass:cmd="netstat -p tcp":loc=1111

pass:cmd="netstat -m data":loc=1105

```
pass:cmd="netstat -r":loc=1105
```

```
pass:cmd="netstat -e":loc=1111
```

```
pass:cmd="netstat -d 0 -f":loc=1111
```

Dependencies

Only one of the options can be specified at a time.

Notes

The **netstat** command is executed through the **pass** command.

The options {-m,-p,-h} are not supported for GPLs that are loaded on E5-based cards.

Output for GPLs that are NOT loaded on E5-based cards

```
pass:loc=1107:cmd="netstat"
```

or

```
pass:loc=1107:cmd="netstat -h"
```

```
Command Accepted - Processing
```

```
tekelecstp 08-02-02 12:16:34 EST EAGLE 38.0.0
```

```
PASS: Command sent to card
```

```
Usage: netstat [-a] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp]
        [-i] [-r] [-d 0|1 [-m] [-p] [-z] [-h 1..24]]
```

Options:

```
-a      display socket information for all protocols
-h      Displays this message
-m      display buffer pool information for 1 of the system pools
-p      display socket information for 1 of the protocols
-i      display interface information for all interfaces
-r      display the route table information
-d      display driver measurement data
```

```
;
```

```
tekelecstp 08-02-02 12:16:34 EST EAGLE 38.0.0
```

```
NETSTAT command complete
```

```
;
```

pass: loc=1105: cmd="netstat -a"

Usage: netstat [-a] [-e] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp

]

[-i] [-r] [-d 0|1] [-m] [-p] [-z] [-h 1..24] [-f]]

Options:

- a display socket information for all protocols
- e display DPL driver measurement data
- d display Ethernet driver measurement data
- h display this message
- m display buffer pool information for 1 of the system pools
- p display socket information for 1 of the protocols
- i display interface information for all interfaces
- r display the route table information

nslookup

Nameserver Lookup

This command returns the IP address for a given hostname, or returns a hostname for a given IP address.

Keyword: nslookup

Command Class: IP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **nslookup** command has the option destination. An IP address

or hostname can be specified for the destination, as in the commands **nslookup 192.168.100.3** and **nslookup dcm1107a**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

Range:

a-z, A-Z, 0-9, -, . (any string of characters beginning with a letter and comprising up to 60 characters in length)

-h

This options provides help information for the command.

Example

nslookup 192.9.200.44

nslookup nc.tekelec.com

Dependencies

The actual **nslookup** text string must be followed by a destination (either a hostname or IP address).

Whether a host is found depends on the configuration of the host table and domain name servers.

Notes

The **nslookup** command is executed through the **pass** command.

Output

pass:loc=1105:cmd="nslookup"

or

pass:loc=1105:cmd="nslookup -h"

```

ping

Packet Internetwork Groper

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

Keyword: ping

Command Class: IP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ping** command has the option destination. An IP address or hostname can be specified for the destination, as in the commands **ping 192.9.200.44** and **ping nc.tekelec.com**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine's host number.

Range:

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

Range:

any string of characters beginning with a letter and comprising ('a'..'z', 'A'..'Z', '0'..'9', '-', '.') up to 120 characters in length.

-i

This option specifies the number of ping requests to send.

Range: 1 - 5

Default: 3

-n

This option specifies the size of message to use in test.

Range: 12 - 2048

Default: 64

-h

This options provides help information for the command.

Example

ping 192.9.200.44

ping nc.tekelec.com

ping 192.9.200.44 -i 5 -n 2048

Dependencies

The actual **ping** text string must be followed by a destination (either a hostname or IP address) prior to the options.

Notes

The **ping** command is executed through the **pass** command.

Output**pass:loc=1105:cmd="ping" or****pass:loc=1105:cmd="ping -h"**

Command Accepted - Processing

```

rlghncxa03w 04-07-27 08:29:35 EST  EAGLE5 31.6.0

PING command complete
;
```

NOTE: In the above example, the response shows eight bytes less than the entry (192 as opposed to 200) because the ping command may use eight bytes automatically.

sctp

Stream Control Transmission Protocol

This command is used to provide a view of SCTP instance and association information.

Keyword: sctp

Command Class: SCTP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a aname

This option is used to retrieve the measurements and information for a specific association.

-l

This option is used to display logging details for associations. The logging details are independent of the association state (close or open).

-p <port>

This option is used to retrieve the measurements for a specified SCTP port.

-r

This option is used to reset specified measurements. The associated report is not displayed.

-h

This option is used to display help information for the command. Either brief or full help reports can be generated.

-m

This option is used to display SCTP incoming/outgoing (IO) header audit reports for common and dedicated IO header pools. The IO header is a transmission sequence number (TSN) control block used in processing SCTP chunks. The report shows total, currently available, and minimum IO header counts for the IO header pool shared by all associations (common pool) and the IO header pool for each association (dedicated pool).

Example

```
pass:cmd="sctp -a aname":loc=1307
```

```
pass:cmd="sctp -l":loc=1307
```

```
pass:cmd="sctp -l aname":loc=1307
```

```
pass:cmd="sctp -p port":loc=1307
```

```
pass:cmd="sctp -r -a aname":loc=1307
```

```
pass:cmd="sctp -r -l aname":loc=1307
```

```
pass:cmd="sctp -m"
```

```
pass:cmd="sctp"
```

Dependencies

The **-r** option can be specified in the same command as the **-a**, **-p**, or **-l** options. Otherwise, only one option can be specified at a time.

Notes

None

Output

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h full** option to the command line.

Example brief help report:

pass:loc=1305:cmd="sctp -h"

Usage: [[[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]]] | [-m] | [-h
[full]]]

Options:

(no parameters)	display list of SCTP ports
-a aname	display association report
-p port	display SCTP port report
-r	reset specified SCTP measurements
-m	display IO header usage report
-l aname	display association event log
-l	display all event logs
-r -l	reset all SCTP event logs
-r -s	reset all SCTP measurements and pegs
-h	displays command help (brief or full)

;

rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0

SCTP command complete

;

Example of a full help report:

pass:loc=1307:cmd="sctp -h full"

```
Usage: sctp [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]]] | [-m]
| [-h [full]]
```

Options:

(no parameters)	display list of SCTP ports
-a aname	display association report
-p port	display SCTP port report
-r	reset specified SCTP measurements
-m	display IO header usage report
-l aname	display association event log
-l	display all event logs
-r -l	reset all SCTP event logs
-r -s	reset all SCTP measurements and pegs
-h	displays command help (brief or full)

no parameters option

Summary list of all SCTP instances. To list all the SCTP ports issue the following command:
sctp

-a aname option details

Retrieves detailed information and measurements for a specific association. For example the following SCTP command will get the measurements and detailed information for the association with association name = assoc1.
sctp -a assoc1

-p port option details

Retrieves detailed information for a specified SCTP port. For example the following SCTP command will get the detailed information for the SCTP port with a local port of 200.
sctp -p 200

-r option details

Resets specified SCTP Measurements. See examples below.
Resets measurements for specified association:
sctp -r -a assoc
Resets measurements for all associations on port 2000:
sctp -r -p 2000
Resets measurements and event logs for all ports/associations:
sctp -r
Resets event logs for specified association:
sctp -r -l assoc
Resets event logs for all associations:
sctp -r -l
Resets measurements for all associations:
sctp -r -s

-m

This option displays SCTP IO header audit report for common and dedicated IO header pools. The report shows total, currently available and minimum (low water mark) IO header counts for common and each association's dedicated pool.
IO header is a TSN control block used in processing SCTP chunks. Common pool is IO header pool shared by all associations. Dedicated pool is a per-association IO header pool.
sctp -m;

-l option details

This option displays logging details for associations. The logging details are independent of the association state (close or open). See examples below:
The following SCTP command will get the logging details for all associations on the specified card.
sctp -l

The following Sctp command will get the logging details for the association with association name = assoc1.

```
sctp -l assoc1
```

;

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

Sctp command complete

;

Example summary list of all Sctp ports. All Sctp ports and number of associations associated with each port is displayed.

pass:loc=1307:cmd="sctp"

```

sockrtt

Socket Round Trip Time

This command is used to report and reset the round-trip time statistics for application sockets. Minimum, maximum, and average times are kept for each open socket. The Retransmission Mode (BSD, FIXED, or MOD) and the Fixed Round Trip Time are also displayed.

Keyword: sockrtt

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **sockrtt** command has the option socket name. The socket name must be specified for which statistics will be displayed, as in the command **sockrtt socyellow**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

socket name

This option is **mandatory** and specifies the socket name for which statistics are to be displayed.

Range:

up to 15 alphanumeric characters.

-r

This option resets all statistics for the given socket name.

-h

This option provides help information for the command.

Example

sockrtt

sockrtt -h
sockrtt socyellow
sockrtt socyellow -r

Dependencies

None

Notes

The **sockrtt** command is executed through the **pass** command.

Output

pass:loc=1105:cmd="sockrtt" or

pass:loc=1105:cmd="sockrtt -h"

Command Accepted - Processing

```
rlghncxa03w 04-07-27 08:32:34 EST EAGLE5 31.6.0

soipdata

SEAS Over IP Data

This command is used to display the SOIP operational data captured for the last 24 hours.

Keyword: soipdata

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-f

This option displays full operational data (all counts).

-s

This option is used to display the number of errors received with error type Bad Source.

-d

This option is used to display the number of errors received with error type Bad Destination.

-v

This option is used to display the number of errors received with error type Bad Version.

-g

This option is used to display the number of Good Day messages received.

-e

This option is used to display the number of error messages sent (Sum of Bad Version, Bad Source and Bad Destination).

-u

This option is used to display the number of UPL messages received.

-t

This option is used to display the number of UPL messages transmitted.

-r

This option is used to reset the specified error count.

-h

This option is used to display help for the command.

Example

soipdata -h

soipdata -f

soipdata -r

soipdata -u

Dependencies

None

Notes

None

Output

pass:loc=1305:cmd= "soipdata -h"

```
Usage: soipdata [[-f ] |
                [[-s] [-d] [-v] [-g] [-e] [-u] [-t]
                [-r] [-h]]
```

Options:

```
-f  Display Full Operational data (all the counts)
-s  Display number of SR-5129 Messages received with Bad Source
-d  Display number of SR-5129 Messages received with Bad Destination
-v  Display number of SR-5129 Messages received with Bad Version
-g  Display number of Good Day Messages Received.
-e  Display number of error messages sent (Sum of BadVersion, BadSource and
BadDestination)
-u  Display number of Number of UPL messages received
-t  Display number of Number of UPL messages transmitted.
-r  Reset the Specified Error Count
-h  display command help
```

pass:loc=1305:cmd="soipdata -f"

SOIPDATA: SR-5129 Operational Data Report

Operational Data

reason		count
Message Recived with Bad Source	1	
Message Recived with Bad Destination	2	
Message Recived with Bad Version	0	
Number of Goodday Messages Received	1	
Number of Error Messages Sent		10
Number of UPL Messages Received		12000
Number of UPL Messages Sent		19000

pass:loc=1105:cmd=pass:loc=1305:cmd="soipdata -r"

SOIPDATA : All SOIP Operational data has been reset

pass:loc=1305:cmd="soipdata -r -u"

SOIPDATA: Number of UPL Messages Received has been reset.

pass:loc=1305:cmd="soipdata -u"

SOIP Operational Data

reason		count
Number of UPL Messages Received	0	

soiplog

SEAS Over IP Log

This command is used to display the logs for the SR-5129 messages for a particular SEAS terminal.

Keyword: soiplog

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-l

This option is used to enable and disable logging.

-d

This option is used to display live message logs

-n X

This option is used to display the last X number of messages.

-h

This option is used to display the help for this command.

Example

soiplog -h

soiplog -l enable":loc=XXXX

Dependencies

None

Notes

With two active connections to the CCS MR, logging must be enabled on each E5-IPSM card that has an active SEAS terminal in order to properly log all SR-5129 communication data.

Assuming a message size of 500 bytes, each E5-IPSM card can log approximately 2000 messages.

If an attempt is made to enable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

Warning: SOIP Logging Enabled from Terminal: <New logging enabled terminal>

If an attempt is made to disable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal

"Warning: SOIP Logging disabled from Terminal: <New logging enabled terminal>"

If an attempt is made to turn on logging on a terminal when it is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

"Warning: SOIPLLOG Started on Terminal: <New logging enabled terminal>"

Output

pass:loc=1305:cmd= "soiplog -h"

```
Usage: SOIPLLOG [[-l option] | [-d] [-n] [-h]]

Options:
-l <enable/disable>    Enable/Disable the logs
-d                      Display live message logs
-n <num>               Display last <num> number of messages.
Range=1..2000
-h                      Display Command Help
```

To Enable Real time logging and display, the following commands must be entered one after the other:

pass:cmd="soiplog -l enable":loc=XXXX

pass:cmd="soiplog -d":loc=XXXX

To enable logging and to display the last N number of logged messages, the following commands must be entered one after the other:

pass:cmd="soiplog -l enable":loc=XXXX

pass:cmd="soiplog -n N":loc=XXXX

traceroute

IP Tracing Utility

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

Keyword: traceroute

Command Class: IP Stack Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **traceroute** command has the option **IP address**. The IP address can be specified for the remote host to which the UDP message is sent, as in the command **traceroute 208.55.20.177**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

Range:

String of characters, beginning with a letter, up to 120 characters in length. Valid characters are **a-z**, **A-Z**, **0-9**, **-** (hyphen), **.** (period)

-h

This option provides help information for the command.

-m maximum hops

This option specifies the maximum number of hops before the trace is terminated.

Range: 1-30

Default: 10

-n

This option specifies that only the IP Address of each host will be displayed (not the hostname).

-p port

This option provides the user port number.

Range: 1-65535

Default: 33434

Example

```
tracert
```

```
tracert www.remotedest.com
```

```
tracert www.remotedest.com -m 20
```

```
tracert www.remotedest.com -m 20 -n
```

```
tracert 208.55.20.177
```

```
tracert 208.55.20.177 -m 20 -p 40000
```

Dependencies

If a Domain Name is specified, either the Domain Name must exist in the IP Host table or the Domain Name Server A or B must be provisioned.

Notes

The **tracert** command is executed through the **pass** command.

Output

The following example illustrates the help information for the command.

pass:loc=1103:cmd="traceroute" or
pass:loc=1103:cmd="traceroute -h"

```

Command entered at terminal #1.

ualog

User Adapter Log

Use this command to report on the user adapter (UA) state machine history for a specified association name. State machine history is kept in a circular buffer in memory. The **-i** and **-x** options are used to include or exclude groups of events from the state machine history.

Keyword: **ualog**

Command Class: Application Maintenance

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ualog** command has the parameter aname. The association name must be specified for which the user adapter log will be displayed, as in the command **ualog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

-h

This option displays help (usage) information for the command.

-i event group

This option includes groups of events in the state machine history.

Range: service, ua

-x event group

This option excludes groups of events from the state machine history.

Range: service, ua

Example

```
pass:loc=1105:cmd="ualog s7000"
```

Dependencies

None

Notes

None

Output

pass:loc=1105:cmd="ualog s7000"

```

When a M3UA or SUA PDU is received that contains one or more errors, a response error message is transmitted containing an error code. Error codes are recorded to and displayed in the UALOG only when the UA peer-to-peer message logging option is enabled (**-i ua**), as shown in the following example.:

pass:loc=1315:cmd="ualog assoc1315a1"

Error Codes

NOTE: The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18

The following error codes can appear in the error messages:

0x01—Invalid Version

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

0x03—Unsupported Message Class

A message was received with an unexpected or unsupported Message Class.

0x04—Unsupported Message Type

A message was received with an unexpected or unsupported Message Type.

0x05—Unsupported Traffic Handling Mode

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

0x06—Unexpected Message

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

0x07—Protocol Error

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

0x09—Invalid Stream Identifier

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

0x0d—Refused - Management Blocking

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

0x0e—ASP Identifier Required

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

0x0f—Invalid ASP Identifier

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier.

0x11—Invalid Parameter Value

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

0x12—Parameter Field Error

A message is received with a parameter that has a wrong length field.

0x13—Unexpected Parameter

A message contains an invalid parameter.

0x14—Destination Status Unknown

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

0x15—Invalid Network Appearance

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

0x16—Missing Parameter

A message is received, and a mandatory parameter is not included in the message.

0x19—Invalid Routing Context

A message is received from a peer with an invalid (unconfigured) Routing Context value.
The invalid Routing Context is included in the error message.

0x1a—No Configured AS for ASP

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

Summary of Range Values for :link Parameter

Table A-1 lists the valid **link** parameter range values signaling links assigned to each type of card for which a location can be specified in the command **loc** parameter. The commands that use these values refer to this table in their **link** parameter description.

NOTE: The link parameter is a synonym for the port parameter in signaling link definitions for a few EAGLE 5 ISS releases. Then the port parameter will be removed.

Table A-1. Summary of Ranges for **link** Parameter

Card	Link	Supported Application
Two-port LIM	A	All supported link applications. The two-port LIM supports the DS0 , OCU , V35 , ATM , E1-ATM , or E1 interface.
Two-port LIM	B	All supported link applications except ss7gx25 (X.25 signaling link), atmansi (ATM high-speed signaling link), atmitu (E1 ATM high-speed signaling link), or ss7ipgw and ipgwi (IP signaling link). The iplim and iplimi applications support sockets, M3UA/SCTP associations, or M2PA/SCTP associations on ports on dual-slot DCMs.
Multi-port LIM	A, B, A1, B1, A2, B2, A3, B3	The ss7ml GPL with DS0 interface at 56 Kb running the ss7ansi application only.
E1/T1 MIM	A, B, A1, B1, A2, B2, A3, B3	The ss7ml GPL running the ss7ansi or ccs7itu application.
IPLIMx with 8 Points (SSEDCM)	A, B, A1, B1, A2, B2, A3, B3	The iplim and iplimi GPLs running the iplim and iplimi applications with sockets, M2PA/SCTP associations, or M3UA/SCTP associations.
HC-MIM	A, B, A1-A31, B1-B31	Runs the ss7ansi or ccs7itu application. A maximum of 64 links can be assigned to each HC-MIM card.
HC-MIM for SE-HSL	A, B	Runs the ss7ansi or ccs7itu application. A maximum of 2 SE-HSL links can be assigned to a card.
E5-ATM	A, B	Runs the atmansi or atmitu application. The card can support up to 2 signaling links.
E5-ENET	A, B, A1-A7, B1-B7, A1-A15, B1-B15	The iplim and iplimi GPLs running the iplim and iplimi applications with sockets, M2PA/SCTP associations, or M3UA/SCTP associations. The ipsggpl running the ipsg applications.

Table A-1. Summary of Ranges for **link** Parameter

Card	Link	Supported Application
E5-E1T1	A, B, A1-A15, B1-B15	Runs the ss7ansi or ccs7itu application. A maximum of 32 links can be assigned to each E5-E1T1 card.
E5-E1T1 for SE-HSL	A, B	Runs the ss7ansi or ccs7itu application. Only 1 SE-HSL link can be assigned to a card.

Possible Values for PST/SST/AST

This section lists the possible values for the primary state (PST), secondary state (SST), and associated state (AST) shown in the output of Report Status (rept-stat-) and Retrieve (rtrv-) commands.

Status can apply to the following types of entities (not all values are possible for every entity type):

card	terminal port
clock	serial port
cluster	but
TCP/IP data link	signaling link
subsystem	linkset
EPAP/ELAP	ACM

PST

Primary state possible values are the following:

IS-ANR—(In Service - Abnormal) The entity is in service but only able to perform a limited subset of its normal service functions.

IS-NR—(In Service - Normal) The entity is in service and handling all its normal service functions.

OOS-MA—(Out Of Service - Memory Administration) The entity is out of service because it has not been equipped.

OOS-MT—(Out Of Service - Maintenance) The entity is out of service and is not available to perform its normal service function. The maintenance system is actively working to restore the entity to service.

OOS-MT-DSBLD—(Out Of Service - Maintenance -Disabled) The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

SST

Secondary state possible values are the following:

ACTIVE—(Active) The entity is currently in use and is handling its normal service function as the primary service provider. (Master) The entity is currently in a master state in relation to its redundant unit.

ALLOWED—(Allowed) The entity is handling its normal service function.

AVAIL—(Available) Entity service is available to another entity.

BLOCKED—(Blocked) The entity has been manually prohibited from handling traffic.

BUSY—(Busy) The entity is handling the maximum traffic capacity and has no spare capacity for new service requests.

CONN—(Connect) The card's entity status is in connected state.

DISC—(Disconnect) The card's entity status is in disconnected state.

FAULT—(Fault) The entity has failed.

IDLE—(Idle) The entity is in use and has spare capacity for service. For a telnet terminal, this indicates a "ready for connection" status.

INHIBITED—(Inhibited) The entity has been manually prevented from performing its normal service function.

ISOLATED—(Isolated) The entity cannot be detected through software or hardware.

MANUAL—(Manual) The entity has manually been removed from service and is not carrying any traffic.

MEA—(Mismatch of Equipment and Attributes) A B link is provisioned for a card other than a LIMATM or a LIME1ATM card.

OVFLW-1—(Overflow) One entity cannot provide service to another entity due to service denial.

PROHIBIT—(Prohibited) The entity is not handling traffic because of a failure in the network.

RESTRICT—(Restricted) The traffic the entity is handling is restricted. The normal capacity or configuration is not being used because of a failure in the network. The normal capacity, functionality or configuration of an entity may be restricted during loading or synching of data. This can occur when the Measurements Platform has not yet been enabled.

STANDBY—(Standby) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. For an IPSM card, Standby is the state just prior to Ready, while the card completes initializations.

STANDBY—(Slave) The entity is currently in a slave state in relation to its redundant unit.

TEST—(Test) The entity is currently in a test state.

UNAVAIL—(Unavailable) Entity service is unavailable to another entity.

UEQ—(Unequipped) The entity is not equipped.

UNBLOCKED—(Unblocked) The entity is handling its normal service function.

AST

Associated state possible values are the following:

----- (Blank)—The field may be left blank.

ACCESS—(Accessible) Traffic is being carried between the local entity and an adjacent, or remote, service provider. A full connection has been completed.

ACTIVE—(Active) The entity is currently in use and is handling its normal service function as the primary service provider. (This appears as an AST for the MPS when there is an alarm on it.)

ALMINH—(Alarm Inhibited) The alarm has been inhibited.

BIP ERROR—(Board Identity Prom) The entity has both daughterboard and motherboard prom error.

DB DIFF—(Database Different) The entity has a database difference.

D BIP ERR—(Daughterboard Identity Prom) The entity has a daughterboard prom error.

ENET FLT—(Ethernet fault) An Ethernet fault exists.

GWS—(Gateway Screening) Linkset has gateway screening. See the **rept-stat-ls** command.

INACCESS—(Inaccessible) Traffic is not being carried from the local entity to another service provider. A breakdown in a complete circuit has been detected.

LOCAL—(Local) Entity has become locally isolated.

M BIP ERR—(Motherboard Identity Prom) The entity has a motherboard prom error.

MPS UNAVL—The DSM card cannot communicate to an MPS.

STANDBY—(Standby) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. (This appears as an AST for the MPS when there is an alarm on it.)

XX%—(Progress indicator for cards that are performing a warm restart and are currently data loading. Shows the percentage of tables that have been downloaded for GPLs that support a persistent LNP database (**scep**)).

Point Code Formats and Conversion

Many of the commands used for database configuration use point codes. This section describes the point code formats that the system supports. If you need additional information or procedural information, refer to the *Database Administration Manual - SS7*.

The system supports four different point code formats:

- ANSI point codes
- ITU International point codes
- ITU National point codes
- ITU National 24-bit point codes

Each format is described in further detail in the following sections.

ANSI Point Codes

ANSI point codes are made up of three groups of digits called the network indicator (*ni*), network cluster (*nc*), and network cluster member (*ncm*). The values for ANSI point codes depend on the value of the **pctype** parameter of the **chg-sid** command, either **ansi** or **other**.

If the **chg-sid:pctype** parameter is set to **ansi**, the range of values for an ANSI point code is as follows:

ni—001-255

nc—001-255 (if *ni* = 001-005)

nc—000-255, * (if *ni* = 006-255)

ncm—000-255

The following rules apply to provisioning ANSI point codes if the **chg-sid:pctype=ansi** parameter is specified:

- An *ni* value of **0** is not allowed (for example, **dpc=0-1-1** and **dpc=0-0-0** are not valid point codes).
- If the *ni* value is **1, 2, 3, 4**, or **5**, then the *nc* value cannot be **0** (for example, **dpc=5-0-1** is rejected).
- If the *ni* value is **1, 2, 3, 4**, or **5**, then network routing point codes are not allowed (for example, **dpc=4-*-*** is rejected).

If the **chg-sid:pctype** parameter is set to **other**, the ANSI point codes do not meet ANSI standards. The range of values for these ANSI point codes is as follows:

ni—000-255

nc—000-255, *

ncm —000-255, *

The following rules apply to provisioning ANSI point code if the **chg-sid:pctype=other** parameter is specified:

- An *ni* value of **0** is allowed, however **dpc=0-0-0** is rejected (for example, **dpc=0-1-1** is accepted).
- The *nc* value can be **0** for all values of *ni* (for example, **dpc=5-0-1** is accepted).
- Network routing point codes are allowed for all values of *ni* (for example, **dpc=4-*-*** is accepted).

An ANSI point code containing all zeros (**0-0-0**) is not a valid point code and cannot be entered into the database.

ANSI point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code subfield values to indicate a Private Point Code (**p-5-0-1**, for example). See "Spare and Private Point Code Subtype Prefixes".

NOTE: Point codes specified by many commands, including those for site identification, routing keys, and LNP, are required to be full point codes. The asterisk values are not valid in the commands that specify these point codes. The command Dependencies sections identify the point codes that must be full point codes in the commands.

A range of values for a subfield is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** through **100**.

The asterisk (*) point code value indicates a single cluster address for a cluster point code (for example, **20-2-***) or a network routing destination (**20-*-***). If * is used for the *nc* subfield, then * must be also be used for the *ncm* subfield.

A double asterisk (**) and a triple asterisk (***) can also be used for the *nc* and *ncm* subfields of the ANSI point code, but only for the **rtrv-dstn**, **rept-stat-dstn**, **rtrv-rte**, and **rept-stat-rte** commands. If *, **, or *** is used for the *nc* subfield, then *, **, or *** must be used for the *ncm* field

For examples of all of these point code values, see the **rtrv-dstn** output in Chapter 5 of the *Commands Manual*.

ITU International Point Codes

The ITU international point codes are made up of three groups of digits called *zone*, *area*, and *id*. The range of values for ITU International point codes are:

zone—**0-7**

area—**000-255**

id—**0-7**

An ITU international point code containing all zeros (**0-000-0**) is not a valid point code and cannot be entered into the database.

ITU international point codes support the Spare Point Code subtype prefix (**s-**). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-5-222-1**, for example). See "Spare and Private Point Code Subtype Prefixes".

ITU National Point Codes

The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers (members) separated by dashes.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is on, ITU national point codes can have group codes assigned to them. The point code is a 1- to 5-digit number. The group code is a two-character field ranging from **aa** to **zz** that is entered as the last subfield of the point code and is separated by a dash from the rest of the point code. An example is **12345-az**.

If the flexible point codes option is enabled (see the **chg-stpopts** command, **:npcfmti** parameter), an ITU national point code format consists of 2, 3, or 4 numbers separated by dashes (formatted as *m1-m2-m3-m4*). When the ITUDUPPC feature is also on, the format is *m1-m2-m3-m4-gc* with a group code. If one of the *m1*, *m2*, *m3*, *m4* members is set to zero bits, no value is entered for that position in the point code. For example, if the **npcfmti** parameter value is set to **3-8-3-0**, valid point codes would be **1-100-1-aa** with a group code, or **7-255-7** with no group code. See the tables in the **chg-stpopts** command description for valid member values and additional examples.

The following ranges of values are valid:

nnnnn—**0-16383**

nnnnn-gc—**0-16363**; group code is *aa-zz* (the ITUDUPPC feature must be on)

m1-m2-m3-m4—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14.

m1-m2-m3-m4-gc—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14. Group code is *aa-zz* (the ITUDUPPC feature must be on).

An asterisk value (*) is allowed only for the **rtrv-dstn** and **rtrv-rte** commands to retrieve ITU-N DPCs if the ITUDUPPC feature is on (for point codes with group codes). The node and group code cannot both be *. For example, **dpcn=12345-*** and **dpcn=**aa** are allowed, but **dpcn=**-*** is not allowed.

If flexible point codes are also used, all valid *m1*, *m2*, *m3*, and *m4* must all be either a number or an *. For example, **1-100-1-aa** and ***-**-aa** are allowed, but **1-**-aa** is not allowed.

ITU national point codes support the Spare Point Code subtype prefix (s-). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-12345** or **s-1-3-5-5-gc**, for example). See "Spare and Private Point Code Subtype Prefixes".

Converting ITU National Point Code Formats

Introduction

Gateway screening only allows ITU national point codes to be provisioned in the database by the enter, delete, or change gateway screening commands, and displayed by the gateway screening retrieve commands as a single number. If a format other than a single number (**14-0-0-0**) for the ITU national point code has been defined by the **npcfmti** parameter of the **chg-stpopts** command, the ITU national point code must be converted into a single number so that it can be used by gateway screening.

For example, the format of the ITU national point code is **4-4-4-2** and you would like to add point code **7-7-7-1** into the allowed OPC screen. The point code **7-7-7-1** would have to be converted to a single number so that the point code can be added to the allowed OPC screen. To determine what multiple-part ITU national point code is represented by the single number ITU national point code in the gateway screening table, the single number point code must be converted to a multiple-part point code.

To convert a single number ITU national point code to a multiple-part point code, go to "Converting Single Number ITU National Point Codes".

To convert a multiple-part ITU national point code to a single number point code, go to "Converting Multiple-Part ITU National Point Codes".

For a definition of the different formats that can be used for ITU national point codes, see "ITU National Point Codes".

Converting Single Number ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the NPCFMTI field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **14781** and **695** are converted to point codes using the **3-8-3-0** format.

Convert a single number ITU national point code to a multiple-part ITU national point code as follows.

Procedure - Converting a Single Number ITU national point code to a multiple-part ITU national point code

- 1 Convert the point code to a binary number. This can be done with most scientific calculators.

The number **14781** converts to the binary number 11100110111101.

The number **695** converts to the binary number 1010110111.

NOTE: Make sure the binary number contains 14 digits. If it does not, add leading zeros to the binary number to bring the total number of digits in the number to 14.

In this example, the binary equivalent for the decimal number 695 (1010110111) contains 10 digits; four zeros must be added to the beginning of the binary number. The resulting binary number is now 00001010110111.

-
- 2** Divide the binary number into the number of parts required by the format of the ITU national point code. For this example, the format is **3-8-3-0**. Because the last part of the point code format is **0**, the point code format contains only three parts. Divide the point code into three parts, the first part of the point code contains the first three digits of the 14-digit binary number, the second part of the point code contains the next eight digits of the 14-digit binary number, and the third part of the point code contains the last three digits of the 14-digit binary number. For this example, the binary numbers would be divided like this:

11100110111101 = 111 00110111 101

00001010110111 = 000 01010110 111

-
- 3** Convert each part of the point code into a decimal number using the same scientific calculator used in step 1 and separate each part of the point code with dashes. The results are as follows.

111 00110111 101 = **7-55-5**

000 01010110 111 = **0-86-7**

When the ITU national point codes are converted from single numbers to multiple-part point codes, the resulting value of the multiple-part point code depends on the point code format specified by the **npfnti** parameter of the **chg-stpopts** command. When converting the single number point code **14781** to the point code format **3-8-3-0**, the resulting point code value is **7-55-5**. If point code **14781** is converted to the point code format **4-4-4-2**, the resulting point code value is **14-6-15-1**.

Converting Multiple-Part ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the **npfnti** field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **7-55-5** and **0-86-7**, using the **3-8-3-0** point code format, are converted into a single number.

Convert multiple-part ITU national point codes to a single number as follows.

Procedure - Converting Multiple-Part ITU National Point Codes to a Single Number

- 1** Convert each part of the point code into a binary number using a scientific calculator. The results are as follows.
- 7-55-5** = 111 00110111 101
- 0-86-7** = 000 01010110 111
-
- 2** Combine each part of the point code into a single binary number as follows.

111 00110111 101 = 11100110111101
 000 01010110 111 = 00001010110111

NOTE: If the binary number has any zeros at the beginning of the number, remove these zeros as they are not necessary.

In this example, the binary equivalent for the point code **0-86-7** (00001010110111) contains four zeros at the beginning of the binary number. When the leading zeros are removed from the binary number, the resulting binary number is now 1010110111.

-
- 3** Convert the binary number to a decimal number using the same scientific calculator used in step 1.
 The binary number 11100110111101 converts to the decimal number **14781**.
 The binary number 1010110111 converts to the decimal number **695**.
-

24-bit ITU-National Point Codes

The 24-bit ITU national point codes are made up of three groups of digits called *main signaling area*, *sub signaling area*, and *signaling point*. The valid values for 24-bit ITU national point codes are:

main signaling area —**000-255**

sub signaling area —**000-255**

signaling point—**000-255**

24-bit ITU national point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code field values to indicate a Private Point Code (**p-2055-222-2011**, for example). See "ITU National Point Codes".

Spare and Private Point Code Subtype Prefixes

The Spare Point Code Support feature and the Internal Point Code Support feature provide optional point code subtype prefixes. The Spare Point Code feature must be enabled before a point code subtype prefix can be specified for a point code.

NOTE: The SEAS interface does not support point code subtype prefixes.

The values **p-**, **s-**, and **ps-** are valid point code subtype prefixes. The dash “-” separates the point code subtype prefix from the remainder of the point code. The prefixes are displayed in lower case. The syntax for the remainder of the point code remains the same.

The Spare Point Code prefix (**s-**) applies only to ITU-I and ITU-N point code domains (ITU-N24 point codes do not support the Spare Point Code prefix), to allow the EAGLE 5 ISS to fully support ITU National and International Spare Point Codes. Table A-2 lists the commands that support the Spare Point Code subtype prefix.

The Private (Internal) Point Code prefix (**p-**) applies to all point code domain types (including ITU-N24 point codes), to allow messages destined to the End Office Node to be routed from the inbound LIM to the outbound IPGWx. Table A-3 lists the commands that support the Private Point Code subtype prefix.

The subtype prefix **ps-** can be specified when the point code parameter supports both the spare and private point code prefixes.

Table A-2. Commands that support the Spare Point Code Prefix

Command	Description	Applicable Point Code Parameters
alm	Alarm	dpci and dpcn
appl-rtkey	Application Route Key	dpci and dpcn ; opci and open
cspe	Concerned Signaling Point Code	pci and pcn
dstn	Destination	spci and spcn ; dpci and dpcn ; and to Alias combinations, as shown in Figure 1.
ent-trace	Enter Trace	dpci and dpcn ; opci and open
gsmmap-scrn	GSM MAP Screening	npci and npcn
gsmopts	GSM Options	ppmspci1 , ppmspci2 , ppmspcn1 , ppmspcn2
gsm-sopcode	GSM Short Message Services OP-Code	pci and pcn
gtt/gta	Global Title Translation/Global Title Address	pci and pcn
ls	Linkset	apci and apcn
map	Mated Application	pci and pcn ; mpci and mpcn
mrn	Mated Relay Node	pci and pcn ; pci1 and pcn1 ; pci2 and pcn2 ; pci3 and pcn3 ; pci4 and pcn4
na	Network Appearance	type=ituis , type=ituns
pass	Pass Commands	Syntax for routing keys
rmt-appl	Remote Application	ipci and ipcn
rte	Route	dpci and dpcn
scr-aftpc	Gateway Screening Allowed Affected Point Code	pcst and pctype
scr-blkdpc	Gateway Screening Blocked Destination Point Code	pcst and pctype
scr-blkopc	Gateway Screening Blocked Origination Point Code	pcst and pctype
scr-cdpa	Gateway Screening Called Party (CDPA PC Destination) Point Code	pcst and pctype
scr-cgpa	Gateway Screening Calling Party (Origination) Point Code	pcst and pctype

Table A-2. Commands that support the Spare Point Code Prefix

Command	Description	Applicable Point Code Parameters
scr-destfld	Gateway Screening Affected Destination (Concerned) Point Code	pcst and pctype
scr-dpc	Gateway Screening Destination Point Code	pcst and pctype
scr-opc	Gateway Screening Origination Point Code	pcst and pctype
sid	Site ID	True pci and pcn ; cpci and cpcn ; ncpci and ncpcn .
spc	Secondary Point Code	spci and spcn

Table A-3. Commands that support the Private Point Code Prefix

Command	Description	Applicable Point Code Parameters
dstn	Destination	spci and spcn ; dpc , dpca , dpci , and dpcn Does not apply to Aliases
ls	Linkset	If ipgwapc = yes, apc , apcn , apci , and apcn
gtt/gta	Global Title Translation	pc , pca , pci , and pcn
inh/unhb-alm	Destination alarm inhibit	dpc , dpca , dpci , and dpcn
rept-stat-cluster	Report Cluster Status	dpc and dpca
rept-stat-dstn	Report Destination Status	dpc , dpca , dpci , and dpcn
rmt-appl	Remote Application	ipc , ipca , ipci , and ipcn
rst-dstn	Restore Destination	dpc and dpca
rte	Route	dpc , dpca , dpci , and dpcn

Valid CIC Ranges for SI and MSU Types in Routing Key Static Entries

Table A-4 lists the valid CIC ranges for use with SI and MSU types in Routing Key table static entries.

Table A-4. Valid CIC Ranges for SI and MSU Types

SI	MSU for ANSI DPC	MSU for ITU DPC	Comments
4 (TUP)	N/A	CIC is 12 bits. Range is 0-4095.	The TUP protocol is used only in ITU networks.
5 (ISUP)	CIC is 14 bits. Range is 0-16383.	CIC is 12 bits. Range is 0-4095.	
13 (QBICC)	CIC is 32 bits. Range is 0-4294967295.		

NAIV/NAI Mapping

Table A-5 shows the mapping between the **naiv** and the **nai** parameters.

Table A-5. NAIV/NAI Mapping

NAIV	NAI	Description
0	—	Unknown
1	Sub	Subscriber Number
2	Rsvd	Reserved for national use
3	Natl	National significant number
4	Intl	International number
5–127	—	Spare

NPV/NP Mapping

Table A-6 shows the mapping between the **npv** and the **np** parameters.

Table A-6. NPV/NP Mapping

NPV	NP	Description
0	–	Unknown
1	E164	ISDN/telephony numbering plan
2	Generic	Generic numbering plan
3	X121	Data numbering plan
4	F69	Telex numbering plan
5	E210	Maritime mobile numbering plan
6	E212	Land mobile numbering plan
7	E214	ISDN/mobile numbering plan
8	Private	Private network or network-specific numbering plan
9–15	–	Spare

Cards that use the ent-card Command

Table A-7 contains information about cards that use the **ent-card** command for provisioning.

Table A-7. Valid **ent-card** Applications (**appl**) and Card Types (**type**)

Card Name (as shown on card label)	Part Number	Card Type (:type)	Application Type (:appl)	Maximum Cards in the Database

* Though the system allows 250 MCPM cards, practical usage is 2. ** A LIM, EILA, or ILA is a link interface module using the AINF interface and can be installed in place of the LIM-DS0A, LIM-OCU, or LIM-V.35. It is configured in the database as either a LIM-DS0A, LIM-OCU, or LIM-V.35 card. *** If any MPS-based features are running in the system, up to 25 DSMs or E5-SM4Gs are allowed in the system. If only GTT is running, up to 32 DSMs can be used in the system with the 50,000 GTT feature. † E5-SM4Gs or DSMs are required for the LNP feature. For more information about turning the LNP feature on, refer to the <i>LNP Feature Activation Guide</i>. † † For the E1 or T1 interface, either SS7 application (SS7ANSI or CCS7ITU) can be assigned to these cards. For more information on the E1 or T1 interface go to Chapter 3 “System Administration Procedures” in the <i>Database Administration Manual - SS7</i>. Part numbers followed by (R) are ROHS numbers. These numbers are equivalent to the non-ROHS numbers that they are paired with.				

Summary of Loopback Testing Commands and Functions

The following section, Table A-8, Table A-9, and summarize the loopback testing commands and functions in the system.

The **tst-slk** command provides several methods for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select **lxvr** (local transceiver), **oam**, **line**, **payload**, and **sltc** loopback tests. The **tst-slk** command will be rejected if a loopback test is not compatible with the link type.

- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- For high-speed links (ATM), the **lxvr**, **oam**, **line**, **payload**, and **sltc** tests are allowed.
- For SS7IPGW and IPGWI DCMs, the **tst-slk** command is not supported.
- For IPLIMx DCMs, only the **loopback=sltc** test is allowed, and is allowed only for links having IPLIML2 type of M2PA.
- For LIME1, LIMT1, or LIMCH cards, or for the E5-ENET card running the IPSG application, only the **loopback=sltc** test is allowed.
- The E5-ATM card can function as either an E1 MIM card or a T1 MIM card, depending on how the card is provisioned. **loopback=sltc** test is allowed.

The **act-lbp** command activates test on one or more loopback points for testing data signaling link elements in one CCS7 transmission path. The maximum number of loopback points is 32.

For a single loopback point test, the parameters can be entered on the command line. If the parameters are not entered at the command line, the LFS database is used. For multiple loopback point tests, the LFS database must be used.

The **ent-lbp** command is used to create the loopback points in the LFS database. The LBP's may be entered in any order.

See the command descriptions in this manual for details on entering parameters and using the commands.

Table A-8. Loopback Testing Commands and Functions—LIME1 and LIMT1 Cards

Command/Function	LIME1 (within a channel)	T1 MIM (within a channel)	E1 MIM (within a channel)	T1 HC- MIM	E1 HC- MIM	Testing Limits
ent-lbp OAM Database for Multiple LFS points per LFS tests No impact on actual link behavior other than allowing multiple points.	n/a	Yes	n/a	Yes	n/a	32 points per card no limit on # of cards
act/dact-lbp EAGLE initiated Level 1 DS0 LFS tests Link State—Link is down Equipment tested—Level 1 element(s) in a signaling path Purpose—Test the error rates of a signaling path Description—Sends loopback code to establish loopback, then performs BERT test for a specified period of time. Typical use—To validate signaling path has acceptable error rate.	n/a	Yes	n/a	Yes	n/a	1024 concurrent tests per system 1 test per card
Remote Loopback FAR END initiated DS0 LFS Test Link State—Link can be up or down Equipment tested—Near end hardware up to level 2 (LXVR)	n/a	Yes	n/a	Yes	n/a	no limit on # of cards

Table A-8. Loopback Testing Commands and Functions—LIME1 and LIMT1 Cards

Command/Function	LIME1 (within a channel)	T1 MIM (within a channel)	E1 MIM (within a channel)	T1 HC- MIM	E1 HC- MIM	Testing Limits
and far end hardware level 1 interface Purpose-Auto—loopback a BERT test to the far end Description—When receiving a loopback code, deactivate the link and go into loopback Typical use—used to remotely test the far end with standard DS0 BERT tests						
tst-slk SLTC <i>EAGLE initiated</i> <i>Level 3 SS7 SLT</i> Link State—Link is up Equipment tested—Near and far end up to Level 3 Purpose—Test the entire path to the far end at Level 3 Description—This will send an SLTM out and expects an SLTA back. Typical use—To validate connectivity of a signaling path.	Yes	Yes	Yes	Yes	Yes	1024 concurrent link tests per system
tst-slk OAM <i>EAGLE initiated</i> <i>Level 1 ATM test</i> Link State—Link is down Equipment tested—Near and far end level 1 software and hardware including all hardware on the cards Purpose—Test the entire near and far end level 1 hardware by exchanging ATM cells Description—Sends OAM cells out to far end for 60 seconds if no errors, or 2	n/a	n/a	n/a	n/a	n/a	1024 concurrent link tests per system

Table A-8. Loopback Testing Commands and Functions—LIME1 and LIMT1 Cards

Command/Function	LIME1 (within a channel)	T1 MIM (within a channel)	E1 MIM (within a channel)	T1 HC- MIM	E1 HC- MIM	Testing Limits
minutes when errors are received. Typical use—Verifies ATM cells can be exchanged between 2 signaling points						
tst-slk LINE <i>EAGLE</i> initiated <i>Level 1-2 ATM test</i> Link State—Link is down Equipment tested—Near end hardware up to level 2 (LXVR) and far end hardware level 1 interface Purpose—Hardware continuity check between near and far end Description—The following steps occur: 1. Device under test (DUT) sends T1 bit-oriented code (BOC) to remote device 2. Remote device receives BOC and programs hardware 3. DUT attempts level 2 alignment 4. If link aligns (level 2), test passes, else test fails 5. DUT sends BOC to remote device to remove loopback 6. Remote device receives BOC and re-programs hardware	n/a	n/a	n/a	n/a	n/a	1024 concurrent link tests per system
NOTE: Note: If the DUT boots in the middle of sequence, the remote device just needs to have the link activated or de-						

Table A-8. Loopback Testing Commands and Functions—LIME1 and LIMT1 Cards

Command/Function	LIME1 (within a channel)	T1 MIM (within a channel)	E1 MIM (within a channel)	T1 HC- MIM	E1 HC- MIM	Testing Limits
activated and it returns to the original programming. Typical use—Used for a link in line timing to check continuity from the near end level 2 hardware to the level 1 interface at the far end						
tst-slk PAYLOAD EAGLE <i>initiated Level 1-2 ATM test</i> Link State-Link is down Equipment tested—Near end hardware up to level 2 (LXVR) and far end hardware level 1 interface Purpose—Hardware continuity check between near and far end Description—The following steps occur: 1. Device under test (DUT) sends T1 bit oriented code (BOC) to remote device 2. Remote device receives BOC and programs hardware 3. DUT attempts level 2 alignment 4. If link aligns (level 2), test passes, else test fails 5. DUT sends BOC to remote device to remove loopback 6. Remote device receives BOC and re-programs hardware Typical use—used for a link in master timing to check continuity from the near end level 2	n/a	n/a	n/a	n/a	n/a	1024 concurrent link tests per system

Table A-8. Loopback Testing Commands and Functions—LIME1 and LIMT1 Cards

Command/Function	LIME1 (within a channel)	T1 MIM (within a channel)	E1 MIM (within a channel)	T1 HC- MIM	E1 HC- MIM	Testing Limits
hardware to the level 1 interface at the far end						
tst-slk LXVR <i>EAGLE</i> <i>initiated Level 1 Internal card loopback</i> Link State—Link is down Equipment tested—Local card Purpose—Test the near end card only Description—This will test the near end card up through level 2. Typical use—To validate the card on the Eagle as good	No	No	No	No	No	1024 concurrent link tests per system

Table A-9. Loopback Testing Commands and Functions—LIM and ATM Cards

Command/Function	DS0 MPL	OCU	V. 35	E1- ATM	T1- ATM	IPLIM	IPGW	Testing Limits
ent-lbp OAM <i>Database for Multiple LFS points per LFS tests</i> No impact on actual link behavior other than allowing multiple points.	Yes	No	No	n/a	n/a	n/a	n/a	32 points per card no limit on # of cards
act/dact-lbp <i>EAGLE</i> <i>initiated Level 1 DS0 LFS tests</i> Link State—Link is down Equipment tested—Level 1 element(s) in a signaling path Purpose—Test the error rates of a signaling path Description—Sends loopback code to establish loopback, then performs	Yes	No	No	n/a	n/a	n/a	n/a	1024 concurrent tests per system 1 test per card

Table A-9. Loopback Testing Commands and Functions—LIM and ATM Cards

Command/Function	DS0 MPL	OCU	V. 35	E1- ATM	T1- ATM	IPLIM	IPGW	Testing Limits
BERT test for a specified period of time. Typical use—To validate signaling path has acceptable error rate.								
Remote Loopback FAR <i>END initiated DS0 LFS Test</i> Link State—Link can be up or down Equipment tested—Near end hardware up to level 2 (LXVR) and far end hardware level 1 interface Purpose-Auto—loopback a BERT test to the far end Description—When receiving a loopback code, deactivate the link and go into loopback Typical use—used to remotely test the far end with standard DS0 BERT tests	Yes	Yes	No	n/a	n/a	n/a	n/a	no limit on # of cards
tst-slk SLTC <i>EAGLE</i> <i>initiated Level 3 SS7 SLT</i> Link State—Link is up Equipment tested—Near and far end up to Level 3 Purpose—Test the entire path to the far end at Level 3 Description—This will send an SLTM out and expects an SLTA back. Typical use—To validate connectivity of a signaling path.	Yes	Yes	Yes	Yes	Yes	Yes (not M3UA)	n/a	1024 concurrent link tests per system

Table A-9. Loopback Testing Commands and Functions—LIM and ATM Cards

Command/Function	DS0 MPL	OCU	V. 35	E1- ATM	T1- ATM	IPLIM	IPGW	Testing Limits
tst-slk OAM EAGLE <i>initiated Level 1 ATM test</i> Link State—Link is down Equipment tested—Near and far end level 1 software and hardware including all hardware on the cards Purpose—Test the entire near and far end level 1 hardware by exchanging ATM cells Description—Sends OAM cells out to far end for 60 seconds if no errors, or 2 minutes when errors are received. Typical use—Verifies ATM cells can be exchanged between 2 signaling points	n/a	n/a	n/a	Yes	Yes	n/a	n/a	1024 concurrent link tests per system
tst-slk LINE EAGLE <i>initiated Level 1-2 ATM test</i> Link State—Link is down Equipment tested—Near end hardware up to level 2 (LXVR) and far end hardware level 1 interface Purpose—Hardware continuity check between near and far end Description—The following steps occur: 1. Device under test (DUT) sends T1 bit-oriented code (BOC) to remote device 2. Remote device receives BOC and programs hardware 3. DUT attempts level 2 alignment	n/a	n/a	n/a	n/a	Yes	n/a	n/a	1024 concurrent link tests per system

Table A-9. Loopback Testing Commands and Functions—LIM and ATM Cards

Command/Function	DS0 MPL	OCU	V. 35	E1- ATM	T1- ATM	IPLIM	IPGW	Testing Limits
4. If link aligns (level 2), test passes, else test fails 5. DUT sends BOC to remote device to remove loopback 6. Remote device receives BOC and re-programs hardware								
NOTE: If the DUT boots in the middle of sequence, the remote device just needs to have the link activated or de- activated and it returns to the original programming. Typical use—Used for a link in line timing to check continuity from the near end level 2 hardware to the level 1 interface at the far end								
tst-slk PAYLOAD EAGLE <i>initiated Level 1-2 ATM test</i> Link State-Link is down Equipment tested—Near end hardware up to level 2 (LXVR) and far end hardware level 1 interface Purpose—Hardware continuity check between near and far end Description—The following steps occur: 1. Device under test (DUT) sends T1 bit oriented code (BOC) to remote device 2. Remote device receives BOC and programs hardware	n/a	n/a	n/a	n/a	Yes	n/a	n/a	1024 concurrent link tests per system

Table A-9. Loopback Testing Commands and Functions—LIM and ATM Cards

Command/Function	DS0 MPL	OCU	V. 35	E1- ATM	T1- ATM	IPLIM	IPGW	Testing Limits
3. DUT attempts level 2 alignment 4. If link aligns (level 2), test passes, else test fails 5. DUT sends BOC to remote device to remove loopback 6. Remote device receives BOC and re-programs hardware Typical use—used for a link in master timing to check continuity from the near end level 2 hardware to the level 1 interface at the far end								
tst-slk LXVR <i>EAGLE</i> <i>initiated Level 1 Internal card loopback</i> Link State—Link is down Equipment tested—Local card Purpose—Test the near end card only Description—This will test the near end card up through level 2. Typical use—To validate the card on the Eagle as good	Yes	Yes	Yes	Yes	Yes	No	No	1024 concurrent link tests per system

Figure A-1. ATM Loopback Tests

B

Acronyms and Abbreviations

A-Port	ANSI-41 Mobile Number Portability
AINPQ	ANSI-41 INP Query
AAL	ATM Adaptation Layer
AAL5	ATM Adaptation Layer 5
AAL5CP	ATM Adaptation Layer 5 Common Port
AATM	ATM Applique
ACG	Automatic Call Gapping
ACM	Application Communications Module
ADJ DPC	Adjacent Destination Point Code
AI	Address Indicator
AIN	Advanced Intelligent Network
AINF	Application Interface Applique
ANSI	American National Standards Institute
AP	Application Processor
APC	Adjacent Point Code
ARP	Address Resolution Protocol
AS	Application Server; a logical entity serving a specific Routing Key
ASM	Application Services Module
ASP	Application Server Process
ATI	Any Time Interrogation
ATM	Asynchronous Transfer Mode
ATMANSI	The application software for the ATM (high-speed) SS7 signaling links
ATM HSL	Asynchronous Transfer Mode High Speed Link
ATMM	ATM Layer Management
AVL	Availability Measurements report
AVLD	Daily Availability measurements report
AVLDTH	Day-to-Hour Availability measurements report
BCSM	Basic Call State Model
BIP	Board Identification PROM
BITS	Building Integrated Timing System
BLM	Bulk Load Module
BPHCAP	The application software used by the application processor and the IMT processor of the LIMATM
BPDCM	The application software for flash memory management on the DCM card.
BSD	Berkeley Software Distribution
BSN	Backward Sequence Number
CAS	Channel Associated Signaling
CCM	Command Class Management

CCS	Common Channel Signaling
CCS7	Common Channel Signaling System #7
CCS7ITU	The application software for the ITU SS7 signaling links
CDPA	Called Party Address
CDPN	Called Party Number
CGPA	Calling Party Address
CF	Control Frame
CIC	Circuit Identification Code
CLLI	Common Language Location Identifier
CLU	Network Cluster
CM	Cluster Management
CNCF	Calling Name Conversion Facility
CP	Communication Processor
CPU	Central Processing Unit
CRC	Cyclic Redundancy Check
CRMD	Cluster Routing and Management Diversity
CRP	Circular Route Prevention
CSL	Common Screening List
CSPC	Concerned Signaling Point Code Group
CSU	Channel Service Unit
DB	Database
DCM	Database Communications Module
DIP	Dual In-Line Package
DIX	Digital/Intel/Xerox de facto standard for Ethernet Media Access Control Type
DN	Dialed or Directory Number
DPC	Destination Point Code
DRAM	Dynamic Random Access Memory
DS0	Digital Signal Level - 0
DSM	Database Services Module
DSU	Data Service Unit
DTA	Database Transport Access
E5-E1T1	EPM-based E1/T1 Multi-Channel Interface Module
E5-ENET	EPM-based Ethernet card
ESIS	Eagle 5 Integrated Monitoring Support
EBDA	Enhanced Bulk Download and Audit
EDR	Efficient Data Representation
EF	Extension Frame
EGTT	Enhanced Global Title Translation
EIA	Electronic Industries Association
EILA	Enhanced Integrated LIM Applique
EIR	Equipment Identity Register
ELAP	Eagle LNP Application Processor
EMP	Eagle Monitoring Protocol
EMSALM	Element Management System Alarm Monitor
ENET	Ethernet
EOAM	Enhanced Operations, Administration, and Maintenance
EOAP	Enhanced OSS Application Process
EPAP	Eagle Provisioning Application Processor
EPM	Embedded Processor Module (E5-E1T1 and E5-ENET cards are EPM-based cards)
EPROM	Erasable PROM
ESP	Extended Services Platform
FAK	Feature Access Key
FAP	Fuse and Alarm Panel
FAS	Frame Alignment Signal

Acronyms and Abbreviations

FISU	Fill In Signal Unit
FPBA	Frame Power Budget Alarm
FPCR	Full Point Code Routing
FPT	Frame Power Threshold
FSN	Forward Sequence Number
FTA	File Transfer Area
FTP	File Transfer Protocol
FTRA	FTP-based Table Retrieve Application
GDB	GSM Real-Time Database
G-Flex	GSM Flexible Numbering
G-Port	GSM Mobile Number Portability
GLS	Generic Loading Service
GMSC	Gateway MSC
GPL	Generic Program Load
GPSM	General Purpose Service Module
GSL	Generic Software Load
GSM	Global System for Mobile Communications
GTA	Global Title Address
GTI	Global Title Indicator
GTT	Global Title Translation
GTWY	Gateway Administration measurements report
GWS	Gateway Screening
GWSA	Gateway Screening Application
GWSM	Gateway Screening Messages
HC-MIM	High Capacity Multi-Channel Interface Module
HDB3	High Density Bipolar 3 encoding
HIPR	High Speed IMT Packet Router
HLR	Home Location Register
HOMERN	Home Network Routing Number Prefix
HMUX	High-Speed Multiplexer
HRN	Home Routing Number
HSL	High-Speed Links
IAM	Initial Address Message
IC	Integrated Circuit
ICMP	Internet Control Message Protocol
ID	Identity
IDP	Initial Detection Point
IEC	International Escape Code
IETF	Internet Engineering Task Force
IGM	IS41 GSM Migration
IGTTLS	Intermediate Global Title Translation Load Sharing
IL	Incremental loading
ILA	Integrated LIM Applique
IMEI	International Mobile Equipment Identifier
IMF	Integrated Message Feeder
IMSI	International Mobile Station Identifier
IMT	Inter-processor Message Transport
IN	Intelligent Network
INAP	Intelligent Network Application Part
INET	Internet
INH	Inhibit
INP	INAP-based Number Portability
INSL	In-Network Subscriber List
IP	Internet Protocol

IPGWI	An ITU version of SS7IPGW
IPGWx	Point to multi-point IP Transport GPL, referring to SS7IPGW (ANSI) and IPGWI (ITU)
IPLIM	The application software used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.
IPLIMI	The application software used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.
IPLIMx	Point to point IP Transport GPL, referring to IPLIM (ANSI) and IPLIMI (ITU)
IPMX	IMT Power and Multiplexer
IPS	Internet Protocol Services
IPSM	Internet Protocol Services Module
IS-41	Interim Standard 41, same as and interchangeable with ANSI-41
IS-ANR	In Service - Abnormal
ISDN	Integrated Services Digital Network
IS-NR	In Service - Normal
ISUP	ISDN User Part
ITU	International Telecommunications Union
ITUDUPPC	ITU National Duplicate Point Code
JIP	Jurisdiction Indicator Parameter
LAN	Local Area Network
LB	Load Balancing
LBP	Loop Back Point
LC	Logical channel
LED	Light Emitting Diode
LFS	Link Fault Sectionalization
LIM	Link Interface Module
LIM-AINF	Link Interface Module with the AINF interface
LIM-ATM	LIM with ATM interface
LIM-DS0	LIM with DS0 Applique
LIM-E1	LIM with E1 Applique
LIM-OCU	LIM with Office Channel Unit Applique
LIM-V35	LIM with V35 Interface
LNP	Local Number Portability
LNPMR	LNP Message Relay
LNPQS	LNP Query Service
LNP SMS	LNP Short Message Service
LPE	Logical Processing Element
LPO	Link Processor Outage
LRN	Location Routing Number
LS	Link Set
LSA	Link Status Alignment
LSB	Least Significant Bit (bit 1)
LSL	Low-Speed Link
LSMS	Local Service Management System
LSN	Link Set Name
LSO	Link Status out of Service
LSPE	Link Status Proving Emergency
LSPN	Link Status Proving Normal
LSR	Link Status Ready
LSSU	Link Status Signal Unit
M2PA	SS7 MTP2-User Peer-to-Peer Adaptation Layer
M3UA	SS7 MTP3-User Adaptation Layer
MAAL	Management ATM Adaptation Layer
MAP	Mobile Application Part

Acronyms and Abbreviations

MAPSCRN	GSM MAP Screening measurements report
MCAP	MAS Communication Application Processor Card
MCC	Mobile Country Code
MCM	Maintenance Communication Module
MCP	Measurement Collection Processor
MCPM	Measurement Collection and Polling Module
MDAL	Maintenance Disk and Alarm (card)
MDN	Mobile Dialed Number
MGT	Mobile Global Title
MGTT	Modified Global Title Translation
MF	Miscellaneous Frame
MIM	Multi-Channel Interface Module
MIN	Mobile Identification Number
MLPRST	MTP Low Priority Route Set
MNP	Mobile Number Portability
MNP SMS	Portability Check for Mobile Originated SMS
MNP-SRF	Signaling Relay Function for support of Mobile Number Portability
MOBR	Origin-based MTP Routing feature
MPC	Multiple Point Code feature
MPL	Multi-port LIM
MPS	Multi-Purpose Server
MR	Message Relay
MRN	Mated Relay Node
MRN	Message Reference Number
MS	Mobile Station
MSB	Most Significant Bit
MSC	Mobile Switching Center
MSAR	Memory space accounting reporting
MSISDN	Mobile Station ISDN Number or Mobile Switching ISDN Number
MSRN	Mobile Station Roaming Number
MSU	Message Signal Unit
MTCD	Maintenance Daily measurements report
MTCDTH	Maintenance Day-to-Hour measurements report
MTCH	Maintenance Hourly (marginal) measurements report
MTCS	Maintenance Status (link/link set) measurements report
MTP	Message Transfer Part
MTP2	Message Transfer Part, Level 2
NAI	Nature of Address Indicator
NCAI	Nested Cluster Allowed Indicator
NCR	Nested Cluster Routing
NEC	National Escape Code
NFAS	Non-Frame Alignment Signal
NI	Network Indicator
NIC	Network Information Center
NID	Network Identification
NM	Network Management
NP	Number Plan
NPA	Numbering Plan Area
NPAC	Number Portability Administration Center
NPANXX	Numbering Plan Area and Exchange
NRT	Network Routing
NSAP	Network Service Access Point
NSE	Network Security Enhancement
NSFI	Next Screening Function Indicator

NSP	Network Services Part
NSPC	New Secondary Point Code
OAM	Operations, Administration, and Maintenance
OAP	Operation System Support Application Processor
OAMP	Operations, Administration and Maintenance Part
OBSR	Origin-based SCCP Routing feature
OCU	Office Channel Unit
OOS-MA	Out of Service - Memory Administration
OOS-MT	Out of Service - Maintenance
OOS-MT-DSBLD	Out of Service - Maintenance Disabled
OPC	Origination Point Code
OPCODE	Operation Code
OPNAME	Operation Name
OSI	Open Systems Interconnection
OSS	Operations Systems Support
PC	Point Code
PCR	Preventive Cyclic Retransmission
PCS	Personal Communications Service (North American GSM)
PDBA	Provisioning Database Application
PDBI	Provisioning Database Interface
PDN	Packet Data Network
PDS	Persistent Device States
PLNP	PCS 1900 LNP
PLNPQS	LNPQS support provided for PLNP
PPSMS	Prepaid Short Message Service Intercept
PROM	Programmable Read-Only Memory
PSEL	Presentation Selector
PST	Primary State for Maintenance
PSTN	Public Switched Telephone Network
PVC	Permanent Virtual Circuit
PVN	Private Virtual Network
Q3	Q.3 Protocol
RAM	Random Access Memory
RBASE	Record Base measurements report
RC	Relative Cost
RI	Routing Indicator
RFC	Request for Comments
RMC	Remote Maintenance Center
RMTTP	Reliable Multicast Transport Protocol
RN	Routing Number
RTDB	DSM Real-time database
RTT	Round Trip Time
SAAL	Signaling ATM Adaptation Layer
SAPC	Secondary Adjacent Point Code
SCCP	Signaling Connection Control Part
SCM	System Configuration Manager
SCMG	SCCP Management
SCP	Service Control Point
SCRSET	Screen Set
SCSI	Small Computer System Interface
SCTP	Stream Control Transmission Protocol
SE-HSL	Synchronous E1 High Speed Link
SEAS	Signaling Engineering and Administration System
SIB	Status Indication "Busy"

Acronyms and Abbreviations

SIE	Status Indication “Emergency” Alignment
SIN	Status Indication “Normal Alignment”
SIO	Service Information Octet
SIO	Status Indication “Out of Alignment”
SIOS	Status Indication “Out of Service”
SK	Service Key
SKTS	Service Key/TeleService List
SLK	Signaling Link
SLS	Signaling Link Selection
SLSCI	Signaling Link Conversion Indicator
SLTA	Signaling Link Test Acknowledgement
SLTM	Signaling Link Test Message
SMS	Short Message Service
SMSC	Short Message Service Center
SMSMR	Prepaid Short Message Service
SNAI	Service Nature of Address Indicator
SNM	Signaling Network Management
SNR	Subsystem Normal Routing
SOR	Support for Optimal Routing
SORP	Socket Option Registration Primitive
SPC	Secondary Point Code Signaling Point Code
SRF	Signaling Relay Function
SRI	Send Routing Information
SRVSEL	Service Selector
SS7	Signaling System #7
SS7ANSI	The application software for the ANSI SS7 signaling links
SS7GX25	The application software for the X.25/SS7 gateway feature
SS7IPGW	The application software used by the DCM card for TCP/IP point-to-multipoint capability
SSA	Subsystem Allowed (An SCCP management message)
SSEL	Session Selector
SSN	SS7 Subsystem Number
SSP	Service Switching Point
SSU	Status Signal Unit
ST	Stop Digit—BCD value 15 (0xF)—used to indicate the end of dialing in some applications
STC	Signaling Transport Card
STP	Signal Transfer Point
STP LAN	The application software for the STP LAN feature
SUA	SS7 SCCP-User Adaptation Layer
SVC	Switched Virtual Circuit
TALI	Transport Adapter Layer Interface (RFC 3094)
TCP	Transmission Control Protocol
TCAP	Transaction Capabilities Application Part
TDM	Terminal Disk Module
TFA	Transfer Allowed
TFC	Transfer Congested (traffic)
TFP	Transfer Prohibited
TFR	Transfer Restricted
TLNP	Triggerless LNP
TOS	Type of Service
TPS	Transactions Per Second
TRA	Traffic Restarting Allowed
TRBL	Trouble

TRW	Traffic Restarting Waiting
TSC	Time Slot Counter Synchronization
TSM	Translation Services Module
TT	Translation Type
TUP	Telephone User Part
TV	Ticket Voucher
TVG	Group Ticket Voucher
UA	IETF User Adaptation Layers
UAM	Unsolicited Alarm Message
UART	Universal Asynchronous Receiver - Transmit
UDP	User Datagram Protocol
UDTS	Unit Data Transfer Service
UI	User Interface
UID	User ID
UIM	Unsolicited Informational Message
UPD	Update
VGTT	Variable Length GTT
VLR	Visitor Location Register
VMSC	Voice Mail Service Center Visited Mobile Switching Center
VSCCP	VxWorks Signaling Connection Control Part
WNP	Wireless Number Portability
WNPQS	Wireless Number Portability Query Service
X.25 DE	X.25 Destination Entity
XGTT	Expanded GTT (GTT Table Expansion)
XMAP	Expanded MAP Table
