Chapter 2. Features Num - E

18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)	2-1
Description	2-1
Upgrade Procedure	2-1
Hardware Requirements	2-2
24-Bit ITU-N Point Code Support Feature (Release 31.0)	2-2
56 Million G-Flex Entries (Release 29.1) (IP7 Release 7.1)	2-3
Description	2-3
Hardware Requirements	2-3
Enhancements to Existing Commands	2-3
Alarms and Error Codes	2-3
2500 Routing Keys (IP7 Release 7.1)	2-3
Description	2-3
Hardware Requirements	2-4
Enhancements to Existing Commands	2-4
Alarms and Error Codes	2-5
4000 Routesets (Release 23.0)	2-5
Alarms	2-7
40,000 GTT Capacity (Release 28.0) (IP7 Release 6.0)	2-7
48 Million Numbers (Release 27.0)	2-7
General Description	2-8

System-Level Requirements	2-11
Required Hardware	2-11
Upgrade Considerations	2-12
New Commands	2-13
Changed Commands	2-14
Alarms	2-14
5 Minute Linkset Data (Release 25.0)	2-14
Changed Commands	2-15
5-8 Bit Sequencing Assurance (Release 24.0)	2-16
Command Changes	2-17
Signaling Link Selection Conversion	2-17
15 Minute Measurements (Release 31.3)	2-18
500 SS7 Links (Release 21.0)	2-19
5000 Routes (Release 26.1)	2-20
Changed Commands	2-20
6000 Routesets (Release 29.0)	2-21
Hardware Requirements	2-22
Enhancements to Existing Commands	2-22
65,535 Entries per Translation Type (Release 22.0)	2-23
8-Bit SLS Support (Release 21.0)	2-24
Additional Integrated Sentinel Support (Release 28.2)	2-25
Description	2-25
New Hardware Required	2-25
Enhancements to Existing Commands	2-25
Alarms and Error Codes	2-27
Administrable SLTMs (Release 20.0)	2-27
AINF Applique (Release 21.0)	2-27
Alarm Enhancements (Release 26.0)	2-27
Allow a Mated Application to Work as Primary-Secondary and Secondary-Primary (Release 22.0)	2-28
Allowed Affected Destination Field Screen (Release 22.0)	2-31
Allowed CDPA Screen on SCCP Management Format ID (Release 22.0) ...	2-34
Alternate Command Keywords (Release 20.0)	2-34
ANSI G-Flex Support at 1700 TPS per DSM (Release 30.3)	2-35
ANSI/ITU MTP Gateway (Release 20.0)	2-35
Level 3 MSU Discrimination	2-35
MSU Routing	2-36

Administering Point Codes	2-37
Local Link Congestion	2-37
Remote Link Congestion	2-38
ANSI-ITU-China SCCP Conversion (Release 31.3)	2-39
ANSI/ITU SCCP and TCAP Conversion (Optional) (Release 22.2)	2-39
Changed Commands	2-40
ANSI/ITU SCCP and TCAP Conversion (Release 24.0)	2-40
Changed Commands	2-41
Backup Provisioning Network Interface (Release 29.0)	2-41
Hardware Requirements	2-41
Enhancements to Existing Commands	2-41
Calling Name Conversion Facility (CNCF) (Release 23.1)	2-42
Limitations	2-44
PIP and GN Parameters	2-46
Conversion of PIP to GN	2-48
Conversion of GN to PIP	2-49
Message Conversion	2-50
Calling Name Conversion Facility (CNCF) with Redirect Capabilit (Release 24.0)	2-55
Gateway Screening Stop Action Commands	2-55
Gateway Screening Enter Commands	2-55
Gateway Screening Change Commands	2-56
Gateway Screening Retrieve Commands	2-56
Unsolicited Information Messages	2-57
CDU for DSM (Release 26.05)	2-60
CDU Port	2-60
Quick Test	2-60
Ping Test	2-60
New Commands	2-61
Enhanced Commands	2-61
New and Enhanced CAP Downloadable Utility (CDU) Commands	2-61
CgPA GWS Routing Indicator Enhancement (Release 31.3)	2-63
Change Default ATM CLP Bit for Data Cells from 1 to 0 (Release 31.3)	2-63
Changeover and Changeback Procedure for Processor Outage and LIN (Release 21.0)	2-64
Cluster Routing and Management Diversity (Release 21.0)	2-65
Exception Lists (X-lists)	2-65

Cluster Routing	2-68
Compatibility with Non-Cluster Routing STPs	2-68
Compatibility with the ITU Network and X.25 Gateway	2-69
Cluster Management When the Cluster Routing Feature is Turned Off	2-69
Command Class Management (Release 29.0)	2-70
Hardware Requirements	2-70
New Commands	2-70
Enhancements to Existing Commands	2-70
Limitations	2-72
Command Output Changes (Release 22.0)	2-72
Configuring the Frequency of RST Messages on Low Priority Routes (Release 22.0)	2-73
Configuring the Unauthorized Use Warning Message (Release 22.0)	2-75
Congestion Abatement Reporting (Release 21.0)	2-77
Consistent Command Response Conversion (Release 22.2)	2-78
Command Execution	2-79
Consistent Command Response Conversion (Release 24.0)	2-79
Command Execution	2-79
Cost Factor on Routing (Release 20.0)	2-80
Customer Definable Alarms (Release 20.0)	2-80
Database Integrity Enhancements (Release 20.0)	2-81
Database Management Command Functions (Release 20.0)	2-81
Backup	2-82
Restore	2-82
Copy GPL	2-83
Copy Measurements	2-83
Disk Directory	2-83
Database Transport Access (DTA) (Release 20.0)	2-83
Delay Vs. Throughput (IP7 Release 5.0)	2-84
Upgrade Considerations	2-89
Limitations	2-89
Disallow Simultaneous Logins Sessions with the Same User ID (Release 21.0)	2-90
Disk Coherency Tests (Release 20.0)	2-90
Disk Copy Fixed to Fixed (Release 20.0)	2-91
Display Inhibited Alarms (Release 29.0)	2-91
Hardware Requirements	2-91

Enhancements to Existing Commands	2-92
Eagle OA&M IP Security Enhancements (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	2-93
Description	2-93
Hardware Requirements	2-100
Enhancements to Existing Commands	2-100
Alarms and Error Codes	2-101
Upgrade Considerations	2-101
Limitations	2-102
E1 Administration and Alarms (Release 26.3)	2-102
Description of E1 Operation within an EAGLE	2-102
Eagle Application Support for E1	2-103
Hardware Requirements	2-104
New Commands	2-104
Enhancements to Existing Commands	2-104
Alarms	2-106
Upgrade Considerations	2-107
Limitations	2-107
E1 ATM High Speed Link (Release 28.1) (IP7 Release 6.0)	2-108
New Hardware	2-108
Enhancements to Existing Commands	2-108
Limitations	2-110
E1/T1 Multi-Channel Interface Module (Release 28.0) (IP7 Release 6.0) ..	2-112
Hardware Requirements	2-112
New Commands	2-113
Enhancements to Existing Commands	2-113
Eagle Alarm Modifications for Synchronization with Harris (Release 31.5)	2-115
Eagle Initiated OAP User Interface (Release 24.0)	2-115
OAP Commands	2-115
LNP Service Commands	2-116
Auditing the OAP Database	2-117
Eagle Measurement Reports (Release 20.0)	2-117
Eagle Support for Integrated Sentinel (Release 28.0)	2-117
Description	2-117
Hardware Requirements	2-117
New Commands	2-118

Enhancements to Existing Commands	2-118
EDCM Support (IP7 Release 4.0)	2-119
ELAP Network Address Translation (NAT) (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	2-121
Description	2-121
Network Address Translation (NAT) on MPS	2-121
Hardware Requirements	2-123
Enhancements to the ELAP Text-Based Interface	2-123
Alarms and Error Codes	2-127
Embedded OAP (Release 24.0)	2-127
EOAP Processor Card - P / N 800-0271-01	2-130
4-Port Serial I / O Card - P / N 800-0272-01	2-131
350W Power Supply - P / Ns 800-0274-01 and 800-0267-01	2-131
Hard Drive and CD-ROM Drive	2-132
EOAP Connectors	2-132
Asynchronous Maintenance Modem	2-137
EOAP User Console	2-137
Fans	2-138
Third Party Software	2-138
EOAP to Eagle Interface	2-139
EOAP to SEAS Interface	2-140
EOAP to LSMS Interface	2-140
End Office Support (IP7 Release 5.0)	2-141
Upgrade Considerations	2-141
Limitations	2-141
Enhance RTRV-LOG (Release 31.3)	2-142
Enhanced Bulk Download (Release 25.0)	2-143
Hardware Requirements	2-143
Alarms (UAMs) and Info Messages (UIMs)	2-144
Serviceability	2-146
Selection of DCM Card Slot	2-147
Minimum LSMS'Eagle Ethernet Facility	2-148
Upgrade Considerations	2-149
New Commands	2-149
Changed Commands	2-150
Limitations/Restrictions	2-150
Enhanced Database Status Reports (Release 20.0)	2-150

Enhanced GPL Management (Release 25.0)	2-151
Upgrade Considerations	2-151
Changed Commands	2-151
Enhanced GSM Map Screening (Release 31.4)	2-152
Enhanced GTT (Release 26.0)	2-152
Upgrade Considerations	2-153
New Commands	2-153
Changed Commands	2-154
Obsolete Commands	2-155
Enhanced Link Diagnostics (Release 22.0)	2-155
Enhanced Load Distribution (Release 21.0)	2-156
Enhanced Routing Key Support (IP7 Release 2.0)	2-156
Understanding the Routing Key Table Used in Release 1.0	2-156
Enhancements to the Routing Key Table in Release 2.0	2-157
Understanding the Use of Dynamic and Static Routing Entries for ss7ipgw Routing	2-159
New Commands for Routing Key Enhancements	2-159
Enhancements to Existing Commands for Routing Key Enhancements	2-160
Enhanced Software Loading (Release 20.0)	2-161
Enhancement to Backup TFR/TCR Procedures (Release 21.0)	2-161
Enhancement to GTT Failure Messages (Release 25.0)	2-162
Effect on Existing UIMs	2-163
Enhancements to GWS Reject Messages (Release 25.0)	2-164
SEAS Compliance	2-164
Enlarged LNP SPID and NPANXX Support (Release 24.0)	2-165
RTRV-LNP-SP Command	2-166
Entering a Global Title Translation to a Non-Mated Application without Adding the Application as Mated Application (Release 22.0)	2-166
EOAP / OAP Support of HSOP Protocol (Release 28.0)	2-167
New Hardware Required	2-167
LSMS Eagle Communication Overview	2-167
EOAP / OAP Overview	2-168
Enhancements to Existing Commands	2-169
EPAP 2.0 Alarm Migration from ELAP (Eagle 28.0)	2-169
EPAP / ELAP 2.0 Security and UI Enhancements (Release 28.0)	2-170
Hardware Requirements	2-170
Enhancements to Existing Commands	2-170

EPAP Provisioning Performance Enhancements (Release 29.0)	2-171
Hardware Requirements	2-171
Enhancements to the User Interface	2-172
Upgrade Considerations	2-172
Limitations	2-172
EPAP Security Enhancements (Release 29.0)	2-172
Hardware Requirements	2-173
Upgrade Considerations	2-173
Limitations	2-173
EPAP Support of Eagle's ITU Duplicate Point Code (Release 29.0)	2-173
Hardware Requirements	2-174
Upgrade Considerations	2-174
Limitations	2-174
Equipment Identity Register (EIR) (Release 31.0)	2-175
Error Message Reporting Enhancement (Release 21.0)	2-175
Ethernet B Interface for IPGWx and IPLIMx (Release 28.1)	
(IP7 Release 6.0)	2-175
Hardware Requirements	2-176
New Commands	2-176
Enhancements to Existing Commands	2-177
Limitations	2-177
Expanded Terminal Output Groups (Release 31.3)	2-178
Extended Bus Interface (Release 20.0)	2-178
Extension Shelf Backplane (Release 23.0)	2-178

Chapter 3. Features F - K

False Link Congestion Management (Release 21.0)	3-1
Feature Control Mechanism (IP7 Release 3.0)	3-2
New Commands for Feature Control Mechanism	3-2
File Transfer Utility (Release 20.0)	3-3
Flash Memory Management (Release 23.0)	3-3
New Commands	3-4
Changed Commands	3-5
Existing IMT Command Changes	3-6
Flexible Point Code Formatting (Release 26.0)	3-6
Changed Commands	3-7
Affected Commands	3-7
Upgrade Considerations	3-9

Limitations	3-9
Force Change of an Assigned Password at First Login (Release 21.0)	3-9
FTP Retrieve and Replace (Release 29.0) (IP7 Release 7.0)	3-10
Hardware Requirements	3-11
FTRA 2.1 Compatibility with Eagle 31.3 (Release 31.3)	3-12
G-Flex C7 Relay (Release 26.2)	3-13
New Commands	3-13
Enhancements Commands	3-15
Upgrade Considerations	3-18
Limitations	3-19
G-Port MNP (Release 26.2)	3-19
New Commands	3-20
Changed Commands	3-21
G-Port MNP Circular Route Prevention (Release 28.1)	3-24
Hardware Requirements	3-24
Enhancements to Existing Commands	3-24
Upgrade Considerations	3-25
Gateway Threshold Exceeded Notification (Release 22.0)	3-25
Global Title Modification (Release 28.1) (IP7 Release 6.0)	3-26
Hardware Requirements	3-26
Enhancements to Existing Commands	3-27
Upgrade Considerations	3-28
Global Title Translation (GTT) (Release 20.0)	3-28
GR-376 Interface (Release 26.0)	3-28
Commands	3-28
Limitations	3-30
General Purpose Service Module-II (GPSM-II) for MCAP Slot (Release 28.0)	3-31
New Hardware Required	3-32
Enhancements to Existing Commands	3-32
Upgrade Considerations	3-33
Group Ticket Voucher (Release 23.0)	3-34
Command Changes	3-36
Alarms	3-37
Measurements	3-38
Group Ticket Voucher for SCCP Cards (Release 27.0)	3-39
Changed Commands	3-40

New UAMs/ UIMs	3-41
Upgrade Considerations	3-42
Limitations	3-42
GSM MAP Screening (Release 26.1)	3-42
Hardware Requirements	3-43
Upgrade Considerations	3-43
New Commands	3-43
Changed Commands	3-44
New UAMs/ UIMs	3-45
Limitations	3-46
GSM MAP Screening Duplicate/Forward (Release 29.0)	3-46
Hardware Requirements	3-47
Enhancements to Existing Commands	3-47
Upgrade Considerations	3-48
Limitations	3-48
GTT by TT Measurements and GR-376 Enhancements (Release 26.0)	3-48
Upgrade Considerations	3-50
Changed Commands	3-51
GTT Error Reporting Enhancements (Release 21.0)	3-51
GTT Table Increase (Release 29.0)	3-51
Hardware Requirements	3-52
Enhancements to Existing Commands	3-52
GTT UIM 21 Digit Length Enhancement (Release 29.0)	3-53
Hardware Requirements	3-53
Enhancements to Existing Commands	3-53
GWS Error Reporting Enhancement (Release 21.0)	3-53
High Speed Master Timing (Release 26.0)	3-54
Overview	3-54
Feature Concept	3-56
TDM Card	3-58
MCAP Card	3-59
Administration	3-59
Maintenance	3-60
High-Speed Multiplexer (HMUX) (Release 27.2)	3-62
New / Changed Commands	3-63
Hardware Requirements	3-64
Upgrade Considerations	3-65

Holdover BITS Clock Support (Release 21.0)	3-65
Idle Terminal Port Logout (Release 21.0)	3-65
IETF M3UA for “A” Link Connectivity (Release 28.1)	3-67
Hardware Requirements	3-67
Alarms and Error Codes	3-67
IETF M3UA Support including IETF SUA (IP7 Release 5.0)	3-67
New Hardware	3-68
Upgrade Considerations	3-68
Limitations	3-68
IETF Protocol Update (Release 28.1) (IP7 Release 6.0)	3-68
Hardware Requirements	3-68
New Commands	3-68
Enhancements to Existing Commands	3-69
IETF SCTP for “A” Link Connectivity (Release 28.1)	3-69
Hardware Requirements	3-70
Alarms and Error Codes	3-70
IETF SCTP Support (IP7 Release 5.0)	3-71
New Hardware	3-71
Upgrade Considerations	3-72
Limitations	3-72
IETF SUA for “A” Link Connectivity (Release 28.1)	3-72
Hardware Requirements	3-73
Alarms and Error Codes	3-73
Implementation of SNMP Agent (IP7 Release 2.0)	3-73
Supported Managed Object Groups	3-73
Supported SNMP Messages	3-74
Deviations from SNMP Protocol	3-75
Enhancements to Existing Commands for the SNMP Agent Feature ...	3-76
Improved Routing Management (Release 20.0)	3-76
IMT Fault Isolation (Release 22.0)	3-76
IMT Subsystem Alarms (Release 20.0)	3-77
INAP-based Number Portability (INP) (Release 26.05)	3-77
Hardware Requirements	3-78
New Commands	3-78
Enhancements to Existing Commands	3-79
Increased Linkset Capacity (Release 28.0)	3-81
New Hardware Required	3-81

Enhancements to Existing Commands	3-81
Increase GTT Entries per TT to 200,000 (Release 29.0)	3-81
Hardware Requirements	3-82
Enhancements to Existing Commands	3-82
INP Number Normalization (Release 26.3)	3-82
Description	3-82
Hardware Requirements	3-82
Enhancements to Existing Commands	3-82
Increase Gateway Screening Screen Sets to 255 (Release 22.0)	3-83
Increase in Time Zones (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	3-84
Description	3-84
Hardware Requirements	3-86
Enhancements to Existing Commands	3-86
Alarms and Error Codes	3-87
ISUP Message Type Screening	3-88
Description	3-88
Hardware Requirements	3-88
New Commands	3-88
Enhancements to Existing Commands	3-94
Alarms and Error Codes	3-99
GTWY Measurements	3-100
Increase the Number of Mated Application Entries (Release 22.0)	3-101
Increased GTT Transactions (Release 21.0)	3-101
Increasing the Size of the Service Provider ID Table (Release 23.2)	3-101
Interim Global Title Modification (IP7 Release 2.2)	3-101
Enhancements to Existing Commands for Interim GT Modification ..	3-102
Intermediate GTT Loadsharing (Release 28.1)	3-102
Hardware Requirements	3-103
New Commands	3-103
Enhancements to Existing Commands	3-103
Limitations	3-104
Intrusion Alert (Release 21.0)	3-104
IP7 Internationalization (IP7 Release 4.0)	3-105
New and Changed commands for this feature	3-105
IPMX/MCAP/TDM Replacement (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	3-107

Description	3-107
HMUX	3-107
GPSM-II for MCAP Slots	3-107
Enhancements to Existing Commands	3-107
Alarms and Error Codes	3-112
IP7 Transport Feature (Release 26.1)	3-113
New Features	3-113
Changed Commands	3-114
IP-SCP with LNP Capability (Lab Only) (IP7 Release 1.0)	3-116
IP-SCP with LNP Capability (IP7Release 2.0)	3-117
IPLIM Protocol Support Enhancement (Release 28.1) (IP7 Release 6.0)	3-117
Hardware Requirements	3-118
Enhancements to Existing Commands	3-118
Limitations	3-118
IPLIMx to 8 Points (Release 29.1) (IP7 Release 7.1)	3-118
Description	3-118
Hardware Requirements	3-119
Enhancements to Existing Commands	3-119
Alarms and Error Codes	3-122
IP User Interface: Telnet Support (Release 29.0) (IP7 Release 7.0)	3-123
Hardware Requirements	3-124
Enhancements to Existing Commands	3-124
Limitations	3-125
IS-41 to GSM Migration (Eagle Release 30.0/ IP7 Secure Gateway Release 8.0)	3-126
Description	3-126
Enhancements to Existing Commands	3-126
Alarms and Error Codes	3-130
ISCC Interface Loopback Test (Release 22.0)	3-130
ISUP Normalization Administration (IP7 Release 5.0)	3-132
New Commands	3-132
Enhancements to Existing Commands	3-133
Upgrade Considerations	3-133
Limitations	3-134
ISUP Message Type Screening (Eagle Release 30.0/ IP7 Secure Gateway Release 8.0)	3-135
Description	3-135

Hardware Requirements	3-135
New Commands	3-135
Enhancements to Existing Commands	3-141
Alarms and Error Codes	3-146
GTWY Measurements	3-147
ISUP-Over-IP Gateway for Connectivity to IP-SEPs (IP7 Release 1.0)	3-148
ISUP Normalization in the IP7 SG (IP7 Release 4.0)	3-149
ITU Duplicate Point Code Routing (Release 26.05)	3-149
Enhancements to Existing Commands	3-151
ITU MTP Restart (Release 26.0)	3-151
Upgrade Considerations	3-152
Changed Commands	3-152
Measurements	3-153
UIMs	3-153
Limitations	3-153
ITU SLS Enhancements (Release 26.0)	3-154
Changed Commands	3-154
Restrictions	3-155
Upgrade Considerations	3-155
ITU-TFR Procedure (Release 26.1)	3-155
Upgrade Considerations	3-156
New UIMs	3-156
Changed Commands	3-156
ITU Gateway Measurements Enhancements (PR19536) (Release 26.05) ...	3-157
New Measurements Reports Implemented for this Feature	3-157
Enhancements to Existing Commands	3-159
KSR Terminal Feature (Release 20.0)	3-160

Chapter 4. Features L - O

Large System (Release 27.2)	4-1
Hardware Required	4-1
Changed Commands	4-2
Upgrade Considerations	4-3
Limitations	4-3
Large System—Phase 2 (Release 28.0)	4-3
Hardware Required	4-3
New Commands	4-4
Enhancements to Existing Commands	4-4

Enhancements to Existing Commands	4-4
Large System (Phase 3)—1500 Links (Release 29.0)	4-4
Hardware Requirements	4-5
Enhancements to Existing Commands	4-5
Last 10 Command Retrieval (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	4-7
Description	4-7
Hardware Requirements	4-7
Enhancements to Existing Commands	4-7
Alarms and Error Codes	4-7
Limitations	4-7
Link Failure Status Information (Release 22.0)	4-8
Link Fault Sectionalization (Release 21.0)	4-12
Remote Loopback Testing for DSOA	4-14
Remote Loopback Testing for OCU	4-14
Link Diagnostics	4-14
Hardware Configuration	4-15
Link Fault Sectionalization Test Indicators	4-16
Link Fault Sectionalization Test Report	4-17
Commands	4-17
Link Maintenance Enhancements/LFS Increase for MPL-T and MIM (Release 31.3)	4-19
Link Status Reporting (Release 21.0)	4-20
Linkset ID to Measurements Report (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	4-24
Description	4-24
Hardware Requirements	4-24
Enhancements to Existing Commands	4-24
Alarms and Error Codes	4-25
Linkset Name Increase—ANSI/ITU (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	4-26
Hardware Requirements	4-26
Enhancements to Existing Commands	4-26
Alarms and Error Codes	4-30
Limitations	4-30
LNP 96 Million TNs—EAGLE 5 (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	4-31
Summary	4-31

Description	4-32
Highlights	4-33
Hardware Requirements	4-34
Enhancements to ELAP Graphical User Interface	4-35
Enhancements to Existing Commands	4-39
Alarms and Error Codes	4-42
Upgrade Considerations	4-44
LNP AIN Query Enhancement (PR28376) (Release 26.0)	4-47
Changed Commands	4-47
LNP Measurements Enhancements (Release 25.0)	4-47
Message Relay Measurements per SSP	4-47
Upgrade Considerations	4-51
New / Changed Commands	4-51
LNP Message Relay Enhancement (PR28810) (Release 26.0)	4-51
Changed Commands	4-52
LNP Response to STPLAN (PR28660) (Release 26.0)	4-53
LNP—10 Digit Telephone Number Subscription Commands (Release 22.0)	4-53
LNP—Allow Subsystem Command (Release 22.0)	4-54
LNP—Automatic Call Gapping (Release 22.0)	4-54
LNP—Automatic Call Gapping Commands (Release 22.0)	4-55
LNP—Call Completion to Ported Number (CCPN) (Release 22.0)	4-56
LNP—Change Database Command (Release 22.0)	4-56
LNP—Changes to Existing Commands (Release 22.0)	4-57
LNP—Self ID Commands	4-57
LNP—Mated Application Commands	4-57
LNP—chg-feat and rtrv-feat Commands	4-58
LNP—clr-disk-stats Command (Release 22.0)	4-58
LNP—Degraded Mode (Release 22.0)	4-58
LNP—Destination Point Code Exception Report (Release 23.1)	4-60
New and Changed Commands	4-60
LNP—disp-disk-stats Command (Release 22.0)	4-60
LNP—Eagle LNP Configuration (Release 22.0)	4-61
LNP—Element Manager System (EMS) (Release 22.0)	4-62
LNP—Enhanced Global Title Translation Routing Services (Release 22.0)	4-63
LNP—Impact of LNP on Other Features (Release 22.0)	4-64
Gateway Screening	4-64

Translation Type Mapping	4-65
STPLAN	4-65
Database Transport Access (DTA)	4-65
Other Features	4-65
LNP—Inhibit Subsystem Command (Release 22.0)	4-65
LNP—Location Routing Number Commands (Release 22.0)	4-66
LNP—Mapping LNP Translation Type Commands (Release 22.0)	4-66
LNP—Measurements (Release 22.0)	4-67
LNP—System Wide Measurements	4-67
SSP Measurements	4-68
LNP—LRN Measurements	4-68
NPANXX Measurements	4-68
LNP—Message Relay (Release 22.0)	4-69
LNP—MSU Trap and Trace Command (Release 22.0)	4-70
LNP—MTP and SCCP Management to Support LNP (Release 22.0)	4-70
LNP—New LNP Input and Output Groups (Release 22.0)	4-71
LNP—New Unsolicited Alarm Messages (UAMs) (Release 22.0)	4-71
LNP Degraded Mode Alarm	4-71
LNP—Auto Inhibit / Uninhibit Alarms	4-71
LNP Subsystem Alarms	4-72
LNP—New Unsolicited Information Messages (UIMs) (Release 22.0)	4-72
LNP—Subsystem State Change Failures	4-72
LNP—ACG Overload Level Change	4-73
LNP—NPANXX Commands (Release 22.0)	4-73
LNP—Query Routed as Final Global Title Translation (Release 22.0)	4-73
Global Title Translation Examples	4-75
LNP—Query Routed as Non-Final Global Title Translation (Release 22.0)	4-79
LNP—Report LNP Status Command (Release 22.0)	4-81
LNP—Rerouting Messages for the Local Subsystem (Release 22.0)	4-81
LNP—Retrieve LNP Database Time Stamp Command (Release 22.0)	4-81
LNP—SCCP Management on the LIMs (Release 22.0)	4-82
LNP—Service Commands (Release 22.0)	4-84
LNP—Service Provider Commands (Release 22.0)	4-84
LNP—Split NPA Commands (Release 22.0)	4-85
LNP—Subsystem Application Commands (Release 22.0)	4-85
LNP—System Options Commands (Release 22.0)	4-86
LNP Short Message Service (Release 28.2)	4-87

Description	4-87
Protocol	4-87
Hardware Requirements	4-87
Enhancements to Existing Commands	4-88
Alarms and Error Codes	4-88
Measurements	4-89
Login Failure Message (Release 21.0)	4-89
Login Success or Failure Tracking (Release 21.0)	4-90
Logout on Communications Failures (Release 22.0)	4-91
Command Rejected Error Messages	4-92
LRN Table Increase (Release 26.1)	4-92
Changed Commands	4-92
M2PA on IPLIMx (Release 29.1) (IP7 Release 7.1)	4-93
Description	4-93
Hardware Requirements	4-94
New Commands	4-94
Enhancements to Existing Commands	4-95
Alarms and Error Codes	4-96
Limitations	4-96
M3UA Protocol Enhancements (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	4-97
Description	4-97
Hardware Requirements	4-97
New Commands	4-97
Enhancements to Existing Commands	4-100
Alarms and Error Codes	4-107
Limitations	4-107
Management of Unused User IDs (Release 21.0)	4-108
Manual Deactivation of SRST Message (Release 21.0)	4-109
MAP Table Increase (Release 29.0)	4-109
Hardware Requirements	4-109
Enhancements to Existing Commands	4-109
Measurements Enhancements (Release 22.0)	4-110
Measurements Platform Filename with CLLI (Release 31.3)	4-111
Measurements Platform—Phase 1 (Release 28.0)	4-111
Hardware Required	4-112
New Commands	4-113

Enhancements to Existing Commands	4-113
Miscellaneous Command Adjustments (Release 26.0)	4-115
Activate Echo to a Terminal	4-115
Cancelling rtrv and rept-stat Commands	4-116
Miscellaneous Command Adjustments (Release 26.1)	4-117
Different Database Level Alarm Repetition When UAM 34 Has Been Raised (PR28908)	4-117
Ent-/ Chg-GTT Failure Message Should Show Overlap (PR28909)	4-117
MTP and other MRN Message Format Improvements (Release 21.0)	4-119
MTP Circular Route Detection (Release 21.0)	4-124
MTP Restart (Release 21.0)	4-126
Message Routing	4-128
Aligning Signaling Links in a fully Restarting Node	4-128
Measurements	4-129
Event Reporting	4-129
Alarms	4-129
Existing Commands	4-130
New Commands	4-131
Multiple Capability Point Codes (Release 21.0)	4-131
Multiple Flash Download (Release 29.0)	4-132
Hardware Requirements	4-132
Enhancements to Existing Commands	4-132
Multiple LFS Tests (Release 26.0)	4-132
Latching versus Non-latching LFS Tests	4-133
New Commands	4-135
Changed Commands	4-135
Multiple Point Code Support (Release 26.05)	4-135
Replacing Two STP Pairs with One Eagle Pair	4-136
Multiple Linksets between Two Nodes	4-138
Impact on Other Features	4-140
New Commands	4-142
Enhancements to Existing Commands	4-142
Provisioning Multiple Point Codes	4-143
Upgrade Considerations	4-143
Limitations	4-143
Multi-Port LIM (Release 27.1) (IP7 Release 6.0)	4-144
Description	4-144

Changed Commands	4-145
Hardware Requirements	4-147
Upgrade Considerations	4-147
National Spare Network Indicator Support (Release 22.2)	4-147
Enabled States	4-148
Disabled States	4-148
Gateway STP Impact	4-148
Changed Commands	4-148
National Spare Network Indicator Support (Release 24.0)	4-149
Enabled States	4-149
Disabled States	4-150
Gateway STP Impact	4-150
Changed Commands	4-150
NEBS Compliance (Release 20.0)	4-151
Nested Cluster Routing (Release 26.0)	4-152
Nested Clusters and Cluster Members	4-152
Administration	4-154
General Requirements	4-155
Upgrade Considerations	4-165
Changed Commands	4-165
Network Routing (Release 26.0)	4-167
Types of Routing Strategies Available	4-167
Applications	4-167
MTP Requirements	4-168
Changed Commands	4-174
Network Security Enhancements (Release 29.0)	4-175
Hardware Requirements	4-181
Enhancements to Existing Commands	4-182
Limitations	4-182
Network Surveillance Enhancements (Release 28.0)	4-183
Hardware Requirements	4-183
Enhancements to Existing Commands	4-183
New Control Shelf Backplane (Release 23.0)	4-184
New Hardware (Release 23.1)	4-184
Integrated LIM-AINF Card	4-185
New Hardware (Release 26.05)	4-186
Multi-Purpose Server (MPS)	4-186

Non-ANSI Point Code Support (Release 20.0)	4-186
Non-Generation of Duplicate SEAS Autonomous Messages (Release 22.0)	4-186
Non-SCCP/ISUP Routing (Lab Only) (IP7 Release 1.0)	4-186
Non-SCCP/ISUP Routing (IP7 Release 2.0)	4-187
Notification of Congestion Level Increase (Release 22.0)	4-187
Notification of Inability to Perform a Global Title Translation (Release 22.0)	4-188
Notification of Link Set Outage (Release 22.0)	4-188
Notification of Link Set Recovery (Release 22.0)	4-188
Notification of Locally Initiated Database Copy (Release 22.0)	4-189
Notification of MTP-Level Routing Error (Release 22.0)	4-190
Notification of Recovery from Link Congestion (Release 22.0)	4-190
Number Pooling (Release 24.0)	4-191
Command Changes	4-191
Number Pooling/Efficient Data Representation (EDR) (Release 26.1)	4-192
Overview	4-193
Upgrade Considerations	4-195
Changed Commands	4-196
Limitations	4-196
OAP Upgrade Enhancement (Release 27.2)	4-196
OCTRETRN in 30-Minute Measurements Reports (Release 31.4)	4-196
Online Cartridge Formatting (Release 20.0)	4-197
Option for Subsystem Prohibit (Release 29.0)	4-197
Hardware Requirements	4-198
Enhancements to Existing Commands	4-198
 Chapter 5. Features P - Z	
Password Aging (Release 21.0)	5-1
Password Encryption (Release 21.0)	5-2
Password Requirements (Release 21.0)	5-2
PCS 1900 LNP Query (Release 26.0)	5-2
Feature Functions	5-3
PLNPQS Details	5-3
New UIMs	5-6
Changed Commands	5-6
Upgrade Considerations	5-7
Limitations	5-8

Performance Enhancements (IP7 Release 3.0)	5-8
Primary Aspects	5-9
Secondary Aspects	5-9
Limitations Summary	5-9
New Commands for Performance Enhancements	5-10
Enhancements to Existing Commands for Performance Enhancements	5-10
Persistent Device States (Release 29.0)	5-10
Hardware Requirements	5-11
Enhancements to Existing Commands	5-11
Limitations	5-11
Point-to-Point Connectivity for ITU Point Codes (IP7 Release 2.2)	5-12
Mixed Networks Using the ANSI/ITU Gateway Feature	5-12
Enhancements to Existing Commands for the iplimi Application	5-18
Portability Check for Mobile Originated SMS (Release 29.1)	5-19
Description	5-19
Hardware Requirements	5-22
Enhancements to Existing Commands	5-23
Alarms and Error Codes	5-24
Prepaid SMS Intercept - Phase 1 (Release 28.1)	5-24
Hardware Requirements	5-25
Enhancements to Existing Commands	5-25
Prevention of Congestion from Rerouted Traffic (Release 21.0)	5-26
Prevention of Link Oscillation (Release 21.0)	5-27
Preventive Cyclic Retransmission (PCR) (Release 20.0)	5-27
Normal Retransmission	5-28
Example of Basic Error Correction vs. PCR	5-29
Forced Retransmission	5-30
Derivations for N1 and N2	5-32
Priority Processing of Network Management Messages (Release 21.0)	5-34
Prohibit Removing the Last Route to a Destination if that Destination is being Referenced by Mated Applications or Concerned Signaling PointCode Groups (Release 22.0)	5-35
Prohibit the Assigning of a Linkset with Linkset Types A or E to a Cluster Route (Release 22.0)	5-36
Provisioning Range for Gateway Screening (Release 22.0)	5-36
Quality of Service Enhancements (IP7 Release 3.0)	5-38
TOS	5-39

Nagle's Algorithm	5-40
Feature Implementation	5-40
New Commands for Quality of Service Enhancements	5-42
Enhancements to Existing Commands for Quality of Service Enhancements	5-42
Random SLS Generation (Release 28.0)	5-43
Enhancements to Existing Commands	5-43
Remote Loopback Testing for DS0A (Release 21.0)	5-43
Remote Loopback Testing for OCU (Release 21.0)	5-44
REPT-STAT-CLK Enhancements for Clocking (Release 28.2)	5-45
Description	5-45
Hardware Requirements	5-45
Enhancements to Existing Commands	5-45
Alarms and Error Codes	5-46
REPT-STAT-TRBL Enhancement (Release 29.0)	5-46
Hardware Requirements	5-46
Enhancements to Existing Commands	5-46
RTRV-TBL-CAPACITY Enhancement (Release 29.0)	5-47
Hardware Requirements	5-47
New Commands	5-47
Response to Commands Issued Prior to Login (Release 21.0)	5-48
Revoking a User ID (Release 21.0)	5-48
Routing Key Enhancements (IP7 Release 3.0)	5-49
New Commands for Routing Key Enhancements	5-49
Enhancements to Existing Commands for Routing Key Enhancements	5-50
SCCP Message Type Screening (Release 22.0)	5-51
SCCP/TCAP Over IP Gateway for Point-to-Multipoint Connectivity (IP7 Release 1.0)	5-51
SCCS Interface Support (Release 21.0)	5-53
SCTP Checksum Update (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)	5-54
Description	5-54
Background	5-54
Hardware Requirements	5-55
Enhancements to Existing Commands	5-55
Alarms and Error Codes	5-59
SCTP Retransmission Control (Release 28.1) (IP7 Release 6.0)	5-59

Hardware Requirements	5-59
New Commands	5-59
Enhancements to Existing Commands	5-59
Limitations	5-60
SEAS Enhancements (Release 26.0)	5-61
Affected Commands	5-61
SEAS Enhancements, Autonomous Messages (Release 22.0)	5-66
SEAS Gateway Audit Command (CHK-UNREF-ENT) (Release 22.0)	5-67
SEAS Interface Support (Release 21.0)	5-68
SEAS Verify Signaling Route-Set Status and SCCP Application Status Command (VFY-SRSAPST) (Release 22.0)	5-71
Security Log Increase (Release 26.05)	5-71
Increasing the FTA (File Transfer Area)	5-71
Enhancements to Existing Commands	5-71
Upgrade Considerations	5-72
Limitations	5-72
Selective Alarm Inhibiting (Release 22.0)	5-72
New Commands	5-74
Changed Commands	5-75
Selective Homing of EPAP RTDBs (Release 29.0)	5-76
Hardware Requirements	5-77
Enhancements to the User Interface	5-77
Upgrade Considerations	5-77
Selective Homing of EPAP RTDBs (Release 29.0)	5-77
Hardware Requirements	5-78
Enhancements to the User Interface	5-78
Upgrade Considerations	5-78
Simplifying BIP (Board ID PROM) for Eagle STP Boards (Release 23.1)	5-78
Command Changes	5-79
Alarm Message Changes	5-79
Hourly Status Message Report	5-79
Single Slot Enhanced DCM (Release 28.1) (IP7 Release 6.0)	5-80
Hardware Requirements	5-81
Enhancements to Existing Commands	5-81
Split Allowed CGPA Table (Release 22.0)	5-81
Split of Allowed SIO Table (Release 22.0)	5-82
SS7 Message Rejection Due to Screening (Release 22.0)	5-83

SS7 over High-Speed Signaling Link (Release 23.0)	5-83
SS7-Over-IP Gateway for Point-to-Point Links (IP7 Release 1.0)	5-84
STP LAN Feature (Release 20.0)	5-85
STPLAN Port to DCM (Release 26.0)	5-87
STPLAN with Default Router (Release 23.0)	5-88
Command Changes	5-90
Support 12 Million Ported Numbers (Release 24.0)	5-91
New and Changed Commands	5-91
Support 12 Million Ported Numbers (Release 25.0)	5-92
New and Changed Commands	5-93
Support Changing the Linkset Name (Release 28.0)	5-94
Enhancements to Existing Commands	5-94
Support for IP7 8.0 Gateway Features (Eagle Release 30.0 / IP7 Secure Gateway Release 8.0)	5-96
Description	5-96
Support for LSMS Audit Enhancements (Release 26.1)	5-96
Auditing the Eagle via High-Speed Audit	5-97
New Commands	5-98
Component Interaction Scenario	5-98
Limitations	5-101
Support for LSMS Split Provisioning (Release 26.1)	5-102
Over OAP Serial Channel	5-102
Via Enhanced Bulk Download	5-102
New Commands	5-102
Limitations	5-103
Support for Matching Self-ID Rule in SEAS CHG-SID (Release 22.0)	5-103
Support for MTP Status Functions (IP7 Release 2.0)	5-103
Enhancements to Existing Commands for MTP Status Feature	5-104
Support for Provisioning Multiple EPAPs (Release 29.0)	5-105
Hardware Requirements	5-105
Enhancements to the User Interface	5-105
Upgrade Considerations	5-105
Support for Secure Gateway Functionality through IP7 7.0 (Release 29.0)	5-105
Support for TALI Architecture (IP7 Release 4.0)	5-106
Support for the CLLI Parameter for Adding or Changing Linksets (Release 22.0)	5-106
Support for the New Linkset Name Parameter for Changing the Attributes of a Route (Release 22.0)	5-106

Support for Up to 41 IPLIMx DCMs (IP7 Release 2.2)	5-107
Enhancements to Existing Commands for 41 IPLIMx DCMs	5-107
Support LSMS Disaster Recovery (Release 23.1)	5-108
Auditing the OAP Database	5-108
Support of E1 Interface for SS7 Signaling Links (Optional) (Release 22.2)	5-108
Support of E1 Interface for SS7 Signaling Links (Optional) (Release 24.0)	5-109
Support of E1 Master Clock Interface for SS7 Signaling Links (Optional) (Release 22.2)	5-109
Upgrade Considerations	5-109
Suppression of Gateway Measurements on Non-Gateway Linksets (Release 25.0)	5-109
Changed Commands	5-110
TALI “A” Link Connectivity (Release 28.0)	5-110
Description	5-110
New Hardware Required	5-111
New Commands	5-111
Enhancements to Existing Commands	5-112
TALON Development Kit (IP7 Release 2.0)	5-114
Temporary Alarm Inhibiting and Offline Functions (Release 25.0)	5-114
Alarm System Functionality	5-115
Customer Use Scenario	5-116
Administration	5-119
Maintenance	5-121
Changed Commands	5-123
Thresholding of UIM Messages (Release 25.0)	5-124
Creation of UIMs	5-124
Upgrade Considerations	5-127
Changed Event Log Command	5-127
New Database Administration Commands	5-127
Limitations	5-128
Translation Type Mapping (Release 21.0)	5-128
New Commands	5-130
Triggerless LNP (Release 24.0)	5-130
TCommands	5-130
TSM Warm Restart and Incremental Loading (Release 26.0)	5-131
Warm Restart	5-132
Incremental Loading	5-133

Maintenance	5-134
LNP Audit	5-140
Changed Commands	5-142
New UIMs	5-142
Hardware Requirements	5-144
Upgrade Considerations	5-144
Dependencies	5-145
Limitations/Restrictions	5-145
TT Independence for LNP Queries (Eagle Release 30.0/IP7	
Secure Gateway Release 8.0)	5-147
Description	5-147
Hardware Requirements	5-148
Enhancements to Existing Commands	5-148
Alarms and Error Codes	5-152
Upgrade Considerations	5-152
Limitations	5-152
Two-Point IPLIMx (Eagle 27.1)/Two-Point IPLIMx (IP7 Release 2.2)	5-153
Enhancements to Existing Commands for Two-Point IPLIMx	5-153
Unregistered Routing Key Treatment (IP7 Release 3.0)	5-154
New Commands for Unregistered Routing Key Treatment	5-155
Enhancements to Existing Commands for Unregistered Routing	
Key Treatment	5-155
Upgrade Procedure Enhancements (Release 22.0)	5-156
No Reportable Downtime on Network Restart	5-157
Upgrading the Application Processor of the Main Assemblies from	
the Intel 286/386 to the Intel 486 Microprocessor (Release 20.0)	5-159
Use IMT Bus Instead of MBUS (Release 23.0)	5-160
User-Initiated Keyboard Locking (Release 22.0)	5-160
Using the DPC/SSN Parameters and GTA Range in Displaying Global	
Title Translations (Release 22.0)	5-163
Variable Length GTT (Release 26.1)	5-163
Upgrade Considerations	5-165
Changed Commands	5-165
Alarms	5-166
Hardware Required	5-166
Variable-Length Global Title Translation (Release 26.1) (IP7 Release 2.2)	5-167
Enhancements to Existing Commands for Variable-Length GTT	5-168
Warning Message When LIMs Added with Insufficient TSMs	

(Release 25.0)	5-168
Weighted SCP Load Balancing (Release 27.2)	5-169
Hardware Requirements	5-170
Alarms	5-170
Enhancements to Existing Commands	5-170
Upgrade Considerations	5-170
Limitations	5-171
Wireless Number Portability (Release 23.1)	5-171

About This Manual

This manual provides feature summaries of all Eagle features released since Eagle Release 20.0. This manual also contains descriptions of the previously released features for the IP⁷ Secure Gateway product. This document covers features for Eagle Release 20.0 through Eagle Release 28.1 and IP⁷ Secure Gateway Release 1.0 through IP⁷ Secure Gateway Release 6.0.

This section describes the organization and conventions used throughout this manual.

Organization

This document is organized into the following chapters:

- Chapter 1, *Introduction* provides information about this manual and the documentation suite, Tekelec Technical Services, a list of previously released features listed alphabetically and also grouped under the heading of the release number in which they first occurred, and acronyms found throughout this manual.
- Chapter 2, *Features Num - E* describes features starting with numbers and letters from A to E.
- Chapter 3, *Features F - K* describes features starting with letters from F to K.
- Chapter 4, *Features L - O* describes features starting with letters from L to O.
- Chapter 5, *Features P - Z* describes features starting with letters from P to Z.

Admonishments and Conventions

Admonishments are icons and text throughout this manual that alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

	TOPPLE/DANGER: (This icon and text indicate the possibility of personal injury and equipment damage.)
	DANGER: (This icon and text indicate the possibility of personal injury.)
	CAUTION: (This icon and text indicate the possibility of service interruption.)
	WARNING: (This icon and text indicate the possibility of equipment damage.)

The *Previously Released Features Manual* uses the following conventions:

- This type indicates input by the user. or a section of output that demonstrates a point to the user.
NOTE: EOAP commands in this document are CASE SENSITIVE.
- This typeface indicates output from the machine. A section of output that demonstrates a point to the user is indicated in bold.
- The following UNIX prompts appear throughout this document:
- you are logged in as root
% - you are logged in as ccspj
ok - the operating system is halted
- When describing components within a section which relates to multiple systems, system-specific components are clearly identified, for example, (Eagle STP Only) or (IP⁷ SG Only).
- Components that are specific to a release are labeled with the system and release number; for example, IP⁷ SG 4.0 or later; or Eagle 27.2 or earlier.

Eagle STP Documentation Suite

Tekelec delivers with each system a documentation suite containing to a minimum all required documentation for the ordered system. The documentation suite may include additional manuals for informational purposes.

Eagle STP documentation may be delivered on CD-ROM, in paper copy, or published on Tekelec's secure customer support web site depending on contractual agreements. The secure web site is only accessible through a SecurID™ token card.

The documentation suite typically includes these type of manuals:

- *Administration Manuals* that describe how to administer application processors on the platform.
- The *Commands Error Recovery Manual* contains procedures for logging into and out of the system; a general description of the terminals, printers, and the disk drive used; a description of all the commands used; and the error messages generated by these commands.
- The *Commands Manual* contains software commands for the system, a general description of the terminals, printers, and the disk drive used.

For quick reference, a pocket guide may be included.

- The *Database Administration Manual(s)* contain(s) procedural information required for configuring the system and the system database.
- *Feature Manuals* that each describe a single major feature supported on one of the platforms.
- The *Hardware Manual* contains hardware descriptions and specifications.
- The *Installation Manual* contains cabling requirements, schematics, and procedures for installing the system.
- The *Maintenance Manual* contains procedural, preventive, and corrective maintenance information required for maintaining the system.

For quick reference, pocket guides for maintenance procedures or emergency recovery may be included.

- The *Release Documentation* may contain the following documents for a specific release of the system:
 - *Feature Notice*—Contains a description of the features contained in the specified release. This document is also available on the customer secure web site with the most current information.
 - *Release Notice*—Describes the changes made to the system for the specified release. This document is also available on the customer secure web site with the most current information.

- *Documentation Bulletins*—Announces changes to customer documentation and its re-release.
- *System Overview*—Provides high-level information about the system.
- *Technical Bulletins*—Contain updates to methods or procedures used to maintain the system.
- *Cross-Reference Index*—Lists all first-level headings used throughout the documentation suite.
- *Master Glossary*—Contains an alphabetical listing of terms, acronyms, and abbreviations relevant to the system.

Documentation Packaging, Delivery, and Updates

Customer documentation is provided with each system and is shipped to the sites specified by the customer. The number of documentation sets provided are in accordance with the contractual agreements.

Customer documentation is updated whenever significant changes are made that affect system operation or configuration. Updates may be issued in the form of an addendum or a reissue of the relevant documentation.

The document part number is shown on the title page along with the current revision of the document and the date of publication. The bottom of each page contains the document's date of publication and the document's part number.

When a document is reissued, the following information changes:

- The title page and revision number, the date of publication, and the new software release number, if applicable.
- The date of publication and the document part number, if applicable, on the bottom of each page.

Documentation Bulletins announce changes to customer documentation and include part number and new revision level of the affected manual. The bulletins are posted on the Customer Secure web site and distributed via electronic mail to customers on the distribution list.

Tekelec Technical Services

Tekelec Technical Services provides a point of contact through which support can be provided for problems that may be encountered during normal operation of the system.

For technical assistance, call Tekelec Technical Services at one of the following locations:

- Tekelec, USA (Home Office)
 - 1-888-FOR-TKLC or 1-888-367-8552 (toll free, within continental US and Canada)
 - 1-919-460-2150 (outside continental US)
- **E-mail:**
support@tekelec.com
- Tekelec, Brazil - +55 11 3040 5671
- Tekelec, China - +65 6248 4510
- Tekelec, India - +91 11 5152 8492
- Tekelec, Singapore - +60 3216 4275
- Tekelec, UK and Europe
 - 07071 232453 or 07071 2 EAGLE (within UK)
 - +44 7071 232453 or +44 1784 43 7067 (outside UK)

Or you can request assistance by way of electronic mail at eaglets@tekelec.com.

Once a Customer Service Request (CSR) is issued, Technical Services, along with the customer, determines the classification of the trouble.

Problem Criteria, as defined in this document and in Reference [1].

Problem – Critical

Critical problems severely affect service, capacity / traffic, billing, and maintenance capabilities and requires immediate corrective action, regardless of time of day or day of the week, as viewed by a customer upon discussion with the supplier. For example:

- A loss of service that is comparable to the total loss of effective functional capacity of an entire switching or transport system.
- A reduction in capacity or traffic handling capacity such that expected loads cannot be handled.
- Any loss of safety or emergency capability (for example, 911 calls).

Problem – Major

Major problems cause conditions that seriously affect system operations, maintenance, and administration, etc., and require immediate attention as viewed by the customer upon discussion with the supplier. The urgency is less than in a critical situations because of a lesser immediate or impending effect on system performance, customer, and the customer's operation and review. For example:

- Reduction in any capacity / traffic measurement function
- Any loss of functional visibility and / or diagnostic capability
- Short outage equivalent to system or subsystem outages, with accumulated duration of greater than two minutes in any 24-hour period, or that continue to repeat during longer periods
- Repeated degradation of DS1 or higher rate spans or connections
- Prevention of access for routine administrative activity
- Degradation of access for maintenance or recovery operations
- Degradation of the system's ability to provide any required critical or major trouble notification
- Any significant increase in product related customer trouble reports
- Billing error rates that exceed specifications
- Corruption of system or billing databases

Problem – Minor

Other problems that a customer does not view as critical or major are considered minor. Minor problems do not significantly impair the functioning of the system and do not significantly affect service to customers. These problems are tolerable during system use.

Engineering complaints are classified as minor unless otherwise negotiated between the customer and supplier.

Response

If a critical problem exists, emergency procedures are initiated (see "Emergency Response"). If the problem is not critical, information regarding the serial number of the system, Common Language Location Identifier (CLLI), and initial problem symptoms and messages is recorded and a primary Technical Services engineer is assigned to work the Customer Service Report (CSR) and provide a solution to the problem. The CSR is closed when problem has been resolved.

Emergency Response

In the event of a critical service situation, emergency response is offered by Tekelec Technical Services. **Call 24 hours a day, 7 days a week:**

- Tekelec, USA (Home Office)
 - **1-888-FOR-TKLC or 1-888-367-8552 (toll free, within continental US and Canada)**
 - **1-919-460-2150 (outside continental US)**
- **E-mail:**
support@tekelec.com
- Tekelec, Brazil - **+55 11 3040 5671**
- Tekelec, China - **+65 6248 4510**
- Tekelec, India - **+91 11 5152 8492**
- Tekelec, Singapore - **+60 3216 4275**
- Tekelec, UK and Europe
 - **07071 232453 or 07071 2 EAGLE (within UK)**
 - **+44 7071 232453 or +44 1784 43 7067 (outside UK)**

Emergency response provides immediate coverage, automatic escalation, and other features to ensure a rapid resolution to the problem.

Previously Released Features (Alphabetical Order)

The following features and enhancements were previously released for the Eagle STP (listed in alphabetical order):

- 18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)
- 24-Bit ITU-N Point Code Support Feature (Release 31.0)
- 56 Million G-Flex Entries (Release 29.1) (IP7 Release 7.1)
- 2500 Routing Keys (IP7 Release 7.1)
- 4000 Routesets (Release 23.0)
- 40,000 GTT Capacity (Release 28.0) (IP7 Release 6.0)
- 48 Million Numbers (Release 27.0)
- 5 Minute Linkset Data (Release 25.0)
- 500 SS7 Links (Release 21.0)
- 5000 Routes (Release 26.1)

- 5-8 Bit Sequencing Assurance (Release 24.0)
- 15 Minute Measurements (Release 31.3)
- 6000 Routesets (Release 29.0)
- 65,535 Entries per Translation Type (Release 22.0)
- 8-Bit SLS Support (Release 21.0)
- Additional Integrated Sentinel Support (Release 28.2)
- Administrable SLTMs (Release 20.0)
- AINF Applique (Release 21.0)
- Alarm Enhancements (Release 26.0)
- Allow a Mated Application to Work as Primary-Secondary and Secondary-Primary (Release 22.0)
- Allowed Affected Destination Field Screen (Release 22.0)
- Allowed CDPA Screen on SCCP Management Format ID (Release 22.0)
- Alternate Command Keywords (Release 20.0)
- ANSI G-Flex Support at 1700 TPS per DSM (Release 30.3)
- ANSI/ITU MTP Gateway (Release 20.0)
- ANSI-ITU-China SCCP Conversion (Release 31.3)
- ANSI/ITU SCCP and TCAP Conversion (Optional) (Release 22.2)
- ANSI/ITU SCCP and TCAP Conversion (Release 24.0)
- Backup Provisioning Network Interface (Release 29.0)
- Calling Name Conversion Facility (CNCF) (Release 23.1)
- Calling Name Conversion Facility (CNCF) with Redirect Capability (Release 24.0)
- CDU for DSM (Release 26.05)
- CgPA GWS Routing Indicator Enhancement (Release 31.3)
- Change Default ATM CLP Bit for Data Cells from 1 to 0 (Release 31.3)
- Changeover and Changeback Procedure for Processor Outage and LIN (Release 21.0)
- Cluster Routing and Management Diversity (Release 21.0)
- Command Class Management (Release 29.0)
- Command Output Changes (Release 22.0)

- Configuring the Frequency of RST Messages on Low Priority Routes (Release 22.0)
- Configuring the Unauthorized Use Warning Message (Release 22.0)
- Congestion Abatement Reporting (Release 21.0)
- Consistent Command Response Conversion (Release 22.2)
- Consistent Command Response Conversion (Release 24.0)
- Cost Factor on Routing (Release 20.0)
- Customer Definable Alarms (Release 20.0)
- Database Integrity Enhancements (Release 20.0)
- Database Transport Access (DTA) (Release 20.0)
- Delay Vs. Throughput (IP7 Release 5.0)
- Disallow Simultaneous Logins Sessions with the Same User ID (Release 21.0)
- Disk Coherency Tests (Release 20.0)
- Disk Copy Fixed to Fixed (Release 20.0)
- Display Inhibited Alarms (Release 29.0)
- Eagle OA&M IP Security Enhancements (Eagle R30.0/IP7 SG R8.0)
- E1 Administration and Alarms (Release 26.3)
- E1 ATM High Speed Link (Release 28.1) (IP7 Release 6.0)
- E1/T1 Multi-Channel Interface Module (Release 28.0) (IP7 Release 6.0)
- Eagle Alarm Modifications for Synchronization with Harris (Release 31.5)
- Eagle Initiated OAP User Interface (Release 24.0)
- Eagle Measurement Reports (Release 20.0)
- Eagle Support for Integrated Sentinel (Release 28.0)
- EDCM Support (IP7 Release 4.0)
- ELAP Network Address Translation (NAT) (Eagle R30.0/IP7 SG R8.0)
- Embedded OAP (Release 24.0)
- End Office Support (IP7 Release 5.0)
- Enhance RTRV-LOG (Release 31.3)
- Enhanced Bulk Download (Release 25.0)
- Enhanced Database Status Reports (Release 20.0)

- Enhanced GPL Management (Release 25.0)
- Enhanced GSM Map Screening (Release 31.4)
- Enhanced GTT (Release 26.0)
- Enhanced Link Diagnostics (Release 22.0)
- Enhanced Load Distribution (Release 21.0)
- Enhanced Routing Key Support (IP7 Release 2.0)
- Enhanced Software Loading (Release 20.0)
- Enhancement to GTT Failure Messages (Release 25.0)
- Enhancements to GWS Reject Messages (Release 25.0)
- Enlarged LNP SPID and NPANXX Support (Release 24.0)
- Entering a Global Title Translation to a Non-Mated Application without Adding the Application as Mated Application (Release 22.0)
- EOAP / OAP Support of HSOP Protocol (Release 28.0)
- EPAP 2.0 Alarm Migration from ELAP (Eagle 28.0)
- EPAP / ELAP 2.0 Security and UI Enhancements (Release 28.0)
- EPAP Provisioning Performance Enhancements (Release 29.0)
- EPAP Security Enhancements (Release 29.0)
- EPAP Support of Eagle's ITU Duplicate Point Code (Release 29.0)
- Equipment Identity Register (EIR) (Release 31.0)
- Error Message Reporting Enhancement (Release 21.0)
- Ethernet B Interface for IPGWx and IPLIMx (Release 28.1) (IP7 Release 6.0)
- Expanded Terminal Output Groups (Release 31.3)
- Extended Bus Interface (Release 20.0)
- Extension Shelf Backplane (Release 23.0)
- False Link Congestion Management (Release 21.0)
- Feature Control Mechanism (IP7 Release 3.0)
- File Transfer Utility (Release 20.0)
- Flash Memory Management (Release 23.0)
- Flexible Point Code Formatting (Release 26.0)
- Force Change of an Assigned Password at First Login (Release 21.0)

- FTP Retrieve and Replace (Release 29.0) (IP7 Release 7.0)
- Gateway Threshold Exceeded Notification (Release 22.0)
- Gateway Threshold Exceeded Notification (Release 22.0)
- General Purpose Service Module-II (GPSM-II) for MCAP Slot (Release 28.0)
- G-Flex C7 Relay (Release 26.2)
- Global Title Modification (Release 28.1) (IP7 Release 6.0)
- Global Title Translation (GTT) (Release 20.0)
- G-Port MNP (Release 26.2)
- G-Port MNP Circular Route Prevention (Release 28.1)
- GR-376 Enhancements
- GR-376 Interface (Release 26.0)
- Group Ticket Voucher (Release 23.0)
- Group Ticket Voucher for SCCP Cards (Release 27.0)
- GSM MAP Screening (Release 26.1)
- GSM MAP Screening Duplicate/Forward (Release 29.0)
- GTT by TT Measurements and GR-376 Enhancements (Release 26.0)
- GTT Error Reporting Enhancements (Release 21.0)
- GTT Table Increase (Release 29.0)
- GTT UIM 21 Digit Length Enhancement (Release 29.0)
- GWS Error Reporting Enhancement (Release 21.0)
- High Speed Master Timing (Release 26.0)
- High-Speed Multiplexer (HMUX) (Release 27.2)
- Holdover BITS Clock Support (Release 21.0)
- Idle Terminal Port Logout (Release 21.0)
- IETF M3UA for “A” Link Connectivity (Release 28.1)
- IETF M3UA Support including IETF SUA (IP7 Release 5.0)
- IETF Protocol Update (Release 28.1) (IP7 Release 6.0)
- IETF SCTP for “A” Link Connectivity (Release 28.1)
- IETF SCTP Support (IP7 Release 5.0)

- IETF SUA for “A” Link Connectivity (Release 28.1)
- Implementation of SNMP Agent (IP7 Release 2.0)
- Improved Routing Management (Release 20.0)
- IMT Fault Isolation (Release 22.0)
- IMT Subsystem Alarms (Release 20.0)
- INAP-based Number Portability (INP) (Release 26.05)
- Increase Gateway Screening Screen Sets to 255 (Release 22.0)
- Increase GTT Entries per TT to 200,000 (Release 29.0)
- Increase in Time Zones (Eagle R30.0 / IP7 SG R8.0)
- Increase the Number of Mated Application Entries (Release 22.0)
- Increased Linkset Capacity (Release 28.0)
- Increasing the Size of the Service Provider ID Table (Release 23.2)
- INP Number Normalization (Release 26.3)
- Interim Global Title Modification (IP7 Release 2.2)
- Intermediate GTT Loadsharing (Release 28.1)
- Intrusion Alert (Release 21.0)
- IP7 Internationalization (IP7 Release 4.0)
- IPMX / MCAP / TDM Replacement (Eagle R30.0 / IP7 SG R8.0)
- IP7 Transport Feature (Release 26.1)
- IPLIM Protocol Support Enhancement (Release 28.1) (IP7 Release 6.0)
- IPLIMx to 8 Points (Release 29.1) (IP7 Release 7.1)
- IP-SCP with LNP Capability (Lab Only) (IP7 Release 1.0)
- IP-SCP with LNP Capability (IP7 Release 2.0)
- IP User Interface: Telnet Support (Release 29.0) (IP7 Release 7.0)
- IS-41 to GSM Migration (Release 30.1)
- ISCC Interface Loopback Test (Release 22.0)
- ISUP Message Type Screening (Eagle R30.0 / IP7 SG R8.0)
- ISUP-Over-IP Gateway for Connectivity to IP-SEPs (IP7 Release 1.0)
- ISUP Normalization Administration (IP7 Release 5.0)
- ISUP Normalization in the IP7 SG (IP7 Release 4.0)

- ITU Duplicate Point Code Routing (Release 26.05)
- ITU Gateway Measurements Enhancements (PR19536) (Release 26.05)
- ITU MTP Restart (Release 26.0)
- ITU SLS Enhancements (Release 26.0)
- ITU-TFR Procedure (Release 26.1)
- KSR Terminal Feature (Release 20.0)
- Large System (Release 27.2)
- Large System—Phase 2 (Release 28.0)
- Large System (Phase 3)—1500 Links (Release 29.0)
- Last 10 Command Retrieval (Eagle R30.0/IP7 SG R8.0)
- Link Failure Status Information (Release 22.0)
- Link Fault Sectionalization (Release 21.0)
- Link Maintenance Enhancements/LFS Increase for MPL-T and MIM (Release 31.3)
- Link Status Reporting (Release 21.0)
- Linkset ID to Measurements Report (Eagle R30.0/IP7 SG R8.0)
- Linkset Name Increase—ANSI/ITU (Eagle R30.0/IP7 SG R8.0)
- LNP 96 Million TNs—EAGLE 5 (Eagle R30.0/IP7 SG R8.0)
- LNP AIN Query Enhancement (PR28376) (Release 26.0)
- LNP Measurements Enhancements (Release 25.0)
- LNP Message Relay Enhancement (PR28810) (Release 26.0)
- LNP Response to STPLAN (PR28660) (Release 26.0)
- LNP—10 Digit Telephone Number Subscription Commands (Release 22.0)
- LNP—Allow Subsystem Command (Release 22.0)
- LNP—Automatic Call Gapping (Release 22.0)
- LNP—Automatic Call Gapping Commands (Release 22.0)
- LNP—Call Completion to Ported Number (CCPN) (Release 22.0)
- LNP—Change Database Command (Release 22.0)
- LNP—Changes to Existing Commands (Release 22.0)
- LNP—clr-disk-stats Command (Release 22.0)

- LNP—Degraded Mode (Release 22.0)
- LNP—Destination Point Code Exception Report (Release 23.1)
- LNP—disp-disk-stats Command (Release 22.0)
- LNP—Eagle LNP Configuration (Release 22.0)
- LNP—Element Manager System (EMS) (Release 22.0)
- LNP—Enhanced Global Title Translation Routing Services (Release 22.0)
- LNP—Impact of LNP on Other Features (Release 22.0)
- LNP—Inhibit Subsystem Command (Release 22.0)
- LNP—Location Routing Number Commands (Release 22.0)
- LNP—Mapping LNP Translation Type Commands (Release 22.0)
- LNP—Measurements (Release 22.0)
- LNP—Message Relay (Release 22.0)
- LNP—MSU Trap and Trace Command (Release 22.0)
- LNP—MTP and SCCP Management to Support LNP (Release 22.0)
- LNP—New LNP Input and Output Groups (Release 22.0)
- LNP—New Unsolicited Alarm Messages (UAMs) (Release 22.0)
- LNP—New Unsolicited Information Messages (UIMs) (Release 22.0)
- LNP—NPANXX Commands (Release 22.0)
- LNP—Query Routed as Final Global Title Translation (Release 22.0)
- LNP—Query Routed as Non-Final Global Title Translation (Release 22.0)
- LNP—Report LNP Status Command (Release 22.0)
- LNP—Rerouting Messages for the Local Subsystem (Release 22.0)
- LNP—Retrieve LNP Database Time Stamp Command (Release 22.0)
- LNP—SCCP Management on the LIMs (Release 22.0)
- LNP—Service Commands (Release 22.0)
- LNP—Service Provider Commands (Release 22.0)
- LNP—Split NPA Commands (Release 22.0)
- LNP—Subsystem Application Commands (Release 22.0)
- LNP—System Options Commands (Release 22.0)
- LNP Short Message Service (Release 28.2)

- Login Failure Message (Release 21.0)
- Login Success or Failure Tracking (Release 21.0)
- Logout on Communications Failures (Release 22.0)
- LRN Table Increase (Release 26.1)
- M2PA on IPLIMx (Release 29.1) (IP7 Release 7.1)
- M3UA Protocol Enhancements (Eagle R30.0 / IP7 SG R8.0)
- Management of Unused User IDs (Release 21.0)
- Manual Deactivation of SRST Message (Release 21.0)
- MAP Table Increase (Release 29.0)
- Measurements Enhancements (Release 22.0)
- Measurements Platform Filename with CLLI (Release 31.3)
- Measurements Platform—Phase 1 (Release 28.0)
- Miscellaneous Command Adjustments (Release 26.0)
- Miscellaneous Command Adjustments (Release 26.1)
- MTP and other MRN Message Format Improvements (Release 21.0)
- MTP Circular Route Detection (Release 21.0)
- MTP Restart (Release 21.0)
- Multiple Capability Point Codes (Release 21.0)
- Multiple Flash Download (Release 29.0)
- Multiple LFS Tests (Release 26.0)
- Multiple Point Code Support (Release 26.05)
- Multi-Port LIM (Release 27.1) (IP7 Release 6.0)
- National Spare Network Indicator Support (Release 22.2)
- National Spare Network Indicator Support (Release 24.0)
- NEBS Compliance (Release 20.0)
- Nested Cluster Routing (Release 26.0)
- Network Routing (Release 26.0)
- Network Security Enhancements (Release 29.0)
- Network Surveillance Enhancements (Release 28.0)
- New Control Shelf Backplane (Release 23.0)

- New Hardware (Release 23.1)
- New Hardware (Release 26.05)
- Non-ANSI Point Code Support (Release 20.0)
- Non-Generation of Duplicate SEAS Autonomous Messages (Release 22.0)
- Non-SCCP/ISUP Routing (Lab Only) (IP7 Release 1.0)
- Non-SCCP/ISUP Routing (IP7 Release 2.0)
- Notification of Congestion Level Increase (Release 22.0)
- Notification of Inability to Perform a Global Title Translation (Release 22.0)
- Notification of Link Set Outage (Release 22.0)
- Notification of Link Set Recovery (Release 22.0)
- Notification of Locally Initiated Database Copy (Release 22.0)
- Notification of MTP-Level Routing Error (Release 22.0)
- Notification of Recovery from Link Congestion (Release 22.0)
- Number Pooling (Release 24.0)
- Number Pooling/Efficient Data Representation (EDR) (Release 26.1)
- OAP Upgrade Enhancement (Release 27.2)
- OCTRETRN in 30-Minute Measurements Reports (Release 31.4)
- Online Cartridge Formatting (Release 20.0)
- Option for Subsystem Prohibit (Release 29.0)
- Password Aging (Release 21.0)
- Password Encryption (Release 21.0)
- Password Requirements (Release 21.0)
- PCS 1900 LNP Query (Release 26.0)
- Performance Enhancements (IP7 Release 3.0)
- Persistent Device States (Release 29.0)
- Point-to-Point Connectivity for ITU Point Codes (IP7 Release 2.2)
- Portability Check for Mobile Originated SMS (Release 29.1)
- Prepaid SMS Intercept - Phase 1 (Release 28.1)
- Prevention of Congestion from Rerouted Traffic (Release 21.0)

- Prevention of Link Oscillation (Release 21.0)
- Preventive Cyclic Retransmission (PCR) (Release 20.0)
- Priority Processing of Network Management Messages (Release 21.0)
- Prohibit Removing the Last Route to a Destination if that Destination is being Referenced by Mated Applications or Concerned Signaling Point Code Groups (Release 22.0)
- Prohibit the Assigning of a Linkset with Linkset Types A or E to a Cluster Route (Release 22.0)
- Provisioning Range for Gateway Screening (Release 22.0)
- Quality of Service Enhancements (IP7 Release 3.0)
- Random SLS Generation (Release 28.0)
- Remote Loopback Testing for DS0A (Release 21.0)
- Remote Loopback Testing for OCU (Release 21.0)
- REPT-STAT-CLK Enhancements for Clocking (Release 28.2)
- REPT-STAT-TRBL Enhancement (Release 29.0)
- RTRV-TBL-CAPACITY Enhancement (Release 29.0)
- Response to Commands Issued Prior to Login (Release 21.0)
- Revoking a User ID (Release 21.0)
- Routing Key Enhancements (IP7 Release 3.0)
- SCCP Message Type Screening (Release 22.0)
- SCCP/TCAP Over IP Gateway for Point-to-Multipoint Connectivity (IP7 Release 1.0)
- SCCS Interface Support (Release 21.0)
- SCTP Checksum Update (Eagle R30.0/IP7 SG R8.0)
- SCTP Retransmission Control (Release 28.1) (IP7 Release 6.0)
- SEAS Enhancements (Release 26.0)
- SEAS Enhancements, Autonomous Messages (Release 22.0)
- SEAS Gateway Audit Command (CHK-UNREF-ENT) (Release 22.0)
- SEAS Interface Support (Release 21.0)
- SEAS Verify Signaling Route-Set Status and SCCP Application Status Command (VFY-SRSAPST) (Release 22.0)
- Security Log Increase (Release 26.05)

- Selective Alarm Inhibiting (Release 22.0)
- Selective Homing of EPAP RTDBs (Release 29.0)
- Simplifying BIP (Board ID PROM) for Eagle STP Boards (Release 23.1)
- Single Slot Enhanced DCM (Release 28.1) (IP7 Release 6.0)
- Split Allowed CGPA Table (Release 22.0)
- Split of Allowed SIO Table (Release 22.0)
- SS7 Message Rejection Due to Screening (Release 22.0)
- SS7 over High-Speed Signaling Link (Release 23.0)
- SS7-Over-IP Gateway for Point-to-Point Links (IP7 Release 1.0)
- STP LAN Feature (Release 20.0)
- STPLAN Port to DCM (Release 26.0)
- STPLAN with Default Router (Release 23.0)
- Support 12 Million Ported Numbers (Release 24.0)
- Support 12 Million Ported Numbers (Release 25.0)
- Support Changing the Linkset Name (Release 28.0)
- Support for IP7 8.0 Gateway Features—EAGLE 5 (Eagle R30.0/IP7 SG R8.0)
- Support for LSMS Audit Enhancements (Release 26.1)
- Support for LSMS Split Provisioning (Release 26.1)
- Support for Matching Self-ID Rule in SEAS CHG-SID (Release 22.0)
- Support for MTP Status Functions (IP7 Release 2.0)
- Support for Provisioning Multiple EPAPs (Release 29.0)
- Support for Secure Gateway Functionality through IP7 7.0 (Release 29.0)
- Support for TALI Architecture (IP7 Release 4.0)
- Support for the CLLI Parameter for Adding or Changing Linksets (Release 22.0)
- Support for the New Linkset Name Parameter for Changing the Attributes of a Route (Release 22.0)
- Support for Up to 41 IPLIMx DCMs (IP7 Release 2.2)
- Support LSMS Disaster Recovery (Release 23.1)
- Support of E1 Interface for SS7 Signaling Links (Optional) (Release 22.2)

- Support of E1 Interface for SS7 Signaling Links (Optional) (Release 24.0)
- Support of E1 Master Clock Interface for SS7 Signaling Links (Optional) (Release 22.2)
- Suppression of Gateway Measurements on Non-Gateway Linksets (Release 25.0)
- TALI “A” Link Connectivity (Release 28.0)
- TALON Development Kit (IP7 Release 2.0)
- Temporary Alarm Inhibiting and Offline Functions (Release 25.0)
- Thresholding of UIM Messages (Release 25.0)
- Translation Type Mapping (Release 21.0)
- Triggerless LNP (Release 24.0)
- TSM Warm Restart and Incremental Loading (Release 26.0)
- TT Independence for LNP Queries (Eagle R30.0/IP7 SG R8.0)
- Two-Point IPLIMx (Eagle 27.1)/ Two-Point IPLIMx (IP7 Release 2.2)
- Unregistered Routing Key Treatment (IP7 Release 3.0)
- Upgrade Procedure Enhancements (Release 22.0)
- Use IMT Bus Instead of MBUS (Release 23.0)
- User-Initiated Keyboard Locking (Release 22.0)
- Using the DPC / SSN Parameters and GTA Range in Displaying Global Title Translations (Release 22.0)
- Variable-Length Global Title Translation (Release 26.1) (IP7 Release 2.2)
- Warning Message When LIMs Added with Insufficient TSMs (Release 25.0)
- Weighted SCP Load Balancing (Release 27.2)
- Wireless Number Portability (Release 23.1)
- X.25/SS7 Gateway Feature (Release 20.0)
- Year 2000 Compliance (Release 23.1)

Eagle Release 20.0 Features

- Administrable SLTMs (Release 20.0)
- Alternate Command Keywords (Release 20.0)

- Cost Factor on Routing (Release 20.0)
- Customer Definable Alarms (Release 20.0)
- Database Integrity Enhancements (Release 20.0)
- Database Transport Access (DTA) (Release 20.0)
- Disk Coherency Tests (Release 20.0)
- Disk Copy Fixed to Fixed (Release 20.0)
- Eagle Measurement Reports (Release 20.0)
- Enhanced Database Status Reports (Release 20.0)
- Enhanced Software Loading (Release 20.0)
- Extended Bus Interface (Release 20.0)
- File Transfer Utility (Release 20.0)
- Global Title Translation (GTT) (Release 20.0)
- Improved Routing Management (Release 20.0)
- IMT Subsystem Alarms (Release 20.0)
- KSR Terminal Feature (Release 20.0)
- NEBS Compliance (Release 20.0)
- Non-ANSI Point Code Support (Release 20.0)
- Online Cartridge Formatting (Release 20.0)
- Preventive Cyclic Retransmission (PCR) (Release 20.0)
- STP LAN Feature (Release 20.0)
- X.25/SS7 Gateway Feature (Release 20.0)

Eagle Release 21.0 Features

- 500 SS7 Links (Release 21.0)
- 8-Bit SLS Support (Release 21.0)
- AINF Applique (Release 21.0)
- Changeover and Changeback Procedure for Processor Outage and LIN (Release 21.0)
- Cluster Routing and Management Diversity (Release 21.0)
- Congestion Abatement Reporting (Release 21.0)

- Disallow Simultaneous Logins Sessions with the Same User ID (Release 21.0)
- Enhanced Load Distribution (Release 21.0)
- Error Message Reporting Enhancement (Release 21.0)
- False Link Congestion Management (Release 21.0)
- Force Change of an Assigned Password at First Login (Release 21.0)
- GTT Error Reporting Enhancements (Release 21.0)
- GWS Error Reporting Enhancement (Release 21.0)
- Holdover BITS Clock Support (Release 21.0)
- Idle Terminal Port Logout (Release 21.0)
- Intrusion Alert (Release 21.0)
- Link Fault Sectionalization (Release 21.0)
- Link Status Reporting (Release 21.0)
- Login Failure Message (Release 21.0)
- Login Success or Failure Tracking (Release 21.0)
- Management of Unused User IDs (Release 21.0)
- Manual Deactivation of SRST Message (Release 21.0)
- MTP and other MRN Message Format Improvements (Release 21.0)
- MTP Circular Route Detection (Release 21.0)
- MTP Restart (Release 21.0)
- Multiple Capability Point Codes (Release 21.0)
- Password Aging (Release 21.0)
- Password Encryption (Release 21.0)
- Password Requirements (Release 21.0)
- Prevention of Congestion from Rerouted Traffic (Release 21.0)
- Prevention of Link Oscillation (Release 21.0)
- Priority Processing of Network Management Messages (Release 21.0)
- Remote Loopback Testing for DS0A (Release 21.0)
- Remote Loopback Testing for OCU (Release 21.0)
- Response to Commands Issued Prior to Login (Release 21.0)

- Revoking a User ID (Release 21.0)
- SCCS Interface Support (Release 21.0)
- SEAS Interface Support (Release 21.0)
- Translation Type Mapping (Release 21.0)

Eagle Release 22.0 Features

- 65,535 Entries per Translation Type (Release 22.0)
- Allow a Mated Application to Work as Primary-Secondary and Secondary-Primary (Release 22.0)
- Allowed Affected Destination Field Screen (Release 22.0)
- Allowed CDPA Screen on SCCP Management Format ID (Release 22.0)
- Command Output Changes (Release 22.0)
- Configuring the Frequency of RST Messages on Low Priority Routes (Release 22.0)
- Configuring the Unauthorized Use Warning Message (Release 22.0)
- Enhanced Link Diagnostics (Release 22.0)
- Entering a Global Title Translation to a Non-Mated Application without Adding the Application as Mated Application (Release 22.0)
- Gateway Threshold Exceeded Notification (Release 22.0)
- IMT Fault Isolation (Release 22.0)
- Increase Gateway Screening Screen Sets to 255 (Release 22.0)
- Increase the Number of Mated Application Entries (Release 22.0)
- ISCC Interface Loopback Test (Release 22.0)
- Link Failure Status Information (Release 22.0)
- LNP—10 Digit Telephone Number Subscription Commands (Release 22.0)
- LNP—Allow Subsystem Command (Release 22.0)
- LNP—Automatic Call Gapping (Release 22.0)
- LNP—Automatic Call Gapping Commands (Release 22.0)
- LNP—Call Completion to Ported Number (CCPN) (Release 22.0)
- LNP—Change Database Command (Release 22.0)
- LNP—Changes to Existing Commands (Release 22.0)

- LNP—clr-disk-stats Command (Release 22.0)
- LNP—Degraded Mode (Release 22.0)
- LNP—disp-disk-stats Command (Release 22.0)
- LNP—Eagle LNP Configuration (Release 22.0)
- LNP—Element Manager System (EMS) (Release 22.0)
- LNP—Enhanced Global Title Translation Routing Services (Release 22.0)
- LNP—Impact of LNP on Other Features (Release 22.0)
- LNP—Inhibit Subsystem Command (Release 22.0)
- LNP—Location Routing Number Commands (Release 22.0)
- LNP—Mapping LNP Translation Type Commands (Release 22.0)
- LNP—Measurements (Release 22.0)
- LNP—Message Relay (Release 22.0)
- LNP—MSU Trap and Trace Command (Release 22.0)
- LNP—MTP and SCCP Management to Support LNP (Release 22.0)
- LNP—New LNP Input and Output Groups (Release 22.0)
- LNP—New Unsolicited Alarm Messages (UAMs) (Release 22.0)
- LNP—New Unsolicited Information Messages (UIMs) (Release 22.0)
- LNP—NPANXX Commands (Release 22.0)
- LNP—Query Routed as Final Global Title Translation (Release 22.0)
- LNP—Query Routed as Non-Final Global Title Translation (Release 22.0)
- LNP—Report LNP Status Command (Release 22.0)
- LNP—Rerouting Messages for the Local Subsystem (Release 22.0)
- LNP—Retrieve LNP Database Time Stamp Command (Release 22.0)
- LNP—SCCP Management on the LIMs (Release 22.0)
- LNP—Service Commands (Release 22.0)
- LNP—Service Provider Commands (Release 22.0)
- LNP—Split NPA Commands (Release 22.0)
- LNP—Subsystem Application Commands (Release 22.0)
- LNP—System Options Commands (Release 22.0)
- Logout on Communications Failures (Release 22.0)

- Measurements Enhancements (Release 22.0)
- Non-Generation of Duplicate SEAS Autonomous Messages (Release 22.0)
- Notification of Congestion Level Increase (Release 22.0)
- Notification of Inability to Perform a Global Title Translation (Release 22.0)
- Notification of Link Set Outage (Release 22.0)
- Notification of Link Set Recovery (Release 22.0)
- Notification of Locally Initiated Database Copy (Release 22.0)
- Notification of MTP-Level Routing Error (Release 22.0)
- Notification of Recovery from Link Congestion (Release 22.0)
- Prohibit Removing the Last Route to a Destination if that Destination is being Referenced by Mated Applications or Concerned Signaling Point Code Groups (Release 22.0)
- Prohibit the Assigning of a Linkset with Linkset Types A or E to a Cluster Route (Release 22.0)
- Provisioning Range for Gateway Screening (Release 22.0)
- SCCP Message Type Screening (Release 22.0)
- SEAS Enhancements, Autonomous Messages (Release 22.0)
- SEAS Gateway Audit Command (CHK-UNREF-ENT) (Release 22.0)
- SEAS Verify Signaling Route-Set Status and SCCP Application Status Command (VFY-SRSAPST) (Release 22.0)
- Selective Alarm Inhibiting (Release 22.0)
- Split Allowed CGPA Table (Release 22.0)
- Split of Allowed SIO Table (Release 22.0)
- SS7 Message Rejection Due to Screening (Release 22.0)
- Support for Matching Self-ID Rule in SEAS CHG-SID (Release 22.0)
- Support for the CLLI Parameter for Adding or Changing Linksets (Release 22.0)
- Support for the New Linkset Name Parameter for Changing the Attributes of a Route (Release 22.0)
- Upgrade Procedure Enhancements (Release 22.0)
- User-Initiated Keyboard Locking (Release 22.0)

- Using the DPC/SSN Parameters and GTA Range in Displaying Global Title Translations (Release 22.0)

Eagle Release 22.2 Features

- ANSI/ITU SCCP and TCAP Conversion (Optional) (Release 22.2)
- Consistent Command Response Conversion (Release 22.2)
- National Spare Network Indicator Support (Release 22.2)
- Support of E1 Interface for SS7 Signaling Links (Optional) (Release 22.2)
- Support of E1 Master Clock Interface for SS7 Signaling Links (Optional) (Release 22.2)

Eagle Release 23.0 Features

- 4000 Routesets (Release 23.0)
- Extension Shelf Backplane (Release 23.0)
- Flash Memory Management (Release 23.0)
- Group Ticket Voucher (Release 23.0)
- New Control Shelf Backplane (Release 23.0)
- SS7 over High-Speed Signaling Link (Release 23.0)
- STPLAN with Default Router (Release 23.0)
- Use IMT Bus Instead of MBUS (Release 23.0)

Eagle Release 23.1 Features

- Calling Name Conversion Facility (CNCF) (Release 23.1)
- LNP—Destination Point Code Exception Report (Release 23.1)
- New Hardware (Release 23.1)
- Simplifying BIP (Board ID PROM) for Eagle STP Boards (Release 23.1)
- Support LSMS Disaster Recovery (Release 23.1)
- Wireless Number Portability (Release 23.1)
- Year 2000 Compliance (Release 23.1)

Eagle Release 23.2 Features

- Increasing the Size of the Service Provider ID Table (Release 23.2)

Eagle Release 24.0 Features

- 5-8 Bit Sequencing Assurance (Release 24.0)
- ANSI/ITU SCCP and TCAP Conversion (Release 24.0)
- Calling Name Conversion Facility (CNCF) with Redirect Capability (Release 24.0)
- Consistent Command Response Conversion (Release 24.0)
- Eagle Initiated OAP User Interface (Release 24.0)
- Embedded OAP (Release 24.0)
- Enlarged LNP SPID and NPANXX Support (Release 24.0)
- National Spare Network Indicator Support (Release 24.0)
- Number Pooling (Release 24.0)
- Support 12 Million Ported Numbers (Release 24.0)
- Support of E1 Interface for SS7 Signaling Links (Optional) (Release 24.0)
- Triggerless LNP (Release 24.0)

Eagle Release 25.0 Features

- 5 Minute Linkset Data (Release 25.0)
- Enhanced Bulk Download (Release 25.0)
- Enhanced GPL Management (Release 25.0)
- Enhancements to GWS Reject Messages (Release 25.0)
- Enhancement to GTT Failure Messages (Release 25.0)
- LNP Measurements Enhancements (Release 25.0)
- Support 12 Million Ported Numbers (Release 25.0)
- Suppression of Gateway Measurements on Non-Gateway Linksets (Release 25.0)
- Temporary Alarm Inhibiting and Offline Functions (Release 25.0)
- Thresholding of UIM Messages (Release 25.0)

- Warning Message When LIMs Added with Insufficient TSMs (Release 25.0)

Eagle Release 26.0 Features

Core Features

- GR-376 Interface (Release 26.0)
- GTT by TT Measurements and GR-376 Enhancements (Release 26.0)
- High Speed Master Timing (Release 26.0)
- Miscellaneous Command Adjustments (Release 26.0)
- Multiple LFS Tests (Release 26.0)
- Network Routing (Release 26.0)
- Nested Cluster Routing (Release 26.0)
- PCS 1900 LNP Query (Release 26.0)
- SEAS Enhancements (Release 26.0)
- STPLAN Port to DCM (Release 26.0)
- TSM Warm Restart and Incremental Loading (Release 26.0)

New Engineering Features

- Alarm Enhancements (Release 26.0)

International Features

- ITU MTP Restart (Release 26.0)
- Enhanced GTT (Release 26.0)
- Flexible Point Code Formatting (Release 26.0)
- ITU SLS Enhancements (Release 26.0)

Enhancements

- LNP Response to STPLAN (PR28660) (Release 26.0)
- LNP Message Relay Enhancement (PR28810) (Release 26.0)
- Linkset ID to Measurements Report (Eagle Release 30.0 / IP7 Secure Gateway Release 8.0)

Eagle Release 26.05 Features

Core Features

- Multiple Point Code Support (Release 26.05)
- ITU Duplicate Point Code Routing (Release 26.05)
- Security Log Increase (Release 26.05)
- New Hardware (Release 26.05)

Advanced Database Features

- INAP-based Number Portability (INP) (Release 26.05)

Platform Features

- CDU for DSM (Release 26.05)

Enhancements

- ITU Gateway Measurements Enhancements (PR19536) (Release 26.05)

Eagle Release 26.1 Features

Core Features

- Variable-Length Global Title Translation (Release 26.1) (IP7 Release 2.2)
- IP7 Transport Feature (Release 26.1)
- 5000 Routes (Release 26.1)

International Features

- GSM MAP Screening (Release 26.1)
- ITU-TFR Procedure (Release 26.1)

LNP Features

- Support for LSMS Audit Enhancements (Release 26.1)
- Support for LSMS Split Provisioning (Release 26.1)
- LRN Table Increase (Release 26.1)
- Number Pooling / Efficient Data Representation (EDR) (Release 26.1)

Maintenance Feature

- Miscellaneous Command Adjustments (Release 26.1)

Eagle Release 26.2 Features

Advanced Database Features

- G-Flex C7 Relay (Release 26.2)

International Features

- G-Port MNP (Release 26.2)

Eagle Release 26.3 Features

International Features

- E1 Administration and Alarms (Release 26.3)
- INP Number Normalization (Release 26.3)

Eagle Release 27.0 Features

Core Feature

- Group Ticket Voucher for SCCP Cards (Release 27.0)

LNP Feature

- 48 Million Numbers (Release 27.0)

Eagle Release 27.1 Features

Platform Feature

- Multi-Port LIM (Release 27.1) (IP7 Release 6.0)

Eagle Release 27.2 Features

Core Features

- Large System (Release 27.2)
- Weighted SCP Load Balancing (Release 27.2)

Platform Feature

- High-Speed Multiplexer (HMUX) (Release 27.2)

Engineering Feature

- OAP Upgrade Enhancement (Release 27.2)

Eagle Release 28.0 Features**Core Features**

- Increased Linkset Capacity (Release 28.0)
- Measurements Platform—Phase 1 (Release 28.0)
- E1/T1 Multi-Channel Interface Module (Release 28.0) (IP7 Release 6.0)
- Large System—Phase 2 (Release 28.0)
- Eagle Support for Integrated Sentinel (Release 28.0)
- 40,000 GTT Capacity (Release 28.0) (IP7 Release 6.0)
- TALI “A” Link Connectivity (Release 28.0)
- EPAP 2.0 Alarm Migration from ELAP (Eagle 28.0)
- EPAP/ELAP 2.0 Security and UI Enhancements (Release 28.0)
- Network Surveillance Enhancements (Release 28.0)
- Support Changing the Linkset Name (Release 28.0)

International Features

- Random SLS Generation (Release 28.0)
- EOAP/OAP Support of HSOP Protocol (Release 28.0)

Platform Features

- General Purpose Service Module-II (GPSM-II) for MCAP Slot (Release 28.0)

Eagle Release 28.1 Features

Core Features

- IETF M3UA for “A” Link Connectivity (Release 28.1)
- IETF SCTP for “A” Link Connectivity (Release 28.1)
- IETF SUA for “A” Link Connectivity (Release 28.1)
- IPLIM Protocol Support Enhancement (Release 28.1) (IP7 Release 6.0)
- IETF Protocol Update (Release 28.1) (IP7 Release 6.0)
- SCTP Retransmission Control (Release 28.1) (IP7 Release 6.0)
- Ethernet B Interface for IPGWx and IPLIMx (Release 28.1) (IP7 Release 6.0)

International Features

- Prepaid SMS Intercept - Phase 1 (Release 28.1)
- Global Title Modification (Release 28.1) (IP7 Release 6.0)
- Intermediate GTT Loadsharing (Release 28.1)
- G-Port MNP Circular Route Prevention (Release 28.1)

Platform Features

- E1 ATM High Speed Link (Release 28.1) (IP7 Release 6.0)
- Single Slot Enhanced DCM (Release 28.1) (IP7 Release 6.0)

Eagle Release 28.2 Features

Core Features

- Additional Integrated Sentinel Support (Release 28.2)
- REPT-STAT-CLK Enhancements for Clocking (Release 28.2)

Domestic Marketing Feature

- LNP Short Message Service (Release 28.2)

Eagle Release 29.0 Features

Core Features

- IP User Interface: Telnet Support (Release 29.0) (IP7 Release 7.0)
- FTP Retrieve and Replace (Release 29.0) (IP7 Release 7.0)
- Command Class Management (Release 29.0)
- Persistent Device States (Release 29.0)
- Backup Provisioning Network Interface (Release 29.0)
- EPAP Security Enhancements (Release 29.0)
- EPAP Support of Eagle's ITU Duplicate Point Code (Release 29.0)
- Selective Homing of EPAP RTDBs (Release 29.0)
- Support for Provisioning Multiple EPAPs (Release 29.0)
- EPAP Provisioning Performance Enhancements (Release 29.0)
- Large System (Phase 3)—1500 Links (Release 29.0)
- 6000 Routesets (Release 29.0)
- GTT Table Increase (Release 29.0)
- Increase GTT Entries per TT to 200,000 (Release 29.0)
- MAP Table Increase (Release 29.0)
- Network Security Enhancements (Release 29.0)
- REPT-STAT-TRBL Enhancement (Release 29.0)
- RTRV-TBL-CAPACITY Enhancement (Release 29.0)
- Display Inhibited Alarms (Release 29.0)
- GTT UIM 21 Digit Length Enhancement (Release 29.0)
- Multiple Flash Download (Release 29.0)
- Support for Secure Gateway Functionality through IP7 7.0 (Release 29.0)

International Features

- Option for Subsystem Prohibit (Release 29.0)
- GSM MAP Screening Duplicate / Forward (Release 29.0)

Eagle Release 29.1 Features

Core Features

- M2PA on IPLIMx (Release 29.1) (IP7 Release 7.1)
- IPLIMx to 8 Points (Release 29.1) (IP7 Release 7.1)

International Marketing

- Portability Check for Mobile Originated SMS (Release 29.1)
- 56 Million G-Flex Entries (Release 29.1) (IP7 Release 7.1)

Platform

- 18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)

Eagle Release 30.0/IP7 Secure Gateway Release 8.0 Features

- LNP 96 Million TNs—EAGLE 5
- ELAP Network Address Translation (NAT)
- TT Independence for LNP Queries
- Increase in Time Zones
- ISUP Message Type Screening
- Last 10 Command Retrieval
- Linkset Name Increase—ANSI/ITU
- Linkset ID to Measurements Report
- Support for IP7 8.0 Gateway Features—EAGLE 5
- Eagle OA&M IP Security Enhancements
- IPMX/MCAP/TDM Replacement
- SCTP Checksum Update - IP7 8.0 Gateway Features—EAGLE
- M3UA Protocol Enhancement - s IP7 8.0 Gateway Features—EAGLE
- IS-41 to GSM Migration

Eagle Release 30.3 Features

- ANSI G-Flex Support at 1700 TPS per DSM Card

Eagle Release 31.0 Features

- 24-Bit ITU-N Point Code Support Feature (Release 31.0)
- Equipment Identity Register (EIR) (Release 31.0)

Eagle Release 31.3 Features

- 15 Minute Measurements (Release 31.3)
- ANSI-ITU-China SCCP Conversion (Release 31.3)
- Customer Definable Alarms (Release 20.0)
- Link Maintenance Enhancements / LFS Increase for MPL-T and MIM (Release 31.3)
- Measurements Platform Filename with CLI (Release 31.3)
- Enhanced Software Loading (Release 20.0)
- Expanded Terminal Output Groups (Release 31.3)
- Change Default ATM CLP Bit for Data Cells from 1 to 0 (Release 31.3)
- FTRA 2.1 Compatibility with Eagle 31.3 (Release 31.3)

Eagle Release 31.4 Features

- Enhanced GSM Map Screening (Release 31.4)
- OCTRETRN in 30-Minute Measurements Reports (Release 31.4)

Eagle Release 31.5 Features

- Eagle Alarm Modifications for Synchronization with Harris (Release 31.5)

IP⁷ Secure Gateway Release 1.0

- SCCP/TCAP Over IP Gateway for Point-to-Multipoint Connectivity (IP7 Release 1.0)
- SS7-Over-IP Gateway for Point-to-Point Links (IP7 Release 1.0)
- ISUP-Over-IP Gateway for Connectivity to IP-SEPs (IP7 Release 1.0)
- Non-SCCP/ISUP Routing (Lab Only) (IP7 Release 1.0)
- IP-SCP with LNP Capability (Lab Only) (IP7 Release 1.0)

IP⁷ Secure Gateway Release 2.0

- Non-SCCP/ISUP Routing (IP7 Release 2.0)
- IP-SCP with LNP Capability (IP7Release 2.0)
- Enhanced Routing Key Support (IP7 Release 2.0)
- Implementation of SNMP Agent (IP7 Release 2.0)
- Support for MTP Status Functions (IP7 Release 2.0)
- TALON Development Kit (IP7 Release 2.0)

IP⁷ Secure Gateway Release 2.2

- Point-to-Point Connectivity for ITU Point Codes (IP7 Release 2.2)
- Two-Point IPLIMx (Eagle 27.1)/Two-Point IPLIMx (IP7 Release 2.2)
- Support for Up to 41 IPLIMx DCMs (IP7 Release 2.2)
- Variable-Length Global Title Translation (Release 26.1) (IP7 Release 2.2)
- Interim Global Title Modification (IP7 Release 2.2)

IP⁷ Secure Gateway Release 3.0

- Unregistered Routing Key Treatment (IP7 Release 3.0)
- Feature Control Mechanism (IP7 Release 3.0).
- Performance Enhancements (IP7 Release 3.0)
- Quality of Service Enhancements (IP7 Release 3.0)
- Routing Key Enhancements (IP7 Release 3.0)

IP⁷ Secure Gateway Release 4.0

- IP7 Internationalization (IP7 Release 4.0)
- ISUP Normalization in the IP7 SG (IP7 Release 4.0)
- EDCM Support (IP7 Release 4.0)
- Support for TALI Architecture (IP7 Release 4.0)

IP⁷ Secure Gateway Release 5.0

- IETF SCTP Support (IP7 Release 5.0)

- IETF M3UA Support including IETF SUA (IP7 Release 5.0)
- ISUP Normalization Administration (IP7 Release 5.0)
- End Office Support (IP7 Release 5.0)
- Delay Vs. Throughput (IP7 Release 5.0)

IP⁷ Secure Gateway Release 6.0

International Features

- E1 / T1 Multi-Channel Interface Module (Release 28.0) (IP7 Release 6.0)
- Global Title Modification (Release 28.1) (IP7 Release 6.0)

Platform Features

- E1 ATM High Speed Link (Release 28.1) (IP7 Release 6.0)
- Single Slot Enhanced DCM (Release 28.1) (IP7 Release 6.0)
- IPLIM Protocol Support Enhancement (Release 28.1) (IP7 Release 6.0)
- IETF Protocol Update (Release 28.1) (IP7 Release 6.0)
- SCTP Retransmission Control (Release 28.1) (IP7 Release 6.0)
- Ethernet B Interface for IPGWx and IPLIMx (Release 28.1) (IP7 Release 6.0)
- 40,000 GTT Capacity (Release 28.0) (IP7 Release 6.0)
- Multi-Port LIM (Release 27.1) (IP7 Release 6.0)

IP⁷ Secure Gateway Release 7.0

- FTP Retrieve and Replace (Release 29.0) (IP7 Release 7.0)
- IP User Interface: Telnet Support (Release 29.0) (IP7 Release 7.0)

IP⁷ Secure Gateway Release 7.1

Core Features

- M2PA on IPLIMx (Release 29.1) (IP7 Release 7.1)
- IPLIMx to 8 Points (Release 29.1) (IP7 Release 7.1)
- 2500 Routing Keys (IP7 Release 7.1)

International Marketing

- 56 Million G-Flex Entries (Release 29.1) (IP7 Release 7.1)

Platform

- 18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)

Acronyms

A.....	Ampere
ACL.....	Application Processor Code Loader
ACM.....	Applications Communications Module
AIN.....	Advanced Intelligent Networks
AINF.....	Application Interface Applique
ANSI.....	American National Standards Institute.
AP.....	Application Processor
APD.....	Application Processor DCM bootstrap code
API.....	Application Interface
ASM.....	Application Services Module
ATM.....	Asynchronous Transfer Mode
BITS.....	Building Integrated Timing System
BM.....	Buss Master (Cognitronics)
BOM.....	Bill Of Materials
BP.....	Board Prom
BPDCM.....	Board Prom DCM
Bps.....	Bit per second
CAP.....	Communication & Application Processor
CAR.....	Corrective Action Report
CAS.....	Channel Associated Signaling
CCGT.....	Cancel Called Global Title
CCS.....	Common Channel Signaling
CCSN.....	Common Channel Signaling Node
CE CISPR A.....	Compliance European, Comite Internationale Special des Perturbations Radioelectrique (European Compliance, International Special Committee on Radio Interference, Class A)
CDU.....	CAP Downloadable Utility
CF.....	Control Frame
CLLI.....	Common Language Location Identifier

CI	Clock Interface Card
CME	Common Managed Element
CNAM	Calling Name Delivery Service
COTS	Commercial Off-the-Shelf
CP	Communications Processor
CRC	Cyclid Redundancy Check
CSR	Customer Service Request
D1G	Database Communication 1 Gigabyte Expansion Memory Module
DCM	Database Communications Module
DMS	Disk Management Service
DPC	Destination Point Code
DRAM	Dynamic Random Access Memory
DS0	Digital Signal Level-0 (64 Kbits / sec)
DS1	Digital Signal Level-1 (1.544Mbits / sec)
DSM	Database Services Module
DTA	Data Transport Access
E1	European Digital Signal Level-1 (2.048 Mbits / sec).
EBI	Extended Bus Interface
EDCM	Enhanced Database Communications Module
EF	Extension Frame
EILA	Enhanced Integrated LIM Applique
EMM	Extended Memory Management
EOAM	Enhanced OAM GPL
EOAP	Embedded Operation Support System Applications Processor
ESF	Extended Super Frame
ETSI	European Technical Standards Institute
FAP	Fuse and Alarm Panel
FTA	File Transfer Area
GLS	Generic Loader Services

GPL.....	Generic Program Load
GPLM.....	GPL Management
GPSPM-II.....	General Purpose Service Module
GSM.....	Global System for Mobile Telecommunication
GTT.....	Global Title Translation
GWS.....	GTT Gateway Screening
HCAP.....	High-Speed Communications & Applications Processor
HDLCL.....	High Level Data Link Control
HLR.....	Home Location Register
HMUX.....	High-speed Multiplexor
HS.....	High Speed
HSL.....	High Speed Links
IAD.....	Integrated Access Device
ICM.....	IMT configuration manager task
IETF.....	Internet Engineering Task Force
ILA.....	Integrated LIM Appliques
ILDR.....	IMT loader task
IMT.....	Inter-processor Message Transport
IMTC.....	IMT Control task
IP.....	Internet Protocol
IP ⁷	Tekelec's Internet Protocol to SS7 Interface
IPD.....	IMT Processor DCM operational code
IPMX.....	IMT Power and Multiplexer card
ISDN.....	Integrated Services Digital Network.
IS-NR.....	In Service – Normal
ISR.....	Interrupt Service Routine
ITU.....	International Telecommunications Union
KHz.....	Kilo Hertz (1000 Hertz)
LAN.....	Local Area Network.

LFS.....	Link Fault Sectionalization
LIM.....	Link Interface Module
LNP	Local Number Portability
LIM-AINF.....	A LIM with a software-selectable interface
LSMS	Local Service Management System
M256.....	256 Megabyte Memory Expansion Card
MAP	Mobile Application Part
MAS.....	Maintenance and Administration Subsystem
MASP	Maintenance and Administration Subsystem Processor
MAU.....	Media Access Unit
MBUS	Maintenance Bus
MCA.....	Matrix Controller Assembly
MCAP	Maintenance Communications & Applications Processor
MCP	Measurement Collection and Polling
MCPM.....	Measurement Collection and Polling Module
MDAL	Maintenance Disk and Alarm Card
MF.....	Miscellaneous Frame
MG.....	Media Gateway
MGC.....	Media Gateway Controller
MGCP	Media Gateway Controller Protocol
MIB.....	Maintenance Information Base utility
MIM.....	Multi-Channel Interface Module
MNP	Mobile Number Portability
MPL.....	Multi-Port LIM
MPS	Multi-Purpose Sever
MRN	Mated Relay Node
MSU.....	(SS7) Message Signalling Unit
MTOS	Multi-Tasking Operating System, Industrial Programming Inc.

MTP	Message Transfer Part
NE	Network Element
NEBS	Network Equipment Building System
NPA	Numbering Plan Area
NSD	Tekelec's Network Signaling Division
NXX	Exchanges
OAM	Operations, Administration, & Maintenance
OA&M	Operations, Administration, & Maintenance
OAP	Operations System Support / Applications Processor
OAPF	Operations System Support / Applications Processor Frame
OCU	Office Channel Unit
OEM	Original Equipment Manufacturer
OOS-MT-DSBLD	Out of Service –Maintenance Disabled
OS	Operations Systems
PMTC	Peripheral Maintenance
PSTN	Public Switched Telephone Network
RAM	Random Access Memory
RMA	Return Material Authorization
SCP	Service Control Point (SS7 Network)
SCCP	Signal Connection Control Part
SCM	System Configuration Manager
SCN	Switched Circuit Network
SCSI	Small Computer System Interface
SEAC	Signaling Engineering and Administration Center
SEAS	Signaling Engineering and Administration System
SF	Super Frame
SG	Secure Gateway
SI	Service Indicator
SIP	Session Initiation Protocol

SLS	Signaling Link Selector
SMSC	Short Message Service Center
SNR	Subsystem Normal Routing
SPC	Secondary Point Code
SS7	Signaling System Seven
SSEDCM	Single Slot Database Communications Module
SSP	Service Switching Point (SS7 Network)
SSSTC	Single Slot Sentinel Transport Card
STP	Signal Transfer Point (SS7 Network)
STPLAN	Signaling Transfer Point Local Area Network
T1	The North American telecommunications standard defining a circuit that multiplexes and switches 24 channels and operates at speeds of 1.544 Mbps
TALI	Transport Adapter Layer Interface
TAS	Tone and Announcement Server
TCU	Table Creation Utility
TCP	Transport Control Protocol
TCP/IP	Transmission Control Protocol/Internet Protocol
TDM	Terminal Disk Module
TEKOS	Tekelec Operating System
TOCA	Timing Output Composite Automatic
TOS486	Tekos Operating System for the 486
TOS4M	Tekos Operating System for the 486 implemented via MTOS
TSC	Time Slot Counter
TSM	Translation Services Module
UAM	Unsolicited Alarm Message
UDT	Unit Data Transfer
UIM	Unsolicited Information Message
V.35	ITU Interface Recommendation, V.35
WAN	Wide Area Network

Features Num - E

18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)

Description

EAGLE Release 29.1 requires that the EPAP databases accommodate 56 million G-Flex entries. Additional disk space is being provided by way of a hardware disk replacement, from 18 GB disks to 36 GB disks. All the new space on the data disk (18 GB minus overhead) will be appended to the database file system `/usr/db`. The additional space on the system disk (18 GB minus overhead) will be appended to the swap space. The disk upgrade will occur during a maintenance window, when no software upgrade is scheduled.

Although this feature has been developed specifically for the EPAP, it is not application-specific. This hard drive upgrade could be performed on any MPS server running any GA release.

Upgrade Procedure

The upgrade will be performed as follows:

- The technician will label the disks in the system and the disks in the upgrade kit.

- Using DiskSuite functionality, half of the old disks will be replaced with the new disks, and will sync with the remaining old disks.
- Once the disks have been sync'd, the remaining old disks will be replaced with the remaining new disks. The new disks will then sync again.
- A script will expand the /usr/db and swap file systems to use all the space available.

A backout will be performed as follows:

- The MPS will be brought to run-level zero.
- The technician will remove the 36 GB disks, install all the old disks, and remove the new disks.
- The technician will boot the MPS.
- A script will re-mirror and repair the metadbs.

Hardware Requirements

This feature requires that all four 18 GB disks on an individual MPS be replaced with 36 GB disks. (New MPS's with the EPAP application will be manufactured with the 36 GB disks.)

24-Bit ITU-N Point Code Support Feature (Release 31.0)

The 24-bit ITU-N point code routing label structure is shown in Figure 2-1, where DPC is the Destination point Code, OPC is the Originating Point Code, and SLS is the Signaling Link Selection field.

Figure 2-1. Routing Label Structure

In Figure 2-1, both the DPC and OPC are 24 bits in length, and SLS is the code for signaling link selection for load sharing. Currently, only the least 4 bits of the SLS are used. The upper 4 bits are used as part of CIC in the telephone message label. For other messages, the upper 4 bits of the SLS are set to 0000.

56 Million G-Flex Entries (Release 29.1) (IP7 Release 7.1)

Description

The 56 Million G-Flex Entries feature is a product of the 18GB (P / N 804-1282-01) to 36GB disk (P / N 804-1548-01) hard drive upgrade; see “*18GB to 36GB Hard Drive Upgrade (Release 29.1) (IP7 Release 7.1)*” on page 2-1. As a result of this increased storage capacity, the existing EPAP and Eagle software now can support 56 Million G-Flex entries.

Hardware Requirements

This feature requires the 36 GB disk hard drive (P / N 804-1548-01).

Enhancements to Existing Commands

No commands have been enhanced to support this feature.

Alarms and Error Codes

No new alarms or error codes have been created for this feature.

2500 Routing Keys (IP7 Release 7.1)

Description

This feature increases the total number of routing keys on a SSED CM IPGWx application from 1000 routing keys to 2500, while retaining the DCM IPGWx application to a maximum of 1000 routing keys. The total number of routing keys for each application may be all dynamic, all static, or a combination of both.

The SG supports two types of routing keys for use by the IPGWx application, Static Routing Keys and Dynamic Routing Keys. Both routing keys are stored in one routing key table which is located in RAM on the IPGWx application.

- Static Routing Keys. These routing keys are provisioned via administration commands and are stored in the OAM static database. The SS7IGWx application keeps a copy of the static routing keys in the SS7 Routing Key Table on-board in RAM for quick access.
- Dynamic Routing Keys. Dynamic Routing Keys are provisioned via a request sent over an IP connection and allows an IP connection to automatically direct traffic towards (or away from) themselves by sending messages to the Signaling Gateway.

Note that all IP connections (TALI/TCP, M3UA/SCTP and SUA/SCTP) on the IPGWx application use routing keys. Currently, only TALI sockets have the capability to create dynamic routing keys via dynamic registration. However, this feature makes no assumptions regarding an IP connection's ability to register dynamic routing keys.

New Auto-inhibit Facility

The System Configuration Manager (SCM) software is responsible for determining if the proper GPL should be fully loaded onto the requested card. For IPGWx applications, the SCM software will now calculate the sum of the **chg-sg-opts** command parameters **:srkq** and **:drkq** to see if the total is over 1000.

If the sum is over 1000 and the IPGWx application board is a DCM, the card will be *automatically inhibited*, and the alarm message *Insufficient memory for provisioning* will be displayed. When a DCM IPGWx card is auto-inhibited, it will remain inhibited, unless the following sequence of events occurs.

- The number of routing keys on all IPGWx applications must be reduced to 1000 or less.
- Once the number of routing keys is reduced to 1000, the **chg-sg-opts** command must be issued such that $drkq + srkq \leq 1000$.
- The inhibited IPGWx card must be manually allowed.

Hardware Requirements

This feature requires the SSEDCEM-based IPGWx GPLs (870-2372-xx).

Enhancements to Existing Commands

The following existing commands have been enhanced to support the 2500 Routing Keys feature. For more information on these commands, see the *Commands Manual*.

chg-sg-opts

Use this command to change options for the IP7 Secure Gateway. The parameters **:drkq** and **:srkq** have been enhanced with new maximum range values of 2500.

ent-appl-rtkey

Use this command to configure the Static Routing Key table. This command has been enhanced to support the new maximum size for the routing key table. Its syntax is unchanged.

chg-appl-rtkey

Use this command to change Static Routing Key table entries. This command has been enhanced to support the new maximum size for the Routing Key table. Its syntax is unchanged.

rtrv-appl-rtkey

Use this command to retrieve entries from the static and dynamic Routing Key tables. The range value for the **:num** parameter has increased from 5000 to 10000. Also, the output from this command has been enhanced to report 2500 routing keys. Its syntax remains unchanged.

Alarms and Error Codes**Alarms**

No new alarms have been created to support this feature.

4000 Routesets (Release 23.0)

This feature increases the size of the routing table in the Eagle database from 2000 entries to 4000 entries. With this feature turned on, the user can configure up to 4000 routesets in the database. The Eagle requires that the destination point code of each routeset be entered in the database. So to enter 4000 routesets in the database, 4000 destination point codes must be entered in the database. The size of the destination point code table has been increased from 2000 destination point codes to 4000 destination point codes.

The 4000 routeset feature is activated using the **chg-feat** command. A new parameter, **dstn4000**, has been added to the **chg-feat** command to turn the 4000 routeset feature on. Before the **chg-feat** command can be executed, the link interface modules (LIMs), both low-speed and high-speed, must have the proper memory installed.

All link interface modules (LIMs) running the **ss7ansi**, **ss7gx25**, and **ccs7itu** applications, the low-speed LIMs, must be equipped with one dual inline memory module (DIMM), containing 4 Mbytes of static RAM. All LIMATMs, the link interface module used for the high-speed ATM signaling link, must be equipped with two DIMMs providing a total of 8 Mbytes of memory. This additional memory is required so that the larger routing table can be downloaded to each LIM.

If the **dstn4000** parameter is specified with the **chg-feat** command and even one LIM does not have the proper memory installed, the **chg-feat** command is rejected with this message, and the 4000 routeset feature will not be turned on:

<i>Error Message</i>	E3420 Cmd Rej: Insufficient memory on at least one card for DSTN4000 feature

To verify whether the 4000 routeset feature is on, the **dstn4000** field has been added to the output of the **rtrv-feat** command to show whether the 4000 routeset feature is on or off.

Once the 4000 routeset feature is turned on, the destination point code table can contain up to 4000 destination point codes. The destination point codes are entered with the **ent-dstn** command. The output of the **ent-dstn** command, as well as the **dlt-dstn**, **chg-dstn**, and **rtrv-dstn** commands, shows the capacity of the destination point code table.

The maximum number of destination point codes that the database can contain is set by the **mtpdpcq** parameter of the **chg-stpopts** command, whether or not the cluster routing and management diversity feature is on. The maximum value of the **mtpdpcq** parameter has been changed from 2000 to 4000, but this increase applies only if the 4000 routeset is on.

If the cluster routing and management diversity feature is on, the maximum number of destination point codes contained in the exception list can be changed by the **mtpxlq** parameter of the **chg-stpopts** command. The maximum value of the **mtpxlq** parameter has been changed from 2000 to 4000, but only if the 4000 routeset feature is on.

The minimum value for the **mtpdpcq** and **mtpxlq** parameters remains unchanged at 500.

*Error
Messages*

With the 4000 routeset feature on, the sum of the values of the **mtpdpcq** and **mtpxlq** parameters cannot exceed 4500. When you specify the **mtpxlq** parameter, if the value of this parameter combined with the value of the **mtpdpcq** parameter exceeds 4500, the **chg-stpopts** command is rejected with this message:

```
E2851 Cmd Rej: MTPXLQ cannot exceed available space in the dstn table
```

When you specify the **mtpdpcq** parameter, if the value of this parameter combined with the value of the **mtpxlq** parameter exceeds 4500, the **chg-stpopts** command is rejected with this message:

```
E2880 Cmd Rej: MTPDPCQ cannot exceed available space in the dstn table
```

If the 4000 routeset feature is not on, the maximum value for the **mtpdpcq** and **mtpxlq** parameters remains unchanged at 2000, and the sum of the values of these parameters cannot exceed 2500. The **chg-stpopts** command is rejected if the value for either parameter added to the value of the other parameter exceeds 2500. Either error message E2851 or E2880 appears, depending on which parameter was specified.

With the Cluster Routing and Management Diversity feature on, the output of the **ent-dstn**, **dlt-dstn**, **chg-dstn**, and **rtrv-dstn** commands shows the capacity of the destination point code table.

Alarms

If a user attempts to bring a LIM into service with the **alw-card** command, and the LIM does not contain enough memory to support the 4000 routeset feature, and the 4000 routeset feature is on, a new major alarm, UAM 0433, is generated. The state of the card is automatically set to OOS-MT-DSBLD (out-of-service maintenance disabled).

UAM Messages

```
RLGHNCXA03W 98-04-30 16:28:08 EDT Rel 23.0.0
** 0012.0433 ** CARD 1108 SS7ANSI      Insufficient memory for DSTN4000
```

When the card specified in UAM 0433 has the proper amount of memory installed and the card is brought back into service with the **alw-card** command, UAM 0423 is generated. The state of the card is set to IS-NR (in-service normal). In previous releases, UAM 0423 was reported only for ASM-SCCP cards. In this release, UAM 0423 has been changed to report that the LIMs, in addition to ASM-SCCP cards, are no longer inhibited, and the card is attempting to reload.

```
RLGHNCXA03W 98-04-30 16:28:08 EDT Rel 23.0.0
0012.0423    CARD 1108 SS7ANSI      Card reload attempted
```

40,000 GTT Capacity (Release 28.0) (IP⁷ Release 6.0)

The Eagle currently supports a maximum of 20,400 GTT/sec/system. For many customers, this GTT capacity is insufficient. This is especially true for customers who use a single node, or a single pair of nodes, to centralize GTT for their entire network. This feature allows the Eagle to process a minimum of 40,800 GTT/sec/system.

The 40,000 GTT Capacity feature assumes the use of DSM cards for GTT functionality.

For more information on the GTT feature, refer to the *Database Administration Manual - Features*.

48 Million Numbers (Release 27.0)

The 48 Million Number feature for Eagle Release 27.0 provides the capability to expand the number of ported numbers supported on one Eagle platform from 12 to 48 million numbers. This feature represents both an increase in the number of ported records a single Eagle node can support and a re-architecture of the current LNP solution (i.e. the LSMS-OAP-OAM LNP interface) for increased database update performance.

The terms MPS and ELAP are used to describe the hardware and software that is replacing the EOAP and the LNP functions of the OAM. MPS refers to the hardware and OS software of the new platform. ELAP refers to the 48 million number application running on the MPS.

This feature is optional and requires a corresponding LSMS feature.

General Description

Customer databases of Local Number Portability (LNP) data are constantly growing. Eagle Release 27.0 and LSMS Release 4.0 introduce the 48 Million Number feature to satisfy customer database size requirements. Because of the magnitude of the database size increase, several areas of the existing Eagle/LNP architecture have been upgraded. The following functionality has been changed and improved for Release 27.0:

- Ownership of the "master" or "golden" real-time LNP database has moved from the Eagle OAM to the ELAP.

The data model for the new LNP solution closely resembles that of the International LNP solution. Data is collected at the LSMS from the NPAC (for subscription data) and from local provisioning on the LSMS (for default NPANXX, split NPANXX and other types of LNP records). This data is sent to the active ELAP at an Eagle running Release 27.0 across a TCP/IP connection in the customer's network. The ELAP stores the data locally, and replicates it to the mate ELAP. The ELAP provides real-time database loading and provisioning functions for the Eagle DSM cards, using two dedicated Ethernet networks between the MPS System and the Eagle DSM cards.

When the 48 Million Number feature is enabled, this new data model supersedes the existing Eagle LNP model. The Eagle OAM will not store LNP databases in Release 27.0. Also eliminated with the 48 Million Number feature are the BLM and DCM cards that previously were required to support EBD&A.

- The transmission rate of database updates from the LSMS to the Eagle has increased from 2 TN/sec to 25 TN/sec.

Prior to Release 27.0, LNP updates were sent from the LSMS to the OAP over the customer's network. The minimum OAP hardware in the field today runs on an 85MHz Sparc-4 platform. The OAP translates the data from the LSMS to character based commands resembling SEAS UPL commands for LNP. These commands are sent across a dedicated serial link to an Eagle terminal port at 19,200 Kpbs. The command is then parsed and validated by the Eagle before the real-time database is updated. Real-time updates are sent to SCCP cards serially using a card list.

With Release 27.0, the 48 Million Number feature provides a much faster path for updates. LNP updates are sent from the LSMS to the ELAP over the customer's network. The ELAP performs minimal parsing and validation before updating the real-time database. Real-time updates are sent to the Eagle DSMs in parallel using multicast technology.

- Enhanced Bulk Download and Audit (EBD&A) is supported directly by the ELAP.

The ELAP now provides all of the functionality of EBD&A.

- All cartridge-based bulk download operations have been eliminated.

Bulk loading is accomplished using the EBD&A functionality provided by the ELAP. Since Eagle will not store the real-time database on disk, a cartridge based bulk load is no longer necessary.

- Real-time databases are recovered from one of the mate Eagle's ELAPs in a disaster situation (ELAP failure at one Eagle).

In the unlikely event of a catastrophic failure of the complete MPS system at one Eagle, resulting in the loss of the real-time database, it will be possible to copy the data from one of the MPS servers of the mated Eagle node. After the MPS fault has been corrected, a craftsperson may gain access to it via a modem or through the customer's network. It will then be possible to initiate a connection to one of the MPS servers at the mate Eagle site and initiate a transfer of the real-time database.

- The Eagle security log functionality has been moved to the ELAP.

Figure 2-2 shows the system architecture supporting the 48 Million Number feature.

Attached to each Eagle is an MPS System, consisting of two MPS Servers (Server A and B) and their associated platform software (e.g., Operating System, DBMS, etc.). The servers in the MPS System execute the software developed for the 48 Million Number feature, which is referred to as the "ELAP software."

Throughout the remainder of this description, when the term "ELAP" is used, it means "the ELAP software running on an MPS Server." Thus when we say that there are two ELAPs attached to each Eagle, we mean that there are two MPS Servers attached to each Eagle, both of which are running the ELAP software. These two ELAPs run in a mated-pair configuration, with one behaving as the "active ELAP" and the other as the "standby ELAP."

Figure 2-2. 48 Million Number Architecture

System-Level Requirements

When the 48 million number feature bit is on (see “*Changed Commands*” on page 2-14), the following attributes of the Eagle change:

- OAM-based LNP commands are not be allowed (**tt-serv** is allowed).
- MPS-based LNP commands are allowed (**rtrv-** commands only).
- Enhanced Bulk Download (EBDA) functionality is implicitly inherited by the new architecture

The 48 million number architecture inherits all functionality of the 12 million number architecture (except for a separate bulkdownload component). This includes:

- Support DN to LRN mapping and up to six services for message relay. CLASS,LIDB,ISVM and CNAM message relay service are supported. (Customer-defined services are supported.)
- Support AIN /IN, IS-41 and PCS 1900 LNP query / response.
- Support Measurements (OAM can retain LNP Measurements).
- Support Transaction Log for LNP updates.
- Support for MPS alarming via Eagle terminal.
- Support warm restart / incremental loading of the DSM card.
- Support loading the DSM card.
- Support Warm / Cold Restart of the DSM card (see “*Required Hardware*” on page 2-11)
- Database storage of the LNP data from the LSMS. (**Note: The MPS architecture supports a real-time database only.**)
- LNP Commands (see “*Changed Commands*” on page 2-14 for details) (**tt-serv** and **rtrv-** only)

There is one security log on the ELAP. The security log on the ELAP logs global (across all DSM cards) LNP updates as one entry, regardless of the number of DSM's provisioned. However, actions taken for a specific DSM card by the ELAP are logged on a per-DSM card basis.

The 48 million number architecture does not preclude the operation of the mate STP with the 12 million number architecture.

Required Hardware

To support 48 Million Numbers feature and the increased download rate from the NPAC /LSMS, the following new hardware is being introduced.

DSM

The Database Services Module (DSM) supports 48 million numbers by providing 1 GB daughterboard memory increments up to a total of 4GB. The DSM also provides TCP/IP connectivity directly to the MPS.

Table 2-1 lists the supported DSM configurations.

Table 2-1. DSM Configuration Table

Name	Description	Maximum number of ported numbers supported
DSM1GB	DSM with 1GB populated memory	12,000,000
DSM2GB	DSM with 2GB populated memory	24,000,000
DSM3GB	DSM with 3GB populated memory	36,000,000
DSM4GB	DSM with 4GB populated memory	48,000,000

The DSM does not support the `alloc-mem` command to allocate daughterboard memory. Instead, the memory physically present on the board determines the number of ported records supported.

MPS

The Multi-Purpose Server (MPS) running the ELAP application is designed as a replacement not only for the LNP functionality contained in the EOAP, but also for the LNP database that currently resides on the OAM. The MPS fits into one general purpose frame (GPF).

Upgrade Considerations

ELAP

ELAP software is new software. All initial applications of this feature will be new installations. Future software upgrades will be addressed with the Solaris "pkgadd" utility. The following data must be preserved or re-generated for upgrade:

- Data configured through the user interface
- Security logs
- Data provisioned from the LSMS

Each of these must be addressed by any future upgrade.

Maintenance

Three upgrade considerations affect maintenance:

- Support the EPAP alarms defined in Release 26.05 and 26.1 during upgrade. This must be done for both UAMs and the **rept-stat-mps** output.
- Allow TSM cards to co-exist with DSM cards and support the output in all **rept-stat** reports.
- Allow for the conversion of DSMs from DSM operation to TSM operation via a database restore operation.

Measurements

Measurements data are not preserved from a prior release to the upgrade release during an upgrade. If the customer desires to retain a record of pre-upgrade measurements, a hardcopy of the measurements data can be obtained using the documented LNP measurement report procedures. Alternatively, measurements data can be copied to a Measurements removable cartridge using the **copy-meas** command. The data is then available for offline (non-Eagle) processing. Measurements data cannot be restored to the upgraded Eagle due to potential changes in data formats as a result of the upgrade.

LNP Measurements are preserved when the **lnp48mi1** feature bit is enabled after upgrade.

New Commands

The following new command has been created to support the 48 Million Numbers feature. Refer to the *Command Manual* for current information on this command.

rept-stat-mps

The **rept-stat-mps** command has been created as an *alias* of **rept-stat-epap**. The **rept-stat-mps** command includes the MPS platform status and the EPAP/ELAP status. (The **rept-stat-epap** command is still supported for GPORT/GFLEX/INP customers using EPAP.) The only modification to the **rept-stat-mps** report is to include the six new alarm categories.

NOTE: When the LNP 48 million numbers feature is enabled on your system, the **rept-stat-lsms command is no longer available. Instead, you must use the **rept-stat-mps** command.**

Changed Commands

The following commands have been enhanced to support the 48 Million Numbers feature. For more information on these commands, see the *Commands Manual*.

chg-feat

The **chg-feat** command has been enhanced to allow activation of this feature. The parameter **lnp48mil=on** has been introduced. Once the feature has been turned on, it cannot be turned off.

rtrv-feat

The **rtrv-feat** command has been enhanced to report the status of this feature; it has no parameters.

rpt-stat-lsms

An error response has been added to reject the **rept-stat-lsms** command when the LNP48MIL feature is on.

Alarms

Refer to the *Maintenance Manual* for current alarm information.

5 Minute Linkset Data (Release 25.0)

Release 25.0 adds two new schedules to the Eagle reporting capabilities: D_NM and D_MTCS. Both schedules are available through the Eagle terminal interface, and through the SEAS interface via the OAP.

Figure 2-3 provides a high-level diagram of the capabilities implemented by these new schedules. The D_MTCS schedule is a new capability for generating an on-demand maintenance status report using the **rept-meas** command (Eagle) or the **send-dem-meas** command (SEAS). The report is generated from maintenance block data that is currently maintained within the OAM.

D_NM is a five-minute linkset schedule and supports the **lnkset** entity type. D_MTCS is a snapshot of the maintenance status indicators, and supports the **link** and **lnkset** entity types.

Figure 2-3. Concept Diagram

The D_NM schedule provides five-minute throughput measurements on a per-linkset basis, on demand. The schedule is available through the Eagle HMI or the SEAS interface. Although the reporting of the D_NM schedule is new for Release 25.0, the mechanisms for collecting the data contained in the schedule are currently implemented in the Eagle for link data collection. This feature reorganizes the link data collection to collect on a linkset basis. The linkset measurements are aggregated in a new data store over a five-minute period, and reported in the D_NM schedule. This feature does not impact per-link measurements data reporting.

The D_MTCS schedule provides the current maintenance state (active, out-of-service, or unavailable) of signaling links and linksets. The D_MTCS schedule is available on demand via the **rept-meas** command through the Eagle HMI, or via the **send-dem-meas** command through the SEAS interface. Both interfaces support a parameter to specify reporting current data (**period=active**) for a link or linkset.

Changed Commands

The following commands have been enhanced in support this feature. For more information on these commands, see the *Commands Manual*.

rept-meas

The **rept-meas** command currently supports the parameter **type=nm** if **enttype={link | stp}**. This feature adds **lnkset** to the list of supported values for the **enttype** parameter. The **rept-meas** command has been modified to accept the **type=mtcs** parameter. When the user enters the command:

5-8 Bit Sequencing Assurance (Release 24.0)

The signaling link selection field (SLS) in an MSU is used to balance traffic across the links in each linkset that a message passes through. The originator of the traffic can, by using the same SLS for a group of messages, guarantee that the same links are selected and guarantee that the traffic will be in sequence. In previous releases, the Eagle evenly distributed traffic using a 5-bit SLS by using a 3-bit counter to fill in the three most significant bits in the SLS. This can result in missequencing of MSUs, as shown in the following example and Figure 2-4:

1. Node 1-1-1 generates two messages with the same SLS, intending for them to be sequenced, and transmits them across link 1.
2. STP 2-2-2 converts the 5-bit SLS to an 8-bit SLS, resulting in two different SLS codes. The two messages leave STP 2-2-2 on links 2 and 3 and arrive out of order at node 3-3-3.

Figure 2-4. Example Network for Problem Description

This feature ensures that when a 5-bit SLS is converted to an 8-bit SLS, the MSUs arrive at the destination node in the order that they were generated by the originating node. The Eagle also makes these SLS conversions:

- 5-bit ANSI SLS to 4-bit ITU SLS
- 4-bit ITU SLS to 5-bit ANSI SLS
- 8-bit ANSI SLS to 4-bit ITU SLS

The Eagle does not convert a 4-bit ITU SLS to an 8-bit ANSI SLS.

The 5-bit to 8-bit SLS conversion takes place during the routing process, after the linkset is selected, but before the signaling link is selected. The ITU to ANSI SLS conversion takes place during the ANSI to ITU MSU conversion and after the outgoing signaling link is chosen.

Command Changes

The following commands have been enhanced to support the 5-8 Bit Sequencing Assurance feature. For more information on these commands, see the *Commands Manual*.

- **ent-ls**
- **chg-ls**
- **rtrv-ls**
- **chg-stpopts**
- **rtrv-stpopts**

No new commands have been added for this feature.

ent-ls and chg-ls

A new parameter, **as18**, has been added to the **ent-ls** and **chg-ls** commands to indicate whether the adjacent node is sending MSUs with 8-bit SLSs. This value of this parameter is either **yes** or **no**. The default value for the **as18** parameter of the **ent-ls** command is **no**. The default value for the **as18** parameter of the **chg-ls** command is the current value of the **as18** parameter.

rtrv-ls

The field **as18** has been added to the **rtrv-ls:lsn=** command output showing the value of the **as18** parameter of the **ent-ls** or **chg-ls** command.

chg-stpopts and rtrv-stpopts

A new parameter, **slscnv**, has been added to the **chg-stpopts** command to support the 5-8 Bit Sequencing Assurance feature. The **slscnv** parameter has three values.

Signaling Link Selection Conversion

5-bit to 8-bit SLS conversion is performed under these conditions:

- The incoming linkset is an ANSI linkset
- The **as18=no** parameter is assigned to the incoming linkset
- The outgoing linkset is an ANSI linkset

- The outgoing linkset has either the **slscnv=on** and **slsci=yes** parameters, or the **slscnv=perl**s and **slsci=yes** parameters assigned to it
- The three most significant bits of the SLS are zero.

When an ITU SLS is converted to an ANSI SLS, the ITU SLS is always converted to an ANSI 5-bit SLS. If the MSU containing the converted SLS is rerouted because of a link outage, the SLS may be converted from a 5-bit SLS to an 8-bit SLS.

When an ANSI SLS is converted to an ITU SLS, the ANSI SLS is always converted to an ITU 4-bit SLS.

When a 5-bit ANSI SLS is converted to an 8-bit ANSI SLS, the three most significant bits of the SLS are set using a function of originating point code and incoming port. This ensures that MSUs with the same originating point code, SLS, and incoming port will always have the same SLS after the conversion, guaranteeing that the MSUs arrive at the destination in the same sequence that they were sent.

All ANSI MSUs originating from the Eagle will have an 8-bit SLS.

15 Minute Measurements (Release 31.3)

The 15 minute Measurements feature is controlled by a feature access key and a measurement option. Turning on the feature requires a part number. The feature cannot be turned off once turned on. It is a Permanently ON feature. Upon turn on, the collection period defaults to the 30-minute option to maintain compatibility with the existing system capabilities.

The feature becomes operational when the collection period has been changed to 15 minutes. The collection period can be changed from 30 minutes to 15 minutes (and vice versa) by changing the 15 Minute Measurements collection option of the Measurements Platform options table. When the 15 Minute Measurements collection is disabled, measurements data will be collected and reported each half-hour at hh:00 and hh:30. When the 15 Minute Measurements collection option is selected to enabled, measurements data will be collected and reported four times each hour at hh:00, hh:15, hh:30, and hh:45. The current state of the option is displayed with the Measurements Platform options. Report types supported by 15 Minute measurements are: systot, comp, gtwy, and avl.

Turning on the feature requires a feature access key. This feature cannot be turned off once turned on, therefore it is a Permanently ON feature. When the feature is turned on, the collection period defaults to the 30-minute option to maintain compatibility with the existing system capabilities.

500 SS7 Links (Release 21.0)

In Release 21.0, the maximum number of SS7 signaling links the Eagle can contain is being increased from 268 to 500. For the Eagle to contain 500 SS7 signaling links (a maximum of 250 LIMs), the system configuration has been increased from 3 frames to 6 frames. Each frame can contain 3 shelves, with the exception of the last frame which can contain only 1 shelf, for a maximum of 16 shelves. The numbering of the shelves is 1100 to 6100. This provides card location numbers from 1101 to 6118. Also in Release 21.0, card locations 1111 and 1112 are also configurable in the database. Table 2-2 shows the new numbering scheme for card locations.

Table 2-2. Release 21.0 Card Location Numbering Scheme

	Shelf 1	Shelf 2	Shelf 3
Frame 1	1101 - 1108, 1111 - 1118	1201 - 1208, 1211 - 1218	1301 - 1308, 1311 - 1318
Frame 2	2101 - 2108, 2111 - 2118	2201 - 2208, 2211 - 2218	3201 - 3208, 3211 - 3218
Frame 3	3101 - 3108, 3111 - 3118	2301 - 2308, 2311 - 2318	3301 - 3308, 3311 - 3318
Frame 4	4101 - 4108, 4111 - 4118	4201 - 4208, 4211 - 4218	4301 - 4308, 4311 - 4318
Frame 5	5101 - 5108, 5111 - 5118	5201 - 5208, 5211 - 5218	5301 - 5308, 5311 - 5318
Frame 6	6101 - 6108, 6111 - 6118	Not Equipped	Not Equipped

As a result of the change in the system configuration, the range of values specified for any command that uses the card location or the shelf location as a parameter (the `loc` parameter) have been changed. These commands are:

<code>act-dlk</code>	<code>act-file-trns</code>	<code>act-lpo</code>	<code>act-slk</code>
<code>alw-card</code>	<code>alw-slk</code>	<code>blk-slk</code>	<code>canc-dlk</code>
<code>canc-lpo</code>	<code>canc-slk</code>	<code>cdu</code>	<code>chg-bip-fld</code>
<code>chg-bip-rec</code>	<code>chg-x25-rte</code>	<code>chg-x25-slk</code>	<code>conn-imt</code>
<code>dact-slk</code>	<code>disc-imt</code>	<code>disp-bip</code>	<code>disp-bp</code>
<code>disp-disk-dir</code>	<code>disp-ftp-dir</code>	<code>disp-lba</code>	<code>disp-mem</code>
<code>dlt-bp</code>	<code>dlt-card</code>	<code>dlt-dlk</code>	<code>dlt-ftp</code>
<code>dlt-ip-node</code>	<code>dlt-shlf</code>	<code>dlt-slk</code>	<code>ent-bp</code>
<code>ent-card</code>	<code>ent-dlk</code>	<code>ent-ip-node</code>	<code>ent-shlf</code>
<code>ent-slk</code>	<code>ent-x25-rte</code>	<code>inh-card</code>	<code>inh-slk</code>

<code>init-card</code>	<code>rept-meas</code>	<code>rept-stat-card</code>	<code>rept-stat-db</code>
<code>rept-stat-dlk</code>	<code>rept-stat-slk</code>	<code>rept-x25-meas</code>	<code>rmv-card</code>
<code>rst-card</code>	<code>rtrv-bip</code>	<code>rtrv-card</code>	<code>rtrv-dlk</code>
<code>rtrv-ip-node</code>	<code>rtrv-obit</code>	<code>rtrv-shlf</code>	<code>rtrv-slk</code>
<code>rtrv-trbl</code>	<code>rtrv-x25-rte</code>	<code>rtrv-x25-slk</code>	<code>send-msg</code>
<code>set-mem</code>	<code>tst-bip</code>	<code>tst-dlk</code>	<code>tst-slk</code>
<code>ublk-slk</code>	<code>unhb-slk</code>		

If the Eagle is using the gateway screening, global title translation, X.25 gateway, or STP LAN features, the card requirements to support these features will reduce the maximum number of SS7 signaling links the Eagle can contain. The card requirements for these features are:

- For the gateway screening feature, the Eagle can contain a maximum of 8 ASMs running the `gls` application.
- For the global title translation feature, the Eagle can contain a maximum of 25 ASMs running the `sccp` application.
- There can only be one X.25 signaling link assigned to a LIM.
- For the STP LAN feature, the Eagle can contain a maximum of 20 ACMs.

5000 Routes (Release 26.1)

Some customers with large network configurations require more than 4000 routes, due to the expansion of link capability and/or collapsing networks. This feature is a continuation of route expansion for the Eagle platform, and is intended to replace the 4000 route feature.

The maximum number of administered routes supported in the Eagle STP has been increased from 4000 to 5000 as a system-wide option. The minimum number of x-list entries remains 500.

The Eagle STP now supports, as a system-wide option, the administration and protocol changes required to support 5000 routes. The default for the routing option remains 2000 routes, and 500 x-list entries. No change in x-list capacity is required. Total routes table capacity is 5500 entries.

Changed Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

chg-feat

The **chg-feat** command has been enhanced to allow activation of this feature. The parameter **dstn5000=on** has been introduced. Once the feature has been turned on, it cannot be turned off. This parameter replaces **dstn4000**.

rtrv-feat

The **rtrv-feat** command has been enhanced to report the status of this feature; it has no parameters.

chg-stpopts

The **chg-stpopts** command has been enhanced to allow the number of DPCs and XLIST slots to range from 500 to 5000 (prior to Release 26.1, the maximum number of XLIST slots was 4000). The range for the parameter **mtpdpcq** (number of DPCs allowed) now is 500-5000. The range for the parameter **mtpxlg** (number of XLIST entries which may be dynamically created) also is 500-5000.

rept-stat-rte

This command now reports on the status of up to 5000 routes in the system, as opposed to the 2000 routes allowed in the system when the feature is not turned on.

ent-/chg-/dlt-dstn

No changes are required to the command processing of these **dstn** commands. Current validation concerning available space in the route table is performed, using values read from the STPOPTS table. It is up to the craftsperson to increase the required STPOPTS values to accommodate extra routing table entries, after first turning on the **dstn5000** feature.

rtrv-dstn

The **rtrv-dstn** command's processing remains unchanged, with the exception of its ability to output more DPCs. Additional time is required to print a route table containing 5000 routes, as opposed to the previous 4000.

6000 Routesets (Release 29.0)

The 6000 Routesets feature expands the SS7 routing connectivity between the EAGLE and other nodes by increasing the number of routesets supported by the EAGLE. This allows for the EAGLE to function in larger SS7 networks.

The functionality of this feature applies to all LIM types except LIMs running the GX25 GPL, which will continue to utilize the X.25 2000 Routeset feature. However, the increased 6000 SS7 routeset table will also be downloaded on GX25 card.

NOTE: There is a feature access key for the 6000 Routeset feature. It can not be activated unless the 5000 routeset feature bit is ON and the active and standby OAM is a GPSM-II running the EOAM GPL.

Hardware Requirements

This feature requires the GPSM-II in the active and standby OAM slot, and a TDM change (870-0774-10 or later).

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the 6000 Routesets feature.

chg-stpopts

Use this command to update (change by simple replacement) the values of one or more of the STP node level processing-option indicators maintained in the STP's options table. For this feature, the range of the **:mtpdpcq** and **:mtpxlg** parameters has been changed from 5000 to 6000.

rtrv-stpopts

Use this command to retrieve the current values of the STP's node-level processing option indicators maintained in the STP's options table.

ent-dstn

Use this command to add an SS7 destination address (a destination point code, capability code, or network cluster address), along with its associated destination attributes, to the STP's DESTINATION entity set. The output for this command has been enhanced for this feature.

dlt-dstn

Use this command to delete destinations from the DESTINATION entity set after the STP no longer routes to those destinations. The output for this command has been enhanced for this feature.

chg-dstn

Use this command to modify the attributes of one existing destination. The output of this command has been enhanced for this feature.

rtrv-dstn

Use this command to display the destination point code entries in the destination point code table. The **rtrv-dstn** command's processing remains unchanged, with the exception of the ability to display more DPCs.

65,535 Entries per Translation Type (Release 22.0)

This feature improves the performance of the global title translation subsystem of the Eagle to these levels.

- 850 messages per second
- 21,000 global title translations per second per system
- 65,536 entries per translation type

There is no mechanism to limit the number of global title translation entries to less than 65,537 per translation type. The maximum number of entries in the global title translation table has not changed and is still 270,000 entries. It is possible to enter all 270,000 entries under one translation type. The performance of the global title translation subsystem is not guaranteed when more than 65,536 translations are entered for a single translation type.

The **rtrv-gtt** command output has been changed to show the capacity of the global title translation table is as a percentage of the total number of entries in the system (270,000 entries).

8-Bit SLS Support (Release 21.0)

The signaling link selection (SLS) is a field in the routing label of the MSU. It is set by the originator of the MSU to a random value. It is used by Eagle to pick which outgoing linkset and signaling link to use. MSUs with the same destination and the same SLS take the same path through the network, the same linksets and the same links. The MSUs are guaranteed to arrive at the destination in sequence.

The value of the SLS is used by the Eagle to distribute traffic over the available signaling links in a linkset. The Eagle uses only 16 SLS codes for assignment to linksets or combined linksets. For linksets containing 9 to 15 signaling links, some signaling links are assigned two SLS codes while other signaling links are assigned a single SLS code. This can create an imbalance in traffic distribution and inefficient link utilization. To overcome this problem, the Eagle uses an 8 bit SLS code which provides the Eagle with 256 SLS codes. More SLS codes means the traffic can be distributed more evenly.

Because some signaling points will still be generating messages with a 5 bit SLS, the Eagle provides an option to convert 5 bit SLSs in messages to 8 bit SLSs. This option is set on an outgoing linkset basis. ITU messages continue to use 4 bit SLSs. Messages that go from ITU to ANSI are currently converted from a 4 bit SLS to a 5 bit SLS. If the outgoing linkset uses 5 to 8 bit conversion, the ITU messages are converted to 8 bit SLSs. If the linkset does not use 5 to 8 bit conversion, the ITU messages are converted from 4 bit to 5 bit SLS.

MSUs generated by the Eagle (MTP management, SCCP management, and messages received from X25) will have an 8 bit SLS.

The **slsci** parameter, used with either the **ent-ls** or **chg-ls** commands, indicates whether the 5 bit to 8 bit SLS conversion feature is used to select signaling links for outgoing messages directed to the specified linkset. If the **slsci=yes** parameter is specified, the Eagle replaces any 5 bit SLS value contained in received messages with a random 8 bit value before they are used by the Eagle to select the outgoing signaling link in that linkset. The **slsci=yes** parameter can only be specified for linksets with ANSI SS7 adjacent point codes.

Additional Integrated Sentinel Support (Release 28.2)

Description

This feature adds the following Eagle cards to those supported by the Eagle with Integrated Sentinel Feature introduced in Eagle Release 28.0. Sentinel 8.1 supports monitoring for links on E1-ATM and LIM-ATM cards, and supports SS STC cards for monitoring:

- E1-ATM - With Release 28.2, the Eagle supports Integrated Sentinel functionality for the E1-ATM card.
- LIM-ATM - With Release 28.2, the Eagle supports Integrated Sentinel functionality for the LIM-ATM card.
- SS STC - With Release 28.2, the Eagle supports the existing Sentinel routing functionality (EROUTE GPL) on a SS STC card.

New Hardware Required

No new hardware is required for this feature. Note, however, that the Eagle with Integrated Sentinel feature does require the use of GPSM-II cards in place of MCAP cards, and HMUX cards in place of IPMX cards. Also, the Eagle Time Synchronization feature must be active in conjunction with this feature. In addition, the timing requirements include the use of an external Bits clock.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

rept-stat-card

Use this command to display the card status and maintenance activity states. This command has been enhanced to display the output for an E1 ATM card running the **atmitu** application.

*Example
Output*

The following examples include output for an E1 ATM card running the **limatm**, **ssstc**, and **atmitu** applications:

rept-stat-card:loc=1201

Alarms and Error Codes

No new alarms have been created for this feature.

Error Codes Incorrect use of the new / enhanced commands for the Additional Integrated Sentinel Support feature may result in the error messages in Table 2-3:

Table 2-3. Additional Integrated Sentinel Support Feature: Error Messages

Error Message	New?	Used by Command:
E3727 Max number of cards of application type already exist	Yes	ent-card

Administrable SLTMs (Release 20.0)

This feature allows the user to configure signaling link test messages (SLTMs). To test the coherency of a particular link, two signaling points can transmit periodic test messages. The signaling point initiating the test selects a link to test and then transmits an SLTM containing a test pattern. The other signaling point responds with an echo of the test pattern contained in the SLTM. The intervals between transmission of signal link test messages (SLTMs) are controlled by the sltm_enabled field in a corresponding SLTM table record. The SLTM table record also controls the following:

- the length of the test pattern in the SLTM
- automatic generation of SLTMs
- generation of periodic SLTMs when a link is put in service

The SLTMs can be sent to a signaling link that is in service whenever desired.

AINF Applique (Release 21.0)

The AINF is an integrated applique which supports the DSOA, DSCS and V.35 interfaces on the same applique. The AINF applique can be configured as either a DSOA, OCU, or V.35 interface from the user terminal.

Alarm Enhancements (Release 26.0)

NOTE: This is an engineering feature.

Currently, adding new UAMs to the system requires many modifications to the software. It requires adding ATH events, adding fields to the maintenance block (MB), changing ATH on the application card to set the new field in the MB, possibly updating the MB revision, and changing SCM to analyze the new field and generate the UAM.

Application Defined UAMs allow the application card to generate UAMs without modifying the OAM build. Initially, this capability will be given to every application using the Generic Maintenance Block. The application will then only be required to supply a message reference number (MRN), an output group, a device type, and element information (example: port number) to the Application Defined UAM software.

There will only be one Application Defined UAM allowed per card in the Eagle. That is, only one Application Defined UAM may be active at any given time. Multiple Application Defined UAMs may be defined and sent by the application, but not simultaneously. There is only one slot in the MB for Application Defined UAM.

Allow a Mated Application to Work as Primary-Secondary and Secondary-Primary (Release 22.0)

There are two ways to load share global title translations.

1. A mated application in load shared mode.
2. Two mated applications in dominant mode. The global title translation addresses are split into two ranges such that half of the addresses translate to one mated application and the other half translates to the other.

This feature supports the second method of load sharing. This method of load sharing allows two replicated applications to load share and back each other up in the event of a network failure. Global title translation is load shared by splitting the range of global title addresses and have them work as two separate mated applications. If one application becomes prohibited, SCCP routing translates all the GTT messages in both address ranges to the mated application. The subsystem management messages (SBR/SNR) and SCCP management messages (SSP/SSA) are sent to the adjacent mated application and concerned signaling points.

The following example illustrates how this feature works using a split global title address range.

1. Enter two mated applications as a dominant point code/subsystem pair. In this example, mated application A is point code 001-001-001, **ssn** 10. Mated application B is point code 001-001-002, **ssn** 10.

*Input
Example*

```
ent-map:pc=001-001-001:ssn=10:mpc=001-001-002:mssn=10
:mult=dom:adj=yes
```

This mated application pair entered as A backed up by B, automatically creates an entry of B backed up by A. Either the primary or the backup point code and subsystem can be used as the preferred destination for a global title translation range. The other point code/subsystem is treated as the backup.

- To split the global title ranges, enter two global title translation address ranges. One range uses mated application A and the other uses mated application B.

Input Examples

```
ent-gtt:type=10:gta=800000:egta=800555:xlata=dpcssn:ri=ssn
:pc=001-001-001:ssn=10

ent-gtt:type=10:gta=800556:egta=800999:xlata=dpcssn:ri=ssn
:pc=001-001-002:ssn=10
```

If mated application A becomes unavailable, all global title translation traffic for both address ranges is routed to mated application B. If mated application B becomes unavailable, the specified global title translation traffic is routed to mated application A. If both point code/subsystem pairs are available, the traffic is split according to the translation type and address ranges specified. Normally, the address range is split so that mated application A receives half the translated global title translation traffic and mated application B receives the other half.

The adjacency, concerned signaling point code group, message routing under congestion and subsystem routing parameters in the **ent-map** command apply to both point code/subsystem pairs.

Table 2-4 shows how SCCP routing and subsystem management is handled according to the mated application parameters **adj** (adjacency), **srn** (subsystem routing messages), and **mrc** (message routing under congestion).

Table 2-4. SCCP Routing and SCCP Management Actions for a Primary-Secondary and Secondary-Primary Mated Application

Event	ADJ	SRM	MRC	SCCP Routing and SCCP Management Action
Preferred application fails because an MTP_PAUSE message for its point code has been received	yes	yes	yes or no	1. Send an SBR message to the next preferred application. 2. Reroute traffic to the next preferred application.
	no	yes	yes or no	1. Do not send an SBR message to the next preferred application.
	yes or no	no	yes or no	2. Reroute traffic to next the preferred application.

Table 2-4. SSCP Routing and SSCP Management Actions for a Primary-Secondary and Secondary-Primary Mated Application (Continued)

Event	ADJ	SRM	MRC	SSCP Routing and SSCP Management Action
Previously prohibited preferred application becomes available because an MTP_RESUME message for its point code has been received	yes	yes	yes or no	1. Send an SNR message to the next preferred application. 2. Route traffic back to the preferred application.
	no	yes	yes or no	1. Do not send an SNR message to the next preferred application.
	yes or no	no	yes or no	2. Route traffic back to the preferred application.
Receive an SSP for the preferred application that is allowed.	yes	yes	yes or no	1. Send an SBR message to next the preferred application. 2. If the SSP came from the affected point code, broadcast SSP's to the list of concerned signaling point codes. 3. Reroute traffic to the next preferred application.
	no	yes	yes or no	1. Do not send an SBR message to the next preferred application.
	yes or no	no	yes or no	2. Send SSP's to the list of concerned signaling point codes. 3. Reroute traffic to the next preferred application.

Table 2-4. SCCP Routing and SCCP Management Actions for a Primary-Secondary and Secondary-Primary Mated Application (Continued)

Event	ADJ	SRM	MRC	SCCP Routing and SCCP Management Action
Receive an SSA for the preferred application that is prohibited.	yes	yes	yes or no	1. Send an SNR message to the next preferred application. 2. Send SSA's to the list of concerned signaling points. 3. Reroute traffic to the next preferred application.
	no	yes	yes or no	1. Do not send an SNR message to next preferred application.
	yes or no	no	yes or no	2. Send SSA's to the list of concerned signaling points. 3. Reroute traffic to the next preferred application.
Preferred application becomes congested.	yes or no	yes or no	no	1. Do not reroute messages to the next preferred application.

Allowed Affected Destination Field Screen (Release 22.0)

Release 22.0 introduces a new gateway screening entity, the Allowed Affected Destination Field. The Allowed Affected Destination Field contains the affected destination point code of incoming MTP network management messages. This is also referred to as the concerned point code.

The current method of screening the affected point code in network management messages involves a check for the point code in the routing table, self point codes, and capability point codes. This check is applied after the message has passed all screenings in the configured screen set. This check is independent of the screen set. In order to provide the same capability as currently exists, this method of screening for the affected point code in network management messages is retained. The network management message can also be screened with gateway screening screensets. To screen the network management message with the existing capability, the **destfld** parameter with either the **ent-scrset** or **chg-scrset** command (a new parameter introduced in Release 22.0) must be set to **yes**.

If the **destfld=yes** parameter is specified, all MSU's with the service indicator of 0 (**:si=0**), including through switched messages, are screened by gateway screening against the routing table, self point codes, and capability point codes. This screening step is performed after the MSU has passed all other screening tables.

The advantage of using the configured Allowed Affected Destination Field screening table over the routing table is that it is now possible to reject messages containing point codes in the routing table. Previously, if a network management message concerned a point code in the routing table, it would pass this phase of screening and there was no way to prevent its entry into the network. An interconnecting network could then either accidentally or maliciously send a network management message for a destination in the home network.

The network management messages that require screening by the Allowed Affected Destination Field screen are:

- TFP, TFA, TFR
- TCP, TCA, TCR
- TFC
- UPU
- SRST (RSP, RSR)

All other network management messages are passed.

For cluster messages (TCP, TCA, and TCR), the member of the affected destination field is set to 0. If the affected cluster contains a point code with a member 0, the affected destination field for a TFX message for the member and a TCX message for the cluster will have the same affected destination. For example, a TFP concerning point code 007-007-000 and a TCP concerning cluster point code 007-007-* will both have an affected destination of 007-007-000. Typically, a user would provision an entry in the allowed affected destination field with these parameters, **:ni=007, :nc=007, :ncm=***, all TFX messages concerning the member of the cluster and all TCX messages concerning the cluster are passed. If the user wants to screen TFX messages and TCX messages separately, the allowed SIO screen can be used to send TCX messages to one affected destination table, and send TFX messages to a different affected destination table.

The allowed affected destination field screen is configured with these commands.

- **ent-scr-destfld** - adding a new allowed affected destination field entry into the database
- **dlt-scr-destfld** - removing an allowed affected destination field entry from the database
- **chg-scr-destfld** - changing an existing allowed affected destination field entry in the database
- **rtrv-scr-destfld** - displaying the allowed affected destination field entries in the database

All these commands use these parameters.

- **sr** for the screening reference name of the allowed affected destination field screen
- **ni, nc, ncm** for ANSI point codes
- **zone, area, id** for ITU international point codes
- **npc** for ITU national point codes

The **chg-scr-destfld** command also uses these parameters for the point code values being changed.

- **nni, nnc, nncm** for new ANSI point code values
- **nzone, narea, nid** for new ITU international point code values
- **nnpc** for new ITU national point code values

The **rtrv-scr-destfld** command also uses the **all=yes** parameter to display a detailed output of the allowed affected destination field screen. The following is an example of the output of the **rtrv-scr-destfld:all=yes** command.

*Output
Example:*

```
RLGHNCXA03W 97-06-07 13:14:18 EDT Rel 22.0.0
SCREEN = ALLOWED DESTFLD
SR      NI      NC      NCM      NSF1  NSR/ACT
IEC     240     001     010     STOP  -, -
IEC     241     010     *       STOP  -, -

SR      ZONE    AREA    ID      NSF1  NSR/ACT
IEC     1       003     4       STOP  -, -
IEC     1       003     5       STOP  -, -

SR      NPC
IEC     00235
IEC     00240      NSF1  NSR/ACT
                        STOP  -, -
                        STOP  -, -
```

The allowed affected destination field screen can be referenced, the next screening function indicator (NSFI), by the allowed SIO, allowed DPC, and blocked DPC screens. If the allowed affected destination field screen is the NSF1 of the allowed SIO screen, the service indicator of the allowed SIO entry must be 0, specified by the **:si=0** parameter with the **ent-scr-sio** and **chg-scr-sio** commands, and the entry 0 in the SI field in the **rtrv-scr-sio** command output.

The NSF1 for the allowed affected destination field screen has only one value, STOP.

The redirect and copy functions, for the STP LAN and DTA features, (**:redirect=yes** and **:copy=yes** parameters with the **ent-scr-destfld**, **chg-scr-destfld**, and **rtrv-scr-destfld** commands) can be used with the allowed affected destination field screen.

Allowed CDPA Screen on SCCP Management Format ID (Release 22.0)

The allowed called party address (CDPA) screen can screen messages for the SCMG format ID (SCCP Management Format ID). A new parameter, **scmgid**, has been added to the **ent-scr-cdpa**, **dlt-scr-cdpa**, and **chg-scr-cdpa** commands to configure the allowed CDPA screen to screen for the SCMG format ID. A new field, SCMGID, has been added to the output of the **rtrv-scr-cdpa** command to show the SCMG format ID in the allowed CDPA screen. The following is an example of the new output.

Output Example:

```
RLGHNCXA03W 97-06-07 15:41:38 EDT Rel 22.0.0
SCREEN = ALLOWED CDPA
SR   NI      NC      NCM      SSN      SCMGID   NSFI      NSR/ACT
IEC  240     001     010     001      002      STOP     -, -
IEC  240     001     011     002      ----- STOP     -, -
IEC  240     001     010     12       ----- STOP     -, -
IEC  241     010     *       *        *        ----- AFTPC    IAF
```

The value for the **scmgid** parameter is 1 - 255 or *. This parameter must be specified if the subsystem number of the called party address is set to 1 (**ssn=1**). An SCCP management message has the subsystem field of the called party address set to 1. The SCCP management format ID only applies to SCCP management messages.

The message type of the message being screened for the SCCP message format ID must be either a UDT, UDTS, XUDT or XUDTS message. All other message types are passed.

The wildcard value for the subsystem parameter (**ssn=***) indicates the range of values from 2 to 255. When the subsystem number is a wildcard, the next screening function identifier must be **stop** (**nsfi=stop**). The SCMG format ID does not apply because messages with a subsystem of 2 to 255 are not SCCP management messages.

If the value of the **ssn** parameter is not a wildcard (1 - 255), the NSFI for the Allowed CDPA screen can be either the allowed affected point code screen (**aftpc**) or **stop**.

Alternate Command Keywords (Release 20.0)

This feature provides an alternate set of keywords for current Eagle commands. The following are the new, industry-standard keywords:

Eagle Keyword	Alternate Keyword
cancel	deactivate
inhibit card	remove card
allow card	restore card
act lpo	block slk
allow slk	uninhibit slk
cancel lpo	unblock slk

ANSI G-Flex Support at 1700 TPS per DSM (Release 30.3)

The feature ANSI G-Flex Support at 1700 tps per DSM Card increases the current transaction-per-second (tps) capacity of the G-Flex application running on DSMs cards from 850 tps to 1700 tps in an ANSI environment.

- In an ITU environment, the capacity will remain at 850 tps per DSM card
- The Service Selector table cannot contain an ITU entry Only G-Flex is defined as a service (see the -srvsel commands)
- The G-Flex feature is turned on
- The ansigflex system option is enabled using the chg-stpopts command.

ANSI/ITU MTP Gateway (Release 20.0)

The Eagle acts as a gateway to connect ANSI, ITU international, and ITU national networks. The Eagle also continues to switch traffic that does not need to be converted when the origination network is the same network type as the destination network. In order to be able to perform these functions, the Eagle does the following.

- Discriminates between MSUs originating from each type of network
- Converts MSUs to the appropriate format by converting the message transfer part (MTP) and ISDN user part
- Routes MSUs to the correct destinations

Level 3 MSU Discrimination

The Eagle must determine whether an incoming MSU terminates at the STP or must be routed to another destination. To accomplish the discrimination task, the Eagle does the following.

- Compares the network indicator (NI) of an MSU to a database of valid NIs. If the network indicator is not valid, the MSU is discarded.
- Extracts the network indicator and destination point code (DPC) information from the incoming MSU. If an MSU is transmitted to an ANSI linkset, the network indicator is forced to a binary pattern of “10” before being extracted.
- Determines whether an incoming MSU terminates at the Eagle or must be routed to another destination by joining the network indicator and DPC to a list of self point codes. The self point code is a combination of the true point code and capability point code. The capability point code identifies a group of nodes that have similar capabilities.

MSU Routing

MSU routing occurs after MSU discrimination and before MSU conversion (if conversion is necessary). The Eagle selects an outgoing link on which to transmit the MSU. The MSU formats must be compatible with the linksets that transmit the MSUs.

Eagles are typically deployed in mated pairs. The Eagle has a linkset for each supported network type. The Eagle should have a unique adjacent point code. The Eagle supports up to three self point codes—one for ANSI point codes, one for ITU international point codes, and one for ITU national point codes.

Figure 2-5 shows a sample network with mated gateway STPs. Note that there are different linksets for each network type. In the sample, STP (A) has an ANSI point code (007-001-001), an ITU National point code (09270), and an International point code (5-060-1).

Figure 2-5. Sample Gateway STP Network

Administering Point Codes

The Eagle can support multiple network types because each destination can be addressed by a true point code or by a list of alternate point codes. The list of alternate point codes contains from 0 to 2 alternates. The true point codes and alternate point codes are entered in the key table (by using the **ent-dstn** command). For example, an ANSI destination could have both a true point code and an alternate point code that point to the same routing translation in the routing table.

Local Link Congestion

When a link is congested, the Eagle sends ANSI TFCs to the ANSI origination point code (OPC) and ITU TFCs to the ITU origination point code (OPC). Figure 2-6 shows both an ANSI and an ITU network sending traffic to a congested link (the type of congested link does not matter). When an ANSI node is the source of the traffic to the congested link, the TFC contains a status. When an ITU node is the source of the traffic, the TFC does not contain a status.

Figure 2-6. Traffic to and from a Congested Link

All links in the system operate with four levels of congestion. If the congestion level is “0”, there is no congestion, the Eagle does not transmit TFCs, and no MSUs are discarded. At level 3 (indicating a maximum level of congestion), the Eagle transmits TFCs, and discards MSUs.

Whenever the congestion onset status is above congestion onset level 1, and has not abated below congestion abatement level 1, the Eagle generates a TFC. Whenever the congestion discard status is above discard level 1, and has not abated below discard level 1, the Eagle discards the MSU. See Figure 2-7.

Figure 2-7. Congestion Levels

Remote Link Congestion

Table 2-5 shows the Eagle's response to remote congestion indicators.

Table 2-5. Remote Congestion Response

Event	Eagle's Response
Eagle receives an ANSI TFC	When the Eagle receives an ANSI TFC, the routing table is modified to discard lower priority MSUs being routed to the concerned point code. The TFC contains the congestion status of the concerned point code. The routeset congestion test mechanism is used to abate the congestion.
Eagle receives an ITU TFC	When the Eagle receives an ITU TFC, the routing table is modified to discard the lower priority MSUs being routed to the concerned point code. The TFC does not contain the congestion status of the concerned point code. Instead, the congestion status is user-configurable using the chg-isup-stp:status command. Once the routeset is identified as congested, a timer is used to abate the congestion. The timer is similar to the ANSI routeset congestion test mechanism.
Eagle receives an ANSI RCT	There is no change in the Eagle response when the Eagle receives ANSI routeset congestion test messages.
Eagle receives an ITU RCT	The H0H1 message codes are not contained in the ITU environment. These codes generate an invalid H0H1 MRN, and the message is discarded. This has no impact on the ITU network because the Eagle uses a timer to abate congestion and does not rely on a reply to the RCT message.

ANSI-ITU-China SCCP Conversion (Release 31.3)

Since some ANSI and ITU SCCP parameters are incompatible in format and / or coding, subsequently the EAGLE has not historically supported SCCP traffic between ANSI and ITU networks. A specialized SCCP / TCAP conversion was previously implemented for MTP Routed UDT / UDTS messages. This feature will not interact with the Release 22.2 SCCP / TCAP conversion feature but will be mutually exclusive of it. Since the specialized SCCP / TCAP conversion was implemented, many improvements have been made to the Eagle in regards to ITU SCCP compliance and features. (e.g. EGTT, MGTT). ANSI-ITU-China SCCP Conversion will provide a generic capability that will correctly format and decode / encode the following inter-network SCCP traffic:

- UDT and UDTS messages - includes SCMG messages, which are a specialized form of a UDT
- MTP routed
- GT routed

The feature also provides SCCP management (SCMG) across network type boundaries, i.e. concerned point codes for a mated application may be of a different network type than the mated application.

UDTS message return is controlled inherently by the SCCP layer protocol within the protocol class byte. If bits 5-8 indicate return message on error, a UDTS message will be sent when there is an error. Otherwise, no UDTS is returned to the originator.

ANSI/ITU SCCP and TCAP Conversion (Optional) (Release 22.2)

As an option for release 22.2, the ANSI / ITU SCCP and TCAP Conversion feature enables the Eagle STP to convert MTP-routed SCCP and TCAP messages from ANSI to ITU format and to convert ITU formatted messages to ANSI. The following formatting and coding is supported:

- MTP routed Unitdata (UDT) non-segmented SCCP connectionless messages, including SCMG messages.
- MTP routed Unitdata Service (UDTS) messages (UDT messages returned due to error).

SCCP and TCAP conversion is turned on by way of two separate feature bits, one for the SCCP conversion and one for the TCAP conversion. The SCCP conversion feature must be turned on before, or at the same time as, the TCAP conversion feature.

Changed Commands

The following commands have been changed in support of the ANSI/ITU SCCP and TCAP conversion feature. For more information on these commands, see the *Commands Manual*.

chg-feat

The **sccpcnv** and **tcapcnv** parameters have been added to the **chg-feat** command to enable TCAP / SCCP conversion. Once turned on, this parameter cannot be turned off.

NOTE: sccpcnv must be on before tcapcnv can be on (E3431).

rtrv-feat

The **sccpcnv** and **tcapcnv** parameters have been added to the **rtrv-feat** command used to display the list of optional features and their status on the system. The parameter value is either **on** or **off**, where **off** is the default.

ent-trace

The **ent-trace** debug command has been modified so that for an SS7 card (ANSI or ITU) converted MSUs (MTP / SCCP / TCAP) can be filtered using one or more of the **ssp**, **opc**, and **dpc** parameters.

ANSI/ITU SCCP and TCAP Conversion (Release 24.0)

As an option for release 24.0, the ANSI/ITU SCCP and TCAP Conversion feature enables the Eagle STP to convert MTP-routed SCCP and TCAP messages from ANSI to ITU format and to convert ITU formatted messages to ANSI.

NOTE: This feature is a customized feature and does not conform to any known standard or specification.

The following formatting and coding is supported:

- MTP routed Unitdata (UDT) non-segmented SCCP connectionless messages, including SCMG messages.
- MTP routed Unitdata Service (UDTS) messages (UDT messages returned due to error).

SCCP and TCAP conversion is turned on by way of two separate feature bits, one for the SCCP conversion and one for the TCAP conversion. The SCCP conversion feature must be turned on before, or at the same time as, the TCAP conversion feature.

Changed Commands

The following commands have been changed in support of the ANSI/ITU SCCP and TCAP conversion feature. For more information on these commands, see the *Commands Manual*.

:chg-feat

The **sccpcnv** and **tcapcnv** parameters have been added to the **chg-feat** command to enable TCAP/SCCP conversion. When these parameters are turned on, they cannot be turned off. before the **tcapcnv=on** parameter can be specified with the **chg-feat** command, the **sccpcnv** parameter must be set to on or the **chg-feat** command is rejected.

rtrv-feat

The **sccpcnv** and **tcapcnv** fields have been added to the output of the **rtrv-feat** command used to display whether or not the **sccpcnv** and **tcapcnv** parameters are on or off.

ent-trace

The **ent-trace** debug command has been modified so that for an SS7 card (ANSI or ITU) converted MSUs (MTP/SCCP/TCAP) can be filtered using one or more of the **ssp**, **opc**, and **dpc** parameters.

Backup Provisioning Network Interface (Release 29.0)

Currently, the MPS machines only make use of one interface to the customer network. There is an unused interface (QFE3) available. This feature allows for the configuring of a second interface to the customer network. This second interface must exist on a different subnet than the primary (HME0) interface. The customer can then use either interface to communicate with the MPS (WebUI, PDBI, telnet, etc).

NOTE: It is important to note that this backup interface could also be used for Versant's FTS replication, in the event that something is wrong with the HME0 path. However, this switch is not automatic. A user would have to manually make the change through the configuration text UI at both sites.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

No commands have been enhanced for this feature.

Calling Name Conversion Facility (CNCF) (Release 23.1)

This feature provides a conversion of ISUP IAM messages using two versions of calling name identification presentation (CNIP) for calling name information delivery. One version of the CNIP uses the nonstandard, proprietary ISUP party information (PIP) parameter. The other version uses the ANSI standard ISUP generic name (GN) parameter. The conversion will either replace the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message.

The gateway screening feature is used to select which ISUP messages are converted. The incoming messages are selected based on the OPC and DPC in the routing label of the message, and the message type in the service information octet. The message type is defined by the value of the service indicator (**si**) field of the SIO. ISUP messages contain the value 5 in the service indicator field of the SIO. Screening rules for Allowed OPC, Allowed DPC, and the Allowed SIO entities must be configured in the database for this feature. The **redirect=yes** parameter must be specified with the last entity in the screening process (**nsfi=stop**) to use the CNCF feature to convert the message.

This feature is an optional feature and must be turned on with the **chg-feat** command and the new parameter, **cncf=on**. Before this feature can be turned on, the gateway screening feature must be on. This is shown by the entry **gws = on** in the output of the **rtrv-feat** command. If the gateway screening feature is not on when an attempt is made to turn the CNCF feature on, the **chg-feat** command is rejected with this message:

Error Message E3646 Cmd Rej: GWS must be ON before CNCF can be ON

The **rtrv-feat** command output has been changed to add the **cncf** field showing whether the CNCF feature is on or not.

If the CNCF feature is turned on, the DTA feature is disabled. There are no other command changes to support this feature.

Figure 2-8 shows an example network that contains these two separate ISUP versions. Based on this example, Table 2-6 shows when the ISUP IAM message conversion by the CNCF feature occurs.

Figure 2-8. PIP/GN Parameter Conversion**Table 2-6.** ISUP IAM Message Conversion Examples

Origination Point Code	Destination Point Code	ISUP IAM Message Conversion
001-002-003	004-005-006	Yes
001-002-003	007-008-009	No
004-005-006	001-002-003	Yes
004-005-006	007-008-009	Yes
007-008-009	001-002-003	No
007-008-009	004-005-006	Yes

CAUTION: Take care when configuring the gateway screening rules for this feature. The CNCF feature has no way to validate the gateway screening rules to detect errors in converting messages between compatible networks. For example, using the example network in Figure 2-8, the ISUP IAM message traffic from node 001-002-003 to node 007-008-009 does not need to be converted because they are using the same calling name delivery parameter, PIP. If the gateway screening rules are not carefully configured, these messages could be converted when they do not need to be.

Limitations

No measurements are collected showing the number of MSUs converted by this feature.

No error message is generated if an error occurs during the conversion of the PIP and GN parameters.

If the CNCF feature is turned on, the DTA feature is disabled. No message redirection using the DTA feature will be performed.

If the **copy=yes** parameter is specified with the **redirect=yes** parameter, the MSU is copied for the STP LAN feature after it has been converted by the CNCF feature.

If there are multiple PIP parameters or GN parameters with calling name information within a single ISUP IAM, only the first occurrence of the parameter in the ISUP IAM message is converted.

Messages on X.25 linksets cannot be converted with the CNCF feature.

Only GN IAM messages containing calling name information (Type of Name = Calling Name, Presentation = Allowed, Parameter Length >1) are converted to PIP IAM messages.

Only PIP IAM messages containing Calling Name Information (Sub-Parameter Code = Name Information, Name Element Indicator = Calling Party) are converted to GN IAM messages.

If the received IAM message contains both a GN and a PIP parameter with calling name information, the GN parameter is retransmitted and the PIP parameter is deleted.

Any MSU that is not converted is simply retransmitted. These MSUs include non-ISUP MSUs, non-IAM MSUs, and any IAM MSU received that does not contain either a GN or PIP parameter.

If the PIP parameter contains other information in addition to the calling party name information, only a GN parameter containing calling party name information is generated.

The linkset being screened for this feature should not contain C links (**1st=c** parameter of the **ent-1s** and **chg-1s** commands). This would result in the double conversion of the ISUP IAM messages.

IAM messages containing a GN parameter that are to be converted, must be 262 bytes or less. The ANSI SS7 MSU can contain a maximum of 272 bytes, including the Level 3 routing label. Without the routing label, the MSU can contain 265 bytes, starting at the Circuit ID code field. Since the PIP parameter has 3 bytes more than the GN parameter, the MSU can contain a maximum of 262 bytes.

Table 2-7 summarizes the conversion action performed based on the optional parameters found within the MSU.

Table 2-7. CNCF Conversion Actions

PIP Parameter Content	GN Parameter Content		
	GN Parameter with Calling Name Information	GN Parameter without Calling Name Information	GN Parameter Not Found
PIP Parameter with Calling Name Information	The PIP parameter is deleted. The GN parameter is retransmitted without conversion. No network-specific parameters (0xFD and 0xFE) are deleted.	The PIP parameter is converted to a GN parameter. The GN parameter is retransmitted if it is present. Network-specific parameters (0xFD and 0xFE) are deleted.	The PIP parameter is converted to a GN parameter. The GN parameter is retransmitted if it is present. Network-specific parameters (0xFD and 0xFE) are deleted.
PIP Parameter without Calling Name Information	The PIP parameter is deleted. The GN parameter is retransmitted without conversion. No network-specific parameters (0xFD and 0xFE) are deleted.	The PIP parameter is deleted. The GN parameter is retransmitted if it is present. Network-specific parameters (0xFD and 0xFE) are deleted.	The PIP parameter is deleted. The GN parameter is retransmitted if it is present. Network-specific parameters (0xFD and 0xFE) are deleted.
PIP Not Found	The PIP parameter is not involved. The GN parameter is converted to PIP. No network-specific parameters (0xFD and 0xFE) are deleted.	No parameters are converted. No parameters are deleted.	No parameters are converted. No parameters are deleted.
NOTE: Parameters with calling name information have precedence over parameters without calling name information. For example, an MSU that has both a GN parameter with calling name information and a GN parameter without calling name information is treated as if it were an MSU with a GN parameter with calling name information.			

PIP and GN Parameters

The PIP format contains a parameter name (0xFC), parameter length and optional sub-parameters. The format is shown in Table 2-8. The Name Element Indicator, Name Element Length and Name Information fields can be repeated within a single PIP.

Table 2-8. PIP Parameter Format

Field	Length	Bits Value HGFE DCBA	Comments
Parameter Name	1 octet	1111 1100	Party Information
Parameter Length	1 octet	—	Length of the parameter excluding the parameter name and the parameter length octet
Sub-Parameter Code	1 octet	1111 1110	Name Information
Sub-Parameter Length	1 octet	—	Sum of the number of octets in the Name Element Indicator, Name Element Length, and Name Information fields
Name Element Indicator	1 octet	0000 0001	Calling party name
		0000 0010	Connected party name
		0000 0011	Redirecting party name
Name Element Length	1 octet	—	Number of characters in the name information field (maximum of 15)
Name Information	up to 15 octets	—	Maximum of 15 IA5 characters

The GN format contains a parameter name (0xC7), parameter length and up to 16 additional octets. The format is shown in Table 2-9.

Table 2-9. GN Parameter Format

Field	Bits Value HGFE DCBA	Comments
Parameter Name	1100 0111	Generic Name
Parameter Length	—	Length of the parameter excluding the parameter name and length fields

Table 2-9. GN Parameter Format (Continued)

Field		Bits Value HGFE DCBA	Comments
Octet 1	Presentation	XXXX XX00	Presentation Allowed
		XXXX XX01	Presentation Restricted
		XXXX XX10	Blocking Toggle
		XXXX XX11	No indication
	Spare	XXXX 00XX	Not Used
	Availability	XXX0 XXXX	Name available or name availability unknown
		XXX1 XXXX	Name not available
	Type of name	000X XXXX	Spare
		001X XXXX	Calling name
		010X XXXX	Original called name
		011X XXXX	Redirecting name
		100X XXXX	Connected name
		101X XXXX to 111X XXXX	Spare
Octets 2-n		—	Maximum of 15 IA5 characters

Conversion of PIP to GN

The mapping of PIP parameters to GN parameters for this conversion is shown in Figure 2-9. The new GN parameter length field is computed based on the PIP name element length and not the PIP parameter length or Sub-Parameter length fields.

Figure 2-9. PIP to GN Parameter Mapping

Conversion of GN to PIP

The mapping of GN parameters to PIP parameters for this conversion is shown in Figure 2-10.

Figure 2-10. GN to PIP Parameter Mapping

Table 2-10 shows how the PIP and GN parameters are mapped during the conversion process.

Table 2-10. PIP/GN Parameter Mapping

Party Information Parameter		Generic Name Parameter	
Field Name	Value	Field Name	Value
Parameter Name	Party Information (0xFC)	Parameter Name	Generic Name (0xC7)
Parameter Length	as calculated	Parameter Length	as calculated
Sub-Parameter Code	Name Information (0xFE)	—	no mapping
Sub-Parameter Length	as calculated	—	no mapping
Name Element Indicator	Calling Party Name (1)	Type of Name	Calling Name (HGF=001)
—	no mapping	Presentation	Allowed (BA=0)
—	no mapping	Availability	Name Available (E=0)
Name Element Length	as calculated	—	no mapping
Name Information	Calling Party Name (maximum 15 characters)	Characters	Calling Party Name (maximum 15 characters)

Message Conversion

The conversion process only occurs in ISUP Initial Address Messages (IAM) with either the PIP or GN optional parameters that contain calling party name information. The conversion either replaces PIP parameters with GN parameters or GN parameters with PIP parameters. In some cases, network-specific optional parameters are also deleted from the message. The Level 2 Length Indicator is also updated since the MSU length is changing. The sections shown in bold type show which fields of an IAM with the GN parameter are effected by the CNCF feature.

Calling Name Conversion Facility (CNCF) with Redirect Capability (Release 24.0)

This feature provides a conversion of ISUP IAM messages using two versions of calling name identification presentation (CNIP) for calling name information delivery. One version of the CNIP uses the nonstandard, proprietary ISUP party information (PIP) parameter. The other version uses the ANSI standard ISUP generic name (GN) parameter. The conversion will either replace the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message.

The gateway screening feature is used to select which ISUP messages are converted. The incoming messages are selected based on the OPC and DPC in the routing label of the message, and the message type in the service information octet. The message type is defined by the value of the service indicator (**si**) field of the SIO. ISUP messages contain the value 5 in the service indicator field of the SIO. Screening rules for Allowed OPC, Allowed DPC, and the Allowed SIO entities must be configured in the database for this feature.

Refer to the *Database Administration Manual - Gateway Screening* for details on using this feature.

Gateway Screening Stop Action Commands

Refer to the *Commands Manual* for current usage information.

chg-gws-actset

The **chg-gws-actset** command is used to configure the gateway screening stop action sets in the Eagle database. These stop action sets are used to define the actions performed on the MSUs that pass the gateway screening process.

rtrv-gws-actset

The values of the defined gateway screening stop actions are displayed with the **rtrv-gws-actset** command. Undefined gateway screening stop actions are not displayed.

Gateway Screening Enter Commands

The **actname** parameter has been added to these gateway screening commands to define the action that is performed on the MSU that passes gateway screening. Refer to the *Commands Manual* for current usage information.

- **ent-scr-aftpc**
- **ent-scr-blkopc**
- **ent-scr-blkdpc**

- ent-scr-cdpa
- ent-scr-cgpa
- ent-scr-destfld
- ent-scr-dpc
- ent-scr-opc
- ent-scr-sio
- ent-scr-tt
- ent-scrset

Gateway Screening Change Commands

The **actname** parameter has been added to these gateway screening commands to define the action that is performed on the MSU that passes gateway screening. Refer to the *Commands Manual* for current usage information.

- chg-scr-aftpc
- chg-scr-blkopc
- chg-scr-blkdpc
- chg-scr-cdpa
- chg-scr-cgpa
- chg-scr-destfld
- chg-scr-dpc
- chg-scr-opc
- chg-scr-sio
- chg-scr-tt
- chg-scrset

Gateway Screening Retrieve Commands

The **actname** parameter has been added to these gateway screening retrieve commands to display the gateway screening rules based on the name of the gateway screening stop action set. Refer to the *Commands Manual* for current usage information.

- rtrv-scr-aftpc
- rtrv-scr-blkopc
- rtrv-scr-blkdpc
- rtrv-scr-cdpa

- `rtrv-scr-cgpa`
- `rtrv-scr-destfld`
- `rtrv-scr-dpc`
- `rtrv-scr-opc`
- `rtrv-scr-sio`
- `rtrv-scr-tt`
- `rtrv-scrset`

`chg-feat` and `rtrv-feat` commands

The calling name conversion facility feature is an optional feature and must be turned on with the `chg-feat` command and the `cncf=on` parameter. Before this feature can be turned on, the gateway screening feature must be on. This is shown by the entry `gws = on` in the output of the `rtrv-feat` command. If the gateway screening feature is not on when an attempt is made to turn the calling name conversion facility feature on, the `chg-feat` command is rejected with this message:

Unsolicited Information Messages

The commands `chg-scr-aftpc`, `chg-scr-cdpa`, `chg-scr-cgpa`, `chg-scr-tt`, `ent-scr-aftpc`, `ent-scr-cdpa`, `ent-scr-cgpa`, and `ent-scr-tt` cannot use any entry shown in the `rtrv-gws-actset` command output that contains the redirect stop action (`rdct`) or the CNCF stop action (`cncf`). This restriction is not enforced when the `chg-gws-actset` and the `chg-scr-aftpc`, `chg-scr-cdpa`, `chg-scr-cgpa`, `chg-scr-tt`, `ent-scr-aftpc`, `ent-scr-cdpa`, `ent-scr-cgpa`, and `ent-scr-tt` commands are entered into the database. The database will accept these commands using entries from the gateway screening stop action table, but when the Eagle encounters MSUs that pass gateway screening at the AFTPC, CDPA, CGPA or TT screens, these UIMs (unsolicited information messages) are generated indicating that gateway screening received a MSU that could not be redirected or converted.

In order to stop these UIMs from being generated, the gateway screening rule shown in the UIM must be identified. Once the gateway screening rule has been identified, a gateway screening change command can be used either to remove the gateway screening action set name or change the gateway screening action set name to a different gateway screening action set not containing the CNCF or redirect gateway screening stop actions. The gateway screening stop action set can also be changed with the **chg-gws-actset** command to remove the redirect or CNCF gateway screening stop actions. However, this could keep other gateway screening rules from redirecting or converting MSUs passing gateway screening from the BLKOPC, BLKDPC, SIO, OPC, DPC, or DESTFLD screens.

CDU for DSM (Release 26.05)

CDU (CAP Downloadable Utility) is an existing software platform for diagnostics used by manufacturing in identifying and isolating expansion memory problems in the EAGLE cards quickly and reliably. This feature ports the existing CDU and provides an efficient “go/no go” memory test for the DSM / DCM card.

CDU Port

The existing CDU utility has been ported for the DSM / DCM card, and a new GPL VCDU has been created. The new GPL has all the existing functionality. The DSM board can hold up to 4GB of memory. The CDU or the VCDU utility is downloaded automatically, depending on the type of the board. For the DSM, the VCDU utility is downloaded; for the other boards, the CDU utility is downloaded.

The CDU or the VCDU can be downloaded into any card with the following command:

```
alw-card:loc=xxxx:code=utility
```

The following **act-memtst** command used with the parameter set to "**fast**" lets the VCDU utility test 4GB of memory in 4 hours:

```
cdu:loc=xxxx:cmd="act-memtst:beg=h'100000:end=h'200000  
:type=fast"
```

Quick Test

The quick go/no go test is implemented with the **act-qcktst** command in CDU/VCDU. Using this command, the VCDU utility can check the basic integrity of the memory within 10 minutes. This test includes verifying the address and data lines to the memory, and verifying accessibility of each memory chip of 4GB.

Ping Test

The VCDU utility uses a new command, **act-pingtst**, to test the network. The ping test applies to the DCM / DSM card only.

```
cdu:loc=xxxx:cmd="act-pingtst:port=<a/b>:dest=<ip_address>  
:router=<router>:loop=n"
```

This command activates the ping test. The **port** parameter specifies the origination address. The **dest** parameter specifies the destination address to be pinged. The **router** parameter is an optional parameter that specifies the router through which the network interface can be tested. The **loop** parameter specifies the number of times the test should be run before termination.

New Commands

In support of this feature, new debug commands have been added to the CAP Downloadable Utility (CDU). See “*New and Enhanced CAP Downloadable Utility (CDU) Commands*” on page 2-61.

Enhanced Commands

In support of this feature, some enhancements have been made to the CAP Downloadable Utility (CDU) commands. See “*New and Enhanced CAP Downloadable Utility (CDU) Commands*” on page 2-61.

For more information about formats for the following commands, refer to the *Commands Manual*.

alw-card

This command has been modified to specify that the CDU GPL or the VCDU GPL is correctly downloaded based on the type of board. For the DSM, the VCDU utility is downloaded; for the ASM, the CDU utility is downloaded.

chg-gpl

The value **vxutil** has been added to specify the new <gpl type> for the **appl** parameter.

copy-gpl

The value **vxutil** has been added to specify the new <gpl type> for the **appl** parameter.

rept-stat-gpl

The value **vxutil** has been added to specify the new <gpl type> for the **appl** parameter.

rtrv-gpl

The value **vxutil** has been added to specify the new <gpl type> for the **appl** parameter.

New and Enhanced CAP Downloadable Utility (CDU) Commands

The CAP Downloadable Utility (CDU) is a diagnostic program that can be downloaded to any card using the **alw-card** command. To support this feature, several new commands used to perform diagnostic functions have been added. Additionally, some existing commands have been enhanced.

For more information about formats for the following commands, refer to the “Debug Command”s section in the *Commands Manual*.

New CDU Commands

The following CDU commands have been created in support of this feature.

act-qcktst

Implements a quick go/no-go test to check the basic integrity of the memory within ten minutes. This command applies to the DSM card only.

icanc-qcktst

Aborts the quick test. This command applies to the DSM card only, and has no parameters.

rtrv-qcktst

Displays the quick test results. This command applies to the DSM card only, and has no parameters.

act-pingtst

Implements a network test in the VCDU utility only. This test is applicable to DCM / DSM cards only.

canc-pingtst

Aborts the ping test. This command has no parameters.

rtrv-pingtst

Displays the results of the ping test. This command has no parameters.

dump-memtst

Displays the memory test results continuously without any other output messages. This command has no parameters.

dump-mempat

Displays the memory pattern test results continuously without any other output messages. This command has no parameters.

act-cachetst

Starts the cache test on the specified memory range.

dump-cachetst

Displays the result of the cache test. This command has no parameters.

Enhanced CDU Commands

The following CDU commands have been enhanced in support of this feature.

act-memtst

Starts the memory test.

act-memflt

Tests M256 and D1G error detection and correction capabilities (fault insertion test).

fill-mempat

Fills a section of memory with a specific data pattern.

act-checkbit

Tests the M256 and D1G checkbit DRAM.

CgPA GWS Routing Indicator Enhancement (Release 31.3)

The wildcarding of the CgPA routing indicator (RI=*) produced 2 entries in the GWS database on the LIM card; that reduced the number of CgPA rules available to the customer from 4000 to 2000 per screenset.

The wildcarding has been changed to produce a single database entry for wildcard (*) of the routing indicator in CgPA GWS screening rules. The Eagle does not expand the provisioned wildcard routing indicator into multiple rules in the bound screenset.

Upgrade to Release 31.3 auto consolidates existing entries that were provisioned with RI=*.

Change Default ATM CLP Bit for Data Cells from 1 to 0 (Release 31.3)

The Cell Loss Priority (CLP) bit is in the ATM packet header and is used by ATM network elements to determine which messages are discarded when an ATM network element is in congestion. Should there be congestion in an ATM network element, it will first start to discard ATM packets with a CLP bit of 1 first before discarding any ATM packets with a CLP bit of 0. The CLP bit has the following characteristics: 1. The CLP bit for ATM-SS7 signaling (data cells) is specified to be either 0 or 1 and is not specifically assigned a default value in GR-2878 CORE (ANSI) nor I.361 (ITU). The CLP bit for ATM unassigned / idle (filler) cells is specified to be 0 for T1 interfaces and 1 for E1 interfaces. ATM equipment is required to discard these cells upon receipt and therefore the CLP bit for unassigned / idle (filler) cells will remain unchanged. 2. The CLP bit for ATM-SS7 signaling (data cells) is used by ATM network equipment much in a similar fashion as the priority field is used by

TDM SS7 equipment 3. The CLP bit determines how important a message is when an ATM network node is in congestion and needs to discard messages/packets. Currently, the CLP bit for ATM-SS7 signaling (data cells) is a non-configurable value in the Eagle ATM header that is defaulted to 1 for both LIM-ATM (ANSI) and E1-ATM (ITU) cards. Effective in Release 31.3, this default will be changed to 0 (higher priority). The new CLP bit value of 0 has a higher priority than the current CLP bit value of 1.

Changeover and Changeback Procedure for Processor Outage and LIN (Release 21.0)

Currently, the Eagle performs a sequence controlled changeover instead of a time-controlled changeover when the signaling link gets locally or remotely inhibited or when a local or remote processor outage condition is entered. In these cases, sending a changeover order could result in failure of the signaling link. The Eagle also sends SIPOs when a signaling link is remotely or locally inhibited and also performs a sequence controlled changeover by sending a changeover order to the remote end.

With this release, the Eagle now performs a time controlled changeover under these conditions. The Eagle behaves in the following manner:

- When the signaling link is inhibited locally or remotely, the Eagle does not send SIPOs. Instead a time diversion changeover procedure is started for the inhibited signaling link.
- When the signaling link is unavailable because of a remote or local processor outage, a time controlled changeover is performed instead of sequence controlled changeover.

If a changeover order is received for the unavailable link, while the level 3 T1 timer is in progress, the buffer updating procedure and sequence controlled changeover is performed. The Eagle responds with an emergency changeover acknowledgment if the changeover order is received after the level 3 T1 timer has expired.

This feature applies to both ANSI and ITU signaling links. This feature has no impact on X.25 gateway signaling links since the inhibit and processor outage procedures are not used in the X.25 protocol.

Cluster Routing and Management Diversity (Release 21.0)

The cluster routing and management diversity feature eliminates the need for a full point code entry in the routing table to route to every signaling point in every network. The cluster routing and management diversity feature allows the Eagle to configure one route set to a entire cluster of destinations. This allows the Eagle to manage and switch traffic to more end nodes.

A cluster is defined as a group of signaling points whose point codes have identical values for the network and cluster fields of the point codes. A cluster entry in the routing table is shown with an asterisk (*) in the member field of the point code, for example, 111-011-*. Cluster entries can only be provisioned as ANSI destination point codes. ANSI destination point codes can be specified as either a full point code, for example, 123-043-045, or as a cluster of signaling point codes, for example, 111-011-*.

Provisioning of clusters as well as full point codes that belong to the same cluster as destination point codes is also supported. The point codes 111-011-*, 111-011-005 and 111-011-045 entries can be provisioned. The cluster destination point code 111-011-* represents all the point codes of the cluster except for point codes 111-011-005 and 111-011-045. Cluster entries in the destination point code table can also be used as a destination point code (DPC) for a route. A group of such routes with varying relative cost forms a routeset to a cluster just like a routeset to a full point code.

Exception Lists (X-lists)

An exception list for a cluster is a list of point codes in a cluster whose route status is more restricted than the corresponding route status of that cluster. The term “more restricted” is used when comparing the route status of a cluster member to the route status of the cluster. A PROHIBITED status is more restrictive than a RESTRICTED status and a RESTRICTED status is more restrictive than an ALLOWED status. This list contains point codes that are not assigned to any individual routeset and the only routesets to that node is through a cluster routeset. The exception list is a dynamic list that changes when the status of the cluster routeset or any member routesets in that cluster changes.

For each cluster, the user can specify an exception list exclusion indicator (ELEI) when configuring the cluster point code with the **ent-dstn** command. When the ELEI is **yes**, the Eagle does not maintain exception list entries. When the ELEI is **no**, the Eagle maintains exception list entries.

Exception list entries are stored as an extension of the destination point code table, which can contain up to 2500 entries. The Eagle allows the user to specify the number of entries reserved for the exception list, between 500 to 2000 entries. The remainder of the 2500 entries in the destination point code table are reserved for the full and cluster point codes.

The outputs of the **ent-dstn**, **dlt-dstn**, **chg-dstn**, and **rtrv-dstn** commands display the following destination point code usage information.

- The number of configured full point codes
- The number of configured cluster point codes
- The sum of configured destinations (full and cluster point codes)
- The number of entries reserved for configured destinations (full and cluster point codes). This number is 2500 minus the number of entries reserved for the exception list.
- The number of entries reserved for exception list

There is an STP-wide expiration time value for exception list entries. This timer specifies the amount of time an idle exception list entry can be in the exception list before it is discarded. When this timer expires, unsolicited information message (UIM) 1146, REPT-SLST-TIMO: X-LIST entry expired, is displayed on the terminal and the specified exception list entry is discarded. The following is an example of UIM 1146.

Output Example:

```
RLGHNCXA03W 96-04-16 16:21:11 EDT Rel 21.0.0
1234.1146    CARD 1101    INFO REPT-XLST-TIMO: X-LIST entry expired
              DPC=011-212-033
Report Date: 96-04-16 Time: 16:20:19
```

In this example, the point code (DPC) 011-212-033 was in the exception list, the timer expired, and the point code was discarded from the exception list.

The value of the exception list timer is shown in the MTPXLET field of the **rtrv-stpopts** command output and is configured with the **mtpxlet** parameter of the **chg-stpopts** command.

The **rtrv-stpopts** command output contains three other fields that show the parameters of the exception list, MTPXLQ, MTPXLOT, and MTPDPCQ.

The MTPXLQ field shows the maximum number of entries the exception list (x-list) can contain. This value is configured with the **mtpxlq** parameter of the **chg-stpopts** command.

The MTPXLOT field shows the exception list (x-list) occupancy threshold (in terms of the percentage of the exception list space being used). The percentage of occupancy threshold is configured with the **mtpxlot** parameter of the **chg-stpopts** command. The default value for the threshold is 90%. For example, if there are 1500 entries configured for the exception list and the exception list contains 1000 entries, the percentage of the exception list space being used is 66%. If this threshold is exceeded, a minor alarm, unsolicited alarm message (UAM) 321, X-LIST occupancy threshold exceeded, is displayed. The following is an example of UAM 321.

UAM Messages

```
* RLGHNCXA03W 96-04-16 16:21:11 EDT Rel 21.0.0
* 0061.0321 * XLIST X-LIST occupancy threshold exceeded
```

The MTPDPCQ field shows the maximum number of destination point codes that can be configured in the Eagle.

The Eagle raises a major alarm, UAM 338, X-LIST space full-entry(s) discarded, when the exception list becomes completely full and the Eagle fails to create any more exception list entries. The following is an example of UAM 338.

```
RLGHNCXA03W 96-04-16 16:21:11 EDT Rel 21.0.0
** 0055.0338 ** SYSTEM X-LIST space full-entry(s) discarded
```

An exception list entry's expiration timer is restarted when an exception list entry gets created, updated, or used for routing. This expiration timer can be set for a minimum of 20 minutes to a maximum of 24 hours. The default value for the expiration timer upon system start-up is 60 minutes. If the timer expires before it is restarted, the exception list entry is removed. The expiration timer allows the Eagle to save resources if the exception list entry is sitting idle for a specified period of time.

An exception list entry can be created for three distinct set of conditions.

1. The first set of conditions creates exception list entries based on the status of the route (allowed, restricted, or prohibited) and are marked as "exception list due to routing."
2. The Eagle creates an exception list entry to maintain the congestion status of a non-provisioned, cluster routed destination point code. These entries are marked "exception list due to congestion."
3. The Eagle also creates an exception list to prohibit routing to a member of a cluster when circular routing to that member is detected. These exception list entries are marked "exception list due to circular routing."

An exception list entry for a particular cluster can be removed from the exception list when the following conditions are met:

1. The status of all routes to the specified point code changes to a status that is less or equally restrictive than corresponding status of cluster's routes. This can happen for two reasons.
 - a. A **dact-rstst** command was issued. The **dact-rstst** command changes the route's status to allowed.
 - b. A network management message (TFA or TFR) was received indicating the new status of the route to the specified point code.
2. The expiration timer for the exception list entry expires.
3. When a **chg-dstn** command is issued and changes the ELEI to **yes** for the cluster; the Eagle removes all exception list entries created for that cluster.

4. The **chg-stpopts** command was issued with the **mtpxlet** parameter and the new value for the **mtpxlet** parameter was smaller than the original value. This command can change allocation of routing table entries for exception lists. If the size of the exception list is reduced and the number of entries in the exception list is now greater than the new value of the **mtpxlet** parameter, the Eagle will remove excess exception list entries at random.
5. When a user allows a circular routed “exception list due to circular routing” entry after fixing the problem. The **rst-dstn** command is used to allow the routing.
6. When congestion abates for an “exception list due to routing” entry.

Cluster Routing

When the Eagle receives an MSU to route, the routing function looks for the MSU's destination point code as a full point code entry in the routing table. If found, the full point code entry is used to find the corresponding routeset and the outgoing route. If a full point code entry is not found, the routing function uses the destination point code's network and cluster values to find a cluster entry to which a destination point code belongs. If found, the cluster entry is used to find the corresponding routeset and the outgoing route. If neither a full point code entry or cluster point code entry is found, the Eagle generates UAM 1004, “MTP rcvd unknown DPC.”

Compatibility with Non-Cluster Routing STPs

It is possible that not all STPs in the network that the Eagle is operating in are cluster routing STPs. In such a situation, those STPs not doing cluster routing will interpret TCx messages and apply them to each individual point code belonging to the concerned cluster. This may cause an inconsistency in the status records for exception listed point codes in different STPs. In order to avoid this situation, the Eagle takes the following steps:

1. After broadcasting a TCR message for a cluster, the Eagle enables TFPs for the cluster's exception listed prohibited member point codes by stopping the level 3 T8 timer. This allows TFPs to be sent for prohibited members immediately after a TCR is broadcast.
2. After broadcasting a TCA message for a cluster, the Eagle enables a one-time TFR for the cluster's exception listed restricted member point codes by stopping the level 3 T18 timer and enables the TFPs for the cluster's exception listed (prohibited) member point codes by stopping the level 3 T8 timer. This allows TFPs to be sent for prohibited members and TFRs for restricted members immediately after a TCA is broadcast.

Compatibility with the ITU Network and X.25 Gateway

ITU SS7 networks do not use the concept of clusters of point codes and cluster network management messages. The Eagle does not generate TCx messages towards ITU nodes. The Eagle does not send TCx messages to adjacent ITU point codes during the broadcast phase of TCx messages when the Eagle is acting as an STP between an ITU network and an ANSI network. It is possible that messages may be lost in such a case. In order to reduce message loss and quickly notify the sending ITU node about the status, the Eagle enables TFPs or TFRs immediately (with the level 3 T8 or T18 timers stopped) and relies on the TFPs or TFRs to convey the status information.

While sending response method network management messages in response to a received MSU, the Eagle checks the MSU's originating point code. If the MSU's originating point code is an ITU point code, a TFX message is returned.

Cluster entries can only be provisioned as ANSI destination point codes. Cluster entries cannot be provisioned for ITU international or ITU national destination point codes. The ANSI alias point code for an ITU international or ITU national destination point code must be a full point code. Cluster routing is not supported for X.25 destinations. X.25 destinations and any alias point codes used for X.25 destinations must be full point code entries.

Cluster Management When the Cluster Routing Feature is Turned Off

Cluster routing is an optional feature and can be turned on with the **chg-feat:crmd=on** command. Once this feature is turned on, it cannot be turned off. If this feature is turned off, the Eagle does not send any cluster management messages or allow cluster destination point codes to be added to the destination point code table. The Eagle is capable of processing incoming cluster management messages even though the feature is turned off. When a cluster management message is received, the Eagle treats this message as though network management messages were received for each full point code, configured in the destination point code table, belonging to that cluster.

Command Class Management (Release 29.0)

The Command Class Management feature allows the user to place Eagle commands into 32 new configurable command classes. The craftsman can provision any of these configurable command classes to contain any of the Eagle commands. The command classes can then be assigned to a user and/or terminal, thus allowing the user or terminal the privilege of executing any command in the class. This allows users and terminals to fully configure custom command classes. This capability is controlled via a feature access key.

NOTE: The result is each user/terminal will have access to a set of commands tailored to a specific need. The new configurable command classes are in addition to the existing non-configurable command classes. The current basic and non-configurable command classes will remain.

Refer to the *Commands Manual* for current detailed information on this feature.

Hardware Requirements

No new hardware is needed to support this feature.

New Commands

The following commands have been created to support this feature. For current information, see the *Commands Manual*.

chg-cmd

This new command is used to change the attributes of a command.

rtrv-cmd

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

chg-cmdclass

This new command is used to change the name or description of a configurable command class.

rtrv-cmdclass

This new command is used to retrieve the name and description of a command class.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

chg-secu-trm

This command is used to provision the access rights for a terminal. This command has been modified to allow updates of the new configurable command classes assigned to the terminal.

rtrv-secu-trm

This command is used to display the access rights for a terminal. The output of this command has been enhanced to display the configurable command classes assigned to the terminal.

canc/dact-cmd

The commands **rtrv-secu-user** and **rtrv-cmd** have been added to the list of commands that can be cancelled.

chg-user

Changes properties of a previously-created userID. This command has been modified to allow update of the new configurable command classes assigned to the user.

ent-user

Creates a new UserID. This command has been modified to allow the new configurable command classes to be assigned to the user.

rtrv-user

Displays various attributes defined for the userID currently logged on to the port. The output of this command has been enhanced to display the configurable command classes assigned to the user.

rtrv-secu-user

This command produces a report showing various parameters associated with any one, or all, userIDs that have been provisioned. The output has been modified to display the configurable command classes assigned to the user.

enable-ctrl-feat

This command is used to enable Controlled Features the customer has purchased on a permanent basis or may be used to temporarily turn a feature on for a thirty (30) day trial period. Features may be temporarily enabled by using a temporary password or may be permanently enabled by using a permanent password.

chg-ctrl-feat

This command is used to activate (turn on) Controlled Features or to clear the Critical alarm for a Controlled Feature whose temporary key has expired. This command accepts a Controlled Feature's Part Number (partnum).

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the Command Class Management feature.

Limitations

There is a limitation on the feature's operation regarding the use of the **ent-user**, **chg-user**, **chg-secu-trm** and **chg-cmd** commands. These commands can assign a maximum of eight command classes per command execution. However, subsequent command executions can be used to readily assign the full number of required configurable command classes.

Command Output Changes (Release 22.0)

The method of displaying whether the **copy=yes** or **redirect=yes** parameters have been specified for a given screening entry in the gateway screening retrieve commands has been changed. The heading of the NSR field of the output has been changed to NSR/ACT to display either the next screening reference name (NSR) or the next action that is to be performed (ACT). The same field can be used to display both of these items, because in previous releases, the NSR field is blank when the **copy=yes** and **redirect=yes** parameters have been specified. These parameters can only be specified when the NSFI is set to **stop** and the **nsr** parameter cannot be specified.

If the NSFI of the screen is not **stop** or **fail**, the NSR/ACT field displays the name of the next screening table to be used in the gateway screening process.

When NSFI of the screen is **stop**, the NSR/ACT field contains the following entries.

- -, - — if neither the **copy=yes** or **redirect=yes** parameters have been specified. This entry is also displayed if the NSFI of the screen is **fail** (only with the **rtrv-scr-blkdpc** and **rtrv-scr-blkopc** commands)
- C, - — if only the **copy=yes** parameter has been specified
- -, R — if only the **redirect=yes** parameter has been specified
- C, R — if both the **copy=yes** and **redirect=yes** parameters have been specified

Refer to the *Commands Manual* for current command information..

The outputs of these commands have been changed to this new format.

- **rtrv-scr-opc**
- **rtrv-scr-dpc**
- **rtrv-scr-blkdpc**

- `rtrv-scr-blkopc`
- `rtrv-scr-destfld`
- `rtrv-scr-sio`
- `rtrv-scr-cgpa`
- `rtrv-scr-cdpa`
- `rtrv-scr-aftpc`
- `rtrv-scr-tt`
- `rtrv-scrset`

Configuring the Frequency of RST Messages on Low Priority Routes (Release 22.0)

This feature allows the configuring of a timer to specify the frequency of signaling-route-set-test messages for routes of lower priority than the current route.

In earlier releases, the routeset test messages were sent for every route to every destination for a period of time equal to the value of the level 3 timer T10. With this feature, the Eagle only sends the routeset test messages for routes of equal or higher priority than the current route.

Parameters To send routeset test messages for lower priority routes, new parameters (**mtplprst** and **mtpt10alt**) have been added to the **chg-stpopts** command to turn this capability on and to set the timer to control the frequency that the routeset test messages are sent.

mtplprst — turns on or off the routeset test message for lower priority routes capability. The values for this parameter is **yes** or **no**. The default value for this parameter is **yes**.

mtpt10alt —the timer to control the frequency at which the routeset test messages are sent. The values for this parameter are from 30 to 10,000 milliseconds. The default value for this parameter is equal to the value of the level 3 T10 timer.

When the **mtplprst=no** parameter is specified with the **chg-stpopts** command, the Eagle does not send routeset test messages for the lower priority routes. When the **mtplprst=yes** parameter is specified, the Eagle sends routeset test messages at intervals specified by the value of the **mtpt10alt** parameter.

The network example shown in Figure 2-11 on page 74 shows how this feature works. Table 2-11 shows the priorities of the routesets to destination X.

Table 2-11. Routeset Priorities

Routesets to Destination X	Cost
Ls1 (high priority route)	10
Ls2 (current route)	20
Ls3 (low priority route)	30

Destination X is currently accessible from STP A using route Ls2. STP C and STP B have sent TFP messages for destination X to STP A. STP C is on higher priority route than the current route while STP B is on lower priority route than the current route. By default, the Eagle polls STPs B and C by sending RSP messages for destination X at intervals defined by the level 3 timer T10. The polling frequency to STP B can be changed by changing low priority route set test time interval with the **mtpt10alt** parameter of the **chg-stpopts** command and setting it to a value greater than the value of the level 3 timer T10. RSP messages for destination X are sent to STP C at intervals defined by the level 3 timer T10 and RSP message for destination X are sent to STP B at intervals defined by the **mtpt10alt** parameter.

Figure 2-11. Route Set Test Example

The level 3 T10 timer and **mtpt10alt** parameter of the **chg-stpopts** command are configured independently. The Eagle requires that the value of the **mtpt10alt** parameter is greater than or equal to the value of the level 3 T10 timer. If the value of the level 3 T10 timer is increased to a value greater than the current value of the **mtpt10alt** parameter, the value of the **mtpt10alt** parameter is adjusted to be equal to the new value of the level 3 T10 timer and the following message is displayed in the scroll area of the terminal.

MTP T10alt Timer in STP Options Table adjusted to correspond with T10 Timer.

If the value of the level 3 T10 timer is decreased, the value of the **mtpt10alt** parameter is not adjusted.

Any changes in the values of the level 3 T10 timer and the `mtpt10alt` parameter of the `chg-stpopts` command take affect only after these timers have expired.

Configuring the Unauthorized Use Warning Message (Release 22.0)

Currently, the Eagle displays the following message immediately after successfully logging into the Eagle.

```
NOTICE: This is a private computer system.
Unauthorized access or use may lead to prosecution.
```

In Release 22.0, the user can now configure their own warning message that follows a successful login. The message can contain up to 20 lines of text with each line of text containing up to 70 characters.

When a login attempt is successful, the user sees the warning message (0 - 20 lines) and then 2 lines of login history information. The administrator can configure the warning message so that it and the login history information will not all fit into the scroll area of the Eagle terminal. The user can use scroll area locking (F8) key so the login warning message can be read before it scrolls out of view.

NOTE: When the Eagle is delivered to the user, the database will contain the following login warning message. This complies with the suggested Bellcore default values.

```
NOTICE: This is a private computer system.
Unauthorized access or use may lead to prosecution.
```

The `chg-secu-dflt` and `rtrv-secu-dflt` commands have been modified to configure this warning message.

Two parameters have been added to the `chg-secu-dflt` command to configure the login warning message, `wrnln` and `wrntx`.

The `wrnln` parameter specifies the line number of the login warning message that is being changed. The values for this parameter are from 1 to 20.

The `wrntx` parameter specifies the text for the line number of the login warning message. The text line can contain up to 70 alphanumeric characters and must be enclosed in quotes ("). A text line with no characters can be specified with this text string, "". This prevents the text line from being displayed in the login warning message. A blank line is specified with this text string, "".

The following is an example of how the login warning message can be configured.

```
Input      chg-secu-dflt:wrnln=1:wrntx="*****
Examples: *****"
```

```
chg-secu-dflt:wrnln=2:wrntx="*   notice: this is a private
computer system.          *"

chg-secu-dflt:wrnln=3:wrntx="*   unauthorized access or use will
be prosecuted          *"

chg-secu-dflt:wrnln=4:wrntx="*
*"

chg-secu-dflt:wrnln=5:wrntx="*
*"

chg-secu-dflt:wrnln=6:wrntx="* 06/07/97 notice!!! eagle will be
upgraded between *"

chg-secu-dflt:wrnln=7:wrntx="*                               the hours of
2am-3am on 06/15/97.  *"

chg-secu-dflt:wrnln=8:wrntx="*
*"

chg-secu-dflt:wrnln=9:wrntx="*
*"

chg-secu-dflt:wrnln=10:wrntx="*****
*****"

chg-secu-dflt:wrnln=11:wrntx=" "
chg-secu-dflt:wrnln=12:wrntx=" "
chg-secu-dflt:wrnln=13:wrntx=" "
chg-secu-dflt:wrnln=14:wrntx=" "
chg-secu-dflt:wrnln=15:wrntx=" "
chg-secu-dflt:wrnln=16:wrntx=" "
chg-secu-dflt:wrnln=17:wrntx=" "
chg-secu-dflt:wrnln=18:wrntx=" "
chg-secu-dflt:wrnln=19:wrntx=" "
chg-secu-dflt:wrnln=20:wrntx=" "
```

The following is an example of what this example login warning message would look like after a successful login attempt.

*Output
Example:*

```
*****
*NOTICE: This is a private computer system.*
*UNAUTHORIZED ACCESS OR USE WILL BE PROSECUTED*
**
**
*06/07/97 Notice!!! Eagle will be upgraded between*
*the hours of 2am-3am on 06/15/97*
**
**
*****

0 LOGIN failures since last successful LOGIN
Last successful LOGIN was on port 3 on 97-06-07 @ 12:12:35
```

The parameter **msg** (with the values **yes** or **no**) has been added to the **rtrv-secu-dflt** command to display the text of each line of the login warning message. If the **msg=yes** parameter is specified, the security defaults for user IDs and passwords and the 20 lines of text for the login warning message are displayed. If the **msg=no** parameter (the default value for this parameter) is specified, the security defaults for user IDs and passwords are displayed, but the login warning message text lines are not displayed. The following is an example of the **rtrv-secu-dflt:msg=yes** command output.

*Output

Congestion Abatement Reporting (Release 21.0)

When a signaling link's congestion level changes, these changes are reported to the user as UAMs (unsolicited alarm messages), whether the congestion level increases or decreases. The UAMs show how the signaling link congestion level has changed. Table 2-12 shows the changes in the signaling link congestion level changes and the UAM that reports these changes. No alarms are associated with these UAMs.

Table 2-12. Signaling Link Congestion Messages

From Level	To Level	Output Messages	UAM
0	1	REPT-LINK-CGST: congestion level 0 to 1	0264
0	2	REPT-LINK-CGST: congestion level 0 to 1 REPT-LINK-CGST: congestion level 1 to 2	0264 0265
0	3	REPT-LINK-CGST: congestion level 0 to 1 REPT-LINK-CGST: congestion level 1 to 2 REPT-LINK-CGST: congestion level 2 to 3	0264 0265 0266
1	0	RCVRY-LINK-CGST: congestion has cleared	0269
1	2	REPT-LINK-CGST: congestion level 1 to 2	0265
1	3	REPT-LINK-CGST: congestion level 1 to 2 REPT-LINK-CGST: congestion level 2 to 3	0265 0266

3	2	REPT-LINK-CGST: congestion level 3 to 2	0267

Consistent Command Response Conversion (Release 22.2)

The consistent Command Response Conversion feature enables GUI software to read a consistent command response from the Eagle STP and display the information in a suitable format and language on Keyboard Send / Receive (KSR)-mode-provisioned ports. This requirement fulfills the GUI's requirement to know when an Eagle-initiated command is completed.

Command Execution

To ensure reliability and uniqueness of pattern, a sequence of eight End of Transmission (EOT) characters (h'04) is used to indicate that the entered command has completed. This sequence, in most cases, means that all associated data output in response to the command entered has been displayed. Exceptions in which data output between the start of a command and the receipt of the EOTs may differ from the norm include the following:

- Commands with delayed completion that allow other output to be displayed (for example, **copy-disk** and **format-disk**).
- Commands that report completion but actually continue displaying results for some amount of time (for example, **rept-meas**).
- Commands entered in midstream of unsolicited output via Ctrl-A.

Output Example:

```
lnpstp 97-12-30 18:02:07 EST Rel 22.2.0.0
Error writing table 206:
  on standby TDM (A);
>set-date:date=971201
Command Accepted - Processing

      DMS0002:table not found on disk[H'290e].
;
  lnpstp 97-12-30 18:02:07 EST Rel 220.18.0.0
  set-date:date=971201
  Command entered at terminal #5.
;
  lnpstp 97-12-30 18:02:07 EST Rel 220.18.0.0
  Date set complete.
;(Response Ended - string of EOTs here)
```

Consistent Command Response Conversion (Release 24.0)

The consistent Command Response Conversion feature enables GUI software to read a consistent command response from the Eagle STP and display the information in a suitable format and language on Keyboard Send / Receive (KSR)-mode-provisioned ports. This requirement fulfills the GUI's requirement to know when an Eagle-initiated command is completed.

Command Execution

To ensure reliability and uniqueness of pattern, a sequence of eight End of Transmission (EOT) characters (h'04) is used to indicate that the entered command has completed. These End of Transmission characters are not visible on the terminal display. This sequence, in most cases, means that all associated data output in response to the command entered has been displayed. Exceptions in which data output between the start of a command and the receipt of the EOTs may differ from the norm include the following:

- Commands with delayed completion that allow other output to be displayed (for example, **copy-disk** and **format-disk**).

- Commands that report completion but actually continue displaying results for some amount of time (for example, **rept-meas**).
- Commands entered in midstream of unsolicited output via Ctrl-A. For example:

Output Example:

```
RLGHNCXA03W 99-01-07 00:57:31 EST Rel 24.0.0
Error writing table 206:
  on standby TDM (A);
>set-date:date=990301
Command Accepted - Processing

DMS0002:table not found on disk[H'290e].
;
RLGHNCXA03W 99-01-07 00:57:31 EST Rel 24.0.0
set-date:date=990301
Command entered at terminal #5.
;
RLGHNCXA03W 99-03-01 00:57:31 EST Rel 24.0.0
Date set complete.
;(Response Ended - string of EOTs here
```

Cost Factor on Routing (Release 20.0)

This feature allows the assignment of a weighting factor to a route. The weighting factor is then used by MTP routing to determine which is the primary route, and which are the alternate routes. By using this feature, multiple routes may be assigned to a destination, with a primary route selected for all routing unless congestion or some other condition should be encountered, at which point one of the alternate routes would be chosen.

Each routeset (which is a combination of routes) may be assigned six routes, with each route assigned a different cost factor. The range for cost factors is 0 to 99, with 99 being the least favorable route (highest cost).

Combined linksets may be assigned the same cost factor, allowing equal load sharing over the two linksets. Alternate combined linksets may also be created by assigning a higher cost factor to subsequent linksets.

Customer Definable Alarms (Release 20.0)

This feature allows the user to connect up to 10 external devices to the Eagle for alarm reporting. These are defined in the Eagle database as customer defined troubles. These external devices are monitored and any changes in the state of these devices is reported to the user as an unsolicited alarm message (UAM). Two of these UAMs generate critical alarms, two UAMs generate major alarms, six UAMs generate minor alarms. Table 2-13 lists the UAM, the alarm level, and the trouble ID.

Table 2-13. Customer Definable Troubles Alarm Levels

Customer Trouble ID	Alarm Detected UAM	Alarm Clearing UAM	Customer Trouble ID	Alarm Detected UAM	Alarm Clearing UAM
1	Reserved	N / A	9	Reserved	N / A
2	Reserved	N / A	10	Reserved	N / A
3	0058 - Critical	0062 - Normal	11	0060 - Minor	0062 - Normal
4	0058 - Critical	0062 - Normal	12	0060 - Minor	0062 - Normal
5	Reserved	N / A	13	0060 - Minor	0062 - Normal
6	Reserved	N / A	14	0060 - Minor	0062 - Normal
7	0059 - Major	0062 - Normal	15	0060 - Minor	0062 - Normal
8	0059 - Major	0062 - Normal	16	0060 - Minor	0062 - Normal

The following messages are examples of these UAMs.

UAMs

```

ralncstp01 95-05-12 12:14:59 EST Rel 20.0.0
*C 4054.0058 *C CDT 4 Critical Customer Trouble detected

ralncstp01 95-05-12 12:14:59 EST Rel 20.0.0
** 4055.0059 ** CDT 8 Major Customer Trouble detected

ralncstp01 95-05-12 12:14:59 EST Rel 20.0.0
* 4056.0060 * CDT 11 Minor Customer Trouble detected

ralncstp01 95-05-12 12:14:59 EST Rel 20.0.0
4058.0062 CDT 9 Customer Trouble cleared

```

The status of these UAMs are displayed with the **rept-stat-cdt** command.

When the alarm condition that displayed these UAMs is cleared, UAM number 0062 is displayed.

Database Integrity Enhancements (Release 20.0)

With this feature, the system audits the actual data in each module, provides checksum information, and verifies the checksum information against the original checksum that was downloaded to the module.

Database Management Command Functions (Release 20.0)

In this feature, the database management commands are used to perform the following operations.

- Backing up the database to the fixed disk and to the removable cartridge
- Restoring the database from the fixed disk and from the removable cartridge

- Copying the approved GPLs from the active fixed disk onto a removable cartridge
- Copying the measurements data from the fixed disk onto a removable cartridge
- Displaying the directories and files on either the fixed disks or the removable cartridge

These five operations are discussed separately, below.

Backup

This command makes a backup copy of the administered data that can later be used to restore the data. The backup is made onto both the fixed disks or onto the removable cartridge according to a parameter of the command. The original data is taken from the current partition on the fixed disk.

If the backup is made to the fixed disks, the current partition on a fixed disk is copied to the backup partition on the same fixed disk.

If the backup is made to the removable cartridge, it is taken from the current partition of the fixed disk of the active MASP and copied to the removable cartridge. There is only one data partition on the removable cartridge, and this is defined to be the backup partition.

Restore

This command allows the user to bring back onto the fixed disk a set of known good tables, which had been previously backed-up on a disk (either fixed or removable). This command only restores the administered data tables, not the GPLs or measurement tables.

When the restore is from the fixed disk, the backup partition is copied into the current partition.

When the restore is done from the removable cartridge, the backup partition on the removable cartridge is copied onto the current partition on the fixed disk. This command modifies the data tables on the fixed disks of both the active and standby MASPs.

When the restore is from the removable cartridge, the tables are copied to the fixed disks on both TDMs. It does not propagate any data changes to the SCCP cards, LIMs, and so forth. To propagate the changes resulting from the restored database, the Eagle must be reinitialized.

Copy GPL

This command copies the set of approved GPLs from the active fixed disk on the TDM onto a removable cartridge. This is typically done after the installation of a new GPL on the system, when the GPLs have been approved, and will allow the user to keep one removable cartridge with a copy of all the approved GPLs in use on the system.

These GPLs may be brought back into the system from the removable cartridge using change GPL commands if there is a need to bring a system back to a prior state, or if a spare fixed disk needs to be brought up to date.

Copy Measurements

When there is a need to perform offline analysis of the raw measurements data, this command copies that data onto the removable cartridge. The data is copied from the active fixed disk on the TDM to the removable cartridge.

Measurements collection is not allowed to continue while this command is copying the tables, since this may result in data from one collection period spilling over into data from another collection period. Measurements cannot be copied if measurement collection is turned on. Measurement collection must be turned off if you wish to copy the measurements tables.

Since there are two formats for removable cartridges, and only one of these is valid for measurements, the command will give a clear error message if the wrong type of removable cartridge is mounted in the drive.

Disk Directory

This command displays the directory on the specified disk. It can be used to display the creation date for each file or selected files and to verify that the correct version of files are on the fixed disks or the removable cartridge.

NOTE: Wildcards “*” and “?” can be used for filename matching. The “*” will match any number of characters, and any “?” will match any single character.

Database Transport Access (DTA) (Release 20.0)

This feature interconnects the X.25 and SS7 network protocols. This connection enables the interworking of several telephony and financial database application protocols carried within the X.25 and SS7 messages.

Refer to the *Database Administration Manual - Features* for current details of this feature.

Delay Vs. Throughput (IP⁷ Release 5.0)

This feature provides some level of user control over the TCP retransmission behavior that an individual TALI socket exhibits. Several aspects of TCP retransmissions need to be introduced in order to understand how this delay versus throughput feature will work.

As far as this feature is concerned, there are three primary aspects of TCP retransmissions that need to be understood.

- Retransmission timer
- Retransmission mode
- Congestion window

Retransmission Timer

Conceptually, the TCP retransmission timer is a timer that is started when a TCP data segment is sent on a socket. The TCP data segment is encapsulated in an IP packet (we will refer to this data segment being sent as a TCP packet, even though TCP is a byte oriented transport layer that does not typically send 'packets'). If an acknowledgement for the TCP packet arrives before the timer expires, the timer is stopped. If the timer expires before an acknowledgement arrives, the original packet is assumed to be lost/corrupted and a retransmission of that packet occurs.

In practice, most TCP implementations do not start a separate timer for each packet, rather an internal timer expiration occurs at a fixed interval and upon each internal timer expiration the data related to outstanding transmit packets without acknowledgements is analyzed to determine which retransmissions occur. It may take multiple expirations of the internal timer until the overall timeout exceeds the retransmission timer. Therefore the actual time delay for each initial retransmission falls within a range determined by the frequency of the fixed timer expiration. For example, if a 50 millisecond internal timer is used, and it takes three expirations of the internal timer until a retransmission occurs, the actual timeout used varies from 101 milliseconds to 150 milliseconds.

In this document, the term 'internal retx timer' refers to the internal TCP timer that expires at a fixed interval regardless of how many transmit packets are outstanding. Upon each internal retx timer expiration, retransmissions are analyzed and possibly sent.

In this document, the term 'initial retransmission timeout' refers to the minimum amount of time that passes from when a packet is first transmitted until the initial retransmission occurs. It is important to note that the timeout refers to the minimum time before retransmission (not the maximum or average).

In this document, the term 'retransmission timeout' refers to the minimum amount of time that passes until the next retransmission occurs. The pending retransmission may or may not be the first retransmission based on the condition being described. The 'retransmission timeout' always refers to the current timeout.

In this document, the terms 'previous retransmission timeout' and 'next retransmission timeout' refer to the minimum timeouts before and after the current retransmission timeout.

Retransmission Mode

The retransmission mode refers to how the timeout varies from previous to current to next retransmission timeout.

There are several modes discussed in this document.

- BSD mode refers to exponential growth of the timeout. Upon each timeout the next retransmission timeout is equal to 2 x the current retransmission timeout. Usually there is an upper limit on the exponential growth (exponential up to a threshold, then stays at the threshold).
- FIXED mode refers to a constant timeout that does not change as subsequent retransmissions of the same packet occurs.
- MODIFIED mode refers to a combination of the above two modes. One implementation of this mode may use a fixed mode for two out of every three consecutive retransmissions, shifting to the BSD mode on every third retransmit.

Figure 2-12 shows the relative spacing of timeouts for the three different retransmissions modes. Note that the spacing for BSD mode is incomplete due to its relatively long sequence

Figure 2-12. Spacing of Retransmissions in the Three Modes

- The TCP protocol uses a sliding window to determine how much transmit data can be sent at one time, based on the minimum of the node's transmit

window size and the far end's receive window size. The default TCP sliding window size is 8K bytes. Once 8K bytes of transmit data have been sent, with no acknowledgements received, the transmitter is prohibited from sending more until the far end sends acknowledgments for some portion of the window. The TCP window is said to slide when acknowledgments arrive, allowing packets with higher sequence numbers to be sent as packets with lower sequence numbers are acknowledged.

- Even though a particular socket within a TCP stack is configured for an 8K sliding window size, there are times when the TCP protocol does not take advantage of the entire 8K sliding window. One of these times is when retransmissions occur.
- When the TCP layer needs to retransmit one or more packets on a socket, the TCP protocol uses the minimum congestion window size rather than the TCP sliding window size to limit how much traffic can be sent until it must wait for acknowledgments. The minimum congestion window size is typically much less than the TCP sliding window size. As acknowledgments arrive from the far end after a retransmission event, the node slowly grows the congestion window up from the minimum congestion window to the size of the TCP sliding window.
- Another way of looking at this aspect of retransmission is to state that when a retransmission occurs, a transmitter intentionally lowers its own throughput until enough evidence from the far end arrives to assure the transmitter that the network is not congested. This phenomena is also referred to as congestion avoidance.

Socket Connection Dropped due to Retransmission Timeouts

- One other aspect of TCP retransmissions that should be mentioned is what happens when the same packet gets retransmitted over and over. When multiple retransmissions occur for a single packet, the TCP layer counts the number of retransmissions that is performed, and when this count gets too high the TCP socket is closed due to excessive retransmission timeouts. This shows up in the netstat -p tcp output in the 'connection dropped by rexmit timeout' row.
- In the BSD TCP stack, when a packet has been retransmitted 12 times, the socket is closed. Given the use of the exponential retransmit mode in standard BSD, the 12 retransmissions correspond to a time period of approximately 205.5 seconds where the packet was not able to send / ack'd. (205.5 is based on 500 ms x 511, 511 is the sum of the tcp_backoff[] array which governs how the exponential backoff occurs and when the top threshold is reached).
- In the IP⁷ SG stack, when a packet has been retransmitted 12 times, the socket is closed. Given the use of fixed retransmission mode with a 125ms timer, the 12 retransmissions correspond to a time period of approximately 1.5 seconds where the packet was not able to be send / ack'd.

Behavior of Standard BSD Sockets

Table 2-14 summarizes the TCP retransmission characteristics of a standard BSD socket.

Table 2-14. BSD Socket Retransmission Characteristics

Characteristic	Setting or Behavior (not configurable, applies to all sockets)
initial retransmission timeout	500 milliseconds
tcp window size	8k
retransmission mode	exponential
minimum congestion window	2 x the maximum segment size
how does cong window grow	initially grows exponentially via 1 MSS per ack. past a certain threshold, the growth is linear up to the point where the window is fully open
socket dropped due to retransmission timeout	after approx 205.5 seconds
RTO	500 ms default, algorithm to “learn” RTO by averaging recent round trip times, with software imposed upper bound

BSD sockets are extremely tolerant of poor network conditions and continue to wait for longer and longer time periods before performing subsequent retransmissions. These characteristics are not very well suited for time sensitive data such as SS7.

Behavior of IP⁷ SG Release 4.0 IPLIMX & IPGWX Sockets

Table 2-15 summarizes the IPLIMX & IPGWX retransmission characteristics present in the IP⁷ SG Release 4.0 product.

Table 2-15. IPLIMX Socket Retransmission Characteristics on IP⁷ SG 4.0

Characteristic	Setting or Behavior (not configurable, applies to all sockets)
initial retransmission timeout	125 milliseconds
tcp window size	192k
retransmission mode	fixed
minimum congestion window	32k
how does cong window grow	grows exponentially via 1 MSS per ack up to the point where the window is fully open
socket dropped due to retransmission timeout	after approx 1.5 seconds
RTO	fixed, no dynamic information about actual round-trip times used

IPLIMX & IPGWX sockets have been tuned to handle time sensitive data and expect network conditions with low RTT and few transmission errors. The configuration shown above is not tolerant of networks with RTT above a certain threshold (approximately 100ms) or with too many transmission errors. The 4.0 implementation does not expect packet loss due to congestion. The only loss that is expected is due to hardware and / or transmission errors, bad checksums, and so forth. The 4.0 implementation expects little or no congestion on the network, and does not react in a fair manner (with respect to congestion avoidance) when congestion does occur.

Behavior of IP⁷ SG Release 5.0 IPLIMX & IPGWX Sockets

Table 2-16 summarizes the IPLIMX and IPGWX retransmission characteristics that are available in the IP⁷ SG Release 5.0 product.

Table 2-16. IPLIMX Socket Retransmission Characteristics on IP⁷ SG 5.0

Characteristic	Setting or Behavior (configurable on a per socket basis)
initial retransmission timeout	as low as 125 milliseconds, settable in 125ms increments
tcp window size	192k
retransmission mode	fixed bsd modified
minimum congestion window	32k
how does cong window grow	exponential when mode = fixed modified exponential followed by linear when mode = bsd
socket dropped due to retransmission timeout	varies from 1.5 to 205.5 seconds based on the mode and retransmission timeout configured
RTO	fixed, no dynamic information about actual round-trip times used

As seen in the tables above, the Delay vs. “Throughput for TALI Sockets” feature allows the end user to tune the retransmission characteristics of individual sockets. Sockets can be set so that they can function in a variety of network conditions (for example, LAN connection vs. a trans-Pacific WAN connection).

Upgrade Considerations

The addition of two new parameters in the entry (in the Socket Table) for each TCP/IP Socket necessitates the need for changes to the Upgrade Procedures for Engineering Release 37. These two new fields, Retransmission Mode and Round Trip Time Value, must be initialized to default values. The Retransmission Mode is initially set to "FIXED", with the Round Trip Time set to 60 milliseconds. A third field, the Congestion Window Lower Limit must be set to a calculated value using the default Round Trip Time (60 milliseconds). These fields must be set up for every assigned socket. The upgrade applies to both the OAM and Application copies of the Socket Table.

Limitations

The TCP/IP Protocol Stack timing mechanism has been modified by Tekelec software engineers. These changes enable the protocol to support TCP timers with resolutions as low as 125 milliseconds. It is not within the scope of the "Delay Vs. Throughput for TALI Sockets" feature to implement any other TCP timer resolutions than those currently supported. Each value entered as part of the Round Trip Time parameter is mapped to a corresponding Retransmission Timer, with a resolution of 125 milliseconds.

Disallow Simultaneous Logins Sessions with the Same User ID (Release 21.0)

In Release 21.0, the Eagle does not allow more than one login session to be active at any given time for a specific user ID. During **login** command processing, a check is made to see if the user ID is associated with any currently active login session, or is in the process of logging on to another port. If the user ID is found to be already in use on some other Eagle terminal port, then the login is rejected and the error message (the duplicate login error message) is displayed.

```
E2750 Cmd Rej: UserID already logged on (or is logging on) another port
```

The following message is also displayed in the scroll area of the terminal that gives the terminal port (port yy) that the user (UserID xxxxxxxx) is already logged to.

```
Info: UserID xxxxxxxx is currently logged on to port yy.
```

The check for multiple login sessions is made after the user ID and password have been successfully validated and before any password aging or force password change checking is done. As a result, the following events can occur.

1. If the user specifies an invalid login or password, this message is displayed and the duplicate login error message is not displayed.

```
E2757 Cmd Rej: Invalid userID/password combination
```

2. If the user ID and password is valid, but the user's password requires changing, they do not see the messages or prompts to change the password. Instead, they see the duplicate login error message.

This feature can be disabled by specifying the **chg-secu-dflt** command with the **multlog=yes** parameter

Disk Coherency Tests (Release 20.0)

This feature checks that the information in the database contains the correct pointers. The system can determine whether an update to the database failed and whether the information in the database was corrupted.

Disk Copy Fixed to Fixed (Release 20.0)

This feature allows maintenance personnel to create a mirror image from the active TDM fixed disk drive to the standby TDM fixed disk drive. This is used when replacing or updating a TDM.

If more than one message is sent to the EOAP without the LSMS waiting for a response, the LSMS must manage retries and the sequencing of messages.

The EOAP must be configured locally with the LSMS OSI-Address information necessary for association establishment. The EOAP will initiate association connections with the LSMS.

Display Inhibited Alarms (Release 29.0)

This feature enhances the **rept-stat-alm** report to show all the devices that are alarm-inhibited, at what level and duration they are inhibited, and their current alarm level, if any.

Use of the Display Parameter

- If DISPLAY=INHB is used, a plus sign (+) seen in the “Alarm Inhibit Report” (i.e. in the CUR ALM LVL column) indicates that the current alarm is not inhibited, because the level of the inhibit is less than the level of the alarm.
- Column description:
 - Device and element is listed first. Only devices that are alarm inhibited are shown.
 - Duration shows whether the device is alarm inhibited permanently or temporarily.
 - The “alm inh lev” shows the level in which devices are alarm inhibited. The inh-alm command defaults level to major. Devices cannot be alarm inhibited at a critical level unless the stpopt critalminh is turned on.
 - The “current alm lev” shows the level of the current alarm on that device. “None” means there is no alarm currently on that device. If there is no alarm currently on that device, the Duration should show “Perm.”

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. For current information on this command, see the *Commands Manual*.

rept-stat-alm

This command displays the summary of all alarm counts. It has been enhanced with the new parameters **:display** and **:dev**.

Eagle OA&M IP Security Enhancements (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

NOTE: This feature will be available at a later date. The latest updates to the Feature Notice are maintained on the Tekelec Secure Website; see “Instructions for Accessing Tekelec’s Secure Website” on page FN-114.

Description

The Eagle OA&M IP Security Enhancements feature provides tools to securely pass data across an otherwise non-secure network. Once the Eagle OA&M IP Security Enhancements Feature is turned on, the Eagle allows only secure connections from approved clients, and protects sensitive passwords and information while in transit between the Eagle and a host.

The Eagle OA&M IP Security Enhancements feature uses a software package called Secure Shell. Secure Shell (SSH) is a protocol for secure remote login and other network services over an insecure network. SSH encrypts and authenticates all Eagle IPUI traffic, incoming and outgoing (including passwords) to effectively eliminate eavesdropping, connection hijacking, and other network-level attacks.

SSH consists of several component applications, two of which are relevant for IPUI enhancements: SSH client program for secure remote login (an enhancement for telnet), and SFTP, the secure file transfer protocol (which replaces FTP); refer to the **bold** components of Figure 2-13.

Figure 2-13. The Secure Shell Package

Both applications support strong encryption of passwords and data, using widely accepted cipher routines. In addition, they provide authentication to reliably determine the source of any connection attempt. Lastly, SSH provides a guarantee of data integrity, which ensures data cannot be tampered with, even while in transit over the network. These security features, once implemented, are transparent to the users.

IP Network Security

A non-secure network is vulnerable to several types of electronic attacks. IP protocol itself provides limited inherent capability for confidentiality or security. Because of this, networks that depend on IP are subject to relatively simple attacks; these include eavesdropping on an IP transmission, recording or even modifying data. A protocol analyzer, for instance, can record network traffic, and then the packet's data contents are open to view. Another type of IP attack involves a third-party taking over a session and masquerading as one of the original parties involved in the communication.

IP-based security vulnerabilities include:

- *Snooping*, or eavesdropping on a connection, which is especially damaging while passwords are being transmitted (see Figure 2-14).
- *IP spoofing*, in which an intruder tries to gain access by changing a packet's IP address to make it appear that the packet came from another, trusted host (see Figure 2-15).
- IP source routing, where a host can pretend that an IP packet comes from another, trusted host
- DNS spoofing, where an attacker forges name server records
- Interception of clear text passwords and other data by intermediate hosts
- Manipulation of data by people in control of intermediate hosts
- Attacks based on listening to authentication data and spoofed connection to the server.

Figure 2-14. Example of Snooping**Figure 2-15.** Example of Spoofing

Addressing IP Security

The Eagle Secure Shell package developed for this feature addresses the network vulnerabilities as follows:

Identification

Identification occurs on many levels during a telnet or FTP terminal session. User identification is not only via username, but also through the originating IP address, and also by the Secure Shell client session ID. During the establishment of a secure connection, the host and client go through a process of key exchange and verification, to firmly establish a session identity. Secure Shell is in effect, providing a secure pipe between the client and host for the duration of that connection. All subsequent messages can be verified as originating from that known and established source.

Authentication

Authentication, at the user level, is provided for by the Eagle login (username and password). This establishes the users identity. Secure Shell provides for authentication at the message level, to ensure incoming messages have originated from a known and verified source, while the session is in effect. This prevents network attacks based on spoofing or modifying the IP packets addressing headers, or originator ID.

Confidentiality

Confidentiality is enforced via message encryption. The Secure Shell tools encrypt each packet of data, before being exchanged in the process of either file transfer, or an interactive session. This encryption prevents snooping-type LAN attacks, where a hostile party intercepts and attempt to read messages in transit.

Data Integrity

Encryption also protects the data contained in the message or the message header from being altered or modified (either maliciously or accidentally) while in transit. Any message that fails an integrity test would be discarded, and the protocol would request the originator to resend the lost message. Data integrity is protected by including a Message Authentication Code (MAC) with each packet. The MAC is computed from a shared secret (key), packet sequence number, and the contents of the packet. The message authentication algorithm and key are negotiated when the connection is established.

Encryption

The secure connection and data encryption is established *before* the password or other authentication is ever sent, so all data remains protected. The client determines the encryption cipher; one of several is used, such as 3DES, IDEA, or Blowfish. Once the cipher has been determined (generally within the client preferences), the client and server exchange encryption keys.

Strong Authentication

Strong authentication on a per-user basis would entail the use of public/private key pairs, generated at runtime and distributed to each user's client, along with a pass code that was user specific. These keys could not be pre-generated and stored in a table (with user names and passwords), since that would compromise any security advantage they were meant to impart. This would also entail an administrator account on each IPSM or MCPM card, along with a key server agent, to track user keys. Neither the IPSM nor MCPM platform currently supports administrator shell access, or a file system to store keys generated at runtime. This feature does not address Strong Authentication.

Secure Shell Summary

The top drawing in Figure 2-16 depicts a standard IP packet traveling over a LAN connection to the server. A packet header contains the destination address, the sender's address, etc. The packet contains data. An IP sniffer could open this packet from the IP stream, examine the contents, change the source or destination address, or change the contents. Security tools prevent the originator's address from being altered, the destination address from being altered, and the data is both unreadable, and protected from modification while in transit.

Figure 2-16. IP Network Security

Eagle Secure Shell Solution

The Eagle communicates over IP using two methods: Telnet and File Transfer. Telnet is the remote interactive terminal session. FTP Retrieve and Replace and Measurements Platform use file transfer, for performing bulk data transfer to remote servers.

Secure Shell uses encryption and authentication to protect sensitive data as it passes from one system to another in either scenario. SSH, a terminal connection program, and SFTP, a file transfer program, use an encryption algorithm for protecting all data transmitted over a session, including initial login and password, files and commands sessions.

All data passed through a Secure Shell session is secure: Secure Shell encrypts and authenticates all traffic, incoming and outgoing (including passwords) to effectively eliminate eavesdropping, connection hijacking, and other network-level attacks.

Secure Shell works through three fundamental stages:

- **Integrity** - Guarantees the data traveling over a network arrives unaltered.
- **Encryption** - Scrambles data to render it unintelligible, except to the intended recipients. A network sniffer could not read the enclosed data, as it cannot be decrypted without the key.
- **Authentication** - A secure protocol authenticates the source and destination addresses, as well as encrypts and data contained. Authentication protects against several security problems, e.g., IP spoofing, fakes routes, and DNS spoofing. Nor could false data be substituted, since authentication would reject any but known client's packets.

Applying Secure Shell to Eagle

This feature applies Secure Shell Version 2.0 to Eagle OA&M IP Interfaces. Secure Shell defines a protocol for secure remote login and other secure network services over any non-secure network. It provides an encrypted terminal session with authentication of both the server and client. It provides authentication and secure communications over unsecured channels. In other words, Secure Shell never trusts the net; somebody hostile who has taken over the network can only force Secure Shell to disconnect, but cannot decrypt or play back the traffic, or hijack the connection. Secure Shell contains two separate utilities for IP OA&M connections: SSH and SFTP.

- SSH is the terminal session utility of the Secure Shell package. SSH is a secure replacement for telnet clients.
- SFTP is the file transfer utility that is part of the Secure Shell package.

SSH and SFTP share the same security features, which include:

- A variety of data authentication methods.
- A secure session established between clients and hosts.
- Support for data encryption.

Eagle IP Features

The Eagle OA&M IP Security Enhancements feature affects these features:

- IPUI User Interface (Telnet), introduced in Eagle Release 29.0/IP⁷ Secure Gateway Release 7.0
- FTP Retrieve and Replace, introduced in Eagle Release 29.0/IP⁷ Secure Gateway Release 7.0

- Measurements Platform (Eagle Release 28.0)

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

enable-ctrl-feat

This command is used to enable Controlled Features the customer has purchased on a permanent basis or may be used to temporarily turn a feature on for a thirty (30) day trial period. Features may be temporarily enabled by using a temporary password or may be permanently enabled by using a permanent password.

This command accepts a Controlled Feature's Part Number (partnum) and a Feature Access Key (fak). The OA&M IP Security Enhancements feature Part Number and Feature Access Key numbers will be accepted as valid input for these parameters. No changes to the syntax of this command are required.

chg-ctrl-feat

This command is used to activate (turn on) Controlled Features or to clear the Critical alarm for a Controlled Feature whose temporary key has expired. This command accepts a Controlled Feature's Part Number (partnum). The Eagle OA&M IP Security Enhancements Part Number will be accepted as valid input for this parameter. No changes to the syntax of this command are required.

Eagle OA&M IP Security Enhancements feature can be turned off via the **chg-ctrl-feat** command. (Before turning Secure Shell off, be sure FTP servers and telnet clients are available.) Any configured SFTP servers should have FTP installed as well, or alternate FTP servers provisioned to support FTP Retrieve and Replace or Measurements Platform. Any equipped IPSM cards must be inhibited prior to changing the feature state. MCPM cards must remain active, and transfers that are in-progress are allowed to complete.

NOTE: A major alarm is generated when the feature is turned off.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the Eagle OA&M IP Security Enhancements feature.

Syntax

RTRV-CTRL-FEAT

rtrv-trm

This command retrieves and displays the TERMINAL CONFIGURATION attributes (connected device type, communication settings, type of unsolicited messages received, etc.) for a single or all 16 TDM serial ports. The output for this command has been enhanced to display the SECURE status.

rept-stat-trbl

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

Alarms and Error Codes**Alarms**

Table 2-17 lists the new UAMs created for this feature..

Table 2-17. Eagle OA&M IP Security Enhancements: New UAMs

UAM #	Severity	Message Text
199	None	OA&M IP Security feature disabled
392	Major	OA&M IP Security status is OFF
393	Normal	OA&M IP Security status is ON

Error Codes

Incorrect use of the enhanced commands for the Eagle OA&M IP Security Enhancements feature may result in the error messages listed in Table 2-18:

Table 2-18. Eagle OA&M IP Security Enhancements: Error Messages

Error Message	New?	Used by Command:
E2723 Password operations not allowed on a non-secure terminal	No	chg-user, ent-user, login
E4062 Inhibit IPSM card(s) before changing feature status	Yes	chg-ctrl-feat

Upgrade Considerations

FTRA (FTP-based Table Retrieve Application) software must be upgraded to support the Eagle OA&M IP Security Enhancements feature.

Limitations

Security is a process, not a product. Eagle OA&M IP Security Enhancements will not assist any activity that compromises a host's security in some other way. This feature provides secure access to the Eagle IPUI terminals, and while the Eagle is transferring data off-board to remote SFTP servers. Vigilance still is required in protecting username / password combinations, and in controlling system access to Eagle commands (via the configurable command class feature) to prevent violation of access privilege. This feature does not provide the remote Secure Shell client or server applications (SSH, SFTP).

If this feature is enabled with a temporary key, the key can expire while telnet (SSH) or FTP (SFTP) connections are up and in progress. In this scenario, all existing (legacy) connections remain up, and new connections follow the state of the feature: ON or OFF. Both secure and non-secure connections are possible for the duration of the 'legacy' connection.

E1 Administration and Alarms (Release 26.3)

Currently E1 cards are "provisioned" via dip switches on the LIM board. Although this method of provisioning is functional, customers desire to integrate the provisioning of E1 functionality similar to other LIM cards, via software. This feature enhances the current 2-Port E1 feature by allowing the customer to configure the E1 hardware without using the DIP switches on the applique. This feature also provides support for E1 Master Timing.

Instead of a card having to be removed to change the configuration, each card can be configured using new commands and extensions to existing commands. This capability allows customers ease of configuring and updating their network using the EAGLE. Also, since the DIP switches are no longer required, they can be removed from future production E1 appliques.

NOTE: This feature is backward compatible with the E1 hardware, with or without the DIP switches.

With the introduction of this feature, the administration of the E1 will be done by Eagle commands. Thus various Eagle commands have been created or modified; see "*New Commands*" on page 2-104, and "*Enhancements to Existing Commands*" on page 2-104.

Description of E1 Operation within an EAGLE

The introduction of this feature brings complete product support for the E1 line interface into the Eagle, thereby concluding the E1 effort begun during Release 22.2. Along with V.35, the E1 interface is a primary interface used outside of North America. Thus, this large market base is a large market potential for an EAGLE with an E1 interface.

The E1 cards are provisioned and operate in a fashion very similar to the current DS0/OCU/V.35 signaling links:

- E1 cards and links must be configured in the EAGLE in a manner similar to how existing signaling links are configured. These configuration activities include entering cards, entering links, assigning links to link sets, and activating cards and links, in addition to entering E1 parameters. Changes to existing Eagle commands, and new Eagle commands, to perform these configuration activities are required; see “*New Commands*” on page 2-104 and “*Enhancements to Existing Commands*” on page 2-104.
- Two new card types, 'LIME1' and 'LIMCH', are used to define the E1 card and Channel cards, respectively, in the EAGLE.
- A set of E1-specific interface parameters must be maintained on a per-E1 basis. These parameters include:
 - which E1 port is used (either #1 or #2)
 - CRC4, CAS/CCS, HDB3/AMI, master/slave clocking options
 - signaling bits settings
- A set of E1-specific interface parameters must be maintained on a per-signaling link basis. These parameters include:
 - which E1 card is the card dropping timeslots
 - which timeslots are being used
- The current E1 implementation provisions E1 cards as either DS0 or OCU, based on master/slave timing. This feature provisions the cards as E1 or channel with either master or slave timing.
- Building Integrated Timing System (BITS) clock alarms must be supported when E1 cards with master timing are provisioned in the Eagle. Currently, this is the reason that E1 cards are provisioned as DS0 cards.

The `tst-slk` command will continue to support local transceiver loopback using the ISCC, just like the DS0/OCU/V.35 cards; no changes are necessary.

Eagle Application Support for E1

Currently the SS7 application software initializes the hardware completely based on DIP switch values. With the new E1 Administration and Alarms feature allowing E1 cards to be provisioned, the SS7 application software needs to only initialize the hardware to a benign state until provisioning information is provided. This initial hardware state is similar to the other link interface module (LIM) cards' initial state.

Hardware Requirements

This feature is dependent upon the EAGLE E1 hardware, consisting of the LIM E1 backplane kit (P / N 890-1037-01), which allows connectivity between the E1 LIM card(s) and the corresponding E1 channel card(s) (both P / N 870-1379-01).

New Commands

For more detailed information on the commands in this section, see the *Commands Manual*.

The following new E1 interface commands have been created to support the E1 Administration and Alarms feature:

ent-e1 (enter e1 interface)

This new command is required to add an E1 interface. It allows up to two E1s to be configured per E1 card.

chg-e1 (change e1 interface parameters)

This new command is required to change an E1 interface. It allows the user to update one E1 at a time.

dlt-e1 (delete e1 interface)

This new command is required to delete an E1 interface. It allows the user to remove one E1 at a time.

rtrv-e1 (retrieve e1 interface parameters)

This new command is required to retrieve E1 interface parameters per E1 interface, or all E1s.

Enhancements to Existing Commands

For more detailed information on the commands in this section, see the *Commands Manual*.

ent-card (enter card)

This existent command allows the user to add a new card to the system. The user must specify the card location, type, and application. The card type and the application specify the function assigned to the card. This command has been modified to support the new LIME1 and LIMCH card types.

dlt-card (delete card)

This existing command allows the user to delete a card from the system. The user must specify the card location. This command has been modified to support new rules required for LIME1 card types. No changes to the syntax of this command have been made.

rtrv-card (retrieve card)

This existing command displays information about a card. It shows the card location, card type, the application the card is running, the link set name, and the signaling link code for the LIM cards. The outputs of this command have been modified to support the new LIME1 and LIMCH card types. No changes to the syntax of this command have been made.

ent-slk (enter signaling link)

The **ent-slk** command has been modified to associate a signaling link with an E1 timeslot. The new E1 parameters are valid only when the SLK is an E1 or Channel card. Likewise, all existing V.35- and HSL-specific parameters (**tset**, **llmode**, **lpset**, **atmtsel**, **vci**, **vpi**, **ll**) are invalid when the SLK is an E1 or Channel card.

rtrv-slk (retrieve signaling link)

The command's output has been modified to display the new E1 parameter data in the output. A new value, **e1**, has been added to the **class** parameter to display all E1 links. No other changes to the command syntax have been made.

rst-card (restore [allow] card)

This existing command allows the user to restore or allow a card to the system. The user must specify the card location. This command has been modified to support new rules required for LIME1 and LIMCH card types. No changes to the syntax of this command have been made.

rmv-card (remove [inhibit] card)

This existing command allows the user to remove or inhibit a card from the system. The user must specify the card location. This command has been modified to support new rules required for LIME1 card types. No changes to the syntax of this command have been made.

rept-stat-card (report card status)

This existing command allows the user to retrieve the current status of a card in the system. The user may specify the card location or all cards will be listed. No changes to the syntax of this command have been made.

rept-stat-slk (report signaling link status)

The **rept-stat-slk** command supports the display of a separate status for the E1 associated with the link. The status includes the E1LOC plus the UAM text. If the E1 association is not provisioned, "unknown" is displayed. If the card is not a LIME1 or LIMCH, no E1 output is performed.

Alarms**New UAMs**

Following are the new UAMs for the new E1 fault conditions. All E1 facility outage alarms have a severity level of MAJOR. All alarms are output to the SYSTEM MAINTENANCE output group.

Failure: Facility Outage - Far End failure for Port 1

0225 REPT-E1F:FAC-E1 Port 1 Far End failure

Failure: Facility Outage - E1 AIS detected for Port 1

0226 REPT-E1F:FAC-E1 Port 1 AIS detected

Failure: Facility Outage - E1 Loss of Frame failure for Port 1

0227 REPT-E1F:FAC-E1 Port 1 LOF failure

Failure: Facility Outage - E1 Loss of Signal failure for Port 1.....

0228 REPT-E1F:FAC-E1 Port 1 LOS failure

Failure: Facility Outage - E1 Excessive In Service Bit Error Rate for Port 1

0229 REPT-E1F:FAC-E1 Port 1 10E-3 BER exceeded

End of Failure: E1 available for Port 1

0230 RCVRY-E1F:FAC-E1 Port 1 available

Failure: Facility Outage - Far End failure for Port 2

0460 REPT-E1F:FAC-E1 Port 2 Far End failure

Failure: Facility Outage - E1 AIS detected for Port 2

0461 REPT-E1F:FAC-E1 Port 2 AIS detected

Failure: Facility Outage - E1 Loss of Frame failure for Port 2

0462 REPT-E1F:FAC-E1 Port 2 LOF failure

Failure: Facility Outage - E1 Loss of Signal failure for Port 2

0463 REPT-E1F:FAC-E1 Port 2 LOS failure

Failure: Facility Outage - E1 Excessive In Service Bit Error Rate for Port 2

0464 REPT-E1F:FAC-E1 Port 2 10E-3 BER exceeded

End of Failure: E1 available for Port 2

0465 RCVRY-E1F:FAC-E1 Port 2 available

Upgrade Considerations

- The system release containing the E1 Administration and Alarms feature must be field-upgradable, with the Eagle in an in-service mode.
- The new current and backup tables for E1 link interface parameter values must be created.
- A new phase is needed in the upgrade procedure to update the database with E1 information retrieved from the network cards after the network cards have been loaded with the latest GPL.
- Prior to collecting E1 information, cards will be loaded with the latest GPL with data from the database, including link information. Cards containing existing E1 links must load and bring up their SS7 links using the DIP switches instead of downloaded E1 data in this case.
- Card type field in the current and backup IMTA tables needs to be corrected from DS0/OCU based on information received from each card.
- E1 parameter information needs to be updated in current and backup E1LINK tables.
- E1 timeslot information needs to be updated in current and backup LINK and XLINK tables.
- Since upgrade must be able to be performed remotely, there must be an automated way to map the E1 / Channel card relationship via some method such as far-end loopback detection.
- Since TS0 and TS16 (when CAS is enabled) may be assigned using the DIP switches, the upgrade must detect and report this condition. However, no change can be made to the timeslots.

Limitations

The E1 Administration and Alarms feature has these limitations:

- The configuration of the various E1 / channel cards via the E1 backplane is not validated with the E1 parameter set information.
- There is no verification that the E1 and channel cards are connected to the E1 backplane.

E1 ATM High Speed Link (Release 28.1) (IP⁷ Release 6.0)

International customers desire increased signaling bandwidth by utilizing Asynchronous Transfer Mode (ATM). This capability requires Eagle software to support ATM, as well as some hardware modifications to the existing LIM-ATM card that currently supports ATM over T1. The existing HCAP design for the LIM-ATM, with some modifications to the appliqué, is being used to accommodate the E1 ATM connectivity to the Eagle.

This feature provides a new E1 interface capability on the EAGLE. This new capability is provided using the existing LIM-ATM via an HCAP card, a new Applique' ATM (AATM) daughterboard, and a new GPL. A modified LIM-ATM supporting 2.048 Mb/sec is here referenced as an E1 ATM card. The E1 ATM capability supports a single ATM Virtual Channel Connection (VCC) at a line speed of 2.048 Mbps. The E1 ATM replaces the MTP layers 1 and 2, (ITU-T Q.702 and ITU-T Q.703) with an ATM-based protocol (ITU-T Q.2110, Q.2140 and Q.2144). ATM is used as the transport technology for carrying the signaling information via PDU's between network nodes.

Refer to the *NSD Hardware Manual* for detailed hardware information.

New Hardware

E1 ATM LIM provides one Asynchronous Transfer Mode over E1 Interface at 2.048 Mbps, (P/N 870-1293-xx). This module uses an E1 Asynchronous Transfer Mode Applique (E1 ATM) installed on a High Capacity Application Processor (HCAP) main assembly. The E1 ATM applique provides a new communications capability on the EAGLE, a High Speed Link (HSL) using ATM over E1. This capability is provided using the existing HCAP card, a new applique, and a new GPL (ATMITU).

Refer to the *NSD Hardware Manual* for detailed hardware information.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

ent-card

Use this command to add a card to the database. The card type and application specifies the function assigned to the card. The new range value **atmitu** has been added to the **:appl** parameter. The new range value **lime1atm** has been added to the **:type** parameter.

rtrv-card

Use this command to display the information about a card. The output of this command has been enhanced to display new **ent-card** parameter values.

init-card

Use this command to cause a soft reset of a card. The new range value **atmitu** has been added to the **:app1** parameter.

ent-slk

Use this command to add a low-speed (LSL) or high-speed (ATM HSL or IP) signaling link to a linkset in the database. The new parameters below have been added to this command. Also, the new range value 2048000 has been added to the **:bps** parameter.

tst-slk

Use this command for testing signaling links. This command has been enhanced to prohibit **:loopback=payload** or **:loopback=line** for a card running the ATMITU GPL.

rtrv-slk

Use this command to retrieve link information for LSL and ATM signaling links. Its output has been enhanced to show the values of the new parameters.

rept-stat-slk

Use this command to generate a report of the MTP signaling links status. Its output has been enhanced to show the values of the new parameters.

chg-atm-lps

Use this command to configure a link parameter set with timers and other parameters used by the system to provide level 2 functions for each ATM high-speed signaling link. The parameters **:lpset**, **:tmrt2**, **:n1**, and **:maxnrp** have been enhanced with new range values/default values.

rtrv-atm-lps

Used to display all SAAL timers and parameters for various Link Parameter Sets. This command is required to retrieve LPS parameters. This command has been enhanced to show new parameter range values.

rtrv-atm-prm

This command retrieves system-wide non-configurable ATM Layer parameters for each ATM HSL. The data to be retrieved includes ATM interface parameters and ATM Traffic Descriptor values. This command has been enhanced to show new parameter range values.

act-gpl

Use this command to change the status of the trial GPL from “trial” to “approved.” The status of the previously approved GPL is changed to “trial.” The **:app1** parameter has been enhanced with the new range value **atmitu**.

chg-gpl

Use this command to copy a generic program load from the source disk to the destination disk (both active and standby disks). The **:appl** parameter has been enhanced with the new range value **atmitu**.

rtrv-gpl

Use this command to show the version numbers of the GPLs stored on each fixed disk (TDM) or removable cartridge (MDAL, if available), and the system release table stored on each fixed disk. The **:appl** parameter has been enhanced with the new range value **atmitu**.

rept-stat-gpl

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted. The **:appl** parameter has been enhanced with the new range value **atmitu**.

disp-/set-mem

For these Debug commands, the new range value **atmitu-all** has been added to the **:card** parameter.

ent-/dlt-/disp-bp

For these Debug commands, the new range value **atmitu-all** has been added to the **:card** parameter.

rept-meas

Use this command to generate measurement reports on demand. The **:appl** parameter has been enhanced with the new range value **atmitu**.

rtrv-ls

Use this command to obtain the attributes of a link set or all link sets. This command has been enhanced to display the E1 ATM signaling links.

Limitations**OAM F5 Performance Monitoring**

ATMANSI does not provide OAM F5 performance monitoring. This capability has not been added for this feature. Because the anticipated deployment of this feature is as a direct connection, performance monitoring of the network is not anticipated to supply any additional information that SAAL does not.

OAM F5 Fault Management

ATMANSI only provides OAM F5 fault management for OAM loopback. It does not provide support for alarm surveillance and continuity check. These capabilities have not been added for this feature. Because the anticipated deployment of this feature is as a direct connection, fault management of the network is not anticipated to supply additional functionality. Connection issues will be detected by the SAAL and the link will be deactivated if appropriate.

Traffic Size

Traffic size will have a definite impact on MSU throughput of the system; see Table 2-19.

Table 2-19. Comparison of MSU Size to Throughput

MSU Size	ATM Packet Overhead	Cells/MSU	Max MSU/Sec
20	62%	1	2000
30	43%	1	2000
40	24%	1	2000
50	52%	2	1800
60	43%	2	1800
70	33%	2	1800
80	24%	2	1800
90	43%	3	1200
100	36%	3	1200
150	29%	4	900
200	24%	5	720
250	21%	6	600

AMI

AMI is not supported in this release. HDB3 is the only supported encoding option for the E1 ATM card.

OVERSIZE MESSAGES

Oversize messages (>272 octets) will not be supported in this release. This limitation is a holdover from ATMANSI.

A general purpose implementation of the ATM HSL protocol stack would allow for 'Large MSUs' to be transferred across the physical link. The SSCOP layer is capable of handling data from SSCF that is up to 4096 bytes long. Since SSCF does not add a trailer to MTP3 data, this equates to an MTP3 packet of 4096 bytes.

However, the current implementation of the ATM HSL stack restricts the largest MSU size to 272 bytes of MTP3 data. This restriction will be used for this feature, and as in the ATMANSI gpl, a the same UIM will be generated with a Large MSU is received.

E1/T1 Multi-Channel Interface Module (Release 28.0) (IP⁷ Release 6.0)

The E1/T1 Multi-Channel Interface Module (MIM) provides increased E1 signaling connectivity and a channelized T1 connection to the Eagle STP.

The MIM increases the number of SS7 links (ports) the Eagle handles per E1 card. This allows the Eagle to interact in larger SS7 networks, as well as decreases the footprint of an Eagle (i.e. previously 250 cards were required to support 500 links; now only 63 cards are required). The E1/T1 MIM can be used in systems equipped with either the IPMX or the HMUX board. The MIM also provides a new channelized T1 connection to the Eagle. The MIM can replace an existing LIME1/LIMCH card (as an E1 terminating card or E1 channel card), with no reprovisioning required. E1 MIM is hot-swappable with LIM-E1.

NOTE: For existing E1 customers, the E1 Administration feature will be activated after upgrading to Release 28.0, unless the source release is 26.3.

The E1/T1 Multi-Channel Interface Module (MIM) card has 2 physical backplane port connections, as other LIM cards do. These are referred to here as interface A and interface B. For the E1/T1 MIM, as with the existing LIM-E1 card, interface A has 2 ports of E1/T1 connectivity. These 2 ports are referred to as port #1 and port #2. Interface B provides the expansion port to service channel cards.

Refer to the Database Administration Manual - SS7 for detailed and configuration information.

Hardware Requirements

No new hardware other than the new MIM card itself (870-2198-01) is needed to support this feature.

For detailed information on hardware, refer to the *NSD Hardware Manual*.

New Commands

The following commands have been created to support the E1/T1 MIM feature. For the current usage information, refer to the *Commands Manual*.

ent-t1

Use this command to enter an interface for an E1/T1 MIM card used as a T1 card in the system. You must specify the T1 port number on the card and the T1 card location in the Eagle. Encoding, line length, timing source, and framing options can be set.

chg-t1

Use this command to change an interface for an E1/T1 MIM card used as a T1 card in the system. You must specify the T1 port number on the card and the T1 card location in the Eagle. Encoding, timing source, line length, and framing options can be set.

dlt-t1

This command allows the user to delete a T1 interface. The user must specify the card location and T1 port number.

rtrv-t1

This command retrieves T1 information. The command displays the card location, T1 port number, CRC4, CAS/CCS, encoding/decoding, timing source, clock source, international NFAS data and national NFAS data. If no parameter is specified, the command displays information for all T1's defined by the ENT-T1 command.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the E1/T1 MIM feature. For more information on these commands, see the *Commands Manual*.

ent-card

The **ent-card** command has been modified to support the LIMT1 card type. The value **limt1** has been added to the **:type** parameter.

dlt-card

A new semantic rule has been added to the **dlt-card** command, specifying that a card of type LIMT1 must not have any T1's assigned.

rtrv-card

The **rtrv-card** command now displays the status of all ports of an E1/T1 MIM.

ent-e1

This command allows the user to add an E1 interface to the system. It has been modified to allow AMI encoding for the E1/T1 MIM (8-port card). Note, however, that the 2-port LIME1 card does not allow AMI encoding.

chg-e1

This command allows the user to change an E1 interface. It has been modified to allow AMI encoding for the E1/T1 MIM (8-port card). Note, however, that the 2-port LIME1 card does not allow AMI encoding.

dlt-e1

This command allows the user to delete an E1 interface. It has been modified to support the new SS7 ports for the MIM.

rtrv-e1

This command retrieves E1 information. It has been modified to support the new SS7 ports for the MIM, and to allow AMI encoding for the MIM. Note, however, that the 2-port LIME1 card does not allow AMI encoding.

rept-stat-card

This command has been modified to support the new LIMT1 card type. It also has been modified to reflect the new SS7 ports for the MIM.

inh-card

This command attempts to change the state of the card from IS-NR (in service normal) to OOS-MT-DSBLD (out of service maintenance disabled). It has been modified to support the new LIMT1 card type; i.e. the value **t1** is supported by the **:force** parameter.

alw-/act-/dlt-/canc-/dact-/blk-/ublk-/inh-/unhb-/rept-stat-slk

The range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** have been added to the **:port** parameter of these commands.

act-/canc-lp0

The range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** have been added to the **:port** parameter of these commands.

ent-slk

This command associates a signaling link with an E1 or T1 timeslot. The **:t1port** and **:t1loc** parameters have been created to support the MIM feature.

rtrv-slk

This command retrieves link information for LSL and ATM signaling links. The value T1 has been added to the: **class** parameter. Also, the range values **a1, b1, a2, b2, a3, and b3** have been added to the: **port** parameter.

act-/-chg-/rept-stat-/rtrv-gpl

The parameter range value **bpmp1t** has been added to the: **app1** parameter of these commands.

rtrv-ls

Use this command to show the linkset information. The output for this command has been enhanced to display E 1/T1 information.

Eagle Alarm Modifications for Synchronization with Harris (Release 31.5)

There is an issue between the Harris monitoring system and the alarm generation/clearing shown by the Eagle. There are multiple instances where the Eagle will either silently clear an alarm, or silently refresh an alarm to a different alarm. Since the Harris system is relying on the Eagle output to set or clear alarms on Eagle devices, the two systems alarming counts are frequently out of sync.

Eagle Initiated OAP User Interface (Release 24.0)

In Release 24.0, the OAP configuration information is entered from the Eagle terminals into the Eagle database. When the configuration of an OAP needs to be updated, the OAP configuration data in the Eagle database is sent to the specified OAP.

OAP Commands

The Eagle uses these commands to configure and display the OAP data in the database and send this data to the OAP. Refer to the *Commands Manual* for current usage information.

- **chg-oap-config**
- **chg-oap-lkeys**
- **act-oap-config**
- **rtrv-oap-config**

This feature can be used to configure and update the Texas Micro OAPs currently being used or the Embedded OAPs introduced in Release 24.0. This feature cannot be used to upgrade the OAP software. Upgrading the OAP software must be performed by a terminal connected directly to the OAP.

chg-oap-config

The **chg-oap-config** command is used to configure the Eagle database with the OAP configuration information. This information is sent to the specified OAP with the **act-oap-config** command.

chg-oap-lkeys

The **chg-oap-lkeys** command is used to enter the license keys of the DSET APLI, DSET DSGRuntime, Solstice OSI, and Solstice X.25 third party OAP software into the Eagle database. The license keys are not sent to the OAP with the **act-oap-config** command, but are used when auditing the OAP and Eagle configuration data.

act-oap-config

The **act-oap-config** command is used to update the OAPs with the configuration data entered into the Eagle database with the **chg-oap-config** command.

rtrv-oap-config

This command displays the OAP configuration information in the Eagle database that has been configured with the **chg-oap-config** and **chg-oap-lkeys** commands.

chg-sid

When the Eagle's CLI has been entered into the database or changed with the **chg-sid** command, the OAP configuration must be changed to include the new CLI value. When this change to the Eagle's CLI has been made, the following warning message is displayed in the scroll area of the terminal display, reminding the user that the OAP configuration must be updated with the **act-oap-config** command.

LNP Service Commands

When the LNP feature is on, the LNP services CLASS, CNAM, LIDB, and ISVM must be in the OAP configuration in the Eagle database. When these services are added to the database (with the **ent-lnp-serv** command), removed from the database with the **dlt-lnp-serv** command, or changed with the **chg-lnp-serv** command, the OAP configuration must be updated with the **act-oap-config** command. When any of these changes to the LNP services have been made, the following warning message is displayed in the scroll area of the terminal display, reminding the user that the OAP configuration must be updated with the **act-oap-config** command.

Auditing the OAP Database

In order to keep OAP database synchronized with the Eagle, a checksum is created using all of the OAP configuration data stored on the Eagle. The OAP also calculates this checksum based on the data it has. This checksum is returned by the OAP with every forced maintenance poll allowing the Eagle to compare and act on the result. If the checksum values do not agree, the Eagle generates a minor alarm (UAM 0364) within 10 seconds:

UAM 0364 is cleared within five seconds after the Eagle detects that the databases are synchronized again, and the checksum values of the databases agree, with UAM 0365:

Eagle Measurement Reports (Release 20.0)

Eagle STP measurements provide support for STP performance management, SS7 traffic monitoring and engineering, and Specific feature performance analysis (STPLAN).

Refer to the *Maintenance Manual* for current Eagle measurement information.

Eagle Support for Integrated Sentinel (Release 28.0)

Description

The Eagle STP and the Sentinel Network Maintenance and Diagnostics tool are both existing Tekelec products. Without the Eagle Support for Integrated Sentinel feature, the Sentinel requires physical, clamp-on connections to the Eagle's SS7 signaling links, in order to monitor SS7 traffic. This monitoring method involves costs for cable installation and maintenance for each SS7 link that is to be monitored.

The Eagle Support for Integrated Sentinel feature eliminates the need for intrusive hardware for each link to be monitored; instead, monitoring is via an Ethernet connection. Message Signaling Units (MSUs), alarms and events can be copied to the ESP over the Ethernet link to provide the same network traffic monitoring.

For more information on the Eagle Support for Integrated Sentinel feature, refer to the *Database Administration Manual - Features*.

Hardware Requirements

The Eagle Support for Integrated Sentinel feature requires GPSM-II cards in place of MCAP cards. Also, the Eagle Time Synchronization feature (TSC Sync) must be active in conjunction with this feature. In addition, the timing requirements include the use of an external nits clock.

CAUTION: The Eagle Support for Integrated Sentinel feature also requires the STC cards (870-1945-xx) and HMUX (870-1965-01 Rev A). For Eagle 28.0, DCM cards (870-1945-xx) will serve as STC cards.

NOTE: The TSC feature requires GPSM-II; the Eagle Support for Integrated Sentinel feature requires the TSC feature.

For detailed hardware information, refer to the *NSD Hardware Manual*.

New Commands

The following commands have been created to support the Eagle Support for Integrated Sentinel feature. For more detailed information on the commands in this section, see the *Commands Manual*.

chg-eisopts

This command provides the user the ability to change certain copy options associated with the Extended Services Platform (ESP).

rtrv-eisopts

This command retrieves the user-specified options for the Eagle Support for Integrated Sentinel feature. It has no parameters.

chg-netopts

This command allows the user to change the PVN and PVN submask. The PVN is the Private Virtual Network address within the Eagle. This address is used by the Eagle to assign an IP address for every card in the Eagle, based on this network address and the card location.

rtrv-netopts

This command retrieves the user specified options for the IP networks used by the Eagle. It has no parameters.

rept-stat-eroute

This command displays the status of the EROUTE cards. This command also displays any cards that are denied EROUTE service.

Enhancements to Existing Commands

The following commands have been enhanced to support the Eagle Support for Integrated Sentinel feature. For more information on these commands, see the *Commands Manual*.

chg-feat

This command activates the clock synchronization feature and the Eagle Support for Integrated Sentinel feature. The clock synchronization feature is needed by the Eagle Support for Integrated Sentinel feature to acquire valid timestamps for the copy of MSUs to the ESP. Thus the Eagle Support for Integrated Sentinel feature may not be turned until the TSCSYNC feature bit is turned on.

rtrv-feat

This command has been enhanced to display the status of the **tscsync** and **e5is** feature bits. This command has no parameters.

ent-card

Use this command to add a new card to the system. This command has been enhanced to support the Eagle Router GPL (Generic Program Load).

init-card

This command causes a soft reset of a card.

rept-stat-card

This command displays the card status and maintenance activity states. It has been enhanced to display information on the EROUTE STC card.

EDCM Support (IP⁷ Release 4.0)

As the IP⁷ SG applications add new features and their throughput increases, more memory storage and CPU performance is required from the hardware platform. The Enhanced-Performance DCM (EDCM) is a new version of the DCM that includes more main memory and better processing performance. Additional memory is added, doubling the amount of application SRAM. Some memory is replaced with higher performance chips. The following list highlights the changes embodied by the EDCM:

- The application processor is the AMD K6-IIIe+, which is an embedded version of the AMD K6-III high-performance processor that is used on the DCM 870-1945-xx. This processor consumes less power and produces less heat, leading to increased reliability.
- The application processor operates with an internal clock frequency of 396MHz rather than the 298MHz of the DCM, thereby increasing application performance and reliability.

The following elements of the EDCM are unchanged from the DCM:

- The EDCM requires two frame slots, like the DCM.
- The communication processor is unchanged.

- The amount of communication processor main memory is unchanged (2MB).

Refer to the *NSD Hardware Manual* for current hardware information.

ELAP Network Address Translation (NAT) (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

NOTE: The ELAP NAT feature is only available at the preproduction level.

Description

Customers need to support communication between an ELAP system and a remote browser that may be on the public side of an IP firewall or router that employs Network Address Translation (NAT).

With the ELAP Network Address Translation (NAT) feature, the MPS platform (ELAP/EPAP) supports communications on networks where Network Address Translation (NAT) is employed. This means that the two MPS systems (A and B) can intercommunicate using IP addresses on a private network, yet also support IP addressing and communication with a remote browser that may be on the public or "other" side of a firewall or router employing NAT that is performing the IP address translation.

Network Address Translation (NAT) on MPS

The MPS supports two types of network address translation (NAT), Port Forwarding and Static Address Mapping. In both cases, the MPS will have private IP addresses that are not available outside of the firewall-protected internal network. The firewall will translate particular addresses and port numbers to the internal addresses for the MPS.

The addresses in the Figure 2-17 are examples. Addresses are not restricted to particular classes / ranges.

Figure 2-17. Network Address Translation on MPS

Port Forwarding

Port forwarding allows a single external address to be used for multiple internal systems. The port forwarding firewall maintains a list of services (basically port numbers) and corresponding internal addresses.

Although the MPS has two individual internal IP addresses, external clients are only allowed to reach the internal network using one external address. The MPS servers must use different port numbers for each externally available service in order to distinguish MPS A from MPS B to external clients.

CAUTION: Do not change the default values for these ports.

Static Address Mapping

Static address mapping makes systems that are behind the firewall appear to have public addresses on the external network. A one-to-one mapping exists between internal and external addresses.

An external address must be assigned to the NAT firewall for each MPS side. For the Web UI to be fully functional, the external addresses must be entered into the MPS database.

Hardware Requirements

No new or additional hardware is required to support this feature.

Enhancements to the ELAP Text-Based Interface

This section describes the enhancements to the text-based ELAP Configuration interface made to accommodate this feature. For more information, see the *ELAP Administration Manual*.

ELAP Configuration Menu

Entering '1' from the ELAP Configuration Menu provides a configuration report of the ELAP. Figure 2-18 illustrates an example configuration that includes NAT Address information (see arrows):

Figure 2-18. Display Configuration

```

MPS Side A:  hostname: mpsa-d1c48f  hostid: 80d1c48f
              Platform Version: 3.0.0-22.13.0
              Software Version: ELAP 3.0.0-30.19.0

ELAP B LSMS Connection Port            = 7403
ELAP A EBDA Connection Port            = 1030
ELAP B EBDA Connection Port            = 1030
Time Zone                              = US/Eastern

```

Press return to continue...

Configure Network Interfaces Menu

This menu allows for the configuration of all of the possible network interfaces for the ELAP. When this menu item is selected, the menu shown in Figure 2-19 is displayed (see arrows).

Figure 2-19. Configure Network Interfaces Menu**Configure Forwarded Ports**

Entering a choice of '5' from the Configure Network Interfaces Menu provides the functionality to configure ELAP ports for the Web UI and PDBI interfaces. When this menu item is selected, the menu shown in Figure 2-20 is displayed.

Figure 2-20. Configure Forwarded Ports Menu

/-----Configure Forwarded Ports Menu-----\	
/-----\	
1	Change ELAP A HTTP Port
2	Change ELAP B HTTP Port
3	Change ELAP A HTTP SuExec Port
4	Change ELAP B HTTP SuExec Port
5	Change ELAP A Banner Connection Port
6	Change ELAP B Banner Connection Port
7	Change ELAP A LSMS Connection Port
8	Change ELAP B LSMS Connection Port
9	Change ELAP A EBDA Connection Port
10	Change ELAP B EBDA Connection Port
e	Exit
\-----/	

Each numbered item on the Configure Forwarded Ports menu allows the user to specify a port number used for remote access to the MPS.

Configure Static NAT Addresses

Entering a choice of '6' from the Configure Network Interfaces Menu provides the functionality to configure the static NAT addresses of the ELAP. When this menu item is selected, the menu shown in Figure 2-21 is displayed.

Figure 2-21. Configure Static NAT Addresses Menu

/-----Configure Static NAT Addresses Menu-----\	
/-----\	
1	Change ELAP A Static NAT Address
2	Change ELAP B Static NAT Address
e	Exit
\-----/	

Figure FN-3. Configure Static NAT Addresses Menu

/-----Configure Static NAT Addresses Menu-----\	
1	Change ELAP A Static NAT Address
2	Change ELAP B Static NAT Address
e	Exit
\-----\	

Each numbered item of the Configure Static NAT Addresses menu allows the user to specify an IP Address used outside of the firewall for remote access to the MPS. The values entered here must match the configuration of the firewall.

Alarms and Error Codes

No alarms or error codes have been created / enhanced to support this feature.

Embedded OAP (Release 24.0)

The OAP is a stand alone processor that acts as an interface between the Eagle and operation support system (OSS) devices using standard interfaces and converting the communications to the Eagle proprietary serial interface. The OAP can be used as an interface between the Eagle and the SEAC (Signaling Engineering and Administration Center), for the SEAS feature, and as an interface between the Eagle and the SMS (Service Management System), for the LNP feature. The OAP is installed in the OAP frame of the Eagle.

When used as an interface between the SEAC and the Eagle, the OAP processes SEAS commands into Eagle commands and Eagle commands into SEAS commands.

When used as an interface between the SMS and the Eagle, the OAP receives LNP data and commands from the SMS and converts the SMS commands into Eagle commands and the LNP data is loaded onto the Eagle.

The Embedded OAP (EOAP) replaces the existing Texas Micro OAP with a modular unit with field replaceable components which meet or exceed all of the OAP's current capabilities. In addition, the EOAP provides for the future enhancement of the OAP's responsibilities.

There are two EOAPs in the system, EOAP-A and EOAP-B. The EOAP is in the EOAP shelf which is located in the OAP frame. Each EOAP in the dual configuration consists of a processor card, an interface card, a power supply card, and a center bay containing a removable hard drive and a CD-ROM drive for each EOAP. Figure 2-22 illustrates the layout of the system. Figure 2-23 shows a functional block diagram of the EOAP. Table 2-20 shows the hardware components of the EOAP.

Figure 2-22. Embedded OAP

Figure 2-23. Functional Block Diagram of the EOAP**Table 2-20.** Hardware Requirements of the EOAP

Component	Part Number
Processor Card with the UltraSparc 2I processor and 64 MB of RAM (expandable to 1 GB)	800-0271-01
4-Port Serial I/O Card	800-0272-01
350W 48V DC/DC Power Supply	800-0274-01 800-0267-01
CompactPCI Backplane	850-0489-01
Tekelec APC SCSI Hard Drive - 4 GB minimum	870-1514-01
Tekelec APC 32X SCSI CD-ROM Drive	870-1515-01
Tekelec Right OAP I/O Backplane	850-0487-01
Tekelec Left OAP I/O Backplane	850-0488-01

Table 2-20. Hardware Requirements of the EOAP (Continued)

Component	Part Number
Tekelec Transition Card - Processor Card to the OAP I/O Backplane	850-0496-01
Tekelec Transition Card - Serial I/O Card to OAP I/O Backplane	850-1514-01

EOAP Processor Card - P/N 800-0271-01

Slots 1 and 2 of the EOAP contains the processor card using the UltraSparc 2i processor. This card provides two serial ports, A and B, for connecting the EOAP to the Eagle. Serial port A is accessible from the EOAP backplane and from an RS232C mini-DIN8 serial interface on the front panel. Serial port B is accessible from the EOAP backplane. Both serial ports provide RS232 asynchronous modem support.

CAUTION: The front panel interface on serial port A is provided for monitor output. However, no provision has been made to safeguard the processor card against data entry from the front panel interface. Data input through the front panel serial port is allowable so long as serial port A is not accessed from the rear panel while this occurs. Unpredictable events will occur on the processor card if data is simultaneously input on serial port A through the front panel and back panel connectors.

An RJ-45 Ethernet port on the front of the card provides a negotiated 10/100BaseT network access for LNP support using the LSMS.

The processor card also contains a seven-segment LED, a system status LED, a user configurable alarm LED, and abort and reset capabilities through both manual and software intervention.

The seven segment LED displays the numeric values 0 through 9 and the alphabetic values A through F and H. If the seven-segment LED is displaying a number zero, the processor has been halted. If the seven-segment LED is displaying a number one, the processor is operating normally. If the seven-segment LED is blank, the processor is being reinitialized. The other values for the seven-segment LED have not been defined in Release 24.0.

The processor card is a field replaceable unit. If the processor card is replaced, new license keys must be installed on the hard drive through the Eagle initiated OAP user interface. This is due to the change in the Host ID that will occur with the new processor card.

The processor card is equipped with 64 MB of RAM, and is expandable to 1 GB of RAM.

4-Port Serial I/O Card - P/N 800-0272-01

Slot 3 of the EOAP contains the 4-port serial I/O card, which supplies four RS-232C serial ports. These ports are accessible from the backplane. Two of these ports are used for interfacing the EOAP with SEAS. The other two ports are used to connect the EOAP to a VT-520 console or to an RS232C asynchronous modem. The 4-port serial I/O card is a field replaceable unit.

350W Power Supply - P/Ns 800-0274-01 and 800-0267-01

The power supply for the EOAP is a field replaceable unit that occupies slots 7 and 8 of the EOAP. One of two power supplies can be used on the EOAP. P/N 800-0274-01 is the preferred power supply to use with the EOAP. This power supply is a DC-DC switcher-style power supply. Power supply P/N 800-0276-01 is an alternate power supply that can be used on the EOAP and is based on Astec DC-DC converters.

Two LEDs are located on the front of the power supply. The **power good** LED (a green LED) should be on when input voltage falls within the allowable range of -48 to -72 VDC. The **fault** LED (a red LED) indicates that an internal fault has occurred. These faults include over-voltage, input DC fail warning, loss of output power, and temperature exceeding set limits.

Table 2-21 shows the specifications of both power supplies.

Table 2-21. Power Supply Specifications

Specification	Power Supply P/N 800-0274-01	Power Supply P/N 800-0267-01
Input Range	36VDC - 72VDC	40VDC - 72VDC
Efficiency	75% Typical, derated 2.5% per degree above 40 degrees C	75% typical, derated 10W per degree over 50 degrees C
Ripple / Noise	greater of 1% peak-peak or 50mV	50mV max. for all outputs, peak-peak, dc to 20MHz with coaxial probe and 0.1uF/22uF capacitors at the connector
Connector	Positronics P/N PCI38M 400A1	Positronics P/N PCI38M 400A1
Outputs	+3.3 V - 40A maximum * +5.0 V - 50A maximum * +12.0V - 12A maximum -12.0 V - 2A maximum * - Combined 3.3V and 5.0V current not to exceed 50A	+3.3 V - 25A maximum +5.0 V - 50A maximum +12.0V - 9A maximum -12.0 V - 2A maximum

Table 2-21. Power Supply Specifications (Continued)

Specification	Power Supply P/N 800-0274-01	Power Supply P/N 800-0267-01
Inrush Current	60 A maximum @ 72V 40 A maximum @ 48V 20 A maximum @ 36V	15 A maximum
Internal Fuse	15A replaceable fuse	15 A replaceable fuse

Hard Drive and CD-ROM Drive

The center section of the dual EOAP system contains four individual drive bays. The first and third drive bays contain a SCSI hard drive (P / N 870-1514-01) with a minimum capacity of 4 GB, and is a field replaceable unit. The first drive bay is hardwired to EOAP-A and the third drive bay is hardwired to EOAP-B. If the hard drive is replaced, all site specific information must be reloaded on the EOAP from the Eagle.

The second and fourth drive bays contain a 32X SCSI CD-ROM drive (P / N 870-1515-01). The second drive bay is hardwired to EOAP-A and the fourth drive bay is hardwired to EOAP-B. The CD-ROM drive is a field replaceable unit.

EOAP Connectors

The cards in slots 1 through 8 for each EOAP are connected to the CPCI backplane (P / N 850-0489-01) as shown in Figure 2-23. The interface from the EOAP to the Eagle is provided through another set of backplanes, the left and right backplanes (P / Ns 850-0488-01 for the left backplane and 850-0487-01 for the right backplane). The layout of the left and right backplanes is shown in Figure 2-24. The hard disk and CD-ROM drive for each EOAP connect directly to the left and right backplanes. The CPCI backplane connects to the right and left backplanes with the APC Transition Cards, one for the processor card - P / N 850-0496-01, and one for the serial I / O card - P / N 850-1514-01. The transition cards only provides an electrical connection between the CPCI backplanes and the left and right backplanes for the EOAP assembly. The transition cards do not perform any processing of the signals from either backplane.

Figure 2-24. EOAP Backplane and Connectors**External Interface Descriptions**

Tables 2-22 and 2-23 show the connectors used on the backplanes of the EOAP and on the front of the processor card.

Table 2-22. External Interfaces - OAP A

Connector (Silkscreen Label)	Signal	DESCRIPTION (Software name in parenthesis)	TYPE	Usage/Destination
POWER IN-A	System Power	-48VDC, CHASSIS GND, -48VDCRTN	N / A	From Fuse Panel

System must be halted prior to execution to ensure disk integrity.
ABORT Switch	XIR	Mechanical abort key, when enabled and toggled, generates XIR (externally initiated reset) without resetting the whole system. Sets B_XIR in Reset_Control register.	Mechanical Switch	To be used when abort is required. System must be halted prior to execution to ensure disk integrity.

Table 2-23. External Interfaces - OAP B (Continued)

Connector (Silkscreen Label)	Signal	DESCRIPTION (Software name in parenthesis)	TYPE	Usage/Destination
Front SCSI Port	SCSI-2	Auto-terminating narrow SCSI-2	SCSI-2	Reserved for use by manufacturing
Front Keyboard Port	Sun Keyboard and Mouse	8-pin mini-DIN	Asynchronous	Supports Sun Keyboard and Mouse(Unused)

Asynchronous Maintenance Modem

Although not provided with the EOAP, a Hayes compatible modem can be connected to the EOAP to provide connectivity for remote monitoring and maintenance. This allows access to the EOAP as required by Tekelec Technical Services. The modem is connected to the EOAP through the 4-Port Serial I/O Card through connectors 4A or 4B on the EOAP backplanes. The modem must be configured as shown in Table 2-24. See Table 2-22, Table 2-23, and Figure 2-24 for the designation and location on the backplanes of each connector.

Table 2-24. Modem Configuration

Modem Parameter	Value
Baud Rate	9600 bits per second
Data Bits	7
Parity	Even
Stop Bits	1

EOAP User Console

The user console for the EOAP is provided by a Digital Equipment Corporation VT520 terminal. The VT520 is connected to the EOAP using an RS232C terminal cable attached to connectors 3A or 3B on the EOAP backplanes. See Table 2-22, Table 2-23, and Figure 2-24 for the designation and location on the backplanes of connectors 3A or 3B. This terminal allows for monitoring and direct interfacing capabilities to the EOAP and must be setup for VT100 emulation.

Fans

To help keep the EOAP cool, the Eagle fan assembly is mounted underneath the EOAP. The fan assembly consists of eight fans, two LEDs, and a three-way switch. The fan assembly is powered from the A and B power sources on the EOAP backplanes (connectors FAN A-PWR-A, FAN A-PWR-B, FAN B-PWR-A, and FAN B-PWR-B2, see Table 2-22, Table 2-23, and Figure 2-24).

The three-way switch allows the user to specify how the fans are controlled. The normal position of the switch allows the system software to control when the fans are turned on and off. The **on** and **off** positions of the switch turns the fans on and off and overrides any control by the system software.

One of the LEDs shows whether the fans are on (LED is green) or off (LED is off). The second LED (Table 2-25) shows the alarm status of the fans.

Table 2-25. Fan Alarm Status

LED	Alarm Status
Green	No Fan Alarm
Red	Fan Alarm
Off	No Power

UAMs If there is a failure of any of the fans, or if the three-way switch is in the **off** position, the alarm status LED is red, and a minor alarm (unsolicited alarm message 302) is generated at the Eagle.

```
RLGHNCXA03W 99-01-07 00:57:31 EST Rel 24.0.0
* 0055.0302 * SYSTEM Cooling Fan Failure
```

When the fan failure is cleared, or when the three-way switch is placed in either the ON or normal position, the fan alarm is cleared, the alarm status LED is green, and unsolicited alarm message 303 is generated at the Eagle.

```
RLGHNCXA03W 99-01-07 00:57:31 EST Rel 24.0.0
0056.0303 SYSTEM Cooling Fans Normal
```

The fan alarm and control input and output are obtained from the Clock Out B connector on the last Eagle extension shelf and connected to the BCLKIN-A, BCLKIN-B, BCLKOUT-A, and BCLKOUT-B connectors on the EOAP backplanes. See Table 2-22, Table 2-23, and Figure 2-24 for the designation and location on the backplanes of each connector.

Third Party Software

Table 2-26 shows the third party software and the versions of the software required by the EOAP.

Table 2-26. Third Party Software for the EOAP

Product	Vendor	Embedded OAP Version
DSET APLI	DSET	4.1.3f compiled for Solaris version 2.5.1
DSET DSGRuntime	DSET	4.1.3f compiled for Solaris version 2.5.1
Solstice OSI	Sun	8.1.1
Solaris	Sun	2.5.1
SunLink HSI/S	Sun	2.0
Solstice X.25	Sun	9.1
NetPilot UAL Software	Bellcore	8.2
Performance Technologies Driver	Performance Technologies	810P027930

EOAP to Eagle Interface

The EOAP is connected to the Eagle through the EOAP backplane. The two serial ports on the processor card are used for this connection. The cables are connected to any two of the terminal ports (MMI 0-MMI 15) on the Eagle control shelf backplane.

The EOAP connected to the lower numbered terminal port is considered by the Eagle to be OAP A, and the EOAP connected to the higher numbered terminal port is considered by the Eagle to be OAP B.

The terminal port being used by the EOAP must be configured in the Eagle with the **type=oap** parameter of the **chg-trm** command. When the **type=oap** parameter is specified with the **chg-trm** command, none of the communication attribute parameters, **baud** (the baud rate of the terminal port), **prty** (the parity of the terminal port), **sb** (the number of stop bits for the terminal port's RS-232 connection), and **fc** (the type of flow control for the terminal port's RS-232 connection) can be specified. These parameters are defaulted to the values shown in Table 2-27.

Table 2-27. Eagle Terminal Port Configuration for the EOAP

Terminal Port Parameter	Value
Baud Rate (baud)	19200 bits per second
Parity (prty)	even
Stop Bits (sb)	1
Flow Control (fc)	hw - hardware flow control

To allow the user to reset the EOAP from the Eagle terminal, an alarm / reset cable connects to the EOAP at the OAP RST-A and OAP RST-B connectors and on the Eagle at the OAPALM connector on the control shelf backplane. The Eagle **init-oap** command is used to initiate the reset of the EOAP. The **init-oap** command uses the parameters **oap** and **force**.

- **oap** – Specifies which OAP is being initialized, as considered by the Eagle.
 - **a** – OAP A
 - **b** – OAP B
 - **both** – Both OAPs
- **force** – Forces the reset of the specified OAP if that OAP is operational (its state is either IS-NR, in-service normal, or IS-ANR, in-service abnormal) and it is the only operational OAP. The values for this parameter are either **yes** or **no**. If the specified OAP is not operational, the **force=yes** parameter is not required. The default value for the **force** parameter is **no**.

If the specified OAP is the only operational OAP and the **force=yes** parameter is not specified for the **init-oap** command, the **init-oap** command is rejected with this message.

E2813 Cmd Rej: FORCE=YES must be specified to initialize the last OAP

The **init-oap** command requires that the SEAS feature is on, or the **init-oap** command is rejected with this message.

E2812 Cmd Rej: SEAS feature or LNP feature is not configured

EOAP to SEAS Interface

The EOAP is connected to the SEAC using these connectors on the EOAP backplanes: 5A, 5B, 6A, and 6B. From one of these ports, an RS232C cable is connected to a 9600 bps synchronous modem, which in turn is connected to the SEAS system. If only a single EOAP is being used, both ports on that EOAP are connected to two separate modems. If both EOAPs are being used, only one port on each EOAP is connected to a modem that is connected to the SEAS system. See Table 2-22, Table 2-23, and Figure 2-24 for the designation and location of each connector on the backplanes.

EOAP to LSMS Interface

The EOAP is connected to the LSMS through the Ethernet port (an RJ-45 connection) located on the front of the Processor Card using a 10 / 100BaseT cable.

The EOAP handles eight messages from the LSMS at a time (process and respond to the LSMS), although multiple messages may be sent to the EOAP. No more than eight messages should be sent from the LSMS to the EOAP without a response being returned by the EOAP. If more than one message is sent to the EOAP without the LSMS waiting for a response, the LSMS must manage retries and the sequencing of messages.

The EOAP must be configured locally with the LSMS OSI-Address information necessary for association establishment. The EOAP will initiate association connections with the LSMS.

End Office Support (IP⁷ Release 5.0)

Customers see the IP⁷ Secure Gateway product as a means by which they can take advantage of next generation network technology by migrating existing signaling end points from the PSTN to the IP network. The fact that the SG is a signaling transfer point and has its own point code, however, presents a significant network management issue for them. Some customers do not want to obtain a new point code and reconfigure their network in order to introduce the SG and an IP end office node. This feature provides such customers the means to perform the migration without using a new point code or reconfiguring their network.

Refer to the *Database Administration Manual - Features* for current information on this feature.

Upgrade Considerations

The upgrade of fielded SG software will take into account the changes introduced by End Office Support, and no degradation of system capability will occur from such an upgrade. This feature adds the new Remote Application Table.

Limitations

- The APC assigned to an IPGW linkset should not be used as an IPC for an EO Node. The IPGWx application is to be used as a redundant pair of cards. Proper use would involve having equal cost routes to each linkset of a pair of IPGWx cards. This scheme prevents the use of the IPGWAPC since only one route should exist to that point code. In addition, the IPGWx application currently expects to receive only SNMs for the IPGWAPC. All messages received for the IPGWAPC are discarded, though SNMs may generate MTP primitives. This feature will not prevent the IPGW APC being provisioned as an IPC, but IPGWx will discard the traffic destined to the IPC for this configuration.
- A third point code, the IPC, must be assigned to the EO Node, in order to allow two equal cost routes to be provisioned.

- The End Office Support feature allows one or more IP network elements to share the SG's true and secondary point codes. IP nodes having their own point code are also supported, but not as end office nodes. This feature eliminates one and only one point code for a given network type.
- This feature provides no method for a mated pair of SGs to share an End Office Node. An End Office Node shares the true or secondary point code of the SG. Each SG of a mated pair continues to require a unique true point code. There are no benefits of redundancy if mated SGs share an IPNE operating as two EO Nodes.
- This feature prevents an IP end office node from receiving through-switched messages having SI=0, SI=1, and SI=2, with the exception of UPUs. If such messages are desired, then the IP network element cannot be configured as an end office node.
- An end office node cannot share a SCCP subsystem other than SCMG with the SG. An end office node's SCCP subsystem takes priority over the SG's local SCCP subsystems.
- An end office node must not generate non-UPU, non-TFC, and non-RCT network management messages having OPC=TSPC or CPC=TSPC. The IPGWx application will discard such messages that it receives.
- There are no new measurements specific to the End Office feature. Existing per-socket measurements can be used to see the number of MSUs going to and received from each socket.
- Messages arriving at the SG from the network and having DPC=IPC shall be routed, just as if the message had arrived having DPC=TSPC and an assigned remote application. Such a message will bypass the new discrimination algorithm and be immediately forwarded to the EO Node.
- This feature shall not prevent a user from provisioning a routing key having DPC=IPC. The IPGWx will not generate network management when such a routing key changes states. Messages arriving at the IPGWx cards with DPC=IPC are changed to have DPC=TSPC prior to routing key lookup, and so a routing key having DPC=IPC will never be a match for a message. If no matching routing key having DPC=TSPC is available, then MSUs with DPC=IPC arriving at the IPGWx for transmission will be silently discarded with private pegs.

Enhance RTRV-LOG (Release 31.3)

This enhancement will allow the customer to customize RTRV-LOG output. The following list contains examples of customized reports of the logs:

- Filtered for a particular Output Group
- Separated between UIMs and Alarms and further separated by Output Group

- Filtered by a given alarm number or range of numbers.

In addition, this command is modified to become a cancelable command, allowing a user or sysadmin to stop the processing of the command at any time during its execution.

The RTRV-LOG enhancement feature also included a new command (rtrv-trbltx) that allows the craftsperson to display information from the trbltx table, which contains all of the UIMs and Alarms for each EAGLE release. The information displayed for each entry of the trbltx table will be the MRN, alarm severity (for Alarms), Output Group and text. Optional parameters for rtrv-trbltx allow the craftsperson to display a subset of the information available to them. The optional parameters for rtrv-trbltx allow an Output Group or TYPE to be specified or a range of MRN numbers to be specified. Additionally, all Output Groups may be displayed with a list of MRNs that match each Output Group.

Enhanced Bulk Download (Release 25.0)

This feature is not supported in initial shipments of Release Eagle 25.0. Tekelec will issue a notice when the feature becomes available.

The Eagle Enhanced Bulk Download (EBD&A) feature adds “infrastructure” to the Eagle that supports the implementation of higher functionality at the LSMS.

For current details of this feature, refer to the *LNP Database Synchronization Manual*.

Hardware Requirements

As previously stated, this feature requires the following additional Eagle hardware, which is devoted to the EBD&A function:

- One (1) DCM card and FANS.
- One (1) BLM card. This BLM card must be equipped with enough applique memory cards to be able to load the entire LNP DB. Specifically, the applique requirements for the EBD&A BLM card are exactly the same as the memory requirements for a TSM card running the SCCP application.

Additional memory is required on the SCCP cards to support the addition of 12 million ported numbers. Memory may be added in 256 MByte increments to the TSMs, up to a maximum of 1024 Mbytes of memory.

The following TSM configurations are supported:

- TSM256: TSM with 256 MB populated memory. Maximum number of ported numbers supported: 2,000,000.

- TSM512: TSM with 512MB populated memory. Maximum number of ported numbers supported: 4,000,000.
- TMS768: TSM with 768MB populated memory. Maximum number of ported numbers supported: 6,000,000.
- TSM1024: TSM with 1024MB populated memory. Maximum number of ported numbers supported: 8,000,000 without optional software feature, 12,000,000 with optional software feature. In addition, the parameter `lnp12mil=on` must be set.

Refer to the *NSD Hardware Manual* for current hardware information.

Alarms (UAMs) and Info Messages (UIMs)

Alarms (UAMs)

No new UAMs have been created for this feature.

Info Messages (UIMs)

The following UIMs have been added to Eagle in support of the EBD&A feature. Various UIMs are issued at the Eagle console to keep the operator informed as to the status of the bulk download operation. Eagle issues these UIMs to all terminals configured to receive unsolicited "DB" output.

Awaiting LSMS Bulk Download UIM

This UIM is issued as soon as the `chg-db:action=begined1` command is successfully processed, and then at 5-minute intervals until the database download stream actually starts arriving from the LSMS. As soon as the LSMS starts sending data, the system starts issuing the "download in progress" UIM instead.

This UIM alerts the operator that the Eagle is awaiting the transmission of a download stream from the LSMS.

If the command `chg-db:action=begined1` is issued and this UIM appears repeatedly, the operator should contact the LSMS operator and ask why the LSMS has not started sending the download stream.

The UIM appears as follows:

```
RLGHNCXA03W yy-mm-dd hh:mm:ss <timezone> Rel <release name>
1495      SYSTEM      INFO      Awaiting LSMS Bulk Download
Electronic bulk download from the LSMS may proceed.
Issue chdb:action=finished1, or chdb:action=canceled1, to resume.
;
```

LSMS Bulk Download in Progress UIM

This UIM is issued as soon as the first bulk download record is received from the LSMS, and then at 5-minute intervals until the LSMS signals to Eagle that the entire download stream has been sent. This UIM lets the operator know that the LSMS has actually started sending the DB download stream to the Eagle, and that the transmission of the download stream is still underway and has not yet completed.

Depending upon the operator download options selected, and the size of the LSMS LNP DB, the download could take a very long time; however, if this UIM continues to be displayed well after the download should have completed, this could indicate a problem.

The UIM appears as follows:

```
RLGHNCXA03W yy-mm-dd hh:mm:ss <timezone> Rel <release name>
1496      SYSTEM      INFO    LSMS Bulk Download in progress
;
```

LSMS Bulk Download Complete UIM

This UIM is issued as LSMS signals to Eagle that the entire download stream has been transmitted. This UIM signals that the download is complete, and that the Eagle operator may now complete the bulk download process by issuing one of the following:

- **chg-db:action=finished1** command to copy the LNP DB from the BLM card to the OAM fixed disks, or
- **chg-db:action=canceled1** to prevent the copy to the OAM fixed disks

Appearance of this UIM indicates that the Eagle operator needs to take one of the preceding steps to complete the bulk download operation.

The UIM appears as follows:

```
RLGHNCXA03W yy-mm-dd hh:mm:ss <timezone> Rel <release name>
1497      SYSTEM      INFO    LSMS Bulk Download complete
;
```

LSMS Bulk Download Cancelled at LSMS UIM

This UIM is issued when LSMS signals to Eagle that the bulk download has been cancelled at the LSMS GUI. The UIM lets the Eagle operator know that the bulk download is no longer in progress. The operator can cancel the bulk download (from an Eagle perspective) by issuing the command **chg-db:action=canceled1**.

The UIM appears as follows:

```
RLGHNCXA03W yy-mm-dd hh:mm:ss <timezone> Rel <release name>
1498      SYSTEM      INFO    LSMS Bulk Download cancelled at LSMS
;
```

See “Enhanced GTT (Release 26.0)” on page 2-152 for additional information.

Serviceability

LSMS↔DCM Ethernet Security

Security of the LSMS↔DCM ethernet connection is the customer's responsibility. Neither the Eagle nor the LSMS will provide any type of security to thwart unauthorized attempts to access the Eagle and / or LSMS by “hijacking” the connection.

If the customer is concerned about security (e.g. a hacker who gains access to the Eagle by masquerading as an LSMS, and downloading a faulty database to Eagle via the bulk download facility), he should take steps to ensure that security is not compromised. One such method would be to provide the LSMS↔DCM connection totally within the customer's own internal network, and install a firewall between the customer's internal network and the "outside world," as illustrated in Figure 2-25.

Figure 2-25. LSMS↔DCM Connection with Firewall

Administration of the EBD&A Feature

Provisioning of Necessary BLM and DCM Components

For the EBD&A feature to operate, a dedicated BLM and DCM must be present and running the new GPLs developed for this feature.

- Associating the new EBD&A GPLs with the DCM and BLM card types is accomplished by the existing `ent-card:appl=` command to accept new GPL types (EBDADCM, EBDABLM).
- Other commands that could affect the loading or monitoring of these BLM and DCM components of EBD&A have been modified to accommodate the new GPL types as necessary.

Provisioning of EBD&A DCM Ethernet Details

Provisioning of this information is performed by new commands; see “*New Commands*” on page 2-149. The following scenario shows the minimum number of steps required to configure the DCM card, so that it is functional for EBD&A purposes:

1. `chg-ip-card:loc=xxxx:`

This command provides little information for the EBD&A DCM, but is a pre-requisite for the command to follow. Since the EBD&A DCM card will be acting as a sockets server, additional parameters that this command provides (such as domain name server IP address) are not needed.

2. `ent-ip-host:host=dcm_name:ipaddr=a.b.c.d`

This command tells the DCM card what hostname is associated with the DCM card's IP address. The value for the `host=` parameter is required in order to associate the TCP/IP port (specified in the next step) with the TCP/IP address (specified on the previous step), but its value is unimportant to the EBD&A DCM: specify any unique value. The `ipaddr=` value must be the same value that was specified on the `chg-ip-lnk` command.

3. `chg-ip-lnk:loc=xxxx:port=x:ipaddr=a.b.c.d:submask=x.x.x.x:...`

This command tells the DCM card at `loc=` to assign the IP address (`ipaddr=`) to the indicated port (port in this context is the physical port 'A' or 'B' on the DCM card: it does not refer to the TCP/IP port number). The DCM card now knows what its IP address is for the indicated physical port. Additional parameters available for this command can be used if necessary to configure the operational parameters of the DCM's ethernet link (e.g. link speed).

NOTE: The EBD&A feature is designed to use only the 'A' port of the DCM card. Be sure to attach the physical ethernet connection (i.e. the wire) only to the 'A' port, and then configure the 'A' port accordingly. The 'B' port is ignored by the EBD&A DCM GPL, even if provisioned via the CHG-IP-LNK command. The 'B' port can be configured and used to allow source-level debugging of the DCM card via the VxWorks "Tornado" debugging tool.

Selection of DCM Card Slot

The DCM card currently takes up 2 slots in the Eagle shelf card cage due to the large heat sink on the top of the DCM card. Because of this, the DCM cannot be provisioned in any arbitrary slot. Certain slots in the card cage are adjacent to the cage sides, and / or are adjacent to metal supports welded into the card cage. These slots cannot be used to house a DCM card.

Also, the DCM card requires a substantial amount of power. Due to the way the Eagle fuses power pairs of card slots, the DCM should always be provisioned into an odd-numbered card slot. For example, fuse 1A provides power to both slots 1101 and 1102. The combined current draw for both of these slots must not exceed 3A, or the fuse may blow. Inserting a DCM into slot 1102 when there is another card in 1101 could cause the total current requirements for both of these slots to exceed 3A.

Additionally, the shelf equipped with the DCM card must be equipped with fans in order to keep the card from overheating.

Minimum LSMS↔Eagle Ethernet Facility

The customer is responsible for selecting and providing a connection between the Eagle and LSMS locations so that the LSMS and DCM components may communicate via ethernet.

Unless the speed of the communications line is very poor, the maximum processing speed of the EBD&A feature will most likely be limited by the performance of the BLM card, which has a maximum rate of » 400 DB inserts/second as previously stated; providing communications facilities of very high capacity will not make the EBD&A feature perform its work any faster.

However, selection of an extremely slow communications line will result in EBD&A performance degradation.

Assuming the following:

- Maximum BLM DB insert rate = 400 entries/second.
- Average size of a DB record passed from LSMS à DCM over ethernet = 95 bytes/entry (Note: maximum size would be 120 bytes/entry).
- LSMS is able to extract DB entries from its database (Versant) and present them across the ethernet connection to the Eagle as fast as the BLM can process them.

In order to keep the BLM card 100% busy during bulk download, the ethernet connection must have a transmission rate of:

$$400 \text{ entries/second} * 95 \text{ bytes/entry} = 38,000 \text{ bytes/second}$$

During high-speed audit, it is estimated that the BLM can extract and present 3400 TN/checksum pairs/second. The LSMS, however, has a measured maximum performance of 1,666 extracts from its database/second, therefore the LSMS will most likely be the limiting bottleneck during audits:

$$1666 \text{ entries/second} * 9 \text{ bytes/entry} = 14,994 \text{ bytes/second}$$

Therefore, Tekelec recommends that the LSMS↔Eagle communications link installed for the EBD&A feature have a transmission capacity of » 38,000 bytes/second.

Upgrade Considerations

New EBD&A GPLs

The EBD&A feature introduces two new GPL types to Release 25.0. However, upgrades from previous releases to Release 25.0 need not include steps to create these new GPLs on the system being upgraded, since Release 25.0 introduces functionality to create feature-specific GPLs at the time the feature is installed at the customer site.

Modifications to Eagle LNP Subscription Records on Disk

A new 4-byte field has been added to each LNP subscription record in the Eagle LNP DB. This field is created from unused pad area already present in the record. This new field holds the CRC-32 checksum for the record, enabling the high-speed audit of the subscription record contents by the LSMS. There is no need to obsolete existing LNP DB tables, or create new ones, in order to accommodate the new checksum.

New Commands

Seven commands have been created for provisioning EBD&A DCM ethernet details. Refer to the *Commands Manual* for current usage information.

chg-ip-lnk (change internet protocol link)

Use this command to provision the IP link table.

rtrv-ip-lnk (retrieve internet protocol link)

Use this command to retrieve the IP link table.

chg-ip-card (change internet protocol card)

Use this command to provision IP networking parameters for a given card.

rtrv-ip-card (retrieve internet protocol card)

Use this command to retrieve IP networking parameters for a given card.

dlt-ip-host (delete internet protocol hostname)

Use this command to delete entries from the IP Host table. The IP Host table defines local host names for IP addresses.

ent-ip-host (enter internet protocol hostname)

Use this command to configure the IP Host table. The IP Host table defines local and remote host names for IP addresses.

rtrv-ip-host (retrieve internet protocol hostname)

Use this command to retrieve the IP Host table. The Host table defines local host names for IP addresses.

Changed Commands

Refer to the *Commands Manual* for current usage information.

chg-db

The **chg-db** command has been modified to provide several new parameters in support of the EBD&A feature.

ent-card

The **ent-card** has not been changed *directly* as a result of this feature. However, the R25.0 feature "GPL Enhancements" does modify **ent-card** and other commands related to GPL handling, to allow the provisioning of new hardware and loading of new GPL types, such as the new GPLs introduced by this feature for the BLM and DCM cards.

Limitations/Restrictions

1. The initial implementation of the EBD&A feature only supports auditing of subscriptions. Auditing of other entities in the LNP DB (LRNs, GTT override and default data, service providers, etc.) may be a future enhancement.
2. The speed at which the bulk download and /or auditing functions operate may depend upon factors which are out of Tekelec's control, such as the performance capabilities of the customer's LSMS and /or the speed of the ethernet link connecting the LSMS to the Eagle.
3. No Eagle DB updates of any kind are allowed while the LNP DB is being transferred from the BLM to the OAM fixed disks (i.e. during the duration of the **chg-db:action=finished1** command).
4. Even though two or more Eagles may be connected via Ethernet (via the new DCM card) or other mechanisms (e.g. OAP), no "cross-Eagle" database upload / download capability is supported. That is, uploading an Eagle DB to the BLM, having the LSMS update it, and then downloading it to the mate Eagle (or some other Eagle) via a shared connection is **not** supported. This capability is a possible future enhancement, however.

Enhanced Database Status Reports (Release 20.0)

The database level (resident on every card in the system) and the "coherency" indicator are displayed with this feature. The coherency indicator identifies corrupt database files, which can be corrected using database management commands.

Enhanced GPL Management (Release 25.0)

This feature minimizes the effort required to add new GPLs (applications) to Eagle by updating a table of GPL attributes. The table makes each application available to all existing commands which contain the "**appl** = <**xyz**>" parameter. Likewise, all commands that display an application also have the parameter available.

All commands that use an **appl=** parameter, as well as the commands that administer GPLs, must check the existence of the GPL definition in the table as part of their semantic validation.

All commands that display an APPL as part of their output must retrieve the application name from the new table.

All processes that download applications must retrieve the GPL DOS filename from the new table.

Upgrade Considerations

In order to provide access to new GPLs, the APPL Definitions Table must be updated. Most of this table is filled in at compile time, which means that an updated OAM GPL must be provided in order to support new GPLs. During the upgrade process, new GPLs are available once the updated OAM is running.

The feature does not change any DCBs or maintenance blocks; thus no on-the-fly conversion of data structures is required.

There are no new DMS tables defined by the feature, and no existing DMS tables are modified; therefore, no database conversion is required.

Changed Commands

With Release 25.0, the range of values for **appl** parameter no longer is fixed. It can be any GPL name provided by the APPL. Refer to the *Commands Manual* for current usage information.

ent-card

The range for the **appl** parameter has been enhanced.

rept-stat-card

This command has been enhanced to allow a range of values for the **appl** parameter.

init-card

This command has been enhanced to allow a range of values for the **appl** parameter.

chg-gpl

The APPL has been expanded to include the value OAP, which only transfers the system release id table from removable to fixed disk.

act-gpl

This command has been enhanced to allow a range of values for the **appl** parameter.

rtrv-gpl

This command has been enhanced to allow a range of values for the **appl** parameter.

rept-stat-gpl

This command has been enhanced to allow a range of values for the **appl** parameter.

Enhanced GSM Map Screening (Release 31.4)

The Enhanced GSM MAP Screening Feature is an enhancement to the existing GSM MAP Screening feature that adds the ability to perform screening based on the Called Party Address Global Title Digits (CdPA) including NP and NAI. In addition, wild card entries are supported for the MAP Operation Code, CgPA and CdPA.

Prior to this feature, GSM Map Screening was limited to the combinations of MAP Operation Codes and Calling Party Address Global Title Digits (CgPA GTA). With this feature, the screening is extended to include the ability to a combine the CgPA and CdPA, each including NP and NAI information, along with a new wild card option for the MAP Operation Code, CgPA, and CdPA.

The supported screening actions will continue to be: Discard, Route, Duplicate, Forward , Pass, Duplicate and Discard, and Error (ATI only).

The Enhanced GSM MAP Screening Feature allows the screening to be extended to include the ability to a combine the CgPA and CdPA, each including NP and NAI information, along with a new wild card option for the MAP Operation Code, CgPA, and CdPA.

Enhanced GTT (Release 26.0)

EGTT is an enhancement to the existing GTT function. EGTT provides the following main enhancements to EAGLE's current GTT:

- Increased number of selectors:
- Relaxed GTT rules:
- Deletion of GT:
- Inclusion of SSN in the CDPA:
- Inclusion of OPC in the CGPA:

Refer to the *Database Administration Manual - Features* for current details of this feature.

Upgrade Considerations

After the upgrade and the EGTT feature is enabled, any ITU selectors added with GTI=4 that match any pre-upgraded entries will be an exception to the numbering plan and /or nature of address indicator of the pre-upgraded entry. The pre-upgrade entry will now match on any set of numbering plan-nature of address combinations, other than the added post-EGTT-enabled entries.

New Commands

The commands discussed in this section have been created to support the Enhanced GTT feature. Refer to the *Commands Manual* for current usage information.

STP Enhanced GTT Selector Commands

The GTT Selector commands are a new set of commands that are used to provision new selectors for GTT, replacing the Translation Type (-TT) commands, giving the user greater flexibility when provisioning the type of messages that require Global Title Translation.

ent-gttset: enter gtt selectors command

The **ent-gttset** command specifies the applicable global title selectors required to specify a global title entry.

chg-gttset: change gtt selector command

The **chg-gttset** command specifies the GTT Set (**gttsn**) to be changed.

dlt-gttset: delete gtt selector command

The **dlt-gttset** command deletes a global title selector.

rtrv-gttset: retrieve gtt selector command

This command displays a list of administered global title selector combinations. The list can be filtered using various parameter combinations.

STP Enhanced GTT Set Commands

The GTT Set commands are a new set of commands used to provision sets of GTAs, bridging Selectors and GTAs, thus giving the user greater flexibility when provisioning Global Title Translations.

ent-gttset: enter gtt set command

The **ent-gttset** command specifies the attributes of a new set of global title translations required for global titles. It also creates a tree to which GTAs can be added.

dlt-gttset: delete gtt set command

The **dlt-gttset** command deletes a global title set.

rtrv-gttset: retrieve gtt set command

The **rtrv-gttset** command displays a list of administered global title sets.

STP GTA Commands

The Global Title Address commands are a new set of commands that are used to provision GTTs using the new selectors for GTT. These commands effectively replace the Global Translation Type (-GTT) commands.

ent-gta: enter global title address command

The **ent-gta** command specifies the global title address information for applicable global title selectors required to specify a global title entry.

chg-gta: change global title address command

The **chg-gta** command changes the global title address information applicable to global title selectors required to specify a global title entry.

dlt-gta: delete global title address command

The **dlt-gta** command specifies the global title address information applicable to a global title selector combination to be deleted.

rtrv-gta: retrieve global title address command

The **rtrv-gta** command displays a list of global title address information applicable to a global title selector combination. The displayed list can be filtered by GTA and EGTA parameter values, in addition to other parameters.

Changed Commands

The commands discussed in this section have been modified to support the Enhanced GTT feature. Refer to the *Commands Manual* for the current usage information.

Feature Commands

The Feature commands have been changed to allow administration of the Enhanced GTT feature.

chg-feat

The **chg-feat** command allows the user to activate optional features available for the system. Features are allowed only to be turned on. Once activated, a feature cannot be turned off.

rtrv-feat

The **rtrv-feat** command is used to display the status of the optional features available for the system. This command has been enhanced to display the status of the Enhanced GTT feature.

Obsolete Commands

Once the EGTT feature has been enabled, the GTT Selector, GTT Set, and GTA commands effectively replace the Translation Type (-TT) commands and Global Title Translation (-GTT) commands. (Note that the SEAS equivalents of these commands are maintained.)

The following commands will be rejected when the EGTT feature is ON:

- **ent-tt**: Enter Translation Type Command
- **dl-tt**: Delete Translation Type Command
- **rtrv-tt**: Retrieve Translation Type Command
- **ent-gtt**: Enter Global Title Translation Command
- **chg-gtt**: Change Global Title Translation Command
- **dl-gtt**: Delete Global Title Translation Command
- **rtrv-gtt**: Retrieve Global Title Translation Command

When the EGTT feature is turned on, all data previously provisioned with the old commands is maintained.

Enhanced Link Diagnostics (Release 22.0)

Enhanced Link Diagnostics provides improved information reporting to aid in the investigation of link failures. SS7 Level 2 status information is buffered before and after a link failure has occurred. This feature provides the capability to loop the internal transmit and receive data on the ISCC chip. Link failures can occur on the near end node, far end node or the wire connecting the two nodes. This capability either confirms or eliminates a portion of the near end node as the reason for the link failure.

Enhanced Load Distribution (Release 21.0)

This feature improves the load distribution of traffic on a combined linkset when a signaling link in one of the linksets in the combined linkset fails.

Before Release 21.0, if a signaling link in a combined linkset fails, the traffic is redistributed to the other links in the same linkset. With this feature, the traffic is redistributed over the signaling links in the combined linkset. This feature applies to both ANSI and ITU signaling links.

Traffic is distributed over the combined linkset using the signaling link selection (SLS) values assigned to the signaling links in each linkset. When a signaling link in the combined linkset fails, the system uses the SLS values assigned to the signaling links, the number of signaling links in each linkset, and the number of failed signaling links in the combined linkset to determine which of the remaining signaling links in each linkset will carry the failed signaling link traffic.

To evenly distribute the traffic on all the signaling links in a combined linkset, each linkset in the combined linkset must contain the same number of signaling links.

Enhanced Routing Key Support (IP⁷ Release 2.0)

Release 2.0 offers several enhancements for the routing key table that the IP⁷ Secure Gateway uses to route SS7 Message Signaling Units (MSUs) over the IP network. The routing table is used for SCCP/TCAP-over-IP, ISUP-over-IP, and non-SCCP / non-ISUP connectivity, each of which uses the **ss7ipgw** application.

Understanding the Routing Key Table Used in Release 1.0

The routing key table maps SS7 Routing Keys to TCP/IP socket names, as illustrated by the example in Table 2-28. MSUs that match the parameters in a given row are sent over one of the sockets shown for that row (up to 16 socket associations can be defined for a single routing key). Multiple sockets for a given row allow load sharing. In addition, multiple routing keys can be used to send traffic to a single socket.

Table 2-28. Example SS7 Routing Key Table

SS7 Routing Keys						TCP/IP Sockets that carry traffic for that Routing Key
SS7 DPC	SS7 SI	SS7 SSN	SS7 OPC	CIC START	CIC END	Socket Name
DPC-SI-SSN routing key for SCCP/TCAP-over-IP connectivity						

Table 2-28. Example SS7 Routing Key Table

SS7 Routing Keys						TCP/IP Sockets that carry traffic for that Routing Key
SS7 DPC	SS7 SI	SS7 SSN	SS7 OPC	CIC START	CIC END	Socket Name
5-5-5	03	6	-	-	-	KC_HLR1_1201 KC_HLR2_1201 KC_HLR1_1203 KC_HLR2_1203
ISUP-CIC routing key for ISUP-over-IP connectivity						
5-5-6	05	-	4-4-4	1	100	DN_MSC1_1201 DN_MSC2_1201 DN_MSC1_1203 DN_MSC2_1203
DPC-SI routing key for non-SCCP / non-ISUP connectivity						
5-5-7	02					SF_HLR1_1204

IP⁷ Secure Gateway release 1.0 required the user to use the **ent-appl-rtkey** and **dlt-appl-rtkey** commands to configure the routing key table, which could hold a maximum of 250 keys. For more information about using these commands, refer to the *IP⁷ Secure Gateway Database Administration Manual - Features*.

Enhancements to the Routing Key Table in Release 2.0

IP⁷ Secure Gateway release 2.0 provides the following enhancements for routing keys:

- Routing keys can be dynamically configured by the receipt of a TALI message from the IP network.
- Routing keys that are statically defined (using the **ent-appl-rtkey** command) can be changed by using a new command **chg-appl-rtkey**.
- Up to 1000 routing key entries per DCM card are supported. The customer can specify the maximum number of static keys and dynamic keys to be supported, as long as the total is less than or equal to 1000.

Dynamic Routing Key Registration

This enhancement allows a socket to automatically direct traffic towards, or away from, itself by sending a message to the IP⁷ Secure Gateway. This enhancement allows customers to add IP⁷ routing key intelligence to their IP applications rather than requiring user entry of static routing keys.

When transmitting Message Signaling Units (MSUs), the IP⁷ Secure Gateway routing code looks for a dynamic routing key before searching for a static routing key. When a socket fails, all dynamic entries associated with it are deleted. A dynamic routing key entry can have the same parameters as a static key entry.

Adjusting Static Routing Key Entries

IP⁷ Secure Gateway release 2.0 allows the use of the new **chg-appl-rtkey** command to make one of following adjustments to a routing key that has already been statically defined:

- Any existing static entry's socket associations can be overwritten by a new socket association. If the **chg-appl-rtkey** command assigns a new socket name to a routing key has multiple socket associations, all socket associations are replaced with the new socket name.
- Any existing ISUP-CIC entry (an entry whose SI is equal to 05) can be split into two entries by naming a SPLIT value. One entry uses the original CIC START value and makes the CIC END value equal to one less than the SPLIT value. The other entry uses the SPLIT value as its CIC START value and the original CIC END value for its CIC END value. Each entry retains the OPC, DPC, SI, and socket name associations from the original entry.
- Any existing ISUP-CIC entry (an entry whose SI is equal to 05) can have its CIC range extended and/or decreased as long as the new range does not overlap the range on any other key.

Only one of these changes can be made with each use of the **chg-appl-rtkey** command. If additional changes are needed, enter the command again for each change needed.

Support of Additional Routing Keys

IP⁷ Secure Gateway release 2.0 supports up to 1000 routing key entries (increased from the previous limit of 250) for each DCM card. These 1000 key entries may be either dynamic entries (added by receipt of a request from the IP network) or static entries (configured using the **ent-appl-rtkey** and **dlt-appl-rtkey** commands) or a combination of both. The user can specify the maximum number of static entries and dynamic entries allowed using the **chg-sg-opts** command.

An additional change is a parameter added to the **rtrv-appl-rtkey** command to allow the user to specify the maximum number of routing key entries to be displayed.

Understanding the Use of Dynamic and Static Routing Entries for ss7ipgw Routing

The IP⁷ Secure Gateway has two DCM cards, each of which contains a routing table of up to 1000 entries. The static entries in one table are identical to the static entries in the other table; the dynamic entries may differ depending on messages received from other IP nodes. Table 2-29 provides a summary of the characteristics of static and dynamic entries.

Table 2-29. Comparison of Static and Dynamic Entries in Routing Key Table

Characteristic	Static Entries	Dynamic Entries
Provisioned by:	ent-appl-rtkey , dlt-appl-rtkey , and chg-appl-rtkey commands, entered through the OAM, saved on disk, and reloaded to each DCM card upon reset	Receipt of message over socket; purged when socket fails or DCM card is reset
Option of chg-sg-opts command used to set maximum number of entries	srkq	drkq
Same on both DCMs?	Yes	Not necessarily
Used for routing:	Used only if no matching dynamic entry exists	Used first for routing

New Commands for Routing Key Enhancements

This feature implements the following new administration and maintenance commands. Refer to the *Commands Manual* for current usage information.

chg-appl-rtkey

This administration command allows static routing entries to be modified without needing to delete and re-enter the entry. The command allows any one of the following actions at a time; to perform more than one of these actions, enter the command again:

- Replacing a socket association
- Splitting an existing ISUP-CIC range into two equivalent entries
- Increasing or decreasing the range of an ISUP-CIC routing entry so long as the new range does not overlap any other range

rept-stat-rtkey

This new administration command generates a summary report of the status of static and dynamic routing keys.

drklog

This new pass command displays the log of the most recent (up to 100) dynamic registration requests that have been processed.

Enhancements to Existing Commands for Routing Key Enhancements

For more information about formats for the following commands, refer to the *Commands Manual* for current usage information.

chg-feat

This command includes a new parameter (**:dynrtk=**) used to specify that the Dynamic Routing feature is turned on.

rtrv-feat

The output of this command now includes a display of whether the Dynamic Routing feature is turned on.

chg-sg-opts

This command now includes two new parameters (**:drkq=** and **:srkq=**) used to specify the maximum dynamic keys and static keys, respectively, that can be included in the routing key table. The total of these two parameters cannot exceed 1000.

dlt-appl-rtkey

This command now includes a new parameter (**:loc=**) used to specify on which **ss7ipgw** card a dynamic key should be deleted.

rtrv-appl-rtkey

This command now includes two new parameters:

- Use the parameter **:mode=** to display only static (the default), only dynamic, or both static and dynamic routing key entries.
- Use the parameter **:loc=** to display dynamic routing keys only at the specified card location.

msucount

This pass command is modified to support dynamic routing keys, as follows:

- The output indicates whether the information displayed concerns a static entry or an dynamic entry and whether both static and dynamic entries exist.

- If both static and dynamic entries exist, only the information for the dynamic entry is displayed, unless the user specified the option to override the default such that only the static entry information is displayed.
- The link measurement output displays the total registration requests received and discarded, and total updates to the dynamic routing key table.

Enhanced Software Loading (Release 20.0)

This feature reduces the Eagle's reload time during system initialization or restart to less than 5 minutes. To meet this requirement, the system is reloaded from the fixed disk drives on both the active and standby TDMs (terminal disk modules). Some subsystems are loaded from one fixed disk drive and other subsystems are loaded from the other fixed disk drive. The system operating software determines which subsystems are loaded from each fixed disk drive.

The following conditions are assumed.

- That no cards fail during the loading process.
- All cards remain aligned on the IMT bus which allows the clock to start (no bus transition).
- The loading of gateway screening data is not included in the loading process.

CAUTION: All LIMs are of one application type. The 5 minute loading requirement does not apply if both the SS7ANSI and CCS7ITU applications are being used on the Eagle.

Enhancement to Backup TFR/TCR Procedures (Release 21.0)

TFR/TCR messages may be lost or not processed at a node due to a signaling link failure, congestion or other error conditions. Because of this, other nodes continue to send traffic over a restricted route. This results in C-link congestion. To help prevent this problem, the TFR/TCR procedures have been improved to send a second backup TFR/TCR once per linkset in response to messages received after the first TFR/TCR.

This feature is currently supported in the Eagle (Release 3.3 and later) for TFRs with one exception.

When a TFR is generated because of internal congestion, as opposed to normal route failure, the Eagle responds with one TFR for every 10 messages received. In Release 21.0, this has been changed so that after the first TFR/TCR is sent, the level 3 T18 timer is started. When the level 3 T18 timer expires, the Eagle sends only one backup TFR/TCR.

This feature applies only to ANSI signaling links.

t a response being returned by the EOAP. If more than one message is sent to the EOAP without the LSMS waiting for a response, the LSMS must manage retries and the sequencing of messages.

The EOAP must be configured locally with the LSMS OSI-Address information necessary for association establishment. The EOAP will initiate association connections with the LSMS.

Enhancement to GTT Failure Messages (Release 25.0)

This feature enhances the current SEAS REPT-NOTRNS messages to include four optional parameters currently not supported in the Eagle version of these messages.

- **c4** - "Called Party Global Title Address"
- **d1** - "Calling Party Address Type"
- **d2** - "Calling Party Subsystem Number"
- **d3** - "Calling party Address Point Code"

Effect on Existing UIMs

Implementation of this feature involves a minor change to one of the existing Eagle UIM formats. To add the CgPA information to the SEAS REPT-NOTRANS message, 6 bytes of the DATA field I16 have been deleted. The format before and after the change is shown below; changes are shown in **bold**.

```
xxxx.xxxx  CARD cccc,p  INFO 'test'
            SIO=xx    OPC=###-###-###  DPC=###-###-###
            CDPA LENGTH=###  MSG TYPE=##
            CDPA:  AI=xx  PC=###-###-###  SSN=###  TT=###
ADDR=#####
            DATA=xx xx xx xx xx xx xx xx xx xx xx xx
                  xx xx xx xx xx xx
            LSN=[lnkset]
```

Format with new feature:

```
xxxx.xxxx  CARD cccc,p  INFO 'test'
            SIO=xx    OPC=###-###-###  DPC=###-###-###
            CDPA LENGTH=###  MSG TYPE=##
            CDPA:  AI=xx  PC=###-###-###  SSN=###  TT=###
ADDR=#####
            DATA=xx xx xx xx xx xx xx xx xx xx xx
                  xx xx xx xx xx xx
            LSN=[lnkset]
```

NOTE: The DATA field that is output begins with the CdPA part of the MSU. The CdPA part of the MSU is of variable length, but in most cases is organized as follows:

1st Byte - CdPA Length

2nd Byte - Address Indicator

3rd Byte - SSN

4th Byte - Translation Type

Last 11 Bytes - CdPA Address

Table 2-30 lists the UIMs affected by this change, and use UIM format I16.

Table 2-30. Affected Eagle UIMs

UIM #	Trouble Text
1029	SCCP rcvd inv Cld Party - bad GT ind
1033	SCCP rcvd inv Cld Party - bad network
1034	SCCP rcvd inv Cld Party - no SSN
1042	SCCP rcvd inv GT - bad Translation Type
1043	SCCP did not route - bad translation

Enhancements to GWS Reject Messages (Release 25.0)

This feature enhances the current SEAS REPT-SCRREJ message to include two optional parameters currently not supported in the Eagle version of these messages. The two optional parameters are:

- **rec** - "Rejection Error Code"
- **z** - "Supplier-Specific Parameter Text"

SEAS Compliance

Table 2-31 maps Eagle rejection reasons to the SEAS rejection error codes.

Table 2-31. Eagle-to-SEAS GWS Rejection Mapping

Eagle Gateway Screening Reject Reason (RPT_MRN_GWS_...)	Eagle Supplier-Specific Parameter Text in the "z" Field	SEAS Code	SEAS Reject Code Meaning (per GR-778)
OPC_NOT_ALLOWED OPC_BLOCKED	"GWS rcvd OPC that is not allowed" "GWS rcvd OPC that is blocked"	ONNV	OPC not valid
DPC_NOT_ALLOWED DPC_BLOCKED	"GWS rcvd DPC that is not allowed" "GWS rcvd DPC that is blocked"	DNNV	DPC not valid
SIO_FAILED	"GWS rcvd SIO that is not allowed"	SINV	SI not valid
	No Eagle Equivalent	NINV	NIC not valid
PRIORITY_FAILED	"GWS rcvd a priority that is not allowed"	PRNV	PRI not valid
H0H1_FAILED	"GWS rcvd H0 / H1 that is not allowed"	HCNV	H0 or H1 not valid
CLG_FAILED	"GWS rcvd Clg Party that is not allowed"	CGNV	CgPA PC or SSN not valid
	No Eagle Equivalent	LGNV	CgPA /link set combination not valid
	No Eagle Equivalent	RINV	CdPA routing indicator not valid
CLD_FAILED	"GWS rcvd Cld Party that is not allowed"	CDNV	CdPA SSN or DPC not valid

Table 2-31. Eagle-to-SEAS GWS Rejection Mapping (Continued)

DESTFLD_NOT_ALLOWED	"GWS rcvd AFTPC that is not allowed"	DFNV	Affected destination field not valid
SCMG_APC_FAILED	"GWS rcvd SCMG with not allowed AFTPC"	AFNV	Affected PC / SSN not valid
	No Eagle Equivalent	FINV	SCMG format ID not valid
GT_TYPE_FAILED ALLOWED_TT_FAILED	"GWS rcvd Translation Type not allowed" "GWS rcvd invalid GTI in TT Screening"	TTNV	TT not valid
	No Eagle Equivalent	ISNV	ISUP message type not valid
TFC_APC_FAILED RSP_APC_FAILED RSR_APC_FAILED TCA_APC_FAILED TCP_APC_FAILED TCR_APC_FAILED TFA_APC_FAILED TFP_APC_FAILED TFR_APC_FAILED UPU_APC_FAILED	"GWS rcvd TFC, AFTPC not in routing tbl" "GWS rcvd RSP, AFTPC not in routing tbl" "GWS rcvd RSR, AFTPC not in routing tbl" "GWS rcvd TCA, AFTPC not in routing tbl" "GWS rcvd TCP, AFTPC not in routing tbl" "GWS rcvd TCR, AFTPC not in routing tbl" "GWS rcvd TFA, AFTPC not in routing tbl" "GWS rcvd TFP, AFTPC not in routing tbl" "GWS rcvd TFR, AFTPC not in routing tbl" "GWS rcvd UPU, AFTPC not in routing tbl"	OTNV	Message rejected for a reason not identified by any of the other "rec" field values.

Enlarged LNP SPID and NPANXX Support (Release 24.0)

The Enlarged LNP SPID and NPANXX Support increases the maximum number of service provider IDs (SPID) and NPANXXs that can be configured in the database.

The maximum number of service provider IDs is increased to 10,000. If you try to enter more than 10,000 service provider IDs with either the **ent-lnp-sp**, **ent-lnp-sub**, or **ent-lnp-lrn** commands, the attempt will be rejected with this message.

Error Messages

E3133 - LNP Service Provider Table is full

The maximum number of NPANXX entries is increased to 150,000. If you try to enter more than 150,000 NPANXXs with either the **ent-lnp-npanxx**, **ent-split-npa**, **ent-lnp-sub**, or **ent-lnp-lrn** commands, the attempt will be rejected with this message.

E3138 - LNP NPANXX Table is full

RTRV-LNP-SP Command

The parameters **num**, **force**, and **sp** have been added to the **rtrv-lnp-sp** command to control the number of entries in the service provider ID table that are displayed. Refer to the *Commands Manual* for current usage information.

Entering a Global Title Translation to a Non-Mated Application without Adding the Application as Mated Application (Release 22.0)

In Release 22.0, a global title translation can be entered to a non-mated (solitary) application, either through an Eagle terminal or the SEAS interface, without requiring the application to be defined by the Eagle's **ent-map** command.

The **force** parameter (valid values **yes** or **no**) has been added to the Eagle's **ent-gtt** command that allows the user to override the rules that make sure that the application is defined in the mated application table. The default value for the force parameter is **no** for the Eagle's **ent-gtt** command. If a global title translation is being added from the SEAS interface, the default value for this parameter is **yes**. When a global title translation is entered on the SEAS interface, the Eagle does not check to see if the specified application is defined in the mated application table.

If the global title translation is a final global title translation, the application being referenced by the global title translation must be in the mated application entity set. If the global title translation is being entered on an Eagle terminal with the **ent-gtt** command, the **force=yes** parameter is not specified, and the mated application is defined the mated application table, the command is rejected with the following error messages.

E2450 Cmd Rej : PC/SSN does not exist as a mated application
E2419 Cmd Rej : Point code does not exist in the remote point code table

If the **force=yes** parameter is specified with the **ent-gtt** command and the specified application is required to be defined in the mated application table, the following warning messages are displayed.

CAUTION - DPC-SSN does not exist in the Mated Application table.

CAUTION - DPC does not exist in the Mated Application table.

If the final global title translation is entered on the SEAS interface, the rules checking the mated application table do not apply.

EOAP/OAP Support of HSOP Protocol (Release 28.0)

The EOAP/OAP currently supports only the Q.3 interface to the LSMS. The ELAP supports the HSOP interface to the LSMS. From an internal perspective, it is advantageous for the LSMS to support a single interface to the Eagle, regardless of the architecture deployed. This feature achieves a single interface by requiring the OAP/EOAP to support the HSOP protocol.

HSOP is a fast, reliable protocol developed by Tekelec. LSMS Release 5.0 will support one HSOP protocol to communicate with Eagle release 28.0 and future Eagle releases.

New Hardware Required

No new hardware is required for this feature.

LSMS Eagle Communication Overview

Prior to release 5.0, LSMS supported two different protocols to communicate with pre-28.0 Eagle releases; see Figure 2-26.

Figure 2-26. LSMS Eagle Protocol Interface for Pre-5.0 LSMS Releases and pre-28.0 Eagle Releases

The Q.3 protocol is used by LSMS to communicate with EOAP/OAP. HSOP protocol is used by the EBDA process to send information to DCM cards on Eagle. Enhanced HSOP protocol is used to communicate with the ELAP when the 48 Million feature is enabled.

EOAP/OAP Overview

EOAP/OAP (OSS Application Processor) was developed to provide telephone company network management systems access to the Eagle STP. SEAS (Signaling Engineering and Administration System) provides network management functionality. EOAP/OAP interfaces with SEAS using Telcordia standards and licensed code.

EOAP/OAP software consists of few a processes running on the Solaris 2.5.1 UNIX operating system. With the introduction of the LNP (Local Number Portability) feature, EOAP/OAP was extended to provide the communication channel for updates sent from LSMS to Eagle LNP database using Q.3 protocol.

EOAP/OAP consists of 11 processes. Some processes provide SEAS access to Eagle; others process LNP database updates sent from LSMS to Eagle. LNP database updates are sent from LSMS using the Q.3 protocol to the EOAP/OAP emsAgent process.

The purpose of emsAgent process is to translate Common Management Information Protocol (CMIP) messages from the LSMS M-Actions into TL-1 commands that can be interpreted on the Eagle by the UPL parser.

As Figure 2-26 illustrates, HSOP replaces the Q.3 protocol, and hsopAgent replaces the emsAgent. The hsopAgent process translates LSMS HSOP commands to TL-1 commands that can be interpreted on the Eagle by the UPL parser. The new hsopAgent provides the same interface to the ysTTY process and the ysT1mnt process. It is seamlessly integrated with current EOAP/OAP software; it does not require special configuration to run properly.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the EOAP/OAP Support of HSOP Protocol feature. For more information on these commands, see the *Commands Manual*.

unhb-alm

Use this command to restore alarm reporting for the given device.

inh-alm

Use this command to inhibit the reporting of alarms for the given device.

rept-stat-sys

This command displays a summary status report of the main system entities. The value LSMS Q.3 has been changed to LSMS CONN in the output of this command.

EPAP 2.0 Alarm Migration from ELAP (Eagle 28.0)

This Eagle 28.0 feature converts EPAP message notification and alarming from the type previously used in EPAP 1.0 to the type used in ELAP 2.0.

As revised, EPAP 2.0 employs different Eagle UAMs, uses the MPS System Health Check (*syscheck*) utility to diagnose and report MPS/EPAP platform problems, and uses MPS LEDs more completely.

For additional details, refer to the *EPAP Administration Manual* and the *Maintenance Manual*.

EPAP/ELAP 2.0 Security and UI Enhancements (Release 28.0)

This feature allows the customer to access ELAP and EPAP functionality from any computer workstation capable of supporting an Intranet connection and Microsoft's Internet Explorer 4 browser. This feature does not change major ELAP/EPAP functionality. It does, however, provide Client/Server architecture and a new menu interface to that functionality.

This feature provides a new user interface and presents no impact to the Eagle. The old text-based UI is available for provisioning purposes.

For more information on the EPAP/ELAP Security and UI Enhancements, refer to the *EPAP Administration Manual* or the *ELAP Administration Manual*, and the *Maintenance Manual*.

Hardware Requirements

Customers need a PC that can connect to the LAN/WAN.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the EPAP/ELAP 2.0 Security and Enhancements feature. For more information on these commands, see the *Commands Manual*.

rept-stat-mps

Use this command to display the overall status of the application running on the MPS (multi-purpose server). The output for this command has been updated for this feature.

rept-stat-db

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards. The output for this command has been updated for this

rept-stat-sccp

Use this command to display the certain types of reports. The output for this command has been updated for this feature.

rept-stat-trbl

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area. The output for this command has been updated for this feature.

EPAP Provisioning Performance Enhancements (Release 29.0)

The Enhanced EPAP Provisioning Performance feature replaces FTS with an asynchronous replication scheme. FTS (Fault Tolerant Server) is a protocol used by Versant to achieve data synchronous replication.

EPAP 1.0 and 2.0 provided support for MPS provisioning databases spanning two sites, with each site hosting a database whose data is replicated synchronously to the other via FTS. To ensure synchronous replication of data, this transfer protocol requires that 8 messages be exchanged per update.

Messaging and data exchange must take place over potentially slow customer network. When the customer network is slow (that is, there exists a network latency issue between the two customer sites containing PDBs, such that the round trip delay between sites exceeds 4-5 ms.), the messaging overhead can cause provisioning rates to drop to unacceptable levels.

Asynchronous replication means that the database receiving an update, in this case the Active PDB, can commit and send the client a success or failure code prior to sending the update to the replicated database, in this case the Standby PDB. Note that only successful updates are replicated. Response turnaround on the Active PDB is thus shortened, and the overhead involved in keeping the databases in sync is spared.

With this feature, the round trip time between nodes may be up to 100 ms. without encountering active / standby lag problems.

Single Transaction Mode PDBI Connection

In EPAP 1.0 and 2.0, all PDBI provisioning commands had to be encapsulated in 'begin' and 'end' transaction statements. Many customers, however, wanted only to send one update per transaction. In such a case, the overhead involved in sending transaction boundary tags can become considerable.

In EPAP 3.0, a new PDBI connection type called 'single transaction mode' is provided. When using this connection type, PDBI clients are allowed to send updates outside of 'begin' and 'end' transaction delimiters. The PDB treats each update as being its own transaction. However, transaction delimiters are not ignored in 'single mode'. If the PDBI client issues these delimiters, the series of updates encapsulated by them will be treated as one transaction, as they always have been under the default PDBI connection mode.

Hardware Requirements

No new hardware is required or introduced to support the software.

Enhancements to the User Interface

A new state has been added to the set of PDBA states displayed by the Web UI Banner. This state, entitled “REPLERR,” denotes the presence of alarm MAINT_ALARM_PDBA_REPL_FAILED. REPLERR may also appear on the View PDBA Status page, and the View RTDB Status page.

Upgrade Considerations

During upgrade, the Versant replica file, if present on the MPS, will be moved to a different location so that FTS will not be active in EPAP 3.0. Upon removal of the EPAP 3.0 application package, this file will be set back in its original location, so that the system may resume use of FTS following a backout. If updates have been made to the PDB following upgrade, however, backout will entail full PDB restoration. Otherwise, this feature will not affect the Eagle 28.x/EPAP 2.x to Eagle 30.0/EPAP 3.0 upgrade.

Limitations

These enhancements introduce an important change to the behavior of EPAP. PDBA switchover can no longer be forced while the PDBAs are able to communicate and the Standby is behind. Switchover now entails allowing some definable amount of time for the Standby PDB to be brought up to the level of the Active PDB. If it fails to obtain equal database level in the allotted time, switchover will not occur, and it will return with the number of levels still left to be replicated. This is a safeguard designed to prevent database inconsistency. However, if the Standby PDB cannot reach the Active PDB to determine its level, then the EPAP will allow PDBA switchover to be forced.

EPAP Security Enhancements (Release 29.0)

The EPAP Security Enhancements feature implements a database table of IP addresses that can be added to, deleted from, and retrieved by an authorized user.

The Admin user or user possessing IP action privileges can at any time add, delete, and retrieve IP addresses. Deletion of an IP would cause that IP address to no longer reside in the IP table, and therefore would no longer be able to connect to the EPAP 3.0 GUI. While each of the IP action privileges can be assigned individually to a user, the IP action privileges of add and delete should only be granted to those users with knowledge of the customer network.

The functionality for addition, deletion, retrieval of client IP addresses, and toggling of IP authorization checking are individually assignable and accessible only through the EPAP 3.0 GUI. The IP mechanism implemented in this feature will provide a foundation for further enhancements in privilege control.

The new IP actions of add, delete, retrieval, and toggling of IP authorization checking are available only through the EPAP 3.0 GUI, and added initially to the Admin group only. The privilege of viewing IP addresses on the customer's network should be a security consideration made only by a user with Admin Group privilege. Privileged users can add a custom message in place of the standard 403 Forbidden site error.

NOTE: The IP actions of this function that allow for adding, deleting, retrieving authorized IP Addresses, and the toggling of authorized IP checking are NOT accessible from the EPAP 3.0 text-based UI. They are accessible from the EPAP 3.0 GUI only.

No IP addresses are restricted from accessing the EPAP 3.0 GUI until the Admin user toggles IP authorization to enabled. When IP authorization checking is enabled, all IP addresses not present in the IP authorization list will be refused access to the EPAP 3.0 GUI.

Hardware Requirements

No new hardware is needed to support this feature.

Upgrade Considerations

This feature will impact the EPAP 1.x/2.x to 3.0 upgrade.

Limitations

IP access and range constraints provided by web server and EPAP 3.0 IP address checking functionality will not protect against IP spoofing. The customer must rely on the security of the customer intranet network to protect against spoofing.

EPAP Support of Eagle's ITU Duplicate Point Code (Release 29.0)

The Eagle's Duplicate Point Code feature allows point codes to be provisioned in the Eagle using a two character "group code." For example, a point code of 1-1-1 could be provisioned 1-1-1-ab, where 1-1-1 is the true point code and ab is the group code. This allows the Eagle to route between two nodes that have the same true point code. The Eagle distinguishes between the two by the group code. The group code is only used internally to the Eagle, and is assigned to an incoming message based on the linkset on which it was received.

Currently, the PDBI (Provisioning Database Interface) does not support entering point code with a group code. This presents a problem for some customers running the DPC feature and either G-Flex, G-Port, or INP.

The EPAP Support of Eagle's ITU Duplicate Point Code feature allows group codes to be entered for Network Entity (i.e. SP or RN) point codes via the PDBI.

The following components are affected by this feature:

1. Provisioning Database Interface. Messages related to Network Entity update, create and retrieve will have new optional name value pair called gc for group code.
2. Provisioning Database. EPAP database schema will change. New element gc for group code will be added
3. Provisioning Database Application. Parsing routines will change to accommodate group code.
4. PDDBA-RTDB interface will change to accommodate new group code parameter.
5. Real Time Database. Parsing and storing of new data
6. EPAP User Interface PDB Network Entity screens will add new group code field.
7. EPAP 1.0/2.0 to 3.0 data base migration

Hardware Requirements

No new hardware is needed to support this feature.

Upgrade Considerations

Seamless database upgrade (Versant utility sch2db) path from EPAP 2.0 to 3.0 will be used if possible; otherwise, database migration procedure shall be provided. Migration procedure will not take more than 10 minutes with maximum of 50K entries in Network Entity class.

Limitations

This feature extends, and is dependent upon, Eagle's ITU DPC feature.

Equipment Identity Register (EIR) (Release 31.0)

This feature is intended to reduce the number of GSM mobile handset thefts by providing a mechanism that allows the network operators to prevent stolen or disallowed handsets from accessing the network. This control is done by using the International Mobile Equipment Identity (IMEI) provided during handset registration and comparing it against a set of lists provided by the network operator. There are three lists: Black, Gray and White. Mobile Stations (MS) on the white list are allowed access to the network. MSs on the black list are denied access to the network. MS's on the gray list are allowed on the network, but are logged.

This feature meets the mandate of European countries to provide EIR functionality by providing the network operators the ability to prevent stolen handsets from accessing their networks.

Error Message Reporting Enhancement (Release 21.0)

Before Release 21.0, the global title and gateway screening functions display a single error (unsolicited alarm message - UAM). This does not show all of the global title and gateway screening error messages that occur.

This feature allows more information about global title and gateway screening error messages to be reported to the user.

The number of global title error messages and gateway screening error messages displayed is increased to 5 messages/second/card. Each card can report up to 8 messages per second to the system. Any global title error messages and gateway screening error messages generated beyond the 8 messages/second/card rate are discarded, with the newest messages discarded first. Low priority messages are discarded when the transport buffer is full (8 total messages). High priority messages are discarded when the transport buffer is completely full with high priority messages.

Ethernet B Interface for IPGWx and IPLIMx (Release 28.1) (IP⁷ Release 6.0)

This feature activates the second Ethernet Interface (the B Interface) on the SSED CM card types. This allows IP connection-oriented transports, such as TALI sockets and IETF SCTP associations, to utilize either of the card's Ethernet A or B Interfaces when forming a connection. This feature provides direct access to two separate LANs, effectively doubling the connectivity of each SSED CM card.

As part of this feature's implementation, multiple static IP routes are permitted for SSEDCCM card types. Each unique static route can be configured to use a different gateway router to reach remote destinations. This provides the capability to utilize more network paths for IP connection-oriented transports to access remote IP networks.

The addition of Static IP Routes enables IP connection-oriented transports to be accessible through gateways other than the default router. By providing access to a greater number of IP gateways, more destinations can be reached in a more efficient manner. Also, more time efficient IP connections can be utilized.

Doubling the connectivity to local networks and providing a more diversified access to remote networks greatly increases the flexibility of the IP7 Secure Gateway and Eagle STP. Enabling each SSEDCCM card to directly access two Local Area Networks allows the arrangement of co-located IP7 SG's / Eagles in ways to provide a higher level of redundancy.

Allowing the SSEDCCM to be used as a multi-homing host also allows the SCTP protocol to utilize the protocol's multi-homing capability and provide support for local association endpoints that are multi-homed. SCTP multi-homed endpoints are endpoints that may use both Ethernet interface A and B for SCTP connectivity. This SCTP protocol capability provides for SCTP connections to be established that are more reliable and robust than TCP socket connections.

Hardware Requirements

This feature is intended for SSEDCCM cards. The assignment of IP7 connection-oriented transports to the Ethernet B Interface on DCM cards is not permitted.

New Commands

The following commands have been created to support this feature. For current usage information, see the *Commands Manual*.

ent-ip-rte

This command is used to configure the administrative static IP route table for the specified IPGWx / IPLIMx card.

dlt-ip-rte

This command is used to remove route entries from the administrative static IP route table for the specified IP card.

rtrv-ip-rte

This command is used to retrieve entries from the administrative static IP route table.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

chg-ip-card

This command is used to configure the TCP/IP stack parameters.

ent-assoc

Used to configure the SCTP Associations in the connection table. The new parameter **:alhost** has been added to this command.

chg-assoc

This command is used to configure the connection table. The new parameter **:alhost** has been added to this command.

rtrv-assoc

This command is used to retrieve the configuration data from the connection table. The new parameter **:alhost** has been added to this command.

ent-appl-sock

This command is used to configure the connection table.

sctp pass command

The pass-through commands are used within the **pass** command. Pass-through commands are passed through the OAM card and sent to individual cards for processing. This reduces the need to add card- and application-specific code to the OAM build.

Limitations

Limitations for the Ethernet B Interface for IPGWx / IPLIMx feature are listed below.

- Only one default router can be assigned per card.
- SSEDCM cards will act as follows:
 - uni-homing on the Ethernet A interface,
 - uni-homing on the Ethernet B interface, and
 - multi-homing on the Ethernet A and B interfaces.
- A finite number of static IP routes per card exists; the limit is 50 per card per Eagle.
- There are per card and per system limits on the maximum number of static IP routes supported.

- a maximum of 64 static IP routes per IPGWx / IPLIMx card, and
- a maximum of 1024 static IP routes per system.
- No additional database validations will be performed on upgrade.
- No increased in load performance is provided.
- Static IP routes can lead to unreachable hosts.

Expanded Terminal Output Groups (Release 31.3)

The output groups currently defined by the EAGLE allow the messages generated by the system to be selectively displayed on the various terminals connected to the EAGLE. The expansion adds 12 new output groups and reassigns messages from existing groups to be used exclusively for controlling the output destination of all UAMs and UIMs. Upgrade automatically assigns messages to the correct groups.

The upgrade will automatically change existing groups to the new groups and additional output may be seen post upgrade depending on which groups are activated.

Extended Bus Interface (Release 20.0)

Every two card locations, except for card locations 9 and 10 in all shelves, and 17 and 18 in the control shelf (1117 and 1118), are connected together through the shelf backplane by an extended bus interface (EBI). The EBI is a local bus and not connected to the IMT bus. This allows every two card locations to communicate with each other without going over the IMT bus. The MCAP card and the TDM are connected to each other through the EBI to form the MASP. This also eliminates the 10 Mb/s ethernet LANs with their outboard MAU units that connected the MCMs and PSMs in the Eagle STP/1 MAS.

Extension Shelf Backplane (Release 23.0)

A new extension shelf backplane has been introduced in Release 23.0 with these changes:

- The extension shelf backplane now contains four -48VDC power and ground connections (DB-26 connectors). Two of these connectors are labeled A1 and B1 and are connected to the fuse and alarm panel. The other two are labeled A2 and B2 and are connected to another power source, allowing the Eagle to remain in service when replacing the fuse and alarm panel.
- The shelf address of the extension shelves has been expanded from four bits to six bits, increasing the number of addressable extension shelves

from 15 to 64 and increasing the maximum number of addressable card slots from 250, or 500 signaling links, to a theoretical limit of 1018, or 2036 signaling links. The actual number of addressable card slots is limited by the system software and the hardware configuration of the Eagle. In Release 23.0, the actual number of addressable card slots is 378, or 756 signaling links, but is limited by the system software to 250 cards, or 500 signaling links.

- To enable the cards in the extension shelf to select one of two different types of IPMX cards that could be in the extension shelf, pin D53 of connector P9 transmits signal ABMUXIN- to pin D26 on connectors P1 to P8 and P10 to P17, and pin D53 of connector P26 transmits signal BBMUXIN- to pin D27 on connectors P18 to P25 and P27 to P34.

Features F - K

False Link Congestion Management (Release 21.0)

It's possible that a problem on a signaling link can cause that signaling link to go into congestion, even though the traffic on the linkset is not high enough to cause congestion. For example, if a signaling link has a large number of retransmissions, the throughput of the signaling link could drop enough to cause congestion on that signaling link. To help prevent this from happening, the Eagle starts the level 3 T31 timer whenever a signaling link goes into congestion. If the signaling link remains in the same congestion state until the level 3 T31 timer expires, the signaling link is removed from service. The signaling link becomes unaligned, and the alignment procedure is started.

The congestion level that starts the level 3 T31 timer can be set to either congestion level 1 or congestion level 2 using the **chg-stpopts** command with the **mtpt31ctl** parameter. This congestion level can be verified with the **rtv-stpopts** command and is shown in the MTPT31CTL field. The level 3 T31 timer is started when the signaling link reaches this congestion level or a higher level. An increase in congestion level or abatement to a lower congestion level restarts the timer. When the congestion level goes below the congestion level configured in the **chg-stpopts** command, the level 3 T31 timer is stopped. If the level 3 T31 timer expires and the signaling link's congestion level has not changed, the signaling link is restarted.

For example, if the level 3 T31 timer is set at 60 seconds and a signaling link goes into congestion level 1, the level 3 T31 timer is started. If, after 45 seconds, the signaling link's congestion increases to level 2, the timer is restarted to 60 seconds. If the signaling link remains at congestion level 2 for 60 seconds, the signaling link is taken out of service and it becomes unaligned. Then the alignment procedure is started, and the Eagle attempts to realign the signaling link. The level 3 T31 timer can only be assigned to ANSI SS7 linksets and signaling links.

Feature Control Mechanism (IP⁷ Release 3.0)

Feature Control provides a mechanism for restricting and monitoring controlled features.

DCM throughput is the only controlled feature for release 3.0. The default rate of transactions per second (TPS) on the system for release 3.0 is 200. As a customer's network needs exceed this threshold, ever higher TPS rates can be purchased and enabled in increments of 200 up to a TPS rate of 6000 (raw capacity).

Note that this feature is available only DCMs running IPGWx GPLs.

New Commands for Feature Control Mechanism

Refer to the *Commands Manual* for current usage information.

chg-ctrl-feat

This new database administration command is used for the following purposes:

- To clear the CRITICAL system error without purchasing a permanent feature access key (FAK) when the IP⁷ Secure Gateway encounters an expired temporary key.
- To activate the On / Off features that have been previously purchased and enabled. Note that release 3.0 contains no On / Off features.

enable-ctrl-feat

This new database administration command is used to enable a purchased controlled feature.

rtrv-ctrl-feat

This new database administration command is used to display information about the controlled features that have been purchased and enabled. Information about permanent and temporarily enabled features and features with expired temporary keys is displayed.

ent-serial-num

This new database administration command is used to enter the unique serial number associated with the IP⁷ Secure Gateway product into the system's software database. When the serial number is entered correctly, it can be "locked" using the command's **lock=yes** parameter, so that it cannot be changed using administration commands.

rtrv-serial-num

This new database administration command is used to display the unique serial number associated with the IP⁷ Secure Gateway product that was previously entered into the system. This number will always begin with the letters "NT," and is sometimes referred to as the NT serial number.

File Transfer Utility (Release 20.0)

This feature provides the capability to upload generic updates and changes to the Eagle via a data communications link. This is an objective stated in Bellcore's TR-NWT-000082, Issue 4, December 1992 publication.

The data communications link is accessed through a dial up modem using one of the Eagle's RS-232 serial I/O ports. This data link is a secured link with password protection. The capability is also provided to download data or a generic program loads from the Eagle to a remote site, allowing operators to gather traffic measurement data in bulk or raw form. Tekelec's Technical Services department may also use this capability when troubleshooting site problems.

Flash Memory Management (Release 23.0)

This feature gives the user the ability to update the image of the PROM on the LIMATM, P/N 870-1293-xx, without physically replacing the PROM. The image of the PROM is shown in the Eagle as a GPL, the BPHCAP GPL.

The LIMATM contains a PROM that can be written to by the system software. In previous releases, cards had to be removed from the Eagle and the PROM physically removed from the cards to update the image of the PROM. With this feature, the LIMATM does not have to be removed from the Eagle to update the image of the PROM. Other cards in the system must still be removed from the Eagle to update the image of the PROM.

The BPHCAP GPL contains software used by the application processor and the IMT processor of the LIMATM. Because the BPHCAP GPL contains software for the IMT processor, the IMT Software Download feature, introduced in Release 21.1, is prevented from downloading the IMT GPL to the LIMATM. The system software detects the presence of the LIMATM, and the IMT download is prevented.

The process of loading the BPHCAP GPL on the Eagle is different from the loading of other GPLs.

1. To bring the BPHCAP GPL onto the Eagle, insert the removable cartridge into the removable cartridge drive on the MDAL then copy the BPHCAP GPL from the removable cartridge to the fixed disk with the **chg-gpl** command.
2. Place the card that the BPHCAP GPL is being loaded onto out of service using the **rmv-card** command.
3. Start the BPHCAP GPL change by entering the **init-flash** command with the **code=trial** parameter. This loads the trial version of the BPHCAP GPL onto the specified card. When this command is successful, the card reboots and two minor alarms are generated. One alarm shows that the card is running an unapproved GPL, UAM 0002, and the other shows that the card is running an unactivated BPHCAP GPL, UAM 0004.
4. Place the card back into service with the **rst-card** command.
5. Activate the BPHCAP GPL on the card with the **act-flash** command. UAM 0004 is cleared. UAM 0002 is not cleared until all LIM-ATMs have been updated with the new BPHCAP GPL.
6. Repeat Steps 2 through 5 for other LIMATMs in the Eagle.
7. Make the trial version of the BPHCAP GPL the approved version with the **act-gpl** command.

New Commands

Two new commands have been added to support this feature: **init-flash** and **act-flash**. Refer to the *Commands Manual* for current usage information.

init-flash

This command loads the BPHCAP GPL software to a specified card's inactive flash memory. When the card is reinitialized, the card runs this version of the BPHCAP GPL in the card's inactive flash memory. The specified card for this command must be a high-speed ATM signaling link (LIMATM), and the card must be inhibited. The LIMATM does not have to be defined in the database, but it must be aligned on an IMT bus.

act-flash

This command activates the trial BPHCAP GPL that is currently running on the specified card. The specified card for this command must be a high-speed ATM signaling link (LIMATM).

Changed Commands

These commands have been changed to support this feature: **chg-gpl**, **act-gpl**, **rtrv-gpl**, **rept-stat-gpl**, **copy-gpl**, **rept-stat-card**, and **init-imt-gpl**. Refer to the *Commands Manual* for current usage information.

chg-gpl

A new value for the **appl** parameter, **bphcap** - for the BPHCAP GPL, has been added to the **chg-gpl** command.

act-gpl

A new value for the **appl** parameter, **bphcap** - for the BPHCAP GPL, has been added to the **act-gpl** command.

rtrv-gpl

A new value for the **appl** parameter, **bphcap** - for the BPHCAP GPL, has been added to the **rtrv-gpl** command to display the BPHCAP GPL. The output of the **rtrv-gpl** command has been changed to add the entries for the BPHCAP GPL.

rept-stat-gpl

A new value for the **appl** parameter, **bphcap** - for the BPHCAP GPL, has been added to the **rept-stat-gpl** command to display the BPHCAP GPL. The output of the **rept-stat-gpl** command has been changed to add the entries for the BPHCAP GPL. The new '+' symbol indicates that the BPHCAP GPL currently being run has not yet been activated on the card.

rept-stat-card

The output of the **rept-stat-card** command has been changed to include the version of the BPHCAP GPL if the card type is a LIMATM. The BPHCAP GPL is shown in the output as the FLASH GPL version. If the card type is not a LIMATM, the output of the **rept-stat-card** command is not changed and the FLASH GPL version field is not shown.

TROUBLE TEXT VER. = ----

Existing IMT Command Changes

These commands cannot be executed when either the **init-flash** or the **act-flash** commands are being executed: **init-imt-gpl**, **clr-imt-stats**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-imt**, and **tst-imt**. If any of these commands are entered while the **init-flash** or **act-flash** commands are being executed, this error message appears:

Cmd Rej E2368 - System busy, retry later

The **init-imt-gpl** GPL cannot be executed on a high-speed ATM signaling link card (LIMATM). If the card specified in the **init-imt-gpl** command is a LIMATM, this error message appears:

E2212 Cmd Rej: Invalid card type for this command

Flexible Point Code Formatting (Release 26.0)

The Flexible Point Code Formatting feature provides the customization and flexibility of the Eagle point code provisioning system to meet the needs of ITU-N customers who required a specific ITU-N point code format. The one commonalty of the all ITU-N point codes is that the point code is stored in a 4-byte field in our database (14 bits used for ITU point codes). This value does not change, no matter how it is displayed or input on the Eagle.

For example, suppose the Eagle is deployed to 5 different regions for ITU-N customers in Europe. Each region has its own way of viewing point codes in its private network. One region may wish to distribute its point codes in a format such as A-B, where A ranges from 1 to 1024, and B ranges from 1 to 16. Other regions may wish to use an A-B-C-D point code format. Table 3-1 provides examples of how these point codes might be used in different regions.

Table 3-1. Sample ITU-N Point Codes

Region 1	Region 2	Region 3	Region 4	Region 5
1000-1	5-5-5-1	3-8-3	4000	1000-1-1
1000-5	3-1-1-0	1-7-1	16000	1000-0-1
1000-6	5-2-1-3	1-100-1	12000	800-1-0

Changed Commands

Refer to the *Commands Manual* for current usage information.

chg-stpopts

The **chg-stpopts** command updates (change by simple replacement) the values of one or more of the STP node level processing-option indicators maintained in the STP's options table. This command has been enhanced with new parameter, **npcfmti** (National Point Code Format Identifier). This parameter is used to set the system default for all input and output of ITU-N point codes.

Affected Commands

This section identifies the commands affected by the value of the **chg-stpopts:npcfmti** parameter. See the *Commands Manual* for current information.

chg-dstn

If you specify the **dpcn** or **aliasn** parameters, the format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

chg-gtt

If you specify the **pcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

chg-ls

If you specify the **apcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

chg-map

If you specify the **pcn** or **mpcn** parameters, the format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

chg-rte

If you specify the **dpcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

chg-sid

If you specify the **pcn**, **cpcn**, or **ncpcn** parameters, the format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

dlt-cspc

If you specify the **pcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

dlt-dstn

The format of the specified **dpcn** parameter must match the format for ITU national point codes you assigned with the **chg-stpopts:npcfmti** parameter.

dlt-map

If you specify the **pcn** parameter, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

dlt-rte

If you specify the **dpcn** parameter, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

ent-cspc

If you specify the **pcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

ent-dstn

If you specify the **dpcn** or **aliasn** parameters, the format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rept-stat-dstn

If you specify the **dpcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rept-stat-rte

If you specify the **dpcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rtrv-dstn

If you specify the **dpcn** or **aliasn** parameters, the format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rtrv-gtt

If you specify the **pcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rtrv-ls

This command displays linkset information.

rtrv-map

If you specify the **pcn** parameter, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npcfmti** parameter.

rtv-rte

If you specify the **dpcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmt1** parameter.

rtrv-sid

If you specify the **cpcn** parameter, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npcfmt1** parameter.

rtrv-stpopts

This command displays the current value of the Eagle STP's node-level processing option indicators maintained in the STP's options table.

unh-alm

If you specify the **dpcn** parameter, its format must match the format you assigned with the **chg-stpopts:npcfmt1** parameter.

Upgrade Considerations

All Eagles that are upgraded to software that includes the Flexible ITU-N Point Code Feature must have the NPCFMTI parameter in the STPOPTS table set to a system default of 14-0-0-0.

Limitations

It is important to note that this feature does not provide the ability to support point codes that are not 14 (ITU) or 24 (ANSI) bits in length, and has no impact on Eagle SS7 message processing. Also, it does not apply to gateway screening commands and output, due to the way that GWS was originally designed to take into account the point code format.

Force Change of an Assigned Password at First Login (Release 21.0)

When a password is assigned to a user by the system administrator with either the **ent-user** or **chg-user** commands (the **pid=yes** parameter must be specified with the **chg-user** command to change the user's password), that user is required to change the password when they first login to the Eagle. If the user does not change the password, the login session is rejected.

As part of the password verification process, a check is performed to make sure that the user has changed the password and did not re-enter the current password as the new password.

FTP Retrieve and Replace (Release 29.0) (IP⁷ Release 7.0)

NOTE: The FTP Retrieve and Replace feature provides configuration and data transfer support on the Eagle for the FTP-based Table Retrieve Application (FTRA), which resides on a customer-provided, Windows-based PC or Unix Workstation.

FTRA will be available separately. In order to use FTRA, the IP User Interface: Telnet Support feature (IP UI) must be enabled . When the IP UI feature is enabled in Release 29.0, the functions provided by the FTP Retrieve and Replace feature become available for communication between the Eagle and FTRA.

The FTP Retrieve and Replace feature adds a new and expanded retrieve and replace capability to the IP User Interface Telnet feature.

This feature utilizes:

1. GPSM-II card as the hardware platform for OAM.
2. IPSM card as the hardware platform for the IPS GPL.
3. FTP-based Table Retrieve Application (FTRA) software running on a Unix or Windows-based PC platform connected to the IPSM card.

The FTP Retrieve and Replace Feature provides the following new capabilities:

- Enhanced retrieve capabilities of Eagle table data, whereby the application will retrieve table data transparently upon request by the user, and later will convert, on demand, to a comma separated variable (.csv) file.
- Enhanced input capabilities of Eagle table data, supporting input of script files containing scripts created by the user. The transfer of data to the Eagle is transparent to the user.
- A much faster and more reliable retrieval and input capability.
- Validating data prior to input and identifying the data at issue.

The FTP Retrieve and Replace feature uses FTP commands to transfer relevant parts of the Eagle STP OA&M database to a Unix or Windows-based PC, where a new Tekelec-developed Java-based application is running. The application provides features to input changes to table data.

The IPS GPL is memory-mapped such that the FTP area can handle the largest database file on the OA&M. Figure 3-1 illustrates the feature in relation to the system and customer's network.

Figure 3-1. FTP Retrieve and Replace

Hardware Requirements

This feature requires IPSM (GPSM-II-based) hardware with at least 1 GB of RAM (i.e., DSM 1GB with the IPS GPL [IPSM]).

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

The application requires a UNIX workstation equipped with the following:

- Operating System - Solaris 7
- Processor speed - 500 MHz
- RAM - Minimum 512 MB
- Disk Space - Minimum 10 GB
- CD-ROM drive
- 10/ 100BaseT Ethernet connection to the LAN
- Static IP addressing
- Java Runtime Environment (JRE) 1.4.0 or later

The application requires a Windows PC workstation equipped with the following:

- Operating System - Windows 98 or later with Win32 API
- Processor speed - Pentium III, 750 MHz or faster
- RAM - Minimum 128 MB
- Disk Space - Minimum 500 MB free + 500 MB free per STP
- CD-ROM drive
- 10/ 100BaseT Ethernet connection to the LAN
- Static IP addressing
- Java Runtime Environment (JRE) 1.4.0 or later

FTRA 2.1 Compatibility with Eagle 31.3 (Release 31.3)

The FTRA Release 2.1 provides FTRA compatibility with Eagle 31.3. There are no new features or functionality in Release 2.1.

G-Flex C7 Relay (Release 26.2)

G-Flex optimizes the use of subscriber numbers and number ranges by providing a logical link between any MSISDN / MIN / MDN and any IMSI, as well as between any subscriber number and any HLR. This feature allows subscribers to easily be moved from one HLR to another.

NOTE: This feature applies to any GSM or IS-41, ITU, or ANSI mobile network. In the following text, the term DN is used to indicate MSISDN numbers, MINs, or MDNs. Also, the term subscriber number is used to indicate DN and/or IMSI.

It also allows each HLR to be filled to 100% of its capacity by allowing subscriber number ranges to be split over different HLRs, and individual DNs/IMSI to be assigned to any HLR. Another benefit is that subscriber number routing data is not required to be maintained in all MSCs in the network.

The initial version of G-Flex, as defined in this document, applies to routing to HLRs only. In the future, G-Flex may be expanded to include routing to other intelligent devices, such as SCPs (Service Control Points) and VMSCs (Voice Mail Service Centers), depending upon market needs.

G-Flex is optional on the Eagle STP, and can be turned on (but not turned off) via a feature bit. G-Flex and North American LNP are mutually exclusive on an Eagle node.

Refer to the Features Manual - G-Flex for the current information on this feature.

New Commands

Refer to the *Commands Manual* for current usage information.

Eagle Terminal Database Commands

Eagle GSM System Options Commands

The new GSM system options commands are used to change and display GSM- specific system options in the Eagle database.

chg-gsmopts (change gsm system options)

The **chg-gsmopts** command changes GSM specific system options in the database. This command updates the GSMOPTS Table. Up to 10 CCNC/MCCMNC numbering plan conversion parameter combinations can be created.

rtrv-gsmopts (retrieve gsm system options)

The **rtrv-gsmopts** command retrieves all GSM specific system options from the database.

Eagle Service Selector Commands

The Service Selector commands are a new set of commands used to provision new selectors for the G-Flex service, giving the user greater flexibility when provisioning the type of messages that require G-Flex processing.

For further details on the Service Selector commands and parameters, please refer to the *Commands Manual*.

ent-srvsel (enter service selectors)

The **ent-srvsel** command specifies the applicable GSM G-Flex service selectors indicating G-Flex processing is required. The **serv** parameter will default to the G-Flex service if not specified.

chg-srvsel (change service selectors)

The **chg-srvsel** command specifies the applicable GSM G-Flex selectors required to change an existing GSM G-Flex selector entry. The **nserv** parameter will default to G-Flex if not specified.

dlt-srvsel (delete service selectors)

The **dlt-srvsel** command deletes a GSM G-Flex service selector. The **serv** parameter will default to G-Flex if not specified.

rtrv-srvsel (retrieve service selectors)

The **rtrv-srvsel** command displays a list of administered GSM G-Flex service selector combinations. All output is sorted first by Service, then by Global Title Domain (ANSI first, followed by ITU), then by GTI, then by Translation Type, then by numbering plan, and finally by the nature of address indicator. The output can be filtered by specifying any optional parameter.

Eagle GSM G-Flex Subsystem Number Commands

Three G-Flex subsystem number commands have been created to add, delete, and display subsystem numbers of incoming messages supported by G-Flex.

ent-gsm-ssn (enter gsm supported subsystem number)

The **ent-gsm-ssn** command specifies the incoming MSU supported entity subsystem numbers. Currently only HLR entity object subsystem numbers are allowed. The object type parameter (**obj**) will default to HLR if the parameter is not specified. In the future, this command may be expanded to allow other entity object subsystem numbers (such as AUC).

dlt-gsm-ssn (delete gsm supported subsystem number)

The **dlt-gsm-ssn** command specifies the subsystem number to be deleted.

rtrv-gsm-ssn (retrieve gsm supported subsystem number)

The **rtrv-gsm-ssn** command displays GSM supported subsystem numbers for entity objects. All administered subsystem numbers will be displayed.

EPAP Database Commands

GSM Subscription Commands

The external EPAP provisioning database interface provides enter, change, delete, and retrieve subscriber commands to be used by customer-specific equipment. These or similar commands will also be made available for use by the local EPAP interface, which is only to be used as an emergency backup procedure.

GSM Entity Object Commands

The external EPAP provisioning database interface provides enter, change, delete, and retrieve GSM entity commands to be used by customer-specific equipment. The GSM entity object commands are created to enter, change, delete, and display an entity object (such as an HLR) and its corresponding global title translation in the GSM G-Flex database. Entity object types other than HLR will be added in future releases.

These or similar commands will also be made available for use by the local EPAP interface, which is only to be used as an emergency backup procedure.

Maintenance and Measurement Commands

rept-stat-epap

This new command reports the current SCCP card statistics, including G-Flex statistics at two levels: either per VSCCP card, or for the GSM system as a whole.

Enhancements Commands

Refer to the *Commands Manual* for current usage information

Eagle Terminal Database Commands

Eagle Feature Commands

chg-feat

The **chg-feat** command has been changed to allow administration of the G-Flex. The parameter **gflex={on,off}** has been introduced.

rtrv-feat

The **rtrv-feat** command displays the status of the G-Flex feature.

Eagle Database Commands

chg-db

The **chg-db** command has been enhanced to copy the newly supported Eagle TDM-resident G-Flex database tables during database Backup, Restore, and Repair. Its syntax, however, is unchanged.

rept-stat-db

The **rept-stat-db** command has been enhanced to display both the STP and the GSM database status and level information for each DSM network card, and for each active and standby EPAP real time database. Its syntax, however, remains unchanged.

Maintenance and Measurement Commands

The following existing commands have been updated to allow provisioning, operations, and maintenance activities for DSM cards. For current information on these commands and their parameters, refer to the *Commands Manual*.

rept-stat-sys

The syntax for this command has not been modified, but the report output now includes the status of the EPAP and DSM IP link lines. The remainder of the report is unchanged.

rept-stat-sccp

This command includes a new parameter, **:loc** (**rept-stat-sccp:loc=nnnn**), which provides a detailed view of the status of SCCP services provided by a specific SCCP / VSCCP card. Also, the command handling and scroll area output for this command now includes the DSM card and GSM subsystem status.

The **rept-stat-sccp:mode=perf** command has been enhanced to target the general SCCP traffic performance for both SCCP and VSCCP cards. The report supplies message rates for both direct assignments (LB) and TVG.

rept-meas

This command has been enhanced to include G-Flex measurements in the output sent to the Eagle terminal.

rept-stat-trbl

This command has been enhanced to include the GSM subsystem and DSM/EPAP IP link alarms.

rept-stat-alm

This command has been updated to include the alarm totals of the GSM Subsystem and DSM/EPAP IP links.

inh-card, alw-card

The command handling and scroll area output for this command now includes the DSM card. The following is a new rule to be added, which does not require changing the error message:

E3779 - if the specified card is the only in-service VSCCP card, the **force=yes** parameter is required.

The following is a new rule to be added, which does not require changing the error message:

E3779 - if inhibiting this VSCCP card would cause less than 80% of the IS-NR LIMs to have VSCCP service (i.e., cause the system to enter an unstable Loading Mode), the **force=yes** parameter is required.

ent-card, rtrv-card, dlt-card

The command handling and scroll area output for this command now includes the DSM card. For the **ent-card** command, the parameter value **appl=vscpp** is supported.

The following is a new rule to be added, which can use an existing error message:

E3779 - if the addition of a LIM card exceeds the system's VSCCP service capabilities, the **force=yes** parameter is required.

chg-gpl, act-gpl, rtrv-gpl, rept-stat-gpl, copy-gpl

The command handling and scroll area output for these commands has been enhanced to include the VSCCP GPL.

inh-alm, unhb-alm

These commands are updated to allow both port A and port B to be specified for the parameter **dev=dlk**. This allows alarms to be inhibited on the DSM ports.

alw-map-ss, inh-map-ss

These commands perform the processing necessary to initiate/inhibit a mated application subsystem (INPQS). For Release 26.05, the **alw-map-ss** and **inh-map-ss** commands adhere to the same rules as those used for LNPQS, except as applied to INP. The INP feature bit must be on, and the SSN provided must be the SSN value for the INPQS. In addition, for the **alw-map-ss** command, the INPQS cannot be offline in the database.

pass

The **pass** command allows remote execution of a selected command by the targeted card. Selected commands from the IP7 Secure Gateway product line are allowed as follows:

pass:cmd="ping" Allows troubleshooting of the private EPAP-DSM IP network.

pass:cmd="netstat" Allows troubleshooting of network interface and routing configuration problems within the private EPAP-DSM IP network.

pass:cmd="nslookup" Allows debugging of Domain Name Server to IP addressing tables. DNS is not supported for EPAP cards in the initial release.

pass:cmd="arp" Allows verification and correction of IP stack ARP tables. In general, this command should not be required for normal operation.

pass:cmd="help" Provides a list of supported **pass** commands for the target location.

Upgrade Considerations**Eagle Database**

The Eagle upgrade process is responsible for copying new TDM resident G-Flex tables from the upgrade removable cartridge to the newly formatted fixed disks. The G-Flex feature bit should not be turned on prior to or during an upgrade of an existing Eagle STP.

Eagle STP Audit

The Eagle STP audit is designed to recognize when it is in upgrade mode, and will not attempt to do any activity that requires access to new G-Flex tables, since they will not be present until the upgrade has completed.

In order to convey G-Flex audit-detected errors to the active OAM, space in the common maintenance block header must be identified. In order to prevent false alarms during the upgrade, the revision level of the maintenance block has been redefined. Existing code that examines maintenance blocks will not interpret them if the system is in upgrade mode and the revision level in the received maintenance block is not at the expected value.

Eagle Maintenance

During upgrade, the `rept-stat-epap` command output may not reflect the current state of the GSM system.

Eagle Hardware

This feature requires the MPS Hardware System; see “*New Hardware (Release 26.05)*” on page 4-186.

Limitations

1. An E.214 number received by the G-Flex™ C7 Relay must first be converted to an E.212 number before searching the G-Flex database. If the original E.212 number was truncated to form the E.214 number, the full original E.212 number cannot be recovered, and G-Flex™ will not work properly.
2. No overload controls are required above and beyond existing Eagle lower level mechanisms (e.g. for MTP congestion, etc.).
3. This initial version of the G-Flex™ C7 Relay only supports routing of messages to a single network node for a particular subscriber. For example, an individual subscriber cannot have some messages routed to his HLR, and other messages routed to a separate Authentication Center (AuC). In this example, if the AuC is co-located with the HLR, then this version of G-Flex™ will work. The G-Flex™ design allows for expansion to include routing to multiple network elements (corresponding to multiple services) for the same subscriber.
4. Messages routed by G-Flex™ cannot undergo ANSI-ITU conversion.

G-Port MNP (Release 26.2)

GSM Mobile Number Portability (G-Port) provides mobile subscribers the ability to change the GSM subscription network within a portability cluster, while retaining their original MSISDN(s).

Throughout the world, an increasing number of governments are mandating that telecommunications network operators support service provider number portability. Service provider portability allows a consumer to change service providers while retaining his phone number. Service provider portability is intended primarily to promote competition among service providers. It applies to both wireline and mobile phone networks. In particular, this feature is focused on service provider portability in GSM (Global System for Mobile communications) networks.

While the advent of number portability is good news for consumers, it presents many challenges for network operators. G-Port MNP (Mobile Number Portability) minimizes those challenges for GSM network operators, while enabling them to efficiently meet their regulatory obligations.

For current details of this feature, refer to the *Features Manual - G-Port*.

New Commands

The commands discussed in this section have been created to support the G-Port MNP feature. Refer to the *Commands Manual* for current usage information.

chg-gsmopts (change gsm system options)

The **chg-gsmopts** command changes GSM specific system options in the database. This command updates the GSMOPTS Table.

irtrv-gsmopts (retrieve gsm system options)

The **rtrv-gsmopts** command is used to retrieve all GSM-specific options from the database.

ent-srvsel (enter service selectors command)

The **ent-srvsel** command specifies the applicable G-Port service selectors, indicating G-Port processing is required.

chg-srvsel (change service selector command)

The **chg-srvsel** command specifies the applicable G-Port selectors requires to change an existing G-Port selector entry.

dlt-srvsel (delete service selector command)

The **dlt-srvsel** command deletes the G-Port service selector.

rtrv-srvsel (retrieve service selector command)

The **rtrv-srvsel** command displays a list of administered G-Port service selector combinations. All output is sorted by Global Title Domain (ANSI first, followed by ITU), then by GTT, then by Translation Type, then by numbering plan, and then by the nature of address indicator. The output can be filtered by specifying any optional parameter.

ent-gsm-ssn (enter gsm supported subsystem number command)

The **ent-gsm-ssn** command enters GSM-specific subsystem numbers, currently used to identify HLRs, in the database. This command updates the GSMSSN Table.

dlt-gsm-ssn (delete gsm supported subsystem number command)

The **dlt-gsm-ssn** command deletes GSM-specific subsystem numbers, currently used to identify HLRs, in the database. This command updates the GSMSSN Table.

rtrv-gsm-ssn (retrieve gsm supported subsystem number command)**ent-homern** (enter home network routing number prefix command)

The **ent-homern** command is used to enter the different values of the home network routing number prefix. This command updates the HOMERN table. A maximum of 100 **homern** values can be entered. The value of the **homern** parameter can be a mixture of decimal and hexadecimal digits.

dlt-homern (delete home network routing number prefix command)

The **dlt-homern** command specifies the home network routing number prefix to be deleted.

rtrv-homern (retrieve home network routing number prefix command)

The **rtrv-homern** command displays the home network routing number prefix entered in the database.

Changed Commands

The commands discussed in this section have been enhanced to support the G-Port MNP feature. Refer to the *Commands Manual* for current usage information.

chg-feat

The **chg-feat** command has been changed to allow administration of the G-Port. The parameter **gport={on,off}** has been introduced.

rtrv-feat

The **rtrv-feat** command has been enhanced to report the status of this feature; it has no parameters.

chg-/rtrv-stpopts

The **chg-stpopts** command updates the STPOPTS table. This command has been enhanced by the addition of two new optional parameters: **defcc** <Default Country Code>, **defndc** <Default Network Destination Code>, and **dsmaud** <Audit Running Status>.

The **rtrv-stpopts** command has been enhanced to display the status of these new parameters.

chg-ip-lnk

The **chg-ip-lnk** command has been enhanced with a new parameter, **mcast**. Any database that is downloaded from the MPS to the DSM card requires the **mcast** parameter to be turned on. If it is not turned on, the database will not be downloaded to the DSM.

rtrv-ip-lnk

The **rtrv-ip-lnk** command is used to retrieve the IP LINK table.

rept-stat-sys

The syntax for this command has not been modified, but the report output now includes the status of the EPAP and DSM IP link lines. The remainder of the report is unchanged.

rept-stat-sccp

This command includes a new parameter, **:loc** (**rept-stat-sccp:loc=nnnn**), which provides a detailed view of the status of SCCP services provided by a specific SCCP/VSCCP card. Also, the command handling and scroll area output for this command now includes the DSM card and GSM subsystem status.

The **rept-stat-sccp:mode=perf** command has been enhanced to target the general SCCP traffic performance for both SCCP and VSCCP cards. The report supplies message rates for both direct assignments (LB) and TVG.

rept-meas

This command has been enhanced to include G-Port measurements in the output sent to the Eagle terminal.

rept-stat-trbl

This command has been enhanced to include the GSM subsystem and DSM/EPAP IP link alarms.

rept-stat-alm

This command has been updated to include the alarm totals of the GSM Subsystem and DSM/EPAP IP links.

inh-card, alw-card

The command handling and scroll area output for this command now includes the DSM card. The following is a new rule to be added, which does not require changing the error message:

E3779 - if the specified card is the only in-service VSCCP card, the **force=yes** parameter is required.

The following is a new rule to be added, which does not require changing the error message:

E3779 - if inhibiting this VSCCP card would cause less than 80% of the IS-NR LIMs to have VSCCP service (i.e., cause the system to enter an unstable Loading Mode), the **force=yes** parameter is required.

ent-card, rtrv-card, dlt-card

The command handling and scroll area output for this command now includes the DSM card. For the **ent-card** command, the parameter value **appl=vsccp** is supported.

chg-gpl, act-gpl, rtrv-gpl, rept-stat-gpl, copy-gpl

The command handling and scroll area output for these commands has been enhanced to include the VSCCP GPL.

ent-mem, dlt-mem, disp-mem, disp-bp, set-mem

The command handling and scroll area output for this command now includes the DSM card.

inh-alm, unhb-alm

These commands are updated to allow both port A and port B to be specified for the parameter **dev=dlk**. This allows alarms to be inhibited on the DSM ports.

alw-map-ss, inh-map-ss

These commands perform the processing necessary to initiate /inhibit a mated application subsystem (INPQS). For Release 26.05, the **alw-map-ss** and **inh-map-ss** commands adhere to the same rules as those used for LNPQS, except as applied to INP. The INP feature bit must be on, and the SSN provided must be the SSN value for the INPQS. In addition, for the **alw-map-ss** command, the INPQS cannot be offline in the database.

pass

The **pass** command allows remote execution of a selected command by the targeted card. Selected commands from the IP7 Secure Gateway product line are allowed, as follows:

pass:cmd="ping" Allows troubleshooting of the private EPAP-DSM IP network.

pass:cmd="netstat" Allows troubleshooting of network interface and routing configuration problems within the private EPAP-DSM IP network.

`pass:cmd="nslookup".....` Allows debugging of Domain Name Server to IP addressing tables. DNS is not supported for EPAP cards in the initial release.

`pass:cmd="arp"` Allows verification and correction of IP stack ARP tables. In general, this command should not be required for normal operation.

`pass:cmd="help"` Provides a list of supported **pass** commands for the target location.

G-Port MNP Circular Route Prevention (Release 28.1)

In some cases, networks may have incorrect number portability data for a subscriber. For example, a subscriber may have ported from network A to network B. Network A has the correct routing information, indicating the subscriber now belongs to network B. However, network B may have incorrect routing information indicating that the subscriber still belongs to network A. In this case, network A routes the call to network B, based on its portability data, but network B routes the call back to network A, based on its incorrect data. This behavior results in a circular route.

This feature provides an option to prevent this from happening.

For current detail on this feature, refer to the *Features Manual - G-Port*.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

chg-ctrl-feat

Use this command to activate or deactivate the On / Off features that have been purchased and enabled. The **:partnum** parameter has been enhanced to recognize the feature key for this feature.

rtrv-ctrl-feat

Used to display all Controlled Features the customer has purchased and enabled to date. The output of this command has been enhanced to recognize the feature key for this feature.

chg-gsmopts

Use this command to enter GSM-specific system options in the database. This command has been enhanced with the new parameter **:sridn**.

rtrv-gsmopts

Used to retrieve all GSM-specific system options from the database. The output for this command has been enhanced to show the value of the new parameter.

Upgrade Considerations

The Eagle upgrade process is only responsible for copying new GSM tables from removable cartridge to the newly formatted fixed disks.

Gateway Threshold Exceeded Notification (Release 22.0)

A notification message is produced to alert the user that excessive traffic is occurring on a gateway linkset or an excessive number of MSUs are being discarded on a gateway linkset. When either of these conditions occur, new UIMs are sent to the Eagle terminals.

UIM 1154 - Gateway Arrival Threshold Exceeded - MSU reception threshold exceeded

```
RLGHNCXA03W 97-06-07 16:28:08 EST Rel 22.0.0
0018.1154     SYSTEM      INFO MSU reception threshold exceeded
              LSN=A1234567 REJ=199      RECV=5200  INTRVL=05
              Report Date: 97-06-07   Time: 16:27:19
```

UIM 1155 - Gateway Discard Threshold Exceeded - MSU discard threshold exceeded

```
RLGHNCXA03W 97-06-07 16:28:08 EST Rel 22.0.0
0018.1155     SYSTEM      INFO MSU discard threshold exceeded
              LSN=A1234567 REJ=199      RECV=5200  INTRVL=05
              Report Date: 97-06-07   Time: 16:27:19
```

The message REPT-GTWYACT is sent to the SEAS interface when these conditions occur.

The term excessive is defined by two values.

- The number of MSUs discarded on the gateway linkset.
- The number of MSUs received on the gateway linkset.

These values measured over a user configurable period of time. If either of these values are exceeded within the specified period of time, then this notification occurs.

The threshold at which these UIMs are generated can be configured by the user on the Eagle terminal with the **set-gtwy-acthresh** command.

Parameters

The **set-gtwy-acthresh** command uses these parameters.

:lsn = the name of the link set

:rej = the number of MSUs discarded on the gateway linkset threshold.
The values for this parameter range from 0 to 999999

:recv = the number of MSUs received on the gateway linkset threshold. The values for this parameter range from 0 to 999999

:intrvl = the time interval, in minutes, during which the counts for the **rej** and **recv** parameters are made. The values for this parameter are 5,10,15, 20, and 30.

The current values for these thresholds can be displayed on the Eagle terminal with the **rtrv-gtwy-acthresh** command. The following is an example of the **rtrv-gtwy-acthresh** command output.

Output Example

```
RLGHNCXA03W 97-06-07 08:50:12 EST Rel 22.0.0

LSN      REJ      RECV      INTRVL
WY644368 10       1000      10
WY234456 25       2000      20
LN123445 0        0         0
LN123556 25       2500      30
OP239900 0        0         0
```

These thresholds can also be configured on the SEAS interface with the SET-GTWY-ACTHRESH command function and displayed on the SEAS interface with the RTRV-GTWY-ACTHRESH command function.

The counts for the number of MSUs discarded and received on the gateway linkset are collected in the 5 minute measurement collection. These counts do not appear on any measurement reports, but are collected to support this feature. These counts track the two values that need to be monitored.

This feature no longer allows the 5 minute measurement collection to be stopped with the Eagle's **chg-meas:collect=off** command. The 5-minute measurement collection still occurs, but no values are written to disk and no reports are produced.

Global Title Modification (Release 28.1) (IP⁷ Release 6.0)

This feature allows the user to modify any part of the Global Title in the outgoing message, other than Encoding Scheme, after GTT has been performed. A new Translation Type (TT), Numbering Plan (NP), and/or Network Address Indicator (NAI) value can be specified. Also, a specified number of leading digits of the GT address can be deleted, and/or a set of specified digits can be added to the beginning of the GTA. This is all defined on a per-entry (i.e. GTA) basis.

Refer to the *Database Administration Manual - Features* for current details of this feature.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

chg-feat

The **chg-feat** command has been modified in that the **:mgtt** parameter (feature bit) now assumes the function of the **:prfxdlgt** feature bit (i.e. the feature being replaced by the release 28.1 Global Title Modification feature).

rtrv-feat

Use this command to display the list of optional features and their status on the system. This command has no parameters.

ent-gtt

This command has been enhanced with the new parameters.

chg-gtt

Used to change the routing objects for messages requiring global title translations. This command has been enhanced with new parameters.

rtrv-gtt

Use this command to obtain the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified global title addresses (GTAs) or ranges of GTAs with a given translation type (TT). The output of this command has been modified to display the values of the new parameters.

ent-gta

Use this command to specify the global title address information for applicable global title selectors required to specify a global title entry. This command has been enhanced with the new parameters.

chg-gta

This command changes the global title address information for applicable global title selectors required to specify a global title entry. This command has been enhanced with new parameters.

rtrv-gta

Use this command to display a list of global title address information applicable to the specified GTT set. This list can be filtered using any of a number of parameters. The output of this command has been modified to display the values of the new parameters.

Upgrade Considerations

The Eagle provides an upgrade conversion for customers using the Interim GT Modification feature supplied in Release 26.0. Database conversions are handled during upgrade.

Global Title Translation (GTT) (Release 20.0)

The global title translation (GTT) subsystem of the Eagle can support the following level of activity.

- 850 messages per second
- 21,000 global title translations per second per system

The maximum number of entries in the global title translation table is 270,000 entries. It is possible to enter all 270,000 entries under one translation type. However, the system works most efficiently when there are 65,536 or fewer GTT entries per translation type. While there is no mechanism to limit the number of GTT entries to fewer than 65,537 per translation type, the performance of the GTT subsystem is not guaranteed when more than 65,536 translations are entered for a single translation type.

GR-376 Interface (Release 26.0)

The GR-376 Support feature provides an optional method of data collection from the EAGLE STP. Measurement and reference data is collected with the EAGLE and passed to a supplemental Network Data Collection (NDC) Q adapter function (QAF).

Refer to the *Feature Manual - GR-376* for current information on this feature.

Commands

The following commands have been created or updated to allow provisioning, operations, and maintenance activities for NDC DCM cards:

- *rept-stat-ndc* (new)
- *pass* (new)
- *rept-stat-card* (changed)
- *init-card* (changed)
- *ent-card* (changed)
- *dlt-card* (changed)
- *rtrv-card* (changed)

- *inh-card* (changed)
- *alw-card* (changed)
- *chg-gpl* (changed)
- *act-gpl* (changed)
- *rtrv-gpl* (changed)
- *rept-stat-sys* (changed)
- *rept-stat-gpl* (changed)
- *copy-gpl* (changed)
- *ent-bp* (changed)
- *dlt-bp* (changed)
- *disp-bp* (changed)
- *set-mem* (changed)
- *disp-mem* (changed)

New Commands

This section describes the new commands for this feature. Refer to the *Commands Manual* for current information on these commands.

rept-stat-ndc

This new command supports reporting of EAGLE NDC system status. The connectivity status for each DCM and its mated EMAP / NDC QAF devices are reported. Additionally, an alarm status summary is printed if any alarms exist.

pass

This command allows remote execution of a selected command by the targeted card. Pass-through commands are used within the pass command. Pass-through commands are passed through the OAM card and sent to individual cards for processing. This reduces the need to add card- and application-specific code to the OAM build.

Pass-through commands consist of two types of tokens: command name and command options.

Changed Commands

rept-stat-card

This existing command generates a summary report of cards that are equipped in the system. The **mode=full** parameter gives more information than the normal summary report. No new parameters are added to this command. Support is added for the DCM card type running the EMDC application.

rept-stat-sys

This command has been updated to include the status of DCM cards, (all applications) and NDC Q.3 association status.

init-card, inh-card, alw-card

The command handling and scroll area output for these commands have been updated to include the EMDC-DCM.

ent-card, rtrv-card, dlt-card

The command handling and scroll area output for these commands have been updated to include the EMDC-DCM card. For the **ent-card** command, the **appl=emdc** is supported.

chg-gpl/act-gpl/rtrv-gpl/rept-stat-gpl/copy-gpl

The command handling and scroll area output for these commands include the **BPDCM** and **EMDC** GPLs.

ent-bp/dlt-bp/disp-bp/disp-mem/set-mem

The command handling and scroll area output for these commands has been updated to include the EMDC-DCM.

Limitations

The following limitations apply to the initial release of the GR-376 Support feature:

1. Explicit retrieval of current data objects is not supported.
2. NDC data recovery is provided only when at least one EMAP originally received the data from an EMDC DCM card. No provision is made in the initial release to recover lost data spanning multiple periods.
3. Other than reference data, no GR-495-specified data storage objects are supported for this release.
4. No notifications are supported in the initial release.

General Purpose Service Module-II (GPSM-II) for MCAP Slot (Release 28.0)

The Enhanced MCAP, otherwise known as the GPSM-II (General Purpose Service Module, P / N 850-0622-01) for MCAP Slot, is designed to provide better OAM task performance.

Future applications and table expansions will require increased performance across the IMT bus interface, both to and from the Maintenance and Administration Subsystem (MAS). To help meet this need, the GPSM-II card incorporates a DCM design for the OAM functionality on the Eagle.

GPSM-II is required for supporting the Eagle Support for Integrated Sentinel feature via the Time Slot Counter (TSC) Synchronization feature.

Refer to the *NSD Hardware Manual* for the current hardware description.

New Hardware Required

The GPSM-II feature requires the new GPSM-II (OAM) card described above (“*The Enhanced MCAP, otherwise known as the GPSM-II (General Purpose Service Module, P/N 850-0622-01) for MCAP Slot, is designed to provide better OAM task performance.*” on page 3-31); no additional hardware is required.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

The TSC Synchronization feature requires the new GPSM-II Eagle® hardware equipped with the new TSC Synchronization hardware to support it. Time Slot Synchronization is an existing option for the Eagle that allows all cards in the system containing a Time Slot Counter to synchronize with each another. The ability to have synchronized timing between cards is useful in applications such as system-wide message time stamping.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the GPSM-II feature. For current information on these commands, see the *Commands Manual*.

chg-feat

The **chg-feat** command has been enhanced by the parameter **tscsync={on, off}** to support enabling of the new TSC synchronization feature. This feature bit is required to maintain backward compatibility with the MCAP-256 OAM card.

rtrv-feat

The **rtrv-feat** command has been enhanced to display the status of the TSC Synchronization feature.

init-flash/alw-flash

The **init-flash**, and **alw-flash** commands have been modified to allow specification of the standby OAM as a location. No new parameters or other modifications are required.

inh-card/alw-card

These commands have been enhanced to allow specification of the standby OAM as a location, if that card's type is GPSM-II. The range values for the **loc** parameter have been modified for standby OAP (1113 and 1115).

rtrv-card

The output of the **rtrv-card** command has been enhanced to display the EOAM.

rept-stat-card

The **rept-stat-card** command has been enhanced to display GPSM for the OAM card type when running on GPSM-II hardware, and MCAP when running on 586 MCAP hardware.

rept-stat-clk

This command displays the clock status summary for cards in the EAGLE system. The output of this command has been enhanced to display the status of the TSC clock.

act-flash/init-flash

These commands have been enhanced to allow specification of the standby OAP as a location, if that card's type is GPSM-II. The range values for the **loc** parameter have been modified for standby OAM (1113 and 1115).

chg-/act-/rept-stat-/rtrv-/copy-gpl

These commands have been modified to allow specification of the EOAM GPL. A new range value, **eoam**, has been added to the **appl** parameter for these commands.

The output of the **rept-stat-gpl** command has been enhanced to display the EOAM status, when the EOAM GPL is specified.

Upgrade Considerations

The GPSM-II feature allows the existing OAM functionality to operate on a GPSM card or MCAP card. In addition, the Eagle will also support inserting an MCAP or GPSM card in the control shelf as an OAM card, even if the OAM card that is already inserted does not match the OAM card that is being inserted. This functionality is needed to support upgrade where the hardware is in transition. It is assumed that an Eagle with an MCAP and a GPSM in OAM card slots 1113 and 1115 is a transitional state.

Consequently, software modification of the one-command upgrade function is necessary to support some requirements. Upgrade command support for the inhibiting of the standby OAM and upgrade of the board Flash memory is required.

Group Ticket Voucher (Release 23.0)

This feature is used to control the traffic from the high-speed ATM signaling links to the ASM-SCCP cards and ACMs. The ASM-SCCP cards are used to process messages requiring global title translation. The ACMs are used by the STPLAN feature to send messages selected by the gateway screening feature to a remote host for further processing. The message rate from a single high-speed ATM signaling link can exceed the capacity of a single ASM-SCCP card or a single ACM, so the message traffic is split between multiple ASM-SCCP cards or ACMs.

To determine which card can process the message, each type of message is assigned a group number by the system software.

- SNM messages - group 1
- STPLAN messages - group 2
- SCCP messages - group 3

NOTE: Only SCCP messages containing a destination point code that is the Eagle's true point code or one of its capability point codes are affected by this feature.

Each card of each card type is assigned a member number by the system software when the card is entered into the database with the **ent-card** command. This number is not configurable by the user and cannot be displayed with the **rtrv-card** command. This number is used only internally by the software to identify the cards to the group ticket voucher feature. The member number can range from 0 to 31. The number assigned to the card is the smallest number in the range from 0 to 31 that is not already in use. The STPLAN and SCCP member numbers are assigned independently of each other. The system software does not check the number of ASM-SCCP cards entered into the database, but the system software supports a maximum of 25 ASM-SCCP cards, and a maximum of 30 ACMs. If more than 25 ASM-SCCP cards or 30 ACMs are entered into the database, the member number of the newly entered card is set to 31.

When a signaling link receives an SCCP message or wants to send an STPLAN message to a remote host, it sends a request on the IMT bus to find either an ASM-SCCP card or an ACM (depending on the type of message) that has capacity to handle the message. When a card is found that can handle the message, that card answers the request, informs the requesting signaling link that it can handle the message, and sends in its answer the card's group number and member number. When the requesting signaling link receives the answer, it translates the card's group number and member number into the card's IMT address, then sends the SCCP message or STPLAN message to that IMT address. The request to find the ASM-SCCP card or ACM is referred to as a voucher. The answer to the request is referred to as a ticket. The card that is able to handle the message is referred to as the granter.

Sequenced GTT class 1 traffic on the high-speed ATM signaling links is discarded. The current method for ensuring sequencing in the Eagle is to use only one ASM-SCCP card at a time for any one signaling link's stream of sequenced traffic. This imposes a limit on the rate of traffic from any one stream, the speed of an ASM-SCCP card, 850 messages per second. Since the message rate of a high-speed ATM signaling links far exceeds 850, an ASM-SCCP card cannot handle sequenced traffic from a high-speed ATM signaling link.

Figure 3-2 shows an example of the operation of the group ticket voucher on the IMT bus. This example is for an SCCP message. The action would be the same for an STPLAN message, but the group number would be different.

1. The ASM-SCCP cards periodically refresh the hardware grant counters (one for each bus) dynamically based on their individual available capacities.
2. When a high-speed ATM signaling link receives an SCCP message, the high-speed ATM signaling link sends a TVG (group ticket voucher) request containing the SCCP message group number (group number 3) to find an ASM-SCCP card that can handle the SCCP message.
3. The request is sent around the IMT bus until it finds an ASM-SCCP card that can handle the message. In this example, members 0 and 1 have no capacity, but member 2 does. Member 2 changes the TVG (group ticket voucher) request, a voucher packet, to a ticket packet, changes the group number of the packet to the ASM-SCCP card's member number, member 2, and decrements the card's grant counters for each IMT bus. When member 2's grant counter reaches zero, that ASM-SCCP card has no more capacity for handling messages and the next available member with capacity begins granting tickets.
4. The ticket packet returns to the high-speed ATM signaling link requesting the service. The high-speed ATM signaling link translates member 2's group number to the card's IMT address and sends the SCCP message to that card.

Figure 3-2. Group Ticket Voucher Example

Command Changes

The following commands have been changed to show the group ticket voucher performance information. Refer to the *Commands Manual* for current usage information.

rept-stat-sccp

The **mode=perf** parameter has been added to the **rept-stat-sccp** command to display the performance of the group ticket voucher feature with the global title translation feature.

rept-stat-card

The group ticket voucher status for low-speed signaling links, high-speed ATM signaling links, and ASMs has been added to the **rept-stat-card** reports when the **mode=full** and **loc** parameters are specified. The status displayed is for the previous 5 minutes and the previous 24 hours.

rept-stat-slan

The **mode=perf** parameter has been added to the **rept-stat-slan** command to display the performance of the group ticket voucher feature with the STPLAN feature.

Alarms

These existing alarms are used to support the group ticket voucher feature:

- UAM 336 - LIM(s) have been denied SCCP service - a major alarm
- UAM 152 - LIM(s) have been denied STPLAN service - a major alarm
- UAM 300 - Active OAM Grant Failure - a minor alarm

UAM 336 - LIM(s) have been denied SCCP service

```
RLGHNCXA21W 98-02-04 11:02:30 EST Rel 23.0.0
** 0100.0336 ** SCCP SYSTEM LIM(s) have been denied SCCP service
```

This alarm is used for the high-speed ATM signaling links that are denied SCCP service, in addition to the current use with low-speed signaling links being denied SCCP service by the load balancing function of the Eagle. This alarm is generated for the high-speed ATM signaling links under these conditions:

- When the queue of SCCP messages waiting for a group ticket voucher grant on a high-speed ATM signaling link contains 970 messages and a new message arrives. The oldest message in the queue is discarded and UAM 336 is generated.
- When the message at the front of the group ticket voucher SCCP queue is more than 2 seconds old, it is discarded and UAM 336 is generated. The message age is checked once per second.

The alarm is cleared five seconds after the last discard in either of these two situations.

UAM 152 - LIM(s) have been denied STPLAN service

```
RLGHNCXA21W 98-02-04 11:02:30 EST Rel 23.0.0
** 0100.0152 ** SLAN SYSTEM LIM(s) have been denied STPLAN service
```

This alarm is used for the high-speed ATM signaling links that are denied STPLAN service, in addition to the current use with low-speed signaling links being denied STPLAN service by the load balancing function of the Eagle. This alarm is generated for the high-speed ATM signaling links under these conditions.

- When the queue of STPLAN messages waiting for a group ticket voucher grant on a high-speed ATM signaling link contains 1024 messages and a new message arrives. The oldest message in the queue is discarded and UAM 152 is generated.
- When the message at the front of the group ticket voucher STPLAN queue is more than 2 seconds old. It is discarded and UAM 336 is generated. The message age is checked once per second.

The alarm is cleared five seconds after the last discard in either of these two situations.

UAM 300 - Active OAM Grant Failure

```
RLGHNCXA21W 98-02-04 11:02:30 EST Rel 23.0.0
* 0100.0300 * SYSTEM Active OAM failed grant
```

UAM 300 is generated by a requester if the SNM granter fails. A group ticket voucher granter failure is defined as a group ticket voucher request which completes under one of these conditions:

- When a hardware or software time out has occurred
- When the granter present bit is not set
- When the nonrequested ticket voucher bit is set. A nonrequested ticket voucher is a voucher that has been delivered to a card that did not request a voucher.

This alarm is generated by a requester if the requester experiences a granter failure more than once (perhaps intermittently) within a fifteen second period, or if the mechanism fails continuously for 60 seconds.

Measurements

MSULOST3

The MSULOST3 measurement is currently used to count the number of MSUs discarded when a card does not have an SCCP assignment or when the linkset-on-hold buffer is full. In Release 23.0, this measurement also counts the number of SCCP MSUs that are discarded by the group ticket voucher feature on the high-speed ATM signaling links. The SCCP MSUs are discarded under these conditions:

- All Class 1 (sequenced) SCCP traffic sent to the Eagle.

- A Class 0 SCCP message for Eagle arrives when the SCCP group ticket voucher queue is full.
- A SCCP message in the SCCP group ticket voucher queue is more than 2 seconds old.

The MSULOST3 measurement is displayed in these measurement reports:

SYSTOT-STP - STP system total measurement report

MTCD-STP - STP daily maintenance measurement report

MTCDTH-STP - STP day-to-hour maintenance measurement report

NM-STP - STP network management measurement report

SLANDISC1

The SLANDISC1 measurement is currently used to count the number of MSUs that have not been copied to a remote host because the STPLAN feature is disabled. In Release 23.0, this measurement also counts the number of STPLAN MSUs discarded by the group ticket voucher feature on the high-speed ATM signaling links. The STPLAN MSUs are discarded under these conditions:

- An STPLAN MSU arrives when the STPLAN group ticket voucher queue is full.
- An STPLAN MSU in the STPLAN group ticket voucher queue is more than 2 seconds old.

The SLANDISC1 measurement is displayed in these measurement reports:

SYSTOT-STPLAN - STPLAN system total measurement report

MTCD-STPLAN - STPLAN daily maintenance measurement report

MTCDTH-STPLAN - STPLAN day-to-hour maintenance measurement report

AVL-STPLAN - STPLAN availability measurement report

Group Ticket Voucher for SCCP Cards (Release 27.0)

Group Ticket Voucher replaces SCCP Load Balancing as a method of providing SCCP service to LIM cards.

In the current Eagle implementation, an Eagle Low Speed LIM (LSL) card is assigned to one SCCP card based on the 16:1 LIM - SCCP Engineering rule via load balancing (LB). The LSL-SCCP assignment may change from time to time, but the engineering rules are maintained at all times. This poses a problem to customers, forcing them to purchase unnecessary hardware (SCCP) so they can meet the engineering rules for LB. The Group Ticket Voucher (TVG) solution currently implemented with HSL/SCCP and HSL/SLAN card assignments alleviates this problem.

The Release 27.0 TVG solution is an extension of the Ticket/Voucher solution to the SNM multicast problem. The Ticket/Voucher concept uses an IMT hardware-based request/grant scheme to provide a flow control solution, which allocates message capacity at hardware speeds. Each grant allows a single message to be sent to the granter. The "group" concept is added to provide for multiple groups of granters, each supporting one particular message type.

Each granter has a group ID that is based on the message type it supports, and will only grant capacity to TVG requests which match its group number. Since the TVG mechanism is designed to provide a one-to-many assignment, there will typically be more than one granter for a group. SNM, by its nature, is the only message type, which will have a single granter (OAM).

Each message type supported by TVG will be assigned to a particular group. A card requesting capacity from a particular group will build a TVG request, and set the group number in the request based on the message type. The group numbers are defined as follows:

- SNM group 1
- SLAN group 2
- SCCP(GTT) group 3
- REROUTE group 31

In addition to the group number, each granter is assigned a member number, which identifies the granter. The member number is unique within a group, but may be repeated within other groups in the Eagle. When a granter card grants capacity, it changes the voucher packet into a ticket. It also changes the group number in the packet to its member number. When the TVG request returns to the requester as a ticket, the requester uses the member number along with the group number it saved to look up the IMT address of the granter. The IMT address provides the assignment, which allows the requester to forward the message to the granter.

Changed Commands

The following commands have been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

ent-card

Due to the removal of LB (16:1 / 2:1 rules) from the Eagle, the purpose of the **force=yes** parameter for **ent-card** has changed. This parameter now is used to warn the customers that the new SS7 card may push the system TPS capacity past what the Eagle can currently handle.

rept-stat-card

Currently the **rept-stat-card** command performed on a SS7 card shows the SCCP and SLAN cards servicing that LIM. With LB no longer used, this statistic has been removed from this status report; TVG statistics have been inserted in their place.

rept-stat-sccp

The new values "System Peak TPS Load" and "System Total TPS Capacity" have been added to the REPT-STAT-SCCP report. The "System Peak TPS Load" value represents the highest TPS seen on this system. This value is maintained over a **init-card:appl=oam** event. The "System Total TPS Capacity" value is based on the number of active SCCP cards and what type (i.e. ASM/TSM, DCM, DSM) they are entered as.

rept-stat-slan

The **rept-stat-slan** command used with **mode=perf** parameter gives an expanded performance report for the SLAN subsystem. Note that all references to LB have been removed from this report .

chg-th-sccp

The TPS threshold is now user-configurable via the **chg-th-sccp** command. With this command, the user enters a threshold value. If the user attempts to use the command **ent-card** to add an SS7 card that would exceed the threshold, the command is rejected.

New UAMs/UIMs

When the system running TPS is above the threshold set by the **chg-th-sccp** command, the following major alarm is issued:

```
0330 System SCCP TPS Threshold exceeded
```

If the Eagle has exceeded its rated TPS the critical alarm, the following critical alarm is raised.

```
0437 System SCCP TPS Capacity Exceeded
```

The alarm will not abate until the TPS level is below the rated TPS for the system for a period of 30 seconds and will be cleared with the following UIM:

```
0329 System capacity normal, card(s) abnormal
```

Upgrade Considerations

LB is supported during upgrade to Release 27.0 only.

Limitations

1. Class-1 GTT traffic on will be allowed, but sequencing will not be guaranteed.
2. The number of TVG requests that can be made per card is a function of the number of cards in the system, and decreases as the number of active cards increase. It is approximately $1/(N \times 10^{-6})$ for N cards. For a system with 250 IMT addresses it is limited to about 3300 requests/second. This limitation could become a bottleneck if the number of cards on the IMT bus were increased.

GSM MAP Screening (Release 26.1)

Traditionally, STP message screening has been limited to the MTP and SCCP levels; this has been sufficient to meet operators' needs. However, GSM mobile operators have an increasing need for screening at the Mobile Application Part (MAP) level. This need is driven by advanced network capabilities and proliferating roaming agreements.

New features that require this enhanced screening capability are Inter-operator Short Message Service (SMS) and Any Time Interrogation (ATI). The GSM MAP Screening feature focuses on solving the screening needs associated with ATI, which is defined in MAP version 3. An ATI message allows an external server to interrogate an HLR and obtain information about the location and / or state of a GSM subscriber. It may be desirable to control which external entities can request this information, and what information they can request before allowing the message to pass through to the HLR.

The Eagle-based solution to this problem is designed to allow the user to provision which MAP SSNs are affected, which MAP op codes to screen, which origination points are allowed, and which error messages to use.

NOTE: This feature is only applicable for ITU implementations.

Refer to the *Database Administration Manual - Features* for current information on this feature.

Hardware Requirements

To meet optimum performance in "worst case" scenarios under heavy traffic conditions, it is recommended that GSM MAP Screening be used in conjunction with high performance SCCP hardware (DSMs). There is, however, no specific requirement restricting GSM MAP Screening to DSM hardware, since a throttling mechanism protects system integrity.

Upgrade Considerations

- New tables relating to GSM MAP Screening must be created on the upgraded disk.
- the GSM MAP Screening feature bit should be defaulted to OFF on new upgraded disks.
- The **stpopts** value of **gsmsdecerr** shall be **pass** after upgrade.
- The **stpopts** value of **gsmdflt** shall be **pass** after upgrade.

New Commands

The following new commands have been introduced to support this feature. Refer to the *Commands Manual* for current usage information.

ent-gsmssn-scrn

The **ent-gsmssn-scrn** command allows the craftsperson to provision both origination and destination SSNs to be screened using the GSM MAP Screening feature. The SSN entered with this command is added to the GSM MAP SSN Screening table. All the MAP messages with the originating or destination SSN of this value are screened using the GSM MAP Screening feature.

dlt-gsmssn-scrn

The **dlt-gsmssn-scrn** command allows the craftsperson to delete a SSN from GSM MAP SSN Screening table.

rtrv-gsmssn-scrn

The **rtrv-gsmssn-scrn** command allows the craftsperson to retrieve all or single MAP SSNs in the GSM SSN Screening table.

ent-gsms-opcode

The **ent-gsms-opcode** command allows the assignment of concerned GSM MAP Op-Codes and the default screening action for that Op-Code. This command allows the craftsperson to provision a list of all Op-Codes that the Eagle will attempt to perform GSM Screening on.

dlt-gsms-opcode

The **dlt-gsms-opcode** command allows the deletion of concerned GSM MAP Op-Codes and the default screening action for that Op-Code. This command allows the craftsperson to delete Op-Codes from a list of all Op-Codes that the Eagle will attempt to perform GSM Screening on.

chg-gsms-opcode

The **chg-gsms-opcode** command allows the changing of concerned GSM MAP Op-Code attributes (default screening action and Op-Name) for a specific Op-Code.

rtrv-gsms-opcode

The **rtrv-gsms-opcode** command allows the retrieval of concerned GSM MAP Op-Codes and the default screening action for that Op-Code. This command allows the craftsperson to verify a list of all Op-Codes or single Op-Codes that the Eagle will attempt to perform GSM Screening on.

ent-gsmmap-scrn

The **ent-gsmmap-scrn** command allows the assignment of GSM MAP Screening entries that are used to filter out or allow TCAP messages for certain MAP Op-Codes, based on origination addresses and forbidden parameters.

dlt-gsmmap-scrn

The **dlt-gsmmap-scrn** command allows the deletion of GSM MAP Screening entries that are used to filter out or allow SCCP messages containing MAP Op-Codes, origination addresses, and forbidden parameters.

chg-gsmmap-scrn

The **chg-gsmmap-scrn** command allows changing the attributes (nforbid and nact) of GSM MAP Screening entries that are used to filter out or allow SCCP messages containing MAP Op-Codes, origination addresses, **np**, **nai**, and forbidden parameters.

rtrv-gsmmap-scrn

The **rtrv-gsmmap-scrn** command allows retrieval of GSM MAP Screening entries and their respective attributes (SADDR, EADDR, OPCODE, FORBID, and ACT) from the Eagle STP active database.

Changed Commands

The following commands have been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

chg-feat

The **chg-feat** command has been enhanced to allow activation of this feature. The parameter **gsmscrn=on** has been introduced. Once the feature has been turned on, it cannot be turned off.

rtrv-feat

The **rtrv-feat** command has been enhanced to report the status of this feature; it has no parameters.

ent-ls, chg-ls, rtrv-ls

These commands have been enhanced by a new parameter, **gsmscrn**, which indicates if the MSUs arriving on the linkset should have GSM screening applied to them, if applicable.

chg-stpopts, rtrv-stpopts

These commands have been enhanced by a new parameter, **gsmdflt**, which allows the craftsperson to specify the default screening action (PASS or DISCARD) that occurs when a MAP Op-Code of the MSU is not found in the GSM MAP Op-Code table.

These commands also have been enhanced by second new parameter, **gsmdecerr**, which allows the craftsperson to specify the default screening action (PASS or DISCARD) that occurs when an error is detected in the TCAP layer of the MSU being screened. Such errors included an invalid value for a parameter, length error, missing data, and so on.

New UAMs/UIMs

The following UIM is output when an MSU arrives with a SSN and MAP Op-Code that exist in the GSM SSN and MAP Op-Code tables, but the CGPA address does not exist in the GSM MAP Screening table. Or, the CgPA address exists in the table, but with the wrong NPV / NAIV. In this case, the default action for the OPCODE will apply.

```
1248  GSM MAP Screening rcvd unknown originator
```

The following UIM is output when an MSU is screened in the GSM MAP Screening table, and the MSU is found to contain a forbidden parameter, as provisioned in the GSM MAP Screening table. The action that applies is taken from the matching entry in the GSM MAP Screening table.

```
1249  SCCP rcvd MAP Op-Code w/ forbidden param
```

The following UIM is output when an MSU passes the origination or destination SSN screening process, and then the MAP Op-Code table is searched but the Op-code of the MSU is not found in the MAP Op-code table. In this case the default action from the STPOPTS table shall apply.

```
1250  SCCP rcvd undefined MAP Op-Code
```

The following existing UIM is output when an invalid TCAP message is sent through GSM MAP Screening:

```
1182  SCCP rcvd inv TCAP portion
```

Limitations

1. Overlapping range entries cannot be provisioned.
2. There is no cross-checking between the individual entry table and the range table when numbers are provisioned. The individual table entries are exceptions to the range table. Thus, if an individual number is provisioned that is already part of a range, automatic splitting of the range entry will not occur. (This is not necessarily a limitation.)
3. Per-server measurements are not provided for range table entries, and no per-server measurement will be pegged when a match occurs in the range table.
4. This feature is applicable only for ITU implementations.
5. A given GTA may be entered in the MAP Screening table only once.

GSM MAP Screening Duplicate/Forward (Release 29.0)

The GSM MAP Message Duplicate/Forward feature extends the capabilities of GSM MAP Screening by allowing MAP messages to be routed, discarded, duplicated, or forwarded based on the provisioned screening criteria. This gives the Eagle the ability to offload or copy certain types of MAP messages to an attached processor (such as a SCP) based on the MAP Opcode and / or Calling Party Address.

For these advanced services on MAP messages, targeting messages based only on MTP level screening could lead to many messages being sent to the external platform unnecessarily, possibly impacting the performance of the STP or the external platform. In order to allow a finer granularity in message selection, a method is needed to target only specific MAP messages. Furthermore, it is desirable to achieve this using standard message structures (i.e. SS7).

Refer to the *Database Administration Manual - Features* for current information on this feature.

NOTE: It should be noted that the GSM MAP Message Duplicate/Forward feature is independent of the Eagle's STPLAN and DTA features. It operates and is provisioned in an entirely different manner than either of these existing features.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

chg-gsms-opcode

Use this command to change concerned GSM Map Op-Code attributes (default screening action and Op-Name) for a specific Op-Code. The new parameters **:npci**/**:npcn**, **:nssn**, and **:force** have been added to this command. New range values have been added to the parameter **:ndfltact**.

ent-gsms-opcode

This command allows the assignment of concerned GSM Map Op-Codes and the default screening action for that Op-Code. The new parameters **:pci**/**:pcn**, **:ssn**, and **:force** have been added to this command. New values have been added to the parameter **:dfltact**.

rtrv-gsms-opcode

This command allows the retrieval of concerned GSM Map Op-Codes and the default screening action for that Op-Code. Its output has been enhanced to display the values of the new parameters.

chg-gsmmap-scrn

This command allows changing the attributes (**nforbid** and **naction**) of GSM Map Screening entries that are used to filter out or allow SCCP messages containing Map Op-Codes, origination addresses, **np**, **nai**, and forbidden parameters. The new parameters **:npci**/**:npcn**, **:nssn**, and **:force** have been added to this command. The new values FORWARD, DUPLICATE, and DUPDISC have been added to the **:action** parameter.

ent-gsmmap-scrn

This command allows the assignment of GSM Map Screening entries that are used to filter out or allow TCAP messages for certain Map Op-Codes based on origination addresses and forbidden parameters. The new parameters **:pci**/**:pcn**, **:ssn**, and **:force** have been added to this command. The new values FORWARD, DUPLICATE, and DUPDISC have been added to the **:action** parameter.

rtrv-gsmmap-scrn

This command allows retrieval of GSM Map Screening entries and their respective attributes from the Eagle STP active database. The output of this command has been enhanced to display the values of the new parameters.

Upgrade Considerations

MAP screening tables that were built under the Release 26.1 version of MAP Screening and used the previous default value of NONE for the FORBID parameter will not have that value changed to ALL as a result of an upgrade to this version of MAP Screening. (Those original entries will still have FORBID = NONE, even though new entries after the upgrade will default to FORBID=ALL.)

Limitations

The first implementation of this feature is limited in the following ways:

1. Only works for ITU messages.
2. State and Location are the only GSM Map parameters that screening may forbid.
3. ATI Error responses are the only type of messages that may be sent as a screening rejection response.
4. We do not screen on NP and NAI on a per origination basis, but rather on a per Map Op-Code basis.
5. Measurements are taken on an existing 30-minute schedule and are not reported real-time.
6. During extremely high traffic conditions where 850 messages per second require GSM Map screening on 1 SCCP card, and other SCCP processor intensive features are also in very rare worst case conditions, GSM Map Screening may be throttled to keep SCCP processor utilization below 70%. There will be no alarm or warning when this condition occurs.

GTT by TT Measurements and GR-376 Enhancements (Release 26.0)

This section combines discussion of *two* Release 26.0 features:

- GTT by TT Measurements
- GR-376 Enhancements

The GTT by TT Measurements feature allows Eagle customers to collect measurements and generate reports of GTT activity by Translation Type (TT). GTTs-per-TT reports are available from the Eagle terminal, and via the SEAS interface and the GR-376 interface. GTTs-per-TT reports are available for all provisioned translation types.

The GTT by TT Measurements feature provides Eagle / SEAS support for the GTT-by-TT capability.

The GR-376 Enhancements feature provides the GR-376 support for GTT-by-TT.

Figure 3-3 provides a high-level diagram of the capabilities implemented by GTT by TT Measurements feature and the GR-376 Enhancements feature:

Figure 3-3. Concept Diagram

GTTs are pegged in the SCCP card for each TT and are stored on the fixed disk in 30-minutes intervals and retained for a 24-hour period. The SYSTOT report and the P_SYSTOT schedule are existing capabilities for reporting STP-wide measurement data.

The TT entity type has been expanded to report GTTs performed / not translated per TT for 256 known translation types. This feature provides the customer with information that can be used for service growth trends and potential revenue collection.

A new parameter (**:tt=x**) has been added to the **rept-meas** command to enable the user to specify a translation type to be reported. The demand report requires that a TT be specified, while scheduled reports will provide GTTs per TT for all TTs. This feature provides scheduled and demand reports of GTTs-per-TT to the Eagle UI for half-hourly measurements. Half-hourly GTTs-per-TT measurements are provided to the SEAS interface. See “*rept-meas*” on page 3-51 for more information on changes to the **rept-meas** command.

Table 3-2 specifies the Eagle interpretation of SYSTOT-TT registers that are reported per TT by the GTT by TT Measurements feature and the GR-376 Enhancements feature.

Table 3-2. SYSTOT-TT Register Definition

Register	Description	Eagle Interpretation
GTTPERFD	GTTs Performed	The total number of MSUs that successfully completed global title translation
GTTUN0NS	GTTs Unable to Perform – Diagnostic 0: No Translation for Address of Such Nature	Total number of times that the specified translation type in an MSU was not supported by the STP or the form of the GTT was incorrect for the given translation type.
GTTUTTNTF	GTTs Unable to Perform – TT not found	Not supported
GTTUINVF	GTTs Unable to Perform – Invalid GT format	Not supported
GTTUN1NT	GTTs Unable to Perform – Diagnostic 1: No Translation for This Address	The number of times that a match for the global title could not be found in the translation table.
GTTUGTAR	GTTs Unable to Perform – Incorrect GTA Reference	Not supported
GTTUDPCR	GTTs Unable to Perform – Incorrect Ordered DPC Reference	Not supported
GTTUNABL	GTTs Unable to Perform – All Diagnostics	Not supported

Upgrade Considerations

During upgrade, measurement collection is inhibited (except for GR-376) and any measurement data collected prior to the upgrade is lost. This is the historical method of handling measurement tables during upgrade. No change in this processing is anticipated for this feature or release. In addition, all obsolete measurement tables are removed from the fixed disk by the upgrade process.

Implementation of the GTT by TT measurements feature in the Eagle includes the creation of a new table to store the 30-minute GTTs per TT measurement data. The new table (M30_TT.MEA) resides on the fixed disk and on the measurements removable. The measurement data captured in the table currently requires 16 bytes of storage per entry. The remaining 48 bytes are reserved for future use.

During upgrade, the table will not be present on the previous revision TDM, but is created on the standby TDM during the format disk process. No additional processing is required during the upgrade for this table.

Changed Commands

This feature changes the behavior of the **rept-meas** command when issued with the "**type=systot**" and "**enttype=tt**" parameters. Prior to this feature, no other information was required in order to generate the requested report. With the implementation of this feature, the user must specify a particular translation type using the new "**tt=xxx**" parameter. The subsequent report provides peg counts for the specified TT only. A summary of GTT pegs for all translation types may be obtained via the SYSTOT-STP report.

Refer to the *Commands Manual* for current usage information.

rept-meas

The **rept-meas** command currently supports the parameters **type=systot** and **enttype=tt**. This feature expands the reporting capabilities of the SYSTOT report by allowing the user to specify a TT to be reported.

GTT Error Reporting Enhancements (Release 21.0)

The UIM message formats for global title translation (GTT) error messages have been updated to include more useful information for diagnosing problems in the network. The affected messages include:

- SCCP UDT
- SCCP Message
- SCCP Class
- SCCP CDPA
- SCCP Routing
- SCMG - SCCP Management

GTT Table Increase (Release 29.0)

This feature increases the number of Global Title Table entries. The Eagle GTT capacity can be increased from 270,000 to a maximum of 400,000 Global Title Table entries on TSMs (or a combination of TSMs and DSMs), and from 270,000 to a maximum of 1,000,000 Global Title Table entries on DSMs. The GTT Table Increase Feature is also referred to as the XGTT Feature (Expanded GTT).

XGTT is a controlled feature associated with quantity. XGTT must be initialized to default quantity level 270,000 GTT table entries. One of two Part Numbers is required to enable XGTT. If the system meets minimum hardware requirements, the XGTT feature can be enabled at different quantity levels. One Part Number increases the GTT table size from 270,000 entries to 400,000 entries (893-0061-01); the other increases the GTT table size from 270,000 or 400,000 entries to 1,000,000 entries (893-0061-10).

Hardware Requirements

All existing SCCP ASM cards must be replaced with SCCP TSM or better (DSM) equipment when activating XGTT. The 400,000 feature key allows TSMs and /or DSMs; the 1,000,000 GTT feature key allows DSMs only.

All existing SCCP ASM cards must be replaced with SCCP TSM or better (DSM) equipment when activating XMAP.

NOTE: The Eagle will not allow the feature access key to be activated unless the required SCCP hardware is present in the system.

Also, the Eagle does not allow the feature access key to be activated unless both the active and standby OAM is a GPSM-II.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

The Eagle will auto-inhibit an SCCP card that does not meet the hardware requirements for the respective GTT Table size. This requirement is only applicable after at least one of the two feature access keys is enabled.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the GTT Table Increase feature.

ent-gtt/gta

The existing GTT commands are not changed for administration of the XGTT feature. However, the execution of this command is updated to reflect the maximum number of GTTs/GTAs allowed, depending on whether XGTT has been enabled for 400,000 or 1,000,000 GTT entries.

rtrv/vfy-gtt/gta

This command displays a list of global title address information applicable to the specified GTT set. For this feature, the data display for the XGTT feature is updated for the percentage full and number of entries out of the maximum possible. The values are dependent on whether the XGTT feature has been enabled for 400,000 or 1,000,000 GTT entries.

GTT UIM 21 Digit Length Enhancement (Release 29.0)

This enhancement increases the length of GTT UIMs from 10 digits to 21 digits, providing more space for the SCCP called or calling party address to be displayed.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

No command enhancements are required to support this feature.

GWS Error Reporting Enhancement (Release 21.0)

The UIM message format for gateway screening messages is expanded to provide the user with more information. UIMs resulting from gateway screening failures include:

- Link Set Name
- Originating Point Code (OPC)
- Destination Point Code (DPC)
- Service Information Octet (SIO)
- Gateway Screening Reference

The following rules apply to the SIO information:

Table 3-3. SIO Information

SIO	SSN	Additional Information Included in UIM
0,1,2	N / A	The H0 and H1 heading codes, and the concerned point code
3	1	The SCCP management (SCMG) message type, message length, multiplicity, concerned point code (CPC) and subsystem
3	1	The message type, called party address (CDPA) and all sub-fields, calling party address (CGPA) and all sub-fields
> 3	N / A	The first 24 bytes of the MTP user data (the data following the SLS)

High Speed Master Timing (Release 26.0)

NOTE: This feature has not been tested in the customer environment as of yet.

Overview

The High-Speed (HS) Master Timing feature offers a new mode of operation that allows a high-speed capable (T1 or E1 rate) Link Interface Module (LIM) installed in an Eagle STP to receive its transit timing reference directly from an external high-speed master clock source, instead of slaving to the timing information contained in the received data. The timing information is encoded into the T1 or E1 transmitted data stream to synchronize downstream equipment.

NOTE: The Eagle terminal output screens refer to the composite clocks as Building Integrated Timing Source (BITS) clocks. In this document references to BITS and composite clocks are used interchangeably.

The HS master clock signals are encoded with the data stream originated or received by the Eagle STP, thus assuring synchronized data transmission. The HS Master Timing feature is integrated into the programmable logic contents on the Terminal Disk Module (TDM) card and the PROM of the MAS communications application processor (MCAP) card. The HS Master Timing feature requires updating these cards and the redundant TDM / MCAP card pair to specified release levels. Since a TDM / MCAP card pair makes up the Maintenance and Administration Subsystem Processor (MASP), this card pair is also referred to as MASP in this manual.

The composite clock cables connect the site's composite (BITS) clocks with the Eagle STP control shelf. Implementation of the HS Master Timing feature requires the replacement of both composite clock cables with two new HS master clock cables (RS422 compatible) on control shelf backplane (P / N 850-0330-05 / 06 and later). Figure 3-4 illustrates HS master and composite clock cabling with control shelf backplane (P / N 850-0330-05 / 06 or later).

Implementation of the HS Master Timing feature requires the addition of two HS master clock cables on control shelf backplane (P / N 850-0330-03 / 04). Figure 3-5 illustrates the HS master timing concept for control shelves with backplane (P / N 850-0330-03 / 04).

Only ATM LIM cards or E1 LIM cards can be configured or reconfigured for the HS Master Timing feature. Once the baseline hardware requirements for the HS Master Timing feature have been met:

- physically install an ATM card, add the card to the system database, and enable it for the HS Master Timing feature (ent-slk:atmtsel=external); or
- physically install an E1 LIM card, add the card to the system database, and enable it for the HS Master Timing feature (ent-e1:e1tsel=internal).

Reconfigure any existing ATM LIM card or E1 LIM cards to use the HS Master Timing feature. LIM cards that will continue using the composite clock will not require any changes to the card provisioning.

Figure 3-4. HS Master Timing Concept Control Shelf Backplane
(P / N 850-0330-05 / 06 or later)

Figure 3-5. HS Master Timing Concept using Control Shelf Backplane
(P / N 850-0330-03 / 04)

Feature Concept

Digital networks require accurate timing sources to maintain the integrity of data transmission. Utilizing high-speed clocking provides improved data synchronization capabilities.

Master Clock

The master clock is the source of timing signals and uses these signals for network synchronization. For the HS Master Timing feature, the site's master clock can be a T1 (1.544 MHz) or E1 (2.048 MHz) rate clock source on RS422 compatible cable.

System Clocks

The Eagle STP system clock is derived from the site's master clock source, which is often the site's holdover clock. The Eagle STP typically connects to the site's composite clocks signals, a primary and secondary clock signal for redundancy. The Eagle STP's internal composite clock distributes the signals to all cards at a combined rate of 56 KHz and 8 KHz.

By enabling the HS Master Timing feature on high-speed capable ATM LIM cards or E1 LIM cards, the cards can take their high-speed clock reference directly from the external HS master clock source, such as the master clock source available at the site.

The external HS clock source provides the Eagle STP with a second system clock. The Eagle STP can now connect to

- two 64 KHz composite clocks (primary and secondary clocks) and
- two T1 (1.544 MHz) or E1 (2.048 MHz) rate clock sources (primary and secondary clocks).

With both system clocks, the Eagle STP will distribute the HS clock signals with the composite clock signals. The Eagle STP distributes the clock signals to each frame. All shelves, both extension shelves and control shelves, provide *clock in* and *clock out* connections.

The Eagle STP connects to its primary and secondary system clocks through connectors on the backplane of the control shelf. The backplane connectors are labeled *Primary BITS* and *Secondary BITS*. Both primary and secondary clock signals are sent to each TDM card. The TDM cards select between the primary and secondary signals to provide system clocks (A clocks and B clocks) to the rest of the Eagle. ATM LIM cards use a T1 HS master clock source, E1 LIM cards use a E1 HS master clock source, and DS0A LIMs use the internal composite clock sources. Each ATM or E1 LIM card selects between the HS master A or B clock source. Each DS0A LIM selects between the A or B composite clock source. Figure 3-6 shows system clock use by LIM cards.

NOTE: An STP can be configured for either a T1 (1.544 MHz) or E1 (2.048 MHz) HS master clock source, but not both.

Figure 3-6. System Clocks

TDM Card

Eagle operation is controlled by Maintenance and Administration Subsystem (MAS) cards. MAS cards consist of two MAS communications application processor (MCAP) cards, two Terminal Disk Module (TDM) cards, and one Maintenance Disk and Alarm (MDAL) card. The TDM card contains the fixed disk drive, the terminal processor for 16 serial I/O ports, and an interface to the MDAL card. The MDAL card contains the removable cartridge drive and alarm logic. Prior to the implementation of the HS Master Timing feature, the TDM card directly supported all of the Eagle timing functions by distributing composite clock signals to the system.

Internal Clock Defaults

The TDM card generates an internal composite clock when no external composite clock is present on the primary or secondary inputs. If no T1 or E1 high speed clock, is provided, the high-speed system clocks to the LIM cards become inactive.

The TDM card can independently select between primary and secondary master clock and primary and secondary composite clock, and switches automatically when the active clock fails.

Table 3-4 lists the various clocking modes resulting from the clock inputs received by the TDM card and the resulting clock output to the LIM card.

Table 3-4. TDM Clocking

Inputs to TDM	System Output Clocks to LIM
Master Clock A Available Master Clock B Available	Software selects source for master clock.
Master Clock A Available Master Clock B Unavailable	Hardware selects A clock as master clock regardless of software.
Master Clock A Unavailable Master Clock B Available	Hardware selects B clock as master clock regardless of software.
Master Clock A Unavailable Master Clock B Unavailable	Master clock becomes inactive.
Composite Clock A Available Composite Clock B Available	Software selects source for Tekelec composite clock.
Composite Clock A Available Composite Clock B Unavailable	Hardware selects A clock as Tekelec composite clock regardless of software.
Composite Clock A Unavailable Composite Clock B Available	Hardware selects B clock as Tekelec composite clock regardless of software.

Table 3-4. TDM Clocking

Inputs to TDM	System Output Clocks to LIM
Composite Clock A Unavailable Composite Clock B Unavailable	Software selects internal for Tekelec composite clock. (Tekelec composite clock becomes inactive until software selection is completed.)
Note: "Unavailable" means the clock is invalid or not present.	

For a timing source, ATM LIM cards or E1 LIM cards use the system clock required by their card type and the Generic Program Load (GPL) installed on the card. For detailed information on configuring ATM or E1 cards, refer to the *Database Administration Manual - SS7* of your current documentation suite.

MCAP Card

To support the HS Master Timing feature, a new Programmable Read-Only Memory (PROM) is required for the MCAP card (containing a new Clock LCA bit file in the IMT quadrant of the PROM), new interprocessor message transport (IMT) GPL for LIM cards (SS7ANSI, CCS7ITU, SS7GX25, STPLAN, GLS, SCCP), BPHCAP GPL for High Capacity Application Processor (HCAP) (ATMANSI) cards, BPDCM GPL for DCM cards, and a new OAM GPL.

Administration

The HS Master Timing feature allows a high-speed capable (T1 or E1 rate) Link Interface Module (LIM) installed in an Eagle STP to receive its transit timing reference directly from an external high-speed master clock source, instead of slaving to the timing information contained in the received data. The high-speed master timing feature is enabled through the provisioning of at least one high speed link (ATM or E1 LIM card). At that time, the GPL required for the feature is downloaded from the MCAP card to the TDM card. For provisioning high speed links, the following commands have been changed to support master timing:

- `rept-stat-card:mode=full`
- `rept-stat-clk`
- `ent-slk`
- `rtrv-slk`
- `ent-e1`
- `chg-e1`

Refer to the *Commands Manual* for current usage information.

ent-slk

The **ent-slk** command adds a low-speed or high-speed signaling link to a linkset in the database.

For high speed links, the **ATMTSEL** (ATM Timing Selector) parameter has a new value **external** that selects master timing as timing reference.

rept-stat-card:mode=full:loc=xxxx

The **rept-stat-card:mode=full:loc=xxxx** command displays card status, including clock status for the specified card location. For this feature, high speed clock status has been added for ATMANSI card types only. The data content of the high speed clock fields are determined in the same manner as their non-high speed clock counterparts.

rept-stat-clk

The **rept-stat-clk** command displays the clock status summary for cards in the Eagle system. Fields have been added to report on the status of high speed clocks and are shown in the following output example. The data content of the high speed clock fields are determined in the same manner as their non-high speed clock counterparts.

rtrv-slk

The **rtrv-slk** command show the parameters for low-speed and/or high-speed ATM signaling links.

The **ATMTSEL** parameter has a new value of **external**, which is displayed in the **TSEL** column if the high speed clock has been selected as the timing reference for this high speed link.

rept-stat-trbl

The **rept-stat-trbl** command has not been altered by the introduction of this feature; however, high speed clock troubles may now appear in the **rept-stat-trbl** command output.

Maintenance**Unsolicited Alarm Messages (UAM)**

The system sends unsolicited alarm messages to the system terminal whenever there is a trouble condition.

Clock System UAMs

The message reference numbers and their trouble text are shown below:

```
0183 * 1116-PHS, 1116-SHS clocks failed
0184 * 1114-PHS, 1114-SHS clocks failed
```

```

0185 * 1114-SHS, 1116-PHS, 1116-SHS clocks failed
0186 * 1114-PHS, 1116-PHS clocks failed
0187 * 1114-PHS, 1116-PHS, 1116-SHS clocks failed
0188 * 1114-PHS, 1114-SHS clocks failed
0189 * 1114-PHS, 1114-SHS, 1116-SHS clocks failed
0190 * 1114-PHS, 1114-SHS, 1116-PHS clocks failed
0191 * 1116-SHS clock failed
0192 * 1116-PHS clock failed
0193 * 1114-SHS clock failed
0194 * 1114-SHS, 1116-PHS clocks failed
0195 * 1114-PHS clock failed
0196 * 1114-PHS, 1116-SHS clocks failed

```

Legend: minor (*), major (**), critical (C*), and inhibited (I) alarms.

BITS Clock UAMs

The message reference numbers and their trouble text are shown below:

```

0145 * High Speed Clock A for card failed, clock B normal
0146 * High Speed Clock B for card failed, clock A normal
0147 * High Speed Clocks A and B for card failed
0148 * High Speed Clock A for card normal
0149 * High Speed Clock B for card normal
0159 * Clocks A and B for card normal

```

Legend: minor (*), major (**), critical (C*), and inhibited (I) alarms.

For more information about trouble messages and troubleshooting procedures, refer to the *Eagle STP Maintenance Manual*.

Alarms

The system sends unsolicited alarm messages to the system terminal whenever there is a system fault. Each message has a trouble code and text associated with the trouble condition. The message reference numbers and their trouble text are shown in the following list.

Clock Alarms

The following clock alarms have been added for the HS Master Timing feature:

```

183 * 1116-shs clock failed
184 * 1116-phs clock failed
185 ** 1116-phs, 1116-shs clocks failed
186 * 1114-shs clock failed
187 ** 1114-shs, 1116-shs clocks failed

```

```

188 * 1114-shs, 1116-phs clocks failed
189 ** 1114-shs, 1116-phs, 1116-shs clocks failed
190 * 1114-phs clock failed
191 * 1114-phs, 1116-shs clocks failed
192 ** 1114-phs, 1116-phs clocks failed
193 ** 1114-phs, 1116-phs, 1116-shs clocks failed
194 ** 1114-phs, 1114-shs clocks failed
195 ** 1114-phs, 1114-shs, 1116-shs clocks failed
196 ** 1114-phs, 1114-shs, 1116-phs clocks failed

```

Legend: minor (*), major (**), critical (C*), and inhibited (I) alarms.

Card Alarms

The following card alarms have been added for the HS Master Timing feature:

```

145 * High Speed Clock A for card failed
146 * High Speed Clock B for card failed
147 * High Speed Clocks A and B for card failed
148   High Speed Clock A for card normal
149   High Speed Clock B for card normal
159   High Speed Clocks A and B for card normal

```

Legend: minor (*), major (**), critical (C*), and inhibited (I) alarms.

High-Speed Multiplexer (HMUX) (Release 27.2)

The High-Speed Multiplexer (HMUX) supports the EAGLE Large System feature, which expands the number of links supported by the EAGLE STP. The HMUX enhances the IMT bus by introducing a new 1Gb/sec inter-shelf bus bandwidth. The intra-shelf bus data rate will remain the same at 125Mb/sec.

The HMUX feature also enhances IMT performance by transmitting data between shelves only when it is necessary. Traffic between EAGLE cards on the same shelf will be allowed to remain on the shelf IMT, and will not be required to transmit between shelves. Traffic between shelves will not be required to pass onto an intra-shelf IMT bus if it is not necessary.

Introduction of the HMUX transforms each EAGLE IMT bus from a single ring topology running at 125Mbps, to a central primary ring operating at 1Gb/sec, with a maximum of sixteen secondary rings running at 125Mbps. Refer to Figure 3-7 on page 63.

Figure 3-7. HMUX Ring Topology**New/Changed Commands**

Refer to the *Commands Manual* for current usage information.

init-mux

The **init-mux** command allows an entire HMUX BUS (A / B) or a single HMUX card to be reset at one time, after all HMUX cards for a given bus have had a trial FLASH image downloaded to their respective Inactive partitions. This minimizes the amount of time an HMUX bus is down.

chg-stpopts

The new parameters were added to the **chg-stpopts** command to support this feature.

rtrv-stpopts

The **rtrv-stpopts** command has been enhanced to display the state of the new command options for the **chg-stpopts** command.

act-flash, init-flash

The **act-flash** command activates the trial FLASH GPL that is currently running on the target card. The **init-flash** command loads board prom software to a specified card's inactive FLASH memory, and requests the hardware to use the inactive load the next time the card boots. The **:loc** parameter for these two commands has been enhanced to allow the following values: 1109, 1110, 2309, 2310, . . . , xy09, xy10, where x=frame, y=shelf.

rept-imt-info

This command has been enhanced to display HMUX-related statistics.

clr-imt-stats

This command clears the statistics for the specified IMT address(es).

rept-stat-card

The **:loc** parameter of this command has been extended to include additional card locations.

rept-stat-gpl

This command displays the version number for GPLs that are currently executing on cards. It also displays the approved and trial version numbers of the GPLs each card would run when restarted.

rept-stat-sys

This command has been enhanced to display HMUX system status.

inh-alm

The **:loc** parameter of this command has been extended to include additional card locations.

unhb-alm

This **:loc** parameter of this command has been extended to include the card locations.

Hardware Requirements

Support of this feature requires the following hardware:

Hardware	Assembly Part Number
HMUX	870-1965-01 or later
TDM	870-0774-10 or later
Control Shelf <i>and</i>	870-2321-01 or later
Adapter cable	830-0857-01

MCAP-256 w/ special PROM
with FPGA logic files for new
ECAM CLOCK LCA

870-1307-07

Upgrade Considerations

The following EAGLE tables will be modified /converted /created as part of the upgrade for this feature:

- STPOPTS.TBL /BKP
- (T)BPHMUX.ELF

Holdover BITS Clock Support (Release 21.0)

The holdover BITS clock is an optional external device that provides clock input to the Eagle for a specified period of time when the BITS clock fails. The holdover BITS clock resides in the OAP frame of the Eagle. This feature adds additional outputs on the control shelf to control the holdover BITS clock. The holdover BITS clock is a Telecom Solutions Digital Clock Distributor, DCD-523. The holdover BITS clock maintains clock synchronization for 15 seconds. This meets the Bellcore requirement as specified in TR-NWT-001244. When used with the Eagle, the holdover BITS clock contains the following cards:

- 2 CI cards - clock inputs A and B
- 2 ST3E cards - clocks A and B
- 2 TOCA cards in card locations TO1 and TO2 - outputs to the Eagle

The outputs of the TOCA cards are connected to a wire wrap panel mounted on top of the holdover BITS clock. The clock inputs on the Eagle control shelf are connected to the wire wrap panel.

Idle Terminal Port Logout (Release 21.0)

The Eagle keeps track of how long a login session has remained idle. Every minute, the Eagle examines all of the login sessions currently active. Whenever a login session has been idle (idle is defined as no input from the user) for more than the maximum allowable time (provisionable on a per-port basis), the session is ended by forcing an automatic logout.

The Eagle issues a message to the scroll area of all system administrator terminals whenever a logout occurs. A slightly different message is issued when an idle time logout occurs:

```
User xxxxxxxx auto logged out (idle time exceeded) on port yy.
```

where xxxxxxxx is the user ID that was logged off and yy is the port that the user ID was using before the logoff. In addition to being issued to all system administrator terminals, this same message is sent to the scroll area of the idle terminal that is being logged out.

The idle time logout is designed so that it will not interfere with existing or planned Eagle features that might falsely or undesirably trigger the idle time logout:

- The idle time logout feature is suspended for a port while that port is in the process of transferring a file.
- SEAS ports are not affected by idle port logout. SEAS ports are unique in that no login is required in order to access the Eagle with a SEAS port, and thus there is no login session whose idle time can be monitored.

The maximum idle time value can be configured on a per-port basis; different maximum idle times can be established for each port, using the **tmout** parameter of the **chg-trm** command.

The system administrator is allowed to set a port's idle timeout value to 0. This indicates that a user ID may remain idle on the port indefinitely without being automatically logged off due to idle time expiration.

The system default value for the **tmout** parameter is 30 minutes.

The monitoring of a terminal's idle time (**tmout**) and the automatic logout function only applies to terminal types VT320 (**type=vt320**), KSR, (**type=ksr**), and SCCS (**type=sccs**). The **tmout** parameter can be specified with other terminal types, but it will have no effect.

During a Kermit file transfer, the idle time monitoring is temporarily suspended and the port's idle time is reset to 0 and does not resume until after the file transfer completes, even though there is no user input from the terminal during the file transfer operation. This prevents a terminal from being automatically logged off immediately after a file transfer completes. For example, if the value of the **tmout** parameter for a terminal is 1 minute and a file transfer is performed that takes 5 minutes. The terminal idle monitor is suspended during the file transfer and does not resume until the file transfer operation completes. Therefore, the terminal is logged off 1 minute after the file transfer completes unless there is additional user input.

The idle port logout occurs even if a port is in the process of executing a command when the idle threshold is exceeded. For example, if the **chg-pid** command is executed and the user never supplies any input to the `Enter Old Password :` prompt, when the terminal's idle time threshold is exceeded, the terminal is logged off and the command that was in progress is aborted.

IETF M3UA for “A” Link Connectivity (Release 28.1)

To connect to a variety of IP enabled SCP's, the VXi Softswitch, or other IP enabled network elements, the Eagle STP and IP⁷ Secure Gateway must use industry standard protocols. In the IETF Signaling Transport (SIGTRAN) model, SS7 MTP3-User Adaptation Layer (M3UA) is a User Adapter layer which resides on top of SCTP, necessary for connection to IP enabled network elements.

Hardware Requirements

This feature requires a SSEDCEM (Single Slot Enhanced DCEM).

Alarms and Error Codes

No new alarms or error messages have been created for this feature.

IETF M3UA Support including IETF SUA (IP⁷ Release 5.0)

Although widely accepted throughout the industry, the TALI protocol is not a standard adapter layer protocol at this time. To interoperate with various vendors, the adapter layer protocols produced by the IETF must be implemented on the Secure Gateway. The concepts defined in the IETF drafts will provide a building block for better support of fail-over scenarios that can be implemented in TALI.

The M3UA Layer is designed to fit the need for signaling protocol delivery from an SS7 Signaling Gateway (SG) to a Media Gateway Controller (MGC) or IP-resident Database. The layer is expected to meet the following criteria:

- Support for the transfer of all SS7 MTP3-User Part messages (for example, ISUP, SCCP, TUP, and so forth)
- Support for the seamless operation of MTP3-User protocol peers
- Support for the management of SCTP transport associations and traffic between a SG and one or more MGCs or IP-resident Databases
- Support for MGC or IP-resident Database process fail-over and load-sharing
- Support for the asynchronous reporting of status changes to management.

The SUA Layer is designed to fit the need for the delivery of SCCP-user messages (MAP and CAP over TCAP, RANAP, and so forth) and new third generation network protocol messages over IP between two signaling endpoints. Consideration is given for the transport from an SS7 Signaling Gateway (SG) to an IP signaling node (such as an IP-resident Database). This protocol can also support transport of SCCP-user messages between two endpoints wholly contained within an IP network.

Refer to the *Database Administration Manual Features* for current information on this feature.

New Hardware

Same as IETF SCTP.

Upgrade Considerations

Same as IETF SCTP.

Limitations

Same as IETF SCTP.

IETF Protocol Update (Release 28.1) (IP⁷ Release 6.0)

Since the introduction of the IETF Sigtran protocols in IP⁷ Secure Gateway Release 5.0, the IETF has created newer versions of these protocols. This feature updates the IP⁷ Secure Gateway and Eagle IPLIMx implementation of these protocols to the current revisions.

NOTE: This is a non-orderable feature required for the three IETF Connectivity features and the IPLIM Protocol Support Enhancement feature.

Hardware Requirements

This feature requires a SSED CM (Single Slot Enhanced DCM).

New Commands

The following commands have been created to support this feature. For current information, see the *Commands Manual*.

ent-na

Used to configure the Network Appearance table. A unique network appearance value can be associated with ANSI, ITUI or ITUN networks. When the ITUDUPPC (duplicate point code) feature is enabled, network appearance can be associated with a specific ITUN group code.

dlt-na

Used to delete configured network appearances.

rtrv-na

Used to display the configured network appearances.

chg-as

Used to change the characteristics of an AS (Application Server).

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

rtrv-as

Generates a report on the characteristics of an AS/ASP.

ent-assoc

Used to configure the SCTP Associations in the connection table. An association provides the transport for protocol data units and adapter layer peer messages. Each association is connected to a process on the far end. This command has been enhanced by three parameters: *istrms*, *ostrms*, and *ver*.

rtrv-assoc

Used to retrieve the configuration data from the IPAPSOCK table. This command has been enhanced to display the values of the new **chg-/ent-assoc** parameters.

sctp pass command

The pass-through commands are used within the **pass** command. Pass-through commands are passed through the OAM card and sent to individual cards for processing. This reduces the need to add card- and application-specific code to the OAM build.

For this feature, the output of this command has been enhanced to display Inbound/Outbound stream values.

IETF SCTP for “A” Link Connectivity (Release 28.1)

To connect to a variety of IP enabled SCP's, the VXi Softswitch, or other IP enabled network elements, the Eagle STP and IP⁷ Secure Gateway must use industry standard protocols. In the IETF Signaling Transport (SIGTRAN) model, SCTP is the transport layer for all the User Adapter layers.

SCTP is a reliable transport protocol operating on top of a connectionless packet network such as IP. It offers the following services to its users:

- acknowledged error-free non-duplicated transfer of user data,
- data fragmentation to conform to discovered path MTU size,
- sequenced delivery of user messages within multiple streams, with an option for unordered delivery of individual user messages,

- optional bundling of multiple user messages into a single SCTP packet, and
- network-level fault tolerance through supporting of multi-homing at either or both ends of an association.

The development of SCTP was necessitated by limitations within TCP. TCP has performed immense service as the primary means of reliable data transfer in IP networks. However, an increasing number of recent applications have found TCP too limiting, and have incorporated their own reliable data transfer protocol on top of UDP. The limitations which users have wished to bypass include the following:

- TCP provides both reliable data transfer and strict order-of-transmission delivery of data. Some applications need reliable transfer without sequence maintenance, while others would be satisfied with partial ordering of the data. In both of these cases the head-of-line blocking offered by TCP causes unnecessary delay.
- The stream-oriented nature of TCP is often an inconvenience. Applications must add their own record marking to delineate their messages, and must make explicit use of the push facility to ensure that a complete message is transferred in a reasonable time.
- The limited scope of TCP sockets complicates the task of providing highly available data transfer capability using multi-homed hosts.
- TCP is relatively vulnerable to denial of service attacks, such as SYN attacks.

The transport of PSTN signaling across the IP network is an application for which all of these limitations of TCP are relevant.

This feature is available on the IPGWx GPL and IPLIMx GPL in both the Eagle STP and IP⁷ Secure Gateway products in Release 28.1 of the Eagle STP, and IP⁷ Secure Gateway Release 5.0.

SCTP is a protocol designed to operate on top of a non-reliable protocol such as IP, but yet provide a reliable data delivery to the SCTP user.

Hardware Requirements

This feature requires a SSED CM (Single Slot Enhanced DCM).

Alarms and Error Codes

No new alarms or error codes have been created for this feature.

IETF SCTP Support (IP⁷ Release 5.0)

SCTP is a reliable transport protocol operating on top of a connectionless packet network such as IP. It offers the following services to its users:

- Acknowledged error-free non-duplicated transfer of user data
- Data fragmentation to conform to discovered path MTU size
- Sequenced delivery of user messages within multiple streams, with an option for out-of-order-of-arrival delivery of individual user messages
- Optional bundling of multiple user messages into a single SCTP packet
- Network-level fault tolerance through supporting of multi-homing at either or both ends of an association

The development of SCTP was necessitated by limitations within TCP. TCP has performed immense service as the primary means of reliable data transfer in IP networks. However, an increasing number of recent applications have found TCP too limiting, and have incorporated their own reliable data transfer protocol on top of UDP. The limitations which users have wished to bypass include the following:

TCP provides both reliable data transfer and strict order-of-transmission delivery of data. Some applications need reliable transfer without sequence maintenance, while others would be satisfied with partial ordering of the data. In both of these cases the head-of-line blocking offered by TCP causes unnecessary delay.

The stream-oriented nature of TCP is often an inconvenience. Applications must add their own record marking to delineate their messages, and must make explicit use of the push facility to ensure that a complete message is transferred in a reasonable time.

The limited scope of TCP sockets complicates the task of providing highly available data transfer capability using multi-homed hosts.

TCP is relatively vulnerable to denial of service attacks, such as SYN attacks.

The transport of PSTN signaling across the IP network is an application for which all of these limitations of TCP are relevant.

Refer to the *Database Administration Manual - Features* for the current implementation of this feature.

New Hardware

Hardware support is required for implementation of the IETF Adapter Layer Support feature. Starting with this feature, the new EDCM card is introduced. Refer to the *NSD Hardware Manual* for current information on this card.

These differences in memory are the main reasons for hardware support. We are required to make both socket / association provisioning and card loading decisions differently based on the card type.

Upgrade Considerations

This feature has a unique upgrade consideration than other features in that the specification for which the feature is being developed is not "frozen" until after the feature is complete. This raises the issue of incompatibility between the final specification and this feature. Since the specification is the initial version for the adapter layer, the protocol has defined the version number to be fixed to 1. Therefore, it is not possible to modify the version number from this feature perspective. Another issue is that the impact of any specification changes after this feature is completed is not necessarily impacting the compatibility of the protocol. It is expected that the approved version of revision 1 of the adapter layers is supported at some period in time and that by upgrading the software solves compatibility issues. Another solution is to use a new adapter layer index for the pre-official version of the protocol and convert and fielded releases to the new adapter layer index. The ASPLOG PASS command shows the version of the UA adapter supported. The problem with supporting a revision of a draft is a later revision may be incompatible. The drafts make no provision for support between revisions so a revision 3 of version 1 SUA can't be differentiated between revision 6 of version 1 SUA.

Limitations

The memory requirements for an association are greater than for a socket. Because of this, more associations may be provisioned on the EDCM card.

Not only are socket / association limits based on memory, so is the ratio of associations to sockets. This ratio known as the "trade ratio" defines the number of sockets, which are equivalent to one association with respect to memory consumption.

IETF SUA for "A" Link Connectivity (Release 28.1)

To connect to a variety of IP enabled SCP's, the VXi Softswitch, or other IP enabled network elements, the Eagle STP and IP⁷ Secure Gateway must use industry standard protocols. This feature implements the SCCP User Adaptation Layer (SUA). SUA is an adaptation layer protocol, similar to TALI, which transports SCCP User level protocols.

The SUA Layer was designed to fit the need for the delivery of SCCP-user messages (MAP & CAP over TCAP, RANAP, etc.) and new third generation network protocol messages over IP between two signaling endpoints. Consideration is given for the transport from an SS7 Signaling Gateway (SG) to an IP signaling node (such as an IP-resident Database). This protocol can also support transport of SCCP-user messages between two endpoints wholly contained within an IP network. The layer is expected to meet the following criteria:

- Support for transfer of SS7 SCCP-User Part messages (e.g., TCAP, RANAP, etc.).
- Support for SCCP connectionless service.
- Support for SCCP connection oriented service.
- Support for the seamless operation of SCCP-User protocol peers
- Support for the management of SCTP transport associations between a SG and one or more IP-based signaling nodes).
- Support for distributed IP-based signaling nodes.
- Support for the asynchronous reporting of status changes to management.

Hardware Requirements

This feature requires a SSEDCCM (Single Slot Enhanced DCM).

Alarms and Error Codes

No new alarms or error codes have been created for this feature.

Implementation of SNMP Agent (IP⁷ Release 2.0)

This feature implements a Simple Network Management Protocol (SNMP) agent on each DCM that runs an **ss7ipgw** or **iplim** general program load (GPL). SNMP is an industry-wide standard protocol used for network management. SNMP agents interact with network management applications called Network Management Systems (NMSs).

Supported Managed Object Groups

The SNMP agent maintains data variables that represent aspects of the DCM card. These variables are called managed objects and are stored in a management information base (MIB). The SNMP protocol arranges managed objects into groups. Table 3-5 shows the groups that IP⁷ release 2.0 supports.

Table 3-5. SNMP Object Groups Supported by IP⁷ Release 2.0

Group Name	Description	Contents
system	Text description of agent in printable ASCII characters	System description, object identifier, length of time since reinitialization of agent, other administrative details
interfaces	Information about hardware interfaces on the DCM	Table that contains for each interface, speed, physical address, current operational status, and packet statistics
ip	Information about host and router use of the IP	Scalar objects that provide IP-related datagram statistics, and 3 tables: address table, IP-to-physical address translation table, and IP-forwarding table
icmp	Intranetwork control messages, representing various ICMP operations within the DCM	26 scalar objects that maintain statistics for various Internet Control Message Protocol (ICMP) messages
tcp	Information about TCP operation and connections	14 scalar objects that record TCP parameters and statistics, such as the number of TCP connections supported and the total number of TCP segments transmitted, and a table that contains information about individual TCP connections
udp	Information about UDP operation	4 scalar objects that maintain UDP-related datagram statistics, and a table that contains address and port information
snmp	Details about SNMP objects	30 scalar objects, including SNMP message statistics, number of MIB objects retrieved, and number of SNMP traps sent

Supported SNMP Messages

The SNMP agent interacts with up to two NMSs by:

- Responding to *Get* and *GetNext* commands sent from an NMS for monitoring the DCM.
- Responding to *Set* commands sent from an NMS for maintaining the DCM and changing managed objects as specified.
- Sending *Trap* messages to asynchronously notify an NMS of conditions such as a link going up or down. *Traps* provide a way to alert the NMS in a more timely fashion than waiting to for a *Get* or *GetNext* from the NMS. In this release, only the following traps are supported:
 - *linkUp*, sent when one of the ports on the DCM initially comes up or recovers from a previous failure
 - *linkDown*, sent when one of the ports on the DCM fails

Deviations from SNMP Protocol

Table 3-6 shows how IP⁷ release 2.0 deviates from the standard SNMP protocol definition.

Table 3-6. Deviations from SNMP Protocols

Group	Variable Name	Usage	Deviation
system	sysContact	Text identification of contact information for agent	Cannot be set by <i>Set</i> command; may be set only by chg-sg-opts command.
	sysLocation	Physical location of agent	Cannot be set by <i>Set</i> command; internally set using configuration data already available; set to <CLLI>-<slot of DCM>
	sysName	Administratively assigned name for agent	Cannot be set by <i>Set</i> command; internally set using configuration data already available; set to <CLLI>-<slot of DCM>
interface	ifAdminStatus	Desired state of the interface	Cannot be set by <i>Set</i> command (to ensure that an NMS does not disrupt SS7 traffic by placing an IP interface in a nonoperable state)
ip	ipForwarding ipDefaultTTL ipRoute Dest ipRouteIfIndex ipRouteMetric1-5 ipRouteNextHop ipRouteType iprouteAge ipRouteMask	IP route-specific values	Cannot be set by <i>Set</i> command
	ipNetToMediaIfIndex ipNetToMediaPhysAddress ipNetToMediaNetAddress ipNetToMediaType	IP-address specific information	Can be set by <i>Set</i> command, but not saved across DCM reloads
tcp	tcpConnState	State of a TCP connection	Cannot be set by <i>Set</i> command
snmp	snmpEnableAuthenTraps	Indicate whether agent is permitted to generate authentication failure traps	Cannot be set by <i>Set</i> command

Enhancements to Existing Commands for the SNMP Agent Feature

The `chg-sg-opts` and `rtrv-sg-opts` commands are enhanced with the following new parameters for this feature. For more information about command formats, refer to the *Commands Manual*.

- **:syscount=** specifies a 64-byte string that is stored in the DCM agent MIB-2 *sysContact* variable.
- **:getcomm=** specifies a 32-byte string used as a *Get* community name to validate incoming *Get* and *GetNext* SNMP requests. If the community name in an incoming *Get* and *GetNext* Protocol Data Unit (PDU) matches this parameter, the PDU is accepted for further processing; other wise it is silently discarded.
- **:setcomm=** specifies a 32-byte string used as a *Set* community name to validate incoming *Set* SNMP requests. If the community name in an incoming *Set* Protocol Data Unit (PDU) matches this parameter, the PDU is accepted for further processing; otherwise it is silently discarded.
- **:trapcomm=** specifies a 32-byte string that is placed in the community name field for any *Trap* PDU generated by the DCM agent.

Improved Routing Management (Release 20.0)

This feature allows the Eagle to use E-links, allows the user to make link type assignment for display purposes, and provides two new procedures for handling transfer-prohibited (TFP) network management messages.

Before beginning to route traffic on a non-normal route, the Eagle sends a TFP network management message toward the affected destination. When an STP begins using a lower priority route through another STP to its final destination, a TFP network management message is sent to all accessible adjacent STPs that provide a route to a higher priority. These two handling procedures prevent circular routing.

This feature also uses the ability to enable or disable the broadcast of TFP network management messages. This capability can be administered per linkset or per destination, and has no effect on the Eagle's method of responding to TFP network management messages.

IMT Fault Isolation (Release 22.0)

IMT fault isolation increases the Eagle's ability to diagnose problems on the IMT bus with:

- Improvements to the Eagle's existing diagnostic and reporting mechanisms.

- Additional diagnostics and reports to enable the user to detect IMT faults and to isolate the cause of those faults to the card or bus level.

IMT fault isolation procedures are designed to be used after a problem has been detected. They can be used to solve these problems:

- Isolate IMT bus failures to the bus segment or individual card.
- Identify intermittent failures and the responsible cards.

There are two types of IMT bus errors, transient and nontransient. Transient errors cause packet loss or data corruption, but the cards are still connected to the IMT bus. Nontransient errors cause the cards to be disconnected from the IMT bus. The IMT fault isolation procedures detect nontransient errors.

Nontransient errors fall into two categories:

1. Errors that cause all cards to be isolated from one of the IMT buses (the IMT bus is out of service)
2. Errors that cause a subset of the cards (typically a single card) to be isolated from one of the IMT buses (the IMT bus remains in service).

When an IMT bus is out of service, this feature determines the location and probable cause of the failure. Those faults that are card-specific are isolated to the card. Faults that cannot be isolated to a specific card are isolated to the segment of the IMT bus on which they occur. A segment is identified by the two cards that are its endpoints. No attempt is made to isolate a particular component below the card level. The card is a field replaceable unit.

IMT Subsystem Alarms (Release 20.0)

With this feature, the Eagle displays minor, major, or critical alarms should one or more of the buses in the Interprocessor Message Transport (IMT) subsystem fail. The alarm levels in the individual buses determine the overall alarm for the IMT subsystem.

INAP-based Number Portability (INP) (Release 26.05)

Throughout the world, wireline and wireless operators are receiving directives from national regulators to support service provider number portability in their networks. This allows for subscribers to change to a new service provider while retaining their phone number. In Europe and other parts of the world, with the exception of North America, wireline providers are planning to implement this via the use of an IN (Intelligent Network)-based solution using the INAP (IN Application Part) protocol. This is in line with developed ITU Number Portability supplements. ETSI standards for Mobile Number Portability also define an IN-based solution to be used at the operator's discretion.

While the advent of number portability is good news for consumers, it presents many challenges for network operators. Tekelec's INAP-based Number Portability (INP) feature is intended to minimize those challenges for network operators, while enabling them to efficiently meet their regulatory obligations.

Refer to the *Feature Manual - INP* for the current details on this feature.

Hardware Requirements

INP requires the use of the Multi-Purpose Server (MPS) hardware to host the Eagle Provisioning Application Processor (EPAP) software. Refer to the *NSD Hardware Manual* for the current hardware information.

New Commands

The commands in this section have been created to support the INAP-based Number Portability feature. Refer to the *Commands Manual* for current usage information.

ent-homern, del-homern, rtrv-homern

These new commands are allowed only when the INP feature bit is on.

- The **ent-homern** command enters the list of RN prefixes that belong to the operating network.
- The **del-homern** command deletes a RN prefix from the HOME RN list.
- The **rtrv-homern** command retrieves list of RN prefixes that belong to operating network.

For more information about the command format for these commands, refer to the *Commands Manual*.

chg-inpopts, rtrv-inpopts

These new commands are used to provision INP-specific options and data. They are allowed only when the INP feature bit is on.

For more information about the command format and parameters for these commands, refer to the *Commands Manual*.

ent-srvsel, chg-srvsel, del-srvsel, rtrv-srvsel

These new commands are used to specify the set of selectors that identify a message as requiring INP query (**serv=inpq**) or INP MR (**serv=inpmr**) service. These commands are allowed when one or both of the INP and GFLEX feature bits are on. The **snai** parameter values **rnidn**, **rnndn**, and **rnsdn** are allowed only when the service is INPMR.

For more information about the command format and parameters for these commands, refer to the *Commands Manual*.

Enhancements to Existing Commands

The commands in this section have been enhanced to support the INP Number Portability feature. Refer to the *Commands Manual* for current usage information.

chg-feat, rtrv-feat

The **chg-feat** command has been enhanced with the **inp** parameter to activate this feature. It also has been modified to disallow LNP to be turned on if INP is on, and to disallow INP to be turned on if LNP is on. In other words, these two feature bits are mutually exclusive. Also, the INP feature bit requires the GTT feature bit.

The **rtrv-feat** command has been enhanced to report the status of INP; it has no parameters.

chg-map, ent-map, dlt-map, rtrv-map

The Mated Applications commands have been enhanced to permit configuration of the local INP subsystem when the INP feature bit is on. The Eagle's ITU-N true point code is entered as the PCN. The INP SSN, as defined by the SS-APPL command, is entered as the SSN.

If there is a mate INP subsystem, its ITU-N true point code is entered as the MPCN, and its INP SSN is entered as the MSSN. The mate's PC should also be added to the concerned point code (CSPC) group for the MAP entry.

For more information about the format and parameters for these commands, refer to the *Commands Manual*.

chg-ss-appl, ent-ss-appl, dlt-ss-appl, rtrv-ss-appl

The Database Subsystem commands have been enhanced to provide an INP value for the **appl** parameter (i.e. **appl=inp**). INP's SSN and status (online or offline) is entered for **appl=inp**. These commands are allowed when either the LNP or INP feature bit is on. (The INP application is allowed only when the INP feature bit is on.)

For more information about the format and parameters for these commands, refer to the *Commands Manual*.

rept-stat-sccp

This command displays the SCCP card status, including the INP status when the INP feature bit is on.

chg-/rtrv-stpopts

The **chg-stpopts** command has been enhanced by the addition of three new optional parameters: **defcc** <Default Country Code>, **defndc** <Default Network Destination Code>, and **dsmaud** <Audit Running Status>.

The **rtrv-stpopts** command has been enhanced to display the status of these new parameters.

ent-trace

This command has been enhanced to trace INP messages based on the existing triggers GT and /or SSPN, and /or the new triggers DN and Entity ID. The DN and Entity ID parameters are allowed only when one or both of the INP and GFLEX feature bits are on.

- The **gt** parameter has been changed to accept a 1-21 digit hexadecimal number.
- The **sspn** parameter has not been changed.
- The new **entityid** parameter accepts a 1-15 digit hexadecimal number.
- The new **dn** parameter accepts a 5-15 digit hexadecimal number.

LNP-Related Commands

Unlike LNP, INP does not use input and output groups separately from the normal STP groups. Therefore, commands and unsolicited messages commonly used by LNP either have been renamed for INP, use a different group when INP is on, or have been reclassified.

chg-sid, rtrv-sid

The Site Identification (SID) commands have been enhanced to support INP Capability Point Code(s). The SID commands also support the Duplicate Point Codes feature for INP CPC(s); see Figure 3-12 on page 150.

For an INP CPC, the following rules apply to SID commands:

1. The **cpctype** parameter must be "INP".
2. The INP feature must be on.
3. The point code must be specified with the **cpcn** or **cpcli** parameter.
4. Any replacement (new) point code must be specified with the **ncpcn** or **ncpcli** parameter.

Increased Linkset Capacity (Release 28.0)

This feature increases linkset capacity to support a *maximum* of 1024 linksets.

NOTE: For Release 28.0, only 255 of the linksets can be *gateway linksets*. A gateway linkset is a linkset that contains routes to a different network indicator (NI) than the network indicator of the Eagle, or that has Gateway Screening (GWS) on the linkset.

New Hardware Required

There are no additional hardware requirements for the Increased Linkset Capacity feature.

Enhancements to Existing Commands

The following link set commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

ent-ls

Use this command to add a link set with its assigned far-end CLLI, far-end point code, and other link-set attributes. For this feature, the output of this command has been enhanced to display the presence of 1024 linksets.

dlt-ls

Use this command to delete a link set and its attributes. For this feature, the output of this command has been enhanced to display the presence of 1024 linksets.

chg-ls

Use this command to change attributes for a specified link set. The new values overwrite the existing values. For this feature, the output of this command has been enhanced to display the presence of 1024 linksets.

rtrv-ls

Use this command to display the attributes of a link set or all link sets. For this feature, the output of this command has been enhanced to display the presence of 1024 linksets.

Increase GTT Entries per TT to 200,000 (Release 29.0)

This feature increases the number of Global Title Table entries per Translation Type or GTT Set up to 200,000. The GTT Entries Increase per TT to 200,000 Feature does not have any software controls, and therefore no feature keys. The feature is automatically included as part of Eagle 29.0/IP⁷ Secure Gateway 7.0, provided that all SCCP cards are TSMs or DSMs.

Hardware Requirements

To support this feature, all SCCP cards in the system must be TSMs or DSMs.

Enhancements to Existing Commands

No commands have been enhanced to support this feature.

INP Number Normalization (Release 26.3)

Description

The INP Number Normalization feature allows the INP feature to accept queries either with or without special prefixes on the DN. Upon receipt, INP will strip off the prefix (if specified by the **chg-inpopts** command), convert the DN to international, perform the database query, and return a response to the switch. The CalledPartyNumber in the response may include the special prefix or not, depending on operator configuration of the feature. INP Number Normalization also allows the NAI in an incoming query to be mapped to an internal service NAI.

Hardware Requirements

The INP Number Normalization feature requires the Multi-Platform Server (MPS) system and the EAGLE STP Database Services Module (DSM) subsystem. This hardware was first introduced in EAGLE Release 26.1.

Enhancements to Existing Commands

For current usage information on these commands, see the *Commands Manual*.

chg-inpopts

The **chg-inpopts** command is used to provision INP-specific data. This command updates the INPOPTS Table. All prefixes that need to be removed should be entered via the **chg-inpopts** command.

rtrv-inpopts

The **rtrv-inpopts** command retrieves INP-specific options. The output for the **rtrv-inpopts** commands has been enhanced to show the status of these new parameters.

Increase Gateway Screening Screen Sets to 255 (Release 22.0)

In Release 22.0, the total number of gateway screening screen sets that can be configured in the database has been increased from 64 to 255. When a screening table is changed, this feature displays the following scroll area message showing the number of screen sets affected by changing a screening table. There is no limit to the number of screensets a screening table can be a member of.

Notice: The number of screensets affected is N.

Where **n** is the number of affected screen sets.

Increase in Time Zones (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

The Increase in Time Zones feature increases the number of time zones available for EAGLE administration. In addition to those currently supported (see Table FN-3-8 on page FN-85), the time zones listed in Table 3-7 are now supported.

Table 3-7. New Supported Time Zones

Time Zone	Abbrev.	Offset from GMT (hrs.)
Newfoundland Daylight Time	NDT	- 2.5
Newfoundland Standard Time	NST	- 3.5
Brazil Standard Time	BRA	- 3
Alaska Daylight Time	AKDT	- 8
Alaska Standard Time	AKST	- 9
Universal Time Coordinated	UTC	0
British Summer Time	BST	+ 1
Western European Summer Time	WEST	+ 1
Central European Time	CET	+ 1
Central European Summer Time	CEST	+ 2
French Winter Time	FWT	+ 1
French Summer Time	FST	+ 2
Middle European Time	MET	+ 1
Middle European Summer Time	MEST	+ 2
Eastern European Time	EET	+ 2
Eastern European Summer Time	EEST	+ 3
South African Standard Time	SAST	+ 2
Moscow Time	MSK	+ 3
Moscow Summer Time	MSD	+ 4
India Standard Time	IST	+ 5.5
India Daylight Time	IDT	+ 6.5
China Coast Time	CCT	+ 8
Republic of Korea	ROK	+ 9

Table 3-7. New Supported Time Zones (Continued)

Time Zone	Abbrev.	Offset from GMT (hrs.)
Australian Western Standard Time	AWST	+ 8
Australian Western Daylight Time	AWDT	+ 9
Australian Central Standard Time	ACST	+ 9.5
Australian Central Daylight Time	ACDT	+ 10.5
Australian Eastern Standard Time	AEST	+ 10
Australian Eastern Daylight Time	AEDT	+ 11
New Zealand Standard Time	NZST	+ 12
New Zealand Daylight Time	NZDT	+ 13

Prior to this feature, the EAGLE administration supported the time zones shown in Table 3-8.

Table 3-8. Currently Supported Time Zones

Time Zone	Abbreviation	Offset from GMT (hours)
Greenwich Mean Time	GMT	0
US Eastern Daylight Time	EDT	- 4
US Eastern Standard Time	EST	- 5
Pacific Daylight Time	PDT	- 7
Pacific Standard Time	PST	- 8
Mountain Daylight Time	MDT	- 6
Mountain Standard Time	MST	- 7
US Central Daylight Time	CDT	- 5
US Central Standard Time	CST	- 6
Hawaiian Daylight Time	HDT	- 9
Hawaiian Standard Time	HST	- 10
Atlantic Daylight Time	ADT	- 3
Atlantic Standard Time	AST	- 4
Western European Time	WET	0

As a result of this feature, all output banners and display of time zones in output content now allow 4 spaces for the time zone.

NOTE: This does not include SEAS output headers, which will remain at 3 characters. All 4-character time zones will be truncated to 3 characters in SEAS output.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

set-time

Use this command to set/change the Eagle's Real-Time Clock. This command affects the time setting system-wide.

There is no parameter for seconds; executing this command always sets the seconds to zero.

Syntax

```
SET-TIME
:TIME= <Time (HHMM)>
:TZ= <Time Zone>
```

Parameters

:time

Sets the time.

Range = 0000-2359

:tz

Sets the time zone.

Range = EST, EDT, CST, CDT, MST, MDT, PST, PDT, HST, HDT, AST, ADT, GMT, WET, WEST, UTC, BST, CET, CEST, MET, MEST, FWT, FST, EET, EEST, SAST, MSK, MSD, IST, IDT, CCT, AWST, AWDT, ROK, ACST, ACDT, AEST, AEDT, NZST, NZDT, BRA, AKST, AKDT, NSD, NDT

Example Output

```
> set-time:time=1600:tz=edt
```

Command Accepted - Processing

```
stp10615 02-10-09 16:00:03 EST EAGLE 30.0.0
set-time:time=1600:tz=edt
```

Command entered at terminal #3.

;

stp10615 02-10-09 16:00:00 EDT EAGLE 30.0.0

Time set complete.

;

rept-stat-db

Displays a report showing various status indicators for the active and standby OAM database, and also the status of the database on each of the network cards. This output for this command has been enhanced to display 4-character time zones.

Example Output

```
tekelecstp 02-10-29 08:39:24 NZST EAGLE 30.0.0
rept-stat-db:display=all
Command entered at terminal #4.

```

Alarms and Error Codes

No new alarms or error codes have been created for this feature.

ISUP Message Type Screening

Description

The ISUP Message Type Screening feature provides the Eagle with the capability to screen on ISUP message type. This feature augments the Gateway Screening functionality currently provided by the Eagle. The feature is based on the previous release of major enhancements to the Gateway Screening feature. (At that time, ISUP message type screening was not implemented.) The enhanced functionality of Gateway Screening results in a more secure, easily administered network.

NOTE: The functionality provided by this feature is not controlled by feature key or STP option. As part of core GWS capability, it becomes a core component the Eagle STP.

Hardware Requirements

This feature requires the hardware baseline for Release 30.0. This includes the GPSPM-II and TDM-10 (or later) configuration of the MASP (for the EOAM GPL), along with ASM cards (for the GLS GPL) and LIM, MPLIM, and ASM (SCCP GPL) cards to support screening of network protocol traffic.

New Commands

The following commands have been created to support this feature. For more information, see the *Commands Manual*.

ent-scr-isup

This command is used to add an allowed ISUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Syntax

```
ENT-SCR-ISUP
:SR=<screen name>
:ISUPMT=<ISUP message type>
:NSFI=<STOP>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = One alpha and 5 optional alphanumeric characters

:nsfi=stop

This parameter must have the value STOP.

Range = STOP

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

Example Input/Output

```
ENT-SCR-ISUP:SR=IEC:ISUPMT=1:NSFI=STOP
```

```
tekelecstp 02-09-02 09:39:13 EST Rel 30.0.0
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
Command entered at terminal #4.
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

```
ENT-SCR-ISUP:SR=IEC:ISUPMT=9:NSFI=STOP
```

```
tekelecstp 02-09-02 09:41:41 EST Rel 30.0.0
ent-scr-isup:sr=iec:isupmt=9:nsfi=stop
Command entered at terminal #4.
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

```
ENT-SCR-ISUP:SR=IBIG:ISUPMT=1&&128:NSFI=STOP
```

```
tekelecstp 02-09-02 09:44:58 EST Rel 30.0.0
ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop
Command entered at terminal #4.
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

```
ENT-SCR-ISUP:SR=IAL:ISUPMT=*:NSFI=STOP
```

```
tekelecstp 02-09-02 09:47:03 EST Rel 30.0.0
ent-scr-isup:sr=ial:isupmt=*:nsfi=stop
```

```
Command entered at terminal #4.
ENT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

chg-scr-isup

This command is used to change the attributes associated with a specific allowed ISUP screening reference in the Allowed ISUP entity set.

Syntax

```
CHG-SCR-ISUP
:SR=<screen name>
:ISUPMT=<ISUP message type>
:NISUPMT=<New ISUP message type>
:NSFI=<STOP>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:nisupmt

Specifies the new ISUP message type for the entry. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = One alpha and 5 optional alphanumeric characters

:nsfi=stop

This parameter must have the value STOP if entered.

Range = STOP

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

Example Output

```
CHG-SCR-ISUP:SR=IEC:ISUPMT=1:NISUPMT=1&&2
```

```
tekelecstp 02-09-02 10:26:27 EST Rel 30.0.0
chg-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2
```

```
Command entered at terminal #4.  
CHG-SCR-ISUP: MASP A - COMPLTD  
;
```

dlt-scr-isup

This command is used to delete an allowed ISUP screening reference from the Allowed ISUP entity set.

Syntax

```
DLT-SCR-ISUP  
:SR=<screen name>  
:ISUPMT=<ISUP message type>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

Example Output

```
DLT-SCR-ISUP:SR=IEC:ISUPMT=9  
  
tekelecstp 02-09-02 11:59:41 EST Rel 30.0.0  
dlt-scr-isup:sr=iec:isupmt=9  
Command entered at terminal #4.

Command entered at terminal #4.  
DLT-SCR-ISUP: MASP A - COMPLTD  
;
```

rtrv-scr-isup

This command is used to display an allowed ISUP screening reference in the Allowed ISUP entity set. The REF column of the output indicates YES when the screen is referenced by another screen; otherwise, it is NO.

Syntax

```

RTRV-SCR-ISUP
:SR=<screen name>
:NSFI=<STOP>
:ISUPMT=<ISUP message type>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
:ALL=<YES,NO>

```

Parameters**:sr**

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:nsfi=stop

This parameter must have the value STOP if entered.

Range = STOP

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = 1 alpha and 5 optional alpha-numeric characters

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

:all

Supplies an additional output field, the NSR/ Action.

Example Input/Output

```

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

Commands Enhanced with :nsfi=ISUP.

For the commands listed in Table 3-9, the :nsfi parameter has been enhanced with the new value ISUP.

Table 3-9. Commands with New Range Value :nsfi=isup

chg-scr-blkdpc	chg-scr-dpc	chg-scr-sio
ent-scr-blkdpc	ent-scr-dpc	ent-scr-sio
rtrv-scr-blkdpc	rtrv-scr-dpc	rtrv-scr-sio

rtrv-scrset

Use this command to retrieve an existing screenset. The output for this command has been enhanced to show the ISUP table.

Syntax

```
RTRV-SCRSET
:SCRN=<screen set name>
:NSFI=<next screen function identifier>
:NSR=<next screen reference>
:COPY=<COPY Stop Action>
:ACTNAME=<GWS Stop Action Set Name>
:ALL={YES, NO}
:DESTFLD={YES/NO}
```

Parameters

No parameters have been enhanced for this command.

Example Output

```

rtrv-scrset:scrn=gws1

rept-meas

Use this command to generate measurement reports on demand. The **:enttype** parameter has been enhanced with the new range value LSONISMT.

Syntax

```

REPT-MEAS
:ENTTYPE = <Entity>
...

```

Parameters

:enttype= <...,lsonismt>

The name of a specific entity to report on.

Range = <...,lsonismt> (specifies measurements for ISUP message type screening)

Example Output

The following example specifies an ANSI gateway linkset for the **lsn** parameter where **enttype=lsonismt**. The output format is the same as for an ITU gateway linkset:

rept-meas:type=gtwy:enttype=lsonismt:lsn=ls1201a:ni=43

```

rlghncxa03w 02-12-19 12:00:00 EST Rel 30.0.0

;

```

rlghncxa03w 02-12-06 11:01:35 EST Rel 30.0.0
END OF ON-DEMAND LSONISM-TGWY MEASUREMENT REPORT

```

;

rept-ftp-meas

This command provides the capability to manually initiate generation and FTP transfer of a measurements report from the MCPM to the customer's FTP server. The **:enttype** parameter has been enhanced with the new range value LSONISM.

Syntax

```

REPT-FTP-MEAS
:TYPE=<REPORT TYPE (SCHEDULE)>
:PERIOD=<REPORT PERIOD>
:HH=<HALF HOUR>
:ENTTYPE=<ENTITY>
:DAY=<DAY-OF-WEEK>

```

Parameters

:enttype= <...,lsonismt>

The name of a specific entity to report on.

Range = <...,LSONISMT> (specifies measurements for ISUP message type screening)

Example Output

```

rlghncxa03w 03-02-23 12:47:07 EST Rel 2.2.0
Measurement Reports will be generated to FTP

```

```

rlghncxa03w 03-02-23 12:47:07 EST Rel 2.2.0
REPT-FTP-MEAS command was successful.

```

chg-measopts

Provides the capability to enable or disable the automatic generation and FTP transfer of scheduled measurements reports to the FTP server. This command has been enhanced with the new parameter **:gtwylsonismt**.

Syntax

```

CHG-MEASOPTS
:GTWYLSONISMT=<GTWY-LSONISMT REPORT>
<existing parameters...>

```

Parameters

:gtwylsonismt

GTWY linkset report for ISUP message type per originating NI.

Range = ON,OFF

Example Output

```

rlghncxa03w 00-02-18 17:02:57 EST Rel 2.2.0
CHG-MEASOPTS: MASP A - COMPLTD;

```

rtrv-measopts

Generates a UI display showing the enabled / disabled status of all FTP scheduled reports. The output for this command has been enhanced with the status of the GTWY-LSONISMT report.

Syntax

```

RTRV-MEASOPTS

```

Parameters

This command has no parameters.

Example Output

```
> rtrv-measopts

Alarms and Error Codes**Alarms****UIMs**

Two UIMs are associated with the ISUP Message Type Screening feature:

- UIM 1022 is generated if the link set limit (100) or the system limit (3000) of ISUP message types screened is exceeded.

```
1022   System Meas. limit exceeded for LSONISMT
```

- UIM 1160 is generated when a message fails the Allowed ISUP screening:

```
1160   GWS rcvd ISUP that is not allowed
```

Error Codes

Incorrect use of the enhanced commands for the ISUP Message Type Screening feature may result in the error messages listed in Table 3-10:

Table 3-10. ISUP Message Type Screening: Error Messages

Error Message	New?	Used by Command:
E2136 At least one optional parameter is required	No	chg-scr-isup
E2281 Invalid ENTTYPE for this TYPE	No	rept-ftp-meas, rept-meas

E2539 No match on NSR parameter during retrieve	Yes	rtrv-scr-isup

GTWY Measurements

For Release 30.0, the new measurements report type GTWY-LSONISMT has been added. The measurements for this new report are kept on a per-link set, per- originating NI (ANSI), per-ISUP message type basis. These measurements will be reported in the
gtwy-lsonismt_yyyymmdd_hhmm.csv FTP report files (mm is a half-hour boundary)

Increase the Number of Mated Application Entries (Release 22.0)

Release 22.0 increases the number of entries that the mated applications table can contain from 256 to 1024.

Increased GTT Transactions (Release 21.0)

This feature increases the performance of the global title translation (GTT) feature from 9300 MSUs per second to 21,000 MSUs per second when the GTT table is at its full capacity.

Increasing the Size of the Service Provider ID Table (Release 23.2)

In Release 23.2, the number of service providers that can be configured in the Eagle database for the Local Number Portability feature with the **ent-lnp-sp**, **ent-lnp-lrn**, and **ent-lnp-sub** commands has been increased 100 to 250. If the service provider ID table is full when either of these commands are executed, the command is rejected with this message.

Error Messages

E3133 Cmd Rej: LNP Service Provider table is full

The output of the **rtrv-lnp-sp** command has been changed to show that the total number of entries in the service provider ID table is now 250. The percentage of the maximum number of entries that the service provider ID table contains is based on the 250 entries that the service provider ID table can contain.

Interim Global Title Modification (IP⁷ Release 2.2)

The feature is also known as Prefix Deletion of Global Title. The IP⁷ Secure Gateway changes the SCCP called party address for certain TTs before routing the message, but after GTT is performed, in one of the following ways:

When the IP⁷ Secure Gateway receives a message that requires global title translation and contains one of the following TT values:

- 180–190
- 202
- 203
- 210–215

it does the following:

1. Performs the global title translation
2. Deletes the first three digits

3. Forwards the message

When the IP⁷ Secure Gateway receives a message that requires global title translation and contains a TT value of zero, it does the following:

1. Performs the global title translation
2. Deletes the first three digits if they are 050 or 051
3. Forwards the message

These TT values cannot be provisioned or otherwise changed by the user.

Enhancements to Existing Commands for Interim GT Modification

The following commands have been enhanced to support the **iplimi** feature. For more information about formats for the following commands, refer to the *Commands Manual*.

chg-feat

This command includes a new parameter (**:prfxdlgt=**) used to specify that the Interim GT Modification feature is turned on.

rtrv-feat

The output of this command now includes a display of whether the Interim GT Modification feature is turned on.

chg-gtt

This command now allows the user to specify a value of zero for the New GT TT (NGT) parameter.

ent-gtt

This command now allows the user to specify a value of zero for the New GT TT (NGT) parameter.

Intermediate GTT Loadsharing (Release 28.1)

This feature provides Eagle the ability to load share between multiple nodes after global title translation, when the post-GTT message is Route-on GT (intermediate GTT).

Previously, the Eagle only allowed load sharing between multiple nodes when the Eagle was performing final GTT. Final GTT means the result of the Eagle's translation is a point code (PC) and subsystem number (SSN), and the routing indicator in the outgoing message is set to Route-on-SSN. The load sharing is accomplished by accessing a mated application (MAP) table, which specifies the PC, SSN and relationship of a mated node. This load sharing mechanism was not allowed if the Eagle was performing intermediate GTT, where the routing indicator in the outgoing message was set to Route-on-GT.

Some customers have a need to load share between nodes even when the STP is performing intermediate GTT. This may occur in a network that does not use capability point codes (CPC). This generally occurs in a quad-STP configuration where the first STP pair performs an intermediate GTT, and then must load share to the second STP pair, which will then perform the final GTT. If a CPC is not available for routing to the second STP pair, up to now there has been no way for the Eagle to perform load sharing.

This feature supports a minimum of 1700 GTT transactions per second per DSM card, or 850 GTT transactions per second per TSM card while running GTT, VGTT, EGTT, and Global Title Modification.

Hardware Requirements

No new hardware is needed to support this feature.

New Commands

The following commands have been created to support this feature. For current usage information, see the *Commands Manual*.

ent-/chg-mrn

Use these commands to assign PCs to PC groups.

dlt-mrn

Use this command to remove entries from the mated relay nodes (MRN) table. A single command may either remove a PC from a group, or remove the entire group.

rtrv-mrn

Use this command to display the mated relay node application relationship information maintained by the Eagle.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

chg-ctrl-feat

Use this command to activate or deactivate the On/Off features that have been purchased and enabled. The **:partnum** parameter has been enhanced to recognize the feature key for this feature.

rtrv-ctrl-feat

Used to display all Controlled Features the customer has purchased and enabled to date. The output of this command has been enhanced to recognize the feature key for this feature.

canc-cmd

This command has been enhanced to halt the processing and output of the **rtrv-mrn** command.

Limitations

Any given PC can be part of only one PC group, i.e., any PC entered as part of a PC group cannot later be made part of a different PC group, unless it is first deleted from the initial group.

Intrusion Alert (Release 21.0)

To alert the Eagle system administrator to a possible attempt by an unauthorized person trying to login to the Eagle, the Eagle issues a scroll area message. When 5 or more consecutive attempts to login to the Eagle have failed, the following scroll area message is sent to all terminal ports that can receive unsolicited Security Administration messages:

Info: xxxxxxxxxx successive LOGIN failures on port pp

Where:

xxxxxxx is the number of consecutive login failures on the port
(1 - 4, 294, 967, 295)

pp is the terminal port (1 - 16) that the login attempts were made on.

When the attempt to login to the Eagle is successful after a series of failed consecutive login attempts, or if the active MASP reboots, the count of failed consecutive login attempts for that port is reset to 0.

Attempts to login to the Eagle, which are not completed normally, are not considered login attempts and are not included in the count of failed consecutive attempts. For example, while prompting for a password, you might use the F9 key is used to abort the command, or errors might occur when the Eagle is looking up a user ID or password.

IP⁷ Internationalization (IP⁷ Release 4.0)

This Feature the following topics:

- Multiple Point Code Support
- Replacing Two EThis fetxisting STP Pairs with One SG Pair
- Multiple Linksets Between Two Nodes

Refer to the *Database Administration Manual - SS7* for the current details of the feature.

Impact on Other Features - Local Subsystems

The SG allows only the True Point Code to be entered into the MAP table. Also, the SG continues to allow the user to enter translations to the True Point Code, but the SG does not allow the user to enter translation to a Secondary Point Code.

If a node sends a rt-on-gt query, the node should set the query's DPC to be the SG's Capability Point Code. If a node sends a rt-on-ssn query, the node should

Summary of Modifications

New and Changed commands for this feature

Refer to the *Commands Manual* for current usage information.

ent/chg-ls

Change ENT/CHG-LS commands to include the new parameter, MULTGC, providing support for multiple ITU-N group codes on a single ITU linkset.

chg-ls

Change CHG-LS commands to include new parameter SAPC to support secondary APC (SAPC) for ITU linksets. New parameter ACTION to add and delete a SAPC from a linkset. Also, change output of RTRV-LS command to display SAPCs for the linkset.

ent-rte

Change ENT-RTE command to allow ITU-N destinations with different group codes to be routed over a linkset basedon its MULTGC setting.

ent-slk

Change ENT-SLK command to evaluate if MULTGC is enabled on its assigned linkset and if so, verify that links are all type IPLIMI or IPGWI.

ent/dlt/rtrv-appl-rtkey

Change ENT/DLT/RTRV-APPL-RTKEY commands to support group codes on ITU-N point code when duplicate point code feature bit is enabled.

rtrv-ls

RTRV-LS - output of this command will be modified to include SAPCs of the linkset.

IPMX/MCAP/TDM Replacement (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Beginning in EAGLE Release 30.0, the IPMX, MCAP-256 and TDM* (*all versions earlier than -10) cards are obsolete. Any EAGLE or EAGLE 5 customer upgrading to Release 30.0 must replace all IPMX cards with HMUX cards (870-1965-01), all MCAP-256 cards in slots 1113 and 1115 (the former MCAP slots) with GPSM-II cards (870-2360-01), and any TDM card of a version earlier than -10 with TDM-10 (or later) cards (870-0774-10).

Replacement of the -05 backplane also is required, as this backplane does not support HMUX.

NOTE: These hardware upgrades must be performed prior to the software upgrade. After the upgrade to Release 30.0 has been completed, an MCAP card will not be allowed to boot in the system. Only a GPSM-II card will be allowed in the former MCAP slots.

HMUX

The High-Speed Multiplexer (HMUX) is baseline hardware for IP7 Secure Gateway Release 8.0. It replaces the obsolete IPMX card, and increases the number of links supported by the IP7 Secure Gateway in a future release. The HMUX enhances the IMT bus by introducing a new 1Gb/sec inter-shelf bus bandwidth. (The intra-shelf bus data rate remains the same at 125Mb/sec.)

HMUX also enhances IMT performance by transmitting data between shelves only when it is necessary. Traffic between IP7SG cards on the same shelf is allowed to stay on the shelf IMT, and is not required to transit between shelves. Traffic between shelves is not required to pass onto an intra-shelf IMT bus, if this is not necessary.

GPSM-II for MCAP Slots

Future applications and table expansions will require increased performance across the IMT bus interface both to and from the Maintenance and Administration Subsystem. To meet this need, the GPSM-II incorporates an EDCM-based design for the OAM functionality on the IP7 Secure Gateway. There is also a need to increase available memory and performance on the OAM for these applications and for future use.

The GPSM-II utilizes a 1GB memory daughterboard.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

rept-stat-card

Use this command to display the card status and maintenance activity states. The command output has been enhanced to display the MCAP/IPMX changes.

Syntax

```
REPT-STAT-CARD
```

Example Output**rept-stat-card**

```

rtrv-card

Use this command to display the information about a card. Its output has been enhanced to display EOAM information.

Syntax

```
RTRV-CARD
```

Example Output

The following example shows the output for a GPSM-II card with the enhanced OAM function.

rtrv-card

```
rlghncxa03w 00-02-15 16:34:56 EST Rel 30.0.0
CARD   TYPE      APPL      LSET NAME      PORT SLC LSET NAME      PORT

canc-lpo

This command cancels a local processor outage (LPO) and restores the link to its previous state. The output for the **canc-lpo** command has been enhanced to display an invalid **GPSM-II OAM** location.

Example Output

canc-lpo:loc=1113:port=a (note 1113 = invalid loc (**GPSM-II OAM**))

```
rlghncxa03w 00-02-07 11:11:28 EST Rel 30.0.0
Command Rejected : Location is not valid for command
```

rept-imt-info

Use this command to display the following statistics:

- The IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- The current IMT bus use statistics
- The **hmx** card error statistics

Syntax

```
REPT-IMT-INFO
:SLOC
:ELOC
...
```

Parameters**:eloc= (optional)**

End location. Specifies the card location of the last card in the range.

Range = 1101–1108, 1109-1110*, 1111–1112, (1113 and 1115 **GPSM-II OAM**),...

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range = 1101–1108, 1109-1110*, 1111–1112, (1113 and 1115 **GPSM-II OAM**),...

init-imt-gpl

Use this command to load the specified IMT GPL software to the specified card, and to reset that card. The locations 1113 and 1115 have been removed from the **:loc** parameter.

Syntax

```
INIT-IMT-GPL
:LOC
...
```

Parameters**:loc= (optional)**

Specifies the address of the card to be initialized.

Range = 1101–1108, 1111–1112, 1201–1208

...

chg-gpl

Use this command to copy a generic program load from the source disk to the destination disk (both active and standby disks). The OAM GPL range value has been removed from the **:appl** parameter.

Syntax

```
CHG-GPL
:APPL
```

...

Parameters**:appl= (optional)**

The generic program load (GPL) identifier; in other words, the name of the GPL to be uploaded from the system removable cartridge to the Eagle.

Range = atmansi, atmitu, bpdcm, bphcap, bphcapt, bphmux, bpmpl, bpmplt, ccs7itu, ebdablm, ebdadcm, emdc, eoam, eroute, gls, imt, ipgwi, iplim, iplimi, mcp, ~~oam~~, sccp, ss7ansi, ss7gx25, ss7ipgw, ss7ml, stplan, vsccp, vxwslan, utility

...

rept-stat-gpl

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted. The OAM GPL range value has been removed from the **:appl** parameter.

Syntax

```
REPT-STAT-GPL
:APPL
...
```

Parameters**:appl= (optional)**

The type of GPL to report on.

Range = atmansi, atmitu, bpdcm, bphcap, bphcapt, bphmux, bpmpl, bpmplt, ccs7itu, ebdablm, ebdadcm, emdc, eoam, eroute, gls, imt, ipgwi, iplim, iplimi, mcp, ~~oam~~, sccp, ss7ansi, ss7gx25, ss7ipgw, ss7ml, stplan, vsccp, vxwslan, utility

...

rtrv-gpl

Use this command to show the version numbers of the GPLs stored on each fixed disk (TDM) or removable cartridge (MDAL, if available) and the system release table stored on each fixed disk. The OAM GPL range value has been removed from the **:appl** parameter.

Syntax

```
RTRV-GPL
:APPL=
...
```

Parameters**:appl= (optional)**

The type of GPL to report on.

Range = atmansi, atmitu, bpdcm, bphcap, bphcapt, bphmux, bpmpl, bpmplt, ccs7itu, ebdablm, ebdadcm, emdc, eoam, eroute, gls, imt, ipgwi, iplim, iplimi, ips, mcp, ~~oam~~, sccp, ss7ansi, ss7gx25, ss7ipgw, ss7ml, stplan, vsccp, vxwslan, utility

...

chg-stpopts

Use this command to change the values of one or more of the STP node level processing option indicators maintained in the STP's options table. The value IPMX has been removed from description of the **:hmuxabus** and **:hmuxbbus** parameters.

Syntax

```
CHG-STPOPTS
:HMUXABUS
:HMUXBBUS
...
```

Parameters

:hmuxabus = (optional)

HMUX on IMT bus A indicator.

Range = **yes** (HMUX bus A option turned on), **no**

Default = No change in the current value.

System default = **no**

:hmuxbbus = (optional)

HMUX on IMT bus B indicator.

Range = **yes** (HMUX bus B option turned on), **no**

No change in the current value.

System default = **no**

...

Alarms and Error Codes

Alarms

No UAMs/UIMs have been created or modified for this feature.

Incorrect use of the enhanced commands for the IPMX/MCAP/TDM feature may result in the error messages listed in Table 3-11:

Table 3-11. IPMX/MCAP/TDM: Error Messages

Error Message	New?	Used by Command:
E2101 Card location already equipped	No	rtrv-card
E2143 The terminal state request was unanswered	No	chg-trm

Table 3-11. IPMX/MCAP/TDM: Error Messages (Continued)

Error Message	New?	Used by Command:
E2144 Location invalid for hardware configuration	No	alw-card, inh-card, rept-stat-db
E2154 Card slot reserved by system	No	rept-stat-db
E2212 Invalid card type for this command	No	chg-bip-rec, disp-bip, rtrv-bip, disp-bip, disp-mem, dlt-bp, disp-mem, set-mem, dlt-appl-rtkey, rtrv-appl-rtkey init-int-gpl
E2242 Destination card invalid	No	chg-bip-fld, chg-bip-rec, disp-bip, rtrv-bip, tst-bip
E2270 Card does not exist or is not an LPE	No	init-card
E2378 The specified card cannot be inhibited	No	inh-card, rmv-card
E2398 Standby MASP is isolated	No	format-disk, rtrv-obit, rtrv-trbl
E3097 GPSM-II required to support more than 700 links	No	enable-ctrl-feat
E3778 Active/Stby GPL versions are not compatible	No	copy-disk, format-disk

IP⁷ Transport Feature (Release 26.1)

To address the technological needs of the convergence of voice and data networks, Tekelec introduces the IP⁷ line of products. This product line addresses the needs of SS7 and IP converged networks, assuring the seamless and secure transfer of voice and data signaling traffic and providing carriers with a full portfolio of applications, including an SS7/IP gateway, internetwork routing, and SS7/IP internetwork services.

New Features

The initial release of the IP⁷ Transport feature supports the following functions related to SS7/IP convergence.

- The **iplim** application provides point-to-point connectivity (a single TCP/IP connection from a DCM card to another device) within an ANSI network, specifically, SS7-over-IP for point-to-point signaling links (B/C/D links) between STPs.
- The **iplimi** application provides the same connectivity for International Telecommunications Union (ITU) point codes that the **iplim** application provides for American National Standards Institute (ANSI) point codes.
- Two-point IPLIMx allows a single DCM card loaded with the **iplim** application or the **iplimi** application to support two point-to-point links. In previous releases, each point-to-point link required a separate DCM card.
- Support for up-to-41 DCMs that run the **iplim** or **iplimi** application.
- A new DCM card, capable of supporting up-to-2000 MSUs per second, can be loaded with the **iplim** or **iplimi** application; customers can use any combination of the original and new DCM cards.

This section may occasionally refer to the **iplim** and **iplimi** applications by the term 'IPLIMx' when discussing their common functions.

Refer to the *Database Administration Manual - SS7* for current information on this feature.

Changed Commands

Table 3-12 lists the commands affected by the IP⁷ Transport feature.

Table 3-12. Eagle Commands Affected by IP⁷ Transport

Command	Description	Impact
act-gpl	Activate Generic Program Load	Add IPLIMx GPL
act-lbp	Activate LoopBack Point Test	If IPLIMx reject cmd
act-lpo	Activate Local Processor Outage	Support IPLIMx
act-slk	Activate Signaling Link	Support IPLIMx
alw-slk	Allow Signaling Link	Support IPLIMx
blk-slk	Block Signaling Link	Support IPLIMx
canc-lpo	Cancel Signaling Link	Support IPLIMx
canc-slk	Cancel Signaling Link	Support IPLIMx
chg-appl-sock	Change Application Socket	Support IPLIMx
chg-bip-rec	Change Board ID PROMs Record	Support IPLIMx
chg-dcmps	Change DCM Parameter set	Support IPLIMx
chg-gpl	Change Generic Program Load	Add IPLIMx GPL

Table 3-12. Eagle Commands Affected by IP⁷ Transport (Continued)

Command	Description	Impact
chg-ip-card	Change CARD IP parameters	All DCM
chg-ip-lnk	Change Link IP Parameters	All DCM
chg-slk	Change Signaling Link	Support IPLIMx
copy-gpl	Copy Generic Program Load	Add IPLIMx GPL
dact-lbp	Deactivate LoopBack Point Test	If IPLIMx reject cmd
dact-slk	Deactivate Signaling Link	Support IPLIMx
disp-bp	Display Breakpoint	Add IPLIMx to card parm
disp-mem	Display Memory	Add IPLIMx to card parm
dlt-appl-sock	Delete Application Socket	Support IPLIMx
dlt-bp	Delete Breakpoint	Add IPLIMx to card parm
dlt-ip-host	Delete IP hostname	All DCM
dlt-slk	Delete signaling link	Add IPLIMx GPL
ent-appl-sock	Enter Application Socket	Support IPLIMx
ent-bp	Enter Breakpoint	Add IPLIMx to card parm
ent-card	Enter card	Add DCM
ent-ip-host	Enter IP hostname	All DCM
ent-slk	Enter signaling link	Add IPLIMx GPL
inh-slk	Inhibit Signaling Link	Support IPLIMx
init-card	Initialize Card	Add IPLIMx GPL
init-sys	Initialize System	Add IPLIMx to appl parm.
rept-meas	Report measurements	Add IPLIMx to card parm
rept-stat-card	Report Card Status	Add DCM card type
rept-stat-gpl	Report GPL Status	Add IPLIMx GPL
rept-stat-sccp	Report SCCP Status	Changes for TVG
rept-stat-slan	Report SLAN Status	Changes for TVG
rept-stat-slk	Report Signaling Link Status	Support IPLIMx
rept-stat-sys	Report System Status	Support IPLIMx
rept-stat-trbl	Report Trouble Status	Support IPLIMx
rtrv-appl-sock	Retrieve Application Socket	Support IPLIMx
rtrv-bip	Retrieve Board ID PROMs	Support IPLIMx
rtrv-dcmps	Retrieve DCM Parameter Set	Support IPLIMx

Table 3-12. Eagle Commands Affected by IP⁷ Transport (Continued)

Command	Description	Impact
rtrv-gpl	Retrieve Generic Program Load	Add IPLIMx GPL
rtrv-ip-card	Retrieve CARD IP parameters	All DCM
rtrv-ip-host	Retrieve IP hostname	All DCM
rtrv-ip-lnk	Retrieve Link IP Parameters	All DCM
rtrv-slk	Retrieve Signaling Link	Support IPLIMx
set-mem	Set Memory	Add IPLIMx to card parm
tst-slk	Test Signaling Link	Support IPLIMx
ublk-slk	Unblock Signaling Link	Support IPLIMx
unhb-slk	Uninhibit Signaling Link	Support IPLIMx

Refer to the *Commands Manual* for details on these commands.

IP-SCP with LNP Capability (Lab Only) (IP⁷ Release 1.0)

Currently available only in the lab environment, this feature allows the IP⁷ Secure Gateway to act as an IP-SCP. The SCCP/TCAP queries are received and responses returned over an IP interface.

Figure 3-8. IP Connected LNP Application (Lab Only)

NOTE: This functionality is provided in IP⁷ Secure Gateway Release 1.0 for lab investigation only. This function is not available for network implementation.

IP-SCP with LNP Capability (IP⁷ Release 2.0)

This feature, which was available only in a laboratory environment in release 1.0, allows the IP⁷ Secure Gateway to act as an IP-SCP. The SCCP / TCAP queries are received and responses returned over an IP interface.

Figure 3-9. IP Connected LNP Application (Lab Only)

IPLIM Protocol Support Enhancement (Release 28.1) (IP⁷ Release 6.0)

Customers require IETF protocol-based A-Link capacity up to 30,000 TPS between PSTN network elements and IP network elements. In addition, the customer requires that the data link layer protocols used to communicate with the IP network element be M3UA / SCTP / IP. Current releases of Tekelec IP⁷ Secure Gateway applications do not provide features supporting these requirements.

In this feature, the IPLIMx GPLs have been enhanced to provide for M3UA / SCTP / IP connections, in addition to the present MTP3 / SAAL / TALI / TCP / IP connections. Its rated capacity has been increased from 2000 TPS to 3000 TPS.

Each IPLIMx IP network connection is an SS7 signaling link. Sixteen of these links can be assigned to a linkset, yielding a theoretical total TPS of 48K. Currently, the maximum TPS limit is 30,000. The link can also be made a part of a combined linkset. With this feature, full support is provided for M3UA encodings and decodings; only a subset of the M3UA procedures, however, is supported. M3UA Internet draft v12 is implemented.

Due to the nature of the M3UA / SCTP protocols, links using this type of connection have fewer MTP2 features than those using SAAL / TALI / TCP. The resulting IPLIMx GPL supports DPC-SLS routing, but not SI or CIC routing.

Hardware Requirements

This feature requires a SSEDCCM (Single Slot Enhanced DCM).

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

ent-slk

Used to assign a signaling link to an equipment port on the STP and assign it as a member of a link set. A new parameter has been added to this command.

rtrv-slk

Used to retrieve link information for LSL and ATM signaling links. This command has been enhanced to display the value of the new **ent-slk** parameter.

msucount

The MSUCOUNT report has been enhanced for IPLIM-M3UA Links.

Limitations

This feature reflects a partial implementation of the M3UA draft specification. All M3UA Internet draft v12 encodings and decodings are supported. A subset of the M3UA Internet draft v12 procedures is supported.

IPLIMx to 8 Points (Release 29.1) (IP7 Release 7.1)

Description

The IPLIMx to 8 Point feature expands the capability of the Multipoint IPLIMx feature to support not just two, but eight IPLIMx signaling links on a SSEDCCM. This feature reduces the number of SSEDCCM cards required to provide a given number of IPLIMx signaling links. ANSI and ITU are supported by this feature.

Figure 3-10 illustrates the configuration supported by the IPLIMx to 8 Point feature. With this configuration 8 IP connections use the "A" and "B" interface. The socket/port identifier names are consistent with the naming convention used for Multi Port LIM. Any signaling link can use either Ethernet interface A or interface B.

Figure 3-10. IPLIMx to 8 Point Connectivity (8 Signaling Links)

Hardware Requirements

This feature requires the Single Slot EDCM (870-2372-01).

Enhancements to Existing Commands

For more detailed information on the commands in this section, see the *Commands Manual*.

The following commands have been enhanced to support the IPLIMx to 8 Points feature.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key.

chg-ctrl-feat

This command activates (turns on) Controlled Features or to clear the Critical alarm for a Controlled Feature whose temporary key has expired. This command accepts a Controlled Feature's Part Number (partnum). The IPLIMx to 8 Points feature Part Number will be accepted as valid input for this parameter. No changes to the syntax of this command are required.

rtrv-ctrl-feat

This command displays all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the IPLIMx to 8 Points feature.

ent-appl-sock

Use this command for the **iplim**, **iplimi**, or **ss7ipgw/ipgwi** application to configure the Socket table, which is used to associate the local host/local port to a remote host/remote port. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

chg-appl-sock

This command is used to configure the Socket table. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

rtrv-appl-sock

This command is used to retrieve the configuration data from the Socket table. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

rept-stat-applsock

This command generates a report of the IP application sockets' status. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

ent-assoc

This command is used to configure the SCTP Associations in the socket table. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

chg-assoc

This command is used to configure the IPAPSOCK table. The **:port** parameter has been enhanced with the range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** for IPLIMx ports.

rtrv-assoc

This command is used to retrieve the configuration data from the IPAPSOCK table. The **:port** parameter has been enhanced with the range values **a1, b1, a2, b2, a3, and b3** for IPLIMx ports.

rept-stat-assoc

Use this command to generate a report of the SCTP association's status. This command has been enhanced with the new parameter, **:port**.

ent-slk

Use this command to assign a signaling link to an equipment port on the STP and assign it as a member of a link set. The **:port** parameter has been enhanced with the range values **a1, b1, a2, b2, a3, and b3** for IPLIMx ports.

dlt-slk

Use this command to dissociate the equipment of a link port from a logical signaling link. The **:port** parameter has been enhanced with the range values **a1, b1, a2, b2, a3, and b3** for IPLIMx ports.

rtrv-slk

Use this command to retrieve link information for signaling links. The **:port** parameter has been enhanced with the range values **a1, b1, a2, b2, a3, and b3** for IPLIMx ports.

alw-/act-/canc-/dact-/inh-/unhb-/tst-/rept-stat-slk

For these commands, the **:port** parameter has been enhanced with the range values **a1, b1, a2, b2, a3, and b3** for IPLIMx ports.

rtrv-card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling link code, and the ports. The output for this command has been enhanced to show up to 8 provisioned ports on IPLIMx cards.

msucount

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and sockets. The **-1 [port]** option has been added to this command. The **port** value can be **a, b, a1, b1, a2, b2, a3, and b3** for links on supported cards. If **port** is not specified, **msucount** displays link statistics for port A for IPGWx and ports A and B, if provisioned, for IPLIMx.

connmgr

This pass command is used to generate reports about the status of the connection manager. The Connection Manager Data Summary has been enhanced to show all provisioned ports.

ent-assoc

Used to configure the SCTP Associations in the connection table. An association provides the transport for protocol data units and adapter layer peer messages. Each association is connected to a process on the far end. The range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** have been added to the **:port** parameter of this command.

chg-assoc

Used to configure the IPAPSOCK table. The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. The range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** have been added to the **:port** parameter of this command.

rtrv-assoc

Used to retrieve the configuration data from the IPAPSOCK table. The range values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** have been added to the **:port** parameter of this command, and the output enhanced.

rtrv-ls

Use this command to obtain the attributes of a link set or all link sets. This feature adds support for display of up to 8 links for IPLIMx on SSEDCM.

;

blk/ublk-slk

For this feature, these commands are not valid for IP links (IPLIM/IPLIMI, SS7IPGW/IPGWI).

act/canc-lpo

For this feature, these commands are not valid for IP links (IPLIM/IPLIMI, SS7IPGW/IPGWI).

Alarms and Error Codes**UAMs**

For this feature, LEDs are used to indicate link status.

In MultiPoint IPLIMx, each LED displays the status of a single port. LED A represents the status of port A, and LED B represents the status of port B. Both LEDs are set to RED when the card is initialized. When the state of the port changes to In Service Normal (ISNR), the corresponding LED is changed to GREEN. When the state of the port changes to Out Of Service (OOS), the corresponding LED is changed to RED.

In 8 Point IPLIMx, each LED displays the status of up to 4 ports. LED A represents the status of ports A, A1, A2, A3. LED B represents the status of ports B, B1, B2, B3. Both LEDs are set to RED when the card is initialized.

The LED is set to GREEN if all of the active ports it represents are ISNR. If any of the active ports are not ISNR, the LED will remain RED.

If a port goes OOS but remains active, the LED will be RED.

A port is considered active if an **act-slk** command has been issued for it. A port is considered inactive if a **dact-slk** command has been issued for it.

IP User Interface: Telnet Support (Release 29.0) (IP⁷ Release 7.0)

This feature supports IP-based connections to the Eagle UI via a telnet client. The Telnet feature adds up to 8 connections via a single IPSM card, up to 3 cards per system (total 24 telnet access ports), in addition to the existing 16 RS232 terminal ports.

NOTE: This feature is for use within a customer's private network ONLY. Connectivity to the Internet is NOT recommended, since no encryption scheme has been implemented to protect passwords transmitted across the network to the EAGLE.

Key benefits of this feature are:

- Access speed is improved;
- Remote access is enabled;
- Dial-up will not be required;
- Additional Eagle UI access points;
- Access to the Eagle UI from a network;
- Improved UI speed and data throughput;
- Provide a robust platform for future IPUI development.

The additional ports are accessible from any existing LAN or WAN connection along a customer's IP-based network. Craftspersons only need access to a standard **telnet** client in order to connect to and work on the Eagle.

This feature targets the customer's demand for improvements to the Eagle UI in the areas of network management, provisioning and maintenance tools, for which this feature provides a foundation.

As the first step in developing user interface improvements, this feature moves away from dedicated, hard-wired RS232 ports, and adds IP-based UI connections to the Eagle.

With this feature, IP-based access provides a standard interface via which Eagle commands are entered from a telnet session to the Eagle. The Eagle then provides command responses back to the remote telnet terminal. The Eagle can, in this case, provide responses without pacing (slowing down) the output.

Initially, Eagle telnet sessions resemble Eagle user interface in KSR mode. This feature is the first delivery of UI enhancements; additional features will build on the Telnet UI foundation.

The IPUI solution consists of adding 1 to 3 IPSM cards, with IP connectivity, to the Eagle. This enables telnet clients to connect from anywhere on the customers' IP LAN.

Refer to the *Database Administration Manual - System Management* for current information on this feature.

Hardware Requirements

This feature requires a IPSMI card for every 8 terminal ports, to a maximum of 24 IP terminal ports per system.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

chg-trm

Use the change terminal command to configure the operational characteristics of each of the 16 terminal ports used to connect modems, printers, and terminals to the system. The range value for the **:trm** parameter has been changed from 1...16 to 1...40. Also, the new value TELNET has been added to the **:type** parameter.

rtrv-trm

This command retrieves and displays the TERMINAL CONFIGURATION attributes (connected device type, communication settings, type of unsolicited messages received, etc.) for a single or all 16 TDM serial ports. The range value for the **:trm** parameter has been changed from 1...16 to 1...40. Also, the output of this command has been enhanced to display the new range value TELNET.

alw/rst-trm

This command attempts to change the state of the specified serial port from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal). The range value for the **:trm** parameter has been changed from 1...16 to 1...40.

inh/rmv-trm

This command sets the primary state of a serial port to OOS-MT-DSBLD (out-of-service maintenance disabled). The range value for the **:trm** parameter has been changed from 1...16 to 1...40.

rept-stat-trm

This command displays the status of the terminals. The range value for the **:trm** parameter has been changed from 1...16 to 1...40.

ent-card

Use this command to add a card to the database. The card type and application specifies the function assigned to the card. The new range value IPS has been added to the **:app1** parameter. Also, the new range value IPSM has been added to the **:type** parameter.

rtrv-card

Use this command to display the information about a card. The output of this command has been enhanced to display new parameter values.

Limitations

- This feature does not provide the client telnet application.
- Some function keys are not supported, but alternative keystrokes are identified.
- The ECHO command between TELNET devices and serial terminals is not supported.
- LOCK command not supported from TELNET terminals.
- Eagle commands **chg-secu-trm** and **rtrv-secu-trm** are not supported for telnet terminals.
- Persistent-device-states feature must be ON, for telnet terminals to default to Inhibited state, through initializations and reboots.
- Entering new passwords, or changing existing passwords is not supported from telnet terminals. This covers the commands **chg-user**, **ent-user**, **dlt-user**, and **chg-pid**. Security-related activity must be performed through a serial terminal (Terminals 1-16). Also, new users logging in for the first time, or users updating expired passwords, or any other activity where the EAGLE prompts for a new password, must be performed from a serial terminal.

IS-41 to GSM Migration (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

The IS-41 to GSM Migration Feature is planned for Release 30.1. The overall purpose of this feature is to support call termination for customers in migration from IS-41 to GSM wireless technology. The major functional areas of the Eagle that support IS-41 to GSM Migration are Database Administration, Protocol, and Measurements. This feature gives the wireless service provider a way to begin the migration of mobile subscribers from IS-41 to GSM while allowing those subscribers to retain their existing phone number. Once the subscriber is marked as migrated, the GSM handset is fully functional. This feature allows termination of calls to either an IS-41 or GSM handset based on the provisioned migration status of the subscriber. The IS-41 to GSM Migration feature is based on the same technology as the Eagle's G-Port feature. Therefore, this document refers to G-Port in several areas. The IS-41 to GSM Migration feature is implemented as an enhancement to the existing G-Port feature. Therefore, IS-41 to GSM Migration is considered and referred to as a G-Port feature in the current document.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

chg-gsmopts

Use this command to enter GSM (Global System for Mobile Telecommunications) system options in the database. This command updates the GSMOPTS Table.

Syntax

```
rtrv-gsmopts
:DEFMCC= <E212 Default
      Mobile Country Code>
:DEFMNC=<E212 Default
      Mobile Network Code>
:CCNC=<E214 Country
      Code and
      network Code>
:MCCMNC=<E212 Mobile
      Country Code and
      Mobile Network Code>
:SRFADDR=<Entity address
      of the MNP_SRF node>
:SRFNAI=<NAI value of the
      MNP_SRF>
:SRFNP=<NP value of the
      MNP_SRF>
:MSRNDIG=<RN to be used
      as is or
```

```

        concatenated
        with MSISDN>
:MSRNNAI=<NAI value for
        MSRN>
:MSRNNP=<NP value for
        MSRN>
:DEFMAPVR=<Default
        MAP version>
:SRIDN=<DN Location for
        SRI>
:PPSMSGTA=<Entity
        Address of IN
        platform>
:NPPSMSGTA=<New Entity
        Address of IN
        platform>
:PPSMSPCI1/PPSMSPCN1=
        <IN platform 1 ITU-I/
        ITU-N Point Code>
:PPSMSRI1=<Routing
        Indicator for IN
        platform 1>
:PPSMSPCI2/PPSMSPCN2=
        <IN platform 2 ITU-I/
        ITU-N Point Code>
:PPSMSRI2=<Routing
        Indicator for IN
        platform 2>
:IS412GSM=<IS41 to GSM
        Migration Prefix>

```

Default = No change to current value

Parameters

:is412gsm

IS-41 to GSM migration prefix.

Range = 1–15 digits (**0–9, A–F, a–f**), **none**

If you specify **none**, the value for the **is412gsm** parameter is deleted.

To specify this parameter, the G-Port feature must be turned on.

Example Output

```

chg-gsmopts:defmcc=214:defmnc=34

rlghncxa03w 00-08-20 09:04:14 EST Rel 2.2.0
CHG-GSMOPTS: MASP A - COMPLTD

```

rtrv-gsmopts

Use this command to display all GSM (Global System for Mobile Telecommunication) system options from the database.

Syntax**rtrv-gsmopts****Parameters**

None

Example Output

The following example shows the output if the G-Port feature is turned on.

rtrv-gsmopts

```
rlghncxa03w 00-08-20 09:04:14 EST Rel 28.1.030.1.0
GSM OPTIONS
-----
DEFMCC      = NONE
DEFMNC      = NONE
SRFADDR     = 123456789abcdef
MSRNDIG     = RN
DEFMAPVR    = 1
SRIDN       = TCAP
IS412GSM   = 0123456789abcde
```

The following example shows the output if the Prepaid Short Message Service (PPSMS) feature is turned on.

rtrv-gsmopts

```
GSM OPTIONS
-----
DEFMCC      = 214
DEFMNC      = 34
MSRNDIG     = RN
DEFMAPVR    = 1
SRIDN       = TCAP
IS412GSM   = 0123456789abcde
PPSMSRI1    = SSN
PPSMSRI2    = GT
PPSMSPCI1   = 1-1-1
PPSMSPCN2   = -----
PPMSGTA     = 1112223333,
              2223334444,
              ABCDEF123456ABC
```

Legend

DEFMCC	E212 default mobile country code.
DEFMNC	E212 default mobile network code.
CCNC	E214 country code and network code.
MCCMNC	E212 mobile country code and mobile network code.
SRFADDR	Entity address of the MNP_SRF node.
SRFNAI	The nature of address indicator value of the MNP_SRF.
SRFNP	The numbering plan value of the MNP_SRF.
MSRNDIG	The routing number to be used as is or to be concatenated with the MSISDN.
MSRNNAI	The nature of address indicator value for the MSRN.
MSRNNP	The numbering plan value for the MSRN.
SRIDN	Send Routing Information Dialed Number location.
PPSMSRI1	A routing indicator for an Intelligent Network (IN) platform used by Prepaid Short Message Service Intercept (PPSMS) for credit checking.
PPSMSRI2	A routing indicator for an Intelligent Network (IN) platform used by Prepaid Short Message Service Intercept (PPSMS).
PPSMSPCI1	An ITU international point code for an IN platform used by PPSMS.
PPSMSPCI2	An ITU international point code for an IN platform used by PPSMS.
PPSMSPCN1	An ITU national point code for an IN platform used by PPSMS.
PPSMSPCN2	An ITU national point code for an IN platform used by PPSMS.
PPMSGTA	Entity addresses for up to 3 IN platforms used by PPSMS.
IS412GSM	IS-41 to GSM Migration prefix.

Alarms and Error Codes

Alarms

New UIMs

Table 3-13 lists the new UIMs created to support this feature.

Table 3-13. IS-41 to GSM Migration Feature: New UIMs

UIM #	Severity	Message Text
1130	None	LOCREQ rcvd - IS412GSM not provisioned
1131	None	Invalid digits in IS41 MAP Digits parm

Error Codes

Incorrect use of the enhanced commands for the IS-41 to GSM Migration feature may result in the error messages listed in Table 3-14.

Table 3-14. IS-41 to GSM Migration Feature: Error Messages

Error Message	New?	Used by Command:
E3991 GPORT feature must be on	Yes	chg-gsmopts
E3993 GTIA/GTI must not be specified when (N) SERV= GPORT	No	ent/chg-srvsel (message deleted)

ISCC Interface Loopback Test (Release 22.0)

The ISCC Interface Loopback Test tests the interface to ISCC chip. The ISCC chip has a local loopback mode in which the internal transmit data is tied to the internal receive data such that the data to be transmitted is actually looped back as data just received. If the test is successful, the hardware and software up to the ISCC chip is not the cause of the failure.

The loopback test is similar to looping back the transmit and receive interfaces by using a loopback plug on the backplane. However, the advantages of using the ISCC loopback test over a loopback cable are:

- loopback test is interface independent
- loopback plug will not work for V.35 interfaces
- all hardware baselines supported
- can be done remotely
- no intrusive mechanical action on the part of the user

The disadvantages of the ISCC loopback test are:

- doesn't validate the other hardware components on the SS7 LIM card

- doesn't validate the Eagle backplane

When the ISCC loopback test is started, the ISCC chip is put into the local loopback mode. The SS7 LIM goes through the alignment process. If the signaling link aligns, the ISCC chip has passed the test. The ISCC chip is put back to normal operation and the results are displayed to the user.

Throughout this test, the link is deactivated and not available for traffic. When the ISCC loopback test is running, the SST state of the signaling link displays the entry LPBK and the AST of the signaling link displays the entry ISCC. These states of the signaling link are displayed with the **rept-stat-slk** command.

Parameters To run the ISCC loopback test, the **loopback** parameter has been added to the **tst-slk** command. The values of the **loopback** parameter are either **yes** or **no**.

yes = perform the ISCC loopback test

no = do not perform the ISCC loopback test (the default value)

*Input/
Output
Example*

tst-slk:loc=1201:port=a:loopback=yes

```
RLGHNCXA03W 97-06-07 15:55:57 EST Rel 22.0.0
2408.1078 CARD 1203,A INFO ISCC Loopback test PASSED
```

Report Date: 97-06-07 Time: 15:55:57

The ISCC loopback test can only test one signaling link at a time. The signaling link to be tested must be in the OOS-MT-DSBLD state or the test cannot be executed. If the link is still active (in the IS-NR state) and an attempt is made to execute the ISCC loopback test, the command is rejected and this message is displayed.

*Error
Messages*

E2916 Cmd Rej: Link must not be active to execute loopback

The ISCC loopback test cannot be executed if the link fault sectionalization feature is running. If the link fault sectionalization feature is running and an attempt is made to execute the ISCC loopback test, the command is rejected and this message is displayed.

E2921 Cmd Rej: LFS must not be running on requested link

The ISCC loopback test only works for SS7 LIMs. If the signaling link selected to test is not an SS7 LIM and an attempt is made to execute the ISCC loopback test, the command is rejected and this message is displayed.

E2292 Cmd Rej: Card does not exist or is not a LIM (LOC)

No command such as **act-slk**, that would change the state of the signaling link from OOS-MT-DSBLD, can be executed while the ISCC loopback test is running.

During the ISCC loopback test, no level 1 information about the link is available.

The ISCC loopback test cannot run if the specified card is unplugged.

ISUP Normalization Administration (IP⁷ Release 5.0)

New “Variant” ON / OFF Control Features are added for all the new *Tekelec-defined* Variants in PSTN Category 1 that Tekelec supports. Tekelec pre-assigns the PSTN Presentation values associated with each of these Control Features.

New Quantity Control Features are added to allow a customer the ability to provision a specified quantity of *user-defined* Variants within the PSTN Categories 4096-65535. Each Quantity Control Feature is associated with a specific quantity of Variants, i.e. 1, 2, 3, ... 20-Variants. The customer can only provision as many *user-defined* Variants as was purchased.

Refer to the *Database Administration Manual - Features* for current information on this feature.

New Commands

This section describes the new set of commands that will be created to administer the new Variant database tables. Refer to the *Commands Manual* for current information.

ent-pstn-pres

This new command provisions *Tekelec-defined* and *user-defined* PSTN Presentation values, including the PSTN Category, PSTN ID and descriptive text, i.e., “GERMAN ISUP”. This command may be used to define values within the *Tekelec-defined* range (PSTN Category_0-4095) as long as there exists an associated ON / OFF Control Feature, and its status is ENABLED. This command may be used to define values within the *user-defined* range (PSTN Category_4096-65535) as long as there exists an associated ISUP Normalization Quantity Control Feature and its status is ENABLED and its capacity is not going to be exceeded.

chg-pstn-pres

This new command changes the descriptive text of a previously provisioned PSTN Presentation value.

dlt-pstn-pres

This new command deletes a previously provisioned PSTN Presentation value.. The entry in the ISUP Variant table associated with the deleted PSTN will be marked as available. All of the associated ISUP messages and parameters that have been provisioned for the PSTN / Variant with the CHG-ISUPVAR-ATTRIB command are deleted.

chg-isupvar-attrib

This new command provisions the ISUP message and parameter database for a Variant based on the PSTN Presentation value.

copy-isupvar-attrib

This new command has been introduced to copy a “source” Variant database to a “destination” Variant database. This command provides the user with a quick way to provision a Variant by copying a source Variant database that has a similar ISUP protocol definition. The user can then use the **chg-isupvar-attrib** command to make the changes for the new protocol.

rtrv-isupvar-attrib

This new command is introduced to display the Variant database provisioned by the **chg-isupvar-attrib** command. An assortment of displays is possible depending on the filters applied.

Enhancements to Existing Commands

This section describes the changes required for existing commands. Refer to the *Commands Manual* for current information.

enable/chg/rtrv-ctrl-feat

These existing commands are modified to support the new Control Features. a

rtrv-pstn-pres

This existing command currently outputs a hard-coded display. It is modified to display the new *Tekelec-defined* PSTNs as well as any *user-defined* PSTNs that have been defined with the **ent-pstn-pres** commands.

chg-appl-rtkey

This existing command needs to be modified to access the new ISUP Variant table to determine if the PSTN Presentation value entered is valid. It needs to be modified to allow both Tekelec-defined and user-defined Variant PSTNs.

Upgrade Considerations**Feature Control Table**

The size of an entry and the maximum number of entries in the FEATCTRL.TBL does not change. However, there are new entries for the new Controlled Features introduced by this feature. It is necessary during the upgrade process to preserve the status of the existing permanently and temporarily ENABLED Control Features.

ISUP Normalization Variant Table

Prior to an Upgrade from IP⁷ SG Release 4.0 to IP7 SG Release 5.0, TCU has already built four entries in the table for the four Variant databases (Q.767, ETSIV3, UK, and Germany) and set the appropriate "control_flag" in each entry. During the Upgrade procedure the ETSIV3 Variant is preserved. The other three Variants (Q.767, UK and Germany) are preserved only if their associated Controlled Feature is ENABLED. During the Upgrade, the three Control Features are checked, and for each feature that is not ENABLED, its corresponding table entry is set back to default values, i.e., de-provisioned.

Limitations

There is a potential problem if Temporary Feature Keys are allowed for the Quantity Control Feature. If the temporary key expires, how are ISUP Variant Table entries reclaimed, and how are routing keys disabled. For example, if the feature key for 10-table-entries expired, leaving the 5-table-entries key enabled, there would be no way to know which five entries to keep. The solution is that Tekelec will not provide temporary keys for Quantity Control Features.

ISUP Message Type Screening (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

The ISUP Message Type Screening feature provides the Eagle with the capability to screen on ISUP message type. This feature augments the Gateway Screening functionality currently provided by the Eagle. The feature is based on the previous release of major enhancements to the Gateway Screening feature. (At that time, ISUP message type screening was not implemented.) The enhanced functionality of Gateway Screening results in a more secure, easily administered network.

NOTE: The functionality provided by this feature is not controlled by feature key or STP option. As part of core GWS capability, it becomes a core component the Eagle STP.

Hardware Requirements

This feature requires the hardware baseline for Release 30.0. This includes the GSM-II and TDM-10 (or later) configuration of the MASP (for the EOAM GPL), along with ASM cards (for the GLS GPL) and LIM, MPLIM, and ASM (SCCP GPL) cards to support screening of network protocol traffic.

New Commands

The following commands have been created to support this feature. For more information, see the *Commands Manual*.

ent-scr-isup

This command is used to add an allowed ISUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Syntax

```
ENT-SCR-ISUP
:SR=<screen name>
:ISUPMT=<ISUP message type>
:NSFI=<STOP>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = One alpha and 5 optional alphanumeric characters

:nsfi=stop

This parameter must have the value STOP.

Range = STOP

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

Example Input/Output

```
ENT-SCR-ISUP:SR=IEC:ISUPMT=1:NSFI=STOP
```

```
tekelecstp 02-09-02 09:39:13 EST Rel 30.0.0
```

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
```

```
Command entered at terminal #4.
```

```
ENT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

```
ENT-SCR-ISUP:SR=IEC:ISUPMT=9:NSFI=STOP
```

```
tekelecstp 02-09-02 09:41:41 EST Rel 30.0.0
```

```
ent-scr-isup:sr=iec:isupmt=9:nsfi=stop
```

```
Command entered at terminal #4.
```

```
ENT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

```
ENT-SCR-ISUP:SR=IBIG:ISUPMT=1&&128:NSFI=STOP
```

```
tekelecstp 02-09-02 09:44:58 EST Rel 30.0.0
```

```
ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop
```

```
Command entered at terminal #4.
```

```
ENT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

```
ENT-SCR-ISUP:SR=IALI:ISUPMT=*:NSFI=STOP
```

```
tekelecstp 02-09-02 09:47:03 EST Rel 30.0.0
```

```
ent-scr-isup:sr=iall:isupmt=*:nsfi=stop
```

```
Command entered at terminal #4.
ENT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

chg-scr-isup

This command is used to change the attributes associated with a specific allowed ISUP screening reference in the Allowed ISUP entity set.

Syntax

```
CHG-SCR-ISUP
:SR=<screen name>
:ISUPMT=<ISUP message type>
:NISUPMT=<New ISUP message type>
:NSFI=<STOP>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:nisupmt

Specifies the new ISUP message type for the entry. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = One alpha and 5 optional alphanumeric characters

:nsfi=stop

This parameter must have the value STOP if entered.

Range = STOP

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

Example Output

```
CHG-SCR-ISUP:SR=IEC:ISUPMT=1:NISUPMT=1&&2
```

```
tekelecstp 02-09-02 10:26:27 EST Rel 30.0.0
chg-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2
```

```
Command entered at terminal #4.  
CHG-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

dlt-scr-isup

This command is used to delete an allowed ISUP screening reference from the Allowed ISUP entity set.

Syntax

```
DLT-SCR-ISUP  
:SR=<screen name>  
:ISUPMT=<ISUP message type>
```

Parameters

:sr

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

Example Output

```
DLT-SCR-ISUP:SR=IEC:ISUPMT=9
```

```
tekelecstp 02-09-02 11:59:41 EST Rel 30.0.0  
dlt-scr-isup:sr=iec:isupmt=9  
Command entered at terminal #4.  
DLT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

```
dlt-scr-isup:sr=iec:isupmt=1&&2
```

```
tekelecstp 02-09-02 12:00:30 EST Rel 30.0.0  
dlt-scr-isup:sr=iec:isupmt=1&&2  
Command entered at terminal #4.  
DLT-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

rtrv-scr-isup

This command is used to display an allowed ISUP screening reference in the Allowed ISUP entity set. The REF column of the output indicates YES when the screen is referenced by another screen; otherwise, it is NO.

Syntax

```

RTRV-SCR-ISUP
:SR=<screen name>
:NSFI=<STOP>
:ISUPMT=<ISUP message type>
:ACTNAME=< GWS Stop Action Set Name>
:NSR=< Next Screen Reference>
:ALL=<YES,NO>

```

Parameters**:sr**

The name of the individual ISUP screen to which this rule will be added. If SR does not exist, it will be created.

Range = 1 alpha and 3 optional alpha-numeric characters

:nsfi=stop

This parameter must have the value STOP if entered.

Range = STOP

:isupmt

Specifies the ISUP message type. A single value or range of values may be entered. A * indicates all possible values, i.e. the entire range of 0-255.

Range = 000-255, *range entry is allowed, e.g. 123&&126

:actname

Specifies the GWS Stop Action Set Name.

Range = 1 alpha and 5 optional alpha-numeric characters

:nsr

Specifies Next Screen Reference.

Range = 1 alpha and 3 optional alphanumeric characters

:all

Supplies an additional output field, the NSR/ Action.

Example Input/Output

```
rtrv-scr-isup

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

Commands Enhanced with :nsfi=ISUP.

For the commands listed in Table 3-15, the :nsfi parameter has been enhanced with the new value ISUP.

Table 3-15. Commands with New Range Value :nsfi=isup

chg-scr-blkdpc	chg-scr-dpc	chg-scr-sio
ent-scr-blkdpc	ent-scr-dpc	ent-scr-sio
rtrv-scr-blkdpc	rtrv-scr-dpc	rtrv-scr-sio

rtrv-scrset

Use this command to retrieve an existing screenset. The output for this command has been enhanced to show the ISUP table.

Syntax

```
RTRV-SCRSET
:SCRN=<screen set name>
:NSFI=<next screen function identifier>
:NSR=<next screen reference>
:COPY=<COPY Stop Action>
:ACTNAME=<GWS Stop Action Set Name>
:ALL={YES, NO}
:DESTFLD={YES/NO}
```

Parameters

No parameters have been enhanced for this command.

Example Output

```

rtrv-scrset:scrn=gws1

e1070402 02-07-22 10:06:09 EST Rel 30.0.0
rtrv-scrset:scrn=gws1

chk-unref-ent

This command requests the STP to check for unreferenced entities in the STP gateway screening entity sets. The new parameter **:isup** has been added to support ISUP message type screening.

Syntax

```

CHK-UNREF-ENT
[:OPC =<Boolean>]
[:DPC =<Boolean>]
[:BLKOPC =<Boolean>]
[:BLKDPC =<Boolean>]
[:SIO =<Boolean>]
[:CGPA =<Boolean>]

rept-meas

Use this command to generate measurement reports on demand. The **:enttype** parameter has been enhanced with the new range value LSONISMT.

Syntax

```

REPT-MEAS
:ENTTYPE = <Entity>
...

```

Parameters

:enttype= <...,lsonismt>

The name of a specific entity to report on.

Range = <...,lsonismt> (specifies measurements for ISUP message type screening)

Example Output

The following example specifies an ANSI gateway linkset for the **lsn** parameter where **enttype=lsonismt**. The output format is the same as for an ITU gateway linkset:

rept-meas:type=gtwy:enttype=lsonismt:lsn=ls1201a:ni=43

```

rlghncxa03w 02-12-19 12:00:00 EST Rel 30.0.0

 MSUISPMT = 61423

;

```

rlghncxa03w 02-12-06 11:01:35 EST Rel 30.0.0
END OF ON-DEMAND LSONISMT-GTWY MEASUREMENT REPORT
;

```

rept-ftp-meas

This command provides the capability to manually initiate generation and FTP transfer of a measurements report from the MCPM to the customer's FTP server. The **:enttype** parameter has been enhanced with the new range value LSONISMT.

Syntax

```

REPT-FTP-MEAS
:TYPE=<REPORT TYPE (SCHEDULE)>
:PERIOD=<REPORT PERIOD>
:HH=<HALF HOUR>
:ENTTYPE=<ENTITY>
:DAY=<DAY-OF-WEEK>

```

Parameters

:enttype= <...,lsonismt>

The name of a specific entity to report on.

Range = <...,LSONISMT> (specifies measurements for ISUP message type screening)

Example Output

```

rlghncxa03w 03-02-23 12:47:07 EST Rel 2.2.0
Measurement Reports will be generated to FTP

rlghncxa03w 03-02-23 12:47:07 EST Rel 2.2.0
REPT-FTP-MEAS command was successful.

```

chg-measopts

Provides the capability to enable or disable the automatic generation and FTP transfer of scheduled measurements reports to the FTP server. This command has been enhanced with the new parameter **:gtwylsonismt**.

Syntax

```

CHG-MEASOPTS
:GTWYLSONISMT=<GTWY-LSONISMT REPORT>
<existing parameters...>

```

Parameters

:gtwylsonismt

GTWY linkset report for ISUP message type per originating NI.

Range = ON,OFF

Example Output

```

rlghncxa03w 00-02-18 17:02:57 EST Rel 2.2.0
CHG-MEASOPTS: MASP A - COMPLTD;

```

rtrv-measopts

Generates a UI display showing the enabled / disabled status of all FTP scheduled reports. The output for this command has been enhanced with the status of the GTWY-LSONISMT report.

Syntax

```

RTRV-MEASOPTS

```

Parameters

This command has no parameters.

Example Output

```
> rtrv-measopts

```

Alarms and Error Codes**Alarms****UIMs**

Two UIMs are associated with the ISUP Message Type Screening feature:

- UIM 1022 is generated if the link set limit (100) or the system limit (3000) of ISUP message types screened is exceeded.

```
1022    System Meas. limit exceeded for LSONISMT
```

- UIM 1160 is generated when a message fails the Allowed ISUP screening:

```
1160    GWS rcvd ISUP that is not allowed
```

Error Codes

Incorrect use of the enhanced commands for the ISUP Message Type
Screening feature may result in the error messages listed in Table 3-16:

Table 3-16. ISUP Message Type Screening: Error Messages

Error Message	New?	Used by Command:
E2136 At least one optional parameter is required	No	chg-scr-isup
E2281 Invalid ENTTYPE for this TYPE	No	rept-ftp-meas, rept-meas

E2539 No match on NSR parameter during retrieve	Yes	rtrv-scr-isup

GTWY Measurements

For Release 30.0, the new measurements report type GTWY-LSONISMT has been added. The measurements for this new report are kept on a per-link set, per- originating NI (ANSI), per-ISUP message type basis. These measurements will be reported in the
gtwy-lsonismt_yyyymmdd_hhmm.csv FTP report files (mm is a half-hour boundary).

ISUP-Over-IP Gateway for Connectivity to IP-SEPs (IP⁷ Release 1.0)

This functionality allows SS7 nodes to exchange ISUP protocol messages with one or more signaling end points (class 4 switches, class 5 switches, VoIP gateways, media gateway controllers (MGCs), or remote access servers) residing on an IP network. The IP⁷ Secure Gateway node maps the originating point code, destination point code, and circuit identification code to a TCP/IP address and port. The SEP is provided the originating and destination point codes in the MTP level 3 routing label as part of the passed protocol.

Figure 3-11. SEP Connectivity via ISUP over IP

This feature provides TCP/IP point-to-multipoint connectivity by way of a new GPL, SS7IPGW, running on the DCM which, together with the hardware, provides connectivity to databases (or other switching equipment) for SS7 devices that reside on ethernet TCP/IP networks.

A single DCM card running the SS7IPGW application provides connections to multiple IP devices (IP-SCPs, class 4 switches, class 5 switches, VoIP gateways, media gateway controllers, or remote access servers.) Multiple DCM cards running the SS7IPGW application are required, with similar configuration, to provide redundancy. The following is a common sequence of events that illustrates the use of point-to-multipoint connectivity:

1. Traditional SS7 devices route MSUs (such as ISUP Queries) to the gateway.
2. The gateway forwards the translated MSU to the correct TCP/IP device based on point code and filter information in the MSU.
3. The ISUP query is processed at the IP-SEP, and the IP-SEP sends an ISUP reply back to the gateway.
4. The gateway forwards the ISUP reply back to the sender of the original query.

To provide point-to-multipoint connections for SEP connectivity via ISUP over IP, a number of administration steps must first be performed, as follows:

- Set the ISUP over IP feature bit (**ipisup**). This is done with the **chg-feat** command.
- Links, link sets, destinations and routes to the destinations must be configured.
- The socket connections at each DCM card running the SS7IPGW application must be configured.
- The SS7 routing keys that are transported over each defined socket at each card must be configured. SS7 routing keys are filters consisting of values representing the DPC, SI, OPC and CIC fields from a incoming MSU message. All MSUs that match the filter are sent to the corresponding socket. The sockets represent TCP sessions. These keys allow for distribution of MSUs on the IP network.

ISUP Normalization in the IP⁷ SG (IP⁷ Release 4.0)

This feature allows an IP⁷ SG to deliver ISUP messages that arrive at the SG from the PSTN in a country specific ISUP variant format, to an IP device in a normalized ISUP format. Likewise, it enables traffic received from an IP device in a normalized ISUP format to be delivered to a PSTN link in the appropriate country variant format. The normalized ISUP messages are carried in TALI packets. Data is contained in the TALI packet itself to specify what National network (i.e., what country) the ISUP message originated from or is destined to and what ISUP variant the original PSTN message was formatted in.

This feature allows an IP device (e.g., a MGC providing Class 4 Tandem functionality) connected to an IP⁷ SG to perform call setup for multiple countries without knowledge of the various countries' ISUP message formats. The MGC needs only to support encode / decode functionality for the normalized format and does not have to support encode / decode functionality for each ISUP variant.

Refer to the *Database Administration Manual - Features* for current information on this feature.

ITU Duplicate Point Code Routing (Release 26.05)

This feature allows an Eagle STP mated pair to route traffic for two or more countries that may have overlapping point code values. For example, in the network shown in Figure 3-12, both Country 1 and Country 2 have SSPs with a PC value of 2047.

Figure 3-12. Network Example #1

Users must divide their ITU-National destinations into groups. These groups will likely be based on Country. However, one group could have multiple countries within it, or a single country could be divided into multiple groups. The requirements for these groups are:

- No duplicate point codes are allowed within a group.
- ITU-National traffic from a group must be destined for a PC within the same group.
- The user must assign a unique two-letter group code to each group.

For example, in the network shown in Figure 3-12 on page 150, Country 1 can only have 1 point code with a value of 2047. Traffic coming from SSP 2047 in Country 1 can only be destined to other nodes within Country 1. In this example, the user assigns a group code of 1 to Country 1, and a group code of 2 to Country 2.

When the user enters an ITU-National point code, he or she must also enter the group code, using the format "point code - group code". This group code must be used for any command that uses an ITU-N point code.

For current details on this feature, refer to the *Database Administration Manual - SS7*.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature.

chg-feat

rtrv-feat

All commands that allow the entry of an ITU-N destination now accept a group code for the ITU-N destination if the ITUDUPPC feature bit is on. The group code is part of the ITU-N point code.

These commands are:

ent-dstn, chg-dstn, dlt-dstn, rtrv-dstn (Destination Commands)

ent-rte, chg-rte, dlt-rte, rtrv-rte (Route Commands)

ITU MTP Restart (Release 26.0)

ITU MTP restart is a network management feature. It enables a restarting signaling point to bring a sufficient number of signaling links into the available state, and to update its routing tables before user traffic is restarted to the newly available signaling point.

This feature enables operators to implement ITU MTP Restart throughout their networks.

A central part of the restart procedure is the exchange of network status information between the restarting MTP and the adjacent nodes. In order for the procedure to make sense, the network status should not change significantly during this information exchange. As a consequence, there is an overall restart time defined for the node whose MTP is restarting as well as for the adjacent nodes. During this time, all activities within the node whose MTP is restarting as well as the adjacent nodes should be completed. This requires that the time available is used in an efficient way.

As a basis of the restart procedure, it is assumed that most of the signaling points within the network are accessible. Thus at the beginning of the restart procedure, all concerned routes are considered to be allowed, and the update of the network status is performed by the exchange of transfer-prohibited (TFP) and /or transfer-restricted (TFR) messages. The MTP restart procedure uses the Traffic Restart Allowed (TRA) message that is defined in section 15 of Q.704.

When an adjacent node has finished sending all relevant TFP and /or TFR messages to the node with the restarting MTP, it finally sends a TRA message that indicates that all relevant routing information has been transferred. Thus, at the node with the restarting MTP, the number of received TRA messages is an indication of the completeness of the routing data.

When the restarting MTP has completed all actions or when the overall restart time is over, it sends TRA messages directly to all of its adjacent nodes accessible via a direct link set. These messages indicate that the restart procedure is terminated and User traffic should be started.

Refer to the *Database Administration Manual - SS7* for current information on this feature.

Upgrade Considerations

ITU MTP Restart introduces four new timers into the Eagle's Level 3 Timer Table (IT18, IT19, IT20, IT21). There now resides 24 extra bytes of padding in the Level 3 Timer structure. With each timer taking 4 bytes, the total number of bytes needed for the new timers is 16 bytes.

The Level 3 Timer provides plenty of space to house the four new timers. Therefore during upgrade, only a conversion function will be required to handle the new table. This will convert the old structures without the timers to the new structures with the new timers, and set the new timers to their default values.

Changed Commands

Refer to the *Commands Manual* for current usage information.

chg-feat

This command has a new parameter, **itumtprs**.

rtrv-feat

This command has been modified to display whether or not the ITU MTP Restart feature has been activated.

ent-ls

The **ent-ls** command has been changed to allow the user to provision **mtpmse=yes** on an ITU linkset, if the ITU MTP Restart Feature bit has been turned on with the **chg-feat** command.

chg-ls

The **chg-ls** command has been changed to allow the user to provision **mtpmse=yes** on an ITU linkset, if the ITU MTP Restart Feature bit is turned on.

rtrv-ls

The **rtrv-ls** command has been changed to accept the **mtprse** parameter. If this parameter is specified, the command will show only the linksets that have the specified value of MTPRSE.

chg-13t (level 3 timers)

The **chg-13t** command has been changed to add timers IT18, IT19, IT20, IT21.

rtrv-13t

The **rtrv-13t** command has been changed to show the value of timers IT18, IT19, IT20, IT21.

chg-stpopts (stp options)

The **chg-stpopts** command has been changed allow the user to change the **mtprsi** parameter if either the ANSI Restart Feature bit or the ITU Restart Feature bit (**itumtpres**) is on.

Measurements

The measurement MTPRESTS will be pegged when Eagle restarts. This is an existing peg count that was previously used by ANSI restart, and will now be used for ANSI Only Restarts, ITU Only Restarts, and Mixed ITU / ANSI Restarts.

UIMs

The following UIMs are used by the ITU Restart feature. These are existing UIMs that were previously used by ANSI restart, and will now be used for ANSI Only Restarts, ITU Only Restarts, and Mixed ITU / ANSI Restarts.

- UIM #1088 - REPT-MTP-RSTRT: MTP Restart started
- UIM #1089 - RCVRY-MTP-RSTRT: MTP Restart Completed
- UIM #1087 - MTP RSTRT rcvd unexpected user traffic

Limitations

1. The Eagle will delay bringing into service Linksets that are not Restart Capable (**mtprse=no**) until after Restart is Complete.
2. While it is desirable to bring one link per linkset into service first when performing a Full Restart, because of the Eagle's distributed architecture there is no advantage to this. Thus the Eagle tries to align all links.
3. The restarting node should stop T18 when sufficient links are available, and enough TRA messages have been received. The Eagle will stop T18 when all activated restart capable links are available, and it has received TRAs on all restart-capable linksets.

4. If all ITU links fail, but the Eagle still has ANSI links available, the Eagle will not perform a Full MTP Restart. In a Mixed ANSI/ITU network, the Eagle will only perform a Full restart if all links, both ITU and ANSI, fail.
5. TFPs received on a link before the link is available at Level 3 will not be processed.

ITU SLS Enhancements (Release 26.0)

The ITU SLS Enhancements feature gives Eagle customers the ability to modify the method the Eagle distributes traffic across ITU SS7 links.

Eagle uses the LSB of SLS to load share between linksets of a combined linkset. ITU-T ISUP messages use a SLS that is obtained from the lower 4 bits of the CIC field representing the circuit being used.

CIC selection can be determined based on an odd/even method where a SSP uses either all odd CICs, or all even CICs, to help prevent “glaring” (i.e., 2 SSP attempting to seize the same trunk at the same time). This causes the LSB of the SLS to be fixed; if the LSB is fixed, inadequate load sharing occurs for the SS7 network. This situation can also occur within a single linkset (international), since Eagle also uses the SLS (containing a fixed LSB) to select a link within a linkset.

Refer to the *Database Administration Manual - SS7* for current information on this feature.

Changed Commands

The following commands have been modified to accommodate the SLS Enhancement. Refer to the *Commands Manual* for current usage information.

chg-feat

The **chg-feat** command has been modified to allow the customer to enable the "Use of Other Bit" functionality.

rtrv-feat

The **rtrv-feat** command has been modified to display whether the "Use of Other Bit" feature is enabled or disabled.

ent-ls

The **ent-ls** command has been modified to allow the customer to set the bit (1-4) to rotate as the new SLS LSB. It also has been modified to allow the customer to make the selection of the "other bit" (5-16, or none).

chg-ls

The **chg-ls** command has been modified to allow the customer to set the bit (1-4) to rotate as the new SLS LSB. It also has been modified to allow the customer to make the selection of the "other bit" (5-16, or none).

rtrv-ls

The **rtrv-ls** command has been modified to display the values entered for the "Other CIC Bit" and "Rotated Bit."

Restrictions

When two linksets are used as a combined linkset, they should have the same *Other CIC Bit* and *Rotated SLS Bit* settings. This is not enforced in the Eagle, and there is no warning mechanism for incorrectly provisioned linksets and routes

Upgrade Considerations

- Default values "Bit Rotation" and "Other Bit" must be set in LS tables during upgrade from Release 25 to 26.
- The *Use Other CIC Bit* feature bit must be set to disabled during the upgrade.

ITU-TFR Procedure (Release 26.1)

Currently, the Eagle implements most, but not all, of the signaling route management capabilities defined in ITU-T recommendation Q.704, section 13. In particular, those capabilities defined as national options are not yet implemented.

The ITU TFR (International Telecommunication Union - Transfer Restricted) feature implements the transfer-restricted procedures defined in section 13.4 of Q.704¹. The TFR procedure is used to redirect traffic away from a STP that is having problems routing traffic to a destination. When a STP determines that a destination is restricted, the STP will send, to its adjacent SPs, a TFR message containing an affected destination.

When a destination is restricted, the STP should not be used to route messages to the destination, even though it still has limited capability to do so. The TFR message is sent to the adjacent STPs to inform them of this condition.

¹ ITU-T Recommendation Q.704, SS7 - Signalling network functions and messages, ITU-T, July 1996.

The ITU TFR procedure can be enabled or disabled on a per ITU-N linkset basis (see “*Changed Commands*” on page 3-156). When the TFR procedure is enabled on a given linkset, TFR messages can be sent to the adjacent PC for the affected destinations.

NOTE: The procedure does not apply to ITU-I linksets. The ANSI network employs its own similar version of the TFR procedure for ANSI linksets.

Upgrade Considerations

Default values for "ITU TFR Procedure" must be set in LS tables during upgrade to Release 26.1. Table 3-17 shows the tables requiring modifications during the upgrade process.

Table 3-17. Tables and Fields Affected by Upgrade

Modified Tables	New Fields	Size	Value
Linkset	ITUTFR	1 byte	0 (off)

New UIMs

This feature introduces a new UIM that is output in the event a TFR message is received on a ITU-N linkset that does not support the ITU TFR Procedure (parameter is OFF).

1233 MTP Invalid ITU TFR RCVD

When this occurs, the craftsperson should check if the **itutfr** parameter needs to be enabled for the linkset, or if the problem exists on an adjacent STP.

Changed Commands

The following commands have been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

ent-/chg-ls

These commands have been enhanced with a new parameter, **itutfr**, to enable / disable the TFR Procedure on a per linkset basis, for ITU-N linksets only. The default value is OFF.

rtrv-ls

The **rtrv-ls** command has been modified with a new parameter, **itutfr**, to display all linksets that have the TFR procedure enabled, for ITU-N linksets only. The parameter value is displayed on the 2nd line of output when an LS name is specified.

ITU Gateway Measurements Enhancements (PR19536) (Release 26.05)

The ITU GTWY measurements schedule allows for the collection and reporting of ITU gateway-related data from the STP. The Eagle already has ANSI GTWY measurements collection and reporting facility in place, but the LIM & SCCP cards do not currently measure the ITU data required to be reported in the GTWY measurements schedule.

To address this situation, the LIM & SCCP cards have been modified to measure this data, and the OAM has been modified to collect it from the MTP (LIM) and SCCP cards, store it, and report it when requested.

The OAM currently polls MTP and SCCP cards every 30 minutes for GTWY measurements data. The responses the MTP/SCCP cards send back in response to these polls has been extended to include the ITU gateway-related data required by the ITU GTWY measurements. The OAM now stores this data in the measurements database, and retains it for a 25-hour period (same as for ANSI measurements).

New Measurements Reports Implemented for this Feature

The following ITU GTWY measurements have been implemented for this feature.

- The ITU GTWY measurements for the STP, LNKSET, LSDESTNI and LSORIGNI entity types have been implemented. The implementation is based on the existing ANSI GTWY measurement processing, with the exception that the ITU GTWY measurements are done per Linkset basis, whereas ANSI measurements are done per Linkset per NI basis.
- The measurements for entity type LNKSET provide the counts for various types of MSUs (for example, TFP/TCP, TFR/TCR, TFA/TCA, SLTA/SLTM, sub-system messages, and so on) received and transmitted per ITU GTWY Linkset.
- The measurements for entity type LSDESTNI provide the counts for inter-network messages received and transmitted per ITU GTWY Linkset.
- The measurements for LSORIGNI provide the counts for the various types of MSUs rejected, as a result of Gateway Screening failure due to one or more factors. The measurements are done per linkset basis.
- The STP-GTWY measurements provide the aggregate of other GTWY types measurements on a system total basis.

The diagrams below illustrate various GTWY configurations (OPC / DPC in networks other than Eagle's Adj Point Code).

Figure 3-13. ANSI Gateway Configuration - (Linksets LSA1 & LSA2 are ANSI Gateway Linksets)

Figure 3-14. ITU Gateway Configuration (Linksets LSI1 & LSI2 are ITU Gateway Linksets)

Figure 3-15. ANSI-ITU Gateway Configuration

To obtain these measurement reports via the EAGLE interface, the value "gtwy" must be specified for the **type** parameter for the **rept-meas** command. For the **rept-meas:type=gtwy** command, support for STP, LNKSET, LSDESTNI and LSORIGNI as valid values for the **type** parameter is continued.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

rept-meas

This command generates reports on demand. ITU gateway measurements are done for STP and on a per linkset basis for LNKSET, LSDESTNI, and LSORIGNI entity types.

To support this feature, the value **gtwy** has been added to the **type** parameter to obtain the measurements reports discussed above. This value specifies internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset per Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

KSR Terminal Feature (Release 20.0)

The Keyboard Send Receive (KSR) feature enhances the Eagle's dial-up administration functions by allowing faster throughput, since the control characters associated with the VT320 mode of terminal operation need not be transmitted.

The command used to modify the terminal configurations has a new parameter added to enable the KSR feature.

Features L - O

Large System (Release 27.2)

Eagle 27.2 introduces the Large System Feature, which increases the number of SS7 high- and low-speed links supported by the Eagle, currently limited to 500 links per system, to 700 links.

The Eagle Large System supports, with the existing 250 available card slots, the simultaneous operation of the following combinations of links (Table 4-1):

Table 4-1. Large System Configurations

Configuration	ATM Links	Low Speed Links
Configuration #1	100	600
Configuration #2	0	700

- Low speed links are defined as 56kb/sec or 64kb/sec links achieved through multi-port LIMs or any combination of the multi-port LIMs and 2-port LIMs.
- ATM links are defined by the existing EAGLE High Speed Link feature provided via the LIM-ATM board. Up to 100 of the 700 links can be LIM ATM links.

Hardware Required

To support the Large System requirements, new hardware components have been introduced to increase the Eagle system capacity beyond its current limitations.

High-Speed Multiplexer (HMUX)

The HMUX enhances the IMT bus by introducing a new 1Gb/sec inter-shelf bus bandwidth. The intra-shelf bus data rate remains 125Mb/sec. HMUX also enhances IMT performance by transmitting data between shelves only when necessary. Traffic between EAGLE cards on the same shelf is allowed to stay on the shelf IMT, and is not required to transit between shelves. Traffic between shelves is not required to pass onto an intra-shelf IMT bus.

Multi-Port LIM (MPL)

The Multi-Port LIM feature, which was introduced in Release 27.1, supports the Large System feature by expanding the number of DS0 links supported by the EAGLE STP to meet customer requirements for expanded link capacity and reduced system footprint. The Multi-Port LIM feature introduces a new EAGLE card called the Multi-port LIM Card.

MCAP-256 (P/N 870-1307-07)

The current MCAP-256 has been modified with a new PROM to support the HMUX card.

TDM (P/N 870-0774-10)

The new version of the Terminal Disk Module (TDM) provides an integrated interface to transmit the 16 pairs of shelf IDs to the HMUX boards in the Eagle system.

Changed Commands

Refer to the *Commands Manual* for current usage information.

ent-slk

For this release, the syntax of the **ent-slk** command has not been changed. However, support for 700 links requires some clarification of the following existing error message:

**Error
Message**

E3409 Cmd Rej: Max number combined LSLs and ATM HSLs already entered

This message appears when you try to enter a low-speed or ATM high-speed signaling link and the system already contains the maximum number of links it can support.

Upgrade Considerations

Upgrade to the EAGLE Large System from an existing fielded Release 26.0 or later EAGLE system can be done without a nodal outage. New IMT cabling, link cabling, control shelf backplane replacement, EAGLE card replacement, and supplemental hardware/cabling may be required. Additionally, special software may be required to support any temporary configurations. Also, upgrade to the Large System from an existing fielded Release 26.0 or later EAGLE system can be executed without forcing a change to the existing Signaling Link Codes (SLCs).

Measurements data are not preserved from a prior release to the upgrade release during an upgrade. If the customer desires to retain a record of pre-upgrade measurements, a hardcopy of the measurements data can be obtained using the documented measurement report procedures. Alternatively, measurements data can be copied to a Measurements removable cartridge using the **copy-meas** command. The data is then available for offline (non-EAGLE) processing. Due to potential changes in data formats as a result of the upgrade, measurements data cannot be restored to the upgraded EAGLE.

Limitations

The volume of data in the Measurements Reports on a Large System requires that they be sent to a dedicated terminal paced at 19.2K baud.

Large System—Phase 2 (Release 28.0)

This feature builds upon the Large System foundation, and increases the number of SS7 high- and low-speed links supported by the Eagle to 1200 links.

Refer to the *Database Administration Manual - SS7* for more information.

Hardware Required

To provision up to 1200 signaling links in the database, the following hardware must be installed:

- HMUX cards, P / N 870-1965-XX, replacing all the IPMX cards.
- GPSM-II, P / N 870-2360-XX or later, installed in card locations 1113 and 1115.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

- TDM, P / N 870-0774-10 or later, installed in card locations 1114 and 1116.
- Control Shelf Backplane, P / N 850-0330-06
- The Measurements Platform feature must be enabled.
- Enough Multiport LIMs (MPL), P / N 870-1826-XX, or E1 / T1 MIMs, P / N 870-2198-XX to bring the number of signaling links from 701 to 1200, installed according to the provisioning rules for a 1200 signaling link system; see the following section. The system can contain a mix of 2-port LIMs, Multiport LIMs, and E1 / T1 MIMs.

For detailed hardware information, refer to the *NSD Hardware Manual*.

New Commands

No new commands were created to support the Large System—Phase 2 feature.

Enhancements to Existing Commands

For more detailed information on the commands in this section, see the *Commands Manual*.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the Large System—Phase 2 feature. For current information on these commands, see the *Commands Manual*.

chg-meas

Use this command to turn measurement collection on or off or to schedule autonomous measurement reports. Use the command `chg-meas:collect=off` to turn off reports to the UI when using <700 links.

Large System (Phase 3)—1500 Links (Release 29.0)

The Large System (Phase 3)—1500 Links feature is the Eagle with 1,500 links.

Customers continue to rapidly expand their link capacities beyond the configuration supported in previous releases. The Large System—Phase 2 feature with 1200 links, 115 ATM cards and 100 IPLIMs, implemented in Release 28.0, has been expanded to include additional links, as well as Sigtran-based associations.

With the increased number of links (and with the introduction of the 6,000 Routesets feature) the Multicast traffic will grow significantly.

With this feature, the total number of signal links supported by Eagle is 1500 total links per system. The Eagle also enforces the following link / card counts:

- Maximum of 1500 links is the total number of links supported per system:
 - Default of 1200 links are allowed
 - Allow maximum 1500 links by Feature Key
- Within the total number of links allowed, the user may provision:
 - Maximum 115 ATM cards
 - Maximum 100 IPLIM cards
 - Maximum 2 SS7IPGW (ANSI) application DCM cards
 - Maximum 2 IPGWI (ITU) application DCM cards

The Eagle enforces a maximum link count of 1500 total links per system, as well as the following link / card counts:

- Maximum 1500 links
- Maximum 115 ATM cards
- Maximum 100 IPLIM cards
- Maximum 2 IPGTWY cards

For this feature, the Eagle provides feature access keys to exceed 1200 links. The default for these feature access key is OFF.

Hardware Requirements

No new hardware required or introduced to support the software. However, in order to provision more than 1,200 links, the Eagle must be equipped with the HMUX and TDMs (870-0774-10) or later, and GPSM-II must be the active and standby EOAM.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key for enabling 1,500 links.

This command is used to enable Controlled Features the customer has purchased on a permanent basis or may be used to temporarily turn a feature on for a thirty (30) day trial period. Features may be temporarily enabled by using a temporary password or may be permanently enabled by using a permanent password.

This command accepts a Controlled Feature's Part Number (partnum) and a Feature Access Key (fak). The Large System (Phase 3) Part Number and Feature Access Key numbers will be accepted as valid input for these parameters. No changes to the syntax of this command are required.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the Large System (Phase 3) feature.

rtrv-slk

This command retrieves link information for LSL and ATM signaling links. It has been enhanced to display the increased number of links.

Last 10 Command Retrieval (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Currently the Eagle supports retrieving the last command entered from the terminal only. Customers use this feature when making multiple entries that require only minor changes to the previous command. They want the ability to display the last 10 commands entered, in a manner similar to the DOSKEY function.

The Last 10 Command Retrieval feature supports command retrieval of at least the last 10 commands entered at KSR, VT 320, and SCCS type terminal (up to 20 commands for IP User Interface terminals). This capability is supported at the Eagle MMI terminals, as well as at terminals connected via the IP user interface.

NOTE: This feature is supported only on KSR, VT 320, and SCCS type terminals. Terminals configured as SEAS or OAP terminals are not supported for this feature.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

No commands have been enhanced for this feature. See the *Commands Manual*, Chapter 4, for discussion of the arrow keys used with this feature.

Alarms and Error Codes

Alarms

No new alarms/error codes have been created for this feature.

Limitations

Resetting the COM parameters on terminal clears the history queue. This is only done internally by software. This occurs when a terminal is inhibited and allowed (i.e. `inh-trm:trm=xx` and `alw-trm:trm=xx`) or Kermit transfer is initialized (i.e. with command `act-file-trns`).

Link Failure Status Information (Release 22.0)

The level 2 SS7 data is divided into 2 groups, service data and alignment data.

Service data is a running history of when the link comes in service and goes out of service. The history contains the reason the link fails from the perspective of Level 2 along with the timestamp. This information can be used to help solve whether the near end or far end node is responsible for causing the link to fail. This is a list of all the possible level 2 link failure reasons.

- RC/BSNR link failure — Received two out of three invalid backward sequence numbers from the far end. The far end office should be contacted to determine why invalid BSNs are being sent.
- RC/FIBR link failure — Received two out of three invalid forward indicator bits from the far end. The far end office should be contacted to determine why invalid FIBs are being sent.
- SIE received — Received status indication of Emergency from the far end. An SIE indicates the far end is now being aligned. The far end office should be contacted to determine why an SIE was sent.
- SIN received — Received status indication of Normal from the far end. An SIN indicates the far end is now being aligned. The far end office should be contacted to determine why an SIN was sent.
- SIO received — Received status indication of Out of Alignment from the far end. An SIO is sent when the node begins initial alignment. The far end office should be contacted to determine why an SIO was sent.
- SIOS received — Received status indication of Out of Service from the far end. An SIOS is sent upon completion power up until initial alignment is started. An SIOS is also sent when the far end cannot transmit or receive message signal units for reasons other than processor outage. The far end office should be contacted to determine why an SIOS was sent.
- Stop commanded — Level 3 commanded Level 2 to stop.
- Stopped receiving data — No data is being received on the signaling link. Check the physical connections of the signaling link. Using an analyzer, test for level 1 and level 2 functions.
- SUERM link failure — Signal Unit Error Rate Monitor (SUERM) counter exceeded threshold. The SUERM maintains a counter to estimate the signal unit error rate. The far end office should be contacted to determine why the error rate is high.
- Too many ISCC interrupts — Too many interrupts received over the link.
- TXC/T6 expired — Remote congestion timer expired. The far end is in congestion too long. The far end office should be contacted to determine why BSN and BIB are not being sent.

- TXC/T7 expired — Excessive delay of acknowledgment timer expired. Far end taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine why the delay in acknowledging MSUs.

The level 2 link failure reason shows which node on the link caused the fault and why. If the history shows the link did not realign after the failure, the alignment data buffer shows the reason the link was unable to be realigned.

Alignment data is a running history of Level 2 alignment events with timestamps. This information can be used to help solve why the link does not realign.

Alignment events are buffered during the out of service, initial alignment, aligned / ready and aligned / not ready states. Only the first unique occurrence of an event and its timestamp is buffered. Alignment events are transmitted signal units, received signal units, level 3 commands, level 2 status and state transitions. Table 4-2 lists all the possible alignment events sorted by event type. Realignment may fail for reasons other than the events listed in Table 4-2. For example, realignment fails if an SIO is received when the link is in the aligned / ready state. Therefore, the failure reason is displayed as an abnormal link state control state transition.

Table 4-2. Signaling Link Alignment Events

Transmitted	Received	State	Event
FISU	FISU / MSU	IAC Idle	AERM / Abort proving
SIO	SIO	IAC Not aligned	T2 expired
SIE	SIE	IAC Aligned	T3 expired
SIN	SIN	IAC Proving	Exceeded proving period count
SIB	SIB	Out of Service	Stop commanded
SIOS	SIOS	Initial Align	SUERM link failure
SIPO	SIPO	Align / Ready	RC / BSNR link failure
		Align / Not Ready	RC / FIBR link failure
		In Service	Stopped receiving data
		Processor Outage	Too many ISCC interrupts
			T1 expired

These are definitions of the alignment failure reasons.

- AERM / Abort proving - Alignment Error Rate Monitor (AERM) counter exceeded threshold. AERM increments a counter if it detects an error in the signal unit. Aborting the proving period causes the proving period count to be incremented. If the proving period count exceeds its threshold, the link will fail with the Level 2 Exceeded proving period count failure reason. The far end office should be contacted to determine the cause for the high error rate.
- Exceeded proving period count - The proving period was aborted five times by the AERM before the proving period timer expired. The far end office should be contacted to determine the cause for the high error rate.
- RC/BSNR link failure — Received two out of three invalid backward sequence numbers from the far end. The far end office should be contacted to determine why invalid BSNs are being sent.
- RC/FIBR link failure — Received two out of three invalid forward indicator bits from the far end. The far end office should be contacted to determine why invalid FIBs are being sent.
- Stop commanded — Level 3 commanded Level 2 to stop.
- Stopped receiving data — No data is being received on the signaling link. Check the physical connections of the signaling link. Using an analyzer, test for level 1 and level 2 functions.
- SUERM link failure — Signal Unit Error Rate Monitor (SUERM) counter exceeded threshold. The SUERM maintains a counter to estimate the signal unit error rate. The far end office should be contacted to determine why the error rate is high.
- T1 expired - Align / Ready timer expired. Far end is not responding during Aligned / Ready or Aligned / Not Ready states before timer expires. The far end office should be contacted to determine why the far is not responding.
- T2 expired - Not aligned timer expired. Far end is not responding during Not Aligned Initial Alignment Control state before timer expires. The far end office should be contacted to determine why the far end is not responding.
- T3 expired - Aligned timer expired. Far end is not responding during Aligned Initial Alignment Control state before timer expires. The far end office should be contacted to determine why the far end is not responding.
- Too many ISCC interrupts — Too many interrupts received over the link.

The service data and alignment data is displayed with the **l2stats** parameter of the **rept-stat-slk** command. The **l2stats** parameter has the following values:

no = don't display Level 2 status information (the default value)

align = display alignment data only

service = display service data only

both = display both alignment and service data

brief = display at most last 10 alignment data events only

The alignment data is displayed in a three column format. Column 1 is the type of event that was buffered. Column 2 is the event. Column 3 is the timestamp for the event.

The service data is displayed in a two column format. Column 1 contains the event. Column 2 has the corresponding timestamp.

The following is an example of how the service data and alignment data is displayed.

If a card is unplugged, the link status information is lost.

The alignment data buffer and service data buffers are circular buffers that can hold 69 events.

The level 2 statistics can only be displayed for SS7 LIMs. If the specified signaling link is not an SS7 LIM, the command is rejected and this message is displayed.

Error Message E2918 Cmd Rej: Link must be SS7 to display Level 2 stats

Link Fault Sectionalization (Release 21.0)

The EAGLE STP supports up to 16 Link Fault Sectionalization (LFS) tests at one time and a maximum of 32 remote link elements for each LFS Test while being able to display real time results of the tests in progress.

Link fault sectionalization allows maintenance personnel, using industry standard error patterns, to perform DSOA fault sectionalization tests, a series of far-end loopback tests from the local EAGLE STP or to a remote EAGLE STP, and to identify faulty segments of an SS7 transmission path up to and including the remote network element. Refer to Figure 4-1 and Figure 4-2.

The SS7 LIM must be powered up and provisioned with the signaling link deactivated before starting the link fault sectionalization tests. No messages are transferred to or from the signaling link by the SS7 LIM while the link is performing a link fault sectionalization test.

Figure 4-1. DS0 Link LBP for Latching Test

Figure 4-2. OCU/DCU Link LBPs for Non-Latching Test

The point on the signaling link at which each loopback test ends is called the far-end loopback point. A far-end loopback point (LBP) is achieved when the remote link element (RLE) sends the received data back to the transmitter, allowing the transmitter to verify the received data.

The remote link elements are shown in Table 4-3.

Table 4-3. Link Fault Sectionalization Tests Remote Link Element (RLE) Types

Element	RLE Description	Latching	Nonlatching
DSO	DSO Dataport	Yes	No
OCU	OCU Dataport	Yes*	Yes
CSU	CSU Dataport	Yes*	Yes
DSU	DSU Dataport	Yes*	Yes
NEI	Network Element Interface	Yes	No
* The OCU, CSU and DSU must be strapped or optioned to support latching link fault sectionalization loopback.			

The LBP is moved along the signaling link path until the LBP is in the far-end network element. Therefore, each LBP along the link requires the initiation of one link fault sectionalization test on the SS7 LIM.

The link fault sectionalization test types for loopback tests are shown in Table 4-4.

Table 4-4. Link Fault Sectionalization Test Types

Link Fault Sectionalization Test Types	Description
Latching link fault sectionalization test (LLT-auto)	A loopback point is established using signaling commands and remains until it is removed by signaling commands.
Latching link fault sectionalization test (LLT-man)	A loopback point is established by manual means and remains until it is removed by manual means.
Nonlatching link fault sectionalization test (NLT)	A loopback command is interleaved with the test data.

Remote Loopback Testing for DSOA

This capability allows a LIM card at a remote location running the *ss7ansi* application to be placed in loopback automatically when it receives a valid latching loopback code sequence from the network (when a test pattern is detected). This allows the signaling link connected to that card to be tested from another far-end network element or maintenance test unit. While in loopback mode, the signaling link assigned to the LIM card that is in loopback mode is out of service.

Remote Loopback Testing for OCU

This feature allows a LIM card (configured as a LIMOCU) running the *ss7ansi* application to be placed in loopback automatically when it receives a valid latching loopback code sequence from the network (when a test pattern is detected). Both latching and nonlatching loopback are supported. Because latching and nonlatching loopback cannot be mixed in a network, the loopback testing mode selected depends on the network configuration and configuration of OCU channel bank. The OCU channel bank recognizes the loopback control codes and does a current reversal. The LIMOCU only sees a current reversal and acts on that without knowing whether it is latching or nonlatching. While in loopback mode, the signaling link assigned to the LIM card that is in loopback mode is out of service.

Link Diagnostics

Link Diagnostics provides detailed status information of link failures. This capability either confirms or eliminates a portion of the near-end node as the reason for the link failure. Refer to Figure 4-3.

Figure 4-3. Link Diagnostic Diagram

SS7 Level 2 status information is buffered before and after a link failure has occurred. This feature provides the capability to loop the internal transmit and receive data on the LIM card. Link failures can occur on the near end node, far end node, or the cable connecting the two nodes.

Link Failure Status Information

The Level 2 SS7 data is divided into two groups: service data and alignment data.

Service data is a running history of when the link comes in service and goes out of service. The history contains the reason the link fails from the perspective of Level 2 along with the timestamp. This information can be used to help solve whether the near end or far end node is responsible for causing the link to fail.

Alignment data is a running history of Level 2 alignment events with timestamps. This information can be used to help determine why the link does not realign.

The service and alignment data buffer and service data buffers can each hold 69 events.

Hardware Configuration

The link fault sectionalization feature requires a LIM running the SS7ANSI application with the AINF interface. With this interface, the test data is guaranteed to be a continuous data stream, and the commands provide the ability to put any element in the link into latched loopback.

The test data is provided by the AINF interface and is shown in Table 4-5. The data stream sent is verified against the data stream received and a bit error count is updated. When the bit error count exceeds 255, the value of the bit error count remains at 255 and does not overflow.

Table 4-5. Link Fault Sectionalization Test Patterns

Test Pattern	Data	Description
B2047	N / A	2047-bit Bert pattern sent until it is terminated by software.
B2047 Non Latching	N / A	2047-bit Bert pattern sent interleaved with loopback command until it is terminated by software.
B511	N / A	511-bit Bert pattern sent until it is terminated by software.
B511 Non latching	N / A	511-bit Bert pattern sent interleaved with loopback command until it is terminated by software.
OCTET	default = h'32	A continuous series of the specified octet data is sent until it is terminated by software. (Latching only)
ALTERNATE	default = h'FF	A count of 100 octets of the specified data followed by 100 octets of 0 is sent alternating until it is terminated by software. (Latching only)

Link Fault Sectionalization Test Indicators

Two indicators have been added to the **rept-stat-slk** and **rept-stat-ls** commands to show whether the signaling link has a far end loopback condition and if a link fault sectionalization test is in progress.

When the signaling link is in a far end loopback condition:

- The primary state (PST) is OOS-MT-DSBLD.
- The secondary state (SST) is LPBK.
- The associate state (AST) is FE.

When a link fault sectionalization test is in progress:

- The primary state (PST) is OOS-MT-DSBLD.
- The secondary state (SST) is LPBK.
- The associate state (AST) is LFS.

When both the signaling link is in a far end loopback condition and a link fault sectionalization test is in progress:

- The primary state (PST) is OOS-MT-DSBLD.
- The secondary state (SST) is LPBK.
- The associate state (AST) is FE-LFS.

Link Fault Sectionalization Test Report

Test results are displayed to the terminal when the link fault sectionalization tests have completed. The following is an example of a link fault sectionalization test report.

Output Example

```
RLGHNCXA03W 96-04-16 16:02:05 EST Rel 21.0.0
LOC = 1205 Port = B LSN = ----- Start time = 11:10:34

PATTERN = ALTERNATE DATA= FF MAXERR = 10 TIME = 00:02:00

TEST STATUS = ERROR, bit error exceeded threshold.

5    -----  NEI   0    LLT   15           1          00:01:20
```

Commands

The link fault sectionalization feature is an optional feature on the Eagle. A new parameter has been added to the **chg-feat** command to turn this feature on (**lfs=on**). Once this feature is turned on, it cannot be turned off.

The output of the **rtrv-feat** command has been modified to show whether the link fault sectionalization feature is on (**lfs=on**) or off (**lfs=off**).

Refer to the *Commands Manual* for current usage information.

The link fault sectionalization feature introduces five new commands.

- **ent-lbp** — add link fault sectionalization test data to the database
- **dlt-lbp** — remove link fault sectionalization test data from the database
- **rtrv-lbp** — display link fault sectionalization test data in the database
- **act-lbp** — start a link fault sectionalization test.
- **dact-lbp** — stop a link fault sectionalization test.

The link fault sectionalization data is configured in the database using the parameters shown in Table 4-6.

Table 4-6. Link Fault Sectionalization Data Entry Parameters

Link Fault Sectionalization Data Entry Parameters	Description
Card Location	SS7 LIM card location
Port Number	Port a or b on the SS7 LIM
Loopback Point Number	Identifies the remote link element for setting the loopback point. Value is from 1 to 32.
CLLI	Description of the remote link element

Table 4-6. Link Fault Sectionalization Data Entry Parameters (Continued)

Link Fault Sectionalization Data Entry Parameters	Description
Remote Link Element Type	The remote element type from Table 4-3 on page 4-13.
Repetition Count	A repetition of the same element type in the link path. This is needed for configuring the link element as a latched loopback point. The value is from 0 to 31.
Link Fault Sectionalization Test Type	Link fault sectionalization test type from Table 4-5 on page 4-16 (LFS-man not supported for the database)

The **act-1bp** command starts one or a sequence of link fault sectionalization tests. The data stream sent is verified against the data stream received and the bit error counts and block error counts are displayed when the test completes.

The link fault sectionalization test parameters are described in Table 4-7. If either the remote link element type, repetition count, or link fault sectionalization test type are specified with the **act-1bp** command, they must all be specified and the loopback point number parameter is ignored. Otherwise the values for remote link element type, repetition count, or link fault sectionalization test type are read from the data entered with the **ent-1bp** command using the loopback point number parameter value. The test data parameter is only valid for test patterns OCTET and ALTERNATE.

If all LBPs are selected for the loopback point number parameter, a sequential test of the LBPs, as entered in the database with the **ent-1bp** command for that signaling link, is performed until the entire signaling link has been tested. When performing a test with all LBPs, the test is aborted with the first failed test.

The test is stopped either because the amount of time for the test has expired or if the bit error threshold has been exceeded. The time duration parameter specifies the maximum time duration for one link fault sectionalization loopback point test. The default value is one second (00:00:01) and the maximum value that can be entered is 24 hours (24:00:00). The bit error threshold parameter specifies the maximum number of bit errors allowed for one link fault sectionalization loopback point test. The default value is 56 errors and the maximum value that can be entered is 4,838,400 (24 hours x 56 errors per second).

Table 4-7. Link Fault Sectionalization Test Parameters

Parameters	Description
Card Location	SS7 LIM card location
Port Number	Port a or b
Loopback Point Number	The remote link element for setting the loopback point. Value is from 1 to 32, or if this parameter is not specified, all LBPs are selected.
Remote Link Element Type	The remote element type from Table 4-3 on page 4-13.
Repetition Count	A repetition of the same element type in the link path. The value is from 0 to 31.
Link Fault Sectionalization Test Type	Link fault sectionalization test type from Table 4-4 on page 4-14.
Time duration	Time for one loopback point in hours, minutes, and seconds (hh:mm:ss). The value is from 00:00:01 to 24:00:00. The default value is 1 second (00:00:01).
Error threshold	Bit error threshold. The value is from 0 to 4838400. The default value is 56.
Test pattern	The test pattern from Table 4-5. The default value is B2047.
Test data	The octet to be used for test pattern OCTET or ALTERNATE only.

The **dact-1bp** command stops the link fault sectionalization test in progress and cancels any pending link fault sectionalization tests for the SS7 link. The pending tests are the next sequential LBPs for the SS7 signaling link when an entire link test was initiated.

Link Maintenance Enhancements/LFS Increase for MPL-T and MIM (Release 31.3)

Proper functionality of a signaling link (SLK), from an EAGLE MTP card to a remote Network Element, is determined through a variety of mechanisms provided by Eagle. This feature covers two main areas of improvement to these mechanisms. These improvements are the introduction of an operator command to force a signaling link into local line-oriented loopback and the enhancement of the TST-SLK command to allow for duration tests up to 24 hours.

The LFS Increase for MPL-T and MIM feature increases the number of simultaneously initiated Link Fault Sectionalization (LFS) tests on the MPL-T, T1 MIM and CR-T1 MIM from 1 to at least 4.

Link Status Reporting (Release 21.0)

The current method for reporting link unavailability requires the user to decipher several print outs. The first report informs the user of the link status, while subsequent reports detail the reasons for the status change. This feature provides a single report informing the user of the link unavailability with the corresponding reason. This report is generated by the **rept-stat-slk** command. If there are multiple reasons for the link becoming unavailable, the user is informed of the highest priority cause.

The **rept-stat-slk** command output is expanded to display new error codes in the Unvail Cause field for each of the link unavailability causes detailed in the Table 4-8. Two lines of information for the Unvail Cause field are displayed if conditions require it.

When an unavailability cause clears, the alarm text is displayed for the next highest priority cause.

When the last unavailability cause clears, a link available message (UAM 200) is displayed.

Table 4-8. 21.0 Link and Link Set UAMs

UAM	Alarm	MRN in Release 21.0	Signaling Link Unavailability Priority	Abbreviation for the rept-stat-slk Unvail Cause field
0200	None	RCVRY-LKF: link available		
0201	Minor	REPT-LKF: remote NE loopback	1	NE
0202	Minor	REPT-LKF: HWP - too many link interrupts	3	INTR
0203	Minor	REPT-LKF: lost data	4	LD
0204	Minor	REPT-LKF: XER - SUERM threshold exceeded	5	XER

0264	None	REPT-LINK-CGST: congestion level 0 to 1		
0265	None	REPT-LINK-CGST: congestion level 1 to 2		

Table 4-8. 21.0 Link and Link Set UAMs (Continued)

UAM	Alarm	MRN in Release 21.0	Signaling Link Unavailability Priority	Abbreviation for the rept-stat-slk Unavail Cause field
0266	None	REPT-LINK-CGST: congestion level 2 to 3		
0267	None	REPT-LINK-CGST: congestion level 3 to 2		
0268	None	RCVRY-LINK-CGST: congestion level 2 to 1		
0269	None	RCVRY-LINK-CGST: congestion has cleared		
0270	None	REPT-LINK-CGST: discard level 0 to 1		
0271	None	REPT-LINK-CGST: discard level 1 to 2		
0272	None	REPT-LINK-CGST: discard level 2 to 3		
0273	None	RCVRY-LINK-CGST: discard level 3 to 2		
0274	None	RCVRY-LINK-CGST: discard level 2 to 1		
0275	None	RCVRY-LINK-CGST: discard has cleared		
0317	None	RCVRY-LKSTO: link set allowed		
0318	Minor	REPT-LKSTO: link set prohibited		

The signaling link unavailability messages use Bellcore recommended keywords in the output message. Table 4-9 shows the keywords that are supported in Release 21.0.

The signaling link unavailability messages also support Bellcore signaling link related keywords, link unavailability messages have been updated to support SEAS link failure cause codes shown in Section 8 of the *SEAS-STP Interface Specification, GR-310-CORE*, Issue 1, November 1994. These standard three letter codes denote the reason for link failure.

Table 4-9. Bellcore Message Keywords

Keyword	Event
REPT-XLST-TIMO	Removal of Member from X-list Due to Timeout
REPT-MTPLP-DET	MTP Loop detected: Prohibited Destination
REPT-MTPLP-SUST	Sustained Prohibited Destination Due to MTP Loop
RCVRY-MTPLP-RST	Resumption of Traffic to Loop Prohibited Destination
REPT-LKSTO	Link Set Failure
RCVRY-LKSTO	Recovery From Link Set Failure
REPT-MTP-RSTRT	Commencement of MTP Restart
REPT-STATUS-RSTRT	Progress of MTP Restart
RCVRY-MTP-RSTRT	Completion of MTP Restart
REPT-LINK-CGST	Link Congestion Level Increase
RCVRY-LINK-CGST	Link Congestion Level Decrease
REPT-LNK-MGTINH	Near End Link Management Inhibit
RCVRY-LNK-MGTINH	Near End Link Management Uninhibit
REPT-LKF	Link Failure
RCVRY-LKF	Recovery From Link Failure
REPT-LNK-MANUAV	Near End Manually Made Link Unavailable
RCVRY-LNK-MANUAV	Near End Manually Made Link Available

Linkset ID to Measurements Report (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Currently, the Eagle On-Demand Component Measurement report for the command **rept-meas:enttype=link** provides the linkset ID (name) for the linkset to which the link in question belongs. However, unsolicited scheduled reports of this type do not provide the linkset ID in the report, which can make link monitoring difficult for some customers.

The Linkset ID to Measurements Report feature adds the field "Linkset ID" to the unsolicited Component Measurement reports created with **rept-meas:enttype=link**.

Hardware Requirements

There are no hardware requirements for this feature.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. For more information on this commands, see the *Commands Manual*.

rept-meas

Use this command to generate an Eagle measurements report. The field "Linkset ID" has been added to the unsolicited Component Measurement reports created with the parameter **:enttype=link**.

Syntax

```
REPT-MEAS
:ENTTYPE
```

Parameters

:enttype=link

The entity type for the measurement report.

Range = stp,link,lnkset,tt,stplan,origni,origninc,lsdestni,lsorigni,lsonismt,lnpnp,mapscrn

Example Output

```

Alarms and Error Codes

Alarms

No new UAMs/UIMs or error codes have been created for this feature.

Linkset Name Increase—ANSI/ITU (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Customers may need more than 8 characters that the EAGLE currently allows for the linkset name. The linkset name may be used to identify the EAGLE and the adjacent point code and have other codes associated with it such as link speed and linkset size codes. All these attributes added up can exceed 8 characters.

The Linkset Name Increase—ANSI/ITU feature increases the maximum linkset name from 8 characters to 10 characters.

NOTE: For SEAS-provisioned linksets, SEAS still supports a maximum of 8 characters.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

The range value for the **:lsn** parameter has been enhanced to allow up to 10 characters. Table 4-10 lists the commands that use the **:lsn** parameter.

Table 4-10. Commands Using the **:lsn** Parameter

chg-ls	ent-slk
dlt-ls	rtrv-slk
ent-ls	rept-stat-slk
rtrv-ls	
rept-stat-ls	inh-alm
chg-rte	unhb-alm
dlt-rte	
ent-rte	rtrv-gtwy-acthresh
rtrv-rte	set-gtwy-acthresh
chg-ttmap	
dlt-ttmap	rept-meas
ent-ttmap	
rtrv-ttmap	dact-rstst

Example output for the affected **rtrv-** and **rept-** commands appears below.

rtrv-ls

Use this command to display the linkset information. The output for this command has been enhanced to display 10-character linkset names.

Example Output**rtrv-ls**

rtrv-ttmap

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. The output for this command has been enhanced to display 10-character linkset names.

Example Output**rtrv-ttmap:lsn=nc001**

```
rlghncxa03w 00-02-22 12:02:36 EST Rel 30.0.0
LSN      IO  ETT  MTT
nc001    I   047  032
nc001    I   128  055
nc001    I   238  128
nc001    I   254  016
nc001    O   016  254
nc001    O   128  238
TTMAP table for nc001 is (6 of 64) 9% full
;
```

rept-meas

Use this command to generate measurement reports on demand. The output for this command has been enhanced to display 10-character linkset names.

rtrv-gtwy-acthresh

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process. The output for this command has been enhanced to display 10-character linkset names.

Example Output

```
eagle10207 02-08-23 10:09:59 EST Rel 30.0.0

Alarms and Error Codes**Alarms**

No new alarms/error codes have been created for this feature.

Limitations

For SEAS verify commands that allow a wildcard for the linkset name parameter, the Eagle will display all linkset names, including the ones that were entered via Eagle commands and contain more than 8 characters. However, the names will be truncated to 8 characters. Therefore it may appear that there are duplicate linkset names, when each actually is unique.

Furthermore, in SEAS, the user cannot specify a particular linkset name that is greater than 8 characters, either for ENT-, CHG-, or VFY- commands. If the user tries to retrieve information about a specific linkset that appears to have duplicates, it will not be clear which is the desired linkset name from the results of a wildcard display of VFY-LS. The best thing for a user to do is to enter all linkset names via SEAS, or, if also entering them via Eagle commands, structure the names with >8 characters so as not to cause duplicates if they are truncated to 8 characters.

LNP 96 Million TNs—EAGLE 5 (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

The concepts and facilities in this section apply to the LNP 96 Million TNs feature, the Increase LNP LRN and Default NPA-NXX Table Capacities feature, and the Mass Update of SPIDs feature. For convenience of discussion, these three features are presented here.

NOTE: The LNP 96 Million TNs feature, the Default NPA-NXX Table Capacities feature, and the Mass Update of SPIDs feature are EAGLE 5 features.

Summary

LNP 96 Million TNs Feature—EAGLE 5

Customers would like to increase the database capacity of the existing 48 Million number EAGLE LNP solution. Increasing the database capacity on a single node solves several architectural issues some customers face in regionalizing their LNP solutions.

This feature increases an EAGLE single node LNP number capacity from 48 Million to 60, 72, 84, or 96 Million LNP Numbers.

NOTE: The existing 4G DSM cards will support this feature. Other variants of DSM cards (i.e. 1G, 2G, and 3G), however, are not supported.

Increase LNP LRN and Default NPA-NXX Table Capacities Feature

Currently, major hub customers, whether regionalized or centralized, potentially can run out of LRN table capacity and, more critically, default NPA-NXX table capacity. There is an anticipated need to increase these tables in all supported ELAP-DSM LNP configurations, except the 1GB (12 Million) configuration.

This feature increases an EAGLE single node LNP LRN table to a maximum of 150,000, and the default NPA-NXX table to a maximum of 300,000 entries for all configurations of the ELAP-DSM LNP solution, excluding 1 GB DSM and all TSM variants.

Mass Update of SPIDs

NOTE: The Mass Update of SPIDs function is not operational unless LSMS 6.1 is used.

This feature supports the ability to update a set of subscription and network data from one Service Provider ID to another. The NPAC (Number Portability Administration Center) provides an offline file with selection criteria for the data to be modified. The data is independently updated at the LSMS (Local Service Management System); update information is not received over the NPAC /LSMS interface. The LSMS then creates the necessary file to transmit to the Eagle to effect the same changes. This must be done for systems having TSMs or DSMs.

Although this feature is optional, no feature controls are required at the Eagle; these controls are present at the LSMS.

NOTE: The Mass Update of SPIDs feature is supported only on the MPS-LSMS interface.

Description

The Local Number Portability (LNP) implementation for the ELAP Application on the MPS platform consists of a Real-Time-Database (RTDB) component, which performs the following tasks.

- Accepts provisional transactional updates from a Local Service Management System (LSMS).
- Processes Auditing requests.
- Processes Bulk re-load request of the entire Database (DB).
- Handles Provisioning & Reload sessions to the PROV task.
- Services UI requests for Data Retrieval.

Ownership of the "golden database" resides on the LSMS, and maintains the integrity of the RTDB. All provisioning occurs on the LSMS. Additionally, the ELAP provides the ability to locally provision LNP data through the ELAP User Interface.

Figure 4-4 provides an architectural overview an LNP 48/96 Million System.

Figure 4-4. LNP 48/96 Million System Architectural Overview

Highlights

Feature Control Mechanism

This feature requires that the LNP feature be on. Previously, the mechanism for identifying this condition was to perform the EAGLE UI command **rtrv-feat** and to view the LNP component in the "ON" state. This feature employs the Feature Control Mechanism. With feature keys, the verification method for identifying the LNP feature condition is to perform the EAGLE UI command **rtrv-ctrl-feat**. If the "LNP portedTN" entry is displayed, the LNP feature is considered to be ON.

The feature key mechanism provides some additional security against mistakes and/or fraud, thereby protecting the feature assets. There is a single feature key to indicate the existence of the ELAP device. This feature key behaves similarly to the previous LNP48MIL feature bit.

The LNP ELAP Configuration feature key indicates that the VSCCP applications should look to the TCP/IP connection for the source of the LNP DB. Three additional feature keys (LNP ported TN QTY, LNP ported NPANXXs QTY, and LNP ported LRNs QTY) regulate the maximum capacity allowed within the LNP DB System.

Under the current system, neither the feature bits nor the feature keys are conveyed to the ELAP. The ELAP currently performs no regulation of the capacities within the LNP System, other than the global capacity that it can perform. The LNP 96 Million TNs Feature enforces LNP quantities on the ELAP by way of the feature keys. Loading and maintaining the feature key table on the ELAP via the OAM accomplishes this enforcement. Therefore, the feature keys are to be provisioned solely on the OAM, and the associated keys are to be distributed to the ELAP. Synchronization occurs on the ELAP in a similar manner to that of the EAGLE LIM cards.

Upgrade routines convert feature bits to feature keys by examining the existing feature bits and SCCP hardware to determine the LNP ELAP Configuration feature key and LNP QTY levels.

Object Capacity

The maximum capacity of the objects for persistent storage is increasing; see Table 4-11.

Table 4-11. Maximum Object Capacity

Object	LNP 12 Million	LNP 48 Million	LNP 96 Million
Telephone Number (TN)	12 Million	48 Million	96 Million.
NPANXX	150,000	150,000	300,000
Local Routing Number (LRN)	100,000	100,000	150,000

Measurements Collection

The measurements requirements remain the same as the existing LNP 12 Million and LNP 48 Million architectures, with the exception of the expanded NPANXX and LRN listed in Table 4-12. Measurement objects are capped at 150,000 NPANXXs and 100,000 LRNs when collection is performed via the OAM. When measurements are being collected by the Measurement Platform, the objects are capped at 300,000 NPANXXs and 150,000 LRNs.

SCCP Application Storage and Provisioning

The new LNP 96 Million TNs architecture utilizes DSM cards ranging from 1 GB to 4 GB of expanded memory. Like the existing LNP systems, the LNP 96 Million TNs feature auto-inhibits any SCCP application card that does not meet the minimum hardware requirements, based upon feature key capacities and the LNP ELAP Configuration feature keys.

Hardware Requirements

The MPS 3.0 platform is required for this feature.

DSMs

The following DSM configurations are supported:

Table 4-12. DSM Configuration Table for Release 30

Name	Description	Maximum Number of Ported/pooled numbers supported
DSM 1GB	DSM with 1GB populated memory and 12 Million feature access keys activated	12,000,000
DSM 2GB	DSM with 2GB populated memory and 24 Million feature access keys activated	24,000,000
DSM 3GB	DSM with 3GB populated memory and 36 Million feature access keys activated	36,000,000
DSM 4GB	DSM with 4GB populated memory and 48, 60, 72, 84, or 96 Million feature access keys activated	96,000,000

MPS

The Multi-Purpose Server (MPS) does not require additional processors, memory, and / or additional disk capacity to accommodate the requirements for the 96 Million number feature.

Enhancements to ELAP Graphical User Interface

The ELAP Graphic User Interface has been enhanced to support this feature. For more information, see the *ELAP Administration Manual*.

Simplex Mode Menu Option

The new Simplex Mode menu option provides the functionality to view as well as change (i.e toggle) whether or not the ExAP is in simplex mode; see Figure 4-5.

Figure 4-5. Maintenance>Simplex Mode Submenu

View Simplex Mode

This menu selection displays whether or not the ExAP is in simplex mode state; see Figure 4-6. The user requires "View Simplex Mode" action privilege to view this menu selection.

Figure 4-6. View Simplex Mode Screen

Change Simplex Mode

This menu selection toggles simplex mode on the selected ExAP; see Figure 4-7

Figure 4-7. Change Simplex Mode Screen

The current state of the selected ExAP is determined prior to the output of this screen. If the ExAP is not currently in simplex mode, this screen will enable the user to force it into simplex mode. If the contrary is true, the user will be enabled to remove the simplex mode condition on the selected ExAP. User requires "Change Simplex Mode" action privilege to view this menu selection.

View LNP Qty Features

This new ELAP version-only menu item selection displays the enabled LNP quantity features as provisioned on the Eagle; see Figure 4-8. The user requires "View LNP Qty Features" action privilege to view this menu selection.

Figure 4-8. View LNP Qty Features Screen

A

Subscriptions

This menu option allows the user to retrieve a single subscription record using a single 10-digit subscription or an optional 10-digit subscription range as a key; see Figure 4-9. If a single 10 digit subscription is used the exact value is displayed if present, otherwise, a "not found" message is displayed.

If a 10-digit subscription range is used a start value (TN:) and end value (ETN:) must be specified and the first subscription found in the specified range is displayed if present, otherwise, a "not found" message is displayed.

The first subscription found in the specified range is displayed, if present; otherwise, a "not found" message is displayed.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

chg-feat

This command allows the user to activate optional features available on the system. Because they no longer have feature bits, the following parameters have been deleted: `:lnp`, `:lnp12mil`, `:lnp18mil`, `:lnp48mil`, and `:force`.

rtrv-feat

This command allows the user to display the list of optional features and their status on the system. Parameters whose feature bits have been removed no longer are displayed.

CAUTION: The following output example may differ from the output shown at your terminal, and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

Example Output

```
rlghncxa03w 02-11-28 11:34:04 EST Rel 30.0.0.
EAGLE FEATURE LIST

;

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the 96 Million LNP feature. The 96 Million LNP feature is turned on when the LNP TNs quantity is greater than 0 in the `rtrv-ctrl-feat` command output.

CAUTION: The following output example may differ from the output shown at your terminal, and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

Example Output**rtrv-ctrl-feat**

Table 4-16. 96 Million LNP Feature: Error Messages (Continued)

Error Message	New?	Used by Command:
E4006 DSM's are required when LNP and VGTT are ON	Yes	enable-ctrl-feat
E4020 The maximum number of optional tables has been allocated	Yes	alloc-mem
E4101 LNP ELAP CFG feat incompatible w/ SCCP/EBDADCM/EBDABLM appl	Yes	chg-ctrl-feat

Upgrade Considerations

Eagle

The EAGLE upgrade must occur prior to the ELAP v3.0 upgrade. This allows for a stepwise upgrade process that will ensure “loss-less” traffic and continued service through the upgrade process. The EAGLE VSCCP-DSM application will support the legacy ELAP up to the LNP 48 Million architecture, including Warm-Restart.

The EAGLE will convert the existing LNP feature bits to feature keys as part of the upgrade conversion process. In all cases, the Feature Keys 893-0094-01 representing 150,000 NPANXXs and 893-0105-05 representing 100,000 LRN capacities will be set, except for those specifically indicated.

Table 4-17 and Table 4-18 show how the LNP Subscription quantities and LNP ELAP Configuration key are to be set through examining existing feature bits and IS-NR SCCP hardware. If conflicting feature bits and SCCP hardware are encountered during the upgrade process, the upgrade will fail during the table conversion.

Table 4-17. TSM Feature Key Upgrade Matrix

Feature Bit On	SCCP Hardware IS-NR			
	TSM-256 MB	TSM-512 MB	TSM-768 MB	TSM-1024 MB
LNP	893-0110-01 (2M TNs)	893-0110-02 (4M TNs)	893-0110-03 (6M TNs)	893-0110-04 (8M TNs)
LNP12MIL	N/A ^a	N/A ^a	N/A ^a	893-0110-05 (12M TNs)
LNP18MIL ^b	N/A ^a	N/A ^a	N/A ^a	N/A ^a
LNP48MIL	N/A ^a	N/A ^a	N/A ^a	N/A ^a

a These cards will be auto-inhibited and not detected during the upgrade process.

b LNP18MIL is an Obsolete Feature Configuration and should not be present in the field.

Table 4-18. DSM Feature Key Upgrade Matrix

Feature Bit On	SCCP Hardware IS-NR			
	DSM-1 GB	DSM-2 GB	DSM-3 GB	DSM-4 GB
LNP	893-0110-04 (8M TNs)	893-0110-04 (8M TNs)	893-0110-04 (8M TNs)	893-0110-04 (8M TNs)
LNP12MIL	893-0110-05 (12M TNs)	893-0110-05 (12M TNs)	893-0110-05 (12M TNs)	893-0110-05 (12M TNs)
LNP18MIL ^b	N/A ^b	N/A ^b	N/A ^b	N/A ^b
LNP48MIL	893-0109-01 (ELAP) 893-0110-05 (12M TNs) 893-0105-05 (100k LRNs) 893-0094-01 (150k NPAs)	893-0109-01 (ELAP) 893-0110-06 (24M TNs) 893-0105-01 (150k LRNs) 893-0094-02 (300k NPAs)	893-0109-01 (ELAP) 893-0110-07 (36M TNs) 893-0105-01 (150k LRNs) 893-0094-02 (300k NPAs)	893-0109-01 (ELAP) 893-0110-08 (48M TNs) 893-0105-01 (150k LRNs) 893-0094-02 (300k NPAs)

ELAP

The ELAP v3.0 upgrade must occur after the EAGLE v30.0 upgrade has occurred. This is to allow the EAGLE v30.0 time to soak with upgraded hardware such as GPSM-II and HMUX. During the ELAP upgrade process the RTDB database will be moved from its current location `/usr/rt` to the `/usr/db` location in preparation for the upgrade process and allows for back-out capabilities.

Once the LNP 48 Million tables are located in the `/usr/db` directory, new LNP 96 Million TNs architecture tables are created and populated through conversion of the old data. This avoids the Bulk Download procedures from the LSMS in order to populate the new architecture. Once conversion has occurred on one ELAP, it can then be loaded from the mate as part of the mate upgrade.

When upgrade of the ELAPs are complete, the DSM connection will be re-established. Once the ELAP-DSM connection is re-established, the VSCCP-DSM application will recognize the architectural change and set all connected DSM cards to INCONSISTENT. This will allow for continuation of LNP queries from the protocol, yet prevents any further DB updates. By re-booting the SCCP application, the reloading of data will take on the new architecture.

NOTE: This specifically entails that a COLD re-start will occur on each DSM card being reloaded with the new 96 Million architecture, regardless of the LNP quantity setting in the feature key.

NOTE: An ELAP v3.0 is not structurally compatible with and EAGLE Release v27, 28 and 29 (pre release 30.0); therefore it must not be connected in that configuration.

The steps involved in performing the upgrade are specific to maintaining provisioning capability to the EAGLE DSM cards at all times, starting with ELAP v1.0 or v2.0 units operating in duplex mode.

- Maximum NPANXX Objects

The maximum NPANXX objects is capped at 300,000 NPANXXs. Although feature keys have been allocated for further expansion in the future, they will not be permitted to be provisioned.

- Maximum NPANXX Objects

The maximum LRN objects is capped at 150,000 LRNs. Although feature keys have been allocated for further expansion in the future, they will not be permitted to be provisioned.

- OAM-based Measurements Subsystem

The OAM-based Measurements Subsystem will not support the LRN and NPANXX increase to 150,000 and 300,000 entries, respectively. The OAM will collect and report 100,000 LRNs and 150,000 NPANXXs only.

The NPANXXs reported will be the first 150,000 provisioned NPANXXs. Collection data for the remaining 150,000 NPANXXs will be discarded.

The LRNs reported will be the first 100,000 provisioned LRNs. Collection data for the remaining 50,000 LRNs will be discarded. Note that this could result in a significant change in the reported data set, if provisioning occurs during upgrade.

- OAM Upgrade

The OAM Upgrade will not execute if LNP18MIL = ON and LNP48MIL = OFF. Although this is a condition carried over from the LNP 18 Million TN feature (which became obsolete in EAGLE Release 27.0), it still may be encountered. In this event, the upgrade will return a failure, and will not continue until the LNP48MIL feature bit is turned ON.

LNP AIN Query Enhancement (PR28376) (Release 26.0)

Currently, the LNP AIN solution does not preserve the Charge Number and Charge Party Station type in the LNP AIN query and response. Without these parameters, SSP's cannot set up calls to IC type trunk groups.

With this enhancement, the EAGLE STP's LNP solution provides the ability to copy Charge Number and Charge Party Station type parameters from the LNP AIN query to the LNP AIN response. This capability is accessed on a per-STP basis via the LNPOPTS.

Changed Commands

The **chg-lnpopts** and **rtrv-lnpopts** commands have been enhanced in support of this feature. Refer to *Commands Manual* for current usage information.

chg-lnpopts

The **ccp** parameter has been added to this command.

rtrv-lnpopts

The **ccp** parameter is retrieved by this command.

LNP Measurements Enhancements (Release 25.0)

This feature adds additional per SSP measurements for LNP Queries and for LNP Message Relay. It splits existing per SSP measurements into ported and non-porting measurements, and it adds Message Relay measurements for CNAM and ISVM messages to the existing LIDB and CLASS Message Relay measurements.

Message Relay Measurements per SSP

The following message relay measurements are pegged per SSP:

1. LIDBGTP - Ported LIDB transactions, per originating SSP
2. LIDBGTNP - Non-Ported LIDB transactions, per originating SSP
3. CLASSGTP - Ported Class transactions, per originating SSP

4. CLASSGTNP - Non-Ported Class transactions, per originating SSP
5. CNAMGTP - Ported CNAM transactions, per originating SSP
6. CNAMGTNP - Non-Ported CNAM transactions, per originating SSP
7. ISVMGTP - Ported ISVM transactions, per originating SSP
8. ISVMGTNP - Non-Ported ISVM transactions, per originating SSP

For the above counts, Ported means Successful 10 digit translations; non-Ported means an aggregate of the following:

- Successful 6 digit translations (non-ported numbers in portable NPA-NXX) either default GTT or normal GTT
- Successful 6 digit translations (non portable numbers) normal GTT
- Failed 6 digit translations (no GTT entry matched)

NOTE: Only MSUs with valid and supported parameters are pegged.

The originating SSP is derived from:

1. Calling Party address in the SCCP header. The point code must exist and the RI must NOT = GT.
2. OR the OPC of the MTP routing label.

This implementation will peg measurements under the above circumstances for any ANSI UDT or UDTs MSU requiring global title.

For backwards compatibility, the following counts also are maintained on disk. These counts are the sum of the ported and non-ported measurements for that service:

1. LIDBGTRQ - Total LIDB transactions, per originating SSP
2. CLASSGTRQ - Total Class transactions, per originating SSP

$LIDBGTRQ = LIDBGTP + LIDBGTPN$

$CLASSGTRQ = CLASSGTP + CLASSGTNP$

Figure 4-11 illustrates the various subsystems involved in the EAGLE/LNP. The shaded boxes represent the subsystems affected by these new measurements. For measurements purposes all GTT measurements occur with the SCRC application, regardless of whether the MSU is a routine GTT or MR GTT. The transactions are recorded for LNP MR service and regular GTT entries.

NOTE: Only MSUs with valid GTT parameters and format are pegged.

Figure 4-11. LNP Block Diagram**Limitations for Message Relay Measurements**

1. Only valid GTT MSUs are pegged. The following conditions are considered invalid MSUs:
 - a. SCCP called SSN not included in MSU,
 - b. Called party GT indicator not equal to 0010 (TT only)
2. ITU MSUs are not pegged.
3. CLASS, LIDB, CNAM, and ISVM translations are recorded *only* if the TT-SERV table is provisioned with CLASS, LIDB, CNAM, and ISVM TT values
4. These measurements are recorded per originating SSP only so far as the point code exists in the provisioned routing table data base.
5. If the originating SSP does not have a full PC entry in the routing table, but does have a cluster entry, the measurement will be pegged for the cluster entry.

LNP Query Measurements per SSP

Before Release 25.0, the number of LNP Queries processed per SSP were pegged. Beginning with Release 25.0, this count is broken into two separate counts:

1. SSPQRCVP - Ported LNP Queries processed, per originating SSP
2. SSPQRCVNP - Non-Ported LNP Queries processed, per originating SSP

These measurements are pegged only if the message goes to Eagle's LNP subsystem. The message must also be formatted correctly.

The following types of LNP Queries are pegged:

- AIN Queries
- IN Queries
- Wireless LNP Queries
- Triggerless LNP Messages (ISUP IAM messages intercepted by TLNP)

The originating SSP is derived from:

1. Calling Party Point Code in the SCCP header (AIN, IN, and WLNP Only).
The point code must exist and the RI must NOT = GT.
2. OR the OPC of the MTP routing label.

The originating SSP must be in the routing table, or the measurement will not be pegged. If the originating SSP does not have a full PC entry in the routing table, but does have a cluster entry, the measurement will be pegged for the cluster entry.

For backwards compatibility, SSPQRCV - the count of Total Queries processed, per originating SSP, will also be maintained on disk. This count is the sum of the ported and non-porting LNP Queries processed.

$$\text{SSPQRCV} = \text{SSPQRCVP} + \text{SSPQRCVNP}$$

Collection

These new measurements are added to the existing per SSP LNP measurements data maintained hourly and daily. The data is collected along with the existing per SSP data from all SCCP cards.

Storage

The per SSP measurements tables on disk are replaced with enhanced tables to store the additional registers.

Upgrade Considerations

Due to data changes to support additional measurements, the following tables sizes are increased. The old versions of these table have been obsoleted, and a new version of these tables created.

- mday_ssp.meas
- m60_ssp.meas
- mon_ssp.meas
- tue_ssp.meas
- wed_ssp.meas
- thu_ssp.meas
- fri_ssp.meas
- sat_ssp.meas
- sun_ssp.meas

During upgrade, measurement collection is inhibited and following collection, any measurement data collected prior to the upgrade for these tables is LOST. (This is the historical method of handling measurement tables during upgrade.)

NOTE: Release 25.0 no longer supports the 540MB fixed disk.

New/Changed Commands

This feature does not change any Eagle commands.

LNP Message Relay Enhancement (PR28810) (Release 26.0)

In Release 24.0, a change was implemented to address a non-conformance to the LNP message relay function. This change involved discarding a message if it was related to a ported TN, with LRN override data provisioned, but not for the specific service. This change has resulted in these customers provisioning default service data into the override tables to continue this type of LNP message relay service portability functionality.

In order to address the needs of these customers while continuing to provide the enhanced solution, in Release 26.0 the EAGLE will allow for either method of operation for LNP message relay on a per STP basis.

Figure 4-12. Example Network

Consider the network depicted by Figure 4-12. If customer 212-543-2345 ports from Service Provider B to A, Service Provider A needs to provide CNAM functionality, as it does not provide CNAM service within its network. However, Service Provider B can potentially "resell" CNAM service to Service provider A. The Eagle LNP subsystem for Service Provider B would require that only the override GTT for the CNAM service be provisioned at the STP. Calls from the customer requiring LIDB service that originate in Service Provider's B network would arrive at Service Provider's B Eagle Gateway STP.

Since 212-543-2345 is ported out, the override GTT data is first used. If the override data contains only data for CNAM service, the Eagle formerly used the default data in the NPAC subscription information for LIDB and route the query to Service Provider A's Gateway STP.

This functionality was changed so that individual services would not default to the NPAC subscription data if the override GTT data was provisioned for one service, but was missing for another service. Due to this change, if Service Provider B wanted to route the LIDB query to Service Provider A's gateway STP, Service Provider B would have to provision the NPAC default data into the override table in order not to reject the LIDB query. This could cause unacceptable provisioning requirements for Service Provider B.

Changed Commands

The **chg-lnpopts** and **rtrv-lnpopts** commands have been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

chg-lnpopts

The **servport** parameter has been added to this command.

rtrv-lnpopts

The **servport** value is retrieved by this command.

LNP Response to STPLAN (PR28660) (Release 26.0)

Currently, STPLAN functionality does not include LNP responses generated from the Eagle LNP Database. This is due to the fact that the response is an Eagle-generated MSU that does not have the STPLAN copy flag set.

With this feature, the LNP Query Service application now supports the copying of LNP response messages to the STP/LAN application. All LNP response messages will have the GWS Action Set ID set to the value of the corresponding LNP query message. This ensures that all LNP query messages that passed gateway screening with the STOP&COPY action set will have their responses copied to STPLAN.

The LNP response messages that are copied to STP/LAN are:

- AIN
- IN
- TCAP Error Response
- Wireless LNP
- PCS 1900

LNP—10 Digit Telephone Number Subscription Commands (Release 22.0)

Refer to the *Commands Manual* for current usage information.

ent-lnp-sub

The **ent-lnp-sub** command is used to add an LNP 10 digit ported telephone number and its LNP query LRN or message relay global title information to the database.

dlt-lnp-sub

The **dlt-lnp-sub** command is used to remove an LNP 10 digit ported telephone number message relay service, LRN, or the entire telephone number subscription from the database.

chg-lnp-sub

The **chg-lnp-sub** command is used to change the attributes of an existing 10 digit telephone number subscription. The **chg-lnp-sub** command uses these parameters.

rtrv-lnp-sub

The **rtrv-lnp-sub** command displays all the LNP 10 digit ported TNs and their assigned services in the database.

dlt-lnp-serv

The **dlt-lnp-serv** command is used to remove an LNP service from the database.

chg-lnp-serv

This **chg-lnp-serv** command is used to change the attributes of an existing LNP service using the **chg-lnp-serv** command.

LNP—Allow Subsystem Command (Release 22.0)

The **alw-ss** command is used to bring a mated application subsystem back into service. This command uses only one parameter, **ssn**, the mated application subsystem number. This command can only be executed when the current state of the mated application subsystem is OOS-MT-DSBLD and the subsystem is online. When the subsystem has been successfully placed back into service, the primary maintenance state of the specified mated application subsystem is set to IS-NR (in service normal).

LNP—Automatic Call Gapping (Release 22.0)

Automatic call gapping controls the rate that location routing number (LRN) queries for a particular telephone number or a portion of a telephone number are received by the Eagle LNP when a particular threshold is reached. ACG controls are used under two conditions:

1. When a node overload condition is detected and an ACG control is configured for that overload level, the Eagle LNP sends an ACG component within each LRN query response it processes. The ACG control is invoked for the first 6 or 10 digits of the called party address in all queries sent to the Eagle LNP to control the rate that queries are processed.
2. If no overload control is sent, the Eagle LNP sends an ACG for a manually initiated control to control the rate of queries for a particular area code (3 digits), area code and prefix (6 digits), 10 digit telephone number, or part of a 10 digit telephone number (6 to 10 digits) are processed. The database can contain a maximum of 256 manually initiated ACG controls.

3. Refer to the *Database Administration Manual - LNP* for the current details of this feature.

LNP—Automatic Call Gapping Commands (Release 22.0)

Refer to the *Commands Manual* for current usage information.

ent-acg-noc

The **ent-acg-noc** command is used to add an ACG node overload control level to the database.

dlt-acg-noc

The **dlt-acg-noc** command is used to remove an ACG node overload control level from the database. The **dlt-acg-noc** command uses only one parameter, **lv1** - the overload levels 1 through 9. The database contains 10 ACG node overload levels, but only nine are configurable.

chg-acg-noc

The **chg-acg-noc** command is used to change the values of an existing ACG node overload control level in the database.

rtrv-acg-noc

The **rtrv-acg-noc** command displays the definitions of the node overload levels in the database. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the ACGs to be sent when at the level. The **rtrv-acg-noc** command uses one parameter, **lv1**, to display a specific node overload level.

ent-acg-mic

The **ent-acg-mic** command is used to assign ACG controls to all LNP queries or to specific LNP query services and called party digits. If the Eagle LNP query service receives a query to which a control applies, then the Eagle LNP sends an ACG, encoded as configured, with the response.

dlt-acg-mic

The **dlt-acg-mic** command is used to remove an ACG manually initiated control.

chg-acg-mic

The **chg-acg-mic** command is used to change an existing ACG manually initiated controls .

rtrv-acg-mic

The **rtrv-acg-mic** command displays the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A set of controls is selected to be displayed by specifying the **type** of control(s), the service (**serv**), and / or the digits (**dgts**).

LNP—Call Completion to Ported Number (CCPN) (Release 22.0)

This capability allows the call to be completed to a telephone number that has been moved from one switch to another, a ported number. When a call is placed to a ported telephone number, the switch where the number used to reside sends a query to the LNP database to obtain the location routing number (LRN). The LRN gives the location of the new switch that the telephone number resides on. When a response to the query is returned to the old switch, the call is completed using the LRN to route the call to the new switch. To implement this capability, these features are required.

- LRN query processing - services LRN queries in real time and generates the appropriate LRN response. Multiple query types are supported.
- SMS interface - the SMS interface is required for LNP database management from an SMS system.
- ACG control - Automatic call gapping is required for overload control when an excessive number of LRN queries are received for a number.
- Local subsystem management - The LNP query processing application is implemented as a local SCCP subsystem and local subsystem management functions are performed in the Eagle LNP.

LNP—Change Database Command (Release 22.0)

A new action, **import**, has been added to the **action** parameter of the **chg-db** command. The **action=import** parameter restores selected portions of the current LNP database from a removable cartridge created by the LSMS. If the Eagle LNP's database becomes severely out of sync with the LSMS's LNP database, the **chg-db:action=import** command can be used to resynchronize the LNP portion of the database with the LSMS.

The removable cartridge containing a copy of the LSMS's LNP database, formatted in Eagle database format, is created at the LSMS. The action of the **chg-db:action=import** command is similar to the action of the **chg-db:action=restore:src=remove** command, except that only these tables in the LNP portion of the database are replaced.

- **servprov.tbl**
- **lnp_stat.tbl** (only a portion of this table is imported)

- lnp_lrn.tbl
- lnp_mr.tbl
- lnp_npa.tbl
- lnp_4dig.tbl
- lnp_dbmm.tbl

After the **chg-db:action=import** command has completed, this minor alarm is raised for all operational TSMs showing that the TSMs must be reinitialized to use the newly imported LNP data.

```
*      5022.0429 *   CARD xxxx SCCC          LNP database is inconsistent
```

When the **chg-db:action=import** command has completed successfully, both the active and standby MASPs are reinitialized.

LNP—Changes to Existing Commands (Release 22.0)

LNP—Self ID Commands

The **cpctype** parameter has been added to the **chg-sid** command to define the type of capability point code being added to the self ID of the Eagle LNP. The Eagle LNP can contain two types of capability point codes, LNP and STP. If the **cpctype=lnp** parameter is specified, the capability point code must be an ANSI point code. The LNP capability point codes are used to associate a specific LNP service or capability (for example, Local Number Portability Query Response and Message Relay service) with one or more of the capability point codes in the self ID of the Eagle LNP. If the **cpctype=stp** parameter is specified, the capability point codes can be an ANSI, ITU international, or ITU national point code. The self ID of the Eagle LNP can contain a maximum of 96 capability point codes.

The CPCA (LNP) field has been added to the output of the **rtrv-sid** command to display the LNP capability point codes contained in the self ID of the Eagle LNP. The **cpctype** parameter has been added to the **rtrv-sid** command to display either the LNP capability point codes (**cpctype=lnp**) or the STP point codes (**cpctype=stp**).

LNP—Mated Application Commands

The **ent-map** and **chg-map** commands have been changed to allow the Eagle's true point code and the LNP subsystem number to be entered into the mated application table, if the LNP feature is turned on. When the LNP subsystem number is specified, the multiplicity indicator can be either solitary (**mult=sol**) or dominant (**mult=dom**). If the LNP feature is not on, the point code specified in these commands must be in the routing table.

LNP—chg-feat and rtrv-feat Commands

The **lnp=on** parameter has been added to the **chg-feat** command to turn the LNP feature on. To show whether the LNP feature is on, the LNP field has been added to the **rtrv-feat** command output.

Before the LNP feature can be turned on, the global title translation feature must be on and the Eagle LNP must be configured with this hardware.

- TSM - P / Ns 870-1289-xx, 870-1290-xx, 870-1291-xx, 870-1292-xx
- MCAP card - P / N 870-1307-xx

NOTE: Once any feature is turned on with the chg-feat command, they cannot be turned off.

LNP—clr-disk-stats Command (Release 22.0)

The **clr-disk-stats** command is a debug command used to clear the disk performance statistics and set all the disk performance statistic fields to 0. This command uses only one parameter, **loc** - the card location of the MASPs, either 1113 or 1115.

LNP—Degraded Mode (Release 22.0)

For the LNP application, software loading has been modified to verify the validity of the hardware configuration for both MASP and SCCP cards. The MASP hardware configuration is verified first. Once MASPs configuration is determined to be valid, then the SCCP hardware configuration is verified. The hardware configuration for MASP and SCCP cards is verified only when the LNP feature is turned on. The verification of the hardware includes:

- validity of the main assembly
- verification of applique's memory size

When the hardware configuration for the MASP is determined to be invalid for the LNP feature, the MASP enters a degraded mode. Degraded mode inhibits some MASP functionality in hopes of preventing more serious system fault conditions.

When the hardware configuration for an SCCP card is determined to be invalid for the LNP application, SCM automatically inhibits loading for that specific SCCP card. A minor alarm is generated indicating that card loading for that SCCP card has failed and has been automatically inhibited (i.e. prevented from reloading again). When card loading has been inhibited, the primary state of the card is set to OOS-MT-DSBLD and the secondary state of the card is set to MEA (Mismatch of Equipment and Attributes).

To activate loading of an SCCP card which has been automatically inhibited, enter the **alw-card** command. The **alw-card** command is rejected if the LNP is in degraded mode.

Degraded mode is entered under any of these situations:

- Active and standby MASPs do not have an E586 main assembly and an applique with a minimum of 256 Mbytes of memory.
- Any IS-NR SCCP card does not have an E586 main assembly and an applique with a minimum of 256 Mbytes of memory.

The following actions are taken during degraded mode:

- LNP database commands for configuring LNP data in the database is rejected. Retrieve commands is accepted.
- Loading of SCCP cards is disabled. SCCP cards requesting to be loaded will have loading automatically inhibited. SCCP cards already in service continue to run.
- The LNP subsystem is prevented from going online. (any attempt to execute the **alw-map-ss** is rejected). The LNP subsystem can be taken offline (the **inh-map-ss** is accepted).
- The PST/SST of each MASP with an invalid configuration is set to IS-ANR/MEA.
- The **rept-stat-sys** command output shows that the Eagle is in degraded mode.

The method to recover from degraded mode is dependent upon the reason degraded mode was entered. The list below defines method(s) to recover from degraded mode for each possible reason the mode can be entered.

- The active and standby OAMs do not have the correct main assembly/applique combination.

Change the MASP hardware configuration to an E586 main assembly with a minimum of 256 Mbytes of memory on the applique.

- An SCCP card does not have the correct main assembly/applique combination.

Change the SCCP hardware configuration to an E586 main assembly with a minimum of 256 Mbytes of memory on the applique.

LNP—Destination Point Code Exception Report (Release 23.1)

The Eagle requires that the destination point code contained in the global title translation data in the database has a route assigned to it so the MSU can be routed to the destination point code. The LNP subscription data the Eagle receives from the LSMS can contain global title translation data with destination point codes that do not have routes assigned to them in the Eagle database. Normally this type of data would be rejected since the Eagle does not know how to route to the destination point code. However, since this data is coming from the LSMS for LNP updates, the Eagle must accept it.

This feature generates a report of LNP subscriptions in the database whose destination point codes have not been assigned to a route. Two types of reports are generated:

- All destination point codes in the LNP database that are not assigned to a route.
- For each telephone number, all destination point codes in the LNP database that are not assigned to a route.

New and Changed Commands

Two new commands have been introduced to the Eagle to support this feature, **rtrv-lnp-dpcer** and **canc-lnp-dpcer**.

Refer to the *Commands Manual* for current usage information.

rtrv-lnp-dpcer

The **rtrv-lnp-dpcer** command is used to generate the report.

canc-lnp-dpcer

This command can be executed only if an LNP DPC exception report specified by the **rtrv-lnp-dpcer** command is being generated. If the **rtrv-lnp-dpcer** command is not being executed when this command is entered, the **canc-lnp-dpcer** command is rejected .

LNP—disp-disk-stats Command (Release 22.0)

The **disp-disk-stats** command is a debug command that displays the disk performance statistics. The MASPs maintain disk read / write access times as well as statistics for each table and application showing the number of disk accesses and cache accesses. The application and table statistics that have zero values will not be output if an application ID or table ID is not specified; only non-zero statistics are displayed in the default report.

Refer to the *Commands Manual* for current usage information.

LNP—Eagle LNP Configuration (Release 22.0)

The Eagle LNP uses the same platform as the Eagle STP, but with these changes.

The LNP data is stored on the fixed disk drive on the TDM. The fixed disk is partitioned to store both the LNP data and the STP data to prevent a failure of either database from affecting the other. The LNP data is downloaded from the fixed disk drive to the TSM, an ASM containing 1 Gbyte of memory. The TSM is made up of an E586 main assembly and 4 M256 appliques. Each M256 applique contains 256 Mbytes of memory.

To configure an Eagle LNP for the LNP feature, these software changes have been made.

- The LNP feature must be turned on with the **chg-feat** command. No LNP commands can be executed if the LNP feature is not turned on. The LNP feature cannot be turned on if the SCCP memory (ASM or TSM) is not large enough to hold the LNP data.
- If a TSM card is loading data, LNP data cannot be configured until the loading process has completed.
- The LNP database is audited every 24 hours.

The LNP database contains this data.

- Six global title translation services requiring message relay service. This data is received from the LSMS.
- Default global title translation for each ported NPANXX. This data is received from the LSMS.
- A list of ported NPANXX requiring SCCP message relay service at the Eagle LNP. This data is received from the LSMS.
- An indication for each translation type (applicable for only ported NPANXXs requiring LIDB, CLASS, ISVM, and CNAM message relay service) indicating if SCCP CDPA includes 10 digits. The default is “Yes.” This indicator is used only when the length of the SCCP CDPA is 10 digits, but only 6 digits are included. If the length of the CDPA is 6 digits, this indicator is ignored. This data is received from the LSMS.
- Six digit global title translation for LNP query messages. This data is not required if this global title translation is performed in a preceding STP. The results of the global title translation is an alias point code (or true point code of the Eagle LNP) and SSN of the LNP query function. The alias point code represents the LNP query function. Using the alias point code instead of true point code allows using same global title translation record in both mated STPs. This global title translation data can be configured from SEAS or Eagle LNP terminals.

- LNP information for each 10 digit ported telephone number. This data is received from the LSMS.
 - Directory number (DN) or range of directory numbers
 - Location routing number (LRN)
 - Current facilities based service provider ID
 - Service 1 global title translation data through Service 6 global title translation data (DPC/SSN, routing indicator, etc.)
 - Billing Service Provider ID
 - If the global title translation is a final global title translation, then the mated application and related data (loadshare mode, concerned point code list, etc.) corresponding to the global title translation data.
- Parameters required to customize LNP query and response processing. These are configured on each Eagle LNP.
 - AMAslpID value
 - Indicator to include or exclude AMAslpID parameter in the AIN response
 - Billing indicators (call type and feature ID) for the IN connection control response
 - 3 or 4 digit CIC for IN connection-control response

Parameters for treatment of outgoing global title translation messages. The new translation type and global title address indicator can be configured for each DPC, as long as the DPC is used in an existing non-final global title translation. The global title address indicator shows the outgoing global title address treatment, either the telephone number or LRN.

LNP—Element Manager System (EMS) (Release 22.0)

The EMS is an interface between the Eagle LNP and the LSMS and converts the LSMS protocol (CMIP) to an asynchronous serial format. Two terminal disk module (TDM) ports (RS-232) running at 19,200 bps connect the EMS to the Eagle. The EMS is connected to the LSMS using the Q.3 interface. The EMS is mounted in the OAPF frame.

The EMS performs these functions.

- Receiving LNP data and requests from the LSMS and converting the LNP data to Eagle LNP commands
- Connection management to the LSMS
- Support data audit function between Eagle LNP and the LSMS

The data downloaded to the Eagle through the EMS is stored in the fixed disks on the TDMs.

The EMS is a TEXAS MICRO™ Intelligent Processor Unit Telecommunications Server, model 9605 (Sparc 05, 85 MHz processor) and contains:

- 32 megabytes of RAM
- a 1.02 gigabyte hard drive using a SCSI interface
- a 1.44 megabyte floppy disk drive, a high-speed serial interface (HSI) SBUS card (with 4 synchronous ports)
- RS-232C-extender SBUS communications board (with 4 asynchronous ports).

The EMS is powered from the OAP frame's fuse and alarm panel with -48 VDC.

The EMS uses this software to allow the Eagle to communicate with the LSMS.

- SUN™ Solaris version 2.4 operating system
- SunLink Solaris version 9 for X.25
- The EMS application software.

The EMS is deployed in pairs at each Eagle LNP for redundancy.

LNP—Enhanced Global Title Translation Routing Services (Release 22.0)

This capability locates the LNP database using 10 digit global title translation. To implement this capability, these features are required.

- Ported NPANXX detection - the Eagle LNP maintains a list of all ported NPANXXs for each translation type that the node must perform 10 digit global title translation for. The first pass search shows if the number belongs to a ported NPANXX.

If the number does not belong to a ported NPANXX, normal global title translation is performed on the number.

If the number belongs to a ported NPANXX, two options are available for performing LNP global title translation.

- The Eagle LNP is not responsible for performing 10 digit LNP global title translation. The Eagle LNP performs normal global title translation which results in routing the MSU to an external LNP database (for example, an LNP SCP) or another STP.

- The Eagle LNP is responsible for performing 10 digit LNP global title translation. This routes the MSU to an internal LNP subsystem for performing 10 digit LNP global title translation.
- Message Relay - This function is required to perform 10 digit LNP global title translation while maintaining backward compatibility with existing non-LNP OSSs. Currently, OSSs (and some switches) use 6 digit global title translation for certain services. To minimize the impact of LNP on these systems, they will continue to route using 6 digit global title translation. If the called party address does not include 10 digits, the 10 digits are extracted from the TCAP portion of the message and are used as a global title address (GTA).
- Prevention of SCCP looping - The complexity of LNP data administration across multiple carrier networks increases the chances of data inconsistencies and may result in SCCP circular looping. The global title translation feature has been enhanced to modify the translation type (TT) and global title address (GTA) as result of translation. The GTA is replaced by the location routing number. This function is optional and can be configured by the user.
- SMS interface - the SMS interface is required for loading LNP global title translation data from an SMS system.
- 10 digit final LNP global title translation - The Eagle LNP requires that final global title translation is performed on 10 digits. When the STP performs 10 digit final global title translation, it will be capable of supporting routing and management of mated databases. All existing functions (load sharing between databases, primary / backup relationship between databases, remote subsystem management, translation type mapping, translation aliasing, etc.) are performed with the 10 digit final LNP global title translation.
- 6 digit default LNP global title translation - If the 10 digit global title translation does not find a match (for example, when a number is not ported but belongs to a ported NPANXX), the Eagle LNP performs a 6 digit default global title translation.

LNP—Impact of LNP on Other Features (Release 22.0)

Gateway Screening

Gateway screening has been modified to help prevent the looping of SCCP messages. When LNP global title translation is performed at SCCP level, SCCP Called Party Address screening is performed after the 6 digit default global title translation, if required, or after 10 digit LNP global title translation.

Translation Type Mapping

Translation type mapping is used on internetwork linksets to prevent the looping of SCCP messages between networks. For example, an originating network maps the translation type **x** to the new value **y** before transmitting it to the destination network. The new translation type value **y** is used in the destination network for translating and routing the MSU to a node inside the destination network. The MSU stays inside the destination network and message looping is prevented.

STPLAN

Gateway screening is used for STPLAN feature to selectively copy MSUs. This has the same impact as gateway screening.

Database Transport Access (DTA)

LNP has no impact on the DTA feature because MSUs are only redirected by the DTA feature before any global title translation takes place.

Other Features

Because LNP applies only to ANSI SS7 networks, the LNP feature has no impact on these features.

- ITU / ANSI Interworking
- X25 / SS7 Interworking

LNP—Inhibit Subsystem Command (Release 22.0)

The **inh-ss** command is used to place a mated application subsystem out of service. This command uses two parameters, **ssn** and **force**. The **ssn** parameter specifies the subsystem number of the mated application subsystem to be taken out of service. If the **inh-ss** command is entered with the **force** parameter set to **yes**, the mated application subsystem is forced out of service. When the subsystem has been successfully taken out of service, the primary maintenance state of the specified mated application subsystem is set to OOS-MT-DSBLD (out of service maintenance disabled).

LNP—Location Routing Number Commands (Release 22.0)

Refer to the *Commands Manual* for current usage information.

ent-lnp-lrn

The **ent-lnp-lrn** command is used to add an LNP location routing number (**lrn**) and its corresponding overriding message relay global title translations (**mrgt**) to the database.

dlt-lnp-lrn

The **dlt-lnp-lrn** command is used to remove a location routing number or its corresponding overriding message relay global title translations from the database.

chg-lnp-lrn

The **chg-lnp-lrn** command is used to change the attributes of an existing LRN and its corresponding overriding message relay global title translations in the database.

rtrv-lnp-lrn

The **rtrv-lnp-lrn** command displays all the LRNs and their associated final overriding message relay global title translations in the database.

LNP—Mapping LNP Translation Type Commands (Release 22.0)

Refer to the *Commands Manual* for current usage information.

chg-lnp-ttmap

The **chg-lnp-ttmap** command is used to change globally administered NGT and RGTA indications for each point code and translation type combinations for a group of existing telephone numbers in the database.

rtrv-lnp-ttmap

The **rtrv-lnp-ttmap** command displays all globally administered NGT and RGTA indications for each point code and translation type combinations for a group of existing telephone numbers in the database.

LNP—Measurements (Release 22.0)

LNP measurements are obtained using the **rept-meas** command and specifying the report types MTCH (:type=mtch, an hourly maintenance report) or MTCD (:type=mtcd, a daily maintenance report) and the entity type LNP (:enttype=lnp). When a report of LNP measurements is requested with the **rept-meas** command, four comma delimited text files containing the LNP measurement information are created in the file transfer area on the active fixed disk. For a daily maintenance report, these files are created.

- MDAY_LNP.CSV - Daily LNP System Wide Measurements
- MDAY_SSP.CSV - Daily LNP Measurements per SSP
- MDAY_LRN.CSV - Daily LNP Measurements per LRN
- MDAY_NPA.CSV - Daily LNP Measurements per NPA

For an hourly maintenance report, these files are created.

- M60_LNP.CSV - Hourly LNP System Wide Measurements
- M60_SSP.CSV - Hourly LNP Measurements per SSP
- M60_LRN.CSV - Hourly LNP Measurements per LRN
- M60_NPA.CSV - Hourly LNP Measurements per NPA

LNP—System Wide Measurements

Table 4-19. MTCD - LNP and MTCH-LNP System Wide Measurement Report

Event Name	Description	Unit
LNPQRCV	The number of total queries received by LNPQS.	peg count
LNPQDSC	The number of invalid queries that are discarded as no reply can be generated.	peg count
LNPQTCPE	The number of error replies with TCAP error code.	peg count
LNPSREP	The number of successful replies.	peg count
LNPQUNPA	The number of correct queries received for non-ported DN when NPANXX is not provisioned.	peg count

This is an example of the text file created when a system wide LNP measurement report is requested.

```

Once the LNP measurement files have been created in the file transfer area on the active fixed disk, these files can be transferred to another computer using the **act-file-trns** command for further processing. To make the file transfer, the computer that the files are transferred to must have these items.

- a VT320 or KSR connection to the Eagle LNP
- a communication program that emulates VT terminals and supports Kermit file transfer, for example, ProComm[®] for Windows
- a spreadsheet software program that interprets comma separated value text files, for example, Microsoft Excel[®]

Once the measurement text files have been created, they must be transferred to another computer. When the files have been transferred, they must be removed from the file transfer area with the **dlt-fta** command. If these files are not removed, no other LNP measurement reports of that report type can be created.

LNP—Message Relay (Release 22.0)

Message Relay (MR) contains these enhancements to existing global title translation functions.

- Extraction of 10 digit dialed number from the TCAP portion of the message: If the MSU contains a 6 digit called party address, the 10 digit dialed number is extracted from the TCAP portion of the MSU.
- Increased number of translations: For each 10 digit dialed number, up to 6 translations are available. The previous limit was 270,000 total translations. The number of dialed numbers that can be entered depends on the hardware, but the minimum hardware configuration supports 500,000 dialed numbers, so 3 million translations can be entered on the minimum hardware configuration. The maximum hardware configuration supports 2 million dialed numbers, so 12 million message relay translations can be entered on the maximum hardware configuration.

- Replacing the global title address: The global title address in the called party address can be replaced with the LRN associated with the ported dialed number.

Message Relay is performed in three stages:

1. The message arrives at the Eagle LNP **route-on-gt**. The Eagle LNP performs 6 digit (NPANXX) translation. The result of this translation indicates if message relay is required. If it is required, the result of this translation also gives the default data that may be used in stage 3.
2. If the results of stage 1 indicates message relay is required, the Eagle LNP performs 10 digit message relay. If the 10 digit number is found, the translation data for the 10 digit number is used to route the message.
3. If the 10 digits are not found, the dialed number is not ported, and the default data from stage 1 is used to route the message.

LNP—MSU Trap and Trace Command (Release 22.0)

Refer to the *Commands Manual* for current usage information.

The **ent-trace** command is a debug command used to trace MSUs sent to SCCP cards.

LNP—MTP and SCCP Management to Support LNP (Release 22.0)

When the LNP subsystem goes offline, the Eagle sends SSPs that cause messages with the routing indicator set to SSN to be diverted to the mate subsystem. But these will not cause messages with the routing indicator set to GT to be diverted. In order to make other nodes divert the messages with the routing indicator set to GT to the mate, the Eagle sends response method TFPs for these messages that require either message relay or LNP query.

There are two reasons the Eagle generates a response method TFP.

While the LNP subsystem is offline, a message arrives with the routing indicator set to GT for one of Eagle's capability point codes. The result of the global title translation is the Eagle's LNP subsystem or that message relay is required on Eagle.

In both of these cases, the Eagle generates a TFP concerning the capability point code and sends the TFP to the OPC in the message. This TFP should cause the OPC to divert traffic to the mate. If a message arrives with the routing indicator set to GT for Eagle's true point code, Eagle does not generate a TFP. Nodes that send traffic to Eagle with the routing indicator set to GT should use one of Eagle's capability point codes, not Eagle's true point code.

If the Eagle receives an RSP (Route Set Test Message - Prohibited) for a capability point code that is used for LNP, and the LNP subsystem is offline, the Eagle does not reply. If the Eagle receives an RSR (Route Set Test Message - Restricted) for a capability point code for LNP, and the LNP subsystem is offline, the Eagle replies with a TFP concerning the capability point code. When LNP subsystem is online, the RSRT replies to both RSRs and RSPs for a capability point code that is used for LNP with a TFA.

LNP—New LNP Input and Output Groups (Release 22.0)

The LNP commands described in the New Commands section are assigned to three new command classes: LNP Basic, LNP Database Administration, and LNP Subscription. To allow users to execute these commands, three new parameters have been added to the **ent-user**, **chg-user**, and **chg-secu-trm** commands: **lnpbas**, **lnpdb**, and **lnpsub**. To show the values assigned to these parameters, the **lnpbas**, **lnpdb**, and **lnpsub** fields have been added to the **rtrv-secu-user**, **rtrv-user**, and **rtrv-secu-trm** command outputs.

Two new unsolicited output message groups have been added to support the LNP feature: LNP Database Administration and LNP Subscription. To allow these types of messages to be output on a specific terminal, the **lnpdb** and **lnpsub** parameters have been added to the **chg-trm** command. To show the values assigned to these parameter, the LNPDB and LNPSUB fields have been added to the **rtrv-trm** command output.

LNP—New Unsolicited Alarm Messages (UAMs) (Release 22.0)

LNP Degraded Mode Alarm

This critical alarm is displayed when the system automatically puts itself in a degraded mode because of invalid OAM hardware configuration for the LNP feature.

```
UAMs      *C   0012.0419 *C SYSTEM                      Entering LNP Degraded Mode
```

When the reason the system has entered degraded mode is resolved, this message is displayed showing that system has returned to normal operation.

```
0012.0420      SYSTEM                      Exiting LNP Degraded Mode
```

LNP—Auto Inhibit/Uninhibit Alarms

This minor alarm is displayed when an SCCP card does not have the hardware configuration required for the LNP application. Loading of the SCCP card is automatically inhibited.

```
* 0012.0421 * CARD 1108 SCCP CARD REPAIR: Incorrect HW
configuration
```

This minor alarm is displayed when an SCCP card hardware configuration does not have enough memory for the LNP data. Loading of the SCCP card is automatically inhibited.

```
* 0012.0422 * CARD 1108 SCCP          CARD REPAIR: Insufficient memory
for LNP
```

When the **alw-card** command is executed, loading of the SCCP card is attempted. This message is displayed indicating that card loading is no longer inhibited.

```
0012.0423      CARD 1108 SCCP          CARD REPAIR: Card reload
attempted
```

LNP Subsystem Alarms

This critical alarm is displayed when the LNP subsystem is unavailable.

```
UAMs  *C 0012.0424 *C LNP SYSTEM          LNP Subsystem is not available
```

This minor alarm is displayed when the LNP subsystem is available, but the LNP Status of all of the SCCP cards is not ACTIVE.

```
* 0013.0425 * LNP SYSTEM          LNP normal, card(s) abnormal
```

This message is displayed when the LNP subsystem becomes available.

```
0014.0426      LNP SYSTEM          LNP subsystem is available
```

LNP—New Unsolicited Information Messages (UIMs) (Release 22.0)

LNP—Subsystem State Change Failures

When the **inh-ss** command is entered and the subsystem is not inhibited, but an inhibit request is already outstanding, this message is displayed.

```
UAMs      RLGHNCA03W 97-06-30 16:28:08 EST Rel 22.0.0
0002.1164  SYSTEM      INFO      Inh LNP SS request already
outstanding
Report Date: 94-03-30 Time: 16:27:19
```

The failure of a coordinated state change of the LNP subsystem resulting from the **inh-ss** command will be reported with this message.

```
RLGHNCA03W 97-06-30 16:28:08 EST Rel 22.0.0
0002.1165  SYSTEM      INFO      Failure Inhibiting LNP SS
Report Date: 94-03-30 Time: 16:27:19
```

LNP—ACG Overload Level Change

When the overall ACG overload level of the system has changed, UIM 1166 is displayed.

```
UAM          RLGHNCA03W 97-06-30 16:28:08 EST Rel 22.0.0
0003.1166    SYSTEM      INFO      ACG Node Overload Level Change
              OLD ACG LEVEL= 4    NEW ACG LEVEL= 5
              Report Date: 94-03-30   Time: 16:27:19
```

LNP—NPANXX Commands (Release 22.0)

Refer to the *Commands Manual* for current usage information.

ent-lnp-npanxx

The **ent-lnp-npanxx** command is used to add an LNP NPANXX (area code and office prefix) and its associated default global title translations to the database.

pdlt-lnp-npanxx

The **pdlt-lnp-npanxx** command is used to remove an LNP NPANXX or its associated default global title translations from the database.

chg-lnp-npanxx

The **chg-lnp-npanxx** command is used to change the attributes of an existing LNP NPANXX and its associated default global title translations in the database.

LNP—Query Routed as Final Global Title Translation (Release 22.0)

This is a case where the final global title translation is performed by a different STP before routing the LNP query to the Eagle LNP. The first STP performs the 6 digit final global title translation and routes the message using Eagle LNP's true point code and subsystem number of LNP query application. The Eagle LNP processes LNP query and sends an LNP response. Figure 4-13 illustrates this action.

Figure 4-13. LNP Query Routed as Final Global Title Translation

1. Line A (708-224-1111) dials Line B (708-713-2222).
2. The originating switch performs digit analysis on the dialed digits to determine how to route the call. The switch determines that B is in a portable NPANXX (708-713) and the line does not reside on the switch.
3. The switch sends an AIN (Info_Analyzed) or IN (InstructionStart) query based on the dialed digits to the capability point code of the first STP.
4. The STP performs final global title translation using 6 digits, determines that the query should be routed to Eagle LNP. The query is routed to LNP application at Eagle LNP using its true point code and subsystem number identifying LNP query application.
5. The LNP application at Eagle LNP finds the telephone number in its LNP database and sends an AIN (Analyze_Route) or IN (ControlConnect) response containing the LRN of the recipient switch.
6. The originating switch receives the LNP response and analyzes the data. The LRN is translated in the LNP routing tables and an ISUP route out of the switch is determined. The LRN is stored in the called party number parameter and the dialed digits are stored in the generic address parameter of the ISUP IAM message. The FCI translated called number indicator is set to indicate a query has been done (set to "translated number").
7. The call is routed to the recipient switch based on the LRN.

8. The recipient switch receives and processes the contents of the IAM message. The switch determines that an LRN is received and that it is the switch's LRN, and the switch replaces the called party number parameter's contents with the dialed digits stored in the generic address parameter. The switch does digit analysis on the dialed digits and finds the subscriber on the switch. The recipient switch completes the call to the subscriber.

Global Title Translation Examples

CLASS TCAP Queries for Portable NPANXX to Another Network

Figure 4-14. Internetwork Class Query

1. The originating switch (708-248) needs to launch a CLASS query for 312-727-1111. The switch formulates the query using the alias point code of the Eagle STP as the destination, and codes the SCCP global title address as the queried number (312-727-1111). The translation type is coded as appropriate for a CLASS query.
2. The Eagle STP receives the query and looks up the global title address of 312-727-1111 in the six digit global title translation table identified by the translation type. Since 312-727 has been designated as a portable NPANXX, the six digit global title translation indicates that message requires 10 digit global title translation on Eagle.
3. The Eagle message relay function checks to see if there is a ten digit translation for the number in the global title address. If there is, the translation information is used to forward the query to the gateway STP of the switch currently serving that telephone number. If no 10 digit translation is found, then the telephone number is still associated with the donor exchange, and a default six digit translation for the NPANXX value would be performed before forwarding the query.
4. The STP performs MTP routing for the message.

5. The gateway Eagle STP performs ten digit final global title translation and routes the CLASS query to the recipient switch. Remote subsystem management is performed. The recipient switch processes it as appropriate. The destination SSP can route the response message directly to the originating SSP, since the point code and SSN for the originating SSP would have been carried unchanged in the calling party address of the SCCP.

Internetwork LIDB Query with 6 Digits Included in the Global Title Address

Figure 4-15. Internetwork LIDB Query with 6-Digit GTA

1. The operator service system launches a LIDB query for 312-727-1111. The switch formulates the query using the alias point code of the STP as the destination, and codes the SCCP global title address with the NPANXX of the queried number (312-727). The translation type is for a LIDB query.
2. The STP receives the query and looks up the global title address of 312-727 in the six digit global title translation table identified by the translation type. Since 312-727 has been designated as a portable NPANXX, the Eagle STP forwards the query to the local LNP global title translation function.

3. The LNP global title translation function recognizes that only 6 digits are present in the global title address. Based on the translation type, the type of query (LIDB) is determined, and the LNP global title translation function decodes the necessary portion of the LIDB TCAP message to determine the ten digit telephone number for the LIDB query. Once the telephone number has been retrieved from the TCAP portion, the LNP global title translation function checks to see if there is a ten digit translation for the number. If there is a match on the full 10 digits of the telephone number, the translation information is used to route the message. (When no match is found for the 10 digit telephone number in the global title translation translations, the default data would be examined on a six digit basis to determine the translation information.) In this case, the ported number is served by another network, so the ten digit translation indicates a non-final global title translation to route to that network's gateway.
4. The Eagle STP would perform MTP routing for the message. The message would be routed to the gateway STP in the next network.
5. The gateway STP receives the LIDB query and processes it as appropriate. The gateway STP may be able to perform a final global title translation based on the six digit global title address value, or may need to perform an LNP global title translation to route the message on ten digits. The gateway STP performs remote subsystem management.

LNP—Query Routed as Non-Final Global Title Translation (Release 22.0)

This is a case where the LNP query is routed as a non-final global title translation MSU. The Eagle STP first performs the regular 6 digit global title translation. If the result of the global title translation is an internal LNP query application, the LNP query is processed and the response is sent to the originating switch. This example illustrates both normal 6 digit global title translation and LNP query processing are done on the same STP. The originating switch uses a separate capability point code (different from capability point code used for non-LNP global title translation) to route LNP global title translation traffic. The advantage of using a separate capability point code is that Level 3 network management can be performed independently for LNP global title translation traffic and non-LNP traffic, such as 800 global title translation traffic. For example, if the LNP application is manually taken out of service, the STP can divert the LNP traffic to the mate by sending a TFR concerning the LNP capability point code. The Eagle LNP continues to process 800 global title translation traffic. Figure 4-16 illustrates this action.

Figure 4-16. LNP Query Routed as a Non-Final Global Title Translation

1. Line A (708-224-1111) dials Line B (708-713-2222).
2. The originating switch performs digit analysis on the dialed digits to determine how to route the call. The switch determines that B is in a portable NPANXX (708-713) and the line does not reside on the switch.

3. The switch sends an AIN (Info_Analyzed) or IN (InstructionStart) query based on the dialed digits to the capability point code of the Eagle STP pair. Different capability point codes are used for LNP and non-LNP global title translation.
4. The Eagle STP performs global title translation on the query and sends the query to a local LNP subsystem. The local LNP subsystem finds the telephone number in its LNP database and sends an AIN (Analyze_Route) or IN (ControlConnect) response containing the location routing number (LRN) (312 979) of the recipient switch.
5. The originating switch receives the LNP response and analyzes the data. The LRN is translated in the LNP routing tables and an ISUP route out of the switch is determined. The LRN is stored in the called party number parameter and the dialed digits are stored in the generic address parameter of the ISUP IAM message. The FCI translated called number indicator is set to indicate a query has been done (set to “translated number”).
6. The call is routed to the recipient switch based on the LRN.
7. The recipient switch receives and processes the contents of the IAM message. The switch determines that an LRN is received and that it is the switch’s LRN, and the switch replaces the called party number parameter's contents with the dialed digits stored in the generic address parameter. The switch does digit analysis on the dialed digits and finds the subscriber on the switch.
8. The recipient switch completes the call to the subscriber.

LNP—Report LNP Status Command (Release 22.0)

The **rept-stat-lnp** command displays the current status of LNP. This command uses the two parameters, **loc** and **card**.

The **loc** parameter is used to display a detailed status of LNP information for the TSM specified by the card location. This detailed report includes information for each of the global title translation (GTT), LNP message relay (LNPMR), LNP query service (LNPQS) and automatic call gapping (ACG) functions.

The **card** parameter has only one value, **sccp-all**. When **card=sccp-all** parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP status of all equipped TSMs is provided. This summary includes global title translation (GTT) and LNP function status for every TSM as well as LNPQS system information. The possible states of the global title translation status are ACTIVE and SWDL (software loading). The possible states of LNP Status are ACTIVE, OFFLINE and SWDL.

Refer to the *Commands Manual* for current information on this command.

LNP—Rerouting Messages for the Local Subsystem (Release 22.0)

If the local LNP subsystem is unavailable and the mated subsystem is available, Eagle uses the routing indicator to determine whether to reroute the message.

If the routing indicator of the message is SSN, Eagle does not reroute the message to the mate. In this case, Eagle is acting as an end node, and end nodes do not reroute. If the return on error option is set, Eagle will generate a UDTs, otherwise it discards the message

If the routing indicator of the message is GT, Eagle reroutes the message to the mated subsystem.

LNP—Retrieve LNP Database Time Stamp Command (Release 22.0)

The **rtrv-lnp-dbts** command displays the LNP database time stamp corresponding to the latest LNP Database update applied by the LSMS.

The time stamp displayed by this command is updated when an LNP database is downloaded from the LSMS with the **chg-db:action=import** command or when a command updating a 10 digit telephone number subscription is received from the LSMS.

Refer to the *Commands Manual* for current information on this command.

LNP—SCCP Management on the LIMs (Release 22.0)

SCCP Management (SCMG) on the LIM is used when the LIM does not have an SCCP card assigned to it. Figure 4-17 shows the message flow for SCMG. If an SCCP message arrives destined for Eagle, the cluster manager (CM) attempts to send the message to an SCCP card. If the LIM is not assigned to an SCCP card, the cluster manager sends the message to SCMG on the LIM.

Figure 4-17. SCMG on the LIM

SCMG on the LIM first determines if all SCCP cards have failed. It performs the following functions when all SCCP cards are unavailable:

1. Generate response method SSPs if the routing indicator in the message is SSN for a local subsystem, other than SCMG.
2. Notify MTP to generate response method TFPs if the routing indicator of the message is GT and is destined for an Eagle capability point code that is used for LNP.
3. Generate UDTs messages if the incoming message is a UDT with the return on error option.

If some SCCP cards are available, SCMG does not send SSPs or TFPs. In this case, the SCCP cards are available, but are overloaded. This is a partial failure: some LIMs have been denied service, but other LIMs have SCCP service. SCMG on the LIM still generates UDTs messages if the incoming message is a UDT with the return on error option.

NOTE: If the UDT message has a calling party address whose routing indicator is set to GT, the LIM does not generate a UDTs, because the LIM cannot perform global title translation.

Table 4-23 shows what actions the Eagle takes when SCCP cards are unavailable and a message arrives requiring LNP.

Table 4-23. Receiving Messages When SCCP is Unavailable

Routing Indicator in Incoming Message	DPC	Full or Partial Failure	LNP Status	Message Handling	Network Management
GT	Capability Point Code	Full	--	Generate UDTs	Send TFP Concerning CPC
GT	True Point Code	Full	--	Generate UDTs	Send UPU
SSN	Capability Point Code	Full	--	Generate UDTs	None
SSN	True Point Code	Full	--	Generate UDTs	Send SSP Concerning True Point Code
GT	LNP Capability Point Code	Partial	Online	Generate UDTs	None
GT	True Point Code	Partial	Online	Generate UDTs	None
SSN	LNP Capability Point Code	Partial	Online	Generate UDTs	None
SSN	True Point Code	Partial	Online	Generate UDTs	None
GT	LNP Capability Point Code	Partial	Offline	Generate UDTs	Send TFP Concerning CPC
GT	True Point Code	Partial	Offline	Generate UDTs	None
SSN	LNP Capability Point Code	Partial	Offline	Generate UDTs	None
SSN	True Point Code	Partial	Offline	Generate UDTs	Send SSP Concerning True Point Code

Table 4-23. Receiving Messages When SCCP is Unavailable (Continued)

Routing Indicator in Incoming Message	DPC	Full or Partial Failure	LNP Status	Message Handling	Network Management
GT	Non LNP Capability Point Code	Partial	--	Generate UDS	None
SSN	Non LNP Capability Point Code	Partial	--	Generate UDS	None

LNP—Service Commands (Release 22.0)

Refer to the *Commands Manual* for current information on the following commands.

ent-lnp-serv

The **ent-lnp-serv** command is used to assign an LNP translation type to a unique LNP service.

Refer to the *Commands Manual* for current information on this command.

LNP—Service Provider Commands (Release 22.0)

Refer to the *Commands Manual* for current information on the following commands.

ent-lnp-sp

The **ent-lnp-sp** command is used to assign an LNP service provider to the database. The **ent-lnp sp** command uses only one parameter, **sp**—4 alphanumeric characters identifying the service provider.

dlt-lnp-sp

The **dlt-lnp-sp** command is used to remove an LNP service provider from the database. The **dlt-lnp-sp** command uses only one parameter, **sp**—4 alphanumeric characters identifying the service provider.

rtrv-lnp-sp

The **rtrv-lnp-sp** command displays the LNP service provider information in the database.

LNP—Split NPA Commands (Release 22.0)

Refer to the *Commands Manual* for current information on the following commands.

By splitting the NPANXX, the user can force 2 different NPANXXs to reference the same last 4 digits of a 10 digit ported telephone number in the database. When either NPANXX is updated, the 10 digit ported telephone numbers in each NPANXX with the same last 4 digits are updated. When the NPANXX is split, all existing NPANXX data for the NPANXX being split is copied to the new NPANXX.

ent-split-npa

The **ent-split-npa** command is used to add a split NPANXX to the database.

dlt-split-npa

The **dlt-split-npa** command is used to remove a split NPANXX from the database. The **dlt-split-npa** command uses only one parameter, **npa** - the split NPANXX, the value in either the NPANXX or NEW NPANXX fields of the **rtrv-split-npa** command output.

rtrv-split-npa

The **rtrv-split-npa** command displays all split NPANXXs in the database. Displaying the split NPANXX is done from the perspective of the old NPANXX, the NPANXX which contains default data.

LNP—Subsystem Application Commands (Release 22.0)

Refer to the *Commands Manual* for current information on the following commands.

ent-ss-appl

The **ent-ss-appl** command is used to reserve a subsystem number for the LNP application and place the LNP application either online or offline using the **ent-ss-appl** command.

dlt-ss-appl

The **dlt-ss-appl** command is used to remove a subsystem application from the database using the **dlt-ss-appl** command. The **dlt-ss-appl** command uses only one parameter, **:appl** = the subsystem application,. The Eagle LNP contains only one subsystem application, the LNP subsystem application.

chg-ss-appl

The **chg-ss-appl** command is used to set an existing subsystem application either online or offline using the **chg-ss-appl** command.

rtrv-ss-appl

The **rtrv-ss-appl** command is used to display all of the applications from the database. The command displays the application type, subsystem number, and application status.

LNP—System Options Commands (Release 22.0)

Refer to the *Commands Manual* for current information on the following commands.

chg-lnpopts

The **chg-lnpopts** command is used to change the LNP specific options.

rtrv-lnpopts

The **rtrv-lnpopts** command displays the LNP specific system options in the database.

LNP Short Message Service (Release 28.2)

Description

Eagle LNP currently supports the message relay function. LNP Short Message Service is an additional service offered in the message relay function. The DPC/SSN for the WSMSC is provisioned in the subscription versions received from the NPAC via the LSMS. This feature incorporates interface, administration, and protocol changes. All functions of the core LNP message relay feature are supported for the new LNP Short Message service. The LNP Short Message Service is unique, in that the service is supported for two protocols, ANSI-41 and PCS1900.

All Eagles must be upgraded to the LNP SMS capable release prior to configuring the LSMS to send WSMSC data in the subscription version. The LNP SMS capable Eagle release will be capable of receiving subscription versions with and without WSMSC data. This allows the Eagles to operate without receiving WSMSC data, until all Eagles are upgraded and the LSMS configuration change is made.

Protocol

Message relay operates on GTT messages with translation types administered as "LNP Services." The 10-digit ported number is extracted from the message, and used to perform a lookup in the LNP database. If the ported number is found, the appropriate ported number or LRN override routing information is used to route the message. If the number is not found, default GTT data is used, if provisioned. Otherwise, the traditional (non-LNP) global title function is performed, using all the digits present in the SCCP layer.

To perform the lookup, the 10-digit dialed number (NPA-NXX-XXXX) is required as the key. Two protocols are supported for the WSMSC support, ANSI-41 and PCS1900. For ANSI-41, the WSMSC DPC/SSN in the subscription version locates the Message Center. For PCS 1900, the WSMSC DPC/SSN locates the HLR. The subscription version contains one set of WSMSC DPC/SSN data. Therefore, incoming messages with different TTs may resolve to the same information in the TN record, using TT aliasing.

Hardware Requirements

No new hardware is needed to support this feature.

NOTE: This feature requires the MPS and DSMs on the Eagle (i.e. 48 Million Number Architecture). This feature also requires the corresponding feature on the LSMS.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

rtrv-ctrl-feat

Used to display all Controlled Features the customer has purchased and enabled to date. The output of this command has been enhanced to recognize the feature key for this feature.

ent-lnp-serv

Use this command to reserve an LNP translation type for a unique LNP service. The value WSMSC has been added to the range of values of Reserved Service Type Name.

chg-lnp-serv

Use this command to change an existing LNP service. The value WSMSC has been added to the range of values of Reserved Service Type Name.

dlt-lnp-serv

Use this command to delete an LNP service or an alias TT associated to an LNP service. The value WSMSC has been added to the range of values of Reserved Service Type Name.

rtrv-lnp-serv

Use this command to retrieve all LNP services. This command has been enhanced to display the value WSMSC as a Reserved Service Type Name.

chg-lnpopts

Use this command to enter LNP-specific system options in the database. This command updates the LNPOPTS table. The new parameter **:wsmsc10dig** has been added to this command.

rtrv-lnpopts

Use this command to display all the LNP-specific system options from the database. The output of this command has been modified to display the value of the **:wsmsc10dig** parameter.

Alarms and Error Codes

Alarms

No new alarms have been created for this feature

Error Codes

Incorrect use of the enhanced commands for the LNP Short Message Service feature may result in the error messages listed in Table 4-24:

Table 4-24. LNP Short Message Service: Error Messages

Error Message	New?	Used by Command:
E3598 LNP48MIL and WNP features must be ON	Yes	<code>enable-ctrl-feat</code>
E3599 WSMSC feature must be activated	Yes	<code>chg-lnpopts</code> , <code>ent-lnp-serv</code> , <code>chg-lnp-serv</code>

Measurements

Two new Measurements Registers have been added to the LNP SSP report; see Table 4-25.

Table 4-25. LNP Short Message Service Measurements Registers

Name	Description
WSMSCGTP	Number of WSMSC Global Title Translations for ported TNs received per originating SSP.
WSMSCGTPN	Number of WSMSC Global Title Translations for non-ported TNs received per originating SSP.

These new LNP SMS Measurements Registers are supported for two protocols: ANSI-41 and PCS 1900. Also, they are supported with and without the Measurements Platform feature enabled. If the Measurements Platform feature is not enabled, the LNP SSP report is generated to the FTA area from which it can be downloaded via Kermit. If the Measurements Platform feature is enabled, the LNP SSP report is transferred to an FTP server.

Login Failure Message (Release 21.0)

When a user attempts to log in to the Eagle and enters either an invalid user ID or password, the Eagle currently responds with the following message.

Error Messages E2264 Cmd Rej: Password verification failed

Error message E2264 is the same message that is issued when the new and verify passwords entered during a password change do not match.

When this message is issued after a failed login attempt, it implies that only password was invalid, when an invalid user ID was entered with a correct password, or both the user ID and password were invalid.

Now, after a failed login attempt, the Eagle responds with a new message,

E2757 Cmd Rej: Invalid userID/password combination.

When this message is received, the user should verify both user ID and password.

Error message E2264 is still issued when the new and verify passwords entered during a password change do not match.

Login Success or Failure Tracking (Release 21.0)

When a user has successfully logged on to the Eagle, a message is displayed followed by 2 lines of login history information. The login history information contains the number of login failures that have occurred since the last time the user successfully logged in to the Eagle and the date and time of the user's last successful login and the terminal that the user logged in to the Eagle on. At each successful login, the login history messages are displayed to the user in the scroll area.

```
xxxx LOGIN failures since last successful LOGIN  
Last successful LOGIN was on port zz on yy-mm-dd @ hh:mm:ss
```

where:

xxxx—the number of unsuccessful login failures since the last successful login

zz—the number (1 - 16) of the port on which the last successful login occurred.

yy-mm-dd—the date of the last successful login

hh:mm:ss—the time of the last successful login

An unsuccessful login attempt is any use of the **login** command, while not already logged on, that does not result in the user getting logged on to the Eagle. Some examples of an unsuccessful login in which the failure count maintained for the user ID is incremented are:

- user ID valid, password invalid
- user ID valid, password valid, user ID is already logged on at some other port.
- user ID valid, password valid, user ID has been suspended
- user ID valid, password valid, a password change is required and the new password is not valid
- user ID valid, password valid, the password is older than allowed by the **page** parameter of either the **ent-user**, **chg-user**, or **chg-secu-dflt** commands, the new password is not valid.
- user ID valid, password valid, the user ID has been inactive for a period of time that is greater than the value of the **uout** parameter of either the **ent-user**, **chg-user**, or **chg-secu-dflt** commands.

Login attempts that are rejected while a terminal port is temporarily locked out due to excessive login failures are not counted. While the terminal port is temporarily locked out, the Eagle immediately rejects all login attempts regardless of the user ID specified on the **login** command and makes no attempt to verify that the specified user ID.

Logout on Communications Failures (Release 22.0)

Whenever communications is lost between the Eagle and a terminal, the user logged on to that terminal will be automatically logged off. Some examples of communications loss are:

- terminal is powered off
- telephone connection between dial-up terminal and Eagle is disrupted
- directly-connected terminal is unplugged from the backplane.

When communications between Eagle and the terminal are re-established, the user must login on the terminal again to access the Eagle on that terminal.

This does not apply to SEAS terminals. SEAS terminals are considered to be connected to the Eagle by secure lines and the **login** command cannot be entered on that terminal.

When a user is logged off of a terminal because of a communications loss, the following message is displayed to all terminals that are able to receive unsolicited system administration messages in addition to the affected terminal.

```
User xxxxxxxx auto logged out (communications failure) on port yy.
```

Where:

xxxxxxx = the user ID that was logged off

yy = the affected terminal port (1 - 16)

If a user is logged off a terminal when the system is in the middle of processing a command that gathers passwords (for example, the **chg-pid**, **chg-user**, or **ent-user** commands), any prompt that is being displayed is removed and the character echo (which was disabled so that the password could be entered) is re-enabled. If the communications loss occurs while the system is in the middle of processing other types of commands (such as a database backup or restore), the user is logged off the terminal, but the command will continue to be executed until it has completed.

If the communications loss occurs while displaying the password prompt while the **login** command is being executed, the command is not interrupted since while the **login** command is in progress, the user is not yet logged in.

If the keyboard is locked when the communications loss occurs, the user is logged off and the keyboard is unlocked.

If a communication failure occurs while a file transfer is in progress, the user is logged off the terminal, but the file transfer continues. The communications failure may or may not affect the successful transfer of the file.

Command Rejected Error Messages

These command rejected error messages are used with the security features in Release 22.0.

<i>Error Messages</i>	E2254 Cmd Rej: Minutes out of range
	E2762 Cmd Rej: Port temporarily disabled due to excessive LOGIN failures
	E2273 Cmd Rej: Seconds out of range
	E2004 Cmd Rej: Keyboard is locked. Enter UNLOCK command
	E2765 Cmd Rej: Invalid password. Keyboard is locked. Enter UNLOCK command
	E2766 Cmd Rej: Command cannot be executed on a SEAS terminal
	E2767 Cmd Rej: Keyboard is not locked
	E2768 Cmd Rej: DURAL must be specified within 0..995959 or 999999
	E2770 Cmd Rej: Port temporarily disabled due to excessive UNLOCK failures
	E2771 Cmd Rej: Both WRNLN and WRNTX must be specified.

LRN Table Increase (Release 26.1)

This feature increases the size of the LRN table within EAGLE from 30000 LRN entries to 100000 LRN entries. It provides the user the ability to administer up to 100,000 LRN entries at the Eagle STP. This number was selected because there are possibly 25,000 end offices, with two LRNs per office (2X maximum capacity).

The enlarged number of LRN entries applies to the OAM and SCCPs GPLs.

Changed Commands

The following commands have been enhanced to support LRN of 100,000 entries:

- `chg-lnp-lrn`
- `dlt-lnp-lrn`
- `ent-lnp-lrn`
- `rtrv-lnp-lrn`
- `chg-db:action=import`

These enhancements do not entail changes to the command syntax. See the *Commands Manual* for more information on these commands.

M2PA on IPLIMx (Release 29.1) (IP7 Release 7.1)

Description

The M2PA on IPLIMx feature provides support for the IETF's SS7 MTP2-User Peer-to-Peer Adaptation Layer (M2PA) protocol to the IPLIMx, prior to RFC status of the protocol.

The SS7 MTP2-User Peer-to-Peer Adaptation Layer (M2PA) protocol supports the transport of SS7 Message Transfer Part (MTP) Layer 3 signaling messages over IP, using the services of SCTP. This protocol would be used between the IPLIMx and an IP Signaling Point employing the MTP Level 3 protocol. M2PA is an IETF-based replacement for the Eagle STP IP Transport feature.

This protocol is intended for use between:

- a Signaling Gateway (SG) and a Media Gateway Controller (MGC)
- an SG and an IP Signaling Point (IPSP)
- an SG and another SG

where Signaling Gateway (SG) is the IPLIMx-equipped Eagle STP or IP⁷ Secure Gateway.

The M2PA on IPLIMx feature enhances IPLIMx in the following ways:

- Adds the M2PA adapter type when provisioning an association for an IPLIMx card.
- Provides an M2PA implementation on IPLIMx that is compliant with v6 of the M2PA internet draft.
- A M2PA link provides for zero message loss on fail-over, while a M3UA link can lose messages.
- A M2PA link provides additional MTP2 features beyond that provided by either SAALTALI or M3UA links.
- A M2PA association acts as both server and client. Both sides of an M2PA link may initiate the association. Two Eagles or Secure Gateways can be connected using M2PA links.

The following aspects of IPLIMx remain unchanged by this feature:

- IPLIMx on SSED CM (870-2372-xx) continues to support both SAALTALI and M3UA links.
- IPLIMx on SSED CM continues to provide a card capacity of 3000 TPS. Application-rated capacity on other cards is unaffected by this feature.

- IPLIMx on SSEDCEM now supports a maximum of eight signaling links. This maximum applies to links of the SAALTALI, M3UA, and M2PA types.
- IPLIMx continues to support only DPC-SLS routing. Routing keys are not supported.
- Multiple ITU-N groups support is provided by SAALTALI and M3UA links. Support of multiple ITU-N groupcodes over M2PA links is provided only for links connecting two Tekelec SGs. Multiple ITU-N groupcode support is not provided by a M2PA link connecting a Tekelec SG to a non-Tekelec IP signaling point.
- IPLIMx does not support ISUP Normalization.

This feature allows for convergence of some signaling and data networks. Switched Circuit Network signaling nodes would have access to databases and other devices in the IP network domain that do not employ SS7 signaling links.

Likewise, IP telephony applications would have access to SS7 services over B, C, and D links. There also may be operational cost and performance advantages when traditional signaling links are replaced by IP network "connections."

Hardware Requirements

This feature requires the Single Slot EDCM (870-2372-01).

New Commands

The following commands have been created to support this feature. For more information, see the *Commands Manual*.

chg-m2pa-tset

Use this command to change M2PA timers in a M2PA timer set. The **:srcset** and **:tset** parameters can be used to copy one timer set to another timer set.

rtrv-m2pa-tset

Use this command to retrieve either a M2PA timer set or all M2PA timer sets.

linkinfo

Use this command to display the state of a signaling link and to retrieve or clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card, and can be any one of the following: a, a1, a2, a3, b, b1, b2 or b3.

NOTE: The **linkinfo** pass command is valid only for IPLIMx GPLs.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

ent-slk

Use this command to add a low-speed (LSL) or high-speed (ATM HSL or IP) signaling link to a linkset in the database. The new value M2PA has been added to the **:iplim12** parameter.

rtrv-slk

Use this command to retrieve link information for LSL and ATM signaling links. The RTRV-SLK report has been modified to display the new 'M2PA' **:iplim12** parameter value for IPLIMx links.

blk-slk (act-lpo), ublk-slk (canc-lpo), inh/unhb-slk, tst-slk

These commands have been enhanced to allow for M2PA links.

ent-assoc

Use this command to configure the SCTP associations in the IPAPSOCK table. The value M2PA has been added to the adapter type parameter, **:adapter**. This command also has been enhanced with the new optional parameter, **:m2patset**.

chg-assoc

Use this command to configure existing SCTP associations in the IPAPSOCK table. The value M2PA has been added to the adapter type parameter, **:adapter**. This command also has been enhanced with the new optional parameter, **:m2patset**.

rtrv-assoc

Use this command to retrieve the configuration data from the IP Socket / Association (IPAPSOCK) table. This command has been modified to report M2PA as an association adapter type. It also displays the M2PATSET value if an association is of the M2PA adapter type.

rept-stat-assoc

Use this command to generate a report of the SCTP association's status. This command has been modified to display the correct primary state (PST) and secondary state (SST) values for M2PA associations.

ent-asp

Use this command to enter an Application Server Process (ASP) and bind an SCTP association with it. This command has been modified to prevent an ASP from being provisioned for an association with the M2PA adapter type.

Alarms and Error Codes**Alarms**

No new alarms have been created for this feature.

Limitations

The M2PA draft v6 protocol provides no facility for specifying network context, such as a group code or network appearance.

IPLIMx supports multiple ITU-N groupcodes over a M2PA link, when the link connects two Tekelec SGs, and each Tekelec SG has the ITUDUPPC feature bit enabled. IPLIMx does not support multiple ITU-N groupcodes over a M2PA link, when the link connects a non-Tekelec signaling point, or the Tekelec SG ITUDUPPC feature bit is disabled.

M3UA Protocol Enhancements (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Customers for M3UA have requested the implementation of the enhancements to RFC3332 to ease Application Server development, enhance robustness, and incorporate support for the SG abating congestion and maintaining congestion status of SS7 destinations on behalf of AS's.

Since the introduction of the IETF Sigtran protocols in IP⁷ Secure Gateway Release 5.0, the IETF has created newer versions of these protocols. This feature updates the IP⁷ Secure Gateway and Eagle IPLIMx implementation of these protocols to the current revisions.

The following summarizes the M3UA RFC updates to this feature:

- Tekelec's M3UA implementation adds support for the optional ASP ID parameter.
- Congestion Control
 - The Secure Gateway prevents a UA (IETF User Adaptation Layers) association from remaining congested forever.
 - The Secure Gateway maintains congestion status of SS7 destinations on behalf of the Applications Servers, as well as abates congestion.
- This feature complies with RFC3332, and supports additional protocol updates.
- This feature also supports several “custom” extensions to RFC3332, to satisfy customer requests.

Hardware Requirements

The M3UA for IP⁷ 8.0 feature runs on existing hardware, i.e. the Single Slot Enhanced DCM (P / N 870-2372-01).

New Commands

The following command has been created to support this feature. For more information, see the *Commands Manual*.

chg-uaps

This command allows modification of a UA parameter set. The command also allows copying a parameter set's settings to another by specifying a destination set and source set. There are ten UA parameter sets. Each UA parameter set has 10 timers and 10 optional parameters. The bit-mapped parameters control SNM and extended UA notification message behavior and an extended UA timer.

Syntax

```
CHG-UAPS
:SET=<Set number>
:TIMER=<Timer number>
:TVALUE=< Timer value>
:PARM=< parameter number>
:PVALUE=<The parameter value>
:SRCSET=< Set number>
```

Parameters**:set**

Designates the Set number.

Range = 1-10

:timer

The Timer number within the parameter set.

Range = 1-10

:tvalue

The value the timer will be set to.

Range = 0-4294967295 msec

:parm

Specifies the parameter number.

Range = 1-10

:pvalue

The numerical value that PVALUE will be set to if specified.

Range = 0-4294967295

:srcset

The source set of the copy.

Range = 1-10

Example Input/Output

```
CHG-UAPS:SET=1:TIMER=1:TVALUE=20

rlghncxa03w 02-03-07 11:11:28 EST Rel 30.0.0
CHG-UAPS:      MASP A - COMPLTD
;

CHG-UAPS:SET=1:PARM=3:PVALUE=h' 7
```

```

rlghncxa03w 02-03-07 11:11:28 EST Rel 30.0.0
CHG-UAPS:    MASP A - COMPLTD
;

CHG-UAPS:SET=2:TIMER=1:TVALUE=30:PARM=2:PVALUE=h'2

rlghncxa03w 02-03-07 11:11:28 EST Rel 30.0.0
CHG-UAPS:    MASP A - COMPLTD
;

```

rtrv-uaps

Use this command to retrieve UA parameter sets. If no parameter sets are specified for the command, all UA parameter sets are displayed. This command has been created to display the UA parameter set specified by the **chg-uaps** command.

Syntax

```

RTRV-UAPS
:SET=<Set Number>

```

Parameters**:set**

Designates the Set number

Range = 1-10

Example Output

```

rtrv-uaps:set=1
rlghncxa03w 00-02-07 09:50:17 EST Rel 30.0.0

```

SET	TIMER	TVALUE	PARM	PVALUE
1	1	10	1	255
1	2	0	2	0
1	3	0	3	0
1	4	0	4	0
1	5	0	5	0
1	6	0	6	0
1	7	0	7	0
1	8	0	8	0
1	9	0	9	0
1	10	0	10	0

```

TIMER 1: AS Recovery Timer (ms) T(r), min time AS msgs are queued,
          SS7IPGW and IPGWI applications enforce 10-200(ms).
TVALUE : Valid range = 32-bits

PARM 1: ASP SNM options. Each bit is used as an enabled/disabled
        flag for a particular ASP SNM option.
PVALUE : Valid range = 32-bits
        BIT
        0=Broadcast
        1=Response Method
        2-5=Reserved

        7-31=Reserved
        BIT VALUE
        0=Disabled , 1=Enabled
        0=Disabled , 1=Enabled

PARM 2: ASP/AS Notification options. Each bit is used an
        enabled/disabled flag for a particular ASP/AS
        Notification option.
PVALUE : Valid range = 32-bits
        BIT
        0=ASP Active Notifications
        1=ASP Inactive Notifications
        BIT VALUE
        0=Disabled , 1=Enabled
        0=Disabled , 1=Enabled

```

```

                2=ASP AS State Query                0=Disabled , 1=Enabled
                3-31=Reserved
PARM  3:  AS/ASP validations.  Each bit is used to control a
          particular AS/ASP validation method.
PVALUE :  Valid range = 32-bits
          BIT
          0=Strict ASP-ID checking    0=Disabled , 1=Enabled
          1-31=Reserved

```

chg-asp

This command has been created to change the UA parameter set an ASP uses for various SNM message and notification response options. UA parameter sets are valid for M3UA associations only.

Syntax

```

CHG-ASP
:ASPNAME=<ASP name>
:UAPS=<UA parameter set name>

```

Parameters**:aspname**

The name assigned to the ASP.

Range = Must adhere to ASP naming conventions.

:uaps

Value used for UA parameter set.

Range = 1-10

Example Input/Output

```

CHG-ASP:ASPNAME=ASPX:UAPS=2

rlghncxa03w 03-02-17 15:35:05 EST  Rel 30.0.0
CHG-ASP: MASP A - COMPLTD
;

```

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

asplog (Pass Command)

This command is used to display the UA state history for a specified Application Server Process (ASP). The **asplog** command has been enhanced as follows:

- It displays the ASP Identifier if the specified ASP has an ASP ID assigned in the AS State table, and the ASP State is in the ASP-Inactive or ASP-Active state. If no ASP ID exists for an ASP, the text "undefined" will appear after the colon instead of a value.

- The ASP UP PDU received event is appended with parentheses enclosing the asp id information. The format is (asp id = hex value for 32 bit or undefined).
- The current text for a transmitted Notification, "NTFY PDU Transmitted," has been replaced with one of the following new text phrases for a transmitted notification event.

"AS DOWN NTFY PDU Transmitted",
"AS INACTIVE NTFY PDU Transmitted",
"AS ACTIVE NTFY PDU Transmitted",
"AS PENDING NTFY PDU Transmitted",
"ALTERN ASP ACTIVE NTFY PDU Transmitted",
"INSUFFICIENT ASPS NTFY PDU Transmitted",
"ASP FAILURE NTFY PDU Transmitted",
"ASP INACT NTFY PDU Transmitted",
"ASP ACT NTFY PDU Transmitted"

ASP Failure, ASP Inactive Notify, ASP Active Notify and Alternate ASP Active will append the asp id in parenthesis.

The version value has been modified to display a new M3UA version. The values to be displayed are M3UARFC or M3UADRAFT8.

Options

```
asplog [asp name] [-i service ua] [-x service ua]
```

Example Output

```

ASPLOG: ASP state history log
rlghncxa03w 00-01-27 08:10:00 EST Rel 30.0.0

    ASP           Association UAPS
    ASP1          sock1       1
    ASP2          sock2       1
    ASP3          sock3       1

ASP Table is (3 of 250) 1% full

```

rept-stat-asp

Use this command to generate a report of the Application Server Process (ASP) status. This command has been enhanced to output the new column titled ASP ID, and will display the ASP Identifier for each ASP that has an ASP ID assigned in the dynamic AS State socket table. If no ASP ID is available, the row will have the text undefined in that column.

The ASP ID is only available when an ASP is in the ASP-Inactive or ASP-Active State. When an association goes down, the ASP ID information is removed from the SG, and recreated after a subsequent ASP-UP message is received containing the ASP Identifier Parameter. Once an ASP ID is set in the ASP Inactive/Active state, the value cannot be modified.

Syntax

```

REPT-STAT-ASP
:ASPNAME=<ASP name>

```

Parameters

:aspname
Name of AS to report on.

Example Output

```

rept-stat-asp

rlghncxa03w 00-02-04 12:57:21 EST Rel 8.0.0

    ASP      ASP ID      PST      SST
    asp1     0x00000001   IS-NR    ASP-ACTIVE

    asp5     undefined    OOS-MT   ASP-DOWN

Command Completed.
;

```

ent-assoc

Use this command to configure the SCTP associations in the IPAPSOCK table. This command has been enhanced to initialize the **:ver** parameter to VER=RFC for M3UA associations.

Example Output

```
ent-assoc:aname=assoc1:lhost=gw105.nc.tekelec.com:lport=1030:
:rhost=gw100.nc.tekelec.com:rport=1030:adapter=m3ua
```

```
rlghncxa03w 00-02-17 15:35:05 EST Rel 2.2.0
ENT-ASSOC: MASP A - COMPLTD
;
```

chg-assoc

Use this command to configure existing SCTP associations in the IPAPSOCK table. This command has been enhanced to allow modification of the optional **:ver** parameter for the M3UA draft revision. The value for this version is either D8 or RFC (the default).

Syntax

```
CHG-ASSOC
:ANAME=<Association name >
:LHOST=<Local Host name>
:LPORT=<Local TCP Port ID>
:RHOST=<Remote host name>
:RPORT=<Remote TCP port ID>
:OPEN=<connection State>
:ALW=<connection state>
:PORT=<signaling link port>
:ADAPTER=<adapter layer>
:ALHOST=<Alternate Local Host name>
:VER=<M3UA Draft 8 or RFC>
....
```

Parameters

:ver=<M3UA Draft 8 or M3UA RFC>

The association can be set up to use M3UA draft 8 or M3UA RFC message formats.

Range = D8, **RFC**

rtrv-assoc

Use this command to retrieve the configuration data from the IP Socket / Association (IPAPSOCK) table. This command has been enhanced to display the UA version supported. The values for this version are updated to either D8 or **RFC** for M3UA associations.

Example Output**rtrv-assoc:aname=swbel32**

```

rlghncxa03w 00-02-04 08:40:18 EST Rel 30.0.0
ANAME SWBEL32

  OSTRMS   2
IP Appl Sock table is (4 of 250) 1% full
;

```

chg-sg-opts

This command is used to change options for the IP⁷ Secure Gateway. This command has been enhanced by the addition of the **:ipgwabate** and **:iplimabate** flags. These flags enable/disable abatement procedures for the IPGWx and IPLIMx applications. Note that these flags currently apply to ANSI destinations only.

Syntax

```

CHG-SG-OPTS
:SYNC=<sync code>
:SRKQ=<static routing key quantity>
:DRKQ=<dynamic routing key quantity>
:SNMPCONT=<SNMP system contact>
:GETCOMM=<SNMP get community name>
:SETCOMM=<SNMP set community name>
:TRAPCOMM=<SNMP trap community name>
:INHFEPALM=<Inhibit TALI socket NEA-FEP Alarms>
:SCTPCSUM=<SCTP checksum algorithm type>
:IPGWABATE=<Enable SS7 congestion abatement procedures on IPGWx>
:IPLIMABATE=<Enable SS7 congestion abatement procedures on IPLIMx>

```

Parameters**:ipgwabate**

This parameter specifies whether or not SS7 congestion abatement procedures are enabled on the IPGWx application. The parameter controls whether the TFC is forwarded to the Secure Gateway's true point code to allow MSUs to be discarded as part of abatement procedures on all cards running the IPGWx application in an SG.

Range = enabled,disabled

:iplimabate=

This parameter specifies whether or not SS7 congestion abatement procedures are enabled on the IPLIMx application. The parameter controls whether the TFC is forwarded to the Secure Gateway's true point code to allow MSUs to be discarded as part of abatement procedures on all cards running the IPGWx application in an SG.

Range = enabled,disabled

Example Output

chg-sg-opts:ipgwabate=yes

```
rlghncxa03w 00-02-07 09:17:40 EST Rel 30.0.0
chg-sg-opts:ipgwabate=yes
Command entered at terminal #4.

Alarms and Error Codes

Table 4-26 lists the new UIM created for this feature.

Table 4-26. M3UA Protocol Enhancements: New UIMs

UIM #	Severity	Message Text
1196	None	IP Connection Congestion Timeout

Error Codes

Incorrect use of the enhanced commands for the M3UA Protocol Enhancements feature may result in the error messages listed in Table 4-27:

Table 4-27. M3UA Protocol Enhancements: Error Messages

Error Message	New?	Used by Command:
E4031 Association's adapter type invalid for command	No	chg-asp
E4084 Specified ASP name not found	No	chg-asp
E4022 All ASPs with OPEN=YES in AS must use same UAPs	Yes	chg-assoc
E4023 Association must have OPEN=NO to change UAPS	Yes	chg-asp
E4024 SRCSET and SET cannot be equal	Yes	chg-asp

Limitations

1. Tekelec's implementation neither supports nor prevents hooking up M3UA to M3UARFC associations, and relies on the M3UA user to configure both ends correctly. A mismatch between versions can transition to the ASP-UP and ASP-Active States, although DATA Messages and others may fail with error messages returned. No adverse affects should occur either.
2. In Tekelec's implementation, since individual queues are not allocated to ASs, any initiation of the AS Recovery Timer T(r) causes the L3_L2 queue for the entire IPGWx card to be placed on hold, queuing messages for all of the AS's ASPs assigned to the card. Because multiple ASs can effectively be assigned to one card, multiple instances of T(r) can be in effect at one time controlling the same L3_L2 queue.

The net result is that the total time the L3_L2 queue is on hold is longer than the duration of the first timer instance, and is not predictable. Because the delay between multiple instances of the timer can't be predicted, the overlap can't be predicted. If each AS is assigned a different value of T(r), this complicates the problem. Therefore, the total time the queue can be on hold is bounded by either an absolute 200 ms, or by the queue depth exceeding congestion thresholds.

Tekelec's implementation will not account for the ASP ID Race Condition. If two ASPs send ASP-UP messages containing the same ASP ID on two different cards simultaneously, there's the potential that the same ASP ID value will be assigned to both the ASPs.

Management of Unused User IDs (Release 21.0)

In Release 21.0, the Eagle maintains the date and time that each user ID last successfully logged on to the Eagle. During the login process, the system computes how many days have elapsed since the last successful login. If the number of elapsed days exceeds the value of the `uout` parameter, used with either the `ent-user`, `chg-user`, or `chg-secu-dflt` commands, access to the Eagle is denied, and the following message is displayed to the user.

*Error
Message*

E2752 Cmd Rej: UserID has become obsolete and cannot be used

This test for inactivity is performed after the user ID and password combination has been validated, and before any of the password aging tests.

The `rstlsl=yes` parameter with the `chg-user` command resets the last successful login date associated with the user to the current date. This allows that user to login to the system.

When a user ID is initially created, the last successful login date and time that is entered in the database is set to the date and time that the user ID was created. If a user ID is created and never used, it becomes obsolete when the number of days the user ID was inactive, measured from the creation date, is greater than the value of the `uout` parameter. At that time, the system does not allow a login session to be established with that user ID.

This feature does not apply to all user IDs assigned to the Security Administration command class. If the Eagle detects that all user IDs have been inactive longer than value of the `uout` parameter (for example, the system administrator mis-typed the date 10 years in the past with the `set-date` command resulting in all user IDs appearing obsolete to the system), no one would have access to the Eagle and the Eagle would be un-administrable. Since the Eagle requires at least one user ID to be assigned to the Security Administration command class, by having this feature not apply to any user IDs assigned to the Security Administration command class ensures that at least one user will always have access to the Eagle.

Manual Deactivation of SRST Message (Release 21.0)

When a destination for a route becomes restricted or prohibited, the Eagle starts sending signaling route set test (SRST) messages for that destination. This feature allows a user to manually stop sending signaling route set test messages for a specific destination on a specific route using the **dact-rstst** command. The destination of the route must be either the DPC of the route, a cluster point code of a route, or an entry on the cluster routing exception list. The route's status is changed to allowed.

If the SRST messages for a particular destination have been manually deactivated and that destination becomes restricted or prohibited again, the **dact-rstst** command must be issued again to manually stop sending the SRST messages for that destination.

MAP Table Increase (Release 29.0)

With the MAP Table Increase feature, the number of GTT MAP Table entries can be increased from 1024 to 2000 or 3000, independent of the GTT capacity. The GTT MAP Table is used for final global title applications. This feature is also known as the XMAP feature.

Hardware Requirements

All existing SCCP ASM cards must be replaced with SCCP TSM or better (DSM) equipment when activating XGTT.

All existing SCCP ASM cards must be replaced with SCCP TSM or better (DSM) equipment when activating XMAP.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the MAP Table Increase feature.

rtrv-map

Use this command to show the mated application relationship information maintained by the system. The output for this command has been enhanced for this feature.

Measurements Enhancements (Release 22.0)

These new measurements are being added to the Eagle.

- The GTWY measurement report type.
- The RBASE measurement report type.
- These measurements in the daily reports (MTCD and MTCDTH): OCTRETRN, TLNKACTV and MSURCERR.
- The MTCH measurement report type for the LNP entity. This report contains measurements that apply to the LNP feature. The details of this report are discussed in the LNP Feature Notice.

The GTWY measurement report collects and reports gateway-related data from the STP. The gateway related data collected for this report is the network management and global title translation load on the Eagle, and the source of this load. The level and source of pass through TCAP traffic is also collected. In previous releases, the MTP cards in the Eagle did not measure the data required to be reported for the GTWY measurement report. In release 22.0, the MTP cards measure this data which is reported when requested. The MTP cards are polled every 30 minutes for the gateway-related data. The gateway-related data is retained by the Eagle for 24 hours.

The addition of the GTWY measurements increases the amount of measurements data collected and reported. To make sure that no measurements data is lost when the data is printed on a printer, Release 22.0 requires that the minimum baud rate of the printer is 9600 bps and that the printer must be able to print at a minimum at 1200 characters per second.

The RBASE measurement report reports various data related to the configuration or status of the Eagle's major configurable components. The data that appears in this report could be obtained in an existing system by issuing a variety of **rtrv-xxxx** and **rept-stat-xxxx** commands. In release 22.0, this information can be obtained by entering a single command and can be displayed in a single report. The data in this measurement report is obtained from either the database or from maintenance tasks performed on the Eagle. The data is not periodically collected and stored in same the manner of other measurements data, but it is collected on demand when a RBASE measurement report is requested.

Measurements Platform Filename with CLI (Release 31.3)

The Measurements Platform Filename with CLI feature allows Measurement Platform processors on several EAGLEs to send their measurements reports to a single directory on a centralized FTP server without duplicate file name problems or overwritten files caused by multiple EAGLEs writing to the directory.

The Measurements Platform Filename with CLI function is controlled. Feature ON/OFF status is controlled by a measurements option. When the option is turned ON, the unique CLI field for each EAGLE is prepended to the beginning of the measurements report file name.

The only other major impact of this feature on the filenames generated to the FTP server is that when the option is ON the year is not included as a part of the name.

Measurements Platform—Phase 1 (Release 28.0)

The Measurements Platform supports the growth path of the Eagle STP beyond 700 links by providing a dedicated processor for collecting and reporting STP, LNP, INP, G-Flex, and G-Port Measurements data. This platform consists of multiple MCPM (Measurement Collection and Polling Module) cards in a primary/secondaries configuration, in which a single primary MCPM performs all collection and reporting functions. The secondary MCPM cards serve as backup for the primary.

NOTE: The measurements platform is required for customers with more than 700 links.

Figure 4-18 presents a logical diagram of the Measurements Platform and its interfaces to the customer's network and the existing Eagle architecture. The Eagle interface is via the standard IMT bus, and allows communications with the network elements and the OAM. The interface to the customer's network supports the FTP transfer of Measurements reports to an FTP server.

Refer to the *Database Administration Manual - System Management* for configuration information. Refer to the *Maintenance Manual* for detailed measurements information.

Figure 4-18. Measurements Platform Architecture

Hardware Required

The Measurements Platform requires a minimum of 2 MCPM cards with at least 2 GB of memory. For Release 28.0, the Measurement Platform uses GPSM-II based cards (P / N 850-0622-01) as the MCPM cards.

CAUTION: Never install or initialize MCAP cards in MASP slots 1113 and 1115 after features that require GPSM-II cards are provisioned. Attempting to initialize MCAP cards with GPSM-II features provisioned will cause a system outage. Before replacing an existing GPSM-II card in a MASP slot (1113 and 1115) contact Tekelec Customer Service.

During card boot up, the amount of memory in the card is verified; if it is less than 2 GB, the card is inhibited.

For detailed information on hardware, refer to the *NSD Hardware Manual*.

New Commands

The following commands have been created to support the Measurements Platform. These commands are available if the Measurements Platform feature is enabled. For the current usage information, refer to the *Commands Manual*.

rept-ftp-meas

This command provides the capability to manually initiate generation and FTP transfer of a measurements report from the MCPM to the customer's FTP server.

rept-stat-meas

This command reports the status of the measurements subsystem including card location and state, Alarm level, and Subsystem State.

chg-measopts

This command provides the capability to enable or disable the automatic generation and FTP transfer of scheduled measurements reports to the FTP server.

rtrv-measopts

This command generates a UI display showing the enabled / disabled status of all FTP scheduled reports.

ent-ftp-serv

Allows the entry of FTP configuration parameters for up to two FTP servers for the Measurements Platform: a Primary and a Secondary.

chg-ftp-serv

Allows changing certain parameters related to the specified FTP server entry.

dlt-ftp-serv

Allows the deletion of a single FTP server entry.

rtrv-ftp-serv

Generates a UI display showing the parameters for each configured FTP server.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the Measurements Platform feature. For more information on these commands, see the *Commands Manual*.

chg-feat

Use this command to activate optional features available on the system. Features are allowed only to be turned on. Once activated, you cannot turn off the feature.

rtrv-feat

Use this command to display the list of optional features and their status on the system. This command has no parameters.

chg-meas

This command is unchanged, with the exception that the parameter **:collect=on/off** controls only the output of scheduled reports to the UI. This parameter has no effect on enabling / disabling collection and report generation on the Measurements Platform. Collection is enabled / disabled by allowing / inhibiting the MCPM cards, and report generation is controlled by the FTP configuration commands.

ent-card

Use this command to add a new card to the system. This command has been enhanced to support the MCP GPL (Generic Program Load).

inh-card

This command has been enhanced to inhibit all MCPM cards to stop collection.

alw-card

This command has been enhanced to enable collection after it was disabled by inhibiting the MCPM card.

rtrv-card

This command retrieves card information, displaying the type, application, port A linkset name, and port B linkset name.

rept-stat-card

Generates a summary report of cards, which are equipped in the system. This command has been enhanced to support the MCPM card.

rept-stat-sccp

Use this command to display the following types of report. The output for **rept-stat-sccp:loc=xxx** has been updated.

act-/chg-/rept-stat-/rtrv-gpl

The parameter range value **:appl=mcp** has been added to these commands.

Miscellaneous Command Adjustments (Release 26.0)

Refer to the *Commands Manual* for current command usage information.

Activate Echo to a Terminal

Customers want the ability to echo a terminal to another terminal(s), in addition to a printer. This capability will allow customers to monitor terminal command input and output from another terminal. This will also allow Tekelec's Technical Services group to monitor customer terminal activity while dialed in on a customer's switch.

Also, during upgrades, this feature will allow Technical services to monitor what the customer is entering into the terminal, step-by-step.

Note that unsolicited output (alarm and network messages) still require the **chg-trm** command to be sent to the screen.

The terminal receiving the echo must be logged on.

Figure 4-19. Echoing Remote Terminal Input/Output

Changed Commands

Refer to the *Commands Manual* for current information on the following commands.

act-echo

This command forces responses from the scroll area of a terminal to be printed to a specified terminal or printer. The command now also supports one terminal echoing to many terminals or many terminals echoing to one terminal.

Cancelling `rtrv` and `rept-stat` Commands

Execution of some `rtrv` and `rept-stat` commands can consume large amounts of time, depending on the particular command and parameters that are entered. If a customer accidentally enters a `rept-stat` or `rtrv` command that takes some time to execute, they cannot easily regain control of the Eagle, and must wait for the command to complete. Customers want the ability to abort (cancel) `rtrv` and `rept-stat` commands that are in progress when more important commands need to be entered.

New Command

The Eagle now provides a new command, `canc-cmd<command>`, in the Security Administration command class, that allows canceling certain commands from another terminal.

In addition to the terminals being freed for additional command input, output from these commands also is halted (i.e. the command is truly aborted).

`canc-cmd`

This command halts processing and output of the commands listed in Table 4-28:

Table 4-28. Commands For Which `canc-cmd` Aborts Processing and Output

Command
<code>rept-stat-card</code>
<code>rept-stat-dstn</code>
<code>rept-stat-ls</code>
<code>rept-stat-slk</code>
<code>rtrv-dstn</code>
<code>rtrv-gta</code>
<code>rtrv-gtt</code>
<code>rtrv-ls</code>
<code>rtrv-map</code>
<code>rtrv-rte</code>
<code>rtrv-seculog</code>
<code>rtrv-slk</code>

Used without the `trm` parameter, the `canc-cmd` command is entered on the same terminal that is currently running the command you want to cancel.

Used with the `trm` parameter, the `canc-cmd` command is entered on a terminal other than the one that is currently running the command you want to cancel.

Miscellaneous Command Adjustments (Release 26.1)

Customers desire multiple enhancements to the administration functionality for the OAM. The following sections describe the enhancements implemented for Release 26.1.

Different Database Level Alarm Repetition When UAM 34 Has Been Raised (PR28908)

When a card in the system is at a different database level than the active OAM, a UAM 34 is sent to the terminal. Because this occurs only once, operators may not notice the alarm at the card, or might enter a **rtrv-trbl** command to see that the card's database is inconsistent with the OAM. Customers wish to have this alarm added to the list of alarms that are reissued to the terminal at prescribed intervals.

For every card in the Eagle system that is at a different database level than the active OAM, UAM 34 is logged and issued to the terminal 30 minutes after the database mismatch occurs, and 30 minutes thereafter.

Output Example

```

**      Alarm Summary: Card database is inconsistent      (xxx of yyy shown)
**
-----
**      card 1101,  card 1201,  card 1202,  card 1203,  card 3113,  card
1314,
**      card 4101,  card 4102,  card 4103,  card 4104,  card 4105,  card
4106,
```

Ent-/Chg-GTT Failure Message Should Show Overlap (PR28909)

When customers enter or modify GTT's, they are able to do so for a range of Global Title Addresses. If GTT entries already exist within that range, the command is rejected and displayed in the scroll area. Customers want the ability to see the actual condition that caused the command to fail, instead of having to execute a **rtrv-gtt** or **rtrv-gta** command on that range.

This enhancement affects the **ent-gtt/-gta**, **chg-gtt/-gta**, and **dlt-gtt/-gta** commands.

For **ent-gtt**, the scroll area message shows the first instance of an overlap for an entry /range.

For **chg-gtt**, the scroll area message shows the first instance of the two existing entries / ranges that the user attempted to change.

Examples: **VGTT feature is off:**

TT	GTA	EGTA	PC	XLAT	RI
253	3037070000	30370799999	1-1-3	DPC	GT
253	3037071000	30370729999	1-1-4	DPC	GT
253	3037073000	30370799999	1-1-1	DPCSSN	SSN

The command **ent-gtt:gta=3037073333** would display an E2401 message, and the scroll area message would be displayed, since there is an overlapping range.

The command **chg-gtt:gta=3037072000:egta=3037074000** would display an E2401 message, and the scroll area message would be displayed, since the change covers two entries. (See the examples below.)

chg-gtt

This example shows what happens when the database contains point codes within the range of 800555000 to 800555999, and the user attempts to change a point code that overlaps that range. In this situation, error message E2401 is generated:

Error Message

```
E2401 Cmd Rej: GTA range overlaps a current range
```

Output Example

```
Enter UI command or 'exit':
chg-gtt:type=2:gta=8005550000:egta=8005555999:pc=5-5-2
chg-gtt:type=2:gta=8005550000:egta=8005555999:pc=5-5-2
Command entered at terminal #4.
  The following GTA ranges overlap the input GTA range
    START GTA      END GTA
    8005550000      8005551999
    8005552000      8005553999
    8005554000      8005555999
E2401 Cmd Rej: GTA range overlaps a current range

      CHG-GTT: MASP A - Command Aborted
```

dlt-gtt

This example shows what happens when the database contains point codes within the range of 800555000 to 800555999, and the user attempts to change a point code that overlaps that range. In this situation, error message E2401 is generated:

```
E2401 Cmd Rej: GTA range overlaps a current range
```

Output Example

```
Enter UI command or 'exit':
dlt-gtt:type=2:gta=8005550020:egta=8005555900
dlt-gtt:type=2:gta=8005550020:egta=8005555900
Command entered at terminal #4.
  The following GTA ranges overlap the input GTA range
    START GTA      END GTA
    8005550000      8005551999
    8005552000      8005553999
    8005554000      8005555999
E2401 Cmd Rej: GTA range overlaps a current range

      DLT-GTT: MASP A - Command Aborted
```

MTP and other MRN Message Format Improvements (Release 21.0)

Table 4-29 shows the MRNs that have been added to Release 21.0.

MTP Circular Route Detection (Release 21.0)

The Eagle automatically tests for circular routing when congestion occurs on an ANSI signaling link. If the routing data were provisioned incorrectly, or were corrupted, MSUs could be routed in an endless circular route. The incorrect routing data could be on the Eagle or at a remote STP. With the addition of cluster routing and E links, the danger of circular routing is greater.

The Eagle starts the test when a signaling link reaches onset congestion threshold 1. The Eagle only runs the test for one signaling link per linkset. If a second signaling link in the same linkset goes into congestion, the Eagle does not start a new test. Each time the signaling link's congestion level increases, the test is restarted. The link interface module (LIM) that terminates to the congested signaling link determines which DPCs have the most MSUs transmitted on the signaling link. The LIM then transmits a circular routing test message to the DPCs that have been sent the most MSUs. The circular route test message can be sent to a maximum of 10 DPCs. This value is configured by the **chg-stpopts** command with the **mtplctcdpcq** parameter. A circular routing test message is a routeset congestion test message with priority of 3.

If any LIM receives one of the test messages before the circular route test timer expires, the Eagle performs the following actions.

- Marks the destination as prohibited due to circular routing.
- Broadcasts TFPs for the destination.
- Reports that circular routing was detected for the destination.
- Raises a critical alarm.

The circular route test timer can be configured by the user using the **chg-stpopts** command with the **mtpltst** parameter. The **mtpltst** parameter value is between 10 and 20 seconds, with 10 seconds being the default value. The DPC remains prohibited until it is manually allowed using the **rst-dstn** (reset destination) command.

If the destination is a cluster point code entry in the routing table, then an exception list (x-list) entry is created for the destination. If the cluster has the exception list exclusion indicator set to yes (meaning do not create x-lists for that cluster), then an x-list is not created, UAM 319 is generated, and a critical alarm is raised for the cluster. The critical alarm can be cleared by entering the **rst-dstn** command for the cluster. The following is an example of UAM 319.

```

UAMs      RLGHNCA03W 96-04-16 16:28:08 EST Rel 21.0.0
          *C 0101.0319 *C DPC 011-210-* REPT-MTPLP-DET: Circ rte det(cong)
                    XMIT LSN=ls01 RC=10
                    RCV LSN=ls14
                    MEMBER=011-210-007

```

If the number of entries in the x-list has exceeded the maximum allowed for the x-list and circular routing is detected, then additional entries to the x-list are not added. In addition to UAM 319 being generated, UAM 321 is also generated. The following is an example of UAM 321.

```

          RLGHNCA03W 96-04-16 16:21:11 EDT Rel 21.0.0
          * 0061.0321 * XLIST X-LIST occupancy threshold exceeded

```

When a point code is prohibited due to circular routing, the Eagle ignores TFX/TCx management messages for that point code. The Eagle does not send routeset test messages for the point code. The Eagle discards any MSUs received for the point code and sends response method TFPs or TCPs.

When Eagle detects circular routing for a destination, it sets the circular routing flag for the destination in the routing table. The **rst-dstn** command clears this flag. Once the circular routing flag is cleared, the status of the destination depends on what type of entry is used.

- If the destination is a member of a cluster for which Eagle performs full point code routing only, all routes to the destination are marked as allowed and the destination's status is allowed. The Eagle broadcasts TFAs for the destination.
- If the destination has a full point code entry in the routing table, and there is also an entry for the point code's cluster, then each route used by the point code that is also used by the cluster entry assumes the status of the route for the cluster entry. The Eagle then determines the point codes route set status and broadcasts TFA/TFR if the point code becomes allowed or restricted.

If the **rst-dstn** command is entered for an x-list entry with the circular routing flag set, the x-list entry is deleted. The point code's status becomes the same as the cluster entry's status.

The circular route detection test feature can be turned on or off with the **mtplti** parameter of the **chg-stpopts** command.

The circular route detection test is not performed for ITU or X25 signaling links.

MTP Restart (Release 21.0)

The MTP restart feature provides an orderly process for bringing signaling links back into service after the Eagle has been restarted after being isolated. During a node's isolation, its route status information could become incorrect. When the node is restarted, the node starts carrying traffic too soon without updating its routing tables. This results in sending traffic on prohibited and restricted routes which eventually are discarded. This increases loss of traffic and also burdens the network to process this unnecessary traffic.

As routes become available or unavailable during restarting, the node acts on a per event basis and propagates the route status to the rest of the network. The sequence of route status messages broadcast depends on the sequence in which the routes became available or unavailable. This can result in sending lot of redundant network management messages. Since the route status is propagated from one node to other, this may have a ripple effect and increases the network management load of the network.

When the MTP restart process is used, a restarting node does not start carrying user traffic until a sufficient number of signaling links are available and the routing tables are sufficiently updated with the current status. Also, the restarting STP broadcasts the network management messages only after its routing table are updated. This reduces the number of unnecessary network management messages broadcast to the adjacent nodes and also makes the behavior of restarting STP more predictable.

The MTP restart process is started when the Eagle detects that it has been isolated under the following conditions.

1. SS7 application subsystem loading (after power on reset, system initialization or SS7 application subsystem initialization). In this case, route status is lost due to memory reset.
2. When the node is totally isolated for a period of time that is equal to the isolation timer (**mtprsit**) due to all signaling link failures (for example, losing both primary and secondary clock). The isolation timer is configurable. In this case, the status of the routes may become inaccurate due to the long amount of time that the node is isolated. The MTP restart procedure is started only if the node is isolated for a period of time that exceeds the value of the isolation timer. The reasons for waiting for the isolation timer to expire before starting the MTP restart process are:
 - a. If the amount of time that the node is isolated is less than the isolation timer, the status of the routes is more accurate.
 - b. Allows the Eagle to force uninhibit signaling links and come out of isolation.

The following conditions should also be met for starting a full MTP restart:

- The MTP restart feature is enabled (**chg-stpopts:mtprsi=yes**)
- There is at least one restart-capable adjacent node (linkset parameter **mtprse=yes**)

There are other conditions in which the Eagle may have inaccurate route status information such as a major but partial failure of the Eagle. The MTP restart process is not invoked in these cases. However, such failures are likely to cause adjacent nodes to become unavailable. This may result in invoking of the MTP restart process in the role of being adjacent to a restarting node.

The MTP restart process brings the signaling links back into service in four steps.

1. The signaling links are activated and traffic is stopped.
2. The Eagle receives route status information from all adjacent nodes.
3. The Eagle broadcasts route status information to all adjacent nodes.
4. Traffic is restarted.

User traffic is not carried on the signaling links during the MTP restart process. Two new protocol messages have been defined to signal the adjacent nodes when traffic may be sent on the linkset connecting the restarting node and the adjacent node.

1. Traffic-restart-waiting (TRW) — an indication to the receiving STP that no user traffic can be sent to the sending signaling point.
2. Traffic-restart-allowed (TRA) — an indication to the receiving STP that user traffic can be sent to the node sending the TRA message.

The route status is exchanged using Transfer (TFx) and Transfer Cluster (TCx) messages.

The MTP restart feature is supported only for ANSI signaling links. This feature is not supported for ITU and X.25 signaling links.

The time it takes to come out of isolation (when the first signaling link is available to carry level 3 traffic) is not increased due to the MTP restart feature.

Message Routing

Route availability has two parts:

- The network route status. This is affected by the TFX/TCx network management messages received from the network. The network route status is in either an Allowed, Restricted, or Prohibited state.
- The local route status. This is affected by changes in the linkset states. Currently, this can be either Allowed or Prohibited.

The MTP restart feature affects the linkset state and thus affects the local route state of all routes using that linkset. Currently a linkset can be in one of the two states, Available or Not Available. With the MTP restart feature, in certain states of the restart procedure, a linkset is available to carry only certain type of messages. During these states, the linkset is available to carry network management messages, signaling test, and maintenance messages that are originated and terminated at the nodes engaged in the MTP restart process. The linkset is not available to carry other types of messages which are commonly referred as user traffic. The user traffic includes ISUP, SCCP and management messages like TFC which are not originated and terminated at the nodes engaged in the MTP restart process. A new state Restart has been added to the local route status during which it is not available to carry user traffic. The local route state of a route can now be in one of three states.

- Prohibit — Linkset failure, same as before
- Restart — Because of the MTP restart process, the linkset cannot carry user traffic
- Allowed — Linkset available to carry all traffic

Aligning Signaling Links in a fully Restarting Node

During the MTP restart process, all adjacent nodes are sending TFX/TCx messages to the restarting node. To handle this burst of traffic and to avoid excessive network management load, the signaling links are activated in the following order:

1. restart-capable signaling links
2. non-restart-capable signaling links
3. X.25 signaling links

If the MTP restart feature is turned on, the alignment of all ANSI signaling links is delayed until all the LIMs containing ANSI signaling links are in service. This allows the Eagle to be restored to network service in an orderly fashion and allows all the LIMs containing ANSI signaling links to participate in the MTP restart process. The amount of time that the alignment of the signaling links is delayed is dependent on the number of LIMs in the Eagle and is shown in Table 4-32.

Table 4-32. MTP Restart Signaling Link Alignment Delay

Number of LIMs Containing ANSI Signaling Links	Signaling Link Alignment Delay
1 to 64	62 seconds
64 to 127	97 seconds
128 to 191	132 seconds
192 or more	167 seconds

Measurements

One new measurement has been added to support the MTP restart feature.

Number of MTP Restarts Initiated —The number of times a full MTP restart is initiated by the STP. This measurement count does not include the number of times the MTP restart process was initiated as a result of messages from adjacent nodes.

This measurement is collected for the whole system and is reported every hour in the STP-SYSTOT measurement report.

Event Reporting

Two new UIMs have been added to support the MTP restart feature.

- UIMs*
1. Commencement of MTP restart process (UIM 1088) — This UIM shows that the Eagle has started the MTP restart process. The following is an example of UIM 1088.
 2. Completion of MTP Restart (UIM 1089) — This UIM shows that the Eagle has completed the MTP restart process. The following is an example of UIM 1089.

```
RLGHNCXA03W 96-04-16 16:28:08 EST Rel 21.0.0
0002.1088      SYSTEM          INFO  REPT-MTP-RSTRT MTP Restart started
              Report Date: 96-04-16  Time: 16:27:19
```

```
RLGHNCXA03W 96-04-16 16:28:08 EST Rel 21.0.0
0002.1089      SYSTEM          INFO  RCVRY-MTP-RSTRT: MTP Restart Completed
              Report Date: 96-04-16  Time: 16:27:19
```

Alarms

No new alarms are required for this feature. The definition of clearing an existing alarm messages has changed because of the MTP restart feature.

- Critical Alarm 0308—Node Isolated due to SLK failures

This alarm is cleared when the first signaling link becomes available at level 3 and not when the Eagle is ready to carry user traffic like ISUP / SCCP. Even though this alarm is cleared, the Eagle is not available to carry user traffic because the MTP restart process is in progress.

Existing Commands

Refer to the *Commands Manual* for current usage information.

chg-feat and rtrv-feat

A new parameter has been added to the **chg-feat** command, **mtprs**, to turn on the MTP restart feature. Once this feature is turned on, it cannot be turned off.

The output of the **rtrv-feat** command has been modified to show whether the MTP restart feature is on (**mtprs=on**) or off (**mtprs=off**).

ent-ls, chg-ls, rtrv-ls

The **ent-ls** and **chg-ls** commands contain a new parameter, **mtprse** (MTP restart equipped) that indicates if the node adjacent to the linkset, specified by the **apc** parameter in the **ent-ls** or **chg-ls** command, is equipped (**mtprse=yes**) or not equipped (**mtprse=no**) with the MTP restart capability. If the MTP restart feature is not turned on, the default value for the **mtprse** parameter is **no**.

The value of the **mtprse** parameter is shown in a new field, MTPRSE, in the **rtrv-ls** command.

chg-13t and rtrv-13t

Nine new timers have been added to the **chg-13t** command to support the MTP restart process.

rept-stat-rte

The **rept-state-rte** command without specifying the **dpc** parameter displays the primary state (PST), secondary state (SST), and associated state (AST) of all destinations. The PST, SST, and AST displayed by the **rept-state-rte** are not changed. If the SST of a linkset is Restart, it is unable to carry user traffic because the MTP restart process is in progress and considers the state of the route as Prohibit.

When the **rept-stat-rte** command is specified with the **dpc** parameter, the output shows the linkset status, non-adjacent point code status and the route status. The linkset status is either Allowed, Prohibit or Restart. When the state of the linkset is Restart, the state of the route is Prohibit.

New Commands

The **chg-stpopts** command is used to enable and disable the MTP restart process. Enabling the MTP restart process can be done only after the MTP restart feature is turned on with the **chg-feat:mtprs=on** command. When the MTP restart process is turned on, by default the MTP restart process is enabled. The MTP restart process can be disabled using the **chg-stpopts** command with the **mtprsi=no** parameter. The **mtprsi** parameter has two values, **yes** for enabling the MTP restart process, and **no** for disabling the MTP restart process. The **mtprsit** parameter specifies the minimum amount of time that the Eagle is isolated before the MTP restart process is started. The value of the **mtprsit** parameter is from 2 to 900 seconds, with a system default value of 5 seconds.

If the MTP restart feature is not on (**mtprs=off**), the **mtprsi** parameter should not be specified with the **chg-stpopts** command. When the MTP restart feature is not on, the **mtprsi** parameter value defaults to **no**, meaning that the MTP restart process is disabled.

Multiple Capability Point Codes (Release 21.0)

Before Release 21.0, the Eagle could have only one capability point code of each network type (ANSI, ITU international, and ITU national) defined with the self ID of the Eagle. With this feature, the Eagle can have up to 96 capability point codes and these capability point codes can have any mixture of network types. This feature also allows the Eagle to use capability point codes when performing global title translation. The capability point code identifies a group of functionally related STPs.

Messages requiring global title translation can be sent to other STPs to determine the final destination of the message. Since each STP has its own unique point code, the message must be sent to a specific STP. There can be more than one STP in a network that can perform the global title translation on the message. To make it easier to route these messages to STPs, capability point codes are assigned to the STPs and the global title translation tables are configured with the capability point code instead of the self ID point code of the STPs in the network. The capability point codes can be assigned to more than one STP in the network.

This allows other STPs to handle the required translation if, for example, the desired STP fails and no action would be required at the sending STP or at the other signaling points in the network to route the message to other STPs in the network to get the required translation.

Multiple Flash Download (Release 29.0)

This feature reduces the total time required to update Flash GPLs (i.e. board PROM) by providing the capability to simultaneously update, via commands, the Flash GPL for multiple cards.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. For current information on this command, see the *Commands Manual*.

`act-flash`

This command activates the trial FLASH GPL that is currently running on the target card. It has been enhanced with the new parameters `:appl`, `:eloc`, and `:sloc`.

`init-flash`

This command loads board PROM software to a specified card's inactive FLASH memory, and requests the hardware to use the inactive load the next time the card boots. It has been enhanced with the new parameters `:appl`, `:eloc`, and `:sloc`.

Multiple LFS Tests (Release 26.0)

The Multiple Link Fault Sectionalization (LFS) Feature allows the maintenance craftsperson to perform up to 16 DSOA fault sectionalization tests from the EAGLE. The LFS tests are initiated by the EAGLE, and are used to test the functionality of the link from the EAGLE SS7 LIM through multiple channel banks to a remote Network Element. With this feature, a craftsperson can test up to 16 SS7 links simultaneously. An unlimited number of tests are supported if the Eagle is not the integrating node for the LFS test.

NOTE: The Multiple LFS is a debug tool provided to the craftsperson. It should be used to help isolate a link failure. Improper use of this feature can result in a link element stuck in a far-end loop-back mode. If an LFS test is aborted by a card reset, it could leave the remote far-end loop-back condition active. Therefore, LFS tests must always be cancelled by the craftsperson if they need to be aborted.

Latching versus Non-latching LFS Tests

The process of activating and maintaining a loop-back is the major difference between latching and non-latching LFS tests.

Non-latching loop-backs are activated by the transmission of the following sequence:

- Minimum of 40 bytes of loop-back code, in multiples of 40 bytes, transmitted continuously until a software command is received to halt transmission or begin test data transmission.
- Alternating loop-back code and test data transmitted continuously until a message is received to halt transmission.

In this case, the loop-back is dropped if every other byte transmitted is not a loop-back code.

Latching loop-backs are activated by the transmission of a sequence of pre-defined control codes. In this case, once the loop-back is established, it can only be removed by another set of pre-defined control codes.

Figure 4-20 illustrates a link from an EAGLE to another EAGLE with two DSO Channel banks in the path, allowing for three LBP for Latching LFS Test.

Figure 4-20. DSO Link LBPs for LLT

Figure 4-21 illustrates a link from an EAGLE to a CSU/DSU with a DS0 and OCU in the path, allowing for three LBP for Non-Latching LFS Test. A loop back cannot be set in the DS0.

Figure 4-21. OCU/DCU link LBPs for NLT

Administrative commands (**ent-lbp**, **chg-lbp**, **dlt-lbp** and **rtrv-lbp**) are used to store, change, delete and confirm the SS7 link RLEs as LBPs in the EAGLE database, where the RLE nearest the EAGLE is known as LBP one.

Table 4-33 shows the valid RLE types for LLT and NLT.

Table 4-33. Remote Link Element (RLE) Types

Element	RLE Description	Valid RLE for LLT	Valid for RLE for NLT
DSO	DSO Dataport.	Yes	No
OCU	OCU Dataport.	Yes **	Yes
CSU	CSU Dataport.	Yes **	Yes
DSU	DSU Dataport.	Yes **	Yes
NEI	Network Element Interface	Yes	No

UAM ** The OCU, CSU and DSU must be strapped/optioned to support Latching LFS loop back.

Maintenance commands (**act-lbp**, **dact-lbp**) should be used to initiate and stop the LFS feature. The SS7 LIM card must be powered up and in service with the link deactivated (OOS_MT_DSBLD) prior to invoking the LFS tests. No SS7 traffic will be transferred to or from the signaling link by the SS7 LIM while the link is performing an LFS test.

New Commands

The Multiple LFS feature requires a new Maintenance command to obtain the current status of the LFS tests. The new command (**rept-stat-lfs**) generates a report of all the SS7 links that are under test, indicating the link location, LBP, pattern, maximum errors (threshold beyond which the test is considered failed), bit-errors since the beginning of this test, and maximum test time and test time elapsed.

Refer to the *Commands Manual* for current usage information.

rept-stat-lfs

This **rept-stat-lfs** command allows the user to display the status of the currently active LFS tests. Along with the link identification information, the command also lists the current LBP, the test pattern, the maximum bit-errors threshold, bit-errors since the beginning of this test, maximum test time, and the time elapsed since the beginning of the test.

Changed Commands

act-lbp

The semantic error message for this command has been changed. As opposed to the earlier version of LFS, Multiple LFS supports more than one LFS test.

dact-lbp

The semantic error message for this command has been changed. As opposed to the earlier version of LFS, Multiple LFS supports more than one LFS test.

Multiple Point Code Support (Release 26.05)

Currently, the Eagle supports three true point codes (one each for ANSI, ITU-National, and ITU-International). In addition, the Eagle supports up to 96 capability point codes, each of which can be designated as either ANSI, ITU-N, or ITU-I. Each capability point code defined on an Eagle node can be used for routing messages to that node. For various reasons, customers might need the Eagle to support more than one true point code in a particular domain.

This feature adds the ability to support Secondary Point Codes (SPCs) in addition to the true point codes used by the Eagle in any of the three domains ANSI, ITU-N and ITUI. Secondary point codes are used by provisioning and routing as if they are the true point code of the Eagle. SPCs are supported for any type of link (A, B, C, D, etc.). There is no effect on provisioning capability point codes as a result of this feature.

In addition to the one True Point Code (TPC) already supported for each of the ANSI, ITU-N and ITU-I domains, the Eagle support a pool of 40 Secondary Point Codes (SPC), each of which may be assigned as either ANSI, ITU-N, or ITU-I (not to exceed a total of 40 in one system). SPCs can be used in the same ways that true PCs are used.

There are three main reasons for this feature:

1. Some customers desire to collapse multiple existing STP's into one Eagle. This can present problems in that end offices and other nodes may not be controlled by the carrier making reprovisioning of these network elements difficult. Multiple Point Code (MPC) support is designed to allow the Eagle to assume more than one point code for SS7 routing. MPC support is different in concept from capability point codes in that provisioning and routing will use secondary point codes as if they were the actual point code of the Eagle.
2. Several customers in the international market want to deploy a single STP pair in multiple national (ITU-N) networks. This may not be possible without the MPC feature, as these operators are often forced to use a unique point code assigned by each national regulator of these target countries.
3. Customers may require additional links between two nodes beyond the number of links permitted by the protocol. For example, the maximum number of links between two nodes in an ITU network is 16. The MPC feature can allow for additional linksets between these nodes, increasing the number of links that can be used.

Replacing Two STP Pairs with One Eagle Pair

The following example shows how an Eagle pair can replace two existing STP pairs. In this example, each Eagle in the pair uses one True Point Code and one Secondary Point Code.

As shown in Figure 4-22, a new Eagle first replaces one existing STP pair. In this case, Eagle's True Point code is set to the True Point Code of the old STP. The adjacent nodes are cut over to the Eagle STP pair. The adjacent nodes do not need to be reconfigured.

Figure 4-22. Replacing the First STP Pair

Next, a second STP pair is replaced with the Eagle pair. As shown in Figure 4-23, an SSP and an STP are being “re-homed” from an old STP pair to a new Eagle STP pair. In this example, the STP (3-3-3) is reconfigured with new routes to recognize that it is now connected to Eagle1 and Eagle2 instead of 1-1-1 and 1-1-2. STP 3-3-3, if not an Eagle STP with Multiple Point Codes, may not be able to support more than one linkset to the same point code. See “*Multiple Linksets between Two Nodes*” on page 4-138 for a description of this capability. The interconnecting device (STP or SSP) can use either the TPC or SPC as the device requires.

At EAGLE1, the user would configure the secondary point code 1-1-1, using the **ent-spc** command. (See “*New Commands*” on page 4-142.) The user would also configure a route to 1-1-2 over the C-linkset. The user would then configure point code 4-4-4 in the Eagle's database to indicate that this point code uses the secondary point code 1-1-1, instead of the Eagle's true point code (**chg-dstn:dpc=4-4-4:spc=1-1-1**). (See “*Enhancements to Existing Commands*” on page 4-142.) This last step would be repeated for all other adjacent SSPs and SCPs that are re-homed from the old STP Pair to the new Eagle Pair.

Similarly, at EAGLE2, the user would configure the secondary point code 1-1-2, and configure a route over the C-link to 1-1-1. The user would also configure point code 4-4-4 in Eagle2's database to indicate that this point code uses the secondary point code 1-1-2, instead of the Eagle's true point code.

When EAGLE1 receives a message from the SSP destined for 1-1-1, Eagle processes the message as if the message was sent to Eagle's True Point Code.

When EAGLE1 generates a message (for example, Network Management, Link Test Messages, or GTT messages) that is destined for 4-4-4, EAGLE1 puts the OPC 1-1-1 in the message. When EAGLE1 generates a message that is destined for 3-3-3 or 5-5-5, it puts the OPC 2-2-1 in the message. When EAGLE1 generates GTT and SCMG messages that are destined for non-adjacent PCs, it includes the OPC 2-2-1 in the message.

Figure 4-23. Replacing a Second STP Pair

Multiple Linksets between Two Nodes

With this feature, it is possible to configure multiple linksets between two nodes, if the adjacent node also supports Multiple Point Codes. Eagle continues to enforce the rule that each linkset must have a different adjacent point code.

One reason for provisioning multiple linksets between two nodes is to increase the number of links that can be configured between STP pairs. For example, in “*Multiple Linkset Example*” on page 4-139, Eagle is connected to an STP pair that supports multiple point codes. Without this feature, only 16 ITU links can be configured between Eagle and the STP pair (8 links in LS1 and 8 links in LS2). In this example, two linksets are added, increasing the number of links to 32 (8 links in each of LS1, LS2, LS3, and LS4).

Figure 4-24. Multiple Linkset Example

In this example, the adjacent point code (APC) for LS1 is 4-1-0 and the APC for LS2 is 4-1-1. 4-1-1 is assigned an SPC of 3-1-1. So adjacent, Adj Node1 sees LS1 as having an APC of 3-1-0, and LS2 as having an APC of 3-1-1.

To load balance over these 4 linksets, half the destinations that use the STP pair can be assigned LS1 and LS3 as a combined linkset. The other half of the destinations can be assigned LS2 and LS4 as a combined linkset.

The commands to provision Eagle1 for the above network are:

Input Examples

```

chg-sid:pc=3-1-0:
ent-spc=3-1-1
ent-dstn:dpc=4-1-0
ent-dstn:dpc=4-1-1:spc=3-1-1
ent-dstn:dpc=4-1-5
ent-dstn:dpc=4-1-6:spc=3-1-1
ent-dstn:dpc=5-5-1
ent-dstn:dpc=5-5-5
ent-ls:lsn=ls1:apc=4-1-0
ent-ls: lsn=ls2:apc=4-1-1
ent-ls: lsn=ls3:apc=4-1-5
ent-ls: lsn=ls4:apc=4-1-6
ent-rte:dpc=4-1-0:lsn=ls1:rc=10
ent-rte:dpc=4-1-1:lsn=ls2:rc=10
ent-rte:dpc=4-1-5:lsn=ls3:rc=10

```

```
ent-rte:dpc=4-1-6:lsn=ls4:rc=10
ent-rte:dpc=5-5-1:lsn=ls1:rc=10
ent-rte:dpc=5-5-1:lsn=ls3:rc=10
ent-rte:dpc=5-5-5:lsn=ls2:rc=10
ent-rte:dpc=5-5-5:lsn=ls4:rc=10
```

Impact on Other Features

Local Subsystems (LNP and Toll-Free)

Eagle allows only the True Point Code to be entered into the MAP table. Also, Eagle continues to allow the user to enter translations to the True Point Code. However, Eagle does not allow the user to enter translation to a Secondary Point Code.

If a node sends a **rt-on-gt** query, the node should set the query's DPC to Eagle's Capability Point Code. If a node sends a **rt-on-ssn** query, the node should set the query's DPC to the TSPC used by that node.

rt-on-gt Queries from a Node That Uses Secondary PC

Nodes that send **rt-on-gt** queries should use the Capability PC, regardless of whether these nodes use a True or a Secondary Point Code.

1. Node sends query with DPC=Eagle's LSS Capability PC, CDPA is **rt-on-gt**, CGPA PC=node's PC
2. Result of translation on Eagle is: DPC=TPC, CDPA is **rt-on-ssn**, CDPA SSN = LSS Subsystem number
3. LSS sends reply with DPC=CGPA PC, OPC = SPC, CDPA is **rt-on-ssn**

In this case, if the Local Subsystem on Eagle fails or is taken offline, Eagle sends a response method TFP:

TFP with DPC = node's PC, OPC = SPC, Concerned PC = Eagle's Capability PC

This TFP causes the node to divert traffic to the mate.

If a node sends a **rt-on-gt** query to either Eagle's True Point Code or a Secondary Point Code, Eagle cannot divert traffic to the mate. In this case, Eagle does not send a TFP concerning the Secondary Point Code or the True Point Code, so the node will not divert traffic to the mate.

rt-on-ssn queries from a Node That Uses Secondary PC

It is possible that nodes using a Secondary PC will send **rt-on-ssn** queries. In this case, these nodes should send the queries to the Secondary Point Code. Eagle will accept **rt-on-ssn** queries from these nodes if the DPC is the TPC or an SPC. However, SCCP Management will not work correctly if the **rt-on-ssn** queries do not use TSPC associated with the sending node.

1. Nodes send query with DPC=SPC, CDPA is **rt-on-ssn**, CDPA SSN = CDPA, SSN = LSS Subsystem number, CGPA PC=node's PC
2. LSS sends reply with DPC=CGPA PC, OPC = SPC, CDPA is **rt-on-ssn**, CGPA PC = SPC

In this case, if the Local Subsystem on Eagle fails or is taken offline, Eagle broadcasts an SSP (assuming that the node is in the Concerned Point Code group):

SSP with DPC = node's PC, OPC = SPC, Affected PC = SPC, Affected SSN = LSS Subsystem number

Measurements

Eagle pegs the following ANSI measurements for messages received from or destined for a different network:

- MSURCVNA
- OCTRCVNA
- ORIGNET_30_SCCP_GTTUNTT
- ORIGNET_30_SCCP_GTTUNADDR
- ORIGNET_30_SCCP_GTTTFDPC
- ORIGNET_30_SCCP_GTTTFDIC

For this feature it is likely, but not required, that the True ANSI point code and the ANSI Secondary Point codes will be in the same network. If they are in different networks, Eagle uses only the network of the True ANSI point code to determine Eagle's network.

For example, assume that Eagle's True ANSI point code belongs to network A, and a Secondary point code is entered that belongs to network B. If a message arrives destined for point code in Network B (other than Eagle's SPC), Eagle treats that message as if it were destined for a different network.

Gateway Screening

The use of the Multiple Point Code feature requires a customer who is also using the gateway screening feature to add provisioning rules to recognize the new site id point code provided by the MPC feature. Failure to add the appropriate rules could result in inappropriately blocked messages.

New Commands

Refer to the *Commands Manual* for current usage information.

The **ent-spc**, **dlt-spc**, and **rtrv-spc** commands have been created to support this feature.

ent-spc

The **ent-spc** command has been created to allow the user to enter an SPC. The user may enter up to 40 SPCs. This command validates that the SPC does not already exist as a True PC, SPC, or a destination in the routing table. All changes to the SPCs are automatically sent to the network cards.

dlt-spc

This command lets the user delete SPCs. For a user to change an SPC, the **dlt-spc** command is used to remove the SPC. Then, the **ent-spc** command is used to enter the new value.

rtrv-spc

This command reports SPC information. When the MPC feature bit is on, the **rtrv-spc** command displays the Secondary Point Codes.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature.

chg-feat

This command has been enhanced with the **mpc** parameter to allow the Multiple Point Codes feature to be turned on.

rtrv-feat

This command has been enhanced to display the value of the **mpc** parameter; it has no parameters.

chg-sid

The **chg-sid** command has been modified to remove the optional **spc** parameter.

ent-dstn

The Secondary Point Code (:**spc**) parameter has been added to the **ent-dstn** command. This is an optional parameter, with the default value of **none**.

chg-dstn

The Secondary Point Code (:**spc**) parameter has been added to **chg-dstn**. This is an optional parameter with the default value of no change to the existing SPC.

rtrv-dstn

rtrv-dstn has been changed to show the Secondary Point Code (SPC) used by the destination.

Provisioning Multiple Point Codes

To use this feature, the user must perform some extra steps when provisioning the Eagle:

- Provision each Secondary Point Code using the **ent-spc** command.
- Provision a route to each of the mate's Secondary Point Codes.
- For each destination that uses a Secondary Point Code, enter the Secondary Point Code using the **ent-dstn** or **chg-dstn** command.

Upgrade Considerations

The upgrade of fielded Eagle software takes into account the changes introduced by Multiple Point Codes and no degradation of system capability will occur as a result of performing the system upgrade.

Any Table Creation Utility (TCU) support needed to transfer information from the single Site Id table to the planned use of a combined Site Id Table and Secondary Point Code table form will be provided.

The MPC Feature Bit will be initialized to OFF.

Limitations

1. The same adjacent point code cannot be used for two different links.
2. Local Eagle subsystems (e.g. LNP) must use the True Point Code.

Multi-Port LIM (Release 27.1) (IP⁷ Release 6.0)

Description

The Multi-Port LIM feature improves the functionality of SS7 routing within EAGLE by increasing the number of SS7 links the EAGLE handles per LIM card. This will allow the EAGLE to interact in larger SS7 networks, and reduces the footprint of an Eagle (i.e. previously 250 cards would have been required to support 500 links; now only 63 cards are required).

The Multi-Port LIM feature has been engineered to satisfy the following requirements:

- Increase link capacity while reducing footprint
- Increase the number of ports on a LIM card from the current 2 to 8.
- Support the complement of low speed links with any combination of 2-port and multi-port LIMs.
- Allow easy transition to higher capacity LIM cards.
- Support alarms for higher-capacity LIM cards, and a larger number of links.

No new measurements are defined in this feature.

The Multi-Port LIM card supports all the card functionality and table capacity currently available (as of Release 26.1) for the 2-port LIM DS0-A card.

The Multi-Port LIM card can replace a 2-port LIM DS0-A within the same slot; see Table 4-34.

Table 4-34. Multi-Port LIM / 2-Port LIM Provisioning Matrix

Provisioned Ports (56 kps)	LIM Type	System Response
A-B	2-port	Accept card
A-B	Multi-port	Accept card
A1-B3	2-port	Reject card
A1-B3	Multi-port	Accept card

A 2-port DS0-A LIM can replace a Multi-Port LIM, depending on the number of ports provisioned.

The Multi-Port LIM provides mapping of ports according to the diagram in Figure 4-25.

Figure 4-25. Multi-Port LIM to 2-Port LIM Relationship

The provisioning of additional ports is not limited to a particular pattern. For example, customers can provision six ports with the following link identifiers:

1 st Port-1101A		1 st Port-1101A3
2 nd Port-1101B		2 nd Port-1101B
3 rd Port-1101A1		3 rd Port-1101A1
4 th Port-1101B1	OR	4 th Port-1101A2
5 th Port-1101A2		5 th Port-1101B2
6 th Port-1101B2		6 th Port-1101B3

Changed Commands

The following commands have been enhanced to support this feature.

Refer to the *Commands Manual* for current usage information.

ent-card

This **:appl** parameter of this command has been extended to include the new *<gpl type>* values BPMPL and SS7ANSI.

rtrv-card

The output for this command has been modified to display the extended *port ID* values **a1**, **a2**, **a3**, **b1**, **b2**, and **b3**.

chg-/act-/rept-stat-/rtrv-gpl

This **:appl** parameter of these commands has been extended to include the new *<gpl type>* values BPMPL and SS7ML.

rept-meas

The **:appl** parameter of this command has been extended to include the new *<gpl type>* values BPMPL and SS7ANSI.

The **:port** parameter of this command has been extended to include the *<port ID>* values **a1, a2, a3, b1, b2, and b3**.

inh-alm/unhb-alm

The **:port** parameter of these commands has been extended to include the *<port ID>* values **a1, a2, a3, b1, b2, and b3**.

rept-stat-card

The output for this command has been modified to accommodate the additional space needed to display the extended values for the port IDs.

rept-stat-trbl

The output for this command has been modified to accommodate the additional space needed to display the extended *port ID* values **a1, a2, a3, b1, b2, and b3**.

rept-stat-ls

The output for this command has been modified to accommodate the additional space needed to display the extended *port ID* values **a1, a2, a3, b1, b2, and b3**. (The space between the SLK and SST columns was increased.).

rtrv-log

The output for this command has been modified to accommodate the additional space needed to display the extended *port ID* values **a1, a2, a3, b1, b2, and b3**.

act-/chg-/dact-/dlt-/ent-/rtrv-lbp

The **:port** parameter of these commands has been extended to include the *<port ID>* values **a1, a2, a3, b1, b2, and b3**.

NOTE: The act-lbp command does not support software loopback for MPL cards.

For the Multi-Port LIM feature, the only modification to the output of these commands is that the 'A' or 'B' character is replaced by one of the extended *port ID* values.

`act-/alw-/blk-/canc-/dact-/dlt-/ent-/inh-/unhb-/rept-stat-/tst-/ublk-slk`

The `:port` parameter of these commands has been extended to include the `<port ID>` values `a1`, `a2`, `a3`, `b1`, `b2`, and `b3`.

For the Multi-Port LIM feature, the only modification to the output of these command is that the 'A' or 'B' character is replaced by one of the extended *port ID* values. Refer to the example for "*rtrv-slk*" (below).

`rtrv-slk`

For the Multi-Port LIM feature, the only modification to the output of this command is that the 'A' or 'B' character is replaced by one of the extended *port ID* values.

Hardware Requirements

To support the increased data content in scheduled reports, terminal pacing must be increased, which requires a 19.2K baud terminal dedicated to output class TRAFFIC. For systems exceeding 350 links, a printer is not recommended.

For the Multi-Port LIM card, no new hardware other than the new MPL card (870-2061-01) itself is needed to support more than 8 ports.

Upgrade Considerations

Measurements data are not preserved from a prior release to the upgrade release during an upgrade. If the customer desires to retain a record of pre-upgrade measurements, a hardcopy of the measurements data can be obtained using the documented measurement report procedures. Alternatively, measurements data can be copied to a Measurements removable cartridge, using the `copy-meas` command. The data is then available for offline (non-Eagle) processing. Measurements data cannot be restored to the upgraded Eagle, due to potential changes in data formats as a result of the upgrade.

National Spare Network Indicator Support (Release 22.2)

The National Spare Network Indicator feature enables the Eagle to support the National Spare value for Network Indicator for both ANSI and ITU-National (ITU-N) links. The National Spare Network Indicator feature is either enabled or disabled for each linkset, where the disabled state is the default condition.

Enabled States

When the National Spare Network Indicator feature is enabled for an ANSI linkset, the incoming message, National (10) or National Spare (11), is read and the outgoing message is forced to National Spare (11).

When the National Spare Network Indicator feature is enabled for an ITU-N linkset, the incoming message of International (00), National (10), or National Spare (11) is read, and the outgoing message is forced to National Spare (11).

Disabled States

When the National Spare Network Indicator feature is disabled for an ANSI linkset, the Eagle can accept only National network indicator (10) and the outgoing message is National (10).

When the National Spare Network Indicator feature is disabled for an ITU-N linkset, the Eagle can accept International network indicator (00) or National (10), and the outgoing message is National (10).

Gateway STP Impact

The National Spare Network Indicator impacts ANSI to ITU-National and ITU-National to ANSI message conversions when the Eagle is configured as a Gateway STP. When enabled, the National Spare Network Indicator feature takes priority over those message conversions.

Changed Commands

The following commands have been changed in support of the National Spare Network Indicator feature:

- **ent-ls**
- **chg-ls**
- **rtrv-ls**

ent-ls

The **nis** parameter has been added to the **ent-ls** command to enable and disable the Network Indicator Spare value when adding a linkset. The parameter value is either ON or OFF, where OFF is the default.

NOTE: The *nis* parameter can only be specified with ANSI or ITU-N links.

If the command initiated to enable this feature conflicts with the links configuration, an error message (E2814) is displayed.

National Spare will force the National Spare (11) state on the outgoing ANSI and ITU-N linksets when it is turned on and defaults to the National (10) state when it is turned off.

chg-ls

The **nis** parameter has been added to the **chg-ls** command to enable and disable the Network Indicator Spare value when changing the attributes for a specified linkset. The parameter value is either **on** or **off**, where **off** is the default.

NOTE: The **nis parameter can only be specified with ANSI or ITU-N links.**

If the command initiated to enable this feature conflicts with the links configuration, an error command (E2814) is displayed.

National Spare will force the National Spare (11) state on the outgoing ANSI and ITU-N linksets when it is turned on and default to the National (10) state when it is turned off.

rtrv-ls

The **nis** parameter has been added to the **rtrv-ls** command to enable and disable the display of the Network Indicator Spare value when retrieving information about a linkset or all linksets. The parameter value is either **on** or **off**, where **off** is the default.

National Spare Network Indicator Support (Release 24.0)

The National Spare Network Indicator feature enables the Eagle to support the National Spare value for Network Indicator for both ANSI and ITU-National (ITU-N) links. The National Spare Network Indicator feature is either enabled or disabled for each linkset, where the disabled state is the default condition.

Enabled States

When the National Spare Network Indicator feature is enabled for an ANSI linkset, the incoming message, National (10) or National Spare (11), is read and the outgoing message is forced to National Spare (11).

When the National Spare Network Indicator feature is enabled for an ITU-N linkset, the incoming message of International (00), National (10), or National Spare (11) is read, and the outgoing message is forced to National Spare (11).

Disabled States

When the National Spare Network Indicator feature is disabled for an ANSI linkset, the Eagle can accept only National network indicator (10) and the outgoing message is National (10).

When the National Spare Network Indicator feature is disabled for an ITU-N linkset, the Eagle can accept International network indicator (00) or National (10), and the outgoing message is National (10).

Gateway STP Impact

The National Spare Network Indicator impacts ANSI to ITU-National and ITU-National to ANSI message conversions when the Eagle is configured as a Gateway STP. When enabled, the National Spare Network Indicator feature takes priority over those message conversions. The network indicator of the MSU will be the National Spare network indicator, no matter what other network indicator conversion rules are enabled for the Eagle.

Changed Commands

The following commands have been changed in support of the National Spare Network Indicator feature:

- `ent-ls`
- `chg-ls`
- `rtrv-ls`

`ent-ls`

The `nis` parameter has been added to the `ent-ls` command to enable and disable the Network Indicator Spare value when adding a linkset. The parameter value is either `on` or `off`, where `off` is the default.

NOTE: The `nis` parameter can only be specified with ANSI or ITU-N links.

If the command initiated to enable this feature conflicts with the links configuration, an error message (E2814) is displayed.

National Spare will force the National Spare (11) state on the outgoing ANSI and ITU-N linksets when it is turned on and defaults to the National (10) state when it is turned off.

chg-ls

The **nis** parameter has been added to the **chg-ls** command to enable and disable the Network Indicator Spare value when changing the attributes for a specified linkset. The parameter value is either **on** or **off**. If the **nis** parameter is specified with the **chg-ls** command, the value of the **nis** parameter is not changed.

NOTE: The **nis parameter can only be specified with ANSI or ITU-N links.**

If the command initiated to enable this feature conflicts with the links configuration, an error command (E2814) is displayed.

National Spare will force the National Spare (11) state on the outgoing ANSI and ITU-N linksets when it is turned on and default to the National (10) state when it is turned off.

rtrv-ls

The **nis** field has been added to the output of the **rtrv-ls** command to display the Network Indicator Spare value when retrieving information about a linkset or all linksets. The parameter value is either **on** or **off**.

NEBS Compliance (Release 20.0)

The Eagle will comply with the requirements of Bellcore's TR-NWT-000063, Network Equipment-Building System (NEBS) Generic Equipment Requirements. This document lists the generic requirements for all new telecommunications equipment systems used in central offices and other telephone buildings of a typical Bellcore Compliant Company. These requirements include:

- Spatial Requirements - vertical and horizontal space allocations within central offices for equipment frames, overhead cabling, lights, and air distribution elements.
- Environmental requirements for all new central office equipment systems including the cable distribution systems, distributing and interconnecting frames, power equipment, operations systems, and cable entrance facilities, and the methods for testing the equipment to determine if it meets the environmental requirements.

There have been no electrical or software changes made to the Eagle for NEBS compliance. The following hardware changes have been made:

- The rear panel support brackets have now been completely welded to the frame instead of tack welded.
- The door closing mechanism is now threaded instead of notched.
- There have been minor changes made to the shelves to strengthen them.
- The end panels are now attached to the bottom of the frames with screws.

Nested Cluster Routing (Release 26.0)

Nested Cluster Routing removes the restriction of having the full point code route on the same route as the cluster route. The Eagle supports up to 500 nested cluster routes with full Network management functionality. A nested cluster route counts as 1 route entry in the route table, and does not otherwise affect the capacity of the route or xlist table.

Nested Clusters and Cluster Members

The cluster routing and management available in prior release of Eagle software required cluster and cluster members to have same route set. With the Nested Cluster feature, however, users can have certain members of the provisioned cluster with different FPC route set. This different route set may be totally different, partially different, or exactly the same.

With the Nested Cluster Routing feature, routes to these members can be changed, deleted, or added. Deletion of a FPC route entry within a cluster will result in the member using the cluster entry for routing. Deletion of a cluster route entry will not delete the FPC route entry. This holds true even if the FPC entry and the cluster have the same route.

The Eagle send cluster network management messages (TCA, TCR, TCP) based on the least restrictive of the cluster's route set status, and the route set status of any FPC entries within the cluster.

The Nested Cluster Routing feature provides a new routing model. (The Eagle allows several routing models.) Table 4-35 describes coupling between the cluster and its members. Coupling describes the relationship between the cluster and member route statuses.

Table 4-35. Eagle Routing Models

Eagle Routing Model	Characteristics	Issues and Resolution	Release
Full Point Code Routing (FPR) No coupling	Eagle will behave as a FPC router when CRMD feature bit is OFF. Only FPC destinations are provisioned. Eagle will never generate TCX messages concerning clusters of provisioned members. Received TCX messages are applied to all members of the concerned cluster.	No issues. There is not coupling between cluster status and member statuses due to the lack of clusters.	Rel 21
Cluster Routing (CR) No coupling NCAI=No	With CRMD feature bit ON, Eagle will allow provisioning of cluster destinations. For cluster destinations, only cluster entries are provisioned. Eagle will generate TCX messages only for provisioned cluster destinations. All received TCX messages are applied to concerned cluster entry if it exists. Otherwise it is applied to all individual members.	No issues. There is no coupling between cluster status and member status's due to the lack of members belonging to provisioned cluster.	Rel 21
Cluster Routing and Management Diversity (CRMD) Full coupling NCAI=No	In this mode, Eagle allows provisioning of clusters as well as members of same clusters. Here cluster and member have the same route set, and they are fully coupled. All TCX messages are applied to members and TCX messages generated by Eagle reflect member status. In this mode, member status cannot be less restrictive than cluster.	No issues regarding network management message generation and processing. Cluster and members cannot have a different route set, and thus E-links cannot be provisioned for member of a cluster.	Rel 21

Table 4-35. Eagle Routing Models (Continued)

Eagle Routing Model	Characteristics	Issues and Resolution	Release
Nested Cluster Routing No coupling NCAI=Yes	In this mode, if the ncai parameter is yes (provided both the feature NCR and the feature CRMD are ON), the user can enter a cluster route set, then enter a different route set for a member of that cluster. In this case, member route set status can be less restricted than cluster route set status.	There is an issue regarding broadcasting network management messages. Because members can be less restricted than the Cluster, broadcast of cluster messages (TCA, TCR, TCP) is based on the least restrictive of the following: The cluster's route set status The route set status of any full point code entries within the cluster Also, when ncai=yes , Eagle will not generate preventive TCPs.	Rel 26

Administration

Nested Cluster Routing (NCR) is administered as a new feature in the Eagle's database. In order to specify the **ncai** parameter (yes, no), both the CRMD feature and the NCR feature must be ON. If **ncai** is **yes**, Eagle allows certain members of the provisioned cluster to have different full point code route set.

If the **ncai** parameter is **no**, standard command handler rules apply (any full point code route set within a cluster must have the same route set as the cluster). If **ncai** parameter is specified as **yes**, new command handler rules apply (full point code route set can be different from the cluster route set). Figure 4-26 provides an example of provisioning a nested cluster and associated member.

1. Turn CRMD feature on: **chg-feat:crmd=on**
2. Turn NCR feature on: **chg-feat:ncr=on**
3. Enter nested cluster destination: **ent-dstn:dpc=5-5-* ncai=yes**
4. Enter routes for nested cluster routing: Enter nested cluster's member X destination: **ent-dstn:dpc=5-5-1**
5. Enter route for associated member X:
ent-rte:dpc=5-5-1:lsn=lsa:rc=10

Figure 4-26. Cluster Network Configuration

In Figure 4-26, cluster route 5-5-* exists from STP-A to STP-B. A member in that cluster, SSP-D, is directly connected to STP-A. If SSP-C is signaling to any member other than 5-5-1, it follows the cluster route to STP-B. The nested feature is used in STP-A.

General Requirements

Circular Routing

Danger of Circular Routing

Danger of circular routing means that if Eagle receives an MSU on a linkset and then routes that MSU, circular routing may occur. In these cases, Eagle normally sends preventive TFPs on these linksets.

This feature does not change the rules for determining if danger of circular routing exists for a destination and linkset. These rules are:

- Danger of Circular Routing only occurs on linksets that are part of the routeset for the destination
- Danger of Circular Routing only occurs if routing over an STP to a destination.

- If the linkset is a Higher cost route than the current route to the destination, there is no danger of circular routing.
- If the linkset is equal cost route as the current route to the destination, there is danger of circular routing.
- If the linkset is lower cost route than the current route to the destination, and the linkset is the least cost route, there is no danger of circular routing.

Figure 4-27. Determining If Danger of Circular Routing Exists

Nested Cluster Routing Rules of Operations

The following rules apply to nested clusters (cluster entries with NCAI set to YES):

1. Eagle will allow the user to enter a full point code route set entry even if the point code is a member of a cluster that has a different route set.
2. When Eagle performs broadcast, Eagle will use the least restricted of the following to determine which cluster message (TCA, TCR, TCP) to send:
 - The Cluster's route set status
 - The route set status of any full point code entries within the cluster
3. Response method TFP or TFR will be used when the cluster destination is more restrictive than a FPC member. The modified TFP response method will send no more than one TFP per cluster member per T8 timer. The modified TFR response method sends no more than one response TFR per cluster member.
4. Eagle will not send preventive TCPs when it begins routing towards a nested cluster. Eagle will, however, send response method preventive TFPs if it receives an MSU when there is danger of circular routing

(Note that it will still send preventive TFPs when it starts routing towards a FPC member of a nested cluster.)
5. Eagle will reply to RCX cluster route set test messages using the less restrictive route set status, as indicated in rule #2.
6. Eagle will reply to RSX full point code route set messages using the full point code's route set status and danger of circular routing.

Received TFX /TCX Message Processing

For this feature, there is no change to received TCx message processing (although a change is required deciding whether to broadcast TCX messages), and there is only one change to received TFX message processing.

A TFX message received for a FPC member will be applied to the FPC member only. However, receiving a TFX message for a member of a nested cluster may cause Eagle to broadcast a cluster message. This is a change from the way cluster routing currently works.

If Eagle then receives a TFP from STP E concerning 5-5-5, Eagle will apply that TFP to 5-5-5. Because all members of the cluster 5-5-* are at least Restricted, Eagle will broadcast a TCR concerning 5-5-*. Eagle will also begin routing traffic to 5-5-5 over LSC.

Broadcasting TCR (for nested cluster) will override the status of previously TFPs sent (for cluster members). However when traffic resumes and the conditions persists (MSU received and there is a danger of circular routing), Eagle will again send response method TFPs for the affected cluster members.

Eagle will still perform the following check for invalid TFX messages: If Eagle receives a TFX message that is less restricted than the status of the route for the cluster, Eagle will discard the TFX and generate a UIM (UIM #1147 for TFA, and UIM#1148 for TFR).

Generating TFX Messages

In regard to generating TFX messages, FPC members are considered individual full point code. Broadcast TFX messages, Preventive TFPs and back-routing TFRs are generated based on route set status and danger of circular routing. For example, in Figure 4-26 on page 155, when LSE is down, Eagle will broadcast TFR(X) because alternate route LSB is still available. When LSE becomes available, Eagle will broadcast TFA(X).

If we have already sent a TCP (transfer cluster prohibited), we do not send a TFP (transfer prohibited for cluster members).

For full point code (FPC) members, a TFX condition is first broadcast and then sent in response method. If the FPC member's route set status is restricted, a TFR is broadcast after T11, then a one time response method TFR is sent after T18.

Generating TCX Messages

Eagle will generate TCX messages based on the least restricted of the following (see rule #2):

- The Cluster route set status
- The route set status of any FPC entries within the cluster

For example, in Figure 4-26 on page 155, if the status of the cluster K route set changed from allowed to prohibited and the member D FPC route set status is allowed, STP-A will generate TCA message based on the least restricted route set status.

If all of the members in a nested cluster have the same route set status, then response method TCX messages will be sent after the broadcast.

If a TCX condition does not change but a TFX condition does, the TCX condition is not broadcast again. But if the TCX condition does change, then we do broadcast the new TCX condition.

The Eagle will only broadcast TCX messages when the nested cluster's route set status changes. TCR broadcast for nested clusters should take place after the expiration of T11.

Generating RSX/RCX Messages

Generating RSX messages

Generating RSX messages will not change for the nested cluster feature.

Responding RSX/RCX Messages

Responding RCX Messages

Eagle will not reply to RCX message when the status of the RCX message matches the status of the reply. If the RCX message is an RCR and the indicated reply is a TCR, Eagle will not send a reply. If the RCX message is a RCP and the indicated reply is a TCP, Eagle will not send a reply. If the **ncai** parameter is **yes**, the response to RCX messages will change.

Eagle will reply to Route Set Cluster Test messages (RCX) using the least restrictive of the cluster's route set status and the route set status of any of the FPC entries within a cluster. Table 4-36 describes the Eagle reply message upon reception of an RCX message.

Table 4-36. RCX Reply Message

Cluster Status	NCAI	Danger of Circular Routing for Cluster?	Status of Least Restricted member	Reply
A	N	N	A	TCA
A	N	Y	A	TCP
R	N	N	R	TCR
R	N	N	P	TCR
R	N	Y	R	TCP
R	N	Y	P	TCP
P	N	NA	P	TCP
A	Y	X	A	TCA
A	Y	X	R	TCA
A	Y	X	P	TCA
R	Y	X	A	TCA
R	Y	X	R	TCR
R	Y	X	P	TCR
P	Y	X	A	TCA
P	Y	X	R	TCR
P	Y	X	P	TCP

Y= Yes, N= No, NA= Not Applicable, X= Don't care, A= Allowed, P= Prohibited, R= Restricted

Responding RSX Messages

Whenever the NCAI parameter is set to YES and a FPC entry exists for the Concerned PC, Eagle will reply based only on the status of the FPC and the danger of circular routing for the FPC. Eagle will not reply to RSX message when the status of the message matches the status of the reply. If the RSX message is an RSR and the indicated reply is a TFR, Eagle will not send a reply. If the RSX message is an RSP and the indicated reply is a TFP, Eagle will not send a reply. Table 4-37 shows how Eagle will reply when it receives a Route Set Test (RSX) message for a member of a cluster.

Table 4-37. RSX Reply Messages

FPC entry exists?	Cluster Status	Danger of Circular Routing for Cluster?	Status of FPC	Danger of Circular Routing for FPC?	Reply
Y	X	X	A	N	TFA
Y	X	X	A	Y	TFP
Y	X	X	R	N	TFR
Y	X	X	R	Y	TFP
Y	X	X	P	NA	TFP
N	A	N	NA	NA	TFA
N	A	Y	NA	NA	TFP
N	R	N	NA	NA	TFR
N	R	Y	NA	NA	TFP
N	P	NA	NA	NA	TFP

Y= Yes, N= No, NA= Not Applicable, X= Don't care, A= Allowed, P= Prohibited, R= Restricted

Response Method TFX

Broadcasting TFX messages for all members of a cluster that do not have a full point code entry could create a huge amount of network management messages. For example, in a customer site of 200 nested clusters, a condition in which a B-link set fails but the E-links are available could generate 255 TFPs or TFRs per cluster, resulting in over 50,000 TFPs or TFRs. The change is not to broadcast TFX messages, but to send TFX messages by response method, with changes to the way we pace response method messages.

If a cluster destination is more restricted than a full point code member, the STP will send a cluster message (TCA or TCR) for the status of the least restrictive member. The STP will then immediately allow response method transfer messages (TFP or TFR) for individual members of the cluster. The STP will limit response method TFPs to 1 TFP per individual member per T8 timer. The STP will only send 1 TFR per individual member.

Response Method TFP

Once the cluster destination is inaccessible (B-link set fails but E-links are available), Eagle sends a (TCA or TCR) message (cluster destination is more restricted than a full point code member). The T8 timer is started after sending the first link set response method TFP. Eagle will send a response method TFP for every member of the cluster (up to 256) that does not have a provisioned FPC route entry.

Response Method TFR

Once the cluster destination is inaccessible (B-link set fails but E-links are available), Eagle sends a (TCA or TCR) message (cluster destination is more restricted than a full point code member). T8 timer is started after sending first link set response method TFP. Eagle will send a response method TFP for every member of the cluster (up to 256) that does not have a provisioned FPC route entry.

Preventive TCP/TFP

Normally, when Eagle begins routing through an STP to a remote destination, Eagle will send a TFP on any linkset where there is danger of circular routing. If the remote destination is a cluster entry with NCAI=NO, Eagle will send a TCP on the linkset.

For example, in Figure 4-28, when Eagle begins routing over LSB to cluster K, Eagle sends a preventive TCP concerning cluster K to STP-B and STP-C.

When **ncai=yes** for cluster, Eagle will not send preventive TCPs. However, if Eagle receives an MSU for the cluster on a linkset that has danger of circular routing, Eagle will send a response method TFP and discard the MSU.

For example, in Figure 4-28, when Eagle begins routing over LSB to Cluster K, Eagle will not send a TCP to STP-B. However, if STP-B sends Eagle an MSU destined for 5-5-2, Eagle will discard the MSU and send a TFP concerning 5-5-2 to STP-B. This will prevent a potential circular routing loop between STP-B, Eagle, and STP-A.

Figure 4-28. Preventive TCP Example

Route Table for Cluster K (5-5-*)

5-5-* LSB, RC=10

5-5-* LSC, RC=20

In Figure 4-29 on page 163, if LSB and the linkset between STP-A and STP-B fail, and if **ncai=no** for 5-5-*, Eagle would send a preventive TCP to STP-A before trying to route traffic for 5-5-* over LSC. (Note that with **ncai=no**, LSE cannot be provisioned.) STP-A would also send a preventive TCP to Eagle concerning 5-5-* before trying to route traffic to 5-5-* over LSC. After receiving the preventive TCP from STP-A, Eagle would determine that the cluster 5-5-* is prohibited.

If both Eagle and STP-A are using nested cluster routing with **ncai=yes** for 5-5-*, they will not send preventive TCPs when they start routing over the LSC. When an MSU destined for 5-5-2 arrives at STP-A, STP-A will route it over LSC.

When Eagle receives the MSU, it will detect the danger of circular routing, and send a response method TFP. STP-A will then create an x-list for 5-5-2. When an MSU destined for 5-5-2 arrives at Eagle, Eagle will route it over LSC. When STP-A receives the MSU, it will detect the danger of circular routing, and send a response method TFP. Eagle will then create an x-list for 5-5-2. This scenario is repeated for each member of 5-5-* other than 5-5-1.

Nested Cluster Routing Examples

Figure 4-29 and accompanying Table 4-38 provide an example of nested cluster routing.

Figure 4-29. Nested Cluster Example #1

Route Table for Nested Cluster K (5-5-*)

5-5-* LSB, RC=10

5-5-* LSC, RC=20

Route Table for FPC Member X (5-5-1)

5-5-1 LSE, RC=5

5-5-1 LSB, RC=10

5-5-1 LSC, RC=20

Table 4-38. Nested Cluster Routing Example

No	Event	Action
1	All link sets are up and all routes are available	Eagle will not send preventive TCP(K) to STP-B because if K is a nested cluster, start routing messages to X using LSE and K using LSB. Eagle will broadcast TCA(K) to SSP1, SSP-X, STP-B, and STP-B.
2	Link set between STP-B and SSP-Y (5-5-2) fails, STP-B sends a TFP(Y)	Eagle will create a (5-5-2) x-list entry and mark it to PROHIBITED on LSB. Eagle will broadcast TFP to SSP1, SSP-X and STP and sends response method TFP concerning 5-5-2 (Rule #3). Eagle will start RSP for Y on LSB.
3	Link set between STP-B and SSP-X (5-5-1) fails, STP-B sends a TFP(X) to Eagle.	Eagle will mark FPC 5-5-1 to PROHIBITED on LSB, Eagle routes the traffic to X via LSE. Eagle will start RSP for X on LSB.
4	Link set between STP-B and SSP-Y(5-5-2) recovers and STP-B sends a TFA(Y) to Eagle.	Eagle will remove (5-5-2) x-list entry prohibited status on LSB, performs rerouting and start routing traffic to SSP-Y via LSB. Eagle will broadcast TFA(Y) to SSP1, SSP-X and STP-A. Eagle sends a preventive TFP(Y) to STP-B
5	Link set between STP-B and SSP-X (5-5-1) recovers and STP-B sends a TFA(X) to Eagle	Eagle will mark FPC 5-5-1 to allowed status on LSB.
6	LSB fails	Eagle will stop using LSB to send traffic to cluster K, mark PROHIBITED on LSB, perform forced re-routing, start T11(K), and start using LSC to switch messages to K. Eagle will mark K RESTRICTED on LSC for all members of K except FPC X. When T11 expires, send TFR response method for all members of K except FPC X.
7	SSP1 sends an MSU with DPC=Y	Eagle will respond with TFR(Y) to SSP1. MSU will be routed on LSC.
8	SSP1 sends an MSU with DPC=X	Eagle will route MSU to SSP-X using LSE.
9	LSB recovers	Eagle will stop using LSC to send traffic to cluster K, performs controlling rerouting on K, and mark cluster K as ALLOWED on LSB, starts routing traffic to cluster K via LSB.
10	SSP sends a route set test (RSR) concerning Y to Eagle	Eagle responds with a TFA(Y).
11	LSC fails.	Eagle will stop using LSC to send traffic to cluster K or FPC X and mark K and FPC X PROHIBITED on LSC.
12	LSC recovers.	Eagle will mark cluster K and FPC X ALLOWED on LSC.

Table 4-38. Nested Cluster Routing Example (Continued)

13	LSE fails.	Eagle will stop using LSE to send traffic to SSP-X, marks PROHIBITED on LSE, perform forced rerouting, start T11(X), send preventive TFP(X) to STP-B and start using LSB to switch messages to FPC X. Eagle will mark FPC X RESTRICTED on LSB. When T11 expires and broadcast TFR(X) to SSP1 and STP-A.
14	SSP1 sends an MSU with DPC=SSP-Y	Eagle will route MSU to SSP-Y using LSB.
15	SSP1 sends an MSU with DPC=SSP-X	Eagle will respond with a TFR(X) to SSP1. MSU will be routed to SSP-X using LSB.
16	LSE recovers.	Eagle will stop using LSB to send traffic to SSP-X, perform controlling rerouting on FPC X and mark FPC X as ALLOWED on LSE, start routing traffic to FPC X via LSE. Eagle broadcast TFA(X) to SSP1, STP-A, and STP-B.

Route Table for Nested Cluster K (5-5-*)

5-5-* LSB, RC=10

5-5-* LSC, RC=20

Route Table for FPC Member P (5-5-1)

5-5-1 LSE, RC=10

Route Table for FPC Member Q (5-5-5)

5-5-5 LSE, RC=10

5-5-5 LSC, RC=20

Upgrade Considerations

The new software accommodates the old database during the upgrade. The new fields for the existing tables, such as the NCR bit in the feature table, defaults to 0 (OFF), and the **ncai** parameter in the destination table defaults to 0 (NO).

Use the **rtrv-dstn** command to verify the status of the **ncai** parameter (it should display **ncai = no** for existing cluster destinations). To activate the Nested Cluster Feature, the software release must contain the CRMD feature (non-nested cluster management).

Changed Commands

Nested Cluster Routing is allowed when the parameter **ncai** (nested cluster allowed indicator) is **yes**, provided both the CRMD feature and the NCR feature bits are turned ON.

Refer to the *Commands Manual* for current information.

chg-feat

The **chg-feat** command has been enhanced to allow activation of the Nested Cluster Routing (NCR) feature. This command updates the MAS Configuration Table. If both the CRMD feature and the NCR feature are turned ON, the **ncai** parameter can be specified (yes, no).

rtrv-feat

The **rtrv-feat** command has been modified to display whether or not the Nested Cluster Routing (NCR) feature has been activated.

ent-dstn

A new parameter, **ncai**, has been added to the **ent-dstn** for cluster destination to indicate whether nested cluster routing is specified.

chg-dstn

A new parameter, **ncai**, has been added to the **chg-dstn** command for cluster destination to indicate whether nested cluster routing is specified.

The **chg-dstn** command has been modified to ensure that provisioning cluster point code and the collection of signaling points sharing the cluster can have a different route set.

rtrv-dstn

The **rtrv-dstn** command has been modified to display the status of the **ncai** parameter (yes, no) for cluster destination point code(s).

ent-rte

The **ent-rte** command has been modified to relax the current restriction that requires individually provisioned members within a cluster to have the same route set as the cluster.

chg-rte

The **chg-rte** command has been modified to relax the current restriction that requires individually provisioned members within a cluster to have the same route set as the cluster.

dlt-rte

The **dlt-rte** command has been modified to make sure that deletion of a cluster route will not delete the full point code route entry, or that deletion of a full point code route entry within a cluster will not delete the cluster entry, even if the full point code and the cluster have the same route.

Network Routing (Release 26.0)

Network routing allows the user to provision a single routeset that will be used for all MSUs destined to members of that network. The advantages of network routing are:

- reduces the number of entries in the route table
- allows routing to members of a network without having to add those members to the route table

An Eagle user can connect to a remote network by provisioning a single route table element. As the remote network grows, the Eagle user does not have to add new route table entries for each new point code in the remote network.

Types of Routing Strategies Available

Eagle currently allows a user to provision two types of routing strategies:

- full point code routing
- network / cluster routing (also called cluster routing)

This feature allows the user to provision a third type of routing strategy:

- network routing

It is possible to provision full point code entries, cluster entries, and network entries for members of the same network. Any overlaps in the routing strategies are handled by a specific searching hierarchy.

Example

All of these route table entries can coexist:

1. 8-1-1 full point code entry
2. 8-1-* cluster entry
3. 8-*-* network entry

The searching hierarchy will try to match against a full point code entry first, followed by a cluster entry, and finally a network entry. In the preceding example, when Eagle routes an MSU destined for 8-1-1, it uses the full point code entry; when Eagle routes an MSU destined for 8-1-2 it uses the cluster entry; and when Eagle routes an MSU destined for 8-2-2, it uses the network entry.

Applications

Network routing is very useful when the destination node is located far from the source node. The reliability of network routing increases when the destination is further away. As depicted by Figure 4-30, routing from network A is more reliable to nodes in network C than to nodes in network B.

Figure 4-30. Example of Network Routing Reliability

If the STPs in Network A use network routing for Network C, Network A can still route traffic to SSP-C, even if two linksets fail. In this example, one of the A-linksets to SSP-C and the C-linkset between STP-C1 and STP-C2 fail. In this case, the Eagle in Network A will continue to route half its traffic to STP-B1, and half to STP-B2. STP-B1 and STP-B2 (which do not use network routing) will route all traffic for SSP-C through STP-C2.

If the STPs in Network A use network routing for Network B, traffic going to SSP-B may be lost if two linksets fail. In this example, one of the A-linksets to SSP-B and the C-linkset between STP-B1 and STP-B2 fail. In this case, the Eagle in Network A will continue to route half its traffic to STP-B1, and half to STP-B2. Traffic for SSP-B routed through STP-B1 will be discarded, resulting in message loss.

MTP Requirements

Routing

In the following discussion, refer to Figure 4-31:

Figure 4-31. Generic Network***Route Availability***

A route is one path to a destination. A routeset is a list of paths to a destination. Route availability consists of two parts:

1. local availability, and
2. remote availability

Remote availability is affected by TFX network management messages. Local availability is affected by linkset failures and recoveries. TFX messages do not affect point codes accessed by network route entries. Therefore, for network route entries, route availability consists of only local availability. The highest priority linkset available for traffic will be used for routing MSUs regardless of the remote availability of that route.

Figure 4-32. Potential Routing Network Failure

In the example in Figure 4-32, linksets LS-C and LS-D form a combined route to network route 7-**-*. Because 7-**-* is a network route, Eagle will always consider the non-adjacent status of the routes to be allowed. In the example shown, Eagle routes traffic destined to 7-7-1 over LS-C and LS-D. Eagle will ignore TFPs concerning 7-7-1 or TCPs concerning 7-7-*.

Point Code Availability

A point code that is accessed by a network route entry is considered available if there is any linkset in the routeset that is available for traffic.

Routing MSUs

MTP message routing will search the routing table up to 3 times to find a routing entry for the received MSU.

The search order is:

1. a full point code match
2. a network /cluster match
3. a network match

Route Management

Congestion

Local Link Congestion

This feature has no impact on the generation of TFC messages. A TFC will be generated concerning point code X-Y-Z, even if X-Y-Z is routed using a network route entry.

Remote Congestion

Because EAGLE has global title capabilities, it is possible that a TFC is received by EAGLE concerning a point code that is accessed by a network route entry. Network route entries will not be affected by TFC messages.

Transfer Messages (TFP, TCP, TFR, TCR, TFA, and TCA)

Broadcast Transfer Messages

Eagle will not broadcast TFX messages for network route entries.

Response Method Transfer Messages

Eagle will send response method TFX messages for network routes as follows:

- Prohibited Network Routes

If Eagle receives an MSU that is accessed by a network route entry, and that network route is prohibited, Eagle will send a response method TFP or TCP message, as follows:

- If there is a full point code defined in the same cluster as the MSU (e.g. 8-*-* and 8-1-1 are defined in Eagle's routing table, and MSU is destined for 8-1-2), Eagle will send a TFP with Concerned PC set to the MSU's DPC.
- Otherwise, Eagle will send a TCP with Concerned PC set to the cluster of the MSU's DPC.

Eagle will pace response method TCPs or TFPs sent to 1 per link per T8 per network route.

For example, in Figure 4-32 on page 170, the network route for 7-*-* becomes Prohibited due to the failure of LS-B, LS-C, and LS-D. When Eagle receives an MSU from X destined for 7-7-1, Eagle will send a response method TCP concerning 7-7-*. When Eagle receives an MSU from X destined for 7-8-2, Eagle will send a response method TCP concerning 7-8-.*.

- Danger of Circular Routing

If Eagle receives an MSU that is accessed by a network route entry, and Eagle detects danger of circular routing (see “*Circular Routing*” on page 4-155 for an explanation of danger of circular routing), Eagle will send a response method TFP or TCP message, as follows:

- If there is a full point code defined in the same cluster as the MSU (e.g. 8-**-* and 8-1-1 are defined in Eagle's routing table, and MSU is destined for 8-1-2), Eagle will send a TFP with Concerned PC set to the MSU's DPC.
- Otherwise, Eagle will send a TCP with Concerned PC set to the cluster of the MSU's DPC.

Eagle will pace response method TCPs sent to 1 TCP per link per T8 per network route.

For example, in Figure 4-31 on page 169, all linksets are available. If Eagle receives an MSU from STP-C destined for 7-7-1, Eagle will detect danger of circular routing, and send a response method TCP concerning 7-7-*. Eagle will also discard the MSU.

- Restricted Network Routes

If Eagle receives an MSU that is accessed by a network route entry, and that network route is Restricted, Eagle will send a one time response method TFR or TCR message, as follows:

- If there is a full point code defined in the same cluster as the MSU (e.g. 8-**-* and 8-1-1 are defined in Eagle's routing table, and MSU is destined for 8-1-2), Eagle will send a TFR with Concerned PC set to the MSU's DPC.
- Otherwise, Eagle will send a TCR with Concerned PC set to the cluster of the MSU's DPC.

For example, in Figure 4-31 on page 169, the network route for 7-**-* becomes Restricted due to the failure of LS-C, and LS-D. When Eagle receives an MSU from X destined for 7-7-1, Eagle will send a response method TCR concerning 7-7-*, then route the MSU over LS-B. When Eagle next receives an MSU from X destined for 7-8-2, Eagle will not respond, and will route the MSU over LS-B.

Reception of Transfer Messages

Eagle will not apply received Transfer messages to a network route.

For example, in Figure 4-32 on page 170, if Eagle receives a TFP concerning 7-7-1, it will have no effect on the routing status of 7-**-*. Eagle will continue to send MSUs destined to 7-**-*, including MSUs destined to 7-7-1, on LS-C.

As another example, if Eagle receives a TCP concerning 7-8-*, it will have no effect on the routing status of 7-*-*. Eagle will continue to send MSUs destined to 7-*-*, including MSUs destined to 7-8-2, on LS-C.

Route Set Test

The MTP routeset test application will be able to handle the reception of full point code RSx and cluster RCx messages that apply to network route entries.

Reception of an RSx Message

If a route set test (RSP or RSR) is received, a full point code reply (TFx) is generated.

The responses to RSP / RSR will be modified according to Table 4-39.

Note that the searching hierarchy applies.

Table 4-39. Reception of an RSx Message

Concerned point code is:	Result
Found by a full point code match	No change to existing rules.
Found by a cluster match	No change to existing rules.
Found by a network match	Send a TFx message based on the current routeset status. • Send a TFP if danger of circular routing. Otherwise: • Send a TFA if network route is Allowed • Send a TFR if network route is Restricted. • Send a TFP if network route is Prohibited.
Not found	No change to existing rules. Send a TFP.

Reception of an RCx Message

If a routeset cluster test (RCP or RCR) is received, a cluster reply (TCx) is generated. The responses to RCP / RCR will be modified according to the following table. Note that the searching hierarchy applies.

Table 4-40. Reception of an RCx Message

Concerned point code is:	Result
Found by a cluster match	No change to existing rules.
Found by a network match	Send a TCx message based on the current routeset status. • Send a TCP if danger of circular routing. Otherwise: • Send a TCA if network route is Allowed • Send a TCR if network route is Restricted • Send a TCP if network route is Prohibited.
Not found	No change to existing rules. Send a TCP.

Changed Commands

The commands discussed in this section have been enhanced as a result of this feature.

Refer to the *Commands Manual* for current information.

chg-feat

The **chg-feat** command has been modified to allow activation of the Network Routing (NRT) feature.

rtrv-feat

The **rtrv-feat** command has been modified to display whether or not the Network Routing (NRT) feature has been activated.

ent-dstn (destination command)

A new parameter, **ncai**, has been added to the **ent-dstn** for cluster destination to indicate whether nested cluster routing is specified.

chg-dstn (destination command)

A new parameter, **ncai**, has been added to the **chg-dstn** for cluster destination to indicate whether nested cluster routing is specified.

dlt-dstn (destination command)

The rules for this command have been changed to accept network destinations.

rtrv-dstn

The **rtrv-dstn** command has been modified to display the status of the **ncai** parameter (yes, no) for cluster destination point code(s).

ent-rte (route command)

This command has been changed to display network destination.

chg-rte (route command)

This command has been changed to display network destination.

dlt-rte (route command)

This command has been changed to display network destination.

rtrv-rte (route command)

This command has been changed to display network destination.

ent-ls, chg-ls (linkset commands)

ent-ls and **chg-ls** currently require the apc to be a full point code. Since this rule is unchanged, network destinations are not allowed for the apc. Refer to the *Commands Manual* for a description of these commands.

ent-gtt, chg-gtt (gtt commands)

ent-gtt and **chg-gtt** currently require the pc to be a full point code. Since this rule is unchanged, network destinations are not allowed for the pc. Refer to the *Commands Manual* for a description of these commands.

LNP Commands

The LNP commands **ent-lnp-npanxx**, **chg-lnp-npanxx**, **ent-lnp-sub**, **chg-lnp-sub**, **ent-lnp-lrn**, and **chg-lnp-lrn** currently require the pc to be a full point code. Because this rule is unchanged, network destinations are not allowed for these commands. Refer to the *Commands Manual* for a description of these commands.

Network Security Enhancements (Release 29.0)

The Network Security Enhancements feature enhances the Eagle's network security by discarding messages that should not be received by the Eagle. This feature is designed to allow maximum flexibility to the user, so that different network implementations can still use the applicable functionalities provided by this feature.

This feature is controlled by a centralized feature key and has four different STP command options to control activation of the three major aspects of this feature:

- MTP message SID verification (Enhanced MTP Security)
 - Option #1: Mate SID verification - SECMTPMATE
 - Option #2: Self SID verification - SECMTPSID

- *Option #3:* MTP Network management message OPC verification (Enhanced MTP Management Protection) - SECMTPSNM
- *Option #4:* SCMG AFTPC verification (Enhanced SCCP Management Protection) - SECSCCPSCMG

The four STP options can be turned on / off independently (see below).

NOTE: This feature is independent of Gateway Screening and is performed before Gateway Screening occurs on the MSU.

MTP Message OPC Verification (SECMTPSID & SECMTPMATE)

The basic concept behind the SECMTPSID option is that for most cases, the Eagle should not receive a message where the OPC is equal to the Eagle's own True, Secondary or Capability Point Code(s). The basic concept behind the SECMTPMATE option is that the Eagle should not receive a message with the True, Secondary, or Capability Point Code of the Mate STP other than across the C link. See Figure 4-33.

Figure 4-33. SECMTPMATE Option Diagram

SECMTPMATE Option

An example of the SECMTPMATE option is shown by the flow of MSU #1 in Figure 4-33. In a standard network configuration, in the event LSN13 and LSN 4 are not available, all messages destined for SSP#1 will be routed through STP A.

STP B should have issued a TFP for SSP #1. However, if the customer provisioned a route to SSP#1 as shown by MSU #1, traffic would still be going to SSP #1 through STP B. STP D should be using D link-LSN 3 to route traffic to SSP #1.

It should be noted that messages following MSU #1 call flow could be 2 possible types.

- MTP routed messages- these would NOT be blocked as the OPC in the routing label would be equal to SSP #2
- GTT routed messages/ Messages Originated by STP B-these would be blocked as the OPC in the routing label would be the OPC of STP B.

Therefore, if STP A has the SECMTPMATE option active, STP A will discard messages received over any link other than LSN 4 whose OPC is equal to the True, Secondary, or Capability point code of STP B. It should again be noted that this option enforces a standard network configuration rule that may not apply to all customers.

SECMTPSID Option

An example of the SECMTPSID option is shown by the flow of MSU #2 in Figure 4-34. Unauthorized Network Element #1 potentially can flood and or send harmful bogus SS7 messages over LSN 10 that appear to have been generated by STP A by sending various messages with the OPC =STP A. This is obviously an undesirable situation and should not be allowed. The Eagle should not receive a message with its own OPC, unless the message is a result of a circular route test or is an SLTM when the far end is in loopback.

Figure 4-34. SECMTPSID Option Diagram

Therefore, assuming STP A has the SECMTPSID option active, it will discard all received messages with an Origination Point Code (OPC) equal to its True, Secondary or Capability Point Code(s), unless all the following criteria are met:

- The Eagle's MTP Circular Route Detection Mechanism sent the message with an OPC equal to the Eagle's TPC/SPC (i.e. message is an RCT message with a priority of 3).

OR

- Message is an SLTM and has an OPC equal to the Eagle's TPC or SPC.

NOTE: SLTMs with an OPC equal to the Eagle's TPC/SPC can be received when the far end is in a physical loopback, and the Eagle will transmit an SLTM (e.g. via `test-slk`). Instead of receiving an SLTA from the far end with an OPC of the far end, the Eagle's SLTM message will be returned. Without this check, SLTMs would be discarded.

MTP Network Management Message OPC Verification (SECMTPSNM)

SECMTPSNM option functionality is based upon the assertion that the Eagle should not receive an MTP network management message unless:

Rule #1 - The OPC is an adjacent point code

Rule #2 - The Eagle has a route to the OPC of the MTP network management message on the linkset which the message was received.

Rule #3 - The Eagle has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received.

For all link types, the following additions/exceptions apply:

- Rule #3 would not apply to RSM messages.
- Rule #1 would not apply to UPU, TFC and RCT messages.

SECMTPSNM Option for A and E Links

Assuming STP A has the SECMTPSNM option active and an MTP network management message is received over an A link, STP A will only allow the message to itself when all the criteria are met. Refer to Figure 4-35.

Figure 4-35. SECMTPSNM A link Option Diagram

- As shown by MSU #2, Unauthorized Network Element #1 can send a TFP with a destination field = SSP#1, an OPC=SSP #3, and a DPC=STP A to STP A. It would pass Rule #1, pass Rule #2 and fail Rule #3.
- Example of why RSM messages are excluded from Rule #3: If LSN 14 and LSN 13 were to fail, STP A would send a TFP to SSP#3 concerning SSP#1. SSP #3 would subsequently send a RSPs to STP A concerning SSP #1 via LSN 10. If Rule #3 applied to the RSP, it would be discarded, since STP A does not have a route to SSP #1 on LSN 10.

SECMTPSNM Option for B-C-D Links

Assuming the STP C has the SECMTPSNM option active, it will allow all MTP network management messages received over B-C-D links when criteria listed in 2.2 are met. Refer to Figure 4-36.

Figure 4-36. SECMTPSNM B-C-D link Option Diagram

- As shown by MSU #3, Unauthorized Network Element #1 can send a TFP with a destination field = SSP#2, an OPC=SSP #3, and a DPC=STP C. STP A would MTP route this message to STP C over LSN 2. STP C would receive this message and it would fail Rule #1, pass Rule #2 and fail Rule #3.
- Example of why RSM messages are excluded from Rule #3- MSU #4-if Unauthorized Network Element #2 injected RSP messages with an OPC=SSP#1, DPC=STP C and a destination field= SSP#2. STP C would reject the message since SSP#1 is a non-adjacent node and would subsequently fail Rule #1. Furthermore, if Unauthorized Network Element #2 injected RSP messages with an OPC=STP A, DPC=STP C, and a destination field= SSP#2, STP C would NOT reject this message since Rules 1 and 2 would be passed.

SCMG AFTPC Verification (SECSCCPSCMG)

SECMTSPSCMG option functionality is based upon the assertion that the Eagle should not receive a SCCP network management message unless:

1. The Eagle has a route to the OPC of the SCMG message on the linkset, on which the message was received.
2. The Eagle has a route to the Affected Point Code in the message on the linkset on which the message was received.

The Affected Point Code (industry term) and the Concerned Point Code (Eagle term) are synonymous. This option will only apply to SSP and SOR messages. This feature will not affect the following messages: SSA, SST, SOG, SBR, SNR and SRT. Refer to Figure 4-37.

Figure 4-37. SECSCCPSCMG Option Diagram

Normal operation for SCMG messages (e.g. SSP) would be for SCP#1 to send an SSP to STPA. STP A will look in the Concerned Point Code table and broadcast SSPs to point codes listed in that table with an OPC =STPA. The SSPs that are broadcasted will have an OPC= STP A and an AFTPC = SCP#1.

As shown by MSU #1 (normal operation), if SCP #1 sends an SSP to STP A (MSU #1), STPA will look in the Concerned Point Code table to see which point codes should receive a broadcast SSP concerning SCP#1. Assuming STP B and STP C are in the CSPC table, SSPs are broadcast to STP B and STP C (MSU #2).

Assuming STP C has the SECSCCPSCMG option active, it will discard any SSP or SOR message received on a linkset for which the Eagle does not have a route to the AFTPC on that linkset. This is similar in nature to the SECMTPNM option except the AFTPC field in the SCMG is checked, instead of the destination field in the MTP network management messages, and ensures that an SSP or SOR message is received over a linkset that STP C has a route for.

As shown by MSU #2, if Unauthorized Network Element #2 attempts to send SSPs with an AFTPC of SCP #2 and a DPC of STP C via LSN 11, STP C will receive the SSP MTP routed from STP A over LSN 2 with the OPC=SCP #2, DPC=STP C, and AFTPC=SCP #2. Since STP C does not have a route to SCP#2 over LSN 2, the message will be discarded.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

chg-stpopts

This command updates (change by simple replacement) the values of one or more of the STP node level processing-option indicators maintained in the STP's options table. This command has been enhanced with the four new parameters :secmtpmate, :secmtpsid, :secmtpsnm, and :secscpcscmg.

rtrv-stpopts

This command retrieves the current values of the STP's node-level processing option indicators maintained in the STP's options table. The output of this command has been enhanced to display the status of the new **chg-stpopts** parameters.

enable-ctrl-feat

This command is used to enable Controlled Features the customer has purchased on a permanent basis or may be used to temporarily turn a feature on for a thirty (30) day trial period. Features may be temporarily enabled by using a temporary password or may be permanently enabled by using a permanent password.

This command accepts a Controlled Feature's Part Number (partnum) and a Feature Access Key (fak). The Network Security Enhancements Part Number and Feature Access Key numbers will be accepted as valid input for these parameters. No changes to the syntax of this command are required.

chg-ctrl-feat

This command is used to activate (turn on) Controlled Features or to clear the Critical alarm for a Controlled Feature whose temporary key has expired. This command accepts a Controlled Feature's Part Number (partnum). The Network Security Enhancements Part Number will be accepted as valid input for this parameter. No changes to the syntax of this command are required.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the Network Security Enhancements feature.

Limitations

This feature will not be implemented on GX25 cards.

It will be assumed that the CPC of the Mate STP will match the CPC of the Eagle. This feature also assumes that routing is provisioned symmetrically between any two points (i.e., if a valid NM message is received on a link set, there should be a corresponding route provisioned to the OPC and destination over that incoming link set; e.g., if A can route to B through C, B should also be able to route to A through C).

Network Surveillance Enhancements (Release 28.0)

The Network Surveillance Enhancement feature adds a new terminal type to the EAGLE system. This terminal type, the Management Terminal (MGMT), provides a machine-to-machine messaging interface between the EAGLE and network Operations Support Systems, OSS. This feature lets the Eagle integrate more smoothly with most network monitoring devices.

Hardware Requirements

No new hardware is required to support this feature.

Enhancements to Existing Commands

The following existing command has been enhanced to support the Network Surveillance Enhancements feature. For more information on these commands, see the *Commands Manual*.

chg-trm

Use this command to modify one or more TERMINAL CONFIGURATION attributes (connected device type, communication settings, type of unsolicited messages received, etc.) of a single TDM serial port.

rtrv-trm

This command retrieves and displays the TERMINAL CONFIGURATION attributes (connected device type, communication settings, type of unsolicited messages received, etc.) for a single or all 16 TDM serial ports.

The new terminal type, **mgmt**, has been added to the output of this command.

lock

Use this command to lock a terminal's keyboard. This command is invalid for terminals of type MGMT.

New Control Shelf Backplane (Release 23.0)

A new backplane for the control shelf has been introduced in Release 23.0 with these changes:

- The maintenance bus has been removed from the backplane.
- The backplane has been redesigned to distribute the clock signals for the high-speed ATM signaling links at 1.544 Mb/s.
- Two serial port connections (DB-15 connectors) have been added to the control shelf backplane, one providing emergency access to the standby MASP, the other providing a connection to the TDM for critical indications.
- The control shelf backplane now contains four -48VDC power and ground connections (DB-26 connectors). Two of these connectors are labeled Primary A and B and are connected to the fuse and alarm panel. The other two are labeled Secondary A and B and are connected to another power source, allowing the Eagle to remain in service when replacing the fuse and alarm panel.
- All Eagle shelves have a binary address to identify the shelf to the system. The control shelf backplane address is permanently configured and cannot be changed. This allows only one control shelf in the Eagle. The shelf address has been expanded from four bits to six bits, increasing the maximum number of addressable card slots from 250, or 500 signaling links, to a theoretical limit of 1018, or 2036 signaling links. The actual number of addressable card slots is limited by the system software and the hardware configuration of the Eagle. In Release 23.0, the actual number of addressable card slots is 378, or 756 signaling links, but is limited by the system software to 250 cards, or 500 signaling links.
- To allow the TDMs to determine which version of the control shelf backplane they are connected to, the control shelf backplane uses pins A49, A50, and A52 on connectors P2 and P4 to send a binary signal to the TDMs. On previous backplanes, these pins were left unconnected, creating a binary signal of 111. On this backplane, the least significant bit of the signal, pin A49, is connected to ground, creating a binary signal of 110. This signal corresponds to this version of the control shelf backplane.

New Hardware (Release 23.1)

Release 23.1 introduces improvements to these cards in the Eagle.

- TDM
- MDAL
- IPMX

- E486 main assembly for the ASM, ACM, LIM, and MCAP card
- E586 main assembly for the TSM-256 and MCAP-256 card

It also introduces a new card into the Eagle, the integrated LIM-AINF.

The electrostatic discharge (ESD) clips on these cards have been redesigned so they do not bend easily, making the insertion and extraction of the cards easier.

Each card has been redesigned so that the tooling holes and holes used for mechanical attachment cannot be used as functional plated-through holes and provide electrical connections between the conductor layers of the card.

The nut and washer assembly used for attaching the faceplate to each card has been replaced with PEM nuts, reducing the labor required to assemble the card.

A diode has been added to the -48V return path to prevent the TDM from being powered by the other TDM through the connections for the fuse alarms.

The BITS clock recovery circuit on the TDM has been improved to tolerate more noise on the clock input and make the BITS clock recovery circuit more stable.

To ensure that the TDM LED comes on when it is supposed to, the controlling resistor for the LED has been changed from 10K Ohms to 1K Ohms.

These design modifications do not have any impact on the software functionality of these cards.

Integrated LIM-AINF Card

A new card is being introduced to the Eagle, the integrated LIM-AINF card, P / N 870-1484-xx. The integrated LIM-AINF card contains all the functionality of the LIM-AINF card, P / N 870-1014-xx, and is contained on one board. The AINF applique is not used or required for the integrated LIM-AINF card. No other applique can be used with this card. It can only serve as a LIM. The integrated LIM-AINF contains the three LIM interfaces, DS0, OCU, and V.35 and uses the system software to select the interface, the same as on the old LIM-AINF card.

New Hardware (Release 26.05)

Multi-Purpose Server (MPS)

The MPS hardware system is being deployed in conjunction with the EAGLE STP Database Service Module (DSM) subsystem for both the G-Flex C7 Relay and Intelligent Network Application Part (INAP)-based Number Portability features. (See “*G-Flex C7 Relay (Release 26.2)*” on page 3-13 and “*INAP-based Number Portability (INP) (Release 26.05)*” on page 3-77 for discussion of these features.)

The MPS hardware system includes the MPS, supporting Local Area Network (LAN) devices and associated peripheral units.

Refer to the *NSD Hardware Manual* for current information on the MPS hardware.

Non-ANSI Point Code Support (Release 20.0)

The Eagle supports the use of the network identifier of “0” to accommodate networks outside of the ANSI network with nonconventional point codes. This network identifier can also be used as a test point code in some applications within the U.S.

Non-Generation of Duplicate SEAS Autonomous Messages (Release 22.0)

This feature allows only one copy of a SEAS autonomous message to be sent to the first available SEAS port. This prevents duplicate SEAS autonomous message from being sent to the SEAS ports.

Non-SCCP/ISUP Routing (Lab Only) (IP⁷ Release 1.0)

This feature allows SS7 nodes to exchange non-ISUP and non-SCCP protocol messages with one or more TCPIP/IP-based devices residing on an IP network. The network example is similar to the SCP connectivity via TCAP over IP. The IP⁷ Secure Gateway node maps the destination point code and service indicator (non-ISUP, non-SCCP) to a TCP/IP address and port.

NOTE: This functionality is provided in IP⁷ Secure Gateway Release 1.0 for lab investigation only. This function is not available for network implementation.

Non-SCCP/ISUP Routing (IP⁷ Release 2.0)

This feature, which was available only in a laboratory environment in release 1.0, allows SS7 nodes to exchange non-ISUP and non-SCCP protocol messages with one or more TCPIP/IP-based devices residing on an IP network. Figure 4-38 shows a network example for this feature. The IP⁷ Secure Gateway node maps the destination point code and service indicator (non-ISUP, non-SCCP) to a TCP/IP address and port.

Figure 4-38. Non SCCP /ISUP Routing

Notification of Congestion Level Increase (Release 22.0)

When the congestion or discard level on a signaling link increases from one level to the next, the Eagle issues one of these UIMs to the Eagle terminals.

<i>UIMs</i>	UIM 264—REPT-LINK-CGST: congestion level 0 to 1
	UIM 265—REPT-LINK-CGST: congestion level 1 to 2
	UIM 266—REPT-LINK-CGST: congestion level 2 to 3
	UIM 270—REPT-LINK-CGST: discard level 0 to 1
	UIM 271—REPT-LINK-CGST: discard level 1 to 2
	UIM 272—REPT-LINK-CGST: discard level 2 to 3

In release 22.0, when one of these UIMs is issued, the Eagle sends the SEAS message REPT-LINK-CGST to the SEAS interface.

The threshold of each congestion or discard level is included in the REPT-LINK-CGST message and is defined as the number of MSUs being transmitted on the signaling link or the number of MSUs being discarded because of the congestion.

Notification of Inability to Perform a Global Title Translation (Release 22.0)

Whenever the Eagle is unable to perform a GTT due to administration table problems, and an MSU is discarded, the Eagle issues one of these UIMs.

<i>UIMs</i>	UIM 1043 — SCCP did not route - bad translation
	UIM 1046 — SCCP did not route - DPC not in MAP tbl
	UIM 1049 — SCCP did not route - SS not in MAP tbl

In Release 22.0, when any of these UIMs are issued, the Eagle sends the REPT-NOTRNS message to the SEAS interface. To control the number of REPT-NOTRNS messages being sent to the SEAS interface, the REPT-NOTRNS message is only sent if less than 10 previous REPT-NOTRNS messages have been sent during a 5 minute period. If 10 REPT-NOTRNS have already been sent during the 5 minute period, no REPT-NOTRNS messages are sent until the 5 minute period has expired. When this 5 minute period expires, a new 5 minute begins and the Eagle resumes sending REPT-NOTRNS messages.

Notification of Link Set Outage (Release 22.0)

When all signaling links in a linkset become unavailable because of multiple signaling link failures or processor outages, the Eagle issues UIM 318 - REPT-LKSTO: Link set prohibited.

In Release 22.0, when UIM 318 is issued, the Eagle sends the SEAS message REPT-LKSTO to the SEAS interface. Included in the REPT-LKSTO message is the number of signaling links that have failed (the primary state of the signaling links is OOS-MT) and the number of signaling links that have been inhibited (the

Notification of Link Set Recovery (Release 22.0)

When the linkset outage condition, reported with UIM 318 or the SEAS REPT-LKSTO message, has been corrected, the Eagle issues UIM 317 - RCVRY-LKSTO: Link set allowed.

In Release 22.0, when UIM 317 is issued, the Eagle sends the SEAS message RCVRY-LKSTO to the SEAS interface. Included in the RCVRY-LKSTO message is the number of signaling links in the linkset that are back in service.

Notification of Locally Initiated Database Copy (Release 22.0)

This feature requires the Eagle to send the REPT-DBCPY message to the SEAS interface any time the Eagle database is backed up or restored with the Eagle command **chg-db**. This message is sent regardless of whether the **chg-db** command was entered correctly or completed successfully.

Table 4-41 defines the indicators used to show which version of the database the REPT-DBCPY message is reporting about.

Table 4-41. REPT-DBCPY Database Indicators

Database Indicator	SEAS Definition	Eagle Definition
C	Current active version of the database	The database in the current partition of the fixed disk
P	Primary version of the database	The database in the backup partition of the fixed disk
X	Copy of the database on an external device	The copy of the database on a removable cartridge

A completion code of COMPLD (completed OK) is sent to the SEAS interface when the **chg-db** command completes with no errors.

A completion code of NSD (not started) is sent to the SEAS interface when the **chg-db** command is rejected because of semantic errors.

A completion code of ABTD (aborted) is sent to the SEAS interface when the **chg-db** command fails during execution.

This message is not sent if the Eagle's **copy-tbl** or **copy-disk** commands are used to overwrite the active database.

Notification of MTP-Level Routing Error (Release 22.0)

When an MSU is discarded because the Eagle has received the MSU with an undefined point code or an invalid SIO, these UIMs are issued.

UIMs UIM 1004—MTP rcvd unknown DPC
 UIM 1018—MTP rcvd invalid SIO

In Release 22.0, when either of these UIMs are issued, the Eagle sends the REPT-MTPERR message to the SEAS interface. To control the number of REPT-MTPERR messages being sent to the SEAS interface, the REPT-MTPERR message is only sent if less than 10 previous REPT-MTPERR messages have been sent during a 5 minute period. If 10 REPT-MTPERR have already been sent during the 5 minute period, no REPT-MTPERR messages are sent until the 5 minute period has expired. When this 5 minute period expires, a new 5 minute begins and the Eagle resumes sending REPT-MTPERR messages.

Notification of Recovery from Link Congestion (Release 22.0)

When the congestion or discard level on a signaling link increases from one level to the next, the Eagle issues one of these UIMs to the Eagle terminals.

UIMs UIM 267—RCVRY-LINK-CGST: congestion level 3 to 2
 UIM 268—RCVRY-LINK-CGST: congestion level 2 to 1
 UIM 269—RCVRY-LINK-CGST: congestion has cleared
 UIM 273—RCVRY-LINK-CGST: discard level 3 to 2
 UIM 274—RCVRY-LINK-CGST: discard level 2 to 1
 UIM 275—RCVRY-LINK-CGST: discard has cleared

In release 22.0, when one of these UIMs is issued, the Eagle sends the SEAS message RCVRY-LINK-CGST to the SEAS interface.

The threshold of each congestion or discard level is included in the RCVRY-LINK-CGST message and is defined as the number of MSUs being transmitted on the signaling link or the number of MSUs being discarded because of the congestion.

Number Pooling (Release 24.0)

Number pooling involves assigning a portion of an NPA-NXX, for example a thousands block (NPA-NXX-X), to a service provider (block holder) which is different from the NPA-NXX holder (the code holder). Before number pooling, numbers were assigned to service providers on an NPA-NXX basis. For smaller service providers needing fewer than 10,000 numbers, this method results in many unused, but reserved numbers. Number pooling is used to allow the allocation of numbers on a smaller block basis.

In the Eagle, a number no longer owned by the NPA-NXX holder can be viewed the same as a number ported to a new service provider. Any or all of the numbers in a given NPA-NXX-X can be ported to the block holder by generating subscription versions with the block holder's data.

The subscription data in the Eagle has been modified to show which of three LNP types have been assigned to the LNP subscription.

- LSSP – Local Service Provider Portability
- LISP – Local Intra-Service Provider Portability
- POOL – Pooled Block Number Port

In the Eagle, the LNP subscriptions containing telephone numbers that are ported to an NPA-NXX-X block holder are designated with the LNP type of POOL. Telephone numbers that are ported before having the LNP type assigned to the telephone subscription are assigned the LNP type NONE.

The LNP type is not part of the subscription version data received from the LSMS, but must be assigned to the subscription data using either the **ent-lnp-sub** or the **chg-lnp-sub** commands.

Command Changes

Refer to the *Commands Manual* for current information.

ent-lnp-sub, chg-lnp-sub, and rtrv-lnp-sub commands

A new parameter, **pctype**, has been added to the **ent-lnp-sub**, **chg-lnp-sub**, and **rtrv-lnp-sub** commands. This parameter defines whether the 10-digit telephone number subscription is an LSSP (local service provider portability) subscription, an LISP (local intra-service provider portability) subscription, or a pooled block number subscription.

rtrv-lnp-tnrpt

The **rtrv-lnp-tnrpt** command is being introduced to Release 24.0 to retrieve and display the LNP subscription data based on the LNP type. The **rtrv-lnp-sub** command can also be used to generate this report, but doing so could impact updating the LNP data in the Eagle at the 2 telephone number per second rate. Using the **rtrv-lnp-tnrpt** command eliminates the impact on updating the LNP data.

canc-lnp-tnrpt

Because the report generated by the **rtrv-lnp-tnrpt** command can be very large and take a long time to generated, the **canc-lnp-tnrpt** command has been introduced to Release 24.0 to allow the user to cancel the report generated by the **rtrv-lnp-tnrpt** command while it is in progress. The **canc-lnp-tnrpt** command has no parameters.

Number Pooling/Efficient Data Representation (EDR) (Release 26.1)

Currently, the assignment of 10,000 (NPA-NXX) blocks of phone numbers to service providers for number portability results in large numbers of unused phone numbers in the NPA-NXX block, especially for smaller service providers. To conserve new NPA-NXX blocks of numbers and to provide more efficient use of existing NPA-NXX blocks, pooling of 1000 number blocks was mandated by NANC.

Number Pooling / EDR allows the NPA-NXX service provider holder (code holder) to assign a portion of an NPA-NXX, i.e. a thousand block (NPA-NXX-X), to another service provider (block holder). EDR (allows this thousand block of numbers to be represented as a single record.

Currently, number pooling is implemented in the industry without EDR. This means that when the 1000 number blocks TN's are pooled (ported out from the code holder), the pool of 1000 numbers comes across the NPAC / LSMS interface as individual records (a 1000 TN port at one time). This can result in interface performance and database utilization problems.

Efficient Data Representation (EDR) was conceived so that pooled 1000 blocks of TN's could be managed as one subscription object. The numbers in a given NPA-NXX-X can be ported from the code holder to the block holder by generating subscription versions with the block holder's data. This type of port is designated with an LNP type of "POOL," which is maintained as part of the subscription version from the SOA to the NPAC to the LSMS and down to the Eagle.

This feature is dependent upon the North American Numbering Council (NANC) 3.0 release, and the associated feature in LSMS 3.0.

Overview

This section is provided to help promote further understanding of this feature.

End Office Perspective

Current switching mechanisms for number portability query and response have been modified to support Number Pooling / EDR. Default routing functionality is maintained.

Because 1000 blocks of TNs are pooled from the code holder to the block holder, special arrangements must be made, since the block holder may not have customers for all the 1000 TNs that were pooled.

This event would cause both Switch X and Z service providers to think the call was misrouted, when indeed it was not.

To remedy this situation, a NP-Reserved marking is used on Switch Z to suppress code 26 and provide unallocated number treatment (for example, "You have reached a number that is not in use").

In this scenario, if 630-224-3005 were assigned to subscriber E, switch Z would find subscriber E in the NPDB, and route the call in Switch Z's network. If subscriber E subsequently ports to a new service Provider, Switch Y, the pooled block in Switch Z indicates that 630-224-3005 is ported to Switch Y, and normal LRN routing occurs for the call.

If there is a timing issue with subscription records being updated from the NPAC to each switch's NPDB, errors in routing can occur. For example, if the NPDB for Switch X is not updated due to equipment problems, a call from subscriber A to subscriber E would be routed by Switch X with the LRN received from its non-updated NPDB. Switch Z detects the LRN as a home LRN, and because the GAP is marked as NP-reserved on the switch, Switch Z provides unallocated number treatment. Switch Z should have released the call with cause code 26.

To alleviate this timing issue, when subscriber E ports to Switch Y, the number from the NPAC can be marked as Ported Out. This marking in the preceding example will operate as follows:

When Switch Z receives the call with the home LRN, the number is marked as ported out at Switch X when subscriber E ports. Then, when Switch Z receives the call with the GAP parameter marked as Ported Out, Switch Z will correctly provide cause code 26 treatment.

In addition, if subscriber E disconnects service, 630-224-3005 is "snapped back" to Switch Z. Typically, the Ported Out marking is removed, and the NP Reserved Marking is reinstated.

When an NPA-NXX is split, the pooled blocks of 1000 TN's will have the same NPA after the split. This means that if area code 919 was split into 919 and 376 area codes, any pooled numbers (919-460-1xxx, 919-345-3xxx, etc) would have the same NPA(919) after the split.

Eagle Perspective (LNP Database)

From the Eagle perspective, Number Pooling / EDR can be viewed as another table lookup prior to defaulting to the default GTT data. As illustrated in Figure 4-39, pooled ranges become an intermediate step in a TN lookup.

Figure 4-39. Database Lookup Hierarchy

Upgrade Considerations

While no new upgrade requirements have been identified, note that the EAGLE must rely on LSMS to provision newly pooled objects, and remove individual subscription exceptions that are contained within the pooled block, in order to take advantage of the EDR capability. The EAGLE database update performance will depend on method that is used to do it. For High-speed bulk-load / reconcile, the Eagle database will be updated at 200 TPS and additional time it takes to do the finish-edl process on the Eagle. If slow-speed reconcile is used, Eagle will be updated at 2 TPS.

Changed Commands

The following commands have been enhanced to support this feature.

Refer to the *Commands Manual* for current information.

ent - /chg - /dlt - lnp - sub

These commands now utilize pooled TN's, such as 9194605***, to represent blocks 1000 TN's as a single object.

Also, the **ptype** and **etn** parameters have been removed from these commands.

rtrv - lnp - sub

This command accepts the parsing of the modified **tn** and **etn** parameters. The optional parameter **ptype** will only accept the value **pool** or **none**, and displays only subscription objects of the type pooled. Likewise, EMS/SEAS **vfy - lnp - sub** commands generate the same results, with responses in EMS/SEAS syntax.

rtrv - lnp - dpcer

This command accepts the parsing of the modified **tn** and **etn** parameters.

rtrv - lnp - tn rpt

This command accepts the parsing of the modified **tn** and **etn** parameters. The optional parameter **ptype** will only accept the value **pool** or **none**, and displays only subscription objects of the type specified.

Limitations

The EAGLE must be upgraded to support EDR data records prior to upgrading the OAP. The OAP must be upgraded to support EDR data records prior to upgrading the LSMS.

OAP Upgrade Enhancement (Release 27.2)

The OAP is now self-configuring, for the purpose of determining the OAP operating mode.

OCTRETRN in 30-Minute Measurements Reports (Release 31.4)

The OCTRETRN register is added to the output of the COMP-LINK report for Eagle for both the Measurements Platform and OAM generated measurements.

The OCTRETRN (octets retransmitted) peg is available on 30 minute intervals. previously, it was only available on 24 hour interval.

Online Cartridge Formatting (Release 20.0)

The Eagle supports online formatting of the removable cartridge. The removable cartridge can be formatted to hold either system data (the database and the GPLs) or measurements data.

Option for Subsystem Prohibit (Release 29.0)

This feature allows the network operator the option to have selected subsystems still marked as prohibited even though an MTP-RESUME has been received (i.e. point code is allowed). This allows a clearer delineation between the concept of a point code and a subsystem for SCCP Management.

NOTE: This feature does not contain any restrictions regarding ITU/ANSI point code formats.

Figure 4-40 provides an example of a network view of this feature.

Figure 4-40. SSN Prohibit Option Diagram

In this figure, STP 1-3-10 is set up so that it is load sharing the application denoted by SSN#1 across all SCP's and is in dominant mode (as primary) for SSN#2.

Currently, if point code 1-3-42 goes down, Eagle marks all SSN's associated with 1-3-42 as prohibited and will broadcast SSP's to nodes contained in the respective CSPC group. The Eagle will subsequently load share SSN #1 across 1-3-43, 1-3-40, and 1-3-41. Traffic destined for SSN #2 will be served by 1-3-40. This operation does not change for this feature.

Prior to this feature, when point code 1-3-42 came back in service and an MTP-RESUME was received, the Eagle would:

1. Mark SSN #1 and SSN #2 related to 1-3-42 as allowed and broadcast SSA's to nodes contained in the respective CSPC group. This was done regardless of the actual status of the subsystem within the point code.
2. If SSN #2 was still down at 1-3-42, the Eagle would wait for a message destined for SSN#2, send the message to SCP 1-3-42 and subsequently receive an SSP for SSN#2 from 1-3-42.
3. Eagle would then subsequently broadcast SSP's to nodes contained in the respective CSPC group, and initiate SST's to SSN#2 to poll for subsystem status.

This feature changes the behavior in steps 1 and 2 above, when the option is on for both SSN #1 and SSN #2 for 1-3-42 to the following when an MTP-RESUME is received:

1. Send SST's to 1-3-42 concerning SSN #1 and SSN #2 and receive either an SSP or SSA from SCP 1-3-42 concerning SSN #1 or SSN #2.
2. Broadcast SSA / SSP's, depending on the result of the SST's, to nodes contained in the respective CSPC group.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

ent-map

This command allows the assignment of mated applications for use with SCCP network management. A mated application is used in the event the local application becomes unavailable. This command has been enhanced with the **:sso** parameter.

chg-map

This command changes the mated point code and subsystem number and its attributes. A mate point code defines an adjacent signaling point, which is considered the mated signal transfer point (STP) to the Eagle. This command has been enhanced with the **:sso** parameter.

rtrv-map

This command can show the mated application relationship information maintained by the Eagle. This information is used to support the routing of SCCP management SSP/SSA messages. The output of this command has been enhanced to display the value of the **:sso** parameter.

Features P - Z

Password Aging (Release 21.0)

When a password is changed, either by the user or by a systems administrator, the date that the change took place is entered in the database along with the updated password.

During the login process, after the system has verified that the user has correctly entered the password, the system uses the date the password was changed to compute the number of days that have elapsed since the password was last changed. The password's age is compared against the value of the **page** parameter (maximum password age) of either the **ent-user**, **chg-user**, or **chg-secu-dflt** commands. If the password's age is greater than the value of the **page** parameter, then a password expired message appears in the command area. The user is prompted to enter and verify a new password. If the new password is acceptable, it is entered in the database along with the date that the change took place (the current date as shown by the Eagle time-of-day clock).

The maximum age of a specific password (**page**) can only be specified with the **ent-user** command or the **chg-user** command. If the **page** parameter is not specified with the **ent-user** command, then the password's age is taken from the system default value. The system default value for the password's age is set with the **page** parameter in the **chg-secu-dflt** command. If the **page** parameter is not specified with the **chg-user** command, then the existing value for the password's age does not change.

The system administrator can set a password's maximum age to 0. This indicates that the password aging is not applied to the password and the password remains valid regardless of how many days have elapsed since it was last changed.

When the user attempts to login with a password that is older than its maximum allowable age, the following message is displayed in the command area after the password has been validated and before the login session is established:

```
Enter new password (password has expired and must be changed) :
```

The user is then prompted to enter and verify a new password. If the password is acceptable, the user is logged on. Otherwise, one of the invalid password error messages is displayed [see “*“Password Requirements (Release 21.0)”*”] and access to Eagle is denied.

Password Encryption (Release 21.0)

To prevent passwords from being disclosed, in Release 21.0, the passwords are stored on the system in an encrypted form. The encryption algorithm that is used is a one-way encryption algorithm, meaning once the passwords are encrypted using the algorithm, the passwords cannot be decoded. Also, any passwords temporarily stored in memory are overwritten with null characters as soon as they are no longer needed.

Password Requirements (Release 21.0)

Currently, the only requirement for a password used in the Eagle is that the password must contain from five to eight alphanumeric characters

In Release 21.0, the rules for passwords have changed to meet Bellcore password requirements. The requirements for passwords can now be configured in the database with the **chg-secu-dflt** command. Passwords on the Eagle can contain a maximum of 12 characters.

Refer to the *Commands Manual* for current information on commands.

PCS 1900 LNP Query (Release 26.0)

This feature provides for LNP query / response in a PCS wireless environment using the LRN method in order to support Service Provider Number Portability, thus extending Eagle's LNP capability.

PLNP addresses the following capability in the network:

Call Completion to Ported Number (CCPN)

This network facility allows completion of a call to a ported directory number, when an MSC trigger is used (i.e. the MSC must be an LNP-capable switch). For PLNP, the MSC sends a query containing a DN, which is a 10-digit NANP called party number for a wire-line subscriber. The DN is used to perform an LNP database lookup in order to find the associated LRN.

Feature Functions

In order to support this new capability, PLNP utilizes the following, currently existing, LNP functions:

1. LNP Query processing: This function services LRN queries in real-time and generates associated LRN values. Multiple query types (AIN, IN, IS-41) are supported.
2. LNP Database: The database supports LNP Query and Message Relay processing, though Message Relay functionality is not supported in the industry.
3. SCCP Subsystem Management: SCCP supports local subsystems. This includes routing to a local subsystem, and performing network management when a local subsystem goes online or offline.
4. Database Audit: This periodically audits the LNP Database to ensure that it has not been altered by unapproved mechanisms, and to ensure that all cards have an identical copy of the LNP Database.
5. LNP related Administration: Support is in place to provision the existing LNP services. Support for provisioning the PLNP service has been added to the existing commands.
6. LNP-related Maintenance: Maintenance supports LNP. This includes reporting the status on the LNP subsystem, and generating alarms, measurements, and UIMs. Minor enhancements have been made to the **rept-stat-lnp** command.

No new alarms are introduced for this feature. Although no new measurements or UIMs have been defined, measurements for PLNP will be maintained and reported separately from other LNP query services.

7. LSMS and the LSMS↔EAGLE interface: No impact on these functions.

PLNPQS Details

All the LNP query messages for call completion to ported number received by EAGLE are processed by PLNPQS. PLNPQS receives queries from the subsystem management task, and implements the processing to parse the query, perform the lookup, and generate the response.

LNP Query is performed as follows:

1. The message arrives at EAGLE.
2. If global title is required, and the translation type is PLNP, the data is routed to the local LNP query subsystem and Site ID True Point Code (SID and SS_APPL tables). Only one LNP subsystem exists for all LNP query processing. If SID / SS_APPL data has not been administered, a UIM is generated and the message is discarded.

3. If global title is not required, the message is routed to the appropriate destination, local subsystem if the EAGLE DPC and SSN are the destination, MTP routed for others.

PLNPQS Query Verification

This section shows the process used by EAGLE, as part of PLNPQS, to verify a PLNP query.

A summary of the verification follows.

PLNP will verify the following values in the MTP and SCCP part:

1. MSU is ANSI national, and point codes are national
2. MSU is SCCP UDT message
3. MSU is SCCP Class 0
4. GTI is 0010 when rt-on-gt, or 0000 when rt-on-ssn
5. TT is the provisioned PLNP TT value
6. PC of originating SSP is in route table, extract PC and SSN for use in the response
7. Length of user part sufficient to hold minimum TCAP part

PLNP will verify the following values in the TCAP part:

1. TCAP package is Query with Permission
2. TCAP package length fits within SCCP user part
3. TCAP transaction ID present, and length = 4, extract value for use in the response
4. Component sequence ID present, and length valid
5. Invoke Last component present, and length valid, extract Invoke ID for use in the response
6. PCS ProvideInstructions:Start operation code present
7. Digit ID parameter, Called Party Number present
8. Calling Party Number, LATA, and ORG station are present

PLNPQS Query Decoding

This section shows the process used by EAGLE to decode a PLNP query. The process is identical to the existing Eagle implementation to decode IN queries, except that:

- the numbering plan for this query is E.164, rather than E.163

- the dialed number must be exactly 10 digits, rather than at least 10

PLNP will verify the following values in the TCAP part:

1. TCAP length valid
2. Parameter Set present, and length valid
3. Service Key present, and length valid
4. Digit ID parameter, Called Party Number is present, length is valid, and the following applies:
 - Type is National
 - Encoding is BCD
 - Numbering Plan is ISDN (E.164)
 - 10 digits present
 - Each digit is correctly encoded (BCD value is 0 to 9, inclusive)

PLNPQS Query Response Generation

PLNPQS response messages can be of the following types: normal messages and error messages.

Normal Responses

This section shows the fields filled in by EAGLE for a "normal" response to a PLNP query. The normal response is sent when the query passes verification and decode, and an LNP database lookup is performed.

Normal responses are identical to the existing Eagle LNP implementation for IN query / response, except that the numbering plan used for the query and response will be E.164 (ISDN), rather than E.163 (Telephony).

The Routing Number in the normal response is filled in as follows:

- if the database lookup succeeds and returns an LRN, the Routing Number in the response is set to the LRN value (i.e. the DN refers to a ported number).
- if the database lookup fails (i.e. the number is not ported), the DN value from the query is used as the Routing Number in the response.

The normal PLNP response is required to include the Digits(Carrier), and Billing Indicators parameters. These parameters are not essential for number portability, but are mandatory parameters for the response. Each will be set to a benign filler value, as shown in the template.

Error Responses

MTP and SCCP level error responses are unchanged from the existing Eagle implementation.

The general rule for error responses are as follows:

- Protocol errors in the component portion (incorrect package or component) are reported with a Reject component in a Response package
- Command errors (where the query completed with an error, though the command was received correctly) are reported with a Return Error component in a Response package

Error handling for PLNP will come into play once a message is routed to the PLNPQS for handling as a PLNP request.

New UIMs

The following new UIM is associated with the PCS 1900 LNP Query feature:

```
1120   TRBL Queue is full: elements overwritten
```

Changed Commands

Refer to the *Commands Manual* for current information on commands.

chg-feat

The **chg-feat** command is used to activate system-wide features. Once a feature is activated (i.e. turned on), it cannot be turned off. The LNP feature bit must be ON for the PLNP feature to be turned ON.

rtrv-feat

The **rtrv-feat** command is used to display the status of all system-wide features, including the status for PLNP.

ent-lnp-serv

Use this command to reserve an LNP translation type for a unique LNP service. A maximum of eight LNP services can be assigned in the database. Two of those eight LNP services are reserved for administration of AIN and IN translation types. The services include four query services (**ain**, **in**, **pcs**, and **wnp**). In addition, any combination of six message relay or user-defined services can also be defined. Translation type names can be defined also and are defaulted to the corresponding reserved service type names.

chg-lnp-serv

The **chg-lnp-serv** command is used to change an existing translation type service reservation in the database. The parameters for this command are service type, new translation type, new digits valid indication, and new translation type name. Thus, it is possible to change the translation type, digits valid indication, and translation type name fields in the database for the specified service type.

dlt-lnp-serv

The **dlt-lnp-serv** command is used to delete a translation type service reservation from the database. The parameters for this command are service type or alias translation type. Only the service type parameter is mandatory. This command updates the LNP TT Table.

rtrv-lnp-serv

The **rtrv-lnp-serv** command is used to retrieve all LNP translation type service reservations from the database. It displays the assigned translation type, translation type name, service type, LNP digit validity indication, and alias translation types.

rept-stat-lnp

This command provides Local Number Portability (LNP) status information.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. The output of the command will vary depending on which feature bits are turned on. The following PLNP information will only be displayed when the PLNP feature bit is turned on.

Upgrade Considerations

Adding additional measurements to support the feature will result in the SCCP maintenance block being modified. During upgrade, OAM must support the old and new version at the same time. During an upgrade back out, the SCCP card must support polling for the old version.

Since this feature does not change any DMS tables, no table conversion will be required.

All SCCP cards must be upgraded to the release that contains PLNP prior to provisioning the PLNP service.

Limitations

1. When the PLNP feature is enabled, and the PLNP service is provisioned, it is not possible to route PLNP queries arriving as Route on GT to an external node. All Route-on-GT PLNP queries will be processed locally under these conditions. This means that customers will not be able to split processing of PLNP queries across multiple network elements.

The product is implemented in this manner in order to retain backward compatibility with the current LSMS product. Rather than utilizing the LSMS to provision PLNP service on a per NPA-NXX basis, the PCS query service is enabled / disabled for all messages.

2. Due to limitation 1, when the LNP database is unavailable, EAGLE will return an error response without performing LNP. Network management for these LNP queries will be used to divert future traffic. A summary of the network management response is shown in Table 5-1.

Table 5-1. Response When PLNP Is Unavailable

Query MSU Routing Indicator	DPC	Message Handling	Network Management
Rt-on-gt	True point code	generate UDTs	Send UPU
	Capability point code	generate UDTs	Send TFP concerning EAGLE's CPC
Rt-on-ssn	True point code	generate UDTs	Send SSP to OPC concerning DPC
	Capability point code	generate UDTs	None.

3. PLNP only supports ANSI messages.
4. There is no Automatic Code Gapping (ACG) for PLNP. Excessive PCS query messages can cause ACG to be initiated for AIN and IN queries, potentially starving out those services if the excessive PCS query messages continue to be sent to EAGLE.
5. Message Relay is not supported for messages which use the PLNP Translation Type.

Performance Enhancements (IP⁷ Release 3.0)

The Performance Enhancements feature provides a set of rules for specifying DCM throughput under different configurations. This feature touches on a wide variety of IP⁷ Secure Gateway system and application issues.

Primary Aspects

The following items can be considered primary aspects of the Performance Enhancements feature:

- Maximum application capacity per DCM is increased to 3000 MSUs per second, with limitations.
- DCM communications processor MSU throughput capacity is increased to 5000 per second.
- The software-imposed limit to maximum TVG request rate is increased to 5000, which requires a limit on active cards present in the system.
- Application performance is enhanced through the use of Nagle's algorithm on all sockets. For more information on Nagle's algorithm, see "*Nagle's Algorithm*" on page 5-40.
- Application performance is enhanced through optimizations in the use of shared memory.
- The **msucount** pass-through maintenance command, used with the **pass** command, is enhanced to provide values for average MSUs per second transmitted and received over a period of time.

Secondary Aspects

The following items can be considered secondary aspects of the Performance Enhancements feature:

- The TCP/IP stack is modified such that the timer used for Nagle's algorithm has a much lower time-out, such as 25 milli-seconds rather than 200 milli-seconds.
- Socket message flow control is modified for the higher capacity.
- TCP re-transmissions at the higher capacity is addressed by increasing socket buffer size from 8 kilo-bytes to 16kilo-bytes.
- The card-level congestion control algorithm is modified for the higher capacity.
- The change-over/change-back control algorithm is modified for the higher capacity.

Limitations Summary

Achievement of the maximum application capacity of traffic requires the following:

- No more than 150 active cards may be present in the system.
- Average MSU size of application traffic must be no greater than 120 octets.

- STPLAN copy on outbound messages is not supported at the capacity rate of traffic, but is still supported at rates up to 2000 MSUs per second.
- Nagle's algorithm must be enabled for all traffic-carrying sockets.

New Commands for Performance Enhancements

There are no new commands for this feature.

Enhancements to Existing Commands for Performance Enhancements

For more information about formats for the commands described in this section, refer to the *Commands Manual*.

The following commands have been enhanced to support the Performance Enhancements feature.

chg-dcmps

The **chg-dcmps** command is used to change the IP parameter set. The parameter value **2** has been designated for use with the **parm** parameter for the **chg-dcmps** command to indicate that Nagle's algorithm is enabled.

rtrv-dcmps

The **rtrv-dcmps** command is used to retrieve information about the IP parameter set. The output of the **rtrv-dcmps** command has been updated to display information about Nagle's algorithm.

msucount

The **msucount** command is used with the **pass** command to retrieve MSU transmit and receive statistics for various entities on an IPGWx and IPLIMx card. The output of the **msucount** command has been updated to show the number of MSUs per second transmitted and received.

Persistent Device States (Release 29.0)

This feature provides persistent states for supported Eagle card, terminal, signal link and TCP/IP link devices. This capability makes it unnecessary to manually log device states prior to an **init-sys**, and retains the OOS-MT-DSBLD device state during an OAM switchover. Supported devices are cards, terminals, SS7 signaling links and TCP/IP data links.

During the **init-sys** process, the OAM will restore supported devices to their maintenance states, resulting in an initialized and configured Eagle. Non-supported devices continue to be processed using the current method.

This feature presents a very efficient mechanism to restore an Eagle to its pre-init-sys state. This **init-sys** aspect of the feature is controlled by a system wide "restore device" option administered by the craftsman with the **chg-stpopt** command. Turning off this option causes the current init-sys processing to occur.

NOTE: The default value for this option remains OFF.

With this feature, faster standby-to-active recovery during a switchover operation are possible, since device states are maintained on the standby MASP, and do not require craftsman intervention following initialization. Disabled or inhibited devices retain their state, provided the PDS data is valid. Otherwise, current switchover processing occurs, and devices may be driven to their default state.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

chg-stpopts

This command updates (change by simple replacement) the values of one or more of the STP node level processing-option indicators maintained in the STP's options table. This command has been enhanced with the **rstrdev** parameter.

rtrv-stpopts

This command retrieves the current values of the STP's node-level processing option indicators maintained in the STP's options table. The output of this command has been enhanced to display the status of the **:rstrdev** parameter.

Limitations

Persistent state data will not be maintained on the standby MASP, in the case of different version numbers for the PDS tables in the active and standby MASPs. The PDS table version changes only if there are new devices supported by the PDS, or more information is added to the table for the supported devices.

Point-to-Point Connectivity for ITU Point Codes (IP⁷ Release 2.2)

The **iplimi** application provides the same functions for International Telecommunications Union (ITU) point codes as the **iplim** application provides for American National Standards Institute (ANSI) point codes, with the exception of any functions that are supported only by ANSI protocols. (Full Restart, Partial Restart, Adjacent Restart, False Link Congestion, and Circular Routing Detection are ANSI-only features.)

Each **iplimi** link provides one point-to-point connection either to an international ITU network node (ITU-I) or to a national ITU network node (ITU-N) for the purpose of carrying SS7 traffic over a TCP/IP network. These links:

- Can be added to a multiple-link linkset in which the other links can be either **iplimi** links or links of another type, such as **css7itu**.
- Fully support SS7 changeover and changeback procedures, including retrieval.
- Have the standard SS7 restriction of 16 links per linkset.

Mixed Networks Using the ANSI/ITU Gateway Feature

If you have also installed the ANSI/ITU Gateway feature (previously available for SS7 networks only), the addition of the **iplimi** application enables the IP⁷ Secure Gateway to use the ANSI/ITU Gateway feature for IP networks as well. Using these features enables IP⁷ Secure Gateway to act as an interface between nodes that support ANSI, ITU-I, and ITU-N protocols. Figure 5-1 shows an example of a complex network that includes all these types of nodes. Table 5-2 provides more detail about the nodes, network types, and point codes used in this example.

The following SS7 protocol constraints determine how the network must be configured:

- A linkset is a group of links that terminate into the same adjacent point code. All links in the linkset can transport compatible MSU formats. The network type of the linkset is the same as the network type of the adjacent point code assigned to the linkset.
- When nodes in different networks need to communicate, each node must have either a true point code or an alias point code for each of the network types. For example, if Node 1 (in an ANSI network) needs to communicate to Node 7 (in an ITU-N network), Node 1 must have an ANSI true point code and an ITU-N alias point code, while Node 7 must have an ITU-N true point code and an ANSI alias point code.
- STPs are usually deployed as mated pairs. The links connecting the STP to its mate are C links. Each STP must have a C linkset for each network type that the STP connects to. Therefore, in Figure 5-1, Nodes 5 and 6 are

connected with three linksets, one each for ANSI traffic, ITU-I traffic, and ITU-N traffic.

- To perform routing, the IP⁷ Secure Gateway must convert the routing labels in MSUs. To perform this conversion, every destination point code (DPC), originating point code (OPC), and concerned point code must be defined in the routing table. Even if the IP⁷ Secure Gateway does not route MSUs to these nodes, they must be provisioned in the routing table to provision the alias point codes required in the conversion process.

Figure 5-1. Complex Network with ANSI, ITU-I, and ITU-N Nodes

Table 5-2. Nodes and Point Codes in Complex Network Example

Node	Node Type	Network Types Supported	True Point Codes¹	Alias Point Codes²
1	SSP	ANSI	A1	N1, I1
2	SSP	ANSI	A2	I2
3	SSP	ANSI	A3	N3, I3
4	SSP	ANSI	A4	N4
5	STP (with IP ⁷)	ANSI, ITU-N, ITU-I	A5, N5, I5	
6	STP (with IP ⁷)	ANSI, ITU-N, ITU-I	A6, N6, I6	
7	STP (with IP ⁷)	ITU-N, ITU-I	N7, I7	A7
8	STP (with IP ⁷)	ITU-N, ITU-I	N8, I8	A8
9	STP (with IP ⁷)	ITU-N, ITU-I	N9, I9	A9
10	STP (with IP ⁷)	ITU-N, ITU-I	N10, I10	A10
11	SSP	ITU-N	N11	I11, A11
12	SSP	ITU-I	I12	N12, A12
13	SSP	ITU-I	I13	N13, A13
14	SSP	ITU-N	N14	I14, A14
15	SSP	ITU-I	I15	N15, A15
16	SSP	ITU-I	I16	N16, A16

Notes:

1. A true point code (TPC) defines a destination in the IP⁷ Secure Gateway's destination point code table. A TPC is a unique identifier of a node in a network. Each Signal Transfer Point (STP) must have a TPC for each network type that the STP connects to. Each Service Switching Point (SSP) connects to only one type of network, so it has only one TPC.
2. An alias point code is used to allow nodes in other networks to send traffic to and from an STP or SSP when the STP or SSP does not have a TPC for the same network type.

The many configured links and point codes in the complex network shown in Figure 5-1 allows most nodes to communicate with other nodes. However, note that Node 2 cannot communicate with Node 13 or Node 16 because Nodes 13 and 16 do not have ANSI alias point codes.

Routing and Conversion Within a Single Network Type

The following steps demonstrate how an IP⁷ Secure Gateway routes and converts MSUs that one ITU-N node sends to another ITU-N node. For example, assume that Node 11 in Figure 5-1 sends an MSU to Node 14. The MSU is routed from Node 11 to Node 7 to Node 5 to Node 9 to Node 14. The following steps describe the actions performed at Node 5 (an IP⁷ Secure Gateway):

1. An ITU-N formatted MSU (which has a network identifier (NI)=10b and a 14-bit destination point code / originating point code) is received on an **iplimi** card (for this example at location 1103).
2. MSU discrimination is performed with the following substeps:
 - a. Compare the received network identifier (NI) to the list of valid NIs. (Each configured linkset for a receiving link has a defined list of valid NIs.) If the comparison fails, the MSU is discarded and an STP measurement is logged. In this example, the received NI (10b) is valid for an **iplimi** card.
 - b. Extract the NI and destination point code (DPC) from the received MSU.
 - c. Determine whether the destination of the received MSU is this STP. If not (as is the case in this example), the MSU is passed to the STP's routing function.
3. The routing function selects which outgoing link to use by searching a routing table for an entry for the DPC (N14 in this example). The routing table identifies another **iplimi** card (for this example at location 1107) to be used for the outgoing link.
4. Determine whether MSU conversion is required (required when the source network type is not the same as the destination network type). In this example, both Node 11 and Node 14 are ITU-N nodes, so conversion is not required.
5. Forward the MSU across the Interprocessor Message Transport (IMT) bus from location 1103 to location 1107, where the MSU is transmitted out the link towards Node 14.

Routing and Conversion Between Different Network Types

The routing and conversion steps performed by an IP⁷ Secure Gateway when an ITU-N node sends an MSU to an ITU-I node are the same as the steps shown in “*Routing and Conversion Within a Single Network Type*” on page 5-16, except for the conversion step.

For example, assume that Node 11 in Figure 5-1 sends an MSU to Node 16. The MSU is routed from Node 11 to Node 7 to Node 5 to Node 9 to Node 16. The following steps describe the actions performed at Node 5 (an IP⁷ Secure Gateway):

1. Perform steps 1 through 3 as shown in “*Routing and Conversion Within a Single Network Type*” on page 5-16. In this example, assume that the routing function determines that the outgoing link is configured on the DCM card at location 1203.
2. Determine whether MSU conversion is required (required when the source network type is not the same as the destination network type). In this example, Node 11 is an ITU-N node and Node 16 is an ITU-I node, so conversion is required. Conversion consists of two phases: Message Transfer Part (MTP) conversion and user part conversion.
3. Perform MTP conversion (also known as routing label conversion). The following parts of the MSU can be affected by MTP conversion:
 - Length indicator—for ITU-N to ITU-I conversion, the length of the MSU does not change
 - Service Information Octet (SIO), Priority—for conversion to ITU, the priority is set to 0. For conversion to ANSI, the priority is set to a default of 0, which can later be changed based on user part conversion.
 - Service Information Octet (SIO), Network Indicator—the NI bits are set to the NI value for the destination node. In this example, NI is set to 00b.
 - Routing Label, Destination Point Code (DPC)—the DPC is replaced with the destination’s true point code. In this example, N16 is replaced by I16.
 - Routing Label, Originating Point Code (OPC)—the OPC is replaced with the appropriate network type’s alias point code for the originating node. In this example, N11 is replaced with I11.
 - Routing Label, Signaling Link Selector (SLS)—no SLS conversion is required between ITU-I and ITU-N nodes. However, if one of the nodes were an ANSI node, conversion would be required between a 5-bit or 8-bit SLS for ANSI nodes and a 4-bit SLS for ITU nodes.
4. Perform user part conversion, if necessary. Currently, only SCCP traffic and network management messages have additional conversion. All other user parts have their data passed through unchanged.
5. Forward the MSU across the Interprocessor Message Transport (IMT) bus from location 1103 to location 1203, where the MSU is transmitted out the link towards Node 16.

Enhancements to Existing Commands for the **iplimi** Application

For current information about formats for the commands described in this section, refer to the *Commands Manual*.

The following commands have been enhanced to support the **iplimi** feature.

ent-card

A new parameter value, **iplimi**, has been added to the **appl** parameter for the **ent-card** command. The IPLIMI GPL is the application software for TCP/IP point-to-point connectivity for ITU-National and ITU-International point codes. The system allows a maximum of 41 cards to be assigned for **iplim** and **iplimi** applications.

rtrv-card

The output of the **rtrv-card** command has been enhanced to display information about any entered DCM cards as shown in the following output for cards at locations 1205, 1207, and 1301:

Debug Commands

disp-bp, disp-mem, dlt-bp, ent-bp, ent-trace, set-mem

A new parameter value, **iplimi**, has been added to the **card** parameter. The new values represent cards running the IPLIMI application.

rept-meas

This command can accept another value, **iplimi**, for the **:appl=** parameter.

When the command is input with **:appl=iplimi**, the measurement reports for all **iplimi** cards are output. These measurement reports are applicable only when used with the STPLAN feature.

act-gpl, chg-gpl, rept-stat-gpl, and rtrv-gpl

A new parameter value, **iplimi**, has been added to the **appl** parameter for the **act-gpl**, **chg-gpl**, **rept-stat-gpl**, and **rtrv-gpl** commands. This new value represents the IPLIMI generic program load (GPL) identifier to be uploaded from the system removable cartridge to the Gateway STP or reported on.

init-card and rept-stat-card

A new parameter values, **iplimi**, has been added to the **appl** parameter for the **init-card** command. This new value represents the IPLIMI generic program load (GPL) residing on the card.

The output of the **rept-stat-card** command has been enhanced to display information about the new IPLIMI GPL.

rept-stat-sys

This command includes a new row in the output. The new row is entitled IPLIMI CARD; it summarizes the status of **iplimi** cards. In addition, **iplimi** cards are counted in the LIM CARD summary row; therefore, **iplimi** cards are double counted.

Also, the output in the SLK summary row includes any **iplimi** links that are defined.

Portability Check for Mobile Originated SMS (Release 29.1)

Description

In GSM networks, when a mobile subscriber sends a short message, or Mobile Originated Short Message Service message (MO SMS), using his or her handset, the message is first deposited in a Short Message Service Center (SMSC). This SMSC is then responsible for determining where the intended recipient, who is also a mobile subscriber, is located. The SMSC accomplishes this by querying the Home Location Register (HLR) of the recipient to determine which Mobile Switching Center (MSC) the subscriber is currently on. Once the location is determined, the SMSC sends the SMS to the recipient.

In a portability environment, this could lead to problems. The SMSC address to which a message is routed is programmed into the GSM mobile handset. When a subscriber ports to another network, the handset is reprogrammed with the SMSC address for the new network. However, the subscriber could then change this address back to the address from his old network. This would cause SMS to be incorrectly sent to the subscriber's old network SMSC, rather than to the new network SMSC. Since the old network would not have billing records for the ported-out subscriber, the subscriber essentially would receive free SMS service.

The Portability Check for Mobile Originated SMS (MNP SMS) feature is designed to prevent such a possibility from occurring. With this feature, the Eagle filters incoming messages based on MAP Operation Code. If the message is a MO Forward Short Message (MO FSM), the originating subscriber's Mobile Subscriber Integrated Services Digital Network (MSISDN) number (i.e. phone number) is used to search the G-Port Mobile Number Portability database.

If a match is found, indicating the subscriber has been ported-out, the Eagle uses the destination SMSC address obtained from the SCCP CdPA to search a list of "home network" SMSC addresses. If a match is found, indicating the ported-out subscriber is attempting to send a short message using the old network's SMSC, the message is discarded. An error message is then generated and returned to the originating MSC.

When the MNP SMS feature is on, the Eagle performs the following functions:

1. Eagle receives a UDT message.
2. Checks if the service selector matches G-Port. If so, continues to Step 3; else goes to step 16.
3. Checks if the CdPA SSN matches one of the SSNs provisioned with object type as MSC. If so, continues with Step 4. If the CdPA SSN matches one of the SSNs provisioned with object type as HLR, then proceeds to step 17; else goes to Step 11.
4. Checks if the message is a MO Forward Short Message (MO FSM). If so, it continues to step 5; else go to step 11.
5. Checks if PPSMS feature is ON. If so, goes to step 12; else continues with Step 6.
6. Checks if MNPSMS feature is ON. If so, continues to step 7; else goes to step 11.
7. The originating subscriber's Mobile Subscriber Integrated Services Digital Network (MSISDN) number (i.e. phone number) is used to search the G-Port Mobile Number Portability database. If MSISDN Number is found in the PDB/DN table, continue to step 8; else goes to step 11.
8. Checks the portability type of the subscriber. If it matches "Ported-out / Not Known / FNPTFN" then continues to step 9. If portability type is "Prepaid-1 / Prepaid-2," goes to step 11.
9. Uses SCCP CdPA Address to search the list of "home network" SMSC addresses. If a match is found, indicating the ported-out subscriber is fraudulently attempting to send SMS using the old network's SMSC, then continues to step 10; else goes to step 11.
10. The message will be discarded, UIM #1129 is printed, and an error message generated and returned to the originating MSC. Go to Step 19.
11. It's a fall-through case. Continue with Normal GTT processing; go to step 19.
12. Checks if message is from one of the IN Platforms (PPSMS Servers). If so, goes to step 18; else continues with step 13.
13. The originating subscriber's Mobile Subscriber Integrated Services Digital Network (MSISDN) number (i.e. phone number) is used to search the G-Port Mobile Number Portability database. If MSISDN Number is found in the PDB/DN table, continue to step 14; else go to step 11.

- 14.** Checks the portability type of the subscriber. If it matches "Prepaid1 / Prepaid2," go to step 18; else continue with step 15.
- 15.** If the subscriber portability type is "Ported out / FNPTFN / Not Known" and MNP SMS feature is also ON, goes to step 9; else goes to step 11.
- 16.** Exits from MNP SMS feature functionality and continues with existing processing for other services or GTT.
- 17.** Exits from MNP SMS feature functionality and continues with existing processing for GPORT.
- 18.** Exits from MNP SMS feature functionality and continues with existing processing for PPSMS.
- 19.** Exits MNP SMS feature functionality.

Figure 5-2 illustrates these functions.

Figure 5-2. Flowchart of MNP SMS Functions

Hardware Requirements

No new hardware is needed to support this feature.

New Commands

The following commands have been created to support this feature. For more information, see the *Commands Manual*.

ent-home-smsc

Use this command to enter HOME SMSC specific addresses into the HOME SMSCADDR table in the database. These addresses are used to identify Short Message Service Centers.

dlt-home-smcs

Use this command to delete HOME SMSC specific addresses from the HOME SMSCADDR table in the database.

rtrv-home-smcs

Use this command to retrieve HOME SMSC specific addresses from the HOME SMSCADDR table.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

enable-ctrl-feat

For this feature, the **enable-ctrl-feat** command accepts a new Feature Access Key.

This command is used to enable Controlled Features the customer has purchased on a permanent basis or may be used to temporarily enable a feature for a thirty (30) day trial period. Features may be temporarily enabled by using a temporary Feature Access Key (fak) or may be permanently enabled by using a permanent Feature Access Key.

This command accepts a Controlled Feature's Part Number (partnum) and a Feature Access Key. The MNP SMS Part Number and Feature Access Key numbers will be accepted as valid input for these parameters.

NOTE: The MNP SMS feature requires the G-Port MNP feature as a prerequisite.

chg-ctrl-feat

This command is used to activate (turn on) Controlled Features or to clear the Critical alarm for a Controlled Feature whose temporary key has expired. This command accepts a Controlled Feature's Part Number (partnum). The MNP SMS Part Number will be accepted as valid input for this parameter. No changes to the syntax of this command are required.

rtrv-ctrl-feat

This command is used to display all Controlled Features the customer has purchased and enabled to date. It has been enhanced to display the status of the MNP SMS feature.

ent-gsm-ssn

Use this command to enter GSM-specific subsystem numbers, currently used to identify HLRs and MSCs, in the database. This command has been modified to check if either the Prepaid Short Message Service feature or Portability Check for Mobile Originated SMS feature is activated, before allowing the object to be designated as MSC.

Alarms and Error Codes**Alarms**

No new alarms have been created for this feature.

If the ported-out subscriber is fraudulently attempting to send SMS using the old network's SMSC, UIM #1129 is printed:

```
1129      PORTED SUBS SMSC MATCHES HOME SMSC ADDR
```

Prepaid SMS Intercept - Phase 1 (Release 28.1)

Mobile operators offering prepaid short message service (SMS) need an efficient way to perform credit checks on the subscriber sending the message, prior to allowing the message to be delivered. Intelligent network (IN) databases are generally used to perform the actual credit check. However, these databases can become overloaded if messages are sent to them for evaluation unnecessarily. An example of such a case is when all short messages, including those from or to contract (postpaid) subscribers, are sent to the IN platform for evaluation. The messages from contract subscribers do not need a credit check; thus this is additional traffic the IN platform must process unnecessarily.

Therefore, additional filtering and screening is needed in the SS7 network to provide a finer granularity in determining which messages actually need to be sent to the IN platform, and which may simply be routed to the SMSC.

The Prepaid SMS Intercept - Phase 1 feature screens incoming messages from MSC based on MAP operation code. If the op-code indicates the message is a MAP_MO_FORWARD_SHORT_MESSAGE (MO_FSM), the sender's MSISDN is retrieved and a database lookup performed. If the MSISDN belongs to a contract subscriber, the message will be routed to the SMSC. If the MSISDN belongs to a prepaid subscriber, the message will be diverted to a third-party IN platform for a credit check before allowing the message to be delivered to the SMSC.

The MAP_FORWARD_SHORT_MESSAGE, referred to as FSM in this document, is a message used to carry a text message (i.e. the "short message") being transmitted from the mobile handset of one subscriber to the mobile handset of another subscriber. In practice, the short message is delivered first to the Short Message Service Center (SMSC) of the sending subscriber. The SMSC is then responsible for sending the short message to the intended recipient. In MAP versions 1 and 2, the FSM message is used for both legs of the delivery. In MAP version 3, a MO_FSM (mobile originated) message is used to deliver the message from the sender to the SMSC, and a MT_FSM (mobile terminated) message is used to deliver the message from the SMSC to the recipient.

Refer to the *Feature Manual - G-Port* for current details on this feature.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

chg-ctrl-feat

Use this command to activate or deactivate the On / Off features that have been purchased and enabled. The **:partnum** parameter has been enhanced to recognize the feature key for this feature.

rtrv-ctrl-feat

Used to display all Controlled Features the customer has purchased and enabled to date. The output of this command has been enhanced to recognize the feature key for this feature.

chg-gsmopts

Use this command to enter GSM-specific system options in the database. This command has been enhanced with the new parameters.

rtrv-gsmopts

Used to retrieve all GSM-specific system options from the database. The output for this command has been enhanced to show the value of the new parameters.

ent-gsm-ssn

Used to enter GSM-specific subsystem numbers; currently used to identify HLRs and MSCs, in the database. The new range value **:obj=msc** has been added to this command.

rtrv-gsm-ssn

Used to retrieve the object associated with the GSM-specific subsystem number from the database. The MSC object has been added to this command's output.

Prevention of Congestion from Rerouted Traffic (Release 21.0)

When the status of the route is changed to allowed (when the route was restricted) or restricted (when the route was prohibited), a burst of rerouted traffic can occur on that route, thus congesting the route. To help keep this from happening, the Eagle in Release 21.0 can control the rate that it broadcasts TFR and TFA messages to adjacent signaling points. This can regulate the amount of traffic the adjacent signaling points can send to the Eagle when the route becomes allowed or restricted.

The rate that the Eagle sends the TFR and TFA messages, (the pacing rate), can be configured with the **tfatfrpr** parameter of the **chg-stpopts** command. The value of the **tfatfrpr** parameter is from 0 to 1 second and can be set in 0.1 second intervals. The default value for the **tfatfrpr** parameter is 1 second. A value of 0 for the **tfatfrpr** parameter indicates that the pacing should stop. The pacing of TFR/TCR is stopped and all remaining TFR/TCR are broadcast at once if the current alternate route used to route traffic to the affected point code is in danger of congestion.

The TFA/TCA and TFR/TCR for each affected point code are sent in groups of 20%. For each time period defined by the pacing rate, 20% of the messages that are to be sent to the adjacent signaling points are broadcast to those signaling points.

This feature is applicable only for ANSI signaling links. The pacing is not done towards ITU networks.

If the destination becomes inaccessible or accessible before all of the TFR/TCR messages are broadcast, then the remaining TFR/TCR messages are not sent.

TFA/TFC messages for multiple affected destinations are sent in parallel.

The pacing of TFR/TCR messages is stopped and all remaining TFR/TCR messages are broadcast at once if the current alternate route used to route traffic to the affected point code is in danger of congestion.

The broadcast of TFA/TFR messages sent about X.25 pseudo point codes is controlled by this feature.

Prevention of Link Oscillation (Release 21.0)

A variety of network problems can cause signaling links to oscillate in and out of service causing frequent changeovers and changebacks and excessive network management message generation. If many links simultaneously oscillate, congestion can occur. When the Eagle begins restoring an out of service signaling link, the Eagle starts the level 3 T32. If the signaling link fails to return to service before the level 3 T32 timer expires, the Eagle does not attempt to bring the signaling link into service until the level 3 T32 timer expires. When the level 3 T32 timer expires, the Eagle attempts to restore the signaling link into service.

The value of the level 3 T32 timer is set with the **chg-13t** command. The range of values for the level 3 T32 timer is from 60 seconds to 120 seconds. The default value for the level 3 T32 timer is 60 seconds.

The link alignment procedures are not delayed under the following conditions:

1. When a signaling link is manually taken out of service using the **dact-slk** command, the level 3 T32 timer is stopped (if it is running).
2. When the signaling link is brought back into service using the **act-slk** command.
3. When a new signaling link is first aligned.

The level 3 T32 timer can only be assigned to ANSI SS7 linksets and signaling links.

Preventive Cyclic Retransmission (PCR) (Release 20.0)

Preventive cyclic retransmission is one of the two forms of error correction for the SS7 protocol. Basic error correction is the other. Preventive cyclic retransmission is a forward error correction scheme that uses positive acknowledgments to support the forward error correction. Negative acknowledgments are not used for retransmission. PCR is used when the one-way delay on a link is greater than or equal to 15 milliseconds. A typical example is a satellite link.

Each message signal unit transmitted is retained at the transmitting end of the signaling link. Copies of that MSU are transmitted to the receiving end of the signaling link until the transmitting end of the signaling link receives a positive acknowledgment from the receiving end that it has received a good MSU. When the transmitting end of the signaling link has received the positive acknowledgment, the MSU it has retained is discarded.

The PCR feature should be used in the following circumstances:

- When the one-way propagation delay on a signaling link is greater than or equal to 15 milliseconds.

- When the signaling links are established via satellite.

The PCR feature has two modes of operation, normal retransmission and forced retransmission.

Normal Retransmission

The following rules apply to normal PCR:

1. If new MSUs are available, the new signal units are sent.
2. If new MSUs are available and retransmission is occurring, retransmission stops, and the new signal units are sent.
3. If no new MSUs are available to be transmitted, MSUs in the retransmission buffer are retransmitted cyclically.

For this example, assume the following:

1. There are only 3 new MSUs to be transmitted from STP A to STP B.
2. The transmission buffer is empty.
3. Both STPs are using PCR for error correction.

Figure 5-3 illustrates how normal PCR works.

Figure 5-3. Example of Normal Retransmission with PCR

MSUs 1 through 3 are sent from STP A to STP B and are copied to the retransmission buffer. During transmission, packets 1 and 3 are corrupted before reaching the remote STP B.

STP A knows to retransmit the MSUs in the retransmission buffer since no new MSUs are available. Figure 5-3 shows several more copies of packets 1 through 3 are retransmitted.

On the receiving side, STP B receives the corrupt MSUs and discards them. Since PCR is used, STP B does not send a negative acknowledgment to STP A. STP B knows that more copies of the packets are arriving.

Under normal conditions, when no message signal units are to be transmitted or cyclically retransmitted, FISUs are sent. In some particular cases, LSSUs, continuous FISUs or flags may be sent.

Example of Basic Error Correction vs. PCR

Figure 5-4 illustrates how PCR outperforms basic error correction when a link experiences a long transmission delay. Assume the delay between the Eagle and the SSP is 1 second for both basic error correction and PCR. The MSU size is 50 octets, and the transmission speed is 64 Kbps.

Examine the Basic Error Correction side of the figure. An MSU is sent from the Eagle to the SSP.

During transmission, the MSU is corrupted. The Eagle is notified two seconds later that it needs to retransmit the signal unit. Another second later, the valid MSU is received by the SSP. The total amount of time is 3 seconds.

Examine the PCR side of Figure 5-4. An MSU is sent from the Eagle to the SSP. During transmission, the MSU is corrupted. Since PCR error correction is used, a negative acknowledgment is not sent. The receiving end knows that another copy is coming. The corrupted MSU arrives at the SSP in 1 second, and the valid MSU arrives 0.00625 seconds later. The total time is 1.00625 seconds. This formula is used to calculate the time interval between the first MSU's arrival and the second MSU's arrival.

$$\frac{8 \text{ bits}}{1 \text{ octet}} \times \frac{1 \text{ second}}{64000 \text{ bits}} \times 50 \text{ octets} = .00625 \text{ seconds to generate another MSU}$$

Figure 5-4. Basic Error Correction vs. PCR

Forced Retransmission

To complement preventive cyclic retransmission, the message signal units available for retransmission are retransmitted with priority when a threshold of outstanding MSUs or a threshold of the number of message signal unit octets available for retransmission has been reached. This is forced retransmission.

With PCR, two thresholds are continuously monitored. These thresholds are the number of message signal units available for retransmission, N_1 , and the number of message signal unit octets available for retransmission, N_2 .

If the N_1 or N_2 value reaches its threshold, no new message signal units or fill-in signal units are sent, and forced retransmission begins. MSUs in the retransmission buffer are sent in the same order that they were originally transmitted. Retransmission continues until all of MSUs have been retransmitted.

NOTE: All MSUs are sent even if acknowledgments are received during forced retransmission. After all MSUs have been retransmitted, acknowledgments, if any, are processed, and the N_1 and N_2 thresholds are re-evaluated.

If both the N_1 and N_2 values are below their respective thresholds, the normal PCR procedure can be resumed.

However, if the N_1 or N_2 value is still at its threshold, forced retransmission continues.

Example of Forced Retransmission

The following example shows how forced retransmission occurs. For this example, 5 MSUs are transmitted. Assume the N_1 threshold is 3, and N_2 is 3800 octets. The average MSU size is 50 octets.

Figure 5-5 shows that the Eagle begins transmitting MSUs to the SSP and copying MSUs to the retransmission buffer.

Figure 5-5. Example of Forced Retransmission

At this point, the threshold for unacknowledged MSUs in the retransmission buffer, N_1 has been reached.

Figure 5-6 shows forced retransmission beginning and continuing until all MSUs in the retransmission buffer have been retransmitted.

Figure 5-6. Example of Forced Retransmission – All MSUs Retrmitted

An acknowledgment for MSUs 1 and 2 comes in before 2 is retransmitted. This does not affect the retransmission of MSU 2. Forced retransmission dictates that all signal units in the retransmission buffer are retransmitted.

After all MSUs have been retransmitted, N_1 and N_2 are re-evaluated. In this case, acknowledgments for MSUs 1 and 2 have been received; thus, N_1 has been reduced and normal PCR resumes. Figure 5-7 shows the new MSUs in the transmission buffer being sent.

Figure 5-7. Example of Forced Retransmission – New MSUs Sent

Derivations for N_1 and N_2

The user is responsible for setting the values for N_1 and N_2 . The following rules serve as a guide for determining these thresholds.

- N_1 is limited by the maximum numbering capacity of the forward sequence number range which dictates that not more than 127 MSUs can be available for retransmission on 56 Kbps or 64 Kbps signaling links.
- N_2 , in the absence of errors, is limited by the signaling link loop delay, T_L . The value of N_2 must ensure that not more than $T_L / T_{eb} + 1$ MSU octets are available for retransmission.
- T_L is the signaling link loop delay, that is, the time between the sending of a message signal unit and the reception of the acknowledgment for this message signal unit in undisturbed operation (see Figure 5-8).

Figure 5-8. Determining Value of Signaling Link Loop Delay Timer (T_L)

Assume that $T_L = 480$ milliseconds or 0.480 seconds. This value is based on a satellite located 22,300 miles above the earth and the signal propagating at a rate of 186,000 miles per second. A minimum of 120 milliseconds are required for a signal to reach a satellite from earth.

- T_{eb} is the emission time of one octet
- Default value for $N_1 = 76$ outstanding MSUS
- Default value for $N_2 = 3800$ octets

Table 5-3. Limitations for Various Line Speeds

Channel Speed	$T_{eb} = 1 \text{ octet} /$ channel speed	$(T_L / T_{eb}) + 1$ rounded to nearest hundred, $T_L = .480 \text{ seconds}$
64 Kbps	$1.25 \times 10^{-4} \text{ seconds}$	~3800 octets
56 Kbps	$1.43 \times 10^{-4} \text{ seconds}$	~3400 octets
38.4 Kbps	$2.08 \times 10^{-4} \text{ seconds}$	~2300 octets
19.2 Kbps	$4.17 \times 10^{-4} \text{ seconds}$	~1200 octets
9.6 Kbps	$8.33 \times 10^{-4} \text{ seconds}$	~600 octets
4.8 Kbps	$1.67 \times 10^{-3} \text{ seconds}$	~300 octets
2.4 Kbps	$3.33 \times 10^{-3} \text{ seconds}$	~100 octets

The calculations for the default values assume an average MSU of 50 octets.

Default N_1 calculation:

$N_1 = 3800 \text{ octets from table above} / 50 \text{ octets from average MSU} = 76$
outstanding MSUs

Default N_2 calculation:

$N_2 = T_L / T_{eb} + 1 = 3800 \text{ octets from table above for 64Kbps signaling link.}$

Priority Processing of Network Management Messages (Release 21.0)

Some of the new protocol features like cluster routing and diversity management have increased the processing complexity of network management functions. Under large failure conditions, it is possible that too many network management functions need to be performed, causing an application processor overload. In the releases prior to release 21.0, if such a condition was encountered, the Eagle discarded the network management messages regardless of what kind of network management message they were. This method of handling network management messages may have an impact on the network's recovering capability under large scale failure conditions when several critical network management functions must be performed.

This feature provides the capability to prioritize the network management functions to make sure that critical network management functions receive high processing priority under such overload conditions.

During normal operation, the network management functions are processed with equal priority, but the Eagle closely monitors for excessive unexpected events which may result in an application processor overload. The prioritizing of network management functions is triggered when the application processor overload is experienced on any LIM.

For this feature, the Eagle collects one measurement, Network Management Messages Discarded due to Network Management Overloading. This measurement collects the number of network management messages discarded when the network management processor overload condition has been reached. Measurements are collected for discarded network management messages at each priority level. This measurement is collected for each signaling link in the system.

The Eagle generates the following UAMs:

- UAMs*
- UAM 304 - Network Management Task Priority Discard Threshold Reached (REPT-NMTSK-DSCD) — a minor alarm generated when a network management message is discarded because the application processor of a LIM is overloaded.
 - UAM 305 - Recovery from Network Management Task Priority Discard Processing (RECVY-NMTSK-DSCD) — generated when the network management overload condition is cleared.

This feature is applicable only for the ANSI network. Network Management events triggered due to change in status of ITU network elements (links, routes, linksets, destination) are processed on first come first served basis

Prohibit Removing the Last Route to a Destination if that Destination is being Referenced by Mated Applications or Concerned Signaling Point Code Groups (Release 22.0)

In previous releases when a route was being removed from the database, the Eagle checked to make sure other routes to the DPC were defined if the DPC of the route was being used by a global title translation. When this condition was detected, the Eagle issued a message warning that the condition was present, but allowed the route to be removed from the database.

In release 22.0, a new rule has been added to the Eagle's `dlt-rte` command and the SEAS DLT-RTE command function that does not allow the specified route to be removed from the database if this condition is present. If the user attempts to remove a route under this condition, the command is rejected. On an Eagle terminal, this error message is displayed.

```
2356 Cmd Rej: Destination referenced by GTT cannot be delete
```

Prohibit the Assigning of a Linkset with Linkset Types A or E to a Cluster Route (Release 22.0)

In previous releases, a user could assign a cluster route to a linkset with a linkset type of either A, B, C, D, or E from both the Eagle terminal and the SEAS interface. In release 22.0, the only linkset types that can be assigned to a cluster route are B, C, or D. The Eagle's **ent-rte** command and SEAS ASGN-RTE command function have been changed to allow only these linkset types to be assigned to cluster routes. If the user attempts to assign a cluster route to a linkset with a linkset type of either A or E, the command is rejected. On an Eagle terminal, the following error message is displayed.

```
E2349 Cmd Rej: Link Set Type invalid for Cluster Destination
```

Provisioning Range for Gateway Screening (Release 22.0)

The values for certain parameters used to configure gateway screening can be entered as a range of values. Allowing a range of values for these parameters reduces the number of entries in the gateway screening tables required to support a particular configuration. The parameters whose values can be entered as a range of values are:

- Parameters*
- **ni** - the network identifier for an ANSI point code
 - **nc** - the network cluster for an ANSI point code
 - **ncm** - the network cluster member for an ANSI point code
 - **pri** - the message priority in the SIO field of an MSU
 - **h0** - the H0 heading code in the SIF field of an MSU
 - **h1** - the H1 heading code in the SIF field of an MSU
 - **type** - the translation type in the called party address field of an MSU

A range of values for these parameters can be specified for gateway screening commands entered on an Eagle terminal or on the SEAS interface.

The range of values for a parameter is specified by the two values defining the range separated by two ampersands, &&. The value to the left of the ampersands must be less than the value to the right of the ampersands, for example, **:ni=002&&100**. In this example, the value of the **ni** parameter is all values from 002 to 100, including the values 002 and 100.

A range of values for an ANSI point code parameter can be specified with wildcards (*) or single values for other point code parameters. Table 5-4 shows the valid combinations of these parameter values.

Table 5-4. Valid Value Combinations for ANSI Point Code Parameters

NI	NC	NCM
Single Value	Single Value	Single Value
Single Value	Single Value	Range of Values
Single Value	Single Value	Wildcard
Single Value	Range of Values	Wildcard
Single Value	Wildcard	Wildcard
Range of Values	Wildcard	Wildcard
Wildcard	Wildcard	Wildcard

A range of values for the **h0** and **h1** heading codes can be specified with wildcards (*) or single values for other heading code parameter. Table 5-5 shows the valid combinations of these parameter values.

Table 5-5. Valid Value Combinations for **h0** and **h1** Parameters

H0	H1
Single Value	Single Value
Single Value	Range of Values
Single Value	Wildcard
Range of Values	Wildcard
Wildcard	Wildcard

When changing or removing an existing gateway screening entry, the ANSI point code values, priority values, **h0** and **h1** heading code values, or translation type values specified with the command must match the values configured in the database for the specified screening reference. If the specified parameter value in a specific screening reference is part of a range of values for that parameter already configured for that screening reference, the command is rejected.

For example, the database contains a gateway screening entry for the range of allowed OPCs 010-010-010 to 010-010-100 in Allowed OPC screening reference opc1. If an attempt is made to remove or change Allowed OPC screening reference opc1 and the ANSI point code 010-010-025 is specified, the command is rejected because point code 010-010-025 is a part of the point code range configured in the database. To remove or change Allowed OPC screening reference opc1, these point code parameters must be specified with the command, **ni=010, nc=010, ncm=010&&100**.

If the ANSI point code, priority value, **h0** and **h1** heading code values, or translation type values specified with an enter command is within the range of values already configured for the specified screening reference, the command is rejected. For example, the **ent-scr-opc** command is entered with the point code 010-010-050 assigned to screening reference opc1. If the database contains the range of point codes 010-010-010 to 010-010-100, specified as **ni=010, nc=010, ncm=010&&100**, the command is rejected. If the database contains an entry for all point codes with the network identifier of 010 and network cluster of 010, **ni=010, nc=010, ncm=***, the command is rejected.

A range of values can be specified when displaying gateway screening entries. The range of values does not have to match the values configured in the database. The range of values specified with a retrieve command is used to limit the number of entries to search for. There are some restrictions for using ANSI point code values with retrieve commands. Table 5-6 shows the valid combinations of the ANSI point code parameters.

Table 5-6. Valid Parameter Combinations for ANSI Point Code Parameters

NI	NC	NCM
Single value	Single value	Single value, a range of values, a wildcard, or NCM value not specified
Single value	A range of values, a wildcard, or the NC value is not specified	the NCM value is not specified
A range of NI values, a wildcard, or the NI value is not specified	the NC value is not specified	the NCM value is not specified

Quality of Service Enhancements (IP⁷ Release 3.0)

It is becoming necessary for networks to employ Quality of Service (QoS) techniques. QoS is a concept that allows elements of data transmission to be measured, improved, and, to some extent, predicted. As networks evolve, consideration must be given to guarantee acceptable levels of bandwidth, jitter, and latency for IP communication protocols, such as VoIP. The QoS enhancements added in release 3.0 provide the solution for these and other network communications parameters.

Quality of Service enhancements provide the ability to set the Type of Service (TOS) field in the IP packet header for QoS routing. This feature does not implement quality of service on its own. It does, however, provides the customer with the ability to set socket options, including the TOS field bits within the outgoing packet. Tekelec does not specify how the TOS bits should be set or interpreted. It is solely up to the customer to implement QoS using scheme best suited for them, by setting the TOS field bits.

TOS

The 8-bit TOS socket option is used to control the quality of service for network traffic. The intent of QoS is to route packets differently according to the TOS value. TOS is set on outgoing packets. The following sections describe the TOS bit field and give an example of a QoS model.

TOS Bit Field

Figure 5-10 describes the TOS bit field structure. The 8-bit TOS field resides in the IP header (Figure 5-9) and is used to identify different priorities/levels/interactions of service used by network routers, such as low-delay service. The TOS field within the outgoing datagram is set from values in the application socket's protocol control block (PCB). The TOS value defaults to 0 (normal service), since the PCB is initialized to zero. The TOS bits may be set to other values and read using the *setsockopt* and *getsockopt* system calls, which provide access to the TOS byte within the PCB.

Figure 5-9. IP Header Fields

4-bit version	4-bit header	8-bit TOS	16-bit total length (in bytes)	
16-bit authentication			3-bit flags	13-bit fragment offset
8-bit TTL		8-bit protocol	16-bit header checksum	
32-bit source IP address				
32-bit destination IP address				

Figure 5-10. TOS Field

7	6	5	4	3	2	1	0
		Reliability	Throughput	Delay	IP precedence		

DS Bit Field

The first network QoS decoding scheme used the TOS bit field description (Figure 5-10). Another QoS decoding scheme is the IETF Differentiated Services (DiffServ) model. DiffServ renamed the TOS field to the DS field. Figure 5-11 describes the DS bit field structure. DS bits 0-5 are reserved for code points (DSCP). The upper two bits (CU) are currently unused. DiffServ code points are broken down into three pools, each pool representing the number of bits used within the DSCP field. Code pool 1, which provides 32 code points, is available for general use, while pools 2 and 3, providing 16 code points, are designated for experimental use only.

Figure 5-11. DS Field

7	6	5	4	3	2	1	0
CU		DSCP					

Figure 5-12. DiffServ Code Point Pool Table

Pool	Code Point Space	Use
1	Xxxxx0	Available
2	xxxx11	Experimental
3	xxxx01	Experimental

This feature allows the customer to modify the full 8-bit TOS socket option to control QoS. The customer is free to implement any QoS model that uses the 8-bit structure within the IP header's TOS/DS bit fields.

Nagle's Algorithm

Nagle's algorithm is currently disabled for all IP⁷ Secure Gateway sockets. So every message is transmitted via Ethernet as soon as possible. This means there is a one-TCP-packet-per-MSU relationship. This minimizes message latency, which is very important to Secure Gateway deployment in networks. While minimizing message latency, this mode of operation results in more packets, and therefore more CPU utilization processing packet headers, and also results in less efficient LAN utilization. When Nagle's algorithm is enabled, it allows the TCP/IP stack to hold onto messages for a period of time in an effort to pack multiple messages into a single TCP packet. At the expense of higher message latency, fewer packets are generated and processed, resulting in lower CPU utilization, and the fewer and larger packets result in more efficient LAN utilization. At high rates of traffic through a socket, message latency is minimal, since the threshold packet size is reached (messages fill the packet) very quickly, causing the stack to transmit the packet. At low rates of traffic, a stack timer governs how long a packet will be held prior to transmission. The application of Nagle's Algorithm only affects packet transmission and has no effect on the processing of received packets.

This feature allows the customer to enable or disable Nagle's algorithm. The socket option is defined as a 1-bit Boolean socket option; 1=Enable, 0=Disable.

Feature Implementation

Figure 5-13 illustrates the overall design for implementing the QoS feature. The example shows how an application socket's TOS value can be changed using commands. The example also could be extended to cover modifying other socket options, including enabling / disabling of Nagle's algorithm. When an application socket is created, it is always assigned to DCMPS parameter set #10, containing the default socket options. Socket options may then be changed using one of the following commands:

chg-appl-sock

In Figure 5-13, example 3, an application socket is changed to a different DCMPS parameter set. In this example the new DCMPS parameter set contains a different TOS value. This is accomplished by issuing the following admin command:

CHG-APPL-SOCK:SNAME=sockname:DCMPS=new_param_set

Changing an open socket to a different DCMPS set forces the socket to use the new DCMPS set's TOS value. This change occurs "on-the-fly." The socket does not need to be closed or inhibited. System call setsockopt() is invoked with the new DCMPS set TOS, thereby updating the affected socket's PCB.

chg-dcmps

In Figure 5-13, example 4, the DCMPS parameter set's TOS parameter is changed to a different value. This causes all sockets using the modified DCMPS parameter set to use the new TOS value. This is accomplished by issuing the following admin command:

CHG-DCMPS:SET=setnum:PARM=1:PVALUE=new_tos_value

Changing the TOS parameter within a DCMPS set forces all existing sockets using that DCMPS set to use the new TOS value. For all open sockets, this change occurs "on-the-fly." System call setsockopt() is invoked for all sockets using the modified DCMPS set, updating the socket's PCB with the new TOS.

Only sockets affected using the above administration commands allow their socket options to be updated / changed.

Figure 5-13. ToS Setup

New Commands for Quality of Service Enhancements

There are no new commands for this feature.

Enhancements to Existing Commands for Quality of Service Enhancements

For more information about formats and outputs for the commands described in this section, refer to the *Commands Manual*.

chg-dcmps

The **chg-dcmps** command is used to change the Type of Service (TOS) parameter set. The parameter value **1** has been designated for use with the **parm** parameter for the **chg-dcmps** command to indicate that Type of Service is enabled.

rtrv-dcmps

The **rtrv-dcmps** command is used to retrieve information about the IP parameter set. The output of the **rtrv-dcmps** command has been updated to display information about Type of Service.

Random SLS Generation (Release 28.0)

The Random SLS Generation feature allows operators to overcome some of the ITU protocol limitations by ignoring the SLS value in the incoming SS7 message when selecting an outgoing link for the message. This is accomplished by generating a new 8-bit SLS value that is used internally by the Eagle to randomly select an outgoing link to the destination.

This feature does not alter the SLS value in the outgoing message; it is the SLS value received in the message. The newly-generated SLS is used for link selection only.

Enhancements to Existing Commands

The following existing command has been enhanced to support the Random SLS Generation feature. For more information on this command, see the *Commands Manual*.

chg-stpopts

Use this command to change the values of one or more of the STP node level processing option indicators maintained in the STP's options table. In support of this feature, a new parameter, **:randsls**, has been added to this command.

Remote Loopback Testing for DS0A (Release 21.0)

This feature allows a LIM with the DS0 interface, or a LIM with the AINF interface configured as a LIMDS0, running the SS7ANSI application to be put in the loopback mode so that the signaling link connected to that card can be tested. The signaling link is tested from a far end network element or from a maintenance test unit. The tests performed on the signaling link check the functionality of the signaling link from the far end network element to the LIMDS0 that is in the loopback mode.

The LIMDS0 establishes the loopback path when it receives a valid latching loopback code sequence from the network. The loopback is released when the card receives the code from the network to take the LIMDS0 out of the loopback mode.

There is no software control or enable for the remote loopback testing feature. The hardware on the LIMDS0 detects and responds to the latching loopback code sequence.

While in the loopback mode, the signaling link is out of service (SIOS). A minor alarm is generated, UAM 222, REPT-LKF: remote FE loopback, and an error message is displayed indicating when the status of the signaling link changes because of remote loopback testing. The alarm is repeated at 15 minute intervals. The following is an example of UAM 222.

```
UAM    RLGHNCXA03W 96-04-16 16:21:11 EDT Rel 21.0.0
        0044.0222   SLK 1201,A sp1      REPT-LKF: remote FE loopback
        SLC=01     FECLLI=A1234567890
```

The following commands have been changed to show the status of the signaling link when the LIMDS0 is placed in the loopback mode.

- `rept-stat-slk`
- `rept-stat-ls`
- `rept-stat-trbl`

Remote Loopback Testing for OCU (Release 21.0)

This feature allows a LIM with the AINF interface, configured as a LIMOCU, running the SS7ANSI application to be put in the loopback mode so that the signaling link connected to that card can be tested. The loopback testing is normally initiated by the remote network element or a maintenance test unit. Both latching and non-latching loopback are supported. Because latching and non-latching loopback cannot be mixed in a network, this depends on the network configuration and configuration of the OCU channel bank. The OCU channel back recognizes the loopback control codes and performs a current reversal. The LIMOCU only sees a current reversal and acts on that without knowing that it is latching or non-latching.

There is no software control or enable for the remote loopback testing feature. The hardware on the LIMOCU detects and responds to the latching loopback code sequence as long as the LIMOCU is running the SS7ANSI application.

While in the loopback mode, the signaling link is out of service (SIOS). A minor alarm is generated, UAM 222, REPT-LKF: remote FE loopback, and an error message is displayed indicating when the status of the signaling link changes because of remote loopback testing. The alarm is repeated at 15 minute intervals. The following is an example of UAM 222.

```

UAM      RLGHNCA03W 96-04-16 16:21:11 EDT Rel 21.0.0
         0044.0222   SLK 1201,A spl      REPT-LKF: remote FE loopback
         SLC=01     FECLLI=A1234567890

```

The following commands have been changed to show the status of the signaling link when the LIMOCU is placed in the loopback mode.

- `rept-stat-slk`
- `rept-stat-ls`
- `rept-stat-trbl`

REPT-STAT-CLK Enhancements for Clocking (Release 28.2)

Description

This feature implements the following enhancements:

- New "**mode=full**" parameter and report. This report prints out a list of cards that are presenting with a clock failure.

NOTE: HS clock information is included in the new report when a card capable of supporting HS links is provisioned (regardless of link provisioning).

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

`rept-stat-clk`

Use this command to display the clock status summary for cards in the Eagle system. This command has been enhanced with the **:mode=full** parameter.;

`canc-cmd`

This command halts processing and output of certain commands. Added **rept-stat-clk** to list of commands that can be canceled

`dact-cmd`

This command halts processing and output of the commands. Added **rept-stat-clk** to list of commands that can be canceled

Alarms and Error Codes

No new error codes or alarms have been created for this feature.

REPT-STAT-TRBL Enhancement (Release 29.0)

This feature is intended to allow users to display only the non-inhibited troubles for captures. This facility allows customers to quickly identify new alarms, versus the old ones they no longer wish to see.

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. For current information on this command, see the *Commands Manual*.

rept-stat-trbl

Use this command to display a summary report of all of the device trouble notifications that are currently logged in the OAM's RAM storage area. The new parameter **:display** has been added to this command, and the command's output has been enhanced.

RTRV-TBL-CAPACITY Enhancement (Release 29.0)

This enhancement introduces the new command `rtrv-tbl-capacity`, which retrieves table use summary information.

Hardware Requirements

No new hardware is needed to support this feature.

New Commands

The following command has been created to support this feature. For current information on this command, see the *Commands Manual*.

`rtrv-tbl-capacity`

Use this command to retrieve table use summary information. For each table listed, the number of table entry elements in use "X" value and the total allowed number of table elements "Y" value is presented, along with a percent "%" full value.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

The output for each of the reports generated by these commands has been updated to display X of Y entries in the associated table.

`rtrv-dstn`

`rept-stat-xlist`

`rtrv-x25-dstn`

`rtrv-spc`

`rtrv-ls`

`rtrv-slk`

`rtrv-x25-slk`

`rtrv-ip-lnk`

`rtrv-map`

`rtrv-gtt`

`rtrv-gta`

`rtrv-scrset`

`rtrv-as`

`rtrv-asp`

Response to Commands Issued Prior to Login (Release 21.0)

Currently, if a command is entered prior to logging in to the Eagle that contains a syntax error, the Eagle responds with a syntax error message. When the user corrects the command and re-enters it, the Eagle then responds with an authority violation error message. This is annoying to the user. The command would not have been accepted prior to being logged into the Eagle, regardless of whether it's syntax was correct.

If a command is entered before the user is logged in to the Eagle, the Eagle responds with the `Command Rejected : Authority violation` message regardless of whether the command's syntax is correct.

Revoking a User ID (Release 21.0)

In Release 21.0, the system administrator can prevent the use of a user ID without having to remove it from the database. When a user ID is revoked, any future login attempts with the suspended user ID is rejected with the following message:

```
E2751 Cmd Rej: UserID has been revoked
```

The check for user ID revocation is made during the login process after the user has entered a valid user ID and password combination, and before any checks are made to see if the user's password must be changed.

A user ID is revoked by using the **revoke=yes** parameter of the **chg-user** command. The **rtrv-user** command output report shows which user IDs are revoked.

Revoking a user ID while the user is currently logged on to the system is allowed. In this case, the login session for the user immediately ends and the user is not allowed to enter any other commands.

The Eagle does not allow user IDs assigned to the security administration command class to be revoked. If this is attempted, the **chg-user** command is rejected with the following error message:

```
E2759 Cmd Rej: Revocation of security admin userID not allowed
```

This prevents the system from becoming un-administrable because all user IDs have been revoked.

A revoked user ID can be put back into service using the **revoke=no** parameter with the **chg-user** command.

Routing Key Enhancements (IP⁷ Release 3.0)

The Routing Key Enhancements feature provides routing to IP devices with an ITU National or International Point code. In addition, routing for TUP messages is also provided.

Routing Key Enhancements, including the following features:

- Multiple Routing Key Registration allows for the registration of up to three routing keys in a single TALF message.
- Q.BICC Routing provides routing to TCP/IP sockets for BICC messages. BICC messages are very similar to ISUP messages, except the CIC has been expanded to 32 bits. Routing for ANSI or ITU BICC messages is based on SI=13, OPC, DPC, and CIC. The point codes within the routing key must be ANSI, ITU National or ITU International.
- ITU Routing Key Enhancements provide the following additional routing capabilities for international users:
 - ITU ISUP CIC Routing provides OPC/DPC/CIC routing to IP devices for ITU ISUP messages. Routing for ITU ISUP messages to an IP device is based on SI=5, OPC, DPC, and CIC. The point codes within the ITU ISUP routing key must be either ITU National or ITU International.
 - ITU DPC-SSN Routing provides DPC/SSN routing to IP devices for ITU SCCP messages. Routing for SCCP messages to an IP device is based on SI=3, DPC, and Subsystem. The point codes within the ITU SCCP routing key must be either ITU National or ITU International.
 - ITU DPC-SI Routing provides DPC/SI routing to IP devices for non-ISUP and non-SCCP ITU messages. Routing to ITU point codes on the IP network for non-ISUP and non-SCCP messages is based on the Destination Point Code and SI indicator, where SI is not 3, 4 (ITU), 5, or 13. A message with SI=4 bound for an ITU National or International point code is assumed to be a TUP message, and is routed as such. The point codes with the ITU DPC-SI routing key must be either ITU National or ITU International.
 - Telephone User Part (TUP) Routing provides OPC/DPC/CIC routing to IP devices for TUP messages. Routing TUP messages to an IP device with an ITU point code is based on SI=4, OPC, DPC, and CIC. The point codes within the routing key must be ITU National. An MSU with SI=4 bound for an ANSI point code will continue to be routed on DPC-SI.

New Commands for Routing Key Enhancements

There are no new commands for this feature.

Enhancements to Existing Commands for Routing Key Enhancements

For current information the commands described in this section, refer to the *Commands Manual*.

The following commands have been enhanced to support the Routing Key Enhancements feature.

msucount

The **msucount** command is used with the **pass** command to retrieve MSU transmit and receive statistics for various entities on an IPGWx and IPLIMx card. A new option has been added to the **msucount** command to provide information about specific point code types: ANSI, ITUI, or ITUN.

drklog

The output of the **drklog** pass-through maintenance command has been updated to display information about ITU entries.

rept-stat-sys

The output of the **rept-stat-sys** command has been enhanced to display information about cards running the IPGWI GPL.

rtrv-card

The output of the **rtrv-card** command has been enhanced to display information about the IPGWI GPL.

rept-stat-card

The output of the **rept-stat-card** command has been enhanced to display information about the IPGWI GPL.

init-card

A new parameter value, **ipgwi**, has been added to the **appl** parameter for the **init-card** command. This value represents the IPGWI GPL residing on the card.

act-gpl, chg-gpl

A new parameter value, **ipgwi**, has been added to the **appl** parameter. This value represents the IPGWI GPL residing on the card.

rept-stat-gpl

The output of the **rept-stat-gpl** command has been enhanced to display status information about the IPGWI GPL.

rtrv-gpl

The output of the **rtrv-gpl** command has been enhanced to display information about the IPGWI GPL.

ent-slk, dlt-slk, chg-slk, rtrv-slk, act-slk, canc-slk, inh-slk, alw-slk, blk-slk, unblk-slk, inh-slk, unhb-slk, tst-slk, rept-stat-slk
 Signaling Link (SLK) and Link/Route Maintenance commands have been enhanced to support the IPGWI GPL.

ent/chg/rtrv/dlt -appl-rtkey, and -sg-opts

Support has been added for TUP and QBICC protocols (**SI=13** indicates QBICC traffic, **SI=4**, for ITU only, indicates TUP traffic). Additionally, there is a maximum of 50 sockets allowed per local host on DCM cards running the IPGWI application, and **port=B** cannot be specified for the IPGWI application.

ent/dlt/rtrv/chg -appl-rtkey

Support has been added for **dpci / dpcn / opci / opcn** formats where **dpci** and **opci** specify ITUI point codes and **dpcn** and **opcn** specify ITUN point codes. Command output has been updated to reflect ITUI and ITUN routing for affected commands.

SCCP Message Type Screening (Release 22.0)

The allowed calling party address (CGPA) screen can screen messages for these SCCP message types: UDT, UDTs, XUdT, and XUdT's. A new parameter, **sccpmt**, has been added to the **ent-scr-cgpa**, **dlt-scr-cgpa**, and **chg-scr-cgpa** commands to configure the allowed CGPA screen to screen for these messages. A new field, SCCPMT, has been added to the output of the **rtrv-scr-cgpa** command to show the SCCP message type in the allowed CGPA screen.

SCCP/TCAP Over IP Gateway for Point-to-Multipoint Connectivity (IP⁷ Release 1.0)

The SCCP/TCAP-over-IP feature allows SS7 nodes to exchange SCCP/TCAP Query/Responses with an IP-SCP. The IP⁷ Secure Gateway manages the point codes and subsystem numbers for the IP-SCP. From the SS7 network perspective, the TCAP queries are routed using these Point Code/SSNs. The signaling gateway maps the Point Code/SSN to one or more TCP sessions, converts the SS7 MSUs to TCP/IP packets by embedding the SCCP/TCAP data inside a TCP/IP packet, and routes it over an IP network. The gateway also manages the application subsystem status from the IP network's perspective and the SS7 network's perspective.

Figure 5-14. SCP Connectivity via TCAP over IP

This feature provides TCP/IP point-to-multipoint connectivity by way of a new GPL, SS7IPGW, running on the DCM which, together with the hardware, provides connectivity to databases (or other switching equipment) for SS7 devices that reside on ethernet TCP/IP networks.

A single DCM card running the SS7IPGW application provides connections to multiple IP devices (IP-SCPs, class 4 switches, class 5 switches, VoIP gateways, media gateway controllers, or remote access servers.) Multiple DCM cards running the SS7IPGW application are required, with similar configuration, to provide redundancy. The following is a common sequence of events that illustrates the use of point-to-multipoint connectivity:

1. Traditional SS7 devices route MSUs (such as TCAP Queries) to the STP.
2. The gateway performs a global title translation and forwards the translated MSU to the correct TCP/IP device based on point code and SCCP subsystem information in the MSU.
3. The TCAP query is processed at the IP-SCP, and the IP-SCP sends a TCAP reply back to the STP.
4. The STP forwards the TCAP reply back to the sender of the original query.

To provide point-to-multipoint connections, a number of administration steps must first be performed, as follows:

- Links, link sets, destinations and routes to the destinations must be configured.
- The socket connections at each DCM card running the SS7IPGW application must be configured.

- The SS7 routing keys that are transported over each defined socket at each card must be configured. SS7 routing keys are filters consisting of values representing the DPC, SI and SSN fields from a incoming MSU message. All MSUs that match the filter are sent to the corresponding socket. The sockets represent TCP sessions. These keys allow for distribution of MSUs on the IP network.

SCCS Interface Support (Release 21.0)

This feature allows the Eagle to interface to the SCCS terminals using existing Eagle message input and output formats. The SCCS type is used for some network monitoring and surveillance applications. The SCCS terminals are the same as KSR terminals, except that a predefined “start-of-message” character is added to indicate the beginning of a new command response or unsolicited message.

Use the Change Terminal (**chg-trm**) command to configure the operational characteristics of the SCCS terminal. Refer to the Commands Manual of your current Documentation Suite.

The following error message is new to this feature:

E2149 Cmd Rej: TYPE = SCCS and PRTY=NONE combination is not allowed

Refer to the Commands Error Recovery Manual of your current Documentation Suite.

SCTP Checksum Update (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Shortly after the introduction of the Stream Control Transmission Protocol (IETF RFC 2960), a fundamental weakness was detected in the Adler-32 checksum¹ algorithm currently used in the RFC. One requirement of an effective checksum is that it evenly and smoothly spreads its input packets over the available check bits. For small packets, Adler-32 provides weak detection of errors.

After much debate and research, the IETF has produced an improved checksum algorithm, CRC-32c, to be used with RFC 2960. The SCTP Checksum Update feature implements this improved algorithm. The SCTP Checksum Update feature provides a choice of SCTP checksum algorithms, and a user interface to both change and display the type of algorithm used.

NOTE: This feature is a SSED CM-based feature only (P/N 870-2372-01).

The IPGWx and IPLIMx support both SCTP checksum algorithms; the current Adler 32 checksum algorithm and the new CRC-32c checksum algorithm. The CRC-32c Checksum algorithm is implemented on all SCTP-based cards in the IP7 or Eagle node.

Background

Checksums provide protection against data corruption in the network. The sender of an SCTP packet computes a checksum according to an algorithm. The checksum is placed in the Checksum field residing in the SCTP Common Header (see Table 5-7). The receiver then re-computes the checksum, using the same algorithm. The SCTP packet is accepted if the checksum is valid; otherwise, the packet is discarded.

Table 5-7. SCTP Common Header Format

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1																
Source Port Number																Destination Port Number																															
Verification Tag																																															
Checksum																																															

¹ Checksums validate the correctness of the received data—specifically in the SCTP protocol stack, this technique ensures the integrity of the transmitted data from the far-end host.

Adler-32

Adler-32 was the only SCTP checksum algorithm supported and used by the SG prior to this feature. The IETF has determined that the Adler-32 checksum does not provide strong protection against error detection when applied to small packets. Because SCTP protocol signaling messages are typically less than 128 bytes, a better-suited checksum algorithm is needed. This algorithm continues to be supported by the SG.

CRC-32c

Now supported by the SG, the CRC-32c SCTP checksum algorithm solves the limitations of Adler-32. CRC-32c provides better error detection for small packets than does Adler-32.

Hardware Requirements

This feature requires the SSED CM (P / N 870-2372-01).

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

Figure 5-15 on page 58 illustrates how these commands are used to change and display the SCTP Checksum Algorithm Option.

chg-sg-opts

This command is used to change options for the IP7 Secure Gateway. The parameter **:sctpcsum** has been added to this command. This parameter specifies which checksum algorithm is to be used for all SCTP type IP connections. Valid values for the new 'checksum' field are either Adler-32 or CRC-32c; all else is invalid and results in a syntax error.

Syntax

```
CHG-SG-OPTS
:SYNC=<sync code>
:SRKQ=<static routing key quantity>
:DRKQ=<dynamic routing key quantity>
:SNMPCONT=<SNMP system contact>
:GETCOMM=<SNMP get community name>
:SETCOMM=<SNMP set community name>
:TRAPCOMM=<SNMP trap community name>
:INHFEFALM=<Inhibit TALI socket NEA-FEP Alarms>
:SCTPCSUM=<SCTP checksum algorithm type>
```

Parameters

:sctpcsum= (optional)
SCTP checksum algorithm type
Range = adler32, crc32

Example Output**chg-sg-opts:sctpcsum=crc32c**

```
rlghncxa03w 00-02-07 09:17:40 EST Rel 30.0.0
chg-sg-opts:sctpcsum=crc32c
Command entered at terminal #4.
CHG-SG-OPTS: MASP A - COMPLTD
;
```

rtrv-sg-opts

This command is used to display the current options for the IP7 Secure Gateway. This command has been enhanced to display the "configured" SCTP checksum algorithm option stored in the IP OPTIONS table.

Example Output**rtrv-sg-opts**

```
rlghncxa03w 00-02-07 09:50:17 EST Rel 30.0.0
SYNC:      TALI
SRKQ:      250
DRKQ:      750
SNMPCONT:  john doe 555-123-4567
GETCOMM:   public
SETCOMM:   private
TRAPCOMM:  public
INHFEPALM: YES
SCTPCSUM:  adler32
;
```

Pass Commands

Maintenance **pass** commands change / display card-level information. The SCTP **pass** command has been modified to accept the new option **-g csum**, which retrieves the SCTP checksum algorithm currently being used.

The NETSTAT **pass** command has been modified to accept the new option **-p sctp**, which displays protocol information for the SCTP (Stream Control Transmission) protocol

Syntax

To display both the "in-use" and "configured" SCTP checksum algorithm on a particular card, the user enters:

```
pass:loc=<cardloc>:cmd="sctp -g csum"
```

where **cardloc** is an SSED CM card location.

Example Output (sctp)

```
> pass:loc=1305:cmd="sctp -g csum"
Command Accepted - Processing

eagle10213 03-02-25 11:26:10 EST Rel 30.0.0
pass:loc=1305:cmd="sctp -g csum"
Command entered at terminal #3.
;
```

```

298	Minor	Card not using config. SCTP csum method
299	None	Config. SCTP csum method alarm cleared

No error codes have been created / modified for this feature

SCTP Retransmission Control (Release 28.1) (IP⁷ Release 6.0)

This feature offers users a choice of two retransmission policies and enhanced control over the behavior of data retransmissions of SCTP associations in the IP⁷ SG. This functionality allows users to tailor retransmissions to their networks, on an individual association basis, to address these time-critical protocol constraints.

NOTE: This is a non-orderable feature required for the three IETF Connectivity features and the IPLIM Protocol Support Enhancement feature.

Hardware Requirements

This feature requires a SSED CM (Single Slot Enhanced DCM).

New Commands

The following command has been created to support this feature. For current usage information, see the *Commands Manual*.

traceroute

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

assocrtt

This command is used to display the SCTP round trip times for a specified association. The Minimum RTO and Maximum RTO parameters have been added to the display output.

connmgr

This command is used to generate reports about the status of the connection manager. The new options **-i** and **-n** have been added to this command. Also, the output for this command has been updated.

aslog

This command is used to display the state changes for a specified Application Server (AS). Only the output for this command has been updated.

asplog

This command is used to display the UA state history for a specified Application Server Process (ASP). Only the output for this command has been updated.

sctp

Use this **pass** command to provide a view of SCTP instance and associations information. Its output has been modified to display the five new SCTP retransmission control parameters **rmode**, **rmin**, **rmax**, **cwmin**, and **rtimes**.

chg-assoc

Used to configure the IPAPSOCK table. The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This command has been enhanced by five parameters.

rtrv-assoc

Used to retrieve the configuration data from the IPAPSOCK table. This command has been enhanced to display the values of the new **chg-assoc** parameters.

Limitations

The SCTP Retransmission Control feature gives the user control over the behavior of SCTP associations. Thus if behavioral characteristics which are not appropriate for the network are chosen, a negative impact on throughput, or complete loss of network element connections connected by SCTP associations, can result.

For instance, if the LIN retransmission mode is selected for a network in which the round trip varies significantly, associations may be closed due to excessive retransmissions. If RFC retransmission mode is selected for a more stable network, less than optimum throughput will result. Therefore, this feature requires the user to properly assess the network characteristics.

SEAS Enhancements (Release 26.0)

These enhancements are part of Tekelec's ongoing effort to become SEAS-compliant.

- The Eagle now supports High Speed Links (ATM-1.536 Mbps) through the SEAS Interface]. (**chg-slk** is not required to be supported.)
- The Eagle now supports provisioning of supplier-specific parameters for the following SEAS commands:
 - **add/chg/vfy-ls** (Linkset)
 - **asgn/chg/vfy-slk** (Link)
 - **add/chg/vfy-gtwyls** (Gateway Linkset)
 - **add/chg/vfy-dstn** for the **ncai** parameter

NOTE: There is no functionally equivalent Eagle command for the SEAS commands ADD/CHG/VFY-GTWYLS. Parameters for the link and screen set on the Eagle will be used to provide the supplier-specific parameter for the ADD/CHG/VFY GTWYLS commands. Supporting screen set names as a supplier-specific parameter is not required.

Affected Commands

add-ls (linkset)

The parameters in Table 5-9 are not currently supported by the SEAS definition of the **add-ls** command:

Table 5-9. Supplier-Specific Parameters

Supplier-Specific Parameters	Description	Allowed Values
BEI	Broadcast Exception Indicator	YES, NO
GWSA	Gateway Screening Allowed Mode	ON, OFF
GWSM	Gateway Screening Messaging Mode	ON, OFF

Table 5-9. Supplier-Specific Parameters

GWSD	Gateway Screening Discard Mode	ON, OFF
SCRN	GWS Screen Set Name	YYYY
SLSCI	SLS Conversion Indicator	ON, OFF
ASL8	Adjacent SLS	YES, NO
SLTSET	SLTM Set ID	1 –20
NIS	Network Indicator Spare	ON, OFF
MTPRSE	MTP Restart Equipped	YES, NO

In order to allow users of the SEAS interface the ability to set values for Eagle- specific parameters, the **unshaded** parameters in Table 5-9 are allowed to be specified using the SEAS supplier specific parameter block. The GWS- specific parameters are not allowed in the supplier-specific parameter block because they are implemented as part of the supplier-specific parameter block of the GTWYLS entity; see “*add-gtwyls (Gateway Linkset)*” on page 5-64.

The syntax for supplier-specific parameter “Z” of the SEAS **add-ls** command is as follows:

Syntax " [BEI] , L3TSET , [SLSCI] , [ASL8] , [SLTSET] , [NIS] , [MTPRSE] "

The following example is provided to help customers understanding the new capability of specifying supplier-specific parameter blocks via SEAS commands on the Eagle.

Suppose the user wants to add a linkset where all of the Supplier Specific parameters get set to the default value. This can be done in four different ways:

Input Example

- add-ls::ls1201:000003:50,rch::lnsc11i1201-012001001:a::,g63d45g25-001-07**
- add-ls::ls1201:000003:50,rch::lnsc11i1201-012001001:a:",,,,,,":,g63d45g25-001-07**
- add-ls::ls1201:000003:50,rch::lnsc11i1201-012001001:a:"0,1,0,0,1,0,0":,g63d45g25-001-07**
- add-ls::ls1201:000003:50,rch::lnsc11i1201-012001001:a:",,0,0,1,0,0":,g63d45g25-001-07**

The first method simply leaves out parameter "Z" and the appropriate default values are assigned.

The second method specifies parameter "Z" enclosed in quotes. All the members of the supplier-specific parameter block are optional, and can be omitted (the colons must always be specified if parameter "Z" is specified).

The third method specifies the appropriate default values for each supplier-specific parameter within the block.

The fourth method specifies default values for SLSCI, ASL8, SLTSET, NIS, and MTPRSE. All four commands will result in the same entry created in the Eagle database.

chg-ls

The following parameters are not currently supported by the SEAS definition of the **chg-ls** command.

Table 5-10. Supplier-Specific Parameters for chg-ls

Supplier Specific Parameters	Description	Allowed Values
TFATCABMLQ	TFA/TCA Broadcast Min. Link Quantity	0 –16
BEI	Broadcast Exception Indicator	YES, NO
GWSA	Gateway Screening Allowed Mode	ON, OFF
GWSM	Gateway Screening Messaging Mode	ON, OFF
GWSD	Gateway Screening Discard Mode	ON, OFF
SCRN	GWS Screen Set Name	AYYY
SLSCI	SLS Conversion Indicator	ON, OFF
ASL8	Adjacent SLS	YES, NO
SLTSET	SLTM Set ID	1 –20
NIS	Network Indicator Spare	ON, OFF
MTPRSE	MTP Restart Equipped	YES, NO

In order to allow users of the SEAS interface the ability to set values for Eagle specific parameters the highlighted parameters above are allowed to be specified using the SEAS supplier specific parameter block. The GWS-specific parameters are not allowed in the supplier specific parameter block because they are implemented as part of the supplier-specific parameter block of the GTWYLS entity; see “*add-gtwyls (Gateway Linkset)*” on page 5-64.

The syntax for supplier-specific parameter "Z" of the SEAS **add-ls** command is as follows:

Syntax " [TFATCABMLQ] : [BEI] : L3TSET : [SLSCI] : [ASL8] : [SLTSET] : [NIS] : [MTPRSE] "

dlt-ls

There are no supplier specific parameters available for the SEAS **dlt-ls** command.

vfy-ls

There are no supplier-specific parameters available for the SEAS **vfy-ls** command on input. However, the output of the **vfy-ls** command includes the following output for the supplier specific parameter block:

Syntax "TFATCABMLQ:BEI:L3TSET:SLSCI:ASL8:SLTSET:NIS:MTPRSE"

add-gtwyls (gateway linkset)

In order to allow users of the SEAS interface the ability to set values for Eagle-specific parameters the **unshaded** parameters in Table 5-11 are allowed to be specified using the SEAS supplier-specific parameter block.

Only GWS-specific parameters are allowed in the supplier specific parameter block. The shaded parameters (with exception to the SCRN parameter) are supported in the Linkset supplier-specific parameter block.

Table 5-11. Supplier-Specific Parameters for add-gtwyls

Supplier Specific Parameters	Description	Allowed Values
bei	Broadcast Exception Indicator	YES, NO
gwsa	Gateway Screening Allowed Mode	ON, OFF
gwsn	Gateway Screening Messaging Mode	ON, OFF
gwsd	Gateway Screening Discard Mode	ON, OFF
l3tset	Level 3 Timer Set	1
scrn	GWS Screen Set Name	AYYY
slsci	SLS Conversion Indicator	ON, OFF
asl8	Adjacent SLS	YES, NO
sltset	SLTM Set ID	1 – 20
nis	Network Indicator Spare	ON, OFF
mtpmse	MTP Restart Equipped	YES, NO
actname	Stop Action Set Name	Alphanumeric (6)
destfld	Destfld Screening	YES, NO

dlt-gtwyls

There are no supplier-specific parameters associated with the **dlt-gtwyls** command.

chg-gtwyls

The supplier-specific parameter block for the **chg-gtwyls** command is equivalent to the supplier-specific parameter block for the **add-gtwyls** command (see “*add-gtwyls (Gateway Linkset)*” on page 5-64).

vfy-gtwyls

There are no supplier specific parameters available for the SEAS **vfy-gtwyls** command on input. However the output of the **vfy-gtwyls** command will include the following output for the supplier-specific parameter block:

Syntax " [GWSA] , [GWSM] , [GWSD] , [ACTNAME] , [DESTFLD] , [SCRN] "

asgn-slk (signaling link)

In order to allow users of the SEAS interface the ability to set values for Eagle specific-parameters, the Eagle supports a supplier-specific parameter block for the SEAS command **asgn-slk**. The supplier-specific parameter block consists of all the parameters from Table 5-12.

Table 5-12. Supplier Specific Parameters of asgn-slk

Supplier Specific Parameters	Description	Allowed Values
l2tset	Level 2 Timer Set	1-20
l1mode	Mode of Operation Used to Select Link Clocking Source	DTE, DCE
tset	Transmitter Signal Element Timing	ON, OFF
ecm	Error Correction Method	BASIC, PCR
pcrn1	Number of MSUs Available For Retransmission Threshold	1-127
pcrn2	Number of MSU Octets Available For Retransmission Threshold	300-35500
lpset	Link Parameter Set Identifier	1-20
atmtsel	ATM Timing Selector	LINE, INTERNAL, EXTERNAL
vci	Virtual Channel Identifier	0-65535

Table 5-12. Supplier Specific Parameters of asgn-slk

Supplier Specific Parameters	Description	Allowed Values
vpi	Virtual Path Identifier	0-4095
ll	ATM Line Length	0-7

The syntax for supplier-specific parameter "Z", of the SEAS ASGN-SLK command, is as follows:

Syntax " [L2TSET] : [LAdresse1MODE] : [TSET] : [ECM] : [PCRN1] : [PCRN2] : [LPSET] : [ATMTSEL] : [VCI] : [VPI] : [LL] "

dlt-slk

No supplier-specific parameter support is required for the SEAS **asgn-slk** command.

chg-slk

No supplier-specific parameter support is required for the SEAS **chg-slk** command.

vfy-slk

There are no supplier-specific parameters available for the SEAS **vfy-slk** command on input. However, the output of the **vfy-slk** command includes the following output for the supplier-specific parameter block:

Syntax " [L2TSET] : [L1MODE] : [TSET] : [ECM] : [PCRN1] : [PCRN2] : [LPSET] : [ATMTSEL] : [VCI] : [VPI] : [LL] "

SEAS Enhancements, Autonomous Messages (Release 22.0)

The Eagle in release 22.0 supports these SEAS autonomous messages.

- REPT-GTWYACT - notification that the gateway threshold has been exceeded
- REPT-SCRREJ - notification that an MSU has been discarded because of gateway screening.
- REPT-DBCPY - notification that the Eagle's database has been either backed up or restored.
- REPT-NOTRNS - notification that the Eagle is unable to perform a global title translation because of problems with the GTT tables and the MSU has been discarded.
- REPT-MTPERR - notification that the Eagle cannot perform MTP level routing for a received MSU and that MSU has been discarded.

- REPT-LKSTO - notification that all signaling links in a linkset are unavailable because of multiple signaling link failures or processor outages.
- RCVRY-LKSTO - notification that the Eagle has recovered from a previously reported linkset outage condition.
- REPT-LINK-CGST - notification that the value *occupancy threshold reached/exceeded* field in the MSU is set to a fixed value regardless of the congestion level being reported.
- RCVRY-LINK-CGST - notification that the value *occupancy threshold reached* field in the MSU is set to a fixed value regardless of the congestion level being reported.

This feature prevents duplicate autonomous messages to be sent to the SEAS ports.

This feature also introduces these new Eagle commands to configure the thresholds for the REPT-GTWYACT and the REPT-SCRREJ messages.

- **set-gtwy-acthresh** - configures the gateway threshold
- **rtrv-gtwy-acthresh** - displays the current values of the gateway threshold
- **set-scrrej-prmtrs** - configures the quantity of REPT-SCRREJ messages are sent to SEAS
- **rtrv-scrrej-prmtrs** - displays the quantity of REPT-SCRREJ messages are sent to SEAS

These actions can also be performed from the SEAS interface with these SEAS command functions, SET-GTWY-ACTHRESH, RTRV-GTWY-ACTHRESH, SET-SCRREJ-PRMTRS and RTRV-SCRREJ-PRMTRS.

SEAS Gateway Audit Command (CHK-UNREF-ENT) (Release 22.0)

Release 22.0 introduces the **chk-unref-ent** command on the Eagle and supports the CHK-UNREF-ENT command function on the SEAS interface.

This feature gives users the ability to identify unreferenced entities in the Eagle's gateway screening entity sets. These unreferenced entities can be dealt with by the user as required.

Unreferenced gateway screening entity sets are those entity sets that are not referenced by another entity with the next screening function identifier (NSFI) and next screening reference (NSR) combination or with the link set screening reference (that is, a screen set used by a link set). Any unreferenced gateway screening entities are displayed by the entity set name (screen set name) and screening reference (NSFI).

The Eagle's **chk-unref-ent** command uses these parameters.

<i>Parameters</i>	:aftpc = Is the Affected PC / SSN entity set to be checked?
	:blkopc = Is the Blocked OPC entity set to be checked?
	:blkdpc = Is the Blocked DPC entity set to be checked?
	:cdpa = Is the Allowed CDPA entity set to be checked?
	:cgpa = Is the Allowed CGPA entity set to be checked?
	:destfld = Is the Affected DESTFLD entity set to be checked?
	:dpc = Is the Allowed DPC entity set to be checked?
	:opc = Is the Allowed OPC entity set to be checked?
	:sio = Is the Allowed SIO entity set to be checked?
	:tt = Is the Allowed TT entity set to be checked?
	:all = Are all the gateway screening entity sets to be checked?

The values for these parameters are either **yes** or **no**, with the default value being **no**.

SEAS Interface Support (Release 21.0)

This feature allows the Eagle to interface with the Signaling Engineering and Administration System (SEAS). The Signaling Engineering and Administration System (SEAS) is an interface defined by Bellcore and used by the Regional Bell Operating Companies (RBOCs), as well as other Bellcore Client Companies (BCCs), to remotely administer and monitor the signaling points in their network from a central location. SEAS provides a single, reliable, machine-to-machine interface by which commands are entered from a Signaling Engineering and Administration Center (SEAC) or a Signaling Network Control Center (SNCC) to various signaling points, such as STPs. These signaling points then provide command responses back to the SEAC. The signaling points also provide automatic alarm and measurement data to the SEAC. Specifically, SEAS is used for the following functions.

- Memory Administration (Recent Change and Verification)
- Network Maintenance
- Network Data Collection (Measurements)
- Network Traffic Management Surveillance
- SEAS Application Control
- Supplier Specific Functions

The SEAS interface has the following capabilities:

- Flow through messages - This allows any Eagle command to be entered into the system from a SEAS console.
- Recent change and verify (immediate activation only) for following data entities:
 - a. MTP (routes, route sets, signaling links, linksets, point codes, etc.)
 - b. GTT (global title translations, subsystems, and mated applications)
 - c. GWS (all gateway screening tables)
- Data collection (autonomous and on-demand) for existing measurement data
- On-occurrence output capability for existing reports
- Supports one active X.25 signaling link and one backup X.25 signaling link. Each X.25 signaling link supports a minimum of 10 PVCs on a LIMV35 card at data rates of 64 kbps, 56 kbps, 19.2 kbps, 9.6 kbps, 4.8 kbps and 2.4 kbps on a per link basis.

The SEAC uses X.25 links to transmit data to and receive data from the signaling points it is monitoring. Terminal inputs to the Eagle use asynchronous RS-232 ports. An operations system support applications processor (OAP) is used to allow the Eagle to communicate with the SEAC. The OAP is an adjunct processor that interfaces to a BX.25 link and converts the data stream to an asynchronous serial format. All conversion from SEAS to Eagle command sets takes place on the Eagle. Two terminal disk module (TDM) ports (RS-232) running at 19,200 bps connect the OAP to the Eagle. Two BX.25 links connect the OAP to the SEAC. The OAP is mounted in a frame similar in design to the other frames used in the Eagle, and is labeled as OAPF.

The OAP is a TEXAS MICRO™ Intelligent Processor Unit Telecommunications Server, model 9605 (Sparc 05, 85 MHz processor) and contains:

- 32 megabytes of RAM
- a 1.02 gigabyte hard drive using a SCSI interface
- a 1.44 megabyte floppy disk drive, a high-speed serial interface (HSI) SBUS card (with 4 synchronous ports)
- RS-232C-extender SBUS communications board (with 4 asynchronous ports).

The OAP is powered from the OAP frame's fuse and alarm panel with -48 VDC.

The OAP uses the following software to allow the Eagle to communicate with the SEAC:

- SUN™ Solaris version 2.4 operating system
- SunLink Solaris version 9 for X.25
- The SEAS application software.

NOTE: Some of the names of the Eagle measurement counters have been changed to match the names used by SEAS. Table 5-13 shows the names of the measurement counters that have changed and the measurement reports and entity types that contain these counters.

Table 5-13. Changed Eagle Measurement Names

Measurement Report	Measurement Entity Type	Current Measurement Name	New Measurement Name
ALL	STP	IMSINVDPC	MSINVDPC
ALL	STP	IMSINVSIO	MSINVSIO
COMP	LINK	DURLNKUN V	DRLKOTG
COMP	LINKSET	MSURGTT	MSUSRGTT
COMP	LINKSET	OCTRQGT	OCTRCGT
MTCD, MTCPTH	LINK	LNKAVALT	LNKAVAIL
MTCD, MTCPTH	LINK	DRLNKINH	DRLKINHB
MTCD, MTCPTH	LINK	SURCERR	MSURCERR
MTCD, MTCPTH	LINK	NEGACKRC V	NEGACKS
MTCD, MTCPTH	LINK	NEARMGIN H	NEARMGIH
MTCD, MTCPTH	LINK	NDCLFABN	NDCFLABN
MTCD, MTCPTH	LINK	NDCLFXDA	NDCFLXDA
MTCD, MTCPTH	LINK	NDCLFXER	NDCFLXER
MTCD, MTCPTH	LINK	NDCLFXDC	NDCFLXDC

SEAS Verify Signaling Route-Set Status and SCCP Application Status Command (VFY-SRSAPST) (Release 22.0)

Release 22.0 supports the VFY-SRSAPST command function on the SEAS interface which is used to display the status of the current MTP signaling routesets, the status of individual routes, and the status of the SCCP application subsystem for specified destinations and applications that the Eagle routes traffic to. This feature reduces the need to use non-SEAS Eagle commands with the SEAS Flow-Through command to display this information.

Security Log Increase (Release 26.05)

Security Logging is used to store the commands that are issued on Eagle, either using the Eagle terminal, or via SEAS Port. The Security Logging facility also stores additional information about the command, such as, date/time received, terminal on which received, UserID, and result of the command execution.

The Security Log Increase feature increases the Log size from 10K entries to 50K entries.

Increasing the FTA (File Transfer Area)

The FTA is used to store the security logs and the hourly and daily measurements (weeks worth of measurements data [5]). The FTA is designed to contain four security logs, each of size 2.5 MB (10K entries * 256 record size). Since the size of the security log has been increased from 10K to 50K, the FTA has been increased by at least 40MB. Hence the FTA has been increased to 100MB to accommodate this feature.

Enhancements to Existing Commands

The following command has been enhanced to support this feature. Refer to the *Commands Manual* for current usage information.

rtrv-seculog

This command retrieves the contents of a security log and displays it in the scroll area. No new parameters have been added to this command. However, it has been modified to display the 80 characters when issued with the **mode=full** parameter, removing the current restriction of 69 characters. The 69th character is marked with a plus sign (+), indicating to the user that more information is available in the security log. Also, the **num** parameter threshold is now 50,000.

Upgrade Considerations

Before the upgrade, entire security log *must* be uploaded. The procedure to upload the security log follows:

1. Issue the **rept-stat-secu** command to determine which security log should be uploaded. Under normal operating conditions, the standby OAM's security log should always contain 0 in the ENTRIES column, and thus should never need uploading. However, if the standby OAM's log contains one or more un-uploaded entries, it should be uploaded as well.
2. Issue the **copy-secu** command with appropriate parameters to cause the log to be copied to the FTA area. Note the name of the file that is created in the FTA area, and also the location 1114/ 1116 of the FTA area which received the copy. This information will be displayed in the scroll area at the successful conclusion of the **copy-secu** command.

If the security log has to be ported onto a PC, the following two steps need to be performed as well

3. On an Eagle terminal that is being emulated on a suitably-equipped PC (e.g. a PC running ProComm), issue the **act-file-trns:loc=xxxx** command, specifying xxxx as the location 1114 or 1116 of the FTA area containing the log to be uploaded.
4. Start a Kermit download session on the PC. If using ProComm, this is accomplished by selecting the "Online" menu item, then "Kermit command", then "Get file". At this point a dialog box will be presented asking for the name of the file to be transferred. Enter the name of the file noted during the **copy-secu** command in step 3, and press the OK button to transfer the file from the Eagle to the PC.

Limitations

Due to the circular nature of the security logs, if the security log is not uploaded when it is full, it will start to overwrite the contents. Hence the security log should be uploaded when "log full" alarm is raised. This feature does not affect any other GPL's running on other cards.

Selective Alarm Inhibiting (Release 22.0)

This feature allows the user to turn off major and minor alarms for specific devices. Critical alarms cannot be turned off. The following are examples of situations where a user may want to turn off alarms.

- When repeated alarms from malfunctioning equipment could mask valid alarms, for example, a signaling link that is out of service because of a physical break that cannot be repaired for days, the alarm for that signaling link can be turned off.

- The Eagle database is being configured. Alarms are generated immediately after entries are entered into the database. If these alarms are ignored and a problem develops that requires immediate attention, that problem may be ignored.

Alarms can only be turned off for these devices or entities.

- cards in the database
- signaling links in the database
- linksets in the database
- Eagle terminals
- system clock
- TCP/IP data links in the database
- customer defined troubles
- SEAS X.25 links

When the system has alarms only for devices that have their alarms turned off, all the alarm indicators (visual and audible) are turned off. If alarms exist for devices that have not been turned off, or for entities whose alarms cannot be turned off, the alarm indicators remain on.

The alarm indicators are turned on only for devices or entities that do not have their alarms turned off, or that cannot be turned off.

When an alarm is turned off, no unsolicited alarm messages (UAMs) are generated for the device when an alarm condition for that device is detected.

When an alarm is turned off, UIM 0004 is displayed to inform the user that the alarm for the specified device has been turned off. In this example, the alarms for card 1201 have been turned off.

UAM RLGHNCXA03W 97-06-07 14:56:48 EST Rel 22.0.0
5005.0004 CARD 1201 SS7ANSI Device alarms inhibited

If an alarm is turned off, it remains off even if the MASP is reset.

A count of the alarms that are turned off is shown in the alarm status region of the VT320 display terminal (Figure 5-16). The alarm status region (Figure 5-17) of the terminal display contains four boxes with numbers underneath. The boxes contains the labels for the alarm types and the numbers show the number of each type of alarm that has been detected on the Eagle.

- CRIT - critical alarms - Indicates a severe, service-affecting condition has occurred and that immediate corrective action is needed, regardless of the time of day or the day of the week

- MAJR - major alarms - Indicates a serious disruption of service or the failure of important circuits is taking place. These troubles require attention and response to restore or maintain system capability
- MINR - minor alarms - Indicates a trouble, but does not have a serious effect on service.
- INH - inhibited alarms - alarms that have been turned off.

Figure 5-16. Eagle Terminal Display

Figure 5-17. Alarm Status Region of the Eagle Terminal Display

ALARM		STATUS	
CRIT	MAJR	MINR	INH
3	10	15	20

New Commands

Two new commands have been introduced to turn off the alarms (**inh-alm**) and turn on the alarms (**unhb-alm**) for specific devices. Both commands use these parameters. Refer to the *Commands Manual* for current usage information.

Changed Commands

These commands have been changed to support the Selective Alarm Inhibiting feature. Refer to the *Commands Manual* for current usage information.

rept-stat-card

The value ALMINH has been added to the **stat** parameter to show the cards that have their alarms turned off. The AST field of the **rept-stat-card** output displays the entry ALMINH if the alarms for the specified card are turned off.

rept-stat-slk

The value ALMINH has been added to the **stat** parameter to show the signaling links that have their alarms turned off. The AST field of the **rept-stat-slk** output displays the entry ALMINH if the alarms for the specified signaling link are turned off.

rept-stat-ls

The value ALMINH has been added to the **stat** parameter to show the linksets that have their alarms turned off. The AST field of the **rept-stat-ls** output displays the entry ALMINH if the alarms for the specified linkset are turned off.

rept-stat-trm

The AST field of the **rept-stat-trm** output displays the entry ALMINH if the alarms for a specific terminal port are turned off.

rept-stat-seas

The AST field of the **rept-stat-seas** output displays the entry ALMINH if the alarms for a specific SEAS port are turned off.

rept-stat-dlk

The AST field of the **rept-stat-dlk** output displays the entry ALMINH if the alarms for a specific TCP/IP data link are turned off.

rept-stat-sccp

The AST field has been added to the **rept-stat-sccp** output to show the associated state of the ASM. When the alarms for a specified ASM have been turned off, the entry ALMINH is shown in the AST field.

rept-stat-clk

The fields PST, SST, and AST have been added to the **rept-stat-clk** output to show the primary (PST), secondary (SST), and associated states (AST) of the system clock. When the alarms for the system clock have been turned off, the entry ALMINH is shown in the AST field.

rept-stat-cdt

When alarms for a specific customer defined trouble have been turned off, the letter I is displayed between the customer defined trouble ID and the alarm level assigned to that customer defined trouble.

rept-stat-sys

The output of the **rept-stat-sys** command has been changed to include the number of alarms that are turned off for these devices (the **inh=** field).

rept-stat-trbl

The output of the **rept-stat-trbl** command has been changed to show the alarms that are turned off. The letter I is placed between the MRN and the alarm level for that MRN to show that the alarm has been turned off.

rept-stat-alm

Three new fields have been added to the **rept-stat-alm** output, INHIBITED ALARMS, ACTIVE ALARMS, and TOTAL ALARMS.

Selective Homing of EPAP RTDBs (Release 29.0)

Currently, the RTDBs on an EPAP (A or B) will look for and receive updates from the local PDBA process on the local EPAP A (PDBA on the same MPS node as the RTDB), regardless of whether it is the active or standby PDB. An RTDB will only receive updates from the remote PDBA process on the mate MPS node if the local PDBA cannot be accessed.

Some customers would prefer to have all RTDBs within an "MPS System" (both nodes of a mated pair, or even multiple nodes within several mated pairs) always receiving updates from the active PDBA process, regardless of whether it is the local or remote PDBA.

The Selective Homing of EPAP RTDBs feature implements an EPAP configuration option that allows the customer to choose whether the RTDBs on a given MPS node will receive updates from a specific PDBA process (which may or may not be active), or from the active PDBA process (which may or may not be local). This option is selectable via the EPAP UI.

The terminology "specific PDBA" is used instead of "local PDBA," because architectures may result in an MPS without a PDB on EPAP A, in which case the RTDBs on that node would not have a "local PDBA." Specific homing would specify the IP addresses of the MPSs with the first and second choices of PDBA. In a two-node MPS system, this maps directly to "local" homing.

Hardware Requirements

No new hardware is required to support this feature.

Enhancements to the User Interface

A new section will be added to the RTDB Status screen of the EPAP UI to display the RTDB Homing policy for both RTDBs on the MPS.

The PDBA Status sections of both the RTDB Status and PDBA status screens will be enhanced to display the current RTDB clients.

Upgrade Considerations

This feature does not impact the EPAP 1.x/2.x to 3.0 upgrade. New Eagles may not be included for provisioning until all affected sites have been upgraded to EPAP 3.0. RTDB homing policy may not be changed until all affected sites have been upgraded to EPAP 3.0. Interaction with Eagle is not affected by this feature.

Selective Homing of EPAP RTDBs (Release 29.0)

Currently, the RTDBs on an EPAP (A or B) will look for and receive updates from the local PDBA process on the local EPAP A (PDBA on the same MPS node as the RTDB), regardless of whether it is the active or standby PDB. An RTDB will only receive updates from the remote PDBA process on the mate MPS node if the local PDBA cannot be accessed.

Some customers would prefer to have all RTDBs within an "MPS System" (both nodes of a mated pair, or even multiple nodes within several mated pairs) always receiving updates from the active PDBA process, regardless of whether it is the local or remote PDBA.

The Selective Homing of EPAP RTDBs feature implements an EPAP configuration option that allows the customer to choose whether the RTDBs on a given MPS node will receive updates from a specific PDBA process (which may or may not be active), or from the active PDBA process (which may or may not be local). This option is selectable via the EPAP UI.

The terminology "specific PDBA" is used instead of "local PDBA," because architectures may result in an MPS without a PDB on EPAP A, in which case the RTDBs on that node would not have a "local PDBA." Specific homing would specify the IP addresses of the MPSs with the first and second choices of PDBA. In a two-node MPS system, this maps directly to "local" homing.

Hardware Requirements

No new hardware is required to support this feature.

Enhancements to the User Interface

A new section will be added to the RTDB Status screen of the EPAP UI to display the RTDB Homing policy for both RTDBs on the MPS.

The PDBA Status sections of both the RTDB Status and PDBA status screens will be enhanced to display the current RTDB clients.

Upgrade Considerations

This feature does not impact the EPAP 1.x/2.x to 3.0 upgrade. New Eagles may not be included for provisioning until all affected sites have been upgraded to EPAP 3.0. RTDB homing policy may not be changed until all affected sites have been upgraded to EPAP 3.0. Interaction with Eagle is not affected by this feature.

Simplifying BIP (Board ID PROM) for Eagle STP Boards (Release 23.1)

This feature changes the 7- and 8-digit serial numbers currently used to identify a board in the Eagle to serial numbers that contain 7, 8, 11, 12, and 14 digits. The serial number is contained in the board ID PROM on each board in the Eagle.

The 7- and 8-digit serial numbers are used on older systems and require no changes to support. The 11-digit serial number is presently used by Tekelec manufacturing, but was not fully supported by the Eagle system software. The 12-digit serial number adds a special character to the serial number used by manufacturing. The 14-digit serial number uses four digits to show the year that the board was manufactured. All the serial number formats are compliant with the Year 2000 feature.

Table 5-14 shows the format of each of the five serial number formats.

Table 5-14. Serial Number Formats

Serial Numbers	Formats
7-digit serial number	ywwxxxx
8-digit serial number	yywwxxxx
11-digit serial number	nnnyywwxxxx
12-digit serial number	nnnyyww*xxxx
14-digit serial number	nnnyyyyww*xxxx
y = year digit (0 - 9) w = week digit (0 - 9) n = product identifier digit (0 - 9) x = serial number digit (0 - F hexadecimal) * = special character (0 - 9, a - z, or A - Z, alphanumeric characters)	

Command Changes

Refer to the *Commands Manual* for current usage information.

rtrv-bip

The output of the **rtrv-bip** command has been changed to show all types of serial numbers. The Week / Year: field has been changed to show the year of manufacture as a 4-digit number.

chg-bip-rec

The **data** parameter of the **chg-bip-rec** command now accepts serial numbers containing 7, 8, 11, 12, or 14 digits.

Alarm Message Changes

UAMs (unsolicited alarm messages) 0013 and 0014 have been changed to include the serial number of the module (main assembly) in the message output.

Hourly Status Message Report

The indicator INHAUDB has been added to the Condition Type field of the Hourly Status Message Report. This indicator shows that the user has manually turned off the alarms for this device. The date and time that the alarm for the device was turned off is displayed in the report. The report also includes the alarm status periodic reminder added to the end of the report to summarize the status of the alarms.

"ALARMS:ACTIVE,2,0,0"
"ALARMS:TOTAL,2,17,8"
"ALARMS:STATUS,AUDIBLE,SILENT,SILENT"

```

The alarm status periodic reminder contains four fields, ALARMS:INHIBITED, ALARMS:ACTIVE, ALARMS:TOTAL, and ALARMS:STATUS.

The ALARMS:INHIBITED field shows the number of alarms of each type that have been turned off.

The ALARMS:ACTIVE field shows the number of alarms of each type that are active and not turned off.

The ALARMS:TOTAL field shows the total number of alarms of each type that the Eagle has detected.

Following each of these fields are three numbers separated with commas. These numbers show the number of each alarm type the Eagle has detected. The first number shows the number of critical alarms. The second number shows the number of major alarms. The third number shows the number of minor alarms.

The ALARMS:STATUS field shows whether the critical, major, and minor alarms are silent or audible.

In this example, the Eagle has 17 major alarms and 8 minor alarms turned off, 2 critical alarms active for a total alarm count of 2 critical alarms, 17 major alarms, and 8 minor alarms. Only the critical alarms are audible.

Single Slot Enhanced DCM (Release 28.1) (IP⁷ Release 6.0)

The dual-slot DCM card (870-1945-03) occupies two slots on the Eagle; the single slot EDCM (SSEDCM, 870-2372-01) card occupies only one slot. Unlike the DCM Card, the single slot EDCM card can be provisioned in any slot. Only IPLIMx and IPGWx applications are allowed to run on the single slot EDCM Card. The DCM card can always be hot-swapped with a single slot EDCM card.

Refer to the *NSD Hardware Manual* for current details of the SSEDCM.

Hardware Requirements

This release introduces a new DCM type family board called the Single Slot EDCM (SSEDCM). Just as the name implies, the SSEDCM card occupies only one slot in an Eagle shelf, as opposed to the dual-slot DCM boards. The provisioning rules for a DCM type board allow provisioning of any slot where a DCM type board can physically be inserted.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For current usage information on these commands, see the *Commands Manual*.

ent-card

This command allows the user to add a new card to the system. The user must specify the card location, card type, and card application.

rtrv-card

This command retrieves card information. The command displays the type, application, port A linkset name and port B linkset name.

If no parameter is specified, the command displays information for all cards defined by the **ent-card** command.

rept-stat-card

Use this command to display the card status and maintenance activity states. The output of this command has been enhanced to display the new GPL and card type. For this feature the output of this command has been updated.

Split Allowed CGPA Table (Release 22.0)

The Allowed CGPA screen has been changed in Release 22.0 to allow for different next screening values depending on the value of the routing indicator (ri) parameter. These options are summarized in Table 5-15.

Table 5-15. Next Screening Options for the Allowed CGPA Screen

RI	NSFI
GT, *	STOP, TT
DPC, *	STOP, CDPA

The messages can be screened on the routing indicator (RI) field. In previous releases, the routing indicator was included in the Allowed CGPA screening entry, but was not part of the screening process. This allowed only one message routing indicator value, or range of values, for each Allowed CGPA entry with a specific **sr/ni/nc/ncm/sccpmt/ssn** parameter combination. In Release 22.0, different routing indicator values can be specified for an Allowed SIO entry with a specific **sr/ni/nc/ncm/sccpmt/ssn** parameter combination, along with different next screening values for each entry. For example, the Allowed SIO screen in Release 22.0 can contain the following entries.

Output Example

```

RLGHNCXA03W 97-06-07 15:58:16 EST Rel 22.0.0
SCREEN = ALLOWED CGPA
SR      NI      NC      NCM      SSN      RI      SCCPMT  NSFI      NSR/ACT
IEC     240     001     010     012     DPC     017     CDPA     NSR1
IEC     240     001     010     012     GT      017     TT       NSR2

```

Split of Allowed SIO Table (Release 22.0)

The Allowed SIO screen has been changed in Release 22.0 to allow for different next screening values depending on the value of the service indicator (**si**) parameter. These options are summarized in Table 5-16.

Table 5-16. Next Screening Options for the Allowed SIO Screen

SI	NIC	PRI	H0	H1	NSFI
00	single value or wildcard	single value, range, or wildcard	single value, range, or wildcard	single value, range, or wildcard	DESTFLD, DPC, BLKDPC, STOP
01, 02	single value or wildcard	single value, range, or wildcard	single value, range, or wildcard	single value, range, or wildcard	DPC, BLKDPC, STOP
03	single value or wildcard	single value, range, or wildcard	Not Specified	Not Specified	CGPA, CDPA, DPC, BLKDPC, STOP
04 - 15	single value or wildcard	single value, range, or wildcard	Not Specified	Not Specified	DPC, BLKDPC, STOP

Also in Release 22.0, messages can be screened on the message priority (PRI) field. In previous releases, the message priority was included in the Allowed SIO screening entry, but was not part of the screening process. This allowed only one message priority value, or range of values, for each Allowed SIO entry with a specific **sr/si/nic/h0/h1** parameter combination. In Release 22.0, different message priority values can be specified for an Allowed SIO entry with a specific **sr/si/nic/h0/h1** combination, along with different next screening values for each entry.

SS7 Message Rejection Due to Screening (Release 22.0)

The Eagle produces these UIMs to alert the user that an MSU has been discarded because of gateway screening.

- UIMs*
- UIM 1005 — GWS rcvd OPC that is not allowed
 - UIM 1006 — GWS rcvd DPC that is not allowed
 - UIM 1007 — GWS rcvd OPC that is blocked
 - UIM 1008 — GWS rcvd DPC that is blocked
 - UIM 1009 — GWS rcvd SIO that is not allowed
 - UIM 1010 — GWS rcvd a priority that is not allowed
 - UIM 1011 — GWS rcvd TFC, AFTPC not in routing tbl
 - UIM 1012 — GWS rcvd Clg Party that is not allowed
 - UIM 1013 — GWS rcvd Cld Party that is not allowed
 - UIM 1014 — GWS rcvd Translation Type not allowed
 - UIM 1015 — GWS rcvd SCMG with not allowed AFTPC

These messages cannot be received at the SEAC unless the SEAS port is configured to receive unsolicited system maintenance messages. In release 22.0, when any of these UIMs are generated, the REPT-SCRREJ message is sent to SEAS, regardless of the configuration of the SEAS port to alert the user at the SEAC that the Eagle has discarded an MSU because of gateway screening.

This feature allows the user to limit how many of these UIMs are sent to the Eagle terminals and how many REPT-SCRREJ messages are sent to SEAS. This limit is configured with the **set-scrrej-prmtrs** command to control the number of UIMs sent to the Eagle terminals, and with the SET-SCRREJ-PRMTRS command function on the SEAS interface to limit the number of REPT-SCRREJ messages are sent to SEAS.

SS7 over High-Speed Signaling Link (Release 23.0)

The ATM high-speed signaling link feature introduces signaling links transmitting at 1.544 Mb/s. Before Release 23.0, the fastest transmission speed on a signaling link was 64 kb/s. This feature uses the ATM (asynchronous transfer mode) protocol to implement this feature. ATM is a specific packet-oriented transfer mode that uses an asynchronous time-division multiplexing technique to multiplex information flow in fixed blocks called cells.

Tekelec's implementation of ATM differs from the Bellcore ATM model in these ways.

- The AAL5CP protocol support (primarily segmentation and reassembly of user data PDUs) is provided by the hardware, from the AATM applique of the high-speed ATM signaling link card, not from the software. The AATM applique also provides CRC10 support for OAM F5 ATM cell flows.
- The ATM driver is not a defined block in the protocol model, but is needed in the Tekelec implementation to control and interface with the AATM applique. The ATM driver provides the software interface to the AAL5CP hardware functionality. The ATM driver also provides the ATMM (ATM layer management) functions that are supported in the Eagle.
- As a part of providing new ATM (MTP-level 2 equivalent) functions into the existing Eagle software (based on MTP-3 and MTP-2, not MTP-3 and SAAL), some of the interfaces to and from MTP level 3 are to and from the MAAL (management ATM adaptation layer), rather than the SSCF (service specific coordination function) handling all MTP-3 interaction.

SS7-Over-IP Gateway for Point-to-Point Links (IP⁷ Release 1.0)

This feature allows the use of an IP network in place of point-to-point SS7 links to carry SS7 MSUs. For example, the C links between a mated pair of STPs or B/D Quad links between STPs can be replaced by an IP transport network with gateway STPs deployed on both ends of the link. The gateway converts the SS7 MSUs to IP packets on one end of the link and IP packets to SS7 MSUs on the other end of the link. Full MTP level 3 functionality is provided with this feature.

Figure 5-18. STP Connectivity via MTP over IP

This feature provides single TCP/IP point-to-point connectivity by way of a new GPL, IPLIM, running on the DCM which, together with the hardware, provides a TCP/IP point-to-point connection to carry SS7 traffic.

To provide point-to-point connections, a number of administration steps must be performed, as follows:

- Links, link sets, destinations, and routes to those destinations via the existing Eagle SS7 administration capabilities must be configured.
- Socket connections that should be created at each IPLIM card must be configured.

Unlike the point-to-multipoint configuration, the user is not required or allowed to configure SS7 Routing Key associations for iplim socket connections. A single socket exists on the DCM card running the iplim application. All SS7 traffic is carried over the single socket.

STP LAN Feature (Release 20.0)

The Eagle STP LAN feature allows the Eagle to support a TCP/IP connection from any interface shelf to external hosts. Message signal units (MSUs) processed by the Eagle can be copied and directed through the LAN interface to an external server or microcomputer application.

The STP LAN feature is an optional feature that is off by default. To use the STP LAN feature, it must be turned on by entering the appropriate command. Once this feature is turned on, it cannot be turned off.

This feature requires a new circuit card, the application communication module (ACM) card. The ACM card provides an Ethernet interface at the interface shelf backplane and the processing power required to support message encapsulation and TCP/IP support.

The Ethernet connection uses an adapter that is connected to a single port media access unit (MAU). The MAU is attached to the backplane interface connector of the ACM and supports standard Ethernet function.

From the MAU, the user may attach any compatible host system. The host system must be using TCP/IP as the higher layer protocol and must support 10BASE2 Ethernet as the transmission method.

The Eagle software on the ACM card receives SS7 MSUs from the LIMs and ASM-SCCP cards and copies those MSUs into memory on the ACM card. The copied MSU is encapsulated and transmitted using TCP/IP packets and Ethernet to the host computer. The host computer is responsible for reassembling the original message and processing the data.

This feature is designed to provide an open system architecture, allowing third parties to design applications that can be attached as adjuncts to the Eagle STP.

The gateway screening feature provides a copy function. When an MSU passes all screening criteria, the MSU is allowed to pass through the Eagle STP out to the SS7 network. With the copy function, the MSU is copied, and the copy is sent through the STP LAN interface to a host application. This allows the host to track which MSUs from an external network were allowed to pass through the Eagle.

The entire MSU is copied, including the MTP, which allows the host application to process the entire message. Total octet counts, including MTP level 2 and level 3, can be tallied and used for a variety of external measurements.

Messages from an X.25 signaling link reflect the translated message. The message is passed to the interface, and the screening and copy functions for an X.25 packet are invoked, after the Eagle has completed protocol conversion. The result is an SS7 message that can be processed by the external application.

One ACM card is capable of servicing a maximum of 30 link interface modules (LIMs), regardless of the LIM type. This allocation is determined by the Eagle's internal load balancing algorithm that is capable of reassigning LIMs to other ACM cards in the event an ACM card should fail, or if the traffic rate to a single ACM changes significantly.

Typically you should provision extra ACM cards for redundancy. By provisioning extra ACM cards, the load balancing software ensures that when an ACM card fails, the LIMs assigned to the failed ACM card are reassigned to another ACM card, providing it has been configured. The Eagle STP can support up to 32 ACM cards.

The IP addresses of adjacent hosts are entered into the Eagle by using the Eagle database administration commands. The Eagle also provides load balancing for all ACM cards. A threshold is set through the database administration commands for each card, which determines when the Eagle begins shedding traffic from the specified ACM card and redistributes that traffic to another ACM card.

This method of load balancing allows the user to configure each ACM card with a threshold, and provides an automatic mechanism by which traffic can be evenly distributed over multiple ACM cards. In addition to load balancing, this feature also reassigns traffic when an ACM card fails, so that all traffic can still be supported even when an ACM card fails. The ACM cards are capable of handling approximately 400 messages per card.

STPLAN Port to DCM (Release 26.0)

This feature ports existing STPLAN functionality to the DCM (Database Communications Module) hardware platform. The DCM provides the Eagle with two 10/100 Base-Tx IEEE 802.3/Ethernet ports capable of carrying IP traffic.

This feature provides:

- the same functionality as STPLAN on ACM
- the same command interface
- the same network interfaces (single 10BaseT port; no 100BaseT)
- the same provisioning rules as for the ACM

NOTE: The DCM is NOT a drop-in replacement for ACM. If a DCM is used as a replacement for an ACM card, the replacement is not a “plug-in” type replacement. The STPLAN card and datalink must be reprovisioned. Also, fans and a new GPL for the DCM are required.

Hardware Requirements

The DCM card currently takes up two slots in the Eagle shelf card cage due to the large heat sink on the top of the DCM card. Because of this, the DCM cannot be provisioned in any arbitrary slot. Because certain slots in the card cage are adjacent to the cage sides, and/or are adjacent to metal supports welded into the card cage, these slots cannot be used to house a DCM card.

Also, the DCM card requires a substantial amount of power. Due to the way the Eagle fuses power pairs of card slots, the DCM should always be provisioned into an odd-numbered card slot. For example, fuse 1A provides power to both slots 1101 and 1102. The combined current draw for both of these slots must not exceed 3A or the fuse may blow. Inserting a DCM into slot 1102 when there is another card in 1101 could cause the total current requirements for both of these slots to exceed 3A.

Additionally, the shelf equipped with the DCM card must be equipped with fans in order to keep the card from overheating.

Fan Assembly

The fan assembly is provided with the EOAP and is also a necessary item for the DCM.

Note that the airflow provided by the Fan Assembly is approximately 100 cubic feet per second.

STPLAN with Default Router (Release 23.0)

The STPLAN application allows the user to selectively copy received messages to a remote host for further processing. The external link consists of an Application Communication Module (ACM) equipped with an Ethernet interface using the TCP/IP protocol to communicate to an external processing device. Each ACM card supports a single destination host. In previous releases, each ACM and corresponding host had to be in the same network. This feature allows messages to be sent to a remote host on a different network using a TCP/IP router between the ACM and the corresponding host. Messages destined for a host in a different network or subnetwork are sent to the default router for routing. Messages destined for a host that is in the same network as the TCP/IP data link is not sent to the router but is sent directly to the remote host. The router is not part of the Eagle.

Figure 5-19 shows an example of using a router with the STPLAN feature. ACMs 1 and 2, with IP addresses 193.4.202.50 and 193.4.202.57, need to route their traffic to the remote host at IP address 200.11.202.44. The ACMs and the remote host are in two different networks, the network ID of the ACMs is 193.4.202 and the network ID of the remote host is 200.11.202. The Eagle can only connect to TCP/IP nodes that are in the same network as the Eagle. A TCP/IP router is placed in between the Eagle and the remote host. The TCP/IP router is located in the same network as the Eagle, with the IP address of 193.4.202.87. The messages can now be sent to the remote host through the TCP/IP router.

Figure 5-19. STPLAN Router Example

The Eagle requires that a default router be entered when the class and network ID of the data link's IP address and the host's IP address do not match or when subnet routing is used. The Eagle cannot tell whether the user has deployed a large network or is using subnet routing. In a large network, no TCP/IP routers are required because all the nodes are directly connected to a single Ethernet network as shown in Figure 5-20.

Figure 5-20. STPLAN in a Large Network

If a user is using subnet routing and therefore multiple Ethernet networks, TCP/IP routers are required and must be configured in the Eagle as shown in Figure 5-21.

Figure 5-21. STPLAN Network with Subnet Routing

The Eagle cannot distinguish between a large network and the use of subnet routing, and cannot detect the omission of a TCP/IP router. For example, the IP addresses of the TCP/IP data links and the remote node are the same in Figures 5-20 and 5-21. In Figure 5-20, the remote node is in the same network as the TCP/IP data links, so no TCP/IP router is needed. In Figure 5-21, the user is using subnet routing. The remote node is in one subnetwork, and the TCP/IP data links are in another subnetwork. Even though the network portion of the IP addresses of the TCP/IP data links and the remote node are the same (93, a Class A IP address), a TCP/IP router is required because the user is using subnet routing.

If, when the user is configuring STPLAN according to the network in Figure 5-21, the TCP/IP router is not configured with the **ent-ip-node** command, the Eagle will not detect that the TCP/IP router has been omitted. No warnings will be given that the TCP/IP router has been omitted. The data link will be unable to function since it will not be able to connect to the TCP/IP node. The Eagle sees the remote node as a TCP/IP node in the same network as the TCP/IP data links, because of the class of the IP addresses, and does not require the user to specify the **iprte** parameter of the **ent-ip-node** command.

Command Changes

The following commands have been changed to support the TCP/IP router in the Eagle database. Refer to the *Commands Manual* for current usage information.

ent-ip-node

The **iprte** parameter has been added to the **ent-ip-node** command.

rtrv-ip-node

The **iprte** parameter has been added to the **rtrv-ip-node** command to display the TCP/IP nodes based on the IP addresses of the TCP/IP routers.

ent-dlk

A new rule specifying the IP address of the TCP/IP data link (**ipaddr**) has been added to the **ent-dlk** command. The value of the **ipaddr** parameter cannot match the TCP/IP router's IP address (the **iprte** parameter of the **ent-ip-node** command).

Support 12 Million Ported Numbers (Release 24.0)

The Support 12 Million Ported Numbers feature allows the Eagle to contain and process 12 million ported telephone numbers for the local number portability (LNP) application. Before Release 24.0, the Eagle could only contain 2 million ported telephone numbers.

NOTE: For Release 24.0, the Eagle supports only 4 million ported telephone numbers.

For the Eagle database to contain up to 12 million ported telephone numbers, **lnp 4digit** database objects must be in the database. Each **lnp 4digit** database object consists of two tables, one in the current partition and one in the backup partition of the database. The Eagle database currently contains one **lnp 4digit** database object, containing up to 2 million ported telephone numbers. This database object contains the database tables named **lnp_4dig.tbl** and **lnp_4dig.bkp**.

Refer to the *Database Administration Manual - LNP* and the *LNP Database Synchronization Manual* for the current details on this feature.

New and Changed Commands

Refer to the *Commands Manual* for current usage information.

alloc-mem

This has been added to the Eagle to create up to 5 additional **lnp 4digit** database objects, for a total of 6 **lnp 4digit** database objects. Each **lnp 4digit** database object contains 2 million ported telephone numbers. If all 5 additional **lnp 4digit** database objects are configured in the database, the database can contain 12 million ported telephone numbers.

rtrv-mem

To display the **lnp 4digit** database objects configured in the database, the **rtrv-mem** command has been introduced into the Eagle. The **rtrv-mem** command uses the optional parameter **obj**, which specifies which type of database object to display.

chg-feat

The **lnp12mil** parameter has been added to the **chg-feat** command so that the necessary LNP 4DIGIT database objects can be created in the database, increasing the maximum number of ported telephone numbers from 8,000,000 to 12,000,000. The **lnp12mil** parameter has only one value, **on**. Once the Support 12 Million Ported Numbers feature is turned on with the **lnp12mil=on** parameter, it cannot be turned off.

rtrv-feat

The **lnp12mil** field has been added to the **rtrv-feat** command output to show whether the Support 12 Million Ported Numbers feature is on or off. In the following example, the Support 12 Million Ported Numbers feature is on.

chg-db

To ensure that the **chg-db** command actions, backup, restore, repair, and import, operate correctly, the capacity of the destination drive must be able to support the additional **lnp 4digit** database objects. The TDMs must contain 4 gigabyte fixed disk drives and the MDAL must contain a 2.3 gigabyte removable cartridge drive. If either of the TDMs or the MDAL do not meet these requirements, the **chg-db** command is rejected.

rept-stat-db

If the LNP feature is on, the output of the **rept-stat-db:display=version** command has been changed to include the version number of the LNP database with each database listed in the **card/appl** field.

format-disk

The **format-disk** command in Release 24.0 formats the fixed disk on the standby TDM in addition to formatting the removable cartridge, and is able to perform a low level format of the target disk.

copy-gpl

Two parameters, **dloc** and **sloc**, have been added to the **copy-gpl** command to copy the GPLs from the fixed disk on the active TDM to either the fixed disk on the standby TDM or the removable cartridge. In previous releases, the GPLs could only be copied from the fixed disk on the active TDM to the removable cartridge.

Support 12 Million Ported Numbers (Release 25.0)

This feature is not supported in initial shipments of Release Eagle 25.0. Tekelec will issue a notice when the feature becomes available.

The Support for 12 Million Ported Numbers feature allows the Eagle to contain and process 12 million ported telephone numbers for the local number portability (LNP) application. Before Release 25.0, the Eagle could contain only four million ported telephone numbers.

For the Eagle database to contain up to 12 million ported telephone numbers, six

lnp 4digit database objects must be in the database. Each **lnp 4digit** database object consists of two tables, one in the current partition and one in the backup partition of the database. The Eagle database currently contains one **lnp 4digit** database object containing up to two million ported telephone numbers. This database object contains the database tables named **lnp_4dig.tbl** and **lnp_4dig.bkp**.

Refer to the *Database Administration Manual - LNP* and the *LNP Database Synchronization Manual* for the current details on this feature.

New and Changed Commands

Refer to the *Commands Manual* for current usage information.

alloc-mem

A new command, **alloc-mem**, has been added to the Eagle to create up to five additional **lnp 4digit** database objects, for a total of six **lnp 4digit** database objects. Each **lnp 4digit** database object contains two million ported telephone numbers. If all five additional **lnp 4digit** database objects are configured in the database, the database can contain 12 million ported telephone numbers.

rtrv-mem

To display the **lnp 4digit** database objects configured in the database, the **rtrv-mem** command has been introduced into the Eagle. The **rtrv-mem** command uses the optional parameter **obj**, which specifies which type of database object to display.

chg-feat

The **lnp12mil** parameter has been added to the **chg-feat** command so that the necessary LNP 4DIGIT database objects can be created in the database, increasing the maximum number of ported telephone numbers from 8,000,000 to 12,000,000. The **lnp12mil** parameter has only one value, **on**. Once the Support 12 Million Ported Numbers feature is turned on with the **lnp12mil=on** parameter, it cannot be turned off.

rtrv-feat

The **lnp12mil** field has been added to the **rtrv-feat** command output to show whether the Support 12 Million Ported Numbers feature is on or off. In the following example, the Support 12 Million Ported Numbers feature is on.

chg-db

To ensure that the **chg-db** command actions, backup, restore, repair, and import, operate correctly, the capacity of the destination drive must be able to support the additional **lnp 4digit** database objects. The TDMs must contain 4 gigabyte fixed disk drives and the MDAL must contain a 2.3 gigabyte removable cartridge drive. If either of the TDMs or the MDAL do not meet these requirements, the **chg-db** command is rejected.

rept-stat-db

If the LNP feature is on, the output of the **rept-stat-db:display=version** will include the version number of the LNP database with each database listed in the CARD/APPL field.

format-disk

The **format-disk** command in Release 25.0 formats the fixed disk on the standby TDM in addition to formatting the removable cartridge, and is able to perform a low level format of the target disk.

copy-gpl

Two parameters, **dloc** and **sloc**, have been added to the **copy-gpl** command to copy the GPLs from the fixed disk on the active TDM to either the fixed disk on the standby TDM or the removable cartridge. In previous releases, the GPLs could only be copied from the fixed disk on the active TDM to the removable cartridge.

Support Changing the Linkset Name (Release 28.0)

With this feature, the Eagle supports changing the linkset name via an Eagle terminal or SEAS, without having to delete or change any other data associated with the linkset (e.g. **ent-ls** command parameters, links, routes).

The ability to change the linkset name via SEAS is supported via the following methods:

- A supplier-specific parameter for the **chg-ls** and **chg-gtwy1s** commands
- Flow-through

All Eagle data that referenced the old linkset name will now reference the new linkset name, except for *old* entries in the security log.

Enhancements to Existing Commands

The following existing commands have been enhanced for the Support Changing the Linkset Name feature. For more information on these commands, see the *Commands Manual*.

chg-ls

Use this command to change the attributes for a specified linkset in the Eagle database. This command has been enhanced by the new parameter **nlsn**

Support for IP7 8.0 Gateway Features (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

Description

Eagle Release 30.0 supports the feature content of IP⁷ Secure Gateway Release 8.0 (i.e. SCTP Checksum Update, M3UA Protocol Enhancements), as well as all IP⁷ content supported by EAGLE Release 29.x.

Support for LSMS Audit Enhancements (Release 26.1)

LSMS users need a method of auditing locally provisioned data as well as data that is sent from the NPAC to the LSMS and subsequently sent to the Eagle. Currently the following data cannot be audited from the LSMS and raises concerns about database consistencies.

- Default GTT
- Override GTT
- NPA-NXX Split Data

This feature provides support for the LSMS audit of default GTT, override GTT, and NPA-NXX split data residing at the Eagle. The LSMS audits the data, which is locally provisioned at the LSMS, against the data at the EAGLE LNP databases. Eagle support allows LSMS retrieval of the data from the Eagle database. (The LSMS will offer a mechanism to reconcile any discrepancies detected.)

In previous releases, even though the Eagle allows the LSMS to provision Default GTT, Override GTT, or service provider database entries, it provided no mechanism to allow the LSMS to retrieve the DB entities that it has provisioned. This hampered the LSMS from determining exactly what was present in the Eagle LNP DB for these entity types: the LSMS could add and delete these entity types, but could not retrieve them.

This feature rectifies this situation by adding the following new commands to facilitate additional auditing capabilities at the LSMS:

- **vfy-lnp-6ddt**
- **vfy-lnp-lrnovr**
- **vfy-split-npa**

These commands are used similarly to the existing **vfy-lnp-10dt** command:

- They are sent by the LSMS to the Eagle via the OAP across the OAP↔Eagle serial interface (also known as the "2 TN / sec channel," or the "slow channel").
- They support retrieval of a single DB entity (see section 3.1.2 on page 13)
- The command response is returned to the LSMS via the OAP, and is formatted similarly to the `vfY-lnp-10dt` output (i.e. machine-readable).

See “*New Commands*” on page 5-98 more information on these commands.

Auditing the Eagle via High-Speed Audit

Eagle Release 25.0 introduced a new feature, "Enhanced Bulk Download & Audit," which allows the LSMS to audit the subscription component of the Eagle's LNP DB at a very high speed, using an ethernet connection that directly connects the LSMS and Eagle. This audit proceeds as follows:

1. LSMS tells Eagle, via the ethernet connection, what range of subscriptions are to be returned. A starting and ending NPANXX is specified, and all subscriptions provisioned within that range are returned.
2. The BLM card on the Eagle (which has a complete copy of the Eagle LNP DB resident in its RAM memory) retrieves each subscription in the start/end range from its database, computes a checksum for the subscription, and returns the subscription's TN (i.e. its “key”) and computed checksum to the LSMS, again using the ethernet connection
3. LSMS computes a checksum for each of the requested subscriptions, and then compares them against the checksum returned by the Eagle:
 - Matching checksums indicate that the subscription information on the Eagle exactly matches the information on the LSMS.
 - Mismatching checksums indicate that the Eagle has the subscription in its database, but that one or more attributes of the subscription (e.g. LRN) are different. The LSMS should update the subscription information in the Eagle to bring the Eagle into sync with the LSMS.
 - If the Eagle does not return a TN/checksum pair for a subscription that the LSMS has, this indicates that the Eagle is missing the subscription. The LSMS should add the subscription to the Eagle database.
 - If the Eagle returns a TN/checksum pair for a subscription that the LSMS does not have in its database, this indicates that the Eagle still has a subscription that should have been deleted. The LSMS should delete the wayward subscription from the Eagle's database.

The Support LSMS Audit Enhancements feature also allows auditing, via the high-speed ethernet link, of the Eagle's database components:

- default GTT (NPANXX)

- override GTT (LRN)
- NPA split

The auditing of the default GTT, override GTT, and NPA split database entities takes place in a manner similar to that described above for subscriptions, i.e. LSMS will request checksums for a range of entities, and the Eagle returns the information (DB entity key / checksum) via the high-speed ethernet connection.

New Commands

This feature introduces three new commands.

Refer to the *Commands Manual* for current usage information.

Note that because access to these commands is only through the OAP, they are available only to the LSMS.

vfy-lnp-6ddt

The **vfy-lnp-6ddt** command lets the user retrieve all ported LNP NPANXX and its associated message relay and LNP Query default global title translations from the database. The **num** parameter determines how many records the user wants to be shown (potentially within a given range). The optional **force=yes** parameter is required if **num** is greater than 50. This parameter is used to prevent inadvertent and time-consuming displays of extremely large amounts of information.

vfy-lnp-lrn

This command allow the LSMS to query the contents of the LRN table for auditing purposes.

vfy-split-npa

This command displays all NPANXX existing in a split mode in the database. Retrieval of NPANXX is done from the perspective of the old NPANXX, i.e, the NPANXX that contains default data. If the NPANXX specified is not split, no data is displayed for that NPANXX.

Component Interaction Scenario

As mentioned, the new auditing and provisioning capabilities that these features provide can take place over either the OAP serial channel, or over the high-speed IP channel. The following scenarios describe the sequence of events that occur over each.

New Audit Capabilities via OAP Serial Channel

In the following list, the item numbers correspond to the *circled* numbers in Figure 5-22 on page 100.

1. The user at the LSMS terminal decides to audit something via the serial OAP connection: override GTT, default GTT, Split NPA, subscriptions, etc. The user enters auditing parameters (e.g. start / end range, etc.) at LSMS GUI screen.
2. The LSMS sends a request to the OAP requesting the first DB entity to be retrieved for audit. The OAP converts this request into a "SEAS-like" command (e.g., **vfy-lnp-6ddt**).
3. A SEAS-like retrieval command is forwarded to the Eagle.
4. The Eagle retrieves the requested DB entity from the active OAM fixed disk and formats the data into a response using "SEAS-like" syntax.
5. A "SEAS-like" response is sent to the OAP in ASCII format
6. The OAP converts and transmits the ASCII response into a format suitable for the LSMS.
7. The LSMS compares the Eagle DB entity against its own database, and displays discrepancy information to the user at the LSMS console.

This retrieve / compare / display cycle repeats until all DB entities have been audited, or until the LSMS user cancels the audit.

Should the LSMS user elect to reconcile the problem(s) detected by the audit, the reconcile commands (e.g. **upd-split-npa**, etc) are sent to the Eagle using the same OAP serial connection. If the Eagle database was severely out of sync, the LSMS operator can elect to reconcile the problem using the Enhanced Bulk Download feature.

Note that the LSMS operator has a choice as to how any DB updates are sent to the Eagle: the LSMS operator can choose to send them either via the serial connection (makes sense if the number of commands to be sent is small), or via the high-speed IP connection (makes sense if the number of commands is very large).

Figure 5-22. LSMS Auditing / Split Provisioning: Sequence of Events

New Audit Capabilities via High-Speed IP Channel

The items in the following lettered list correspond to the *circled* letters in Figure 5-22 on page 100:

- A. The user at the LSMS terminal decides to audit something via the high-speed LSMS↔Eagle IP connection: override GTT, default GTT, Split NPA, subscriptions, etc. The user enters auditing parameters (e.g. start/end range, etc.) at LSMS GUI screen.
- B. The LSMS sends a request to Eagle's DCM card (running EBDADCM GPL) via the IP connection, which is forwarded across IMT to Eagle's BLM card (running EBDABLM GPL).
- C. The BLM card retrieves requested DB entities (e.g. Override GTT entries), generates a CRC-32 checksum for each entity, and returns the entity key (e.g. for Override GTT entity, the key would be the LRN) and its corresponding checksum to the DCM, which is then forwarded to the LSMS via the high-speed IP connection.
- D. The LSMS retrieves the corresponding DB entity from its own database, computes the CRC-32 checksum, then compares the checksum against what the Eagle has provided. Any mismatching of the checksums indicates that what the Eagle has for this entity is different than what the LSMS has.

Furthermore, the DB entity keys that are returned from the Eagle allow the LSMS to detect superfluous entries in, and entries that are missing from, the Eagle LNP DB. All discrepancies are displayed to the LSMS operator.

This retrieve / checksum / compare / display cycle repeats until all DB entities have been audited, or until the LSMS user cancels the audit.

Should the LSMS user elect to reconcile the problem(s) detected by the audit, the reconcile commands (e.g. **upd-split-npa**, etc.) would likely be sent to the Eagle using the OAP serial connection. If the Eagle database was severely out of sync, the LSMS operator could elect to reconcile the problem using the Enhanced Bulk Download feature.

Limitations

The new verify (**vy-xxxx**) commands mentioned above do not support the retrieval of ranges of database entries. Instead, each command accepts the key of a single database entity to be retrieved. The command output shows the details of the single database entity that was specified, assuming that the entity exists, or error information (if it doesn't).

Support for LSMS Split Provisioning (Release 26.1)

NPA-NXX splits currently are provisioned locally at the LSMS and at the Eagle. This is not the optimum method of provisioning LNP data, as the LSMS can service multiple Eagles, making coordination of entering split data cumbersome.

This feature allows NPA-NXX Split data to be provisioned at the LSMS and forwarded to the Eagle, instead of being provisioned at the Eagle separately. This feature supports a single point NPA Split administration from the LSMS.

Over OAP Serial Channel

This feature implements a set of commands that allow the LSMS to provision and query NPA split information at the Eagle, using the connection that exists between the Eagle↔LSMS provided by the OAP. These new commands are:

- **upd-split-npa**
- **dlt-split-npa**
- **vyf-split-npa**

See “*New Commands*” on page 5-102 for more information on these commands.

Via Enhanced Bulk Download

This feature supports downloading of NPA split information to the Eagle as part of a high-speed bulk download. This existing high-speed bulk download facility has been expanded to allow NPA split information to be downloaded.

New Commands

This feature implements three new commands. (Because these commands can be used only via the OAP, they are available only to the LSMS.) For more information on these commands, see the *Commands Manual*.

upd-split-npa

This command forces two different NPANXXs to reference the same last 4 digits TN in the database. During this time, updates to either NPANXX update the same last 4 digit entry of a 10 digit ported TN. The parameters for this command are the existing NPANXX, and the new NPANXX for the split. All existing NPANXX data automatically is copied to the new NPANXX for the split.

dlt-split-npa

This command removes the NPANXX from the database. The parameter for this command is the NPANXX to be removed. This command verifies that the NPANXX input is in a split-NPA condition with another NPANXX.

vfy-split-npa

This command displays all NPANXX existing in a split mode in the database. Retrieval of NPANXX is done from the perspective of the old NPANXX, i.e, the NPANXX that contains default data. If the NPANXX specified is not split, no data is displayed for that NPANXX.

Limitations

The new verify (**vfy-xxxxx**) command mentioned above does not support the retrieval of ranges of database entries. Instead, each command accepts the key of a single database entity to be retrieved. The command output shows the details of the single database entity that was specified, assuming that the entity exists, or error information (if it doesn't).

Support for Matching Self-ID Rule in SEAS CHG-SID (Release 22.0)

In previous releases the SEAS ASGN-SID and CHG-SID command functions could change the self ID point code and CLLI of the Eagle if either SEAS command were entered. From the SEAS interface, only the ASGN-SID command function can change the point code and CLLI of the self ID. The CHG-SID command function is not supposed to change the point code or CLLI of the Eagle, but those parameters are used to verify whether they match the current point code and CLLI of the Eagle.

This feature adds a rule to the SEAS CHG-SID command function on the Eagle that requires that the specified point code and CLLI to match the current self ID point code and CLLI of the Eagle. If they do not match the current values, the CHG-SID command attempt is rejected.

This gives customers using the SEAS interface protection against accidental changing of the Eagle's self ID. This feature does change the functions of the SEAS ASGN-SID and Eagle **chg-sid** commands.

Support for MTP Status Functions (IP⁷ Release 2.0)

This feature, available only on DCM cards that support the **ss7ipgw** application, allows the Message Transfer Part (MTP) status of point codes in the SS7 networks to be made available to IP-connected media gateway controllers (MGCs) and IP-SCPs. This feature is similar to the MTP3 network management procedures used in an SS7 network.

This feature enables an IP device to:

- Divert traffic from an SG that is not able to access a point code that the mated SG can access
- Audit point code status
- Build up routing tables before sending traffic

- Be warned about SS7 network congestion
- Abate congestion
- Obtain SS7 User Part Unavailability status

Enhancements to Existing Commands for MTP Status Feature

This feature implements changes in output for the following existing maintenance commands

.Refer to the *Commands Manual* for current usage information.

msucount

Modified to display the number of MTP primitives transmitted, received, and discarded for each link.

sockstate

Modified to display the version number of the Transport Adapter Layer Interface (TALI) protocol and which MTP Primitives are enabled .

Support for Provisioning Multiple EPAPs (Release 29.0)

Currently, it is only possible to provision a single mated pair of MPS nodes, where each MPS node contains one EPAP A and one EPAP B. EPAP A contains a PDB and an RTDB. EPAP B contains only an RTDB. For customers who need to deploy more than one pair of MPSs, this requires them to provision each pair separately.

Many customers desire the ability to add more MPSs without having to change their provisioning system, or provision from multiple sources.

This feature is transparent to the PDBI clients. Each client can provision data in the same manner, no matter if it is provisioning a single MPS pair, or multiple MPS pairs.

With EPAP 3.0, customers may choose to add Eagles to their network without changing the way that they provision data. EPAP Software updates the Real-time databases at the additional sites. The two MPSs that contain the PDB are called "provisionable" because these are the sites to which the customer provisioning application may connect. The additional MPSs are called "non-provisionable."

Newly added non-provisionable MPSs will use the Selective Homing of EPAP RTDBs feature to specify the PDB(s) from which to receive updates.

Hardware Requirements

The MPS platform is required to support the ability to install both provisionable and non-provisionable EPAP MPSs.

Enhancements to the User Interface

With the addition of Support for Provisioning multiple EPAP RTDBs, references to the "Local" and "Remote" PDB may no longer have meaning. These references will be changed throughout the text UI and GUI to specify the IP address of the PDB being identified.

Upgrade Considerations

This feature does not impact the EPAP 1.x/2.x to 3.0 upgrade. New Eagles may not be included for provisioning until all affected sites have been upgraded to EPAP 3.0. Interaction with Eagle is not affected by this feature.

Support for Secure Gateway Functionality through IP⁷ 7.0 (Release 29.0)

Eagle Release 29.0 supports the feature content of IP⁷ Secure Gateway Release 7.0 (i.e. IP User Interface: Telnet Support and FTP Retrieve and Replace.

Support for TALI Architecture (IP⁷ Release 4.0)

Each release of the IP⁷ Secure Gateway is built to the current level of the Transport Adapter Layer Interface (TALI) protocol. This release of the IP⁷ Secure Gateway supports TALI Release 3.0.

Support for the CLLI Parameter for Adding or Changing Linksets (Release 22.0)

In Release 22.0, the Eagle accepts the FE-CLLI parameter when adding a linkset, changing a linkset, and displaying linksets on the SEAS interface. The FE-CLLI of the point code is not stored in the linkset table, but in the destination point code table.

When the FE-CLLI is specified while adding a linkset or changing a linkset's attributes from the SEAS interface, the FE-PC and FE-CLLI are compared with entries in the destination point code table of the Eagle. If the specified values match an entry in the destination point code table, the command adding the linkset is accepted. If either value does not match any entries in the destination point code table, the command is rejected. When changing a linkset's attributes from the SEAS interface, the FE-CLLI value cannot be changed.

The Eagle's linkset configuration commands, **ent-ls**, **chg-ls**, and **rtrv-ls**, have also been changed to support this feature. The **clli** parameter has been added to the **ent-ls** and **chg-ls** commands. If the value of the **clli** parameter, specified with either the **ent-ls** or **chg-ls** commands, does not match the value of the CLLI of the adjacent point code, shown in the destination point code table by the **rtrv-dstn** command, the command is rejected with this error message.

Error Message E2335 Cmd Rej: CLLI is not identical to that of matching Destination

The output of the Eagle's **rtrv-ls** command has been changed to support this feature. The following is an example of the output of the **rtrv-ls** command if a CLLI has been assigned to the adjacent point code of the linkset.

Support for the New Linkset Name Parameter for Changing the Attributes of a Route (Release 22.0)

The linkset name parameter (**nlsn**) has been added to the Eagle's **chg-rte** command and to the SEAS CHG-RTE command function. This eliminates the requirement on the Eagle to remove an existing linkset and re-enter the linkset with a different linkset name to change the linkset name.

Error Messages The following error messages displayed on the Eagle terminal have been added to the **chg-rte** command.

- Either the **nlsn**, or **rc** parameters must be specified with the **chg-rte** command. In neither of these parameter are not specified, the command is rejected and this error message is displayed.

E2136 Cmd Rej: At least one optional parameter is required

- The new linkset specified by the **nlsn** parameter cannot be assigned to any existing routes. If the new linkset is assigned to any existing routes, the command is rejected and this message is displayed.

E2355 Cmd Rej: Linkset already assigned to route

- If a new link set name (**nlsn**) is specified in the **chg-rte** command, that link set name must be defined in the linkset table. If the new linkset name is not defined in the linkset table, the command is rejected and this error message is displayed.

E2346 Cmd Rej: Linkset not defined

- If a new link set name (**nlsn**) is specified in the **chg-rte** command, that linkset must contain at least one signaling link. If the new linkset does not contain at least one signaling link, the command is rejected and this error message is displayed.

E2128 Cmd Rej: Linkset assigned to route must have at least one link

- The new linkset specified by the **nlsn** parameter can be assigned to an adjacent point code that is a cluster point code as long as the linkset type of this linkset is either B, C, or D. If the linkset type of the linkset that is assigned to a cluster point code is either A or E, the command is rejected and this error message is displayed.

E2349 Cmd Rej: Link Set Type invalid for Cluster Destination

Support for Up to 41 IPLIMx DCMs (IP⁷ Release 2.2)

The IP⁷ Secure Gateway supports up to 41 DCMs that run either the **iplim** application or the **iplimi** application. In previous releases, the limit of DCM cards supported for the **iplim** application was six.

In addition, the IP⁷ Secure Gateway can support two DCMs that run the **ss7ipgw** application.

Enhancements to Existing Commands for 41 IPLIMx DCMs

No changes to existing commands are required.

Support LSMS Disaster Recovery (Release 23.1)

When a disaster occurs and the main LSMS is disabled, the user can switch from the main LSMS to an optional shadow LSMS. The shadow LSMS is a geographically remote LSMS that actively receives data from the NPACs. The shadow LSMS serves as a backup to the main LSMS. The shadow LSMS is continually queuing the transactions for the OAPs. The OAPs are configured to receive data only from the main LSMS. Before the switchover can occur, the shadow LSMS must be in stable condition. The shadow LSMS should have no active alarms or hardware failures and cannot be in the recovery mode with any NPAC.

Once the health of the shadow LSMS is confirmed, the OAPs must be disassociated from the main LSMS and associated with the shadow LSMS. When an OAP tries to establish the association with the shadow LSMS, the resynchronization procedure automatically begins.

Before Release 23.1, changing the association of the OAP and LSMS was performed manually from the OAP and often required the assistance of Tekelec Technical Services. This feature allows a user to use the Eagle terminal to change the association of the OAPs and the main LSMS and shadow LSMS. Two new commands have been introduced to change the OAP LSMS association, **chg-oap-config** and **rtrv-oap-config**.

chg-oap-config

The **chg-oap-config** command is used to change the LSMS association with the OAP in the Eagle database.

rtrv-oap-config

This command displays OAP configuration information in the Eagle database.

Auditing the OAP Database

In order to keep OAP database synchronized with the Eagle, a checksum is created using all of the OAP configuration data stored on the Eagle. The OAP also calculates this checksum based on the data it has. This checksum is returned by the OAP with every forced maintenance poll allowing the Eagle to compare and act on the result. If the checksum values do not agree, the Eagle generates a minor alarm (UAM 0364) within 10 seconds:

Support of E1 Interface for SS7 Signaling Links (Optional) (Release 22.2)

As an option for Release 22.2, the E1 Interface card (E1/Channel Appliance) provides a 2.048 Mbit/sec E1 interface that complies with ITU-T recommendations G.703, G.704, and G.706.

Refer to the *Database Administration Manual - SS7* for current information o this feature.

Support of E1 Interface for SS7 Signaling Links (Optional) (Release 24.0)

As an option for Release 24.0, the E1 Interface card (E1 / Channel appliqué) provides a 2.048 Mbit / sec E1 interface that complies with ITU-T recommendations G.703, G.704, and G.706.

Refer to the *Database Administration Manual - SS7* for current information o this feature.

Support of E1 Master Clock Interface for SS7 Signaling Links (Optional) (Release 22.2)

As an option for Release 22.2, the E1 Master Clocking TDM card provides support for Master E1 clocking. The TDM-E1 card supports master clocking of high-speed links at E1 speeds (2.048Mbits/sec) and provides E1 clocks to all cards in the Eagle system.

Upgrade Considerations

The following considerations must be taken into account when upgrading to this option:

- Customers with Release 22.2 hardware who want to add the Master Timing support option must upgrade their TDM to the TDM-E1.
- Customers who choose to upgrade a system currently using DS-0 links will not have these links available after upgrade when using Master clocking.

Suppression of Gateway Measurements on Non-Gateway Linksets (Release 25.0)

Release 25.0 adds the capability to exclude non-gateway linksets from the P_GTWY schedule. The exclusion can be applied to reports going to the terminal interface, the SEAS interface, both, or neither. The P_GTWY measurement schedule allows for the collection and reporting of gateway-related data from the STP. The P_GTWY schedule, as currently implemented in the Eagle, provides measurement data on all linksets defined in the linkset table.

This new feature, however, provides the Eagle with the capability of optionally reporting only on linksets that are defined as gateway linksets. Gateway linksets are linksets that have a screenset assigned to them, or that have been defined as gateway linksets via SEAS.

The implementation of this feature does not change the measurement data provided by the schedule, but rather controls which linksets are included in the report. This feature also does not change the SEAS command interface to the Eagle for the collection of the P_GTWY schedule.

The optional capability is controlled by a new field, `gtwy_ls_fltr`, which is located in the measurement control table, and can be initialized to independently control reports for Eagle HMI and SEAS interfaces.

Changed Commands

Refer to the Commands Manual for current usage information.

`chg-meas`

The state of the field is user-controlled with the `chg-meas` command, using the new parameter `gtwylsfltr`.

`rtrv-meas-sched`

The `rtrv-meas-sched` command output has been modified to report the current value of the `gtwy_ls_fltr` field.

TALI “A” Link Connectivity (Release 28.0)

Description

This feature provides the capability to interface the EAGLE STP with an SCP by utilizing the TALI/IP protocol stack and the TCAP-over-IP feature of the merged Secure Gateway code. Specifically, this feature provides a TCAP-over-IP interface for SCP connectivity using TALI 3.0. This will allow the EAGLE to perform the SS7 interface functions of the SCP, eliminating the need for the IP7 Front End in this application.

The Eagle STP uses the following features from the IP7 Secure Gateway feature set.

- TCAP Over IP Gateway Connectivity to IP-SCPs
- Feature key support
- TALI 3.0

The TCAP-over-IP feature allows SS7 nodes to exchange SCCP/TCAP Query/Responses with an IP enabled SCP. The Secure Gateway will map the Point Code/SSN to one or more TCP sessions, convert the SS7 MSUs to TCP/IP packets by embedding the SCCP/TCAP data inside a TCP/IP packet, and route it over an IP (IPGTWY) network.

For more information on the TALI A Link Connectivity feature, refer to the Database Administration Manual - SS7.

New Hardware Required

No new hardware is required for this feature.

New Commands

The following commands have been created to support the TALI "A" Link Connectivity feature. For more information on these commands, see the *Commands Manual*.

chg-ctrl-feat

Use this command to activate or deactivate the On/Off features that have been purchased and enabled.

rtrv-ctrl-feat

Use this command to retrieve controlled features that are purchased and enabled in the system.

enable-ctrl-feat

Use this command to enable a Controlled Feature the customer has purchased.

ent-serial-num

Use this command to enter the NT serial number into the database for an Eagle STP IP⁷ Secure Gateway system.

rtrv-serial-num

Use this command to retrieve the NT serial number for the system.

msuroute (msu routing information)

This pass-through (**pass**) command provides a list of all routing keys currently configured on an SS7IPGW/IPGWI card that could be used to route a particular MSU.

Enhancements to Existing Commands

The following existing commands have been enhanced to support the TALI “A” Link Connectivity feature. For more information on these commands, see the *Commands Manual*.

rtrv-ls

Use this command to display the attributes of a link set or all link sets. For this feature, this command has been enhanced to display output for the ITU linkset with IPGWAPC=YES.

ent-card

Use this command to add a card to the database. The card type and application specifies the function assigned to the card. This command has been enhanced with the new range value **:appl=ipgwi**.

rtrv-card

Use this command to display the information about a card. This command has been enhanced to display output for the IPGWI card.

rept-stat-card

Use this command to display the card status and maintenance activity states. This command has been enhanced to display output for the IPGWI card.

act-/chg-/rept-stat-/rtrv-gpl

These commands have been enhanced with the new range value **:appl=ipgwi**. The **rept-stat-gpl** and **rtrv-gpl** commands have been enhanced to display output for the IPGWI application (GPL).

act-/blk-/ublk-/inh-/tst-/unhb-/rept-stat-slk

For these commands, the **:port** parameter value **ipgwi** (IP signaling link) is not supported.

Additionally, for the **rept-stat-slk** command, the **:l2stats** parameter is not valid for the IPGWI application.

rept-stat-sys

This command has been enhanced to display output for the IPGWI application (GPL).

chg-dcmps

Use this command to change the set of generic timers and parameters used by the Eagle application. For this feature, the ranges for the **:parm**, **:pvalue**, and **:timer** parameters are explained below.

rtrv-dcmps

Use this command to retrieve the sets of generic timers and parameters that can be used by any Eagle application.

ent-appl-rtkey

Use this command to configure static entries in the Routing Key table, which associates a routing key with a socket name. It has been enhanced with the parameters described below.

chg-appl-rtkey

This command is used to change static routing key table entries. It has been enhanced by the following parameters.

dlt-appl-rtkey

Use this command to delete static or dynamic entries from the Routing Key table. It has been enhanced by the following new parameters.

rtrv-appl-rtkey

This command is used to retrieve entries from the static and dynamic Route Key tables. It has been enhanced by the following new parameters.

ent-appl-sock

Use this command for the IPLIM, IPLIMI, or SS7IPGW, or **IPGWI** application to configure the Socket table which is used to associate the local host/local port to a remote host/remote port. For SS7IPGW or IPWGI cards, only port a can be assigned to a signaling link.

chg-appl-sock

Use this command for the IPLIM, IPLIMI, or SS7IPGW, or **IPGWI** application to configure the Socket table which is used to associate the local host/local port to a remote host/remote port. For SS7IPGW or IPWGI cards, only port a can be assigned to a signaling link.

rtrv-appl-sock

Use this command to retrieve the configuration data from the Socket table. The Socket table is used to associate the local host/local port to a remote host/remote port. For SS7IPGW or **IPWGI** cards, only port a can be assigned to a signaling link.

msucount

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and sockets. It has been enhanced with the new parameters shown in bold.

TALON Development Kit (IP⁷ Release 2.0)

Release 2.0 of the IP⁷ Secure Gateway also optionally includes the TALON Release 2.0 Development Kit. This kit includes:

- iGate, which includes:
 - iGate clients, which provide the client-side implementation of the Transport Adapter Layer Interface (TALI) protocol, Release 2.0.
 - Application message queues, which hold messages sent between the iGate clients and the customer's application.
 - iGate controller, which controls starting and stopping of iGate clients.
 - iGate command line interface, through which the user enters commands to start up, shut down, and reconfigure iGate components, to send TALI service and management messages, and to obtain status and measurements.
- TALON Assessor, a tool used to test and verify an implementation of the TALI Release 2.0 protocol. The Assessor can implement both sending and receiving messages as either a TALI client or server, as well as provide logging and measurements.
- ISDN User Part (ISUP) Access Library, a collection of C++ classes that allow customers to rapidly develop C++ applications that need to encode and decode ISUP messages. This library allows customer's applications to either set or get the value of an ISUP message or parameter without needing to directly access the bit stream of the ISUP message. Customers can compile their applications in the library, connect to TALON iGate queues, and then receive, parse, process, and send ISUP messages.

For more information about the TALON Development Kit, refer to the TALON Release 2.0 User Manual, which is included on the CD-ROM that contains the TALON software.

Temporary Alarm Inhibiting and Offline Functions (Release 25.0)

These features provide a two-part enhancement to the Selective Alarm Inhibit feature introduced with Release 22.0. First, the craftsperson can choose to have an alarm inhibited until the problem is fixed and the alarm clears (Temporary Alarm Inhibiting).

Second, these features give the craftsperson the mechanism for inhibiting critical alarms (Offline Functions). This is useful when a critical alarm has been investigated, the cause is known, and the critical alarm expected based on the current network. By allowing acknowledgment of specified critical alarms, new critical alarms are not masked.

Currently, alarms are inhibited until the inhibit is manually removed (Permanent Inhibit). Temporary Alarm Inhibiting lets the user specify a temporary inhibit indicating that the inhibition of the alarm should be cancelled when the condition clears. This allows a new occurrence of the same alarm to be issued.

A craftsperson may choose to inhibit existing alarms or future alarms in order to focus on higher severity or unknown alarms. A craftsperson may choose to inhibit alarms for various reasons, including:

- In a special maintenance situation where repeated alarms from malfunctioning equipment would tend to mask more critical unknown alarms (e.g. an out-of-service link due to a physical break that cannot be repaired for days).
- In the situation where the system is being provisioned. Currently alarms are generated immediately after entities are entered into the database. The craftsperson probably ignores these alarms while the system is being configured. Ignoring alarms due to entry of entities could result in the masking of alarms that may require immediate attention.
- In a situation where the craftsperson, while working on repeating alarms from malfunctioning equipment, might tend to mask more critical additional alarms. The craftsperson will want to temporarily inhibit the repeating alarms. When the repeating alarm is cleared, it will be uninhibited, and the craftsperson will be able to see it if it reoccurs.
- In a situation where a device is going to be put offline, or is offline and the repeated critical alarms associated with the offline equipment would tend to mask more critical alarms.

The method for inhibiting alarms is the same, regardless of the reason for inhibition. The craftsperson can either turn off (i.e. Temporary Inhibit or Permanent Inhibit) or turn on (i.e. Uninhibit) specified alarms through command entry. Permanent alarms are persistent.

Alarm System Functionality

There are four Alarm Indicators and one Control / Status display in the system. The fuse panels and row panels have lights to indicate alarms. The Local Maintenance Center and Remote Maintenance Center have signals that can be monitored for alarms.

All of these indicators have separate lines for critical, major, and minor alarms. The Control / Status Display is in the Status Area of the VT320 Screen. The same data is available through the **rept-stat-alm** command. See Figure 5-23.

Figure 5-23. Alarm Indicators

Customer Use Scenario

A typical case where these features are needed follows:

- In an office with alarms that cannot be repaired quickly, "stuck alarm" (e.g. a cut link)...
- and only the remote maintenance center will be monitoring the alarms.

Because the alarms have not been repaired, all the indicators continue to be active (i.e. lights / signals on). When a new alarm arrives that is not for the device that has the "stuck alarm," the RMC indicator cannot accurately inform the maintenance personnel that a new alarm has occurred.

These features allow the maintenance personal to inhibit the "stuck alarm" that will turn off the appropriate alarm indicators. Now, at the RMC, the indicators will be cleared (i.e. lights off), and any alarm generated for a device that does not have its alarms inhibited will activate the indicators (i.e. lights on).

The mechanism for clearing the indicators is by inhibiting the alarms for the failed devices. When all devices that have alarms have had their alarms inhibited, the indicators are cleared.

The RMC indicators in Table 5-17 presents one possible scenario that illustrates the use of the inhibit alarm feature (i.e. Offline Functions) Without the ability of having a cleared indicator, the RMC personnel might not react as quickly as possible to the subsequent link failure.

NOTE: This example does not address the output generated to the RMC maintenance channel. When link 4107 port B failed, the system generated the appropriate output message.

Table 5-17. Example of Inhibit Alarms Use

ACTION	CONTROL COUNTS (Inhibited)			RMC INDICATOR		
	CRIT	MAJR	MINR	CRIT	MAJR	MINR
System clear -- no failed devices in the system	0	0(0)	0	off	off	off
A span is cut at 4:50pm -- cannot be repaired for 10 hours						
Link 1201, A generates alarm because of physical failure	0	1(0)	0	off	ON	off
Link 2318, B generates alarm because of physical failure	0	2(0)	0	off	ON	off
Link 5205, B generates alarm because of physical failure	0	3(0)	0	off	ON	off
Link Set ls1234 generates alarm because all links in link set are Out of Service	0	4(0)	0	off	ON	off
User inhibits alarm for link set ls1234	0	4(1)	0	off	ON	off
User inhibits alarm for link 1201,A	0	4(2)	0	off	ON	off
User inhibits alarm for link 2318,B	0	4(3)	0	off	ON	off
User inhibits alarm for link 5205,B	0	4(4)	0	off	off	off
User turns control over to the Remote Maintenance Center for the night.						
New alarm -- Link 4107, B fails not due to physical span failure	0	5(4)	0	off	ON	off
RMC reacts to the event and investigates the failure						

The scenario presented in Table 5-18 illustrates the use of the temporary inhibit alarm feature. Without the ability of having a cleared indicator, the RMC personnel might not react as quickly as possible to the subsequent link failure.

NOTE: This example does not discuss the output generated to the RMC maintenance channel. When link 4107 port B failed, the system generated the appropriate output message.

Table 5-18. Example of Temporary Alarm Inhibit Use

ACTION	CONTROL COUNTS (Inhibited)			RMC INDICATOR		
	CRIT	MAJR	MINR	CRIT	MAJR	MINR
System clear -- no failed devices in the system	0	0(0)	0	off	off	off
A span is cut at 4:50pm – cannot be repaired for 10 hours						
Link 1201, A generates alarm because of physical failure	0(0)	1(0)	0	off	ON	off
Link 2318, B generates alarm because of physical failure	0(0)	2(0)	0	off	ON	off
Link 5205, B generates alarm because of physical failure	0(0)	3(0)	0	off	ON	off
Link Set ls1234 generates alarm because all links in link set are Out of Service	0(0)	1(0)	0	off	ON	off
DPC prohibited critical alarm	1(0)	4(0)		ON		
User temporarily inhibits critical alarm	1(1)	4(0)		off		
User temporarily inhibits alarm for link set ls1234	1(1)	4(1)	0	off	ON	off
User temporarily inhibits alarm for link 1201,A	1(1)	4(2)	0	off	ON	off
User temporarily inhibits alarm for link 2318,B	1(1)	4(3)	0	off	ON	off
User temporarily inhibits alarm for link 5205,B	1(1)	4(4)	0	off	off	off
User turns control over to the Remote Maintenance Center for the night.						
New alarm – Link 4107, B fails not due to physical span failure	1(1)	5(4)	0	off	ON	off

Table 5-18. Example of Temporary Alarm Inhibit Use (Continued)

RMC reacts to the event and investigates the failure	1(1)	5(4)	0	off	ON	off
Link 4107, B failure and physical span failure corrected.	1(1)	4(4)	0	off	off	off
Link 1201, Span fixed, alarm cleared	1(1)	3(3)	0	off	off	off
Link 2318, Span fixed, alarm cleared	1(1)	2(2)	0	off	off	off
Link 5205, Span fixed, alarm cleared	1(1)	1(1)	0	off	off	off
Link Set ls1234 has no failed links, all alarms cleared.	1(1)	0(0)	0	off	off	off
DPC prohibited – critical alarm cleared	0(0)			off	off	off
A span is cut at 4:00 am – cannot be repaired for 10 hours						
Link 1201, A generates alarm because of physical failure	0(0)	1(0)	0	off	ON	off
Craftsperson knows the span failure has reoccurred.						

Administration

Two commands, **inh-alm** and **unhb-alm**, which were created in Release 22.0, have been enhanced to accommodate the Temporary Inhibit feature and the Offline Functions feature in Release 25.0. These changes allow for the following:

- The craftsperson will be allowed to temporarily inhibit the alarms on a device. The alarms will be inhibited until the alarm is cleared, at which point the device's alarms no longer will be inhibited.
- If a device's alarms are inhibited, the craftsperson will not be able to re-inhibit the same device's alarms. This is important for the scenario where the craftsperson tries to change a permanently inhibited alarm on a device to be temporarily inhibited. The craftsperson must uninhibit the alarms and inhibit them more precisely.
- A craftsperson is provided with a mechanism to inhibit critical alarms. This mechanism includes first allowing the STP option **critalminh**, which allows the inhibiting of critical alarms.
- When a craftsperson inhibits an alarm and specifies that critical alarms will be inhibited, the effect is that critical, major and minor alarms are all inhibited. If the craftsperson inhibits an alarm and specifies that major alarms will be inhibited, the effect is that major and minor alarms are all inhibited.

See “*Changed Commands*” on page 5-123 more information on the **inh-alm** and **unhb-alm** commands.

Administration Rules:

1. A device must exist as a database or system-fixed entity.
2. You cannot inhibit an already inhibited device.
3. You cannot uninhibit an uninhibited device.
4. Normal database rules apply for an administration change to the database.

The command handler parameter combinations for the **inh-alm** and **unhb-alm** appear in Table 5-19.

Table 5-19. Device / Parameter Command Matrix

	No pa- rameters	LOC	PORT	LSN	ID	DPC	DPCA	DPCI	DPCN
CARD		1101..6 118.							
SLK		1101..6 118	A and B						
LS				Link Set Name s					
ROUTE						nnn-ccc- mmm	nnn-ccc- mmm	z-aaa-i	nnnnn
TRM			1..16						
SYSCLK	No paramete rs								
DLK		1101..6 118							
CDT					1..16				
LSMSQ3			A1,A2, B1, B2						
SEASX25			A1,A2, B1, B2						

Maintenance

There are several actions that the maintenance system must control:

- Visual Indicator Control
- Visual Control Area banner display of the inhibited alarm count
- Suppression of alarm output
- Generation of Inhibit Message
- **rept-stat** command changes
- Hourly Status Report changes

Each is discussed in the following sections.

Control Area Changes

There are four boxes on the VT320 Control Area, of which only three were used prior to Release 21.0. The fourth currently displays the number of devices that have alarms inhibited. Viewed from left to right on the screen, they indicate Critical, Major, and Minor alarms, and the number of devices that have alarms inhibited.

Suppression of Output

Suppression of the output occurs when the function call is made to "generate unsolicited alarm output." This prevents any changes to the analysis code. Within the "generate unsolicited output," the action has been changed to "generate unsolicited alarm with no output." This function is used during OAM initialization to set alarms without generating output, and effectively suppresses the output.

New UAMs

Two UAM's inform the user that the device has had its alarms inhibited:

```

      RLGHNCXA03W 99-07-07 00:57:31 EST Rel 25.0.0
      0100.0294   CARD 1201 SS7ANSI      REPT-ALMINH: alarm output Perm
inhibited
;
      RLGHNCXA03W 99-07-07 00:57:31 EST Rel 25.0.0
      0100.0296   CARD 1201 SS7ANSI      REPT-ALMINH: alarm output Temp
inhibited
;

```

Status Command Changes

Device Status Commands

The associated state of a card is displayed as "ALMINH" when a card's alarms are inhibited.

The '**stat**' option for these commands has been extended to support '**ALMINH**', which displays all cards whose alarms are inhibited. When the Associated State is set to **ALMINH**, it is overwritten by other states (e.g. **BIP**) until the inhibition is removed.

See the sections "*rept-stat-sys*" on page 5-123, "*rept-stat-trbl*" on page 5-123, and "*rept-stat-alm*" on page 5-124 for more information.

Hourly Status Report

The Condition Type field in the Hourly Status Report has the **INHAUDB** value added to possible values. The full list of Condition Types follows.

1. **SCMMA** - The device has been disabled due to manual maintenance action (e.g. **inh-card**). This condition applies regardless of previous alarm state.
2. **MTCEINT-0** - The reported device is off-normal (**ANR**), but there is no alarm associated with this device. An alarmed condition for another device typically impacts the state of this device, e.g. **OOS** links affect linksets, **OOS** **DLKs** affect **SLAN** cards.
3. **MAN** - The reported device is off-normal (**OOS-MT**), but there is no alarm associated with this device. The off-normal condition was caused manually, e.g. **ent-dstn** command entry.
4. **NULL** - No specific 'cond type' is currently supported for this release. There is sufficient information to ascertain the device condition from the report. The craftsperson may use **rept-stat-xxx** command(s) to collect further information.
5. **INHAUDB** - The user has manually inhibited alarms for this device. The time when the device was inhibited is recorded, and displayed during the hourly report.

The Hourly Status Report includes the alarm status periodic reminder added at its end. A new status indicates alarms that have been inhibited.

Output Example

```
RLGHNCXA03W 99-07-07 00:57:31 EST Rel 25.0.0
5023.0000 REPT COND CARD
"CARD 1201:,MTCEINT-0,,96-11-19,14:58:24,,,,,"
"CARD 1202:0013,,SA,96-11-19,14:44:38,,,,**"
"CARD 1203:0013,,SA,96-11-19,14:44:38,,,,**"
"CARD 1204:0013,,SA,96-11-19,14:44:38,,,,**"
"CARD 1206:0013,,SA,96-11-19,14:44:38,,,,**"
"CARD 1207:0034,,NSA,96-11-19,14:52:56,,,,* "
"CARD 1208:0013,,SA,96-11-19,14:44:38,,,,**"
"CARD 1216:0013,INHAUDB,NSA,96-11-19,13:44:38,,,,,"
"CARD 1101:0034,MTCEINT-0,NSA,96-11-19,14:52:56,,,,* "
"CARD 1115:0143,,NSA,96-11-19,14:57:52,,,,* "

RLGHNCXA03W 99-07-07 00:57:31 EST Rel 25.0.0
5034.0000 REPT COND ALARM STATUS
"ALARMS:TEMP INHIBITED,1,3,4"
"ALARMS:PERM INHIBITED,2,14,4"

"ALARMS:ACTIVE,2,0,0"
"ALARMS:TOTAL,5,17,8"
"ALARMS:STATUS,AUDIBLE,SILENT,SILENT"
```

Note that the alarm status is shown in the following sequence: critical, major, and minor. Thus the bold text means there are two critical alarms, fourteen major alarms, and 4 minor alarms.

Changed Commands

Refer to the *Commands Manual* for current usage information.

chg-stpopts

The **chg-stpopts** command has been enhanced with the **critalminh** parameter. This parameter allows the craftsperson to inhibit critical alarms. No critical alarms can be inhibited when disabling **critalminh**.

rtrv-stpopts

The **rtrv-stpopts** command has been enhanced to include the current value of the **critalminh** parameter.

inh-alm

The **inh-alm** command has been enhanced to allow the inhibiting of routes. This involves the addition of **route** to the range of values for the parameter **dev**. If no DPC is specified when **dev=route**, the **inh-alm** command is rejected.

unhb-alm

The **unhb-alm** command has been enhanced to allow the uninhibiting of routes. This involves the addition of **route** to the range of values for the parameter **dev**. Also, the parameters **dpc**, **dpca**, **dpci**, and **dpcn** have been introduced so that a craftsperson can uninhibit alarms on specific routes.

If no DPC is specified when **dev=route**, the **unhb-alm** command is rejected.

rept-stat-sys

The display output in response to the **rept-stat-sys** command now includes the display of the count of alarm inhibited devices for cards, links, link sets, routes, terminals, SEAS X.25 links, LSMS Q.3 Associations and terminals.

rept-stat-trbl

The output for this report has been modified to add an indicator to identify alarms that have been inhibited. The letter "I" appears immediately after the MRN to indicate that the alarm has been inhibited.

rept-stat-alm

This command displays the number of alarm(s) per frame that have been inhibited. It adds a row for the total number of inhibited alarms per severity level.

Thresholding of UIM Messages (Release 25.0)

This feature suppresses the generation of a UIM message when it exceeds a certain user-settable threshold. It allows the user to set, delete, or display the UIM threshold and interval on a per-UIM number basis.

The thresholding capability provided by this feature is limited by the systemwide threshold of 4 UIMs per second, i.e. any threshold set using this new feature is superseded by the systemwide threshold, which is not administrable.

In support of this feature, the following commands have been created:

- **set-uim-acthresh** (to set UIM threshold and interval)
- **rtrv-uim-acthresh** (to display the UIM threshold and interval)
- **dlt-uim-acthresh** (to delete the UIM threshold and interval)

In addition, a UIM logging feature has been introduced primarily as a complement to the UIM Thresholding feature. (The UIM Thresholding feature allows for the suppression of UIM messages when they exceed a certain user settable threshold. The user can define the threshold such that no UIM's will be displayed.) The new logging feature provides a way to retrieve all the UIM messages that would have been printed, even those not displayed due to the UIM threshold feature.

The craftsperson can retrieve the logged UIMs with the **rtrv-log** command, using the new value "UIM" for the **type** parameter.

The UIMs are stored on disk only by the active OAM. However, the UIMs that were stored on the standby when it was active can be retrieved with the **rtrv-log** command.

UIM logging occurs on a continuous basis. When the UIM log is full, the oldest event is overwritten by the newest event. A total of 65,536 UIMs can be maintained in the log. This represents a history of time of 4.55 hours, at a maximum creation rate of 4 UIMs per second. The term "creation rate" is defined here as UIMs that are printed or would have been printed if the UIM Threshold feature was not used.

Creation of UIMs

Figure 5-24 shows how UIMs are generated throughout the system. It is important to note that the point where the decision is made to discard UIMs due to thresholding has changed with this feature.

The applications running on cards send UIMs and alarms to the ATH application. The ATH application on every card is polled by STH every 1.28 seconds for the UIM and Alarm information on those cards. Each ATH has a buffer of a total of 10 UIMs and Alarms it can send to the STH during that interval. The STH forwards all the UIMs to SIH for handling. SIH processes 6 UIMs every 20ms. If SIH decides the UIM should be printed, it places the UIM on the HI or LO queues. SIH then paces the output to UI at a rate of approximately 4 UIMs per second.

Figure 5-24. Depiction of UIM Creation, Logging, and Thresholding

Upgrade Considerations

The UIM logging feature requires that a new file be created and initialized during upgrade from any pre-release 25.0 Eagle. This new file holds the history of UIM events. If this file is not created in a release 25.0 Eagle, the OAM will detect the absence of the file and automatically disable logging. The OAM does so by entering the DISABLED logging-state, and will remain in that state until the OAM reboots and can then access the file. If the OAM is in the DISABLED logging state for UIM logging, it means it can not log UIMs.

The new file is 11 Mbytes in size and can hold 65,536 UIMs.

Changed Event Log Command

The **rtrv-log** command retrieves records from one of the logs generated by the Maintenance system; it selects these records based on a span of time or a specific log file index.

Prior to Release 25.0, the only log supported was the Alarm Log.

As of Release 25.0, the **type** parameter can be used to retrieve the events of either the Alarm log (**type=alarm**) or the UIM log (**type=uim**), but not both. The default is **alarm**.

Refer to the *Commands Manual* for current usage information.

New Database Administration Commands

Refer to the *Commands Manual* for current usage information.

set-uim-acthresh

This command sets level thresholds for STP UIM activity reporting. The Eagle suppresses the generation of UIM messages when message generation exceeds the threshold defined for the interval period. Within five seconds after you enter the command, the values are set. Any previous count is cleared, and the new or changed threshold and limit are enforced.

rtrv-uim-acthresh

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

dlt-uim-acthresh

Use this command to clear the level of activity threshold that is used to report UIM messages.

Limitations

The implementation of the UIM logging feature contains the following limitations. These limitations may need to be communicated to the Customer and are candidates for future feature enhancements:

1. Due to the fact that the HI priority queue gets serviced before the low priority queue in SIH, the events may not be logged in the order in which they occurred (put another way, their timestamps might not be ordered due to the nature of SIH). Also, when the time / date is changed (e.g. with the set-time command) the display of these records may appear (from the date-time stamp) to been written in the incorrect order. Taking both these into consideration, there is a timestamp for when the UIM occurred and when the UIM was logged. This aids the retrieval of UIMs.
2. The information in the Log is not self-evident. Technical documentation and /or files must be provided to allow such a file to be analyzed off the Eagle.
3. UIMs are written only to the UIM Log on the active OAM. However, events that were logged previously on the current standby (when it was the active) can be retrieved with the `rtrv-log` command.
4. The writing of UIMs to the Log will continue, unaffected, during a removal of the Log via either a `copy-tbl` or with the Kermit facility.
5. The Log will not be included in the BACKUP/RESTORE capability.
6. The repairing of the Log must be accomplished by a `copy-tbl` command from the removable, should the Log become corrupted.

NOTE: The UIM Log is not audited.

Translation Type Mapping (Release 21.0)

Certain SCCP messages contain a called party address parameter that contains a translation type field. The translation type field indicates the type of global title processing the Eagle must perform. The values used within any particular network may be different than the standardized values that are defined for internetwork applications.

The translation type mapping feature maps standardized internetwork translation type values to intranetwork translation type values used within any particular network. This feature also maps intranetwork translation type values to standardized internetwork translation type values.

The only SCCP messages that are affected by translation type mapping are UDT and XUDT messages, received or transmitted, whose global title indicator is 0010 (ANSI/ITU) or 0100 (ITU). Other messages that contain the called party address parameter are not affected. For example, UDTs messages are assumed to be MTP routed and need not be examined. XUDTs messages are either MTP routed or use one translation type value indicating global title to point code translation and should not be mapped.

The translation type mapping feature is configured for any linkset, however, translation type mapping has no effect on messages in X.25 linksets, since this feature has not been implemented for X.25 linksets. There is currently no specification for translation type mapping in ITU networks, therefore, the Eagle provides the same translation type mapping function as for ANSI networks.

Translation type mapping is performed on each LIM in the linkset. Incoming translation type mapping is performed before global title translation, gateway screening, or the MSU copy associated with the STP LAN feature. Outgoing translation type mapping is performed after global title translation, gateway screening, and the MSU copy associated with the STP LAN feature.

When outgoing translation type mapping is provisioned and the MSU is copied for the STP LAN feature, the copied MSU is mapped. This is done because the mapped translation type may have a different meaning in the local network, causing the MSU to be interpreted incorrectly.

If the database transport access feature is being used, and the MSU encapsulated by the gateway screening redirect function contains a translation type that must be mapped on an incoming basis, the encapsulated MSU contains the mapped translation type. The translation type of the new MSU is obtained from the gateway screening redirect table.

The Eagle supports 64 translation type mappings for each linkset. This includes both incoming and outgoing translation type mappings. Since the Eagle supports a total of 255 linksets, the total number of translation type mappings that can be provisioned in the Eagle is 16,320.

A new measurement report has been created to report the new daily measurements of the linkset, the **mtcd-lnkset** measurement report. Three new measurements are collected and reported.

- **ZTTMAP** — translation type mapping translations performed - The total number of translation type mappings performed by the entire STP maintained over 30 minute intervals. This is displayed in the **syssot-stp** report.
- **ZTTMAPI** — translation type mapping translation performed - MSUs received on the gateway linkset - The number of incoming translation type mappings performed per linkset over 30 minute and daily intervals. These are displayed in the **comp-lnkset** report every 30 minutes and the daily **mtcd-lnkset** report.

- ZTTMAPO —translation type mapping translation performed - MSUs transmitted on the gateway link set - The number of outgoing translation type mappings performed per linkset over 30 minute and daily intervals. These measurements are displayed in the **comp-linkset** report every 30 minutes and the daily **mtcd-linkset** report.

New Commands

The translation type mapping feature introduces four new commands.

Refer to the *Commands Manual* for current usage information.

ent-ttmap

Add translation type mapping data to the database

chg-ttmap

Change translation type mapping data in the database

dlt-ttmap

Remove translation type mapping data from the database

rtrv-ttmap

Display translation type mapping data in the database

Triggerless LNP (Release 24.0)

The Triggerless LNP feature provides service providers a method to route calls to ported numbers without having to upgrade their signaling switch (end office or mobile switching center) software. In a trigger-based LNP solution, the service providers have to modify the end office (EO) or mobile switching center (MSC) to contain the LNP triggers. These triggers cause the EO/MSC to launch the query to the LNP database and route the call based on the returned location routing number (LRN).

Refer to the *Database Administration Manual - LNP* for current configuration information on this feature.

TCommands

Refer to the *Commands Manual* for current usage information.

chg-gws-actset

The **chg-gws-actset** command is used to configure the gateway screening stop action sets in the Eagle database.

chg-feat

The Triggerless LNP feature is an optional feature and must be turned on with the **chg-feat** command and the **tlnp=on** parameter.

rtrv-feat

The **tlnp** field of the **rtrv-feat** command output shows whether the Triggerless LNP feature is on or not.

chg-lnpopts

To support the Triggerless LNP feature, two parameters have been added to the **chg-lnpopts** command, **jipprov** and **jipdigits**.

rtrv-lnpopts

Two fields have been added to the **rtrv-lnpopts** command output, **jipprov** and **jipdigits**.

rept-stat-lnp

This has been updated to show Triggerless LNP status information in the **average usage** and **total errors** fields.

ent-trace command

A new parameter, **tlnpisuptype**, has been added to the **ent-trace** command to allow ISUP MSUs on the LIM to be trapped.

TSM Warm Restart and Incremental Loading (Release 26.0)

In prior releases, when a TSM/BLM card running the SCCP/EBDABLM GPL boots unexpectedly or is manually booted (i.e. init-card), the GPL and the database on the card are reloaded from the OAM. The reload time is significantly affected by the LNP database size, which requires approximately 5 minutes for every one million ported numbers.

However, a complete LNP data reload may not be required if the LNP database on the card is coherent at the time of the reset. If no LNP updates occur from the time the TSM/BLM goes off-bus to the time comes back on the bus, the LNP database on the card is the same as the LNP database on the OAM.

In the event LNP updates occur while the TSM card is not in service, the Incremental Loading feature tracks the updates, and applies them to the card when it is ready.

In either case, a complete data reload may be unnecessary if the on-card LNP database is at or near the same level as the OAM LNP database. Warm restart bypasses data loading of the LNP database only. GPL and non-LNP table data / dynamic data loading is unaffected. Incremental loading applies only to LNP updates, non-LNP database updates are not supported.

Warm Restart

The Warm Restart feature modifies the default Eagle operation to preserve the LNP database during a TSM/BLM card reset provided the requirements for performing a warm restart are met (see Table 5-20). Those requirements are that:

- power to the card is uninterrupted
- card level checks determine a warm restart is allowed
- card database level is the same as the OAM database level or can be incrementally loaded to the current level
- LNP audit is ON and has run at least once (otherwise all LNP checksums on the OAM are unknown)
- card database is coherent at the time of reset and the LNP database audit during card initialization passes

Table 5-20. Conditions for Performing Warm Restart

Condition	Description
POWER ON	Power on reset (card is pulled and reinserted).
XILINX VERSION	M256 Xilinx program version has changed from previous version.
DB VERSION	LNP Database version has changed from previous version. On-line Memory allocation (alloc-mem), import or bulk downloads (chg-db), or changes from release to release may alter the DB version.
DB LEVEL	DB level not supported or difference exceeds incremental loading capability. Caused by reset of OAMs or if the number of updates exceeds the incremental loading capability.
DB STATUS	DB status of the card is incoherent at the time of a reset. Can be caused by a failed network card update or a reset during a database update to the card.
HW ERROR	Hardware error bit checks on the card fail during card initialization.
AUDIT FAILED	Checksum comparisons of the LNP database fail during card initialization. Data on the card is determined to be corrupted after the reset (was not yet detected by normal auditing).

Table 5-20. Conditions for Performing Warm Restart (Continued)

Condition	Description
AUDIT TIMEOUT	LNP initialization audit timed out (SW failure).
NO AUDIT	Unable to perform LNP audit. LNP audit not on (LNP Options has AUDIT=OFF. Or, the rate of LNP updates exceeds LNP audit's ability to compute checksums (excessive unknown checksums). This is more likely on a small database where there are fewer checksums. The percentage of known checksums must be 99% or more. The percentage is based on the number of checksums in use, which is smaller for small databases (such as 2 MIL TNs or less).
USER REQUEST	User initiated <code>init-card</code> or <code>init-sys</code> command reload type cold. The default restart type for these commands is a cold or full LNP data reload. User must specify <code>data=persist</code> for warm restart on command.
UNKNOWN / OTHER	Unknown or other type of software failure.

Incremental Loading

The Incremental Loading / Warm Restart feature modifies the reload procedure for an LNP database card (i.e. TSM). The LNP database will remain persistent as long as power is not removed from the card. In the event of a card reload, the TSM will check to see if an LNP database full reload is required. If a full reload is required, the OAM will be allowed to continue to process LNP updates from the LSMS to the other TSM cards. The OAM will track the database changes required for the reloading TSM card and apply those updates when the TSM is ready to be placed back in service.

This circumvents the need to inhibit LNP updates in most cases. The requirements to perform these operations are:

- A database level and restart type indication from the restarting card can be accepted and processed.
- Card requests for both warm and cold restarts can be processed.
- Changes in the OAM LNP database can be tracked and applied on an "as needed" basis per reloading card.
- DB operations (e.g., `init card` with `DATA = PERSIST / REFRESH`) can be processed properly.
- OAM can temporarily inhibit LNP updates for a small period of time in order to complete the loading process when necessary without losing EOAP / OAP status or Q.3 association with the LSMS.

- Incremental loading will support up to 25 TSM cards and 1 BLM card for incremental loading purposes.

Maintenance

The following sections describe the maintenance changes required as part of the Warm Restart and Incremental Loading features.

Loading Process

The loading process involves the continuous tracking of LNP database changes and applying those changes to cards that are coming into service. Changes to the LNP database occur each time that an LNP transaction takes place. A single LNP transaction (i.e., change) can affect multiple LNP tables. Each LNP transaction generates a new level within the same version of the LNP database (see Figure 5-25). In other words, each LNP database version can go through a number of levels (changes).

Figure 5-25. Database Levels

Applying the LNP data to the card(s) may be done either incrementally or as a full database restoration: cards at the same LNP database version but at different database levels can be incrementally loaded while cards at a different LNP database version must receive a full database download.

In order to track LNP database changes for incremental loading, a table of database levels and modified memory pages will be maintained by OAM. This will allow cards at varying database levels to be incrementally downloaded with a subset of the entire database. As the data changes in time, the changes are to be tracked and then applied to the appropriate card(s) that are in an active load list. Note that all cards appearing within a particular load list will receive the same dataset.

The following subsections discuss the approaches for delivering the LNP data to the appropriate cards and for tracking LNP database alterations.

Card Loading For Warm Restarts

System loading for the SCCP/EBDABLM GPL at the TSM/BLM card will be modified to determine whether to perform a warm or cold restart. Figure 5-26 on page 136 depicts the SCCP/EBDABLM on-card decision making process for this feature.

Figure 5-26. On-Card Warm Restart Decision Flow

Figure 5-26 on page 136 shows that the check for the stored restart type is performed first. The restart type value shall always be warm by default. This value can be set to cold by either an indication to the card from the user (i.e., a forced cold restart) or by the card when some error condition occurred (e.g., LNP database versions did not match). The warm restart type may also be changed at some point during the restart process.

For example, the OAM may determine that the request for a warm restart cannot be honored and deliver an indication for a cold restart (i.e., a full LNP download).

The decision process involves several checks to verify eligibility for a warm restart request. If all of the criteria are met, the request for a warm restart is made. In order to minimize delays in the download process, the SCCP/EBDABLM GPLs shall perform the memory checksum tests in parallel with the data table loading whenever a warm restart is in progress.

Once the non-LNP tables have been loaded and the checksum tests have passed, an indication of the card's readiness to receive LNP data will be raised. At this point, OAM will begin delivery of the LNP tables followed by a new checksum table.

The OAM must be in agreement (i.e., there is no cause to override the request), then the warm restart is performed and an incremental download of the LNP database is carried out if required. The criteria for OAM to be in agreement are as follow:

- The cards reported database level is not greater than the OAMs current database level.
- The cards reported database level must be in the DB Level Transition List (card can be incrementally loaded).
- There are approximately 99% known LNP AUDIT checksums (sufficient to perform on card audit).

SCCP/EBDABLM GPL Impacts

The SCCP and EBDABLM GPLs will be modified to incorporate the decision making ability with regards to the type of restart needed (see Figure 5-26 on page 136). Specifically, the decision to request a warm restart will be made if:

- M256 Xilinx is programmed and the bit file has not changed.
- LNP database version has not changed.
- Hardware error bit checks on the card do not fail.
- Checksum comparisons of the LNP database do not fail. Each applicable card shall be able to compare the LNP database on the card to the LNP database on the OAM.
- **init-card** or **init-sys** command with a reload type of COLD was not requested.

The SCCP and EBDABLM GPLs, operating on the TSM/BLM cards respectively, shall be capable of storing, retrieving, and reporting pertinent information for the restart decision process using non-volatile memory.

The software will maintain, at a fixed memory location, the:

- Xilinx program changed indication.
- LNP database version.
- LNP checksum table.
- Restart request type (warm, cold).

The initialization sequence of the application software must not reprogram the M256 Xilinx. The M256 Xilinx is unable to maintain DRAM data integrity during the reprogramming process. The Xilinx shall be reprogrammed only if a cold restart is to be performed. In addition, if the Xilinx is already programmed and the version has not changed, the DRAM check bit initialization shall be bypassed.

An LNP checksum table is downloaded by the OAM at the end of the download process. This table will be preserved in memory and used to verify the LNP database during the next restart operation.

When a warm restart is requested and agreed upon by OAM, an incremental loading of the LNP database will be performed if required. Should a cold restart be requested or a warm restart request be overridden by OAM, a full LNP database download will be performed.

OAM Impacts

In order for the SCCP/EBDABLM restart type request to be processed during card loading, the OAM GPL will require modifications. The changes will involve:

- All information necessary for the card to determine if it can perform a warm restart will be delivered in the initial download to the card.
- Reacting to a specific restart request type from an authorized card.
- Tracking changes to the LNP database will occur at all times.
- Possibly performing an early card deletion from load list for warm restart if a different restart type is required.
- Downloading the LNP checksum table at the end of the loading process.
- LNP Audit checksum table and incremental load list is cleared upon an import or restore.

The SCCP/EBDABLM GPL will report its current database level to OAM (see Figure 5-25 on page 134 and Figure 5-26 on page 136). The OAM must verify that the database level has not incremented beyond an acceptable point for incremental loading. The restart type may be overridden by the OAM and an indication of such will be delivered back to the restarting card in the form of all LNP database data being delivered.

In addition, if a cold restart is required and the card cannot be incrementally loaded, LNP updates and LNP audits must be ignored by the affected card.

Tracking LNP Changes for Incremental Loading

In order to provide an incremental download of LNP data, modifications to the database must be tracked. As can be noted from Figure 6, the database change engine (DBCD) will write the modified table ids and record entry numbers into a table as changes occur.

Figure 5-27. LNP Data Tracking and Loading Overview

Each LNP database change generates a new database level. The new level shall become the current level and all level entities associated with the LNP transaction will be indicated with the same database level table entry. The table shall be circular so that changes can be tracked and applied to the cards in a continuous manner.

If the number of entities is exceeded within a database level record, the record will be marked as continued and the next entry will contain the same database level, thus extending the database level record entry.

System Loader will read the database transition to determine which entities are to be downloaded to a particular card based upon its reported database level. A protective mechanism shall be used to prevent the System Loader task from reading a record while it is being written to.

System Loader shall create card load lists and associate the database level entities that must be downloaded based upon database levels. Each time period (i.e., an iteration in time, t_0 , t_1 , etc., where $t_n = t_n - t_{n-1}$) will represent some number of database levels: the set of changes that occurred within a given time period. System Loader shall have one list that is the "active list". The active list will represent the cards that are currently receiving LNP data. System Loader shall also maintain additional lists of cards that are waiting for an LNP data download at other DB levels (see Figure 5-27 on page 139). Once a list becomes the active list, no new entries shall be made. Any cards requesting LNP data would have to be placed into a new / other list.

Cards will be assigned to a particular load list based upon their reported database level as well as the time of their request for LNP data. Thus, a card reporting a level of 259, for example, may be placed in a list being formed for level 257 in order to grant its request for data without delay. While this methodology would download data that is not needed by some cards within the group, it prevents cards from waiting for a new list to be formed and takes into account that there is a finite number of lists available.

When Incremental Loading detects that a small amount of time is needed to complete a TSM/BLM download to reach the current DB Level then Incremental Loading will automatically inhibit LNP updates for the time needed to complete the download. Thereby avoiding continuous circular incremental loading of sustained 2TN modifications.

LNP Audit

In order to guarantee the integrity of the LNP database, the TSM/BLM cards shall perform an audit of their LNP database during a warm restart. To achieve this the following changes to the LNP audit process on the OAM and TSM/BLM cards are required:

- TSM/BLM cards shall be capable of ignoring RADB LNP update and LNP audit messages during data loading.

- LNP checksum table shall be downloaded to all TSM/BLM cards during data loading.
- LNP audit's checksum table shall be maintained on the OAM and TSM/BLM cards.

A warm restart is allowed only if LNP audit has completed an audit of the current database at least once and the LNP checksums are approximately 99% known.

LNP AUDIT considers each of the LNP database tables to be segmented into "pages" where a page is defined as the number of table records that can be read into a 32KB buffer using a single disk operation. A "dirty page" is a page that has recently been modified during a database update for which the associated LNP audit checksum is unknown.

During card initialization LNP audit shall checksum the LNP database and compare against the LNP checksum table maintained on the TSM/BLM card. As a result, the LNP checksum table must be downloaded to all TSM/BLM cards during data loading and must be maintained on the TSM/BLM cards during database updates and audit queries.

Currently the checksum table is not loaded to the cards. When a LNP database update occurs the checksums on the card will be set unknown for any dirty pages. When a dirty page is audited the LNP checksum table on the card is updated accordingly by storing the recalculated checksum in the table. During data loading LNP updates and audit notifications shall be ignored at the card: currently a LNP update during loading would reset the TSM/BLM card.

During the warm restart process dirty pages will not be audited, as the checksums for the dirty pages are unknown. The LNP checksums must be approximately 99% known or a warm restart is not permitted (currently a maximum of 250 dirty pages). This initial audit to determine if a warm restart is allowed is performed using the current LNP checksum table in the card's persistent database.

If the checksum compare fails a card reset and full GTT and LNP data reload shall be performed. No application trouble or obituaries will result; the card will simply restart the loading process. The existing LNP audit process currently generates 1 checksum calculation every 1.36 seconds. Typically, LNP updates will dirty the same page(s) as previous updates and thus require significantly fewer writes to disk when collected over multiple updates.

LNP audit does not audit recently changed dirty pages, thus allowing them to be collected over multiple updates. Performance measurements of the existing LNP audit showed on average 5 or fewer unknown checksums (total) for typical sequential updates during 2 TN/sec operation.

If an incremental load to the card is required during a warm restart, the incremental load will complete and then a final audit shall be performed prior to data load complete and going IS-NR. This final audit includes pages dirtied prior to the reset only (checksum is unknown in the persistent LNP checksum table prior to the download of the new LNP checksum table).

A cold restart will result in no pages being audited following the incremental load. Should this final checksum compare fail, indicating that the warm restart failed, a full LNP data reload shall be attempted.

The LNP checksum table shall be reloaded to the cards only after incremental loading is complete and LNP updates have been inhibited. The cards will then complete the audit process for all dirty pages not initially audited during the warm restart verification.

The LNP download and audit timeline for a warm restart is depicted in Figure 5-25 on page 134 and Figure 5-26 on page 136.

Changed Commands

For Release 26.0, the **init-card**/**init-sys** and **alw-card** commands support an additional parameter for specifying the restart method (**data=refresh/persist**). Warm restart is supported by these commands only for BLM/TSM cards.

Refer to the *Commands Manual* for current usage information.

alw-card

This command supports a new optional parameter, **data**.

init-card

This command supports a new optional parameter, **data**.

init-sys

This command supports a new optional parameter, **data**.

New UIMs

Four new UIMs have been created for this feature:

UIMs 1238 Full LNP database reload initiated

 where xxxxxxxx is one of the following:

 XILINX VERSION - M256 Xilinx version has changed.

 POWER ON - Power on reset.

 DB VERSION - LNP Database version has changed.

DB LEVEL - Database level is not supported or difference exceeds incremental loading capability.

HW ERROR - Hardware error bit checks on the card fail.

CHECKSUM - Checksum comparisons of the LNP database fail.

NO AUDIT - Unable to perform LNP DB audit. LNP audit not on or excessive number of unknown checksums.

USER REQUEST - User initiated init-card or init-sys command reload type cold.

UNKNOWN - Unknown

OTHER - Other

This UIM is generated if a cold restart or full LNP database reload is required. The UIM uses the existing I45 (Card Info) format, and indicates that a full LNP database reload is required. A reason for the cold reload is also provided.

Example:

```
eagle10506 06-12-00 11:22:37 GMT Rel 26.0.0-13.0.0
0042.1238   SYSTEM      INFO      Full LNP database reload initiated:
          CARD=1101    GPL=SCCP    CAUSE=USER REQUEST
          Report Date:06-12-00   Time:11:22:37
```

1239 DB updates inhibited: loading mode stability

This UIM is generated if inhibiting LNP database updates is required. UIM 1239 will use the existing I31 (Card Info) format and indicates that LNP database updates are inhibited for loading mode stability.

Example:

```
station1234 06-12-00 16:28:08 EST Rel 26.0.0
1234.1239   SYSTEM      INFO DB updates inhibited: loading stability
          Report Date: 00-06-01   Time: 16:27:19
```

1240 LNP updates allowed: loading mode stability

This UIM is generated when updates are allowed.

Example:

```
station1234 96-08-01 16:28:08 EST Rel 26.0.0
1234.1240   SYSTEM      INFO DB updates allowed: loading stability
          Report Date: 00-06-01   Time: 16:27:19
```

1241 LNP Incremental Loading

This UIM is generated if incremental loading is being performed. The UIM uses the existing I46 (Progress Report) format and indicates the initial incremental loading status of the card. The total number of levels reported may increase from moment to moment, depending upon the sustained LNP database modifications. This UIM is produced twice per load request only when incremental loading is initiated, and an LNP update is attempted.

Example 1:

```
tekelecstp 00-04-24 06:54:41 EST Rel 26.0.0
5402.1241  SYSTEM      INFO  REPT EVT: LNP Incremental Loading.
          Database levels loaded :   xxxx of   yyyy
          Card List: zzzz
          Report Date: 00-04-24 Time: 06:54:41
```

Example 2:

```
eagle10506 00-04-24 06:55:36 GMT Rel 26.0.0-13.0.0
1299.1241  SYSTEM      INFO  REPT EVT:LNP Incremental Loading
          Database levels loaded :  1151 of  1151
          Card List: 1101
          Report Date:00-04-24   Time:06:55:36
;
```

Hardware Requirements

The Warm Restart and Incremental Loading functions require existing Eagle hardware; no new or additional hardware is required for these features. All modifications are at the software level.

- TSM (SCCP) card
- BLM (EBD&A) card.
- MCAP (OAM) card.

The TSM / BLM cards must be equipped with enough daughterboard memory to load the entire LNP database. The daughterboard requirements for the EBD&A BLM card are exactly the same as the memory requirements for a TSM card running the SCCP application.

Upgrade Considerations

Warm restart shall be supported following upgrade to release 26.0. Warm restart shall not be supported during Release 26.0 upgrade. The warm restart feature provides new functionality at the card level for maintaining over a reset the database level, status, checksum, and other information, which is required to determine if a warm restart should be allowed. Without this functionality the integrity of the LNP database cannot be verified. As a result warm restart cannot be supported during the initial upgrade to Release 26.0.

Subsequent upgrades will have the capability to perform a warm restart of TSM/BLM cards provided the warm restart conditions as outlined by this document are met. Additional conditions imposed on a warm restart would include:

- card-level capability for converting the existing LNP database if the upgrade requires any LNP table conversions.
- ability to download new LNP tables during a warm restart which are not defined in the source release database on the card.

Currently, new feature development that requires table conversions is written only for the OAM database and the data is loaded to the cards following conversion. In order to perform a warm restart during an upgrade requiring LNP table conversions, the conversion functions must also be written for the TSM/BLM cards. If the LNP database version does not change and no table conversions are required, upgrades after release 26.0 will be capable of warm restart provided the network conversion utilizes the **data=persist** parameter when initializing TSM/BLM cards.

Dependencies

The warm restart and incremental loading features must be implemented together for a complete solution to exist. These features have no other dependencies.

Limitations/Restrictions

1. LNP audit must be ON and have run at least once to completion. If LNP audit is not turned on, all LNP checksums on the OAM are set to unknown. A warm restart is allowed only if LNP audit has completed an audit of the current database at least once and the LNP checksums are approximately 99% known. Without the LNP checksums in a known state, the database on the TSM/BLM cards cannot be verified following the reset. Warm restart may not be allowed if a worse-case 2 TNs is maintained.

Sustained 2 TNs on a small database will prevent a warm restart. Fewer checksums are in use for a small database. As a result, an update will make a greater percentage of the in-use checksums unknown. Thus the percentage known of the checksums depends on the size of the database.

2. Non-LNP database provisioning which affects the TSM/BLM cards (such as GTT updates to the TSM cards or alloc-mem 4 digit object updates to all TSM/BLM cards) during loading may result in a card reset. Unlike the continuous stream of LNP updates automatically applied to the Eagle from the LSMS, non-LNP updates are controllable by the customer. The customer must decide whether to suspend these updates during TSM/BLM loading based on minimum service and their current priorities.

If the update being applied affects tables already loaded, the card will not reset (i.e. the database class of the update was already loaded by the card).

3. Card loading, including Incremental Loading, is inhibited while the import and restore operations are in progress.
4. Database btree rotations will limit the time tracking capabilities by causing excessive database level entities and multiple database level records to be stored for a single database level.

TT Independence for LNP Queries (Eagle Release 30.0/IP7 Secure Gateway Release 8.0)

NOTE: The TT Independence for LNP Queries feature is only available at the preproduction level.

Description

Currently, the translation type in the query message is used to determine the type of LNP query (AIN, IN, WNP) for correct decoding and response formulation. LNP queries between networks are defined to use TT=11, regardless of the protocol used. Also, there are other cases where the TT alone may not be enough to determine the type of protocol being used, thus making it impossible to correctly decode all queries. Refer to Figure 5-28.

Figure 5-28. Inter-Network Support for LNP Queries

In this example, Network B would not be able to differentiate between the two types of LNP queries received from Network A.

The TT Independence for LNP Queries feature addresses this issue by providing a new method of protocol determination of an incoming query.

With the TT Independence for LNP Queries feature, the LNP subsystem will be able to determine the protocol of the query based on other fields in the SS7 message, rather than relying on the TT value. This allows the same translation type to be used for multiple protocols. It allows a query between two networks to be properly handled. (All LNP queries between networks are defined to be TT 11.)

Hardware Requirements

No new hardware is needed to support this feature.

Enhancements to Existing Commands

The following commands have been enhanced to support this feature. For more information on these commands, see the *Commands Manual*.

ent-lnp-serv

Use this command to reserve an LNP translation type for a unique LNP service. The **:serv** parameter for this command has been enhanced with the LNPQS value; the UDF6 value has been removed.

NOTE: To use the ent-lnp-serv command, the LNP feature must be turned on (see the enable-ctrl-feat and rtrv-ctrl-feat commands).

Syntax

```
ENT-LNP-SERV
:SERV= <Reserved Service Type Name>
:TT= <Translation Type>
:TTN= <User defined TT name>
:DV= <Digits valid>
```

Parameters

:serv= <Reserved Service Type Name>

Specifies the reserved service type name.

Range = IN, CLASS, LIDB, CNAM, ISVM, **LNPQS**, UDF1, UDF2, UDF3, UDF4, UDF5, ~~UDF6~~

Example Output

```
rlghncxa03w 02-11-18 08:50:12 EST Rel 30.0.0
ENT-LNP-SERV: MASP A - COMPLTD
;
```

chg-lnp-serv

Use this command to change an existing LNP service. The **:serv** parameter for this command has been enhanced with the LNPQS value.; the UDF6 value has been removed. The new parameters **:tt** and **:nserv** also have been created.

Syntax

```
CHG-LNP-SERV
:SERV= <Reserved Service Type Name>
:NTT= <New Translation Type>
:NDV= <New Digits valid>
:NTTN= <New User defined TT name>
:TT= <Translation Type>
:NSERV= <Reserved Service Type Name>
```

Parameters

:tt= <Translation Type>

Specifies translation type.

Range = 0 - 255

:nserv= <Reserved Service Type Name>

Reserved Service type name.

Range = AIN,IN,PCS,WNP,CLASS,LIDB,CNAM,ISVM,WSMSC,LNPQS,UDF1,UDF2,UDF3,UDF4

:serv= <Reserved Service Type Name>

Specifies the reserved service type name.

Range = IN, CLASS, LIDB, CNAM, ISVM, **LNPQS**, UDF1, UDF2, UDF3, UDF4, UDF5, ~~UDF6~~

Example Input/Output

```
CHG-LNP-SERV:TT=11:NSERV=LNPQS
```

```
rlghncxa03w 02-11-18 08:50:12 EST Rel 30.0.0
CHG-LNP-SERV: MASP A - COMPLTD
;
```

dlt-lnp-serv

Use this command to delete an LNP service, or an alias translation type associated with an LNP service, from the database. The **:serv** parameter for this command has been enhanced with the LNPQS value; the UDF6 value has been removed.

Syntax

```
DLT-LNP-SERV
:serv= <Reserved Service Type Name>
```

Parameters

:serv= <Reserved Service Type Name>

Specifies the reserved service type name.

Range = IN, CLASS, LIDB, CNAM, ISVM, **LNPQS**, UDF1, UDF2, UDF3, UDF4, UDF5, ~~UDF6~~

Example Output

```
rlghncxa03w 02-11-29 16:40:40 EST Rel 30.0.0
DLT-LNP-SERV: MASP A - COMPLTD
Command Completed.
;
```

rtrv-lnp-serv

Use this command to retrieve all LNP services. This command has been enhanced to include the new reserved status type LNPQS in its display.

Syntax

```
RTRV-LNP-SERV
```

Parameters

This command has no parameters.

Example Output**rtrv-lnp-serv**

```
rlghncxa03w 02-11-28 14:42:38 EST Rel 30.0.0
  SERV  TT   TTN      DV   ALIAS
  AIN    15   AINGTE   TCAP  235
                        236
  LIDB   20   LIDB     SCCP  ---
  WNP    22   WNP      TCAP  ---
  LNPQS  11   LNPQS    TCAP  ---
  PCS    12   PCS      TCAP  ---
  CLASS  25   CLASSGTE  SCCP  ---
  UDF1   201  UDF1     SCCP  ---

  LNP-SERV TABLE IS 2% FULL (7 of 256)
;
```

If the LNP SMS feature is turned on and provisioned, the WSMSC entry is included:

```
rlghncxa03w 02-11-28 14:42:38 EST Rel 30.0.0
  SERV  TT   TTN      DV   ALIAS
  AIN    15   AINGTE   TCAP  235
                        236
  LIDB   20   LIDB     SCCP  ---
  WNP    22   WNP      TCAP  ---
  LNPQS  11   LNPQS    TCAP  ---
  PCS    12   PCS      TCAP  ---
  CLASS  25   CLASSGTE  SCCP  ---
  WSMSC  55   WSMSC    SCCP  ---
  UDF1   201  UDF1     SCCP  ---

  LNP-SERV TABLE IS 2% FULL (8 of 256)
;
```

rept-stat-lnp

Use this command to generate a report of the local number portability (LNP) status information. The report generated by this command has been updated to include the new reserved status type LNPQS in its display.

Syntax

```
:LOC=<Card Address>
:CARD=<GPLID-SUBSYSDIR>
```

Parameters

```
:loc
```

Address of the SCCP card to be reported on. This parameter cannot be specified with the **:card** parameter.

:card

This parameter is not valid with **:loc** parameter.

Example Output

rept-stat-lnp (with WNP, PLNP, and TLNP features on)

```
rlghncxa03w 02-11-07 08:50:14 EST Rel 30.0.0
  LNP SUBSYSTEM REPORT  IS-ANR           Active      -----

dlt-lnp-sub	rtrv-lnp-dpcer
rtrv-lnp-sub	

Alarms and Error Codes

Alarms

No new UAMs have been created for this feature. Table 5-21 lists the new UIM created for this feature.

Table 5-21. TT Independence for LNP Queries: New UIMs

UIM #	Severity	Message Text
1255	None	IS-41 LNP Qry rejected: WNP is OFF

Error Codes

Incorrect use of the enhanced commands for the TT Independence for LNP Queries feature may result in the error messages listed in Table 5-22:

Table 5-22. TT Independence for LNP Queries: Error Messages

Error Message	New?	Used by Command:
E2155 Invalid parameter combination specified	No	<code>chg-lnp-serv</code>
E3250 DV must be SCCP when SERV is a user defined type	No	<code>chg-lnp-serv</code> , <code>ent-lnp-serv</code>
E3251 DV must be TCAP when SERV is WNP, AIN, PCS or IN	No	<code>chg-lnp-serv</code> , <code>dlt-lnp-serv</code> <code>ent-lnp-serv</code>
E4028 TT values for LNP Query services are not allowed	Yes	<code>ent-lnp-npanxx</code>

Upgrade Considerations

While this feature does not affect the upgrade process, note that all SCCP cards must be upgraded to the release that contains the TT Independence for LNP Queries feature, prior to provisioning the LNPQS service.

Limitations

With the implementation of TT Independence, PLNP Queries with TT associated with LNPQS will be processed and pegged as IN LNP Queries.

Despite the fact that the legacy EAGLE's interface allows the provisioning of the LNP NPANXX table's Default Translation (MRGT) using the command `ent-lnp-npanxx`, this should not be done for LNP services. Thus, EAGLE will *not* use the NPANXX Default Translation for LNP Queries, even if this data is provisioned.

Two-Point IPLIMx (Eagle 27.1)/Two-Point IPLIMx (IP⁷ Release 2.2)

Two-point IPLIMx allows a single DCM card loaded with the **iplim** application or the **iplimi** application to support two point-to-point links. In previous releases, each point-to-point link required a separate DCM card.

Two sockets can be provisioned for each DCM card that runs an **iplim** application or **iplimi** application. One socket is associated with the A port and one with the B port. In this case, a port is a signaling link. Both sockets use the same physical interface connection and the same IP address.

Refer to the Database Administration Manual - SS7 for current information on this feature.

Enhancements to Existing Commands for Two-Point IPLIMx

The following commands have been enhanced to support the **iplimi** feature. For current usage information for the following commands, refer to the *Commands Manual*.

ent-appl-sock

This command can now be used for **iplim** and **iplimi** applications and includes a new parameter (**:port=**) to specify which port to use to associate a socket with a signaling link.

chg-appl-sock

This command includes a new parameter (**:port=**) to specify which port to use to associate a socket with a signaling link. This parameter cannot be changed if the socket is open.

rtrv-appl-sock

This command includes a new parameter (**:port=**) to retrieve socket information for the specified port.

rept-stat-applsock

This command includes the new parameters **lhost**, **rhost** and **port**.

msucount

This pass command is modified to display link-level measurements for both signaling links on an **iplim** or **iplimi** DCM card.

Unregistered Routing Key Treatment (IP⁷ Release 3.0)

Unregistered Routing Key Treatment (URKT) provides options for routing misdirected ISUP messages, as well as options for routing other signaling information types such as SCCP and TUP. New Partial and Default routing key types have been introduced to improve the treatment of unregistered routing keys. Supported Partial keys include: DPC+SI+OPC for CIC traffic, DPC+SI for CIC and SCCP traffic, DPC only, and SI only for CIC, SCCP, and MTP3-Other traffic.

Each Partial and Default routing key is associated with a socket, or a list of sockets.

A hierarchy of lookups occurs for each MSU that does not match a full entry in the routing key table. Table 5-23 clarifies how a hierarchical lookup that attempts to deliver each MSU to the best location is performed. Before the lookups can begin, the type of MSU must be determined based on the following:

- Type of MSU equals CIC when the MSU has an SI value of 5, 13 (ANSI and ITU) or 4 (ITU only).
- Type of MSU equals SCCP when the MSU has an SI value of 3 (ANSI and ITU).
- Type of MSU equals Other SI for all other MSUs.

Table 5-23. Unregistered Routing Key Hierarchy

MSU Type	Lookup Order	Portion of MSU that Must Match Routing Key	Full/Partial/Default
CIC	1	DPC + SI + OPC + CIC	Full
	2	DPC + SI + OPC (<i>ignore CIC</i>)	Partial
	3	DPC + SI (<i>ignore OPC & CIC</i>)	Partial
	4	DPC (<i>ignore SI, OPC & CIC</i>)	Partial
	5	SI (<i>ignore DPC & OPC & CIC</i>)	Partial
	6	None	Default
SCCP	1	DPC + SI + SSN	Full
	2	DPC + SI (<i>ignore SSN</i>)	Partial
	3	DPC (<i>ignore SI, OPC & CIC</i>)	Partial
	4	SI (<i>ignore DPC & SSN</i>)	Partial
	5	None	Default
OtherSI	1	DPC + SI	Full
	2	DPC (<i>ignore SI</i>)	Partial

Table 5-23. Unregistered Routing Key Hierarchy

MSU Type	Lookup Order	Portion of MSU that Must Match Routing Key	Full/Partial/Default
	2	SI (<i>ignore DPC</i>)	Partial
	3	None	Default

The hierarchy is intended to guarantee that the MSU is delivered to the best possible location, based on closest match to the MSU content. An MSU that does not match a routing key is discarded.

New Commands for Unregistered Routing Key Treatment

Refer to the *Commands Manual* for current usage information.

msuroute

This feature implements the **msuroute** pass-through maintenance command used with the **pass** command to provide information about all routing keys currently configured on an IPGWx card used to route a particular MSU.

Enhancements to Existing Commands for Unregistered Routing Key Treatment

For more information about formats for the commands described in this section, refer to the *Commands Manual*.

The following commands have been enhanced to support the Unregistered Routing Key Treatment (URKT) feature.

chg-appl-rtkey, dlt-appl-rtkey and ent-appl-rtkey

A new parameter, **type**, has been added to the **chg-appl-rtkey**, **dlt-appl-rtkey**, and **ent-appl-rtkey** commands. The parameter values **full**, **partial**, and **default** are used to specify the three types of keys that can be used to route traffic.

rtrv-appl-rtkey

The **rtrv-appl-rtkey** command has been enhanced to retrieve information about all routing keys, full routing keys only, partial routing keys only, or default routing keys only.

drklog

New options, **-p** and **-d**, have been added to the **drklog** pass-through maintenance command. The **drklog** command is used with the **pass** command to retrieve a history of the dynamic routing key registrations and de-registrations. The **-p** option is used to indicate a Partial routing key. The **-d** option is used to indicate a Default routing key. The absence of the **-p** or **-d** option with this command indicates that a fully specified key is being referenced.

msucount

New options, **-p** and **-d**, have been added to the **msucount** pass-through maintenance command. The **msucount** command is used with the **pass** command to retrieve MSU transmit and receive statistics for various entities on an IPGWx and IPLIMx card. The **-p** option is used to reference a partial routing key. The **-d** option is used to reference a default routing key. The absence of the **-p** or **-d** option with this command indicates that a fully specified key is being referenced.

Upgrade Procedure Enhancements (Release 22.0)

With release 22.0, current Eagle users of release 20.0 can be upgraded directly to release 22.0 without having to be upgraded to release 21.0 or release 21.1. Users of Release 21.0 and 21.1 can be upgraded directly to Release 22.0.

The upgrade procedure is executed in two parts.

- Database and GPL Upgrade — the current databases are converted to the release 22.0 format and the GPLs are upgraded with the release 22.0 GPLs.
- Network Upgrade — distributes the upgraded GPLs through out the system and distributes the converted databases to the upgraded GPLs.

The upgrade procedure uses the **act-upgrade** command and, if upgrading from a release 20.0 system, the **init-network** command. The upgrade procedure also uses these items.

- A removable cartridge containing the release 22.0 software.
- A removable cartridge containing the software of the current release (20.0, 21.0, or 21.1).
- A spare TDM containing the current databases for the current release (20.0, 21.0, or 21.1).

The **act-upgrade** command converts the current, release 20.0, 21.0, or 21.1, database on the active MASP to a release 22.0 database and controls the MASPs during the upgrade process.

The **act-upgrade** command has only one parameter, **action**, which details the type of upgrade action to be performed. The **action** parameter has three values, **converttoam**, **oamcomplete** and **dbstatus**.

The **action=converttoam** parameter converts the databases on both the active and standby MASPs.

The **action=oamcomplete** parameter sets the upgrade phase to phase 3, sets the database to coherent on the active and standby fixed disks, and places the SEAS terminal ports back in service.

The **action=dbstatus** parameter displays the status of all the database partitions on both the active and standby MASPs. The output is identical to the output of the **rept-stat-db:display=version** command.

No Reportable Downtime on Network Restart

Release 22.0 provides for network restarts of the Eagle STP, using the **init-network** command, that require less than 30 seconds of nodal isolation and thus do not require reporting of any STP downtime (GR-929-CORE, section 3.1.1, page 3-3). This enhancement prevents reportable downtime for both network restarts due to unusual conditions and for network restarts during in-service upgrades.

Network restart is the procedure that allows all non-MASP cards to be rebooted and restored to service in an orderly and controlled fashion with the intent to minimize network nodal isolation time, the time during which an Eagle STP is unable to communicate to another node in the network (no signaling links are aligned).

Currently, if an Eagle STP LIM running the SS7ANSI application is rebooted, it takes approximately 42 seconds to reload the card, align the signaling link, and restart traffic on that signaling link. Thus, with the goal to minimize network nodal isolation to be less than 15 seconds during in-service network upgrades and abnormal conditions requiring network restarts, the network restart process initiated by the **init-network** command will be as follows:

1. Before the network restart process can be started, the MASPs must be in one of two possible states, either the GPL status of the MASPs should be in the Upgrade Phase 3 Mode; or the MASPs must be in full function mode. If the MASPs are not in the proper state, the command is rejected with this message.

*Error
Message*

E2980 Cmd Rej: Must be in upgrade phase 3 or full function mode

The term Upgrade Phase 3 Mode means that the MASPs are running the approved GPLs, but the other network processors are only prepared to be upgraded. The Upgrade Phase 3 Mode is reached by entering the **act-upgrade:action=oamcomplete** command during the upgrading process.

The term Full Function Mode means that the MASPs are running the approved GPLs. The full function mode is the normal operating mode for the MASPs.

2. The system chooses two LIMs running either the SS7ANSI or CCS7ITU applications equipped with an in-service active link based on the best available priority scheme. Each LIM must have one signaling link in an in-service active state. These LIMs are referred to as the alternate cards. These LIMs are the first to be preloaded and eventually crossloaded during the network initialization.

The best available priority scheme used by the **init-network** command is as follows:

All the LIMs running either the SS7ANSI or CCS7ITU applications are searched to create a list of a maximum of four LIMs sorted by highest priority link type, with each LIM containing at least one active signaling link. The priority of link types are C, B, A, D, and E in that order. LIMs with two active signaling links, that contain the same link type as LIMs with one active link, are given priority in the list.

After the list has been created, the LIMs are identified as alternate or main cards. If four cards are in the list, then two cards are the alternate cards, and two cards are the main cards. If three cards are in the list, then two cards are the alternate cards, and one is the main card. If two cards are in the list, then one card is an alternate card, and one card is the main card. If only one card is in the list, then it is the main card and there is no alternate card. If no cards are in the list, then the **init-network** command is rejected with this message.

*Error
Messages*

E2981 Cmd Rej: Already in nodal isolation

The **init-network** command requires the four LIMs running either the SS7ANSI or CCS7ITU applications with at least one active signaling link on each LIM. If four LIMs are not available in the Eagle, the **force=yes** parameter must be specified with the **init-network** command. If the **init-network** command is entered with less than four LIMs available, and the **force=yes** parameter is not specified, the command is rejected with this message.

E2371 Cmd Rej: Force parameter is required

3. The value of the **mtpsrst** (MTP restart timer) parameter of the **chg-stpopts** command is checked. If the value of this timer is less than 30 seconds, the **init-network** command is rejected with this message.

*Error
Message*

E2983 Cmd Rej: STPOPTS table MTPRSIT value must be at least 30000.

This makes sure that the MTP restart timer does not expire when the **init-network** command is executed and disabling the MTP restart feature.

4. The system sets the Inhibit Dynamic Data Loading indicator on the LIMs (running the SS7ANSI, CCS7ITU, or SS7GX25 applications) ACMs, and ASMs running the SCCP application.

The term dynamic data loading applies to all of the LIMs (running the SS7ANSI, CCS7ITU, or SS7GX25 applications) ACMs, and ASMs running the SCCP application; and refers to software used to hunt for a card that already has its application software loaded and to crossload dynamic data from that card. Dynamic data is the data maintained on the main assemblies of the LIMs, ACMs, and ASMs that change in response to system conditions.

5. The system reloads all the ASMs running the GLS application and one of the ASMs running the SCCP application, if there is more than one ASM running the SCCP application.
6. After the all the ASMs running the GLS application have been reloaded, and the one ASM running the SCCP application has been preloaded. Then the alternate cards are reloaded. After the alternate cards have been reloaded and are waiting to crossload the dynamic data, then all the other LIMs, ACMs, and ASMs running the SCCP application, excluding the main cards, are reset.
7. When these LIMs, ACMs, and ASMs have completed resetting, the system resets the main cards.
8. The system removes the Inhibit Dynamic Data Loading indication first on the preloaded ASM running the SCCP application and the alternate cards. This allows all the LIMs, ACMs and ASMs running the SCCP application to complete crossloading and align.
9. All cards reset become active, and traffic is restarted.

Upgrading the Application Processor of the Main Assemblies from the Intel 286/386 to the Intel 486 Microprocessor (Release 20.0)

The main assembly for the Eagle's link interface modules (LIMs), applications services modules (ASMs) and application communications modules (ACMs), has been upgraded to the Intel 486 (32 bit, 25 Mhz) microprocessor, replacing the Intel 286 (16 bit, 16 or 20 Mhz) microprocessor. Using the Intel 486 microprocessor more than doubles the internal processing capability of each LIM, ASM, or ACM, and provides 4295 Megabytes of addressable memory map versus just 1 Megabyte for the Intel 286 microprocessor in the non-protected mode. The new design also includes field upgradable socketed memory space to accommodate up to 68 Megabytes of RAM for each main assembly.

Intel 486-based modules are currently being shipped to customer sites for all new Eagle STP installations. These are fully backward compatible with the existing Intel 286-based LIMs, ASMs, and ACMS, and function identically when equipped with all pre-Release 20.0 software, now in use on more than 90 installed Eagle STPs. Eagle STPs equipped with the Intel 486-based modules are hardware-ready for all features currently being developed or planned through 1997.

Use IMT Bus Instead of MBUS (Release 23.0)

In previous releases, the maintenance bus (MBUS) has been used to communicate with the cards in the Eagle without using the IMT bus. The maintenance bus was used to connect or disconnect cards from the IMT bus and to reinitialize the cards in the Eagle. The maintenance bus was carried on the “A” clock cable from the control shelf to the extension shelves.

In Release 23.0, the maintenance bus has been removed from the Eagle, and the messages that were sent across the maintenance bus are now sent on the IMT bus. The maintenance bus can now be used for other purposes, such as distributing the clock signals for the high-speed ATM signaling links.

The commands now using the IMT bus instead of the maintenance bus are: **init-card**, **init-sys**, **disc-imt**, **conn-imt**, **inh-imt**, and **alw-imt**. The operation and performance of these commands from a user’s perspective has not changed.

User-Initiated Keyboard Locking (Release 22.0)

In Release 22.0, a user will be able to secure the terminal while temporarily away from the terminal without having to log off the terminal with a new command, **lock**.

When the **lock** command is entered, the keyboard is immediately locked, the *Command Executed* response appears in the command information area of the terminal display, a **KEYBOARD LOCKED** indicator is displayed in the lower-right portion of the VT320 terminal (this indication is not displayed on KSR terminals), and a counter of consecutive failed attempts to unlock the terminal is set to 0. The following message appears in the scroll area of the terminal.

```
Terminal keyboard is locked. Enter UNLOCK command to unlock.
```

When the terminal keyboard is locked, the only input allowed on the keyboard is the **unlock** command which is used to unlock the keyboard. If any command other than the unlock command is entered while the keyboard is locked, the command is rejected with the following message.

```
E2004 Cmd Rej: Keyboard is locked. Enter UNLOCK command
```

This message is displayed regardless of whether or not the command contained any command syntax errors. In addition, while the keyboard is locked, only these terminal function keys are enabled.

- F6 - refresh screen
- F8 - toggle scroll lock
- F11 - toggle between VT320 and KSR terminal modes

Other terminal function keys are ignored. If one of these function key is pressed no error message is displayed.

When the **unlock** command is entered, the user is prompted for the user's password with the following message.

```
Enter LOGIN password to unlock keyboard :
```

The password that must be entered is the password of the user that was logged on to the terminal when the **lock** command was entered.

If the password entered at the **unlock** command prompt does not match the password of the user logged on to the terminal, then the **unlock** command is rejected with the following error message.

```
E2765 Cmd Rej: Invalid password. Keyboard is locked. Enter UNLOCK command.
```

Each time the **unlock** command is entered, the system increments the counter of consecutive failed unlock command attempts by 1. If the counter equals or exceeds the login failure threshold for the terminal port as defined by the **mxinv** parameter of the **chg-trm** command, then the following message is issued to each terminal able to receive unsolicited system administrator messages.

```
Info: xxxxxxxxxx successive UNLOCK failures on port yy
```

where:

xxxxxxx = the number of consecutive failed **unlock** command attempts (0 - 4,294,967,295)

yy = the number (1 - 16) of the terminal port on which the failed **unlock** command attempt occurred.

In addition, for every consecutive **unlock** command failure that is an even multiple of login failure threshold value, assuming the login failure threshold is greater than 0 (for example, if the value of the login failure threshold is 3, the even multiple of this value is 6), the terminal port is disabled for the period time specified by the **dural** parameter of the **chg-trm** command.

If any commands are entered during the period of time when the terminal port is disabled, the commands are rejected with the following message.

*Error
Messages*

E2770 Cmd Rej: Port temporarily disable due to excessive UNLOCK failures.

Specifying a value of 0 for the **mxinv** parameter turns off the temporary terminal port lockout feature and no messages regarding **unlock** command failures and login failures are issued and the terminal port is not disabled. If the value of the **mxinv** parameter is greater than 0 and the value of the **dural** parameter is 0, the Eagle issues the information message reporting the number of consecutive login failures when that number exceeds the value of the **mxinv** parameter, but the terminal port is not disabled.

If the password entered at the prompt from the **unlock** command matches the password of the user that is logged on to the terminal, the keyboard is unlocked. The following message is displayed in the scroll area of the terminal,

Info: Keyboard unlocked. xxxxxxxxxx UNLOCK commands were attempted.

where xxxxxxxxxx is the number of times the **unlock** command was entered on the terminal.

Any terminal subject to idle terminal monitoring whose keyboard is subsequently locked will not be disabled as long as the keyboard remains locked. As soon as the keyboard is unlocked, the terminal's counter of accumulated idle time is reset to 0 and idle terminal monitoring resumes.

SEAS terminals (a terminal port with the **type=seas** parameter specified) cannot be locked. The **lock** command checks the terminal type of the terminal that the **lock** command is entered on. If the **lock** command is entered on a SEAS terminal, the command is rejected with the following message.

E2766 Cmd Rej: Command cannot be executed on a SEAS terminal

The **unlock** command can be entered on a SEAS terminal, however it is always rejected with the following message because SEAS terminals cannot be locked. No password prompt is issued to the SEAS terminal.

E2767 Cmd Rej: Keyboard is not locked

Any time a user is automatically logged off a terminal while the keyboard is locked, the keyboard will be unlocked. This includes automatic logoffs that are caused by:

- changing terminal characteristics
- inhibiting or allowing the terminal with the **rmv-trm** or **rst-trm** commands
- executing either the **chg-user** or **dlt-user** commands
- communications loss to the terminal

The system administrator can unlock a locked terminal by taking the terminal out of service with the **rmv-trm** command, then restoring the terminal to service with the **rst-trm** command.

While the keyboard is locked, only inputs to the terminal are monitored. Outputs destined for the terminal continue to be output regardless of the state of the keyboard lock.

The **rept-stat-user** command shows which terminals are currently locked with the entry *lock* in the COMMAND field of the output. The following is an example of the output of the **rept-stat-user** command.

USER ID	TERM #	IDLE SINCE	COMMAND	STATE
eagle	8	97-06-07 06:45:23	lock	IDLE
REPORT COMPLETED				

Using the DPC/SSN Parameters and GTA Range in Displaying Global Title Translations (Release 22.0)

This feature enhances both the SEAS *VFY-GTT* and Eagle **rtrv-gtt** commands to support specific values for the **pc** and **ssn** parameters, as well as the end range for the **gta** parameter. This enhancement allows customers with large GTT data bases to limit the amount of output for each verify request, thus avoiding the possibility of reaching the 400K UAL limit.

The **pc**, **ssn**, and **egta** parameters have been added to Eagle's **rtrv-gtt** command.

The SEAS *VFY-GTT* command now supports the **dpc**, **ssn**, and **&&-gta** parameters.

The Eagle does not support the relative cost parameter. When this parameter is specified on the SEAS interface, the Eagle ignores this parameter. The value 50 is displayed in the *VFY-GTT* output because this parameter is mandatory in the output syntax.

The Eagle only supports one DPC-SSN combination for each global title translation (GTT). A specific DPC-SSN entered with a specific global title address for this command must match the one existing for the specified global title address. However, because only one DPC-SSN combination is allowed per GTT, specifying ** for either the DPC or the SSN for a specific global title address results in the same response as if the specific values were entered.

Variable Length GTT (Release 26.1)

Variable Length GTT provides customers the ability to provision Global Title entries of varying lengths to a single Translation Type or GTT Set. In prior releases, only Fixed Length GTT was supported, meaning that all Global Title entries assigned to a single Translation Type or GTT Set had to be the same length.

With Variable Length GTT, customers can assign Global Title entries of up to 10 different lengths to a single Translation Type or GTT Set. These lengths are not defined when entering the Translation Type or GTT Set. As the entries are entered, the software keeps track of the length, allowing only 10 different lengths.

When 10 different lengths are specified for a Translation Type or GTT Set, only Global Title entries with lengths matching those defined are allowed. That is, if the craftsperson has entered 10 different lengths and a new entry is entered with a length that does not match one already entered, the new one will not be allowed.

This feature is controlled with a feature bit. This feature bit may be set independently of whether Enhanced GTT is used or not.

In addition to satisfying the needs of European customers, this feature provides U.S. customers with an easier method of provisioning GTT data, since shorthand ranges can be used to represent large groups of GTAs. Thus more specific GTAs can be provisioned as exceptions to these larger groups.

Consider the following example:

Table 5-24. Variable GTT Example

TT	GTA	EGTA	PC-SSN	XLAT	RI
11	0	9	1-1-1	DPC	GT
11	9193	9194	1-1-2	DPC	GT
11	919460	919460	1-1-3, 23	DPCSSN	SSN
11	9193800000	9193800999	1-1-4, 25	DPCSSN	SSN
11	9193831000	9193833999	1-1-4, 25	DPCSSN	SSN

In this example, the customer wishes to perform final GTT on all numbers matching the last three entries. Note the shorthand used in the third entry, as this single entry represents all numbers beginning with the first six digits of 919460, i.e. 9194600000 - 9194609999. Any number not matching the last three entries requires intermediate GTT, and is routed to different nodes based on the ranges specified. The first entry provides a "default" for all GTAs not matching more specific GTAs entries for this translation type.

As another example, consider the possibility that an MSU comes in with the address "9193805000". The address is a 10-digit number, and therefore would first get looked up on the 10-digit tree. In this example, these would fail. The 6-digit tree would be looked up next. This would fail, too. Finally, the address would match the 4-digit range of 9193 to 9194.

Upgrade Considerations

This section considers the software upgrade requirements of the Variable Length GTT feature, which involves a database upgrade. The database upgrade is impacted by the following changes:

- With this feature, the previous implementation of "Padded Variable Length GTT" becomes obsolete. An upgrade path is provided for customers who have this feature activated. (See "*Hardware Required*" on page 5-166 for more information.)
- Removing any padded entries from the GTT database and entering them into new trees for the corresponding GTT Set also impacts the GTT_SET table entry size.

NOTE: There will be a problem if a PVGTT database has more than 10 different padded lengths.

- If the PVGTT and LNP features are on, a DSM is required (see "*Hardware Required*" on page 5-166 for more information).

Changed Commands

The following commands have been enhanced to support this feature. For current information on these commands, see the *Commands Manual*.

chg-feat

The **chg-feat** command has been enhanced to allow activation of this feature. The parameter **vgtt** = <Variable Length GTT> has been introduced. Once the feature has been turned on, it cannot be turned off.

rtrv-feat

The **rtrv-feat** command has been enhanced to report the status of this feature; it has no parameters.

ent-tt/ent-gttset

When the VGTT feature is ON, the **ndgt** parameter of the **ent-tt** and **ent-gttset** commands is rejected.

rtrv-tt/rtrv-gttset

When the VGTT feature is ON, the **rtrv-tt** and **rtrv-gttset** commands display all supported lengths—up to 10 different lengths—for each TT or GTT Set using the **ndgt** parameter.

ent-/chg-gtt/gta

When the VGTT feature is ON, the enter and change GTT/GTA commands no longer enforce the rule that the number of digits specified must match the **ndgt** parameter of the TT or GTT set. If an overlapping point code is entered, an error message is generated.

add-/chg-gtt

When the VGTT feature is ON, the SEAS add and change GTT commands no longer enforce the rule that the number of digits specified must match the **ndgt** parameter of the TT set.

Alarms**UAMs**

Two new alarms have been created in association with this feature:

- 0909 - Insufficient HW to support LNP and VGTT**Major**
- 0910 - Sufficient HW to support LNP and VGTT**Normal/Clearing**

Hardware Required

This feature has the same hardware requirements, provisioning rules, and ratios as does GTT. However, in order to meet performance requirements, the card required for this feature may need to be upgraded. The choice of hardware will be determined by the sales team based on the current customer database and needs. The hard and fast rule is:

- If LNP is OFF, a TSM should be able to provide the desired performance.
- If LNP is ON, a DSM is needed.

At a minimum, the Variable GTT feature requires TSM cards for SCCP functionality prior to turning on the feature bit. Due to the possible combinations available with SCCP features, Table 5-25 can be used to clarify the required hardware for VGTT, as well as other SCCP features.

Table 5-25. VGTT Required Hardware

Feature	Required Hardware
VGTT	TSMs (N+2)
EGTT	TSMs (N+1)
VGTT + EGTT	TSMs (N+2)
G-PORT, G-FLEX, INP	DSMs (N+1)
VGTT/LNP	DSMs (N+1)
LNP (<12 million)	TSM (N+1)

Table 5-25. VGTT Required Hardware (Continued)

Feature	Required Hardware
LNP (>12 million)	DSM (N+1)
GTT	ASM / TSM (N+1)

Variable-Length Global Title Translation (Release 26.1) (IP⁷ Release 2.2)

The IP⁷ Secure Gateway supports either of the following types of global title translation:

- Standard GTT determines which translation table to use based solely on the Translation Type (TT) contained in the SCCP called party address.
- Enhanced GTT determines which translation table to use based on the TT, Numbering Plan (NP), Nature of Address Indicator (NAI), and Global Title Indicator (GTI), all of which are contained in the SCCP called party address.

For either type of global title translation, each translation table has a fixed length for the numbers it includes.

In previous releases, if the IP⁷ Secure Gateway received a number that had fewer digits than were defined in the table, the IP⁷ Secure Gateway did not perform the GTT. In this release, if the IP⁷ Secure Gateway receives a number that has fewer digits than are defined in the table, the IP⁷ Secure Gateway pads the called party address with special non-decimal characters so that the length of the called party address matches the length used by the table.

(In either release, if the IP⁷ Secure Gateway received a number that had more digits than were defined in the table, the IP⁷ Secure Gateway used as many digits as were defined for the table; for example, if a given translation table contained called party addresses of length 10 and an MSU with a called party address of length 12 was received, the IP⁷ Secure Gateway used the first 10 digits.)

If the user specifies an individual entry or range of entries on the **ent-gtt** command (used to provision a standard GTT translation table) or on the **ent-gta** command (used to provision a enhanced GTT translation table) with a value that has fewer digits than the predefined length of the table, the IP⁷ Secure Gateway adjusts the internal representation of the specified value to match the length of the table.

Whenever a global title address is displayed, it is displayed as it was entered at the terminal.

Enhancements to Existing Commands for Variable-Length GTT

The following commands have been enhanced to support the **iplimi** feature. For more information about formats for the following commands, refer to the *Commands Manual*.

chg-feat

This command includes a new parameter (**:pvgtt=**) used to specify that the Variable-Length GTT feature is turned on.

rtrv-feat

The output of this command now includes a display of whether the Variable-Length GTT feature is turned on.

Warning Message When LIMs Added with Insufficient TSMs (Release 25.0)

This feature enforces the current TSM provisioning rules of one TSM at a minimum for every 16 LIMs when a LIM is added. When a LIM is added, if there are not enough TSMs, a warning message is displayed. The craftsperson then has the option to override the warning, forcing the card to be entered.

Per the EAGLE engineering rules, a minimum of 1 SCCP (ASM or TSM) card is required for each group of 16 low-speed LIMs, with one additional SCCP card required per system for N+1 redundancy.

Since one HSL can provide the data transfer capability of approximately 16 DS0s, 2 HSL ATM cards can be supported by a minimum of 1 SCCP card.

The feature enforces the minimum configuration.

When a low-speed LIM card (ss7ansi, ccs7itu, ss7gx25) or a high-speed LIM card (atmansi) is entered via the **ent-card** command, the number of provisioned SCCP cards is evaluated to ensure that the minimum required configuration is maintained. The minimum configuration value is one SCCP card for each multiple of 16 LSLs, or 2 HSLs, rounded up.

One additional ASM/TSM card is required to maintain N+1 redundancy.

The warning is accomplished via command error or other means, and does not produce an alarm.

The craftsperson must explicitly override the warning to provision a card that breaks the required configuration rule. When this is done, the warning still is displayed.

When the warning is overridden, the event is logged in the security log.

Weighted SCP Load Balancing (Release 27.2)

The Weighted SCP Load Balancing feature allows the user to enter up to eight PC/SSNs into a mated PC/SSN group. Previously, only two mated PC/SSN could be entered. The Mated PC/SSN group can be identified by specifying any PC/SSN within the group. This feature also increases the number of SSN's per PC to 12.

With this feature, Eagle now supports four different modes for PC/SSN groups:

- Solitary
- Dominant
- Load Shared
- Combined Dominant/Load Shared (new)

Combined Dominant/Load Shared mode is new for this feature; the other modes are existing modes. Previously, the mode was determined by the multiplicity parameter. This parameter is no longer used. Instead, the mode is determined by the relative cost of the PC/SSNs.

A group of replicated PC/SSNs are in Combined Load Sharing/Dominant Mode when at least two of the PC/SSNs have the same relative cost, and another node subsystem in the group has a different relative cost. For example, the user enters the mated PC/SSNs in Table 5-26:

Table 5-26. MAP for Combined Load Share Mode

PC/SSN	Relative Cost
1-1-0/10	10
1-1-1/10	10
1-1-2/10	20
1-1-3/10	20

The user then enters the Translations in Table 5-27:

Table 5-27. Translations for Combined Load Share Mode

Translation Type	GTA	PC/SSN
10	000 to 999	1-1-0/10

In this example, if both 1-1-0/10 and 1-1-1/10 are available, Eagle will evenly distribute MSUs for TT 10 to 1-1-0/10 and 1-1-1/10. If 1-1-0/10 fails, Eagle will send all MSUs to 1-1-1/10. If both 1-1-0/10 and 1-1-1/10 fail, Eagle will evenly distribute the MSUs to 1-1-2/10 and 1-1-3/10.

Eagle will not guarantee sequencing when Combined Load Sharing / Dominant mode is used. MSUs with the same SLS values may be sent to different nodes.

Hardware Requirements

There are no additional hardware requirements for this feature.

Alarms

No new UAMs / UIMs have been created or changed for this feature.

Enhancements to Existing Commands

For current information on the commands in this section, see the *Commands Manual*.

The following existing commands have been enhanced to support the Weighted SCP Load Balancing feature.

ent-map (enter mate applications)

This command allows the assignment of mated applications for use with SCCP network management. A mated application is used in the event the local application becomes unavailable. For this feature, enhancements to the **rc** and **materc** parameters of the **ent-map** command have been made. Also, the **adj** and **mult** parameters have been removed.

chg-map (change mate applications)

Use this command to change the mated point code and subsystem number and its attributes. A mate point code defines an adjacent signaling point, which is considered the mated signal transfer point (STP) to the Eagle. For this feature, the **chg-map** command has been enhanced by the **rc** and **materc** parameters.

rtrv-map (retrieve mate applications)

Use this command to display the mated application relationship information maintained by the Eagle. The output of the **rtrv-map** command has been enhanced to display the status of the new **ent-map** / **chg-map** parameters, **rc** and **materc**.

Upgrade Considerations

- During upgrade, the adjacency parameter is deleted, and the **srm** parameter remains unchanged.

- During upgrade for mated subsystems in dominant mode, the primary subsystem is assigned a relative cost of 10, and the backup subsystem is assigned a relative cost of 50.
- During upgrade for mated subsystems in shared mode, both subsystems are assigned a relative cost of 50.
- During upgrade for subsystems in solitary mode, the subsystem is assigned a relative cost of 10.
- During upgrade, the multiplicity parameter is deleted.

Limitations

- The Eagle is not required to support the 2-step NetPilot GTT feature.
- The Eagle does not guarantee MSU sequencing when Load Sharing is used. MSUs with the same SLS values may be sent to different nodes.

Wireless Number Portability (Release 23.1)

This feature enhances the Local Number Portability feature to allow wireless service providers to query the LNP database for ported telephone numbers. The query is used to find the location routing number associated with the ported telephone number so the telephone call can be routed to its proper destination.

The Wireless Number Portability feature can only be used for ANSI messages. The Wireless Number Portability feature is not defined for ITU messages.

When a query arrives at the Eagle from a wireless service provider, it is examined for a translation type associated with the wireless number portability translation type service.

If the query contains a wireless number portability translation type (the route on GT routing indicator) and requires global title translation, the query is routed to the local LNP query subsystem at the Eagle's true point code.

The local LNP query subsystem processes the query to find the location routing number associated with the telephone number contained in the query. A response is sent to the originator of the query with the location routing number for the ported telephone number.

This type of query cannot be routed to an external node. This means that the processing of Wireless Number Portability queries cannot be split across multiple network elements.

If global title translation is not required and if the destination of the query is the Eagle's destination point code and subsystem, the query is routed to the local subsystem. If the destination of the query is not the Eagle's destination point code and subsystem, the query is routed to the destination point code in the query.

The Wireless Number Portability feature must be turned on with the **chg-feat** command and must have the translation types sent from wireless service providers configured in the database with the **ent-lnp-serv** command.

X.25/SS7 Gateway Feature (Release 20.0)

The Eagle X.25/SS7 gateway feature connects SS7 and X.25 networks. This enables applications to connect using different transport services. The gateway converts each X.25 packet to SS7 MSU and routes it to an SS7 network. SS7 MSU going the other way are converted to X.25 packets. The gateway is physically positioned between the SS7 network and X.25 network, and it transports messages from one network to the other using the services of SS7 SCCP (Signaling Connection Control Part) protocol.

The X.25/SS7 gateway feature is an optional feature that is turned off by default. To use the X.25/SS7 gateway feature, it must be turned on by entering the appropriate command. Once this feature is turned on, it cannot be turned off.

The gateway supports the following two types of connectivity to the X.25 node.

- Direct connectivity
- Connectivity through a public or private data network

The Eagle supports 1024 logical channels. All X.25 entities are assigned an SS7 point code and SCCP subsystem number. The individual X.25 connections on the Eagle are assigned X.25 addresses, as well as alias point codes. These are then mapped in the Eagle routing table to logical channels. This allows X.25 messages (which use connection-oriented procedures) to be routed and maintained in the SS7 network (which uses connectionless procedures).

The Eagle uses a LIM equipped with a 486 processor and a generic program load (GPL). The LIM supports the DS0A or OCU, and V.35 interfaces at these lines speeds.

- DS0A at 56 and 64 kbps
- OCU at 56 and 64 kbps
- V.35 at 4.8, 9.6, 19.2, 56, and 64 kbps

The X.25 gateway feature requires that any data that is transmitted must be sent on a connection. A connection represents a route between two application entities (one in the X.25 domain and one in the SS7 domain). It must exist before any messages can be transferred. The connection can be one of three types:

- PVC (permanent virtual circuit): A fixed connection that can only be altered through administration.
- SVCA (switched virtual circuit-automatic): A connection established by the STP as soon as the X.25 gateway card initializes.
- SVCR (switched virtual circuit-remote): A connection established by the X.25-user end when necessary.

Automatic SVCs (SVCAs) are assigned when the X.25 LIM card is booted. The virtual connection is based on information in the routing tables of the Eagle. The X.25 destination (DE) and the SS7 node must be defined in the Eagle database in advance.

Remote SVCs (SVCRs) are assigned on an as-needed basis. This means when an incoming message from the X.25 network or the SS7 network is received, a “virtual” destination and originating point code are assigned.

For these connections, a route must be defined through administration. Every application entity that can be connected through the gateway must be defined. The association between the application entities must also be defined.

In addition to the normal MTP and SCCP processing, the X.25 gateway feature provides two new components for the STP – gateway routing and protocol conversion.

An X.25 link appears to the STP as though it is an SS7 link. Adjacent point codes are either the originating point code of the X.25 distant end (if the connection is direct), or a virtual point code (if the connection is through a network). This is equivalent to routing through an adjacent STP to the signaling points connected to it. See Figure 5-29.

Figure 5-29. Gateway Network

As messages travel from the X.25 network to the SS7 network, the gateway determines the destination point code (DPC) and adds the SS7 SCCP and MTP envelopes to the TCAP message. The gateway determines the virtual circuit and removes the SCCP and MTP envelopes on messages transmitted from the SS7 network side to an X.25 destination.

Other attributes of the gateway are as follows:

- Each X.25 link supports up to 255 logical channels as SVCs or PVCs or a combination.
- All X.25 network-initiated calls are accepted when the calling X.25 node is correctly defined in the STP.
- Gateway screening is supported from the X.25 to the SS7 network.
- Routing does not occur through the X.25 gateway between two X.25 points.
- X.25 networks that do not supply the calling address in the call request are not supported for network-initiated connections.

Message Conversion

The Eagle performs message conversion for all traffic in both directions. The message conversion removes and adds protocol envelopes used by the X.25 and SS7 networks. The data portion of the message is not changed. The MTP / SCCP of SS7 is converted to X.25 and reverse, depending upon the traffic direction.

Address Mapping

Messages originating from the SS7 network destined for the X.25 network can be routed by the destination point code (DPC) assigned to the X.25 entity in the X.25 routing table (called Xpc). This allows SS7 entities to address the X.25 network without knowing X.25 addresses.

The X.25 routing table provides the X.25 address of each X.25 entity, an SS7 point code for each of the X.25 entities, a subsystem number for SCCP routing, the method of routing to be used (Xpc or normal SS7 routing) and the logical channel to be used between each of the specified X.25 entities and the SS7 entities.

Routing by the X.25 point code assignment allows many SS7 entities to communicate to one X.25 entity without each SS7 entity having to know the X.25 address, and allows all SS7 entities to connect to the X.25 entity over one logical channel. This provides for easier routing table administration. Without this capability, every possible connection between X.25 and SS7 entities would have to be defined in the Eagle X.25 routing table.

To support the gateway function, the entities within the X.25 network must be assigned an SS7 point code. This point code is assigned in the Eagle X.25 routing table using Eagle administration commands. The routing table specifies the X.25 address, the SS7 point code assigned to both the X.25 entities and any SS7 entities which need to connect to X.25, a subsystem number for the X.25 entities, and the logical channel to be used on the X.25 link for connections between the specified entities. Full point code routing is used to route packets to a pseudo X.25 point code.

Each Eagle connection to the X.25 network is assigned an X.25 address as well. This allows routing of data from the X.25 network to the SS7 network. An SCCP subsystem number is assigned to the X.25 destination to enable global title translation to the X.25 entity.

Logical channels are also assigned in the X.25 routing table. Each X.25 entity must be assigned an SS7 destination, to allow logical channel assignments to be made for the connection. If there are to be several SS7 entities connecting to the X.25 entity over the same logical channel, a wild card entry can be made in the routing table. This allows any SS7 entity to establish a connection over the specified logical channel, but only one connection can be made at any one time.

X.25 Gateway Routing

X.25 gateway routing is performed through four different functions:

- Connection determination
- X.25 connection control

- Same-link management
- Logical channel to network management mapping

Connection Determination

The destination address for X.25 is defined as a destination element (X.25 DE). An X.25 DE is an object on the X.25 network to which a connection can be made and has a point code assigned to it. An X.25 link can be either point-to-point (direct) or through an intermediary network. A destination for SS7 is a point code, plus an optional subsystem number (SSN).

A destination for X.25 is dependent upon whether a connection is established. A *connection* is defined as a pair of destinations that are exchanging messages. The destination for X.25 is an X.25 address before connection, and a logical channel (LC) after connection. One of the destinations must be in the X.25 domain and the other in the SS7 domain. See Figure 5-30.

Figure 5-30. X.25 Gateway Connection Determination

The connection is determined using the gateway routing table. This process can be divided by whether the message arrives from the X.25 side (inbound) or the SS7 / MTP side (outbound):

- Inbound messages:

If the logical channel on which the message arrives is in the connected state, it already points to an entry in the gateway routing table. The destination point code (DPC) is the value in the SS7 point code field. The origination point code (OPC) is the value in the X.25 point code field.

For an incoming SVC, the X.25 user must first establish the connection.

- Outbound messages:

The DPC is used to locate the connection on which to send the message. The order of the lookup in the routing table is as follows:

- a. The STP locates an entry in the X.25 point code field that matches the DPC. If no entry is found for that point code, the gateway produces MRN #1140 and the MSU is discarded.

NOTE: If no entry is found, or an SVCA defined, the connection cannot be established.

- b. The STP verifies that the OPC matches the SS7 point code field. If there is no match, the gateway produces MRN #1134 and the MSU is discarded.
- c. Once the connection entry is found in the gateway routing table, the STP examines the card address field and proceeds as follows:

If...	then...
the card address is the same as the card that receives the MSU,	the process is complete and the message passes to format conversion.
the card address is not the same card that receives the MSU,	the STP passes the MSU to “single link” management for the card defined in the card address field.

X.25 Connection Control

There is an additional routing requirement, connection routing and control, that is different from SS7 routing. The X.25 requires that a connection be present between the gateway and the X.25 DE before any messages can be exchanged. A connection is established depending upon when and where the connection is made.

A fixed connection route is defined through administration and can be either PVC (permanent virtual circuit), SVCA (switched virtual circuit-automatic) or SVCR (switched virtual circuit – remote). If the connection type field is PVC, the PVC is already established when the link is initialized through provisioning in the PDN and STP. The PVC remains in effect while the link is operational.

If the connection type field is SVCA, the connection is established by the designated LIM card (defined in the location field) immediately after the link becomes initialized. It is possible that the remote end becomes available during this cycle, and makes the connection from the remote end. The remote end could make the connection to any card. The connection remains in effect while the link is operational or until the remote end fails or clears the connection.

If the connection type field is SVCR, the connection can only be made by the X.25 DE as follows:

If an X.25 DE wants to send a message to an SS7 node, and the STP has not established a connection to that node, it attempts to establish one before sending the message. The X.25 DE establishes the connection by sending a call request to the STP with identification in the calling address field, and the SS7 node in the called address field.

When the STP receives the incoming call, the STP verifies both the calling and called addresses using the X.25 address and SS7 address fields. If the STP finds an entry for the X.25 address pair, it checks to see if a connection is active.

If...	then...
the connection is active,	the STP clears the incoming call.
the connection is not active,	it is set as active.
an entry for the X.25 address pair is not found,	the STP checks the X.25 Destination Table to see if the designated X.25 addresses are present.
both addresses are present (the caller is in the X.25 domain and the called address is in the SS7 domain),	the connection is established and a temporary entry is added to the database.

Same Link Management

X.25 requires that if there is a set of links into a PDN (or directly to an X.25 DE), a response to a request must be returned on the same link and logical channel as the request was received. Because MTP routing does not use a particular link on a linkset, it is likely that a response would go to a non-originating LIM. Same link management assures that the message is sent out on the same link. This is achieved by each LIM informing all other LIMs when the state of a connection changes.

Logical Channel to Network Management Mapping

The Eagle X.25/SS7 gateway provides management procedures for failed X.25 logical channels. This feature allows traffic destined for failed logical channels to be rerouted to an alternate route.

When configuring logical channel to network management mapping (LC2NM), you must determine if the X.25 entity is expecting associated queries and responses to use the same logical channel or if they may be assigned to different logical channels. If associated queries and responses can be received over different logical channels, load balancing and failure recovery through alternate routing is supported.

Year 2000 Compliance (Release 23.1)

This feature ensures that there are no date-related problems with the Eagle or created by the Eagle on or after January 1, 2000. The date shown in all outputs from the Eagle continue to be shown as two digits.

The Eagle performs all date and time-of-day operations within the range of dates from January 1, 1995 to December 31, 2036. January 1, 1995 was chosen as the starting date for the range of dates because several Eagle features implemented with Release 21.1 have it as the defined start date.

All Eagle software has been modified to represent all dates unambiguously (that is, the year represented as 00 means the year 2000). The digits 95 through 99 represent the years 1995 through 1999. The digits 00 through 36 represent the years 2000 through 2036. For all software modifications in this feature, the date representations have been made to comply with the date formats shown in *Data Elements and Exchange Formats - Information Exchange - Representation of Dates and Time, ISO 8601, 1998*. The Eagle software that is fully compliant with the requirements of the Year 2000 feature does not need to be modified to comply with *Data Elements and Exchange Formats - Information Exchange - Representation of Dates and Time, ISO 8601, 1998*.

Each year that is divisible by four is a leap year, with the exception of those years that end in “00,” such as 1900. The one exception is that years that are divisible by 400 are leap years, such as 1600 and 2000. The Eagle recognizes the year 2000 as a leap year.

This section is divided into two parts:

- The first part, “*Year 2000 Eagle Compliance*” shows how the Year 2000 feature applies to the Eagle.
- The second part, “*OAP Year 2000 Compliance*” shows how it applies to the OAP.

Year 2000 Eagle Compliance

This section lists the Year 2000 requirements, conditional requirements, and objectives that the Eagle complies with as defined in the Bellcore document, *Year 2000 Generic Requirements: Systems and Interfaces, GR-2945-CORE, Issue 1, BELLCORE, December, 1996*.

The compliance matrix is a table listing the requirement number, objective number, or conditional requirement number as defined in the Bellcore document, the Eagle's level of compliance with the requirement, objective, or conditional requirement, and any comments that may apply to these items.

A requirement is a feature or function of an STP that Bellcore has determined must be a part of the STP to function properly. A requirement is identified in this appendix with the letter R in parentheses, (R).

A conditional requirement is a feature or function of an STP that Bellcore has determined is necessary in certain applications, depending on how the STP is deployed. A conditional requirement may depend on other requirements, objectives, or conditional requirements. A conditional requirement is identified in this appendix with the letters CR in parentheses, (CR).

An objective is a feature or function of an STP that Bellcore has determined is a desirable feature or function for the STP to have, but not required to have. An objective is identified in this appendix with the letter O in parentheses, (O).

There are four levels of compliance used in this compliance matrix.

- Fully compliant
- Partially compliant
- Not compliant
- Not applicable

The table caption for each table refers to the section of the *Year 2000 Generic Requirements: Systems and Interfaces, GR-2945-CORE, Issue 1, BELLCORE, December, 1996* document where the item can be found.

Table 5-28. Section 2.1. Date-Sensitive Criteria – System Integrity

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 2-1	Fully Compliant	
(R) 2-2	Fully Compliant	The minimum range for the Eagle is 1 / 1 / 95 - 12 / 31 / 36
(R) 2-3	Not Applicable	The Eagle does not perform date conversions, computations, and comparisons using the Gregorian Calendar.
(R) 2-4	Fully Compliant	
(R) 2-5	Fully Compliant	
(R) 2-6	Fully Compliant	
(R) 2-7	Fully Compliant	

Table 5-29. Section 2.2. Date-Sensitive Criteria – Application Integrity

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 2-8	Fully Compliant	
(R) 2-9	Fully Compliant	
(R) 2-10	Fully Compliant	
(R) 2-11	Not Applicable	The Eagle does not perform delayed execution.
(R) 2-12	Fully Compliant	
(R) 2-13	Fully Compliant	
(R) 2-14	Fully Compliant	
(R) 2-15	Fully Compliant	
(R) 2-16	Not Applicable	No hashing or random number generation is performed.
(R) 2-17	Fully Compliant	
(O) 2-18	Fully Compliant	
(R) 2-19	Fully Compliant	
(R) 2-20	Fully Compliant	

Table 5-30. Section 3. User Interface

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 3-1	Fully Compliant	
(R) 3-2	Fully Compliant	
(R) 3-3	Fully Compliant	
(R) 3-4	Fully Compliant	
(O) 3-5	Partially Compliant	When two digits are used, Year is displayed in unambiguous format, 95 - 99 represents the 20th century, 00 - 36 represents the 21st century.
(R) 3-6	Fully Compliant	
(R) 3-7	Fully Compliant	
(R) 3-8	Fully Compliant	

Table 5-31. Section 4. Machine-to-Machine Interface

Belcore Requirement	Level of Compliance	Comments/Exceptions
(O) 4-1	Not Applicable	The Eagle will comply with this objective if an external communication system uses the ISO 8601 date format.
(O) 4-2	Not Applicable	The Eagle will comply with this objective if an external communication system uses the ISO 8601 date format.
(R) 4-3	Not Applicable	See the “ <i>OAP Compliance Matrix</i> ” section on page 5-188.
(CR) 4-4	Fully Compliant	
(CR) 4-5	Fully Compliant	
(CR) 4-6	Fully Compliant	
(CR) 4-7	Fully Compliant	
(R) 4-8	Not Applicable	The Eagle does not support BAF / MDR records.
(R) 4-9	Not Applicable	The Eagle does not support BAF / MDR records.
(R) 4-10	Not Applicable	The Eagle does not interact with an MSR system.
(R) 4-11	Not Applicable	The Eagle does not generate MWI Control operations.
(R) 4-12	Not Applicable	The Eagle does not perform ISDN PRI signaling
(R) 4-13	Not Applicable	The Eagle does not interact with an MSR system.

Table 5-32. Section 5. Management Function Areas

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-1	Fully Compliant	
(R) 5-2	Not Applicable	See the “ <i>OAP Compliance Matrix</i> ” section on page 5-188.
(CR) 5-3	Fully Compliant	
(CR) 5-4	Fully Compliant	
(CR) 5-5	Not Applicable	The Eagle does not perform delayed activation.
(CR) 5-6	Not Applicable	The Eagle does not perform scheduled configuration data change.
(CR) 5-7	Not Applicable	The Eagle does not perform reservation configuration data change.
(R) 5-8	Fully Compliant	

Table 5-32. Section 5. Management Function Areas (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-9	Fully Compliant	
(CR) 5-10	Not Applicable	The Eagle does not perform delayed activation.
(R) 5-11	Fully Compliant	
(R) 5-12	Fully Compliant	
(CR) 5-13	Not Applicable	The Eagle does not support automatic backups.
(CR) 5-14	Not Applicable	The Eagle does not support automatic backups.
(CR) 5-15	Not Applicable	The Eagle does not support automatic backups.
(CR) 5-16	Not Applicable	The Eagle does not support automatic backups.
(CR) 5-17	Fully Compliant	
(O) 5-18	Fully Compliant	
(CR) 5-19	Fully Compliant	
(CR) 5-20	Fully Compliant	
(CR) 5-21	Not Applicable	The Eagle does not support automatic backups.
(CR) 5-22	Fully Compliant	
(CR) 5-23	Fully Compliant	
(CR) 5-24	Fully Compliant	
(CR) 5-25	Not Applicable	The Eagle's database restore does not involve date sensitive data.
(CR) 5-26	Fully Compliant	
(CR) 5-27	Fully Compliant	
(R) 5-28	Fully Compliant	
(R) 5-29	Not Applicable	The Eagle does not perform delayed activation.
(R) 5-30	Fully Compliant	
(R) 5-31	Fully Compliant	
(R) 5-32	Fully Compliant	
(R) 5-33	Not Applicable	The Eagle does not perform delayed activation.
(CR) 5-34	Not Applicable	The Eagle does not perform delayed activation.
(R) 5-35	Fully Compliant	
(R) 5-36	Fully Compliant	
(R) 5-37	Fully Compliant	
(R) 5-38	Fully Compliant	

Table 5-32. Section 5. Management Function Areas (Continued)

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-39	Fully Compliant	
(R) 5-40	Fully Compliant	
(R) 5-41	Fully Compliant	
(R) 5-42	Fully Compliant	
(R) 5-43	Fully Compliant	
(R) 5-44	Fully Compliant	
(R) 5-45	Fully Compliant	
(R) 5-46	Fully Compliant	
(R) 5-47	Fully Compliant	
(R) 5-48	Fully Compliant	
(R) 5-49	Fully Compliant	
(R) 5-50	Not Applicable	The Eagle does not allow a grace period.
(R) 5-51	Fully Compliant	
(R) 5-52	Fully Compliant	
(R) 5-53	Fully Compliant	
(R) 5-54	Fully Compliant	
(R) 5-55	Fully Compliant	
(R) 5-56	Fully Compliant	
(R) 5-57	Fully Compliant	
(R) 5-58	Fully Compliant	The Eagle currently does not use cryptography algorithms.
(R) 5-59	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-60	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-61	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-62	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-63	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-64	Not Applicable	The Eagle does not have any X.509 applications.
(R) 5-65	Not Applicable	The Eagle does not have any smart or token card function involving time.

Table 5-33. Section 6. Applications and Functions

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 6-1	Not Applicable	The Eagle does not have any smart or token card services.
(CR) 6-2	Not Applicable	The Eagle does not provide this function or application.
(R) 6-3	Not Applicable	The Eagle does not provide this function or application.
(R) 6-4	Not Applicable	The Eagle does not provide this function or application.
(R) 6-5	Not Applicable	The Eagle does not provide this function or application.
(R) 6-6	Not Applicable	The Eagle does not provide this function or application.
(R) 6-7	Not Applicable	The Eagle does not provide this function or application.
(R) 6-8	Not Applicable	The Eagle does not provide this function or application.
(R) 6-9	Not Applicable	The Eagle does not provide this function or application.
(R) 6-10	Not Applicable	The Eagle does not provide this function or application.
(R) 6-11	Not Applicable	The Eagle does not provide this function or application.
(R) 6-12	Not Applicable	The Eagle does not provide this function or application.
(R) 6-13	Not Applicable	The Eagle does not provide this function or application.

Table 5-34. Section 7. Process-Oriented Criteria

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 7-1	Fully Compliant	
(R) 7-2	Fully Compliant	
(R) 7-3	Fully Compliant	
(R) 7-4	Fully Compliant	
(R) 7-5	Fully Compliant	
(R) 7-6	Fully Compliant

(R) 7-24	Fully Compliant	
(R) 7-25	Fully Compliant	
(R) 7-26	Fully Compliant	
(R) 7-27	Not Applicable	The Eagle product uses maintenance releases for software fixes and not patches.
(R) 7-28	Fully Compliant	
(R) 7-29	Fully Compliant	

Table 5-35. Section 8. System Reliability and Quality Criteria

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 8-1	Not Applicable	The Eagle will be fully compliant.
(O) 8-2	Not Applicable	The Eagle will be fully compliant.
(R) 8-3	Not Applicable	The Eagle will be fully compliant.

Table 5-35. Section 8. System Reliability and Quality Criteria (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 8-4	Not Applicable	The Eagle will be fully compliant.
(O) 8-5	Not Applicable	The Eagle will be fully compliant.
(R) 8-6	Not Applicable	The Eagle will be fully compliant.
(R) 8-7	Fully Compliant	
(O) 8-8	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-9	Fully Compliant	
(O) 8-10	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-11	Fully Compliant	
(O) 8-12	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-13	Fully Compliant	
(O) 8-14	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-15	Fully Compliant	
(O) 8-16	Fully Compliant	
(R) 8-17	Fully Compliant	
(O) 8-18	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-19	Fully Compliant	
(O) 8-20	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-21	Fully Compliant	
(O) 8-22	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.
(R) 8-23	Fully Compliant	The Eagle conforms to all system reliability and quality criteria as documented by Reliability and Quality Statistics.

OAP Year 2000 Compliance

This section lists the software changes that have been made to the OAP so that no date-related problems occur on the OAP on or after January 1, 2000.

All OAP component software has been modified to represent all dates unambiguously according to the date formats shown in *Data Elements and Exchange Formats - Information Exchange - Representation of Dates and Time, ISO 8601, 1998*. All dates that include years but do not currently provide explicit representation of the century have been modified to represent a date according to the calendar date format YYYYMMDD. Date and time information in SEAS traffic through the OAP to the Eagle STP will not have its format modified in the data stream translation. This will ensure compliance with the SEAS 7.0 standard.

Each year that is divisible by four is a leap year, with the exception of those years that end in "00," such as 1900. The one exception is that years that are divisible by 400 are leap years, such as 1600 and 2000. The OAP recognizes the year 2000 as a leap year.

There are three interfaces that cross the boundaries of the OAP to external entities. These are OAP to LSMS, OAP to Eagle, and OAP to SEAS. In instances where a date must be received or transmitted across these boundaries with less than a four-digit year, the OAP components have been modified to accept or provide a date that is unambiguous. These modifications have been performed within the confines of SEAS 7.0 compatibility.

OAP Compliance Matrix

This section lists the Year 2000 requirements, conditional requirements, and objectives that the OAP and its components comply with as defined in the Bellcore document, *Year 2000 Generic Requirements: Systems and Interfaces, GR-2945-CORE, Issue 1, BELLCORE, December, 1996*. This section is divided into two parts. The first section details specific compliance requirement areas that pertain to one or more of the OAP components. The second section addresses requirements that pertain to the life cycle, quality, and reliability of the system as a whole.

The compliance matrix is a table listing the requirement number, objective number, or conditional requirement number as defined in the Bellcore document, the OAP's level of compliance with the requirement, objective, or conditional requirement, and any comments that may apply to these items.

A requirement is a feature or function of the OAP that Bellcore has determined must be a part of the OAP to function properly. A requirement is identified in this appendix with the letter R in parentheses, (R).

A conditional requirement is a feature or function of the OAP that Bellcore has determined is necessary in certain applications, depending on how the OAP is deployed. A conditional requirement may depend on other requirements, objectives, or conditional requirements. A conditional requirement is identified in this appendix with the letters CR in parentheses, (CR).

An objective is a feature or function of the OAP that Bellcore has determined is a desirable feature or function for the OAP to have, but not required to have. An objective is identified in this appendix with the letter O in parentheses, (O).

There are four levels of compliance used in this compliance matrix.

- Fully compliant
- Partially compliant
- Not compliant
- Not applicable

The table caption for each table refers to the section of the *Year 2000 Generic Requirements: Systems and Interfaces, GR-2945-CORE, Issue 1, BELLCORE, December, 1996* document where the item can be found.

Table 5-36. Section 2.1. Date-Sensitive Criteria – System Integrity

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 2-1	Not Applicable	No two-digit date representations or usage of <code>tm_yr</code> .
(R) 2-2	Fully Compliant	Date reporting is based on Solaris time functions, which use <code>time_t</code> . The Tekelec Installation Utilities and the NEBS alarm daemon do not apply to this requirement. All other OAP components comply with this requirement.
(R) 2-3	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-4	Fully Compliant	The Tekelec Installation Utilities and the Artecon Arteport kernel level device driver do not apply to this requirement. All other OAP components comply with this requirement.
(R) 2-5	Fully Compliant	
(R) 2-6	Fully Compliant	The Tekelec Installation Utilities do not apply to this requirement. All other OAP components comply with this requirement.

Table 5-37. Section 2.2. Date-Sensitive Criteria – Application Integrity

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 2-7	Fully Compliant	Date/time comparisons, where present, are based on time_t values. The Tekelec Installation Utilities and the Artecon Arteport kernel level device driver do not apply to this requirement. All other OAP components comply with this requirement.
(R) 2-8	Fully Compliant	The Tekelec Installation Utilities, the Artecon Arteport kernel level device driver, and the NEBS alarm daemon do not apply to this requirement. All other OAP components comply with this requirement.
(R) 2-9	Fully Compliant	Only the Tekelec EMS Agent, Tekelec UAL/X25/Disk status refresh and notification daemon, and the NEBS alarm daemon apply to this requirement and fully comply with this requirement. All other OAP components do not apply to this requirement.
(R) 2-10	Not Applicable	The Solaris operating system is responsible for any cron initiated processes.
(R) 2-11	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-12	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-13	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-14	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-15	Fully Compliant	All date and time stamps are based on Solaris time calls and contain four digits for the year. The Tekelec Installation Utilities, the Artecon Arteport kernel level device driver, and the NEBS alarm daemon do not apply to this requirement. All other OAP components comply with this requirement.
(R) 2-16	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-17	Not Applicable	Analysis of the source code has determined that all timers use Solaris time_t values.

Table 5-37. Section 2.2. Date-Sensitive Criteria – Application Integrity (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(O) 2-18	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-19	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 2-20	Not Applicable	This requirement has been determined to be not applicable by analysis.

Table 5-38. Section 3. User Interface

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 3-1	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 3-2	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 3-3	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 3-4	Not Applicable	This requirement has been determined to be not applicable by analysis.
(O) 3-5	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 3-6	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 3-7	Not Applicable	The Solaris system clock is used.
(R) 3-8	Not Applicable	The Solaris operating system does use tm_yr values.

Table 5-39. Section 4. Machine-to-Machine Interface

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(O) 4-1	Fully Compliant	The OAP will comply with this requirement if an external communications system uses the ISO 8601 format. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and UAL logical channel over X.25 daemon components apply to this objective and fully comply with this objective. All other OAP components do not apply to this objective.
(O) 4-2	Fully Compliant	The OAP will comply with this requirement if an external communications system uses the ISO 8601 format. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and UAL logical channel over X.25 daemon components apply to this objective and fully comply with this objective. All other OAP components do not apply to this objective.
(R) 4-3	Fully Compliant	ASN.1 (X.208) is used. Only the Tekelec EMS Agent applies to this requirement and fully complies with this requirement. All other OAP components do not apply to this requirement.
(CR) 4-4	Fully Compliant	For information that OAP stores and processes as date field information, SEAS protocol or ASN.1 (X.208) is used. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and Bellcore UAL logical channel over X.25 daemon components apply to this conditional requirement and fully comply with this conditional requirement. All other OAP components do not apply to this conditional requirement.

Table 5-39. Section 4. Machine-to-Machine Interface (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(CR) 4-5	Fully Compliant	For information that OAP stores and processes as date field information, SEAS protocol or ASN.1 (X.208) is used. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and Bellcore UAL logical channel over X.25 daemon components apply to this conditional requirement and fully comply with this conditional requirement. All other OAP components do not apply to this conditional requirement.
(CR) 4-6	Fully Compliant	For information that OAP stores and processes as date field information, SEAS protocol or ASN.1 (X.208) is used. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and Bellcore UAL logical channel over X.25 daemon components apply to this conditional requirement and fully comply with this conditional requirement. All other OAP components do not apply to this conditional requirement.
(CR) 4-7	Fully Compliant	For information that OAP stores and processes as date field information, SEAS protocol or ASN.1 (X.208) is used. Only the Tekelec EMS Agent, Tekelec RS232 Asynchronous Send / Receive daemon, and Bellcore UAL logical channel over X.25 daemon components apply to this conditional requirement and fully comply with this conditional requirement. All other OAP components do not apply to this conditional requirement.
(R) 4-8	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 4-9	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 4-10	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 4-11	Not Applicable	This requirement has been determined to be not applicable by analysis.

Table 5-39. Section 4. Machine-to-Machine Interface (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 4-12	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 4-13	Not Applicable	This requirement has been determined to be not applicable by analysis.

Table 5-40. Section 5. Management Functional Areas

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-1	Not Applicable	This requirement only applies to the Solaris operating system.
(R) 5-2	Not Applicable	This requirement only applies to the Solaris license manager.
(CR) 5-3	Not Applicable	No configuration data reporting is provided that is dependent on the start-date / time for the collection determined by analysis.
(CR) 5-4	Not Applicable	This requirement has been determined to be not applicable by analysis.
(CR) 5-5	Not Applicable	This requirement has been determined to be not applicable by analysis.
(CR) 5-6	Not Applicable	The analysis of the source code determined that there is no configuration data change that is scheduled by date / time.
(CR) 5-7	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-8	Not Applicable	All dates reported are based on the Sparc 5 system clock.
(R) 5-9	Not Applicable	All dates reported are based on the Sparc 5 system clock.
(CR) 5-10	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(R) 5-11	Fully Compliant	Only the Tekelec EMS Agent and Bellcore UAL logical channel over X.25 daemon components apply to this requirement and fully comply with this requirement. All other OAP components do not apply to this requirement.

Table 5-40. Section 5. Management Functional Areas (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-12	Fully Compliant	Only the Tekelec EMS Agent and Bellcore UAL logical channel over X.25 daemon components apply to this requirement and fully comply with this requirement. All other OAP components do not apply to this requirement.
(CR) 5-13	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-14	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-15	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-16	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-17	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(O) 5-18	Not Applicable	This objective has been determined to be not applicable by analysis.
(CR) 5-19	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-20	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-21	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-22	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-23	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-24	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(CR) 5-25	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(R) 5-26	Fully Compliant	The system software download is performed as part of the installation process, which is manually initiated and is performed on demand. Only the Tekelec installation utility applies to this requirement and fully complies with this requirement. All other OAP components do not apply to this requirement.

Table 5-40. Section 5. Management Functional Areas (Continued)

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-27	Fully Compliant	Only the Tekelec installation utility applies to this requirement and fully complies with this requirement. All other OAP components do not apply to this requirement.
(R) 5-28	Fully Compliant	Per Tekelec upgrade procedure using trial/approved nondestructive upgrade procedures. Only the Tekelec installation utility applies to this requirement and fully complies with this requirement. All other OAP components do not apply to this requirement.
(R) 5-29	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-30	Not Applicable	Dependent on the Sparc 5 system clock and Solaris date/time functions.
(R) 5-31	Not Applicable	This requirement is for network traffic management.
(R) 5-32	Not Applicable	This requirement is for network traffic management.
(R) 5-33	Not Applicable	This requirement has been determined to be not applicable by analysis.
(CR) 5-34	Not Applicable	This conditional requirement has been determined to be not applicable by analysis.
(R) 5-35	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-36	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-37	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-38	Not Applicable	This requirement only applies to the Solaris operating system.
(R) 5-39	Not Applicable	This requirement only applies to the Solaris operating system.
(R) 5-40	Not Applicable	Password aging is handled by the Solaris operating system.
(R) 5-41	Not Applicable	Notification of password expiration is handled by the Solaris operating system.

Table 5-40. Section 5. Management Functional Areas (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-42	Not Applicable	Password updates are handled by the Solaris operating system.
(R) 5-43	Not Applicable	All process tracking is handled by the Solaris operating system.
(R) 5-44	Not Applicable	All process tracking is handled by the Solaris operating system.
(R) 5-45	Not Applicable	File creation dates are handled by the Solaris operating system.
(R) 5-46	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-47	Not Applicable	All time stamps are the results of Solaris calls and use four-digit dates for the year.
(R) 5-48	Not Applicable	This requirement applies to the Solaris operating system.
(R) 5-49	Not Applicable	This requirement applies to the Solaris operating system.
(R) 5-50	Not Applicable	This requirement applies to the Solaris operating system.
(R) 5-51	Fully Compliant	Only the Tekelec Eagle REPT-UIM autonomous event report daemon and the NEBS alarm daemon components apply to this requirement and fully complies with this requirement. All other OAP components do not apply to this requirement. Also applies to the Solaris operating system.
(R) 5-52	Not Applicable	This requirement applies to the Solaris operating system.
(R) 5-53	Not Applicable	This requirement applies to the Solaris operating system.
(R) 5-54	Not Applicable	The Solaris operating system is responsible for this security authentication requirement.
(R) 5-55	Not Applicable	The Solaris operating system is responsible for this security authentication requirement.
(R) 5-56	Not Applicable	The Solaris operating system is responsible for this security authentication requirement.
(R) 5-57	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-58	Not Applicable	

Table 5-40. Section 5. Management Functional Areas (Continued)

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 5-59	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-60	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-61	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-62	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-63	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-64	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 5-65	Not Applicable	This requirement has been determined to be not applicable by analysis.

Table 5-41. Section 6. Applications and Functions

Belcore Requirement	Level of Compliance	Comments/Exceptions
(R) 6-1	Not Applicable	This requirement has been determined to be not applicable by analysis.
(CR) 6-2	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-3	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-4	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-5	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-6	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-7	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-8	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-9	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-10	Not Applicable	This requirement has been determined to be not applicable by analysis.

Table 5-41. Section 6. Applications and Functions (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 6-11	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-12	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 6-13	Not Applicable	This requirement has been determined to be not applicable by analysis.

OAP System Compliance

The remaining two sections of GR-2945-CORE deal with Process-Oriented Criteria and System Reliability and Quality Criteria. Each of these requirements has been evaluated for applicability and compliance on system / program level for the OAP.

Table 5-42. Section 7. Process-Oriented Criteria

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 7-1	Fully Compliant	
(R) 7-2	Fully Compliant	
(R) 7-3	Fully Compliant	
(R) 7-4	Fully Compliant	
(R) 7-5	Fully Compliant	
(R) 7-6	Fully Compliant	
(R) 7-7	Fully Compliant	
(R) 7-8	Fully Compliant	
(R) 7-9	Fully Compliant	
(R) 7-10	Fully Compliant	
(R) 7-11	Fully Compliant	
(R) 7-12	Partially Compliant	Tekelec's Quality Procedures are used.
(R) 7-13	Fully Compliant	
(R) 7-14	Fully Compliant	
(R) 7-15	Fully Compliant	
(R) 7-16	Fully Compliant	

Table 5-42. Section 7. Process-Oriented Criteria (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 7-17	Fully Compliant	
(R) 7-18	Fully Compliant	
(CR) 7-19	Fully Compliant	
(R) 7-20	Fully Compliant	
(R) 7-21	Fully Compliant	
(R) 7-22	Fully Compliant	
(R) 7-23	Fully Compliant	
(R) 7-24	Fully Compliant	
(R) 7-25	Fully Compliant	
(R) 7-26	Fully Compliant	
(R) 7-27	Fully Compliant	OAP updates are only performed by updates, not be patches
(R) 7-28	Fully Compliant	
(R) 7-29	Fully Compliant	

Table 5-43. Section 8. System Reliability and Quality Criteria

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(R) 8-1	Fully Compliant	
(O) 8-2	Fully Compliant	
(R) 8-3	Fully Compliant	
(R) 8-4	Not Applicable	This requirement has been determined to be not applicable by analysis.
(O) 8-5	Not Applicable	This objective has been determined to be not applicable by analysis.
(R) 8-6	Not Applicable	This requirement has been determined to be not applicable by analysis.
(R) 8-7	Fully Compliant	
(O) 8-8	Fully Compliant	
(R) 8-9	Fully Compliant	
(O) 8-10	Fully Compliant	
(R) 8-11	Fully Compliant	

Table 5-43. Section 8. System Reliability and Quality Criteria (Continued)

Bellcore Requirement	Level of Compliance	Comments/Exceptions
(O) 8-12	Fully Compliant	
(R) 8-13	Fully Compliant	
(O) 8-14	Fully Compliant

NPANXX 4-73, 4-85

NPANXX Measurements

- LNP—Measurements (22.0) 4-68

Number Pooling (EAGLE 24.0) 4-191

- Changed Commands 4-191

Number Pooling / Efficient Data Representation (EDR) (EAGLE 26.1) 4-192

- Changed Commands 4-196
- Limitations 4-196
- Overview 4-193
- Upgrade Considerations 4-195

O

OAM reboot during bulk download

- Enhanced Bulk Download (25.0) 2-149

OAM switchover 5-10

OAP commands

- Eagle Initiated OAP User Interface (24.0) 2-115

OAP Upgrade Enhancement (EAGLE 27.2) 4-196

OAP Year 2000 Compliance

- Year 2000 Compliance (Eagle 23.1) 5-188

Online Cartridge Formatting (EAGLE 20.0) 4-197

OOS-MT-DSBLD (out of service maintenance disabled) 3-124

Option for Subsystem Prohibit (Release 29.0) 4-197

originating MSC 5-19

overview

- Number Pooling / Efficient Data Representation (EDR) (EAGLE 26.1) 4-193

P

pass command 3-29

Password Aging (EAGLE 21.0) 5-1

Password Encryption (EAGLE 21.0) 5-2

Password Requirements (EAGLE 21.0) 5-2

PCS 1900 LNP Query (EAGLE 26.0) 5-2

- Changed Commands 5-6
- Feature Functions 5-3
- Limitations 5-8
- PLNPQS Details 5-3

PDB/DN table 5-20

PDS data 5-11

Persistent Device States (Release 29.0) 5-10

Ping Test

- CDU for DSM (26.05) 2-60

PIP and GN parameters

- Calling Name Conversion Facility (CNCF) (23.1) 2-46

PLNPQS details

- PCS 1900 LNP Query (EAGLE 26.0) 5-3

Point-to-Point Connectivity for ITU Point Codes 5-12

- Mixed Networks Using the ANSI/ITU Gateway Feature 5-12

Portability Check for Mobile Originated SMS (MNP SMS) 5-19

Portability Check for Mobile Originated SMS (Release 29.1) 5-19

ported-out subscriber 5-19

Power Supply card

- Embedded OAP (24.0) 2-131

PPSMS feature 5-20

Preventive Cyclic Retransmission (PCR) (EAGLE 20.0)

- Derivations for N1 and N2 5-32

- Example of Basic Error Correction vs. PCR 5-29
- Forced Retransmission 5-30
- Normal Retransmission 5-28
- Priority Processing of Network Management Messages (EAGLE 21.0) 5-34
- problems
 - critical 1-7
 - major 1-8
 - minor 1-8
- product description
 - ITU MTP Restart (26.0) 3-151
- Prohibit Removing the Last Route to a Destination if that Destination is being Referenced by Mated Applications or Concerned Signaling Point Code Groups (EAGLE 22.0) 5-35
- Prohibit the Assigning of a Linkset with Linkset Types A or E to a Cluster Route (EAGLE 22.0) 5-36
- protocol details
 - Enhanced GTT (26.0) 2-153
- Provisioning Multiple Point Codes
 - Multiple Point Code Support (EAGLE 26.05) 4-143
- Provisioning Range for Gateway Screening (EAGLE 22.0) 5-36
- PVC 5-173

Q

- Quick Test
 - CDU for DSM (26.05) 2-60

R

- Random SLS Generation (Release 28.0) 5-43
- remote link congestion
 - ANSI/ITU MTP Gateway (20.0) 2-38
- Remote Loopback Testing for DSOA
 - Link Fault Sectionalization (21.0) 4-14
- Remote Loopback Testing for DSOA (EAGLE 21.0) 5-43
- Remote Loopback Testing for OCU
 - Link Fault Sectionalization (21.0) 4-14

- Remote Loopback Testing for OCU (EAGLE 21.0) 5-44
- Replacing Two STP Pairs with One Eagle Pair
 - Multiple Point Code Support (EAGLE 26.05) 4-136
- rept-stat-card command 3-30
- REPT-STAT-CLK Enhancements for Clocking (Release 28.2) 5-45
- rept-stat-ndc command 3-29
- REPT-STAT-TRBL Enhancement (Release 29.0) 5-46
- Response to Commands Issued Prior to Login (EAGLE 21.0) 5-48
- restore
 - Database Management Command Functions (20.0) 2-82
- restrictions
 - ITU SLS Enhancements (26.0) 3-155
- Revoking a User ID (EAGLE 21.0) 5-48
- RS232 terminal ports 3-123
- rtrv-feat
 - 4000 Routesets (23.0) 2-6
 - Calling Name Conversion Facility (CNCF) (23.1) 2-42
- RTRV-TBL-CAPACITY Enhancement (Release 29.0) 5-47

S

- same link management
 - X.25/SS7 Gateway Feature (Eagle 20.0) 5-178
- SCCP CdPA 5-19
- SCCP envelopes 5-174
- SCCP Message Type Screening (EAGLE 22.0) 5-51
- SCCS Interface Support (EAGLE 21.0) 5-53
- SCTP Retransmission Control (Release 28.1) 5-59
- SCTP Retransmission Control (Release 28.1) (IP7 Release 6.0) 5-59
- SEAS compliance
 - Enhancements to GWS Reject Messages (25.0) 2-164
- SEAS Enhancements (EAGLE 26.0) 5-61
 - Affected Commands 5-61

- SEAS Enhancements, Autonomous Messages (EAGLE 22.0) 5-66
- SEAS Gateway Audit Command (CHK-UNREF-ENT) (EAGLE 22.0) 5-67
- SEAS Interface Support (EAGLE 21.0) 5-68
- SEAS Verify Signaling Route-Set Status and SCCP Application Status Command (VFY-SRSAPST) (EAGLE 22.0) 5-71
- Security Log Increase (EAGLE 26.05) 5-71
 - Enhanced Commands 5-71
 - Increasing the FTA (File Transfer Area) 5-71
 - limitations 5-72
 - Upgrade Considerations 5-72
- Selective Alarm Inhibiting (EAGLE 22.0) 5-72
 - Changed Commands 5-75
 - New Commands 5-74
- Selective Homing of EPAP RTDBs (Release 29.0) 5-76
- Serial card
 - Embedded OAP (24.0) 2-131
- Service Provider 4-84
- serviceability
 - Enhanced Bulk Download (25.0) 2-146
- Short Message Service Center (SMSC) 5-19
- signaling link selection conversion
 - 5-8 Bit Sequencing Assurance (24.0) 2-17
- Simplifying BIP (Board ID PROM) for Eagle STP Boards (EAGLE 23.1) 5-78
 - Changed Commands 5-79
 - Hourly Status Message Report 5-79
- Single Slot EDCM (SSEDCM) 5-81
 - single slot EDCM card 5-80
- SP 4-84
- Split Allowed CGPA Table (EAGLE 22.0) 5-81
- Split NPANXX 4-85
- Split of Allowed SIO Table (Release 22.0) 5-82
- SS7 Message Rejection Due to Screening (EAGLE 22.0) 5-83
- SS7 over High-Speed Signaling Link (EAGLE 23.0) 5-83
- SS7-Over-IP Gateway for Point-to-Point Links (EAGLE 1.0) 5-84
- SSNs 5-20
- SSP measurements
 - LNP—Measurements (22.0) 4-68
- Stand-alone Eagle G-Flex Relay Function
 - enhanced commands 3-15
 - limitations 3-19
 - new commands 3-13
 - upgrade considerations 3-18
- standby MASP 5-11
- STP LAN Feature (EAGLE 20.0) 5-85
- STPLAN
 - LNP—Impact of LNP on Other Features (22.0) 4-65
- STPLAN Port to DCM (EAGLE 26.0) 5-87
 - hardware requirements 5-87
- STPLAN with Default Router (EAGLE 23.0) 5-88
 - changed commands 5-90
- Subsystem Number 4-85
- Support 12 Million Ported Numbers (EAGLE 24.0) 5-91
 - LNP DB Audit — End of Audit Report 5-92
- Support 12 Million Ported Numbers (EAGLE 25.0) 5-92
- Support Changing the Linkset Name 5-94
- Support for LSMS Audit Enhancements (EAGLE 26.1)
 - limitations 5-103
- Support for LSMS Audit Enhancements (EAGLE 26.1) 5-96, 5-102
 - Auditing the Eagle via High-Speed Audit 5-97
 - component interaction scenario 5-98

- new commands 5-98, 5-102
- over OAP serial channel 5-102
- via enhanced bulk download 5-102
- Support for Matching Self-ID Rule in SEAS
CHG-SID (EAGLE 22.0) 5-103
- Support for Provisioning Multiple EPAPs
(Release 29.0) 5-105
- Support for Secure Gateway Functionality
through IP7 7.0 (Release 29.0) 5-105
- Support for the CLLI Parameter for Adding
or Changing Linksets (EAGLE 22.0)
5-106
- Support for the New Linkset Name
Parameter for Changing the
Attributes of a Route (EAGLE 22.0)
5-106
- Support for Up to 41 IPLIMx DCMs (IP7 2.2)
5-107
- Support LSMS Disaster Recovery (EAGLE
23.1) 5-108
 - auditing OAP database 5-108
- Support of E1 Interface for SS7 Signaling
Links (Optional) (EAGLE 22.2) 5-108
- Support of E1 Interface for SS7 Signaling
Links (Optional) (EAGLE 24.0) 5-109
 - upgrade considerations 5-109
- Support of E1 Master Clock Interface for SS7
Signaling Links (Optional) EAGLE
22.2) 5-109
- Suppression of Gateway Measurements on
Non-Gateway Linksets (EAGLE 25.0)
5-109
- SVC-Automatic 5-173
- SVCR 5-173
- switchover operation 5-11
- system clocks
 - High Speed Master Timing (26.0) 3-56
- system requirements
 - 48 Million Numbers (27.0) 2-11

T

- TALI "A" Link Connectivity 5-110
- TALON Development Kit, Release 2.0 (IP7
2.0) 5-114
- TCP/IP data link 5-10
- Tekelec Technical Services
 - emergency response 1-9

- Telephone Number 4-85
- telnet client 3-123
- telnet session 3-123
- Temporary Alarm Inhibiting and Offline
Functions (EAGLE 25.0) 5-114
 - administration 5-119
 - alarm system functionality 5-115
 - changed commands 5-123
 - customer use scenario 5-116
 - maintenance 5-121
- third-party software
 - Embedded OAP (24.0) 2-138
- Thresholding of UIM Messages (EAGLE
25.0) 5-124
 - Changed Event Log Command 5-127
 - creation of UIMs 5-124
 - limitations 5-128
 - new database administration commands
5-127
 - upgrade considerations 5-127
- Translation Type 4-84
- translation type mapping
 - LNP—Impact of LNP on Other Features
(22.0) 4-65
- Translation Type Mapping (EAGLE 21.0)
5-128
 - new commands 5-130
- Triggerless LNP (EAGLE 24.0) 5-130
 - commands 5-130
- TSM 4-58
- TSM Warm Restart and Incremental Loading
(EAGLE 26.0) 5-131
 - changed commands 5-142
 - dependencies 5-145
 - hardware requirements 5-144
 - incremental loading 5-133
 - limitations 5-145
 - LNP audit 5-140
 - maintenance 5-134
 - new UIMs 5-142
 - upgrade considerations 5-144
 - warm restart 5-132
- TTDM card
 - High Speed Master Timing (26.0) 3-58
- Two-Point IPLIMx (Eagle 27.1) 5-153
 - enhanced commands 5-153
- Types of Routing Strategies Available
Applications 4-167

Changed Commands 4-174
 MTP Requirements 4-168
 Network Routing (EAGLE 26.0) 4-167

U

UDT message 5-20
 UIM 5-20
 UIMs
 ITU MTP Restart (26.0) 3-153
 ITU-TFR Procedure (26.1) 3-156
 Multiple Point Code Support (EAGLE 26.05) 4-143
