ITU international destination point code with subfields *zone-area-id*.

**Range:** **0-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:filtpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:** **16363, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:rcice=** (optional)

This parameter specifies the end of the Real Circuit Identification Code range.

**Range:**     **0-16383,, \* 0-4095,, \* 0-4294967295 \***

- **0-4095**—ITU TUP/ISUP
- **0-16383**—ANSI ISUP
- **0-4294967295**—ANSI Q.BICC

**Default:**     \*

**:rcics=** (optional)

This parameter specifies the start of the Real Circuit Identification Code range.

**Range:**     **0-16383,, \* 0-4095,, \* 0-4294967295 \***

- **0-4095**—ITU TUP/ISUP
- **0-16383**—ANSI ISUP
- **0-4294967295**—ANSI Q.BICC

**Default:**     \*

**:realpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **realpca**

**Range:**     **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:realpci=** (optional)

ITU international destination point code with subfields *zone-area-id*.

**Range:**     **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

**:realpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:**       **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:relcause=** (optional)

Release Cause

**Range:**       **0-127**

**Default:**     **0**

**:si=** (optional)

Service Indicator

**Range:**       **0, 3, 5, 4, 13, \***

**0, \***—NM

**3, \***—SCCP

**5, \***—ISUP

**4, \***—TUP

**13, \***—ANSI Q. BICC

**Default:**     **\***

**:ssn=** (optional)

SCCP Subsystem number

**Range:**       **0-255 \***

**Default:**     **\***

**Example**

**rtrv-pct:epc=1-1-1**

**rtrv-pct:realpc=2-2-2**

**Dependencies**

If the **ssn** or **ecics** parameter is specified, then the **si** parameter must be specified.

A full point code must be specified as the value for the **realpc/realpca/realpci/realpcn** and **epc/epca/epci/epcn** parameters.

The value specified for the **ecice/rcice** parameter must be equal to or greater than the value specified for the **ecics/rcics** parameter, respectively.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters must have the same domain.

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must have at least one route for each value defined in the Route table.

If a groupcode is specified then the values specified for the **realpc**, **filtpc**, and **epc** parameters must have the same group code.

A spare point code cannot be specified as a value for the **epci/epcn**, **filtpci/filtpcn**, and **realpci/realpcn** parameters.

The **ecics** or **rcics** parameter must be specified before the **relcause** parameter can be specified.

The **si=3** parameter must be specified before the **ssn** parameter can be specified.

If the **ecice** or **rcice** parameter is specified, then the **ecics** or **rcics** parameter must be specified, respectively.

If the **ecics**, **ecice**, and **rcics** parameters are specified, then the **rcice** parameter must be specified.

A value of **4**, **5**, or **13** must be specified for the **si** parameter before the **ecice/ecics** and **rcice/rcics** parameters can be specified.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be same as the STP point code.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be same as the STP capability point code.

The **epc/epca/epci/epcn** or **realpc/realpca/realpci/realpcn** parameter must be specified if any other optional parameter is specified.

The values specified for the **ecics/ecice** and **rcics/rcice** parameters must be within the range specified by the parameter definition.

The difference between the values specified for the **ecice** and **ecics** parameters must be equal to the difference between the values specified for the **rcice** and **rcics** parameters.

A value of **5** or **13** must be specified for the **si** parameter before the **relcause** parameters can be specified.

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must already exist in the Route table.

The **ssn** and **cic** parameters cannot be specified together in the command.

If the **ecics**, **rcics**, and **rcice** parameters are specified, then the **ecice** parameter must be specified.

If the same value is specified for the **epc** and **realpc** parameters, then the values specified for the **ecics/ecice** and **rcics/rcice** parameters cannot indicate the same range.

Only one of the **filtpc/a**, **filtpci**, and **filtpcn** parameters can be specified in the command.

The value specified for the **epc/epci/epcn** parameter cannot be the same as a secondary point code.

**Output****rtrv-pct**

**rtrv-ppsopts****Retrieve Prepaid SMS Options**

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

**Keyword:** **rtrv-ppsopts**

**Related Commands:** **chg-ppsopts**

**Command Class:** Database Administration

**Parameters**

**:ppt=** (optional)

Prepaid portability type. This parameter specifies an IN platform.

**Range:** **1-32**

**Example**

```
rtrv-ppsopts
```

```
rtrv-ppsopts:ppt=2
```

**Dependencies**

The Prepaid SMS Intercept Ph1, IDP A-Party Routing, or IDP Service Key Routing feature must be enabled and turned on before this command can be entered.

**Output**

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.  
The following example displays Prepaid SMS options for a specific Prepaid Type.

**rtrv-ppsopts:ppt=1**

```
tekelecstp 08-12-17 15:07:01 EST EAGLE 40.1.0
```

## Prepaid SMS Options

## rtrv-prefix

## Retrieve Prefix

Use this command to retrieve provisioned prefix information for all supported features or for a specified feature.

**Keyword:** rtrv-prefix

**Related Commands:** `chg-prefix`, `dlt-prefix`, `rtrv-ctrl-feat`

**Command Class:** Database Administration

## Parameters

**:feature=** (optional)

**Feature Name.** This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtv-ctrl-feat** command output.

[illegible]

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with “GSM MAP.” Enough additional characters to identify which GSM MAP feature is being entered (at least “GSM MAP SR” to identify the “GSM MAP SRI Redirect” feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

### Example

Retrieve provisioned prefix information for all supported features.

**rtrv-prefix**

Retrieve prefix information for the GSM MAP SRI Redirect feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

## Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output. The following controlled features are supported by this command:

- GSM MAP SRI Redirect

- ISUP NP for EPAP

## Notes

None

## Output

For all features, retrieve the provisioned prefix information. There is additional information displayed in the function column for prefix numbers 6 and 7 of the “ISUP NP with EPAP” feature.

### rtrv-prefix

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 34.1.0
```

| Feature              | NUM | Prefix | Function               |
|----------------------|-----|--------|------------------------|
| GSM MAP SRI Redirect | 1   | 1a1a   |                        |
| GSM MAP SRI Redirect | 2   | ffff   |                        |
| GSM MAP SRI Redirect | 3   | 1234   |                        |
| ISUP NP with EPAP    | 1   | 3b4c   |                        |
| ISUP NP with EPAP    | 6   | 886    | Insertion Country Code |
| ISUP NP with EPAP    | 7   | 0      | Deletion Condition     |

```
FEATPFX table is (6 of 256) 2% full
```

```
;
```

For the “GSM MAP SRI Redirect” feature, retrieve the provisioned prefix information. The table capacity for the total number of entries in use is reported, not just the number of entries displayed. There is no additional information displayed in the Function column for this feature.

### rtrv-prefix:feature="GSM MAP SRI Redirect"

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0
```

| Feature              | NUM | Prefix | Function |
|----------------------|-----|--------|----------|
| GSM MAP SRI Redirect | 1   | 1a1a   |          |
| GSM MAP SRI Redirect | 2   | ffff   |          |
| GSM MAP SRI Redirect | 3   | 1234   |          |

```

**s-** Spare point code**p-** Private point code**ps-** Private and spare point code**rtrv-rte****Retrieve Route**

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

**Keyword:** rtrv-rte

**Related Commands:** chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:clli=** (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:** ayyyyyyyyyy  
1 alphabetic character followed by 10 alphanumeric characters

**Default:** No value given

**:dpc=** (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpc

**Range:** p-, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpci/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code 0-000-0 is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code

option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node *nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or **\*-\*-\*** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (optional)

Linkset name

**Range:** *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

**:mode=** (optional)

This parameter displays the method used to display the output report.

**Range:** **full**

**:pct=** (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

**Range:** **none, s, p, ps**

**none** — Display all point codes that do not have subtype prefixes

**s** — Display only spare point codes

**p** — Display only private point codes

**ps** — Display only private and spare point codes

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:** **ansi, itui, itun, itun24**

## Example

**rtrv-rte**

```

rtrv-rte:dpc=240-012-004:lsn=ls000001
rtrv-rte:clli=dp1:lsn=ls000001
rtrv-rte:dpc=140-012-008
rtrv-rte:clli=dp1rtrv-rte
rtrv-rte:dpcn=3-15-15-15-fr
rtrv-rte:lsn=e1m3itun
rtrv-rte:dpcn24=10-100-14
rtrv-rte:pcst=s
rtrv-rte:pcst=none
rtrv-rte:pctype=ansi
rtrv-rte:pctype=itun24:pcst=none
rtrv-rte:dpc=1-1-**
rtrv-rte:dpc=1-1-***
rtrv-rte:dpc=1-**-*
rtrv-rte:dpc=1-***-*
rtrv-rte:dpc=1-**-*:lsn=ab64
rtrv-rte:dpc=1-**-*:lsn=xx64
rtrv-rte:dpcn=1000-*
rtrv-rte:dpcn=1000-*:lsn=dpcn64
rtrv-rte:dpcn=p-*-aa
rtrv-rte:dpcn=s-9000-*

```

### Dependencies

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must exist in the Destination Point Code table.

The value specified for the **lsn** parameter must exist in the routeset of the destination if the **dpc** parameter is specified.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts** command **npcfmti** parameter.

If the **pctype** parameter has a value of **ansi** or **itun24**, then the **pcst** parameter cannot have a value of **s** or **ps**.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters.

The NRT feature must be turned on before the **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the destination point code has a value of \* in the NC field, the NCM field must also be \* (for example, **dpc=21-\*-\***).

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must be a valid point code.

If the **clli** parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The value specified for the **lsn** parameter must already be assigned to the specified routeset.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

### ***Asterisks in ANSI Point Codes***

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example **20-2-\*\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

### ***Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes***

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-ab** is valid; **\*-15-\*-\*-ab** is not valid).

## Output

In the **rtrv-rte** command output examples, the point code prefixes **s-**, **p-**, and **ps-** indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

Abbreviated output is indicated by 3 vertical dots as shown:

.  
.  
.

The following example displays the output when the Route table is provisioned. This example displays abbreviated output.

### rtrv-rte

;

The following example displays the output when the Route table is empty.

**rtrv-rte**

tekelecstp 08-01-01 12:31:35 EST EAGLE 38.0.0

rtrv-rte

Command entered at terminal #4.

No routes meeting the requested criteria were found

;

The following example retrieves a route by linkset name.

**rtrv-rte: lsn=e2e1**

eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0

rtrv-rte:lsn=e2e1

Command entered at terminal #4.

Extended Processing Time may be Required

| LSN  | DPCA        | RC |
|------|-------------|----|
| e2e1 | 001-001-000 | 10 |
|      | 001-101-001 | 10 |
|      | 004-101-001 | 20 |
|      | 100-100-*   | 10 |
|      | 100-100-001 | 10 |

;

The following example retrieves a route by linkset name and destination point code.

**rtrv-rte: dpc=4-101-1: lsn=e2e1**

eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0

| LSN  | DPCA        | RC |
|------|-------------|----|
| e2e1 | 004-101-001 | 20 |

;

In the following example, the **chg-stpopts:npcfnti** value is set to **7-4-3**.

#### **rtrv-rte:dpcn=127-15-7**

```
eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0
```

| DPCN     | ALIASA | ALIASI | LSN     | RC          | APCN     |
|----------|--------|--------|---------|-------------|----------|
| 127-15-7 | -----  | -----  | ls1     | 10          | 100-10-2 |
|          |        |        | RTX: No | CLLI: ----- |          |

;

In the following example, the **chg-stpopts:npcfnti** value is set to **11-1-1-1** and the ITUDUPPC feature is on.

#### **rtrv-rte:lsn=ls3**

```
eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
```

```
rtrv-rte:lsn=ls3
```

```
Command entered at terminal #4.
```

```
Extended Processing Time may be Required
```

**Legend**

**DPC, DPCA, DPCI, DPCN, DPCN24**—The destination point code to be reached through this route.

**ALIAS, ALIASA, ALIASI, ALIASN/N24**—The alias associated with the route.

**CLLI**—The CLLI associated with the route.

**LSN**—The name of the linkset assigned to this route.

**RC**—The relative cost (priority) assigned to the route.

**APC, APCA, APCI, APCN, APCN24**—The point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

**rtrv-rtx****Retrieve Exception Route**

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the **cic** and **ecic** parameters are displayed.

**Keyword:** rtrv-rtx

**Related Commands:** chg-rtx, dlt-rtx, ent-rtx, rept-stat-rtx

**Command Class:** Database Administration

**Parameters**

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:class=** (optional)

Exception routing class. This parameter causes all exception route sets provisioned for the specified class to be displayed.

**Range:**     **opc, ilsn, cic, si**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:**     **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpci=** (optional)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**     **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:**     **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz**, \*

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or *\*-\*-\** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the *ecic* parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** **0-16383**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:lsn=** (optional)

Link Set Name. The linkset associated with the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-**, **000-255**, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-**, **p-**, **ps-**, **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, p-, ps-, 0-16383, aa-zz, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—s-, p-, ps-

*nnnnn*—0-16383, \*

*gc*—aa-zz, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:open24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** 3-15

### Example

**rtrv-rtx:dpca=1-1-1**

**rtrv-rtx:opca=6-\*-\***

**rtrv-rtx:ilsn=lset4**

**rtrv-rtx:si=5**

**rtrv-rtx:cic=0:ecic=16383**

## Dependencies

Only one of the **opc**, **ilsn**, **cic**, **si**, or **class** parameters can be specified.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

## Notes

\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network (*ni*).

\*\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca/opc/opca** to retrieve all point codes residing in (members of) a given network cluster (*i-nc*), and the network cluster address (if any).

\*\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

\* is allowed only for retrieves (for example, **rtrv-rtx:dpcn=-aa** or **rtrv-rtx:open=-xy**) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on. \*\* and \*\*\* is not allowed for ITU-N DPCs and OPCs (for example, **dpcn=-\*-xy** is rejected). The node and group code cannot both be \* (**dpcn=-\*.\*** is rejected).

**Output**

Retrieve all provisioned exception routes.

**rtrv-rtx**

**rtrv-sccp-msg****Retreive Configured SCCP messages**

Use this command to display the configured SCCP message parameter values.

**Keyword:** rtrv-sccp-msg

**Related Commands:** chg-sccp-msg, tst-msg

**Command Class:** Database Administration

**Parameters**

**:msgn=** (optional)

Message number. This parameter specifies the number of the SCCP message.

**Range:** 1-10

**Example**

**rtrv-sccp-msg:msgn=1**

**Dependencies**

The GTT feature must be turned on before this command can be entered.

**Notes**

None

**Output****rtrv-sccp-msg:msgn=1**

```

tekelecstp 10-03-02 16:17:34 EST  EAGLE 42.0.0

**rtrv-sccp-serv****Retrieve SCCP Service**

Use this command to display the SCCP Service application relationship information maintained by the EAGLE 5 ISS.

**Keyword:** **rtrv-sccp-serv**

**Related Commands:** **chg-sccp-serv, dlt-sccp-serv**

**Command Class:** Basic

**Parameters**

**:serv=** (optional)

Name of the service to be retrieved.

**Range:** **gflex, gport, mnp**

**gflex**— G-Flex (GSM Flexible Numbering)

**gport**— G-Port (GSM Mobile Number Portability)

**mnp**— Mobile Number Portability

**Dependencies**

- The A-Port or IGM feature must be enabled before the **serv=mnp** parameter can be specified.
- The G-Flex feature must be enabled before the **serv=gflex** parameter can be specified.

- The G-Port feature must be enabled before the **serv=gport** parameter can be specified.

**Notes**

Point codes are grouped by service in the output.

**Output**

The number of entries that is reported in use for the SCCPSRV table includes an entry for each point code network type. This entry is not displayed with the point code entries in the output. For example, if 3 ANSI point codes are used, the reported number of ANSI entries is 4.

The following example displays output when no supporting features are turned on, and the SCCP Service table is empty.

### rtrv-sccpopts

### Retrieve SCCP Options

Use this command to display the current value of one or more of the SCCP option indicators maintained in the STP options table.

**Keyword:** rtrv-sccpopts

**Related Commands:** chg-sccpopts

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-sccpopts**

**Dependencies**

None.

**Notes**

None.

**Output**

The following example displays output when the Origin-based MTP Routing feature is enabled and turned on.

**rtrv-sccpopts**

```
tekelecstp 10-02-15 14:07:11 EST  EAGLE 42.0.0
SCCP OPTIONS
-----
CLASS1SEQ                off
CCLEN                    1
ACLEN                    3
INTLUNKNNAI              no
SUBDFRN                  off
MOBRSCCPOPC              MTP
DFLTGTTMODE              CdPA
```

;

The following example displays output that results when the Transaction-based GTT Loadsharing feature is enabled.

**rtrv-sccpopts**

```
tekelecstp 10-02-15 14:07:11 EST  EAGLE 42.0.0

**rtrv-scr-aftpc****Retrieve Allowed Affected Point Code**

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

**Keyword:** rtrv-scr-aftpc

**Related Commands:** chg-scr-aftpc, dlt-scr-aftpc, ent-scr-aftpc

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all AFTPC screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7 \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**      **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**      **stop**

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**    Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** **none, s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:sr=** (optional)

The AFTPC screening reference name

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255 \***

**Default:** Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7, \***

### Example

**rtrv-scr-aftpc**

**rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012**

**rtrv-scr-aftpc:sr=iec**

**rtrv-scr-aftpc:all=yes**

**rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy**

**rtrv-scr-aftpc:sr=aft1**

**rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s**

### Dependencies

If the **nsfi** parameter is specified, the parameter value must be **stop**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **nc=\*** is specified, **ncm=\*** must be specified. If **ni=\*** is specified, **nc=\*** and **nc=\*** must be specified. If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **npc**, **nsfi**, and **nsr** parameters must already exist in the AFTPC entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix **os-**) must exist in the database.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

The Gateway Screening Stop Action table must be accessible.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If no parameters are specified, a list of allowed AFTPC references is produced indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every allowed AFTPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED AFTPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI-NC-NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by *ni-nc-ncm*.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR—up to four characters) or action to be taken (ACT—up to six characters), if the message passes this screen.

## rtrv-scr-blkdpc

## Retrieve Blocked DPC

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

**Keyword:** rtrv-scr-blkdpc

**Related Commands:** chg-scr-blkdpc, dlt-scr-blkdpc, ent-scr-blkdpc

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all blocked DPC screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*, C

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** 0-7, \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*, C

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*, C

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*  
**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0-255.

**Range:** 0-255 \*, C  
**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from 00000-16383.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:** 00000-16383 \*, C

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cgpa, destfld, fail, isup, stop

**cgpa**—Allowed calling party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**fail**—The received message should be discarded.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** ayyy  
 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 000-255 \*, C

**:sr=** (optional)

The BLKDPC screening reference name

**Range:** ayyy  
 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **0-255** \*, C

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:**      **0-7** \*, C

### Example

```
rtrv-scr-blkdpc
```

```
rtrv-scr-
```

```
blkdpc:sr=iec:ni=240:nc=001:ncm=010&&018:nsfi=stop:actname=rdct
```

```
rtrv-scr-blkdpc:sr=iec
```

```
rtrv-scr-blkdpc:all=yes
```

```
rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s
```

### Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the value of the **nsfi** parameter is **stop** or **fail**, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

The value of the **sr** parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **id** or **sp** parameter must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **nc** parameter must already exist in the database

Any specified **ncm** parameter must already exist in the database

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database

Any specified **nsr** parameter must already exist in the database

Any specified **nsfi** parameter must already exist in the database

Any specified **npc** parameter must already exist in the database

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database

The Gateway Screening Stop Action table must be accessible.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

## Notes

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code has the value **c-c-c**.

If the character **c** is specified for any subfield of a three-subfield point code, all three subfields must have the value **c**. No other values can be used. For example, a point code **c-c-255** is not allowed. The

point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

In all cases, if **c** for "continue" is entered for the first subfield in the point code, the other subfields default to **c** in the database.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = BLOCKED DPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-blkopc

## Retrieve Blocked OPC

Use this command to show the blocked originating point code (BLKOPC) screening references in the BLKOPC entity set.

**Keyword:** rtrv-scr-blkopc

**Related Commands:** chg-scr-blkopc, dlt-scr-blkopc, ent-scr-blkopc

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all blocked OPC screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*, C

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7 \*, C

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*, C

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** 0-255 \*, C

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255** \*, C

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255** \*, C

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:** **00000-16383** \*, C

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **cgpa, stop, fail, sio, dpc, blkdp**

**cgpa**—Allowed calling party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**fail**—The received message should be discarded.

**sio**—Allowed SIO is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**blkdp**—Blocked DPC is the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pct=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none, s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point(**s****p**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255** \*, C

**:sr=** (optional)

The BLKOPC screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255** \*, C

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*, C

### Example

**rtrv-scr-blkopc**

**rtrv-scr-blkopc:sr=iec:ni=240:nc=001:ncm=010&&018:actname=copy**

**rtrv-scr-blkopc:sr=iec**

**rtrv-scr-blkopc:all=yes**

**rtrv-scr-blkopc:sr=bop1:npc=128:nsfi=fail**

**rtrv-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s**

### Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **npc**, **nsfi**, and **nsr** parameters must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix **os-**) must exist in the database.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the value of the **nsfi** parameter is **stop** or **fail**, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the value **c** is specified for any subfield of a three-subfield point code, then all three subfields must have a value of **c** (**c-c-c**). No other values, including asterisks can be used. If the value of the first subfield is **c**, then the other subfields default to **c** in the database.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nc=\*** parameter is specified, then the **ncm=\*** parameter must be specified.

The Gateway Screening Stop Action table must be accessible.

If the **ni**=\* parameter is specified, then the **nc**=\* and the **ncm**=\* parameters must be specified.

If the **zone**=\* parameter is specified, then the **area**=\* and the **id**=\* parameters must be specified.

If the **msa**=\* parameter is specified, then the **ssa**=\* and the **sp**=\* parameters must be specified.

If the **ssa**=\* parameter is specified, then the **sp**=\* parameter must be specified.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of blocked OPC references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked OPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

For point codes with three subfields, the value **c** (continue) is used as a place holder. In the event the point code is not found in this screen set, the continue value points to the **nsfi** and **nsr** to be applied next.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code **c-c-c**.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkopc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = BLOCKED OPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are NSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-cdpa****Retrieve Allowed Called Party Address**

Use this command to show the allowed called party address (CDPA) screening references in the CDPA entity set.

**Keyword:** rtrv-scr-cdpa

**Related Commands:** chg-scr-cdpa, dlt-scr-cdpa, ent-scr-cdpa

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed CDPA screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7, \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**      **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**      **aftpc, stop**

**aftpc** — Allowed affected point code is the next screening category

**stop** — The gateway screening process ends and the message proceeds through normal routing

**Default:**    Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:**      *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

**Range:** **none, s**  
**none** — No spare point code prefix required  
**s** — Spare point code prefix required

**Default:** none

**:scmgfid=** (optional)

The SCCP management (SCMG) format ID, which consists of a 1-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **1-255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS

**Range:** **1-255 \***

**Default:** All SCMG format IDs are shown.

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:sr=** (optional)

Displays all allowed CDPA screening references.

**Range:** *ayyy*  
 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255 \***

**Default:** Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7, \***

### Example

**rtrv-scr-cdpa**

**rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ncm=010:ssn=001**

**rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ssn=002&&005**

**rtrv-scr-cdpa:sr=iec**

**rtrv-scr-cdpa:sr=iec:actname=copy**

**rtrv-scr-**

**cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s**

**rtrv-scr-cdpa: sr=cdp1****Dependencies**

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified when **nsfi=stop**.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area** is specified or respecified as an asterisk, **id** must also be an asterisk. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **ncp**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix **os-**) must exist in the database.

The specified screening function identifier(**nsfi**) must be in the allowed CDPA entity set.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

**Notes**

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **xs-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cdpa:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED CDPA**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by the **ni-nc-ncm**.

**SCMGFID**—The SCMGFID format ID.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-cgpa****Retrieve Allowed Calling Party Address**

Use this command to show the allowed calling party address (CGPA) screening references in the CGPA entity set.

**Keyword:** **rtrv-scr-cgpa**

**Related Commands:** **chg-scr-cgpa, dlt-scr-cgpa, ent-scr-cgpa**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed CGPA screening references.

**Range:** **yes, no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0–7.

**Range:** 0-7 \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 000-255 \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–255.

**Range:** 0-255 \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–255.

**Range:** 0-255 \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–255.

**Range:** 0-255 \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from 00000–16383.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:** 00000-16383 \*

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cdpa, stop, tt

**cdpa**—Allowed called party address point code is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**tt**—Allowed translation type point code is the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

**Range:** **none, s**  
**none**— No spare point code prefix required.  
**s**— Spare point code prefix required.

**Default:** **none**

**:ri=** (optional)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

**Range:** **gt, dpc, \***  
**gt**—Allow a called party address with a routing indicator value of "global title."  
**dpc**—Allow a called party address with a routing indicator value of "DPC/SSN."  
**\***—Allow both routing indicator values.

**Default:** Display all

**:sccpmt=** (optional)

The SCCP message type. An asterisk (\*) indicates all possible allowed values; that is, **9, 10, 17, and 18**.

**Range:** **9, 10, 17, 18, \***  
**9, \***— UDT  
**10, \***—  
UDTS  
**17, \***— XUDT  
**18, \***— XUDTS

**Default:** Display all SCCP message types

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:sr=** (optional)

The CGPA screening reference name

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255**  
**Default:** Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0–7.

**Range:** 0-7, \*

### Example

```
rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:ssn=012
```

```
rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:actname=copy
```

```
rtrv-scr-cgpa:sr=cgp1
```

```
rtrv-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

### Dependencies

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified or re-specified, **sp=\*** must also be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **ncp**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

The specified screening reference (**sr**) must be in the allowed CGPA entity set.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACTNAME** field of the **rtrv-gws-actset** command output.

The Gateway Screening Stop Action table must be accessible.

**Notes**

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cgpa:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED CGPA**—This is the screen type.

**SR** —This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are NSA-SSA-SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by the *ni-nc-ncm*.

**RI**—The routing indicator in the called party address.

**SCCPMT**—The SCCP message type.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-destfld

## Retrieve Allowed DESTFLDs

Use this command to show the attributes of one or more allowed affected destination field (DESTFLD) screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

**Keyword:** **rtrv-scr-destfld**

**Related Commands:** **chg-scr-destfld, dlt-scr-destfld, ent-scr-destfld**

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy, none*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed DPC screening references.

**Range:** **yes, no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**Default:** Display all

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7 \***

**Default:**    Display all

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**      **00000-16383 \***

**:nsfi=** (optional)

This parameter indicates that the gateway screening process should stop. If specified for this command, the parameter must have the value of **stop**. The value of **stop** means that the gateway screening process ends and the message proceeds through normal routing.

**Range:**      **stop**

**Default:**    Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

**Range:**      *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**    Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling points(p) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:sr=** (optional)

The name of the individual DESTFLD screen to be displayed.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*, C

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7 \*, C

**Example**

```
rtrv-scr-destfld
```

```
rtrv-scr-destfld:sr=iec:ni=240:nc=001:ncm=010&&018
```

```
rtrv-scr-destfld:sr=iec:id=4:actname=cncf
```

```
rtrv-scr-destfld:all=yes
```

```
rtrv-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s
```

```
rtrv-scr-destfld:sr=dst1
```

**Dependencies**

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified in the command.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

The specified screening reference (**sr**) must be in the allowed DESTFLD entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **id** or **sp** parameter must already exist in the database.

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **nc** parameter must already exist in the database.

Any specified **ncm** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database.

Any specified **npc** parameter must already exist in the database.

Any specified **nsfi** parameter must already exist in the database.

Any specified **nsr** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **ncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The Gateway Screening Stop Action table must be accessible.

## Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-destfld:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED DESTFLD**—This is the screen type.
- **SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.
- **NSFI**—The next screening category to be used.
- **NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-dpc****Retrieve Allowed DPC**

Use this command to show the attributes of one or more allowed DPC screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

**Keyword:** rtrv-scr-dpc

**Related Commands:** chg-scr-dpc, dlt-scr-dpc, ent-scr-dpc

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed DPC screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**       **0-7, \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**       **0-255 \*, C**

**Default:**     Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**       **0-255 \***

**Default:**     Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**       **0-255 \***

**Default:**     Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**       **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**       **blkdpc, cgpa, destfld, isup, stop**

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**     Display all screen references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if

**nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none**, **s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*

**:sr=** (optional)

The allowed DPC screening reference name

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255** \*

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*

### Example

```
rtrv-scr-dpc
rtrv-scr-dpc:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-dpc:sr=iec:id=4
rtrv-scr-dpc:all=yes
rtrv-scr-dpc:all=yes:actname=cncf
rtrv-scr-dpc:sr=dpc1:npc=128:nsfi=stop:pcst=s
```

### Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The specified screening reference (**sr**) must be in the allowed DPC entity set.

Any specified **ni** parameter must already exist in the allowed DPC entity for the screening reference.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (**s-** or no prefix or **s-**) must exist in the database.

If **ni=\*** is specified, **nc=\*** and **ncm=\*** must be specified.

If **nc=\*** is specified, **ncm=\*** must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** must be specified.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the value of the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

Any specified **npc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **pct** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed DPC entity for the screening reference.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

## Notes

If no parameters are specified, a list of allowed DPC references is displayed indicating whether they are referenced or not.

If a single allowed DPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed DPC entity set are shown.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-dpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED DPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-isup****Retrieve Allowed ISUP Screening Reference**

Use this command to display one allowed ISUP screening reference or all allowed ISUP screening references in the Allowed ISUP entity set.

**Keyword:** rtrv-scr-isup

**Related Commands:** chg-scr-isup, dlt-scr-isup, ent-scr-isup

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:all=** (optional)

This parameter is specified to display all allowed ISUP screening references in the Allowed ISUP entity set.

**Range:** yes, no

**Default:** no

**:isupmt/tupmt=** (optional)

ISUP message type or TUP message type in the specified entry. The **tupmt** parameter is not valid for SEAS. A single value or range of values can be entered. An asterisk (\*) indicates the entire range of 0-255.

**Range:** 000-255 \*

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter must have the value of **stop**.

**Range:** stop

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**:nsr=** (optional)

Next screening reference. The **nsr** parameter cannot be specified if **nsfi=stop** is specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

**:sr=** (optional)

The individual ISUP screen to be displayed.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

### Example

**rtrv-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2**

**rtrv-scr-isup:sr=tu01:tupmt=0&&255**

### Dependencies

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

If **sr** is specified, the value must exist in the database.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

### Notes

A range of values for the **isupmt** parameter or **tupmt** parameter can be specified by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk can be used for a parameter value in the **chg-scr-isup**, **rtrv-scr-isup**, and **rtrv-scr-isup** commands only if that parameter value was specified as an asterisk in **tblt-scr-isup** command to define the parameter value.

If no parameters are specified, a list of allowed ISUP references is produced indicating whether they are referenced or not.

## Output

**rtrv-scr-isup**

```

tekelecstp 02-09-02 11:10:38 EST  EAGLE 30.0.0

### Legend

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-isup:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED ISUP**— This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**ISUPMT/TUPMT**—The ISUP message type or TUP Message type in the entry.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-opc

### Retrieve Allowed OPC

Use this command to show an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference).

**Keyword:** **rtrv-scr-opc**

**Related Commands:** **chg-scr-opc, dlt-scr-opc, ent-scr-opc**

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** **ayyyyy, none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed OPC screening references.

**Range:** **yes, no**

**Default:** Display all

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7, \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:**       **0-255 \***

**Default:**     Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:**       **0-255 \***

**Default:**     Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:**       **0-255 \***

**Default:**     Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000-16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**       **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**       **blkopc, sio, dpc, blkdpc, cgpa, stop**

**blkopc**—Blocked OPC is the next screening category.

**sio**—Allowed SIO is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**     Display all screening referenes

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:**       **ayyy**

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point(s) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:sr=** (optional)

The allowed OPC screening reference name

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7 \*, C

### Example

**rtrv-scr-opc**

**rtrv-scr-opc:sr=iec:ni=240:nc=001:ncm=010&&018**

**rtrv-scr-opc:sr=iec:id=4**

**rtrv-scr-opc:all=yes**

**rtrv-scr-opc:sr=opc1:actname=cr**

**rtrv-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s**

### Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **ni=\*** parameter is specified, the **nc=\*** and the **ncm=\*** parameters must be specified.

If the **nc=\*** parameter is specified, then the **ncm=\*** parameter must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the value of the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The specified screening reference (**sr**) must be in the allowed OPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **ni** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **npc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **pcst** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed OPC entity for the screening reference.

If the **nsfi=fail** parameter is specified, then the **n timer**, **nc**, **nn cm**, **n timer**, **n timer**, **n timer**, **n timer**, **n timer**, **n timer**, **n timer**, and **n timer** parameters cannot have a value of **c**.

The Gateway Screening Stop Action table must be accessible.

## Notes

If no parameters are specified, a list of allowed OPC references is produced indicating whether they are referenced or not.

If a single allowed OPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed OPC entity set are shown.

If **all** is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk specified as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### **Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-opc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED OPC**— This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are NSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## **rtrv-scr-sio**

## **Retrieve Allowed SIO**

Use this command to show the attributes of one or more **nic/si/h0/h1** combinations that are allowed for SS7 messages from another network.

**Keyword:** **rtrv-scr-sio**

**Related Commands:** **chg-scr-sio, dlt-scr-sio, ent-scr-sio**

**Command Class:** Database Administration

### **Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed SIO screening references.

**Range:** **yes, no**

**Default:** **no**

**:h0=** (optional)

H0 heading code. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–15**.

**Range:**     **0-15 \***

**Default:**    Display all

**:h1=** (optional)

H1 heading code. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–15**.

**Range:**     **0-15 \***

**Default:**    Display all

**:nic=** (optional)

The network indicator code. An asterisk (\*) indicates all possible values; that is, the entire range of **0–3**.

**Range:**     **0-3 \***

**Default:**    Display all

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**     **blkdpc, cgpa, cdpa, destfld, dpc, isup, stop**

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**cdpa**—Allowed called party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**    Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

(optional; mandatory if **nsfi** is other than **stop**; cannot be entered if **nsfi=stop**)

**Range:**     **ayyy**

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**    Display all

**:pri=** (optional)

Message priority. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–3**.

**Range:**     **0-3 \***

**Default:**    Display all

**:si=** (optional)

The service indicator.

**Range:**     **0-15 \***

**Default:**    Display all

**:sr=** (optional)

The allowed SIO screening reference name

**Range:**     **ayyy**

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     Display all

### Example

```
rtrv-scr-sio
rtrv-scr-sio:sr=iec:nic=1:si=3:pri=2&&3
rtrv-scr-sio:sr=sio1:nic=1:si=1
rtrv-scr-sio:sr=sio1:nic=1:si=1:h0=1:h1=*
rtrv-scr-sio:sr=sio1:si=1:h0=1:h1=1
rtrv-scr-sio:all=yes
rtrv-scr-sio:sr=iec:nic=1:si=1:actname=crncf
```

### Dependencies

If the **si** parameter is not equal to **00**, **01**, or **02**, the **h0** and **h1** parameters cannot be specified.

If the **nic**, **si**, and **h0/h1** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The **nic** parameter must be specified if the **si** parameter is specified.

The network indicator code (**nic**) and the service indicator (**si**) must be specified if the **h0** and **h1** parameters are specified.

If an asterisk value is specified for the **h0** parameter, the **h1** parameter cannot be specified.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **sr** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The Gateway Screening Stop Action table must be accessible.

Invalid **ent-scr-sio nsfi** and **si** parameter combinations specified.

### Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed SIO references is output indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed SIO screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

## Output

**Legend**

For a summary report:

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-sio:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED SIO**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NIC**—The network indicator code in the service information octet.

**PRI**—The priority of a single message or the beginning message priority in a range of priorities in the service information octet.

**SI**—The service indicator for the service information octet, which are the last two bits of the subservice field.

**H0**—The H0 heading code.

**H1**—The H1 heading code.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (**NSR** - up to four characters) or action to be taken (**ACT** - up to six characters), if the message passes this screen.

**rtrv-scr-tt****Retrieve Allowed Translation Type**

Use this command to show the allowed translation type (TT) screening reference in the TT entity set.

**Keyword:** **rtrv-scr-tt**

**Related Commands:** **chg-scr-tt**, **dlt-scr-tt**, **ent-scr-tt**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*  
1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed TT screening references.

**Range:**     **yes, no**

**Default:**   **no**

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**     **cdpa, stop**

**cdpa**—Allowed called party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**   Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**, or the **copy=yes** parameter is specified.

**Range:**     `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**   Display all

**:sr=** (optional)

The TT screening reference name

**Range:**     `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**   Display all

**:type=** (optional)

Translation type. This parameter specifies the global title translation type value in the called party address. The parameter value is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:**     **0-255 \*, && (Allow intervals)**

**Default:**   Display all.

### Example

```
rtrv-scr-tt
```

```
rtrv-scr-tt:sr=iec
```

```
rtrv-scr-tt:all=yes
```

### Dependencies

If the **nsr** parameter is specified, **nsfi=stop** cannot be specified.

If the **actname** parameter is specified and **nsfi** is specified, the value specified for **nsfi** must be **stop**.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

The specified value for the **nsfi** parameter is not valid for TT screen.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The screening reference and translation type for which the attributes are to be retrieved must exist.

The value specified for the **type** parameter must be within the allowed range.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed TT references is produced indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed TT screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

**Output****rtrv-scr-tt**

```

;

**Legend**

**SCREEN = ALLOWED TT**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If a more detailed output is needed, the **rtrv-scr-tt:all=yes** command should be used, or specify the specific screening reference.

**TYPE**—The translation type of that is allowed for global title translation.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scrset****Retrieve Screen Set**

Use this command to show the attributes of one or more screen sets in the screen set entity set.

**Keyword:** rtrv-scrset

**Related Commands:** chg-scrset, dlt-scrset, ent-scrset

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all screen sets (except “placeholder” screen sets that contain only one rule with **nsfi=stop** specified in the rule).

**Range:** yes, no

**Default:** no

**:destfld=** (optional)

This parameter displays the indicator that specifies whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on in the screen set rule, the automatic screening is applied at the end of the provisioned screen set.

**Range:** yes, no

**Default:** Display all

**:nsfi=** (optional)

The values of this parameter indicate in the screen set rules the next screening category that is used in the gateway screening process, or that the gateway screening process should stop. In this command, information is displayed for one or more screen sets containing rules with the specified **nsfi** parameter value.

**NOTE: When nsfi=stop is specified for this command, the command displays only the “placeholder” screen sets that have only one rule, with nsfi=stop specified in the rule. This is a way to locate those “placeholder” screen sets, so that you can add or change the rules to accomplish appropriate screening.**

**Range:** opc, blkopc, sio, dpc, blkdpc, stop

**opc**—Display rules with Allowed OPC as the next screening category.

**blkopc**—Display rules with Blocked OPC as the next screening category.

**sio**—Display rules with Allowed SIO as the next screening category.

**dpc**—Display rules with Allowed DPC as the next screening category.

**blkdpc**—Display rules with Blocked DPC as the next screening category.

**stop**—Display only “placeholder” screen sets that have only one rule in the screen set, with **nsfi=stop** specified as the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. In this command, the **nsr** parameter is used to display information for one or more screen sets with rules that have the specified **nsr** parameter value.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:scrn=** (optional)

The screen set name. When this parameter is specified, the information for only the specified screen set is displayed.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

### Example

```
rtrv-scrset
rtrv-scrset:scrn=scr1
rtrv-scrset:nsr=opc4
rtrv-scrset:nsfi=dpc
rtrv-scrset:actname=copy
```

### Dependencies

The screen set name must already exist.

The **nsfi=stop** parameter must be specified before the **actname** parameter can be specified.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screen set name parameter, the specified value for the **actname** parameter must be assigned to that screen set name.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The **nsr** parameter cannot be entered if the **nsfi** parameter value equals **stop**.

### Notes

If no parameters are specified for the **rtrv-scrset** command, the output shows all the screen sets, the screening function identifier of the root screening table, the screening reference of the root screening table, the memory usage (percentage), the number of entries in the screen set and the overall gateway screening statistics, followed by a summary of statistics for each screen set.

For the **rtrv-scrset:all=yes** command, the output consists of every screen set and every screening reference in each screen set (except “placeholder” screen sets that have only one rule with **nsfi=stop** specified in the rule). The **all=yes** and **nsfi=stop** parameters cannot be specified in the same command.

If the **scrn**, **nsfi**, or **nsr** parameter is entered, summary information for all screens that match the specified parameters is shown.

When the % FULL is over 100%, the screen is inaccessible. A screenset over 100% capacity size will not bind correctly. A screenset can become provisioned over capacity when linking one screen reference to another causes the size to become too large. To reduce a screenset that is over 100% capacity, screen rules must be deleted (see the **dlt-scr-xxx** commands)

**Output**

In the following example the % full is over 100% and the screen is inaccessible.

**rtrv-scrset**

```
rlghncxa03w 03-03-14 16:37:05 EST EAGLE 31.3.0

### Legend

**SCRN**—The name of the screen set.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**FULL**—The capacity of allowed memory a given screen set occupies, expressed as a percentage.

**RULES**—The number of entries in the screen set.

**TABLES**—The number of tables in the screen set.

**DESTFLD**—Displays whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on, the automatic screening is applied at the end of the provisioned screen set.

## rtrv-seas-config

## rtrv-seas-config

Use this command to retrieve configuration information for the CCS Message Router (CCS MR) and the name of the EAGLE 5 ISS source node for the SEAS Over IP interface.

**Keyword:** **rtrv-seas-config**

**Related Commands:** **chg-seas-config**

**Command Class:** Database Administration

### Parameters

### Example

```
rtrv-seas-config
```

### Dependencies

The SEAS Over IP feature must be enabled before this command can be entered.

**Output****rtrv-seas-config**

```
tekelecstp 07-01-23 18:46:01 EST EAGLE 37.5.0
SEASCLLI AUTHMODE
```

```

**Legend**

**PAGE**—Default password aging interval for newly created user IDs

**UOUT**—number of successive days a user ID can go unused (no successful login) before the system denies login

**MULTLOG**—Indicates whether users can be logged on to multiple terminals at the same time

**MINLEN**—Minimum password length

**ALPHA**—Minimum number of alphabetic characters (a–z) required in a new password

**NUM**—Minimum number of numeric characters (0–9) required in a new password

**PUNC**—Minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character.

**MININTRVL**—Minimum number of days before a password can be changed again

**PNOTIFY**—Number of days prior to password expiration in which the user will be notified about upcoming expiration

**PGRACE**—Number of days after password expiration in which the user is allowed to login without requiring a password change

**PREUSE**—Number of passwords in the password history that must be unique

**PCHREUSE**—Number of characters that cannot be reused from the existing password when setting a new password

**WARNING MESSAGE**—Message displayed when a user has successfully logged in

## rtrv-secu-trm

### Display Terminal Access Rights

Use this command to display the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system.

**Keyword:** rtrv-secu-trm

**Related Commands:** chg-secu-trm

**Command Class:** Security Administration

### Parameters

**:trm=** (optional)

Specifies the port about which information will be displayed.

**Range:** 1-16

**Default:** Display all

### Example

**rtrv-secu-trm**

**rtrv-secu-trm:trm=9**

### Dependencies

None

### Notes

None

**Output**

The following example shows attributes of all terminals when the Command Class Management feature is off.

**rtrv-secu-trm**

```
e5oam 08-12-01 23:40:14 EST EAGLE 40.1.0
```

**Legend**

**TRM**—The ID number of the terminal whose characteristics are to be changed

**LINK**—Shows whether the Link Maintenance class of commands is allowed for this terminal

**SA**—Shows whether the Security Administration class of commands is allowed for this terminal

**SYS**—Shows whether the System Maintenance class of commands is allowed for this terminal

**PU**—Shows whether the Program Update class of commands is allowed for this terminal

**DB**—Shows whether the Database class of commands is allowed for this terminal

**DBG**—Shows whether the Debug class of commands is allowed for this terminal

**\*\*\***—Denotes a Security Administration port whose port type has been configured with a value of **none**, or **printer**. These terminal types do not allow you to enter commands.

**U01 - U32**—Configurable command class default names. (If configured with a user-specified name, that name appears.)

**rtrv-secu-user**

**Retrieve Security User**

Use this command to show the security information for all users in the system.

**Keyword:** **rtrv-secu-user**

**Related Commands:** **act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-user**

**Command Class:** Security Administration

**Parameters**

**:uid=** (optional)  
User ID

**Range:** *azzzzzzzzzzzzzzz*  
1 alphabetic character followed by up to 15 alphanumeric characters  
**Default:** Display all

**Example**

**rtrv-secu-user : uid = rogers**

**Dependencies**

If a user ID is specified, the user ID must exist in the UserID table.

**Notes**

Only the system administrator should have access to this command.

Passwords cannot be shown.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following example shows a display when the Command Class Management feature is not enabled:

**rtrv-secu-user**

```

;

**Legend****USER-ID**—The name of the user**AGE**—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.**PAGE**—Shows the maximum password age established for this user ID. When **AGE** becomes greater than **PAGE**, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.**UOUT**—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default **uout** parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.**REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.**LINK**—Shows whether the user has access to all commands in the Link Maintenance command class.**SA**—Shows whether the user has access to all commands in the Security Administration command class.**SYS**—Shows whether the user has access to all commands in the System Maintenance command class.**PU**—Shows whether the user has access to all commands in the Program Update command class.**DB**—Shows whether the user has access to all commands in the Database Administration command class.**DBG**—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled, the following fields appear:

**U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following field is displayed:

**LNPBAS**—Shows whether the user has access to all commands in the LNP Basic command class.**rtrv-seculog****Generate Report from Security Log Contents**

Use this command to retrieve the contents of a security log and display it to the user in the scroll area. Various reports can be produced by varying the values of the command parameters. By default, the report is generated from the log on the active fixed disk, although the **log** parameter can be used to generate the report from the log on the standby fixed disk.

**Keyword:** rtrv-seculog  
**Related Commands:**  
**Command Class:** Security Administration

## Parameters

### **:edate=** (optional)

End date. Use this parameter to report log entries only if they were created on or before the specified date. If the **sdate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

**Range:**       **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

**Default:**     Report log entries regardless of their creation date

### **:etime=** (optional)

End time. Use this parameter to report log entries only if they were created between midnight (00:00:00) and the time specified on this parameter. If the **stime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

**Range:**       **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as **130503**.

**Default:**     Report log entries regardless of their creation time

### **:mode=** (optional)

Use this parameter to produce a either full log report or an abbreviated log report.

**Range:**       **brief, full**

**brief**—Causes only one line of output to be generated for each log entry reported. Some information in each reported log entry is not shown.

**full**—Produces a report showing multiple lines of output for each log record that is reported. This report displays more information from each log record (including the entire command) than the **mode=brief** report.

**Default:**     **brief**

### **:num=** (optional)

Maximum number of records to be displayed. This parameter specifies how many records are to be displayed before the report is terminated.

**Range:**       **1-50000**

**Default:**     **500**—if **mode=brief** is specified

**250**—if **mode=full** is not specified

### **:rectype=** (optional)

Use this parameter to specify whether you want all records in the log to be considered for reporting or only new (that is, un-uploaded) records.

**Range:**       **new, both**

**new**—The report generator scans only new (that is, un-uploaded) records when generating the report. Old records are not considered for reporting, even if they match the reporting criteria.

**both**—All records in the log are considered for reporting.

**Default:**     **new**

**:sdate=** (optional)

Start date. Use this parameter to report log entries only if they were created on or after the specified date. If the **edate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

**Range:**       **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

**Default:**     Report log entries regardless of their creation date

**:slog=** (optional)

Source log indicator. This parameter specifies which log is to be copied to the FTA.

**Range:**       **act, stb**

**act**—Specify **act** to produce the report from the log on the active MASP

**stb**—Specify **stb** to produce the report from the log on the standby MASP

**Default:**     **act**

**:stime=** (optional)

Start time. Use this parameter to report log entries only if they were created between the time specified on this parameter and the end of the day (23:59:59) inclusive. If the **etime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

**Range:**       **000000-235959**

The time must be specified with 6 digits in a 24-hour format (*hhmmss*). For example, enter 1:05:03 p.m. as **130503**.

*hhmmss*—*hh*=hours (**00-23**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

**Default:**     Report log entries regardless of their creation time

**:trm=** (optional)

Terminal ID. Use this parameter to report only those log entries created by the specified terminal.

**Range:**       **1-16**

**Default:**     Report log entries regardless of the associated terminal

**:uid=** (optional)

User ID. Use this parameter to report only those log entries created by the specified user ID. Specify **uid=seas** to report only those commands received on a SEAS terminal. Specify **uid=none** to report only those commands not associated with a user ID. For example, commands issued prior to login.

**Range:**       **azzzzzzzzzzzzzzz**

1 alphabetic character followed by up to 15 alphanumeric characters

**Default:**     Display all

**Example**

```
rtrv-seculog:sdate=021496:edate=021596:num=7
```

```
rtrv-
```

```
seculog:mode=full:sdate=021496:edate=021496:stime=062900:etime=063200
```

**Dependencies**

If both the **sdate** and **edate** parameters are specified, the date that is specified for the **sdate** parameter must be earlier than or equal to the date specified for the **edate** parameter.

If both the **stime** and **etime** parameters are specified, the time that is specified for the **stime** parameter must be earlier than or equal to the time specified for the **etime** parameter.

The month component of the **sdate** and **edate** parameter combination must be specified in the range **1-12**.

The day component of **sdate** and **edate** parameter combination must be specified in the range **1–31**. This value must accurately reflect the number of days in the month and year indicated. For example, **sdate=960631** is not a valid parameter value because June has only 30 days.

The second component of the **stime** and **etime** parameter combination must be specified in the range **00–59**.

The minute component of the **stime** and **etime** parameter combination must be specified in the range **00–59**.

No other security log command can be in progress when this command is entered.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

## Notes

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999

years 00–36 = 2000 through 2036

A consequence of this is that date 000101 (Jan 1, 2000) is greater than 991231 (December 31, 1999).

If the **mode=brief** parameter is specified and the output report has a plus (+) symbol appearing at the end of the command, the plus symbol indicates that more command characters are available to be displayed. Specify the **mode=full** parameter to see these additional characters.

In the **mode=full** output report, a plus (+) symbol appearing at the end of the command indicates the command is longer than 150 characters. Note that even in the uploaded log, each record in the log has room to record only 150 characters of the entered command. If the command is longer than 150 characters, then only the first 149 characters of the command and the plus symbol (to indicate that truncation has occurred) are recorded.

Security log size is limited to 50,000 records. Data from a query that exceeds the size limit of the security log cannot be displayed.

The system checks to ensure that the day portion of any **sdate/edate** value entered is in agreement with the month and year. It issues error message E2252 if the day is found to be invalid (for example, **960631** is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

The system uses the **sdate/edate** and **stime/etime** parameters to select log records for reporting as follows:

- If the date on which the log record was created is not in the date range specified by the **sdate/edate** parameters, the record is not reported. The default **sdate** is the date of the oldest record in the log, and the default **edate** is the current date.
- If the time of day at which the log record was created is not in the time range specified by the **stime/etime** parameters, the record is not reported. The default **stime** is 00:00:00 (midnight), and the default **etime** is 23:59:59.
- Otherwise, the log record is reported, unless it is disqualified by other parameters such as **uid** or **trm**.

As an example, if the following command is entered, records are displayed for October 10, 1996 from 2:00 p.m. until 4:00 p.m., for October 11, 1996, from 2:00 p.m. until 4:00 p.m., and for October 12, 1996, from 2:00 p.m. until 4:00 p.m.

**rtrv-seculog:sdate=961010:edate=961012:stime=140000:etime=160000**

It takes the system approximately one minute to display 500 lines of data in the scroll area. To output a complete **mode=full** report (150,000 lines maximum) takes approximately 300 minutes. For this reason, the **num** parameter defaults to either **125 (mode=full)** or **500 (mode=brief)**, to prevent an excessively long process time, unless you deliberately choose a longer report.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The following message appears in the scroll area if the **slog=stb** parameter is specified (either explicitly or by default) and the standby fixed disk is not available (for example, simplex mode).

```
Command Failed - unable to read security log
```

When the **rtrv-seculog** command is entered, one of the first things that the reporting function does is to examine the log overflowed and logging failure flags in the header of the specified log.

Depending on the nature of the information found, one of the following notices is displayed in the output:

```
Notice: Log overflow has occurred -- report may be incomplete.
```

```
Notice: Logging failure -- report may be incomplete.
```

## Output

The following example shows how all records in the log created between 2/14/96 and 2/15/96 are to be displayed, up to a maximum of 9 records.

**rtrv-seculog:sdate=960214:edate=960215:num=9**

rlghncxa03w 96-02-14 06:32:20 EST EAGLE Release 34.0

### Legend

**UID**—The user ID that issued the command. The value **SEAS** appears if the command was received on a SEAS port. The value **NONE** appears if no user ID was associated with the port at the time the command was logged.

**TRM**—The terminal ID of the terminal where the command was received.

**DATE**—The date when the log entry was made; that is, the date on which the command was received for execution.

**TIME**—The time when the log entry was made; that is, the time the command was received for execution. A 24-hour time format is used (for example, 1:00 p.m. = 130000).

**ST**—The two-letter shorthand notation of the command's status. The complete status can be obtained by re-entering the **rtrv-seculog** command and specifying the **mode=full** parameter. The status abbreviations are as follows:

- **AB**—Command aborted. Displayed when the **canc-cmd:trm** command is issued to abort the following commands: **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-slk**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-ls**, **rtrv-map**, **rtrv-rte**, **rtrv-seculog**, and **rtrv-slk**. An AB status indicates that processing and output of the command have been halted. This status is also displayed for SEAS flow-thru commands that are canceled with the **canc-cmd** (without the **trm** parameter).
- **RJ**—Command rejected. Displayed whenever the results value that would be displayed in the **mode=full** report would be one of the following:

```
Edddd
```

```
FAILED
```

```
rrrrrr/mmmmm
```

- **RL**—Retry later. The system is busy.
- **IP**—In Progress

- **OK**—Command successfully executed
- **TO**—Timed out.

**CMD**—The command that was recorded. In the **mode=brief** report, if the length of the recorded command is greater than or equal to 35 characters (as this much as can be displayed on a single line of the output report), then only the first 34 characters of the command are displayed, and the 35th character is displayed as a plus symbol (+) to indicate that more information is available in the log. Re-enter the **rtrv-seculog** command with the **mode=full** parameter to see the additional information. In the **mode=full** report, a plus symbol at the end of a command indicates that the command is longer than 150 characters.

## rtrv-serial-num

## Retrieve Serial Number

Use this command to retrieve the NT serial number for the system.

**Keyword:** **rtrv-serial-num**

**Related Commands:** **ent-serial-num**

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-serial-num**

### Dependencies

None

### Notes

None

### Output

Dashes appear if the serial number has not yet been entered into the database.

#### **rtrv-serial-num**

```
rlghncxa03w 03-03-29 16:40:40 EST EAGLE 31.3.0
System serial number = nt00001231
```

```
System serial number is locked.
```

```

Command Completed
```

;

## rtrv-sg-opts

## Retrieve IP7 Secure Gateway Options

Use this command to retrieve information about the currently chosen IP<sup>7</sup> Secure Gateway protocol options.

**Keyword:** **rtrv-sg-opts**

**Related Commands:** **chg-sg-opts**, **rtrv-appl-rtkey**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-sg-opts**

**Dependencies**

None

**Notes**

None

**Output****rtrv-sg-opts**

```
rlghncxa03w 08-02-07 09:50:17 EST EAGLE 38.0.0
SRKQ:                250
SNMPCONT:            john doe 555-123-4567
GETCOMM:              public
SETCOMM:              private
TRAPCOMM:             public
SCTPCSUM:             adler32
IPGWABATE:            NO
UAMEASUSEDFTAS:      YES
;
```

**Legend**

**SRKQ**—The static routing key quantity. The maximum number of routing key entries in the Static Routing Key table.

**SNMPCONT**—The system contact information for each SSED CM SNMP agent.

**GETCOMM**—The community name used for messages sent by SS7IPGW cards (SNMP Get and GetNext request validations).

**SETCOMM**—The community name used for SNMP set request validation. This value applies for each SSED CM SNMP agent in the system.

**TRAPCOMM**—The community name used when SNMP traps are generated. This value applies for each SSED CM SNMP agent in the system.

**SCTPCSUM**—The SCTP checksum algorithm type.

**IPGWABATE**—The IPGWx SS7 congestion abatement procedures.

**UAMEASUSEDFTAS**—The UA measurements are generated.

**rtrv-shlf****Retrieve Shelf**

Use this command to display the frames and shelves that are currently provisioned in the system. The type of shelf is also shown.

**Keyword:** **rtrv-shlf**

**Related Commands:** **dlt-shlf**, **ent-shlf**

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

The shelf location.

**Range:** 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

**Default:** Display all configured locations

**Example**

```
rtrv-shlf
```

```
rtrv-shlf:loc=1300
```

```
rtrv-shlf:loc=2100
```

**Dependencies**

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

**Notes**

None

**Output**

The following example displays all configured STP equipment shelves.

**rtrv-shlf**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY
FRAME SHELF      TYPE

  1      2      EXTENSION
  1      3      EXTENSION
  2      3      EXTENSION
;
```

The following example displays a specific STP equipment shelf.

**rtrv-shlf: loc=1300**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=1300
FRAME SHELF      TYPE
  1      3      EXTENSION
CARD   TYPE      APPL      LSET NAME      PORT SLC LSET NAME      PORT SLC
1301   LIMDS0    SS7ANSI    -----      --  --  -----      --  --
1302   LIMDS0    SS7ANSI    -----      --  --  -----      --  --
1303   LIMDS0    SS7ANSI    -----      --  --  -----      --  --
1304   LIMDS0    SS7ANSI    -----      --  --  -----      --  --
1305   LIMDS0    SS7ANSI    -----      --  --  -----      --  --
;
```

The following example displays a specific STP equipment shelf that is not configured (unequipped).

**rtrv-shlf: loc=2100**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=2100
FRAME SHELF      TYPE

This shelf is UNEQUIPPED in the database.
;
```

**Legend**

**FRAME**—The frame location of the shelf.

**SHELF**—The location of the shelf within the frame.

**TYPE**—The type of shelf.

**CARD**—Card location in the specified shelf.

**TYPE**—Card type

**APPL**—Application running on the card.

**LSET NAME**—Linkset name defined for the port on the card.

**PORT**—Port used by the linkset defined on the card.

**SLC**—Signaling link code for the linkset.

**rtrv-sid****Retrieve Self Identification**

Use this command to retrieve site identification characteristics of the system. It shows the point code assigned to this system, the CLLI code of the system, the capability code of the STP, and the type of point codes supported by the system.

**Keyword:** rtrv-sid

**Related Commands:** chg-sid, ent-sid

**Command Class:** Security Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cpc=** (optional)

ANSI capability point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** cpc

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**Default:** Display all

**:cpc/cpc/cpci/cpcn24=** (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

**:cpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**Default:** Display all

**:cpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**Default:** Display all

**:cpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** Display all

**:cpctype=** (optional)

Capability point code type. This parameter displays the CPCs that are provisioned for the specified service.

**Range:** **stp, lnp, inp, eir, gport, gflex, mnp, atinpq, vflex, aiq**

**Default:** **stp**

### Example

**rtrv-sid**

**rtrv-sid:cpc=3-3-3**

**rtrv-sid:cpc=001-001-001**

**rtrv-sid:cyctype=inp**

**rtrv-sid:cpci=2-100-4**

**rtrv-sid:cpcn24=33-33-33**

**rtrv-sid:cpcn=s-00456**

### Dependencies

The STP destination point codes and capability point codes can be specified only as full point codes.

The ANSI point code **0-0-0** and the ITU-I point code **0-000-0** are invalid for STP capability point codes.

The LNP feature must be turned on before the **cpctype=lnp** parameter can be specified.

The INP feature must be turned on before the **cpctype=inp** parameter can be specified.

The EIR feature must be turned on before the **cpctype=eir** parameter can be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be retrieved.

If the **cpcn** parameter is specified, the format of the specified point code must match the format that was assigned with the **chg-stpopts** command **npcfmti** parameter.

The ATINP feature must be enabled before the **cpctype=atinpq** parameter can be specified.

The V-Flex feature must be turned on before the **cpctype=vflex** parameter can be specified.

The A-Port or the IS41 GSM Migration (IGM) feature must be enabled, before the **cpctype=mnp** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **cpctype=aiq** parameter can be specified.

**Notes**

If the **cpc/cpca/cpci/cpcn/cpcn24** parameter is not specified, all site identification characteristics are displayed.

If the STP capability point code is specified and not provisioned, the report contains only the PCA, PCI, PCN or PCN24, CLLI, and PCTYPE fields, with the message:

Capability Point Code specified is not provisioned.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

## Output

The **rtrv-sid** command CPC output is sorted using three sort keys.

- The first sort key is by the **cpctype** service, ordered by: **aiq**, **eir**, **gflex**, **inp**, **stp** (own STP, unlabeled), and either **gport** or **mnp** depending on whether A-Port, ATINP, G-Port or V-Flex is enabled.
- The second sort key is by network type, ordered by: ANSI, ITU-I, ITU-N, then ITU-N24.
- The third sort key is by point code value, ordered low to high.

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The **s-** point code prefix indicates an ITU national or international spare point code or spare capability point code.
- ANSI41 AIQ, EIR, G-Flex, G-Port, INP, LNP and V-Flex capability point codes are indicated in parentheses after the capability point code header.
- STP capability point codes have no parentheses after the header.

The examples show all site identification characteristics provisioned in the system at the time the command was entered.

The following example shows all site identification characteristics provisioned in the system at the time the command was entered. The output includes spare point codes.

**Legend**

**PCA**—The ANSI point code of the STP.

**PCI**—The ITU-TSS international point code of the STP.

**PCN**—The ITU-TSS national point code of the STP.

**PCN24**—The 24-bit ITU national point code of the STP.

**CPCA**—The ANSI capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCN**—The ITU-TSS national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCI**—The ITU-TSS international capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCN24**—The ITU-TSS 24-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**(EIR)**—The identified point code is an Equipment Identity Register (EIR) point code.

**(INP)**—The identified point code is an INAP Number Portability (INP) point code.

**(LNP)**—The identified point code is a local number portability (LNP) point code.

**(GFLEX)**—The identified point code is a G-Flex (GFLEX) point code.

**(GPORT)**—The identified point code is a G-Port (GPORT) point code.

**(MNP)**—The identified point code is an MNP point code.

**(VFLEX)**—The identified point code is a V-Flex (VFLEX) point code.

**(ATINP)**—The identified point code is an ATINP feature (ATINPQ) point code.

**(AIQ)**—The identified point code is an ANSI41 AIQ feature (AIQ) point code.

**CLLI**—The common language location identifier of the STP

**PCTYPE**—The type of point code used by the STP. There are two types of point codes that the EAGLE 5 ISS STP can use, ANSI and OTHER. The value ANSI means the EAGLE 5 ISS STP supports point codes that meet the ANSI standard. The value OTHER means that the EAGLE 5 ISS STP supports point codes that do not meet the ANSI standard.

## rtrv-slk

## Retrieve Signaling Link

Use this command to show the parameters for low-speed signaling links, ATM high-speed signaling links, or both.

**Keyword:** rtrv-slk

**Related Commands:** act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, tst-slk, ublk-slk, unhb-slk

**Command Class:** Database Administration

### Parameters

**:aname=** (optional)

Association name. This parameter specifies the name of the association assigned to the links to be displayed.

**Range:** aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

**:link=** (optional)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All signaling links are shown.

**:type=** (optional)

Link type. This parameter specifies to display a sub-set of links.

**Range:** mtp2, saal, e1, t1, ipsg, iplim, ipgw

**mtp2**— Display low-speed signaling links

**saal**— Display ATM high-speed signaling links

**e1**— Display signaling links for E1 cards. Includes low speed E1 and SE-HSL links.

**t1**— Display signaling links for T1 cards. Includes low speed T1 and ST-HSL-A links.

**ipsg**— Display signaling links configured for IPSG linksets

**iplim**— Display signaling links configured for IPLIM linksets

**ipgw**— Display signaling links configured for IPGW linksets

**Default:** Display all signaling links

**Example**

```

rtrv-slk:loc=1302:link=a
rtrv-slk:loc=1302:link=b2
rtrv-slk:loc=1303:link=a31
rtrv-slk:aname=asocm2pa
rtrv-slk:loc=1305

```

**Dependencies**

If the **link** parameter is specified, the **loc** parameter must be specified. The **loc** parameter can be specified without the **link** parameter.

The **loc** parameter or the **class** parameter, but not both, can be specified in the command.

The slot portion of the specified **loc** parameter must be **01** through **18**, except **09** and **10** cannot be specified (**loc**= xyss, where x is the frame, y is the shelf, and ss is the slot).

Card locations **1113** through **1118** cannot be specified for the **loc** parameter.

The frame and shelf portion of the specified **loc** parameter must be **11**, **12**, **13**, **21**, **22**, **23**, **31**, **32**, **33**, **41**, **42**, **43**, **51**, **52**, **53**, or **61** (**loc**= xyss, where x is the frame, y is the shelf, and ss is the slot).

The **limatm**, **lime1atm**, **limds0**, **limocu**, **limv35**, **lime1**, **limt1**, **limch**, and **dcm** card types are the only valid card types for this command.

The card must be a LIM, an E1/T1 MIM, or an HC-MIM.

The specified card location must be equipped.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3**, **b1-b3**—Multi-port LIM (MPL), SSED CM card running the **thiplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31**, **b1-b31**—HC-MIM card
- **a1-a15**, **b1-b15**—E5-E1T1 card
- **a1-a7**, **b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15**, **b1-b15**—E5-ENET card running the **ipsg** application

The **link** parameter values **a4-a31** and **b4-b31** can be specified only for the HC-MIM card that is used as an E1 card or a T1 card. The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for Channel cards.

The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for even-numbered card locations.

The associated location must be empty or must contain an E5-ATM card before **thlink=b** or **link=a1** parameter can be specified. Upon initialization, the E5-ATM card is in **boot phase-0** for up to 30 secs. During this period, the E5-ATM hardware is not detected, which may result in a lack of support for signalling link **b** or **a1**.

If an E5-ATM card is used, then a value of **a**, **b**, or **a1** must be specified for the **link** parameter. A 3 Links per E5-ATM Card feature quantity must be enabled before the **link=a1** parameter can be specified.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of the card locations.

## Output

```

**Legend**

**LOC**—Location of the card containing the signaling link

**LINK**—Signaling link assigned to the card

**LSN**—Name of the linkset containing the signaling link

**SLC**—Signaling link code of the signaling link

**TYPE**—Type of card

**ANAME**—Association name

**SLKTPS/RSVDSLKTPS**—SLKTPS guaranteed for an IPSG link

**MAXSLKTPS**—Maximum SLKTPS allowed for an IPSG link

**L2TSET**—Number of the level 2 timer set associated with the signaling link

**BPS**—Transmission rate of the signaling link in bits per second

**ECM**—Basic of PC for transmission

**PCRN1**—MSU number

**PCRN2**—Octet number

**LPSET**—ATM link parameter set identifier

**ATMTSEL**—ATM timing selector. Possible values are as follows:

- **INTERNAL**—Derived from an internal clock source operating at 1.544 MHz  $\pm$  200 Hz (ANSI) or 2.048 MHz  $\pm$  103 Hz (ITU).
- **EXTERNAL**—Derived from the High-Speed Master Clock (T1 or E1)
- **LINE**—Derived from its received data stream, if present

**VCI**—ATM virtual channel identifier

**VPI**—ATM virtual path identifier

**LL**—ATM line length

**E1PORT**—E1 card port that has an E1 interface assigned to it.

**E1LOC**—Card location of an E1 card with an E1 interface assigned to it

**T1PORT**—T1 card port that has a T1 interface assigned to it

**T1LOC**—Card location of a T1 card with a T1 interface assigned to it

**TS**—Timeslot associated with the signaling link that is serviced by the E1 or T1 interface

**E1ATMCRC4**—E1 ATM card CRC4 multi-frame structure enable/disable indicator

**E1ATMSI**—Value of two Spare International bits of NFAS data for the E1 ATM card

**E1ATMSN**—Value of five Spare National bits of NFAS data for the E1 ATM card

IPLIML2—IPLIM Level 2 stack (M2PA)

## rtrv-slt

## Retrieve Signaling Link Test Message

Use this command to display the fields of an SLTM (signaling link test message) record in the SLTM table.

**Keyword:** rtrv-slt

**Related Commands:** chg-l3t, chg-slt, ent-ls, rtrv-ls

**Command Class:** Database Administration

### Parameters

**:enabled=** (optional)

Displays the SLTM records that are either enabled (**on**) or disabled (**off**).

**Range:** on, off

**Default:** All SLTM records with the specified value for the enabled parameter are shown.

**:sltset=** (optional)

The signaling link test message (SLTM) record number in the SLTM table.

**Range:** 1-20

**Default:** Display all

### Example

**rtrv-slt**

**rtrv-slt:sltset=1**

**rtrv-slt:enabled=off**

### Dependencies

None

### Notes

None

**Legend**

**SLTSET**—The signaling link test message record number in the SLTM table.

**T1**—The T1 timer value for the SLTM record. After an SLTM test fails, this parameter specifies the amount of time, in seconds, to wait before running the SLTM test again.

**T2**—The T2 timer value for the SLTM record. This parameter specifies the amount of time, in seconds, to wait between running SLTM tests for a normally functioning signaling link.

**MODE**—The SLTM mode to be used when sending test messages.

**ENABLED**—Indicates whether the signaling link test message is enabled.

**PATTERN**—The test pattern to be sent with a signaling link test message.

**rtrv-spc****Retrieve Secondary Point Code**

Use this command to retrieve an SPC (secondary point code) from the active database.

**Keyword:** **rtrv-spc**

**Related Commands:** **dlt-spc, ent-spc**

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:spc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **spca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

The secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:**     **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

### Example

**rtrv-spc**

**rtrv-spc:spc=5-3-3**

**rtrv-spc:spcn24=98-98-98**

**rtrv-spc:spcn=s-00345**

### Dependencies

The MPC feature must be turned on before this command can be entered.

The value of the **spc** parameter must be a full point code.

### Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

**Output**

The following example shows the output for all provisioned secondary point codes. (SPC-N is a flexible point code format as defined with the **chg-stpopts:npcfmt** parameter).

**rtrv-spc**

## rtrv-srvsel

## Retrieve Service Selector

Use this command to display a list of administered service selector combinations. The list can be filtered using various parameter combinations.

**NOTE:** The **rtrv-srvsel** operation may be lengthy because the service selector table can contain over 1,000 entries.

**Keyword:** **rtrv-srvsel**

**Related Commands:** **chg-srvsel**, **dlt-srvsel**, **ent-srvsel**

**Command Class:** Database Administration

### Parameters

**NOTE:** Definitions for the feature options specified by the **on** and **off** parameters are located in the Notes section.

**NOTE:** The nature of address indicator parameters (**naiv** or **nai**) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the **naiv** and the **nai** parameter values.

**NOTE:** The numbering plan parameters (**npv** or **np**) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-8 shows the mapping between the **npv** and the **np** parameter values.

**:dfltact=** (optional)

This parameter specifies the default action ID associated with the service selector entry.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

The **dfltact** parameter can take one of the following values:

- a valid GTT Action ID of type **disc/udts/tcaperr** that must already exist in the GTT Action table
- **fallback**—Fallback to the Relay data. The Relayed MSU is routed as per routing data provided by the service.
- **falltogtt**—Fallback to GTT. If the **gttselid** parameter has a value other than **none**, and the GTT selector search fails, then the GTT selector search is performed again using **gttselid=none**.

**:force=** (optional)

The **force=yes** parameter must be specified when **anum** parameter value greater than 50 is specified to display more than 50 entries.

**Range:** **yes**, **no**

**Default:** **no**

**:gti/gtia/gtii/gtin/gtin24=** (optional)

Global title indicator. For all service selector commands, the domain is defined **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national) and **gtin24** (24-bit ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

**Range:** Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2, 4; gtin=2, 4, gtin24=2, 4**

**Default:** Display all

**:nai=** (optional)  
Nature of Address indicator.  
**Range:** **sub, rsvd, natl, intl**  
**Default:** Display all

**:naiv=** (optional)  
Nature of Address indicator value.  
**Range:** **0-127**  
**Default:** Display all

**:np=** (optional)  
Numbering Plan.  
**Range:** **e164, generic, x121, f69, e210, e212, e214, private**  
**Default:** Display all

**:npv=** (optional)  
Numbering Plan value.  
**Range:** **0-15**  
**Default:** Display all

**:num=** (optional)  
Number of entries to display. The **force=yes** parameter is required when this parameter value is specified greater than 50 entries.  
**Range:** **1-20992**  
**Default:** **50**

**:off=** (optional)  
Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.  
**Range:** **gttrqd, force**

**:on=** (optional)  
Enables or turns on the specified feature options. This parameter specifies a comma separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.  
**Range:** **gttrqd, force**

**:serv=** (optional)  
The Service Module card service.  
**Range:** **eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp, vflex, atinp, ttr, aiq**  
**eir** — Equipment Identity Register  
**gflex** — GSM flexible numbering  
**gport** — GSM number portability  
**inpq** — INP query  
**inpmr** — INP message relay  
**smsmr** — Prepaid SMS Intercept Phase 1, Portability Check for Mobile Originated SMS, MO SMS GSM NP, MO SMS IS41 NP, MO SMS IS41-to-GSM Migration, MO SMS ASD, MO SMS GRN, MO SMS B-Party routing.  
**idps** — IDP Screening for Prepaid  
**idpr** — Prepaid IDP Query Relay  
**mnp** — mobile number portability  
**vflex** — Voice Mail Router

**atinp** — ATI Number Portability Query (ATINP)

**ttr** — Triggerless TCAP Relay

**aiq** — ANSI41 AnalyzedInformation Query

**Default:** Display all

**:snai=** (optional)

The service nature of address indicator.

**Range:** **sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn**

**sub**—Subscriber number

**natl**—National significant number

**intl**—International number

**rnidn**—Routing number prefix and international dialed/directory number

**rnndn**—Routing number prefix and national dialed/directory number

**rnsdn**—Routing number prefix and subscriber dialed/directory number

**ccrndn**—Country code, routing number, and national directory number

**Default:** Display all

**:snp=** (optional)

The service numbering plan.

**Range:** **e164, e212, e214**

**e164**—E.164 numbering plan

**e212**—E.212 numbering plan

**e214**—E.214 numbering plan

**Default:** Display all

**:ssn=** (optional)

Subsystem number.

**Range:** **0-255 \***

**:tt=** (optional)

Translation type.

**Range:** **0-255**

**Default:** Display all

### Example

```
rtrv-srvsel
```

```
rtrv-srvsel:gtii=2
```

```
rtrv-srvsel:tt=0:np=e164
```

```
rtrv-srvsel:serv=vflex
```

```
rtrv-srvsel:serv=aiq
```

```
rtrv-srvsel:on=gttrqd
```

### Dependencies

The INP feature or the AINPQ feature must be turned on before the **serv=inpmr** or **serv=inpq** parameter can be specified.

The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

The value **4** is not valid for the **gti/gtia** parameters.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, then no **np(v)** and **nai(v)** parameter combinations can be specified.

If the **serv** parameter has a value of **inpmr**, **inpq**, **gport**, or **eir**, then the **gtia** and **gti** parameters cannot be specified.

If the **serv=inpmr** parameter is specified, then the value of the **snp** parameter must be **e164** if specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the value of the **serv** parameter must be **inpmr**, **gport**, or **smsmr** if it is specified.

If the **serv=inpq** parameter is specified, then the **gtii** parameter cannot be specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the **serv=gflex** parameter cannot be specified.

If a value of **aiq**, **eir**, **inpq**, or **vflex** is specified for the **serv** parameter then the **snp** and **snai** parameters cannot be specified.

If the **snai=ccrndn** parameter is specified, then the value specified for the **serv** parameter must be **gport**, or **smsmr**.

If the value specified for the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the **serv=ttr** parameter can be specified.

If a value of **idpr** or **ttr** is specified for the **serv** parameter, then the only valid parameters are **tt**, **ssn**, and **gti/gtia/gtii/gtin**, and the only valid optional parameters are **np** and **nai**.

The IDP Screening for Prepaid feature must be turned on before the **serv=idps** parameter can be specified.

The V-flex feature must be turned on before the **serv=vflex** parameter can be specified.

The Portability Check for Mobile Originated SMS or the PPSMS feature must be turned on, or the MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the **serv=smsmr** parameter can be specified.

The ATINP feature must be enabled before the **serv=atinp** parameter can be specified.

If a value of **aiq** or **atinp** is specified for the **serv** parameter, then the **gtin24** parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **serv=aiq** parameter can be specified.

If a DSM4G card is active in the system, then **on=gttrqd** parameter cannot be specified.

If a GTT Action ID is specified as the value for the **dfiltact** parameter, then the Action ID must already exist in the GTT Action table.

The same values cannot be specified for the **on** and **off** parameters.

The **dfiltact=none** parameter cannot be specified.

The EGTT feature must be turned on before the **dfiltact** parameter can be specified.

## Notes

### *on/off options*

- **gttrqd**—GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.
- **force**—Must be specified to display more than 50 entries

## Output

The following example displays all service selectors containing the specified GTI value:

**rtrv-srvsel:gtii=2**

**rtrv-stp****Retrieve STP Information**

Use this command to retrieve information related to the STP at which the command is entered.

The command can retrieve frame and card power consumption and threshold values (in Amps or milliAmps and Watts) for all provisioned frames or for a specified frame. (See the **ent-frm-pwr** command.)

The command can retrieve hardware configuration information (card location, board part number, revision, serial number, card type, card memory, APPL, and GPL version):

- For all provisioned STP frames and shelves
- For a specific provisioned frame
- For a specific provisioned shelf
- For a specific equipped card
- For all cards of the specified card type
- For all cards that contain the specified Board Part Number
- For all cards that are running the specified GPL or GPL version.

**Keyword:** **rtrv-stp**

**Related Commands:** **chg-frm-pwr, dlt-frm-pwr, ent-frm-pwr, rtrv-frm-pwr**

**Command Class:** Database Administration

## Parameters

**NOTE:** As of Release 43.0, the **BLBEPM**, **BLBIOS**, **BLBSMG**, **BLCPLD**, **BLDIAG6**, **BLROM1**, **BLVXW6**, **IMTPCI**, and **PLDPMC1** GPLs are replaced with the **BLIXP** GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

**:display=** (optional)

Display the power consumption and power threshold value for all provisioned frames or for one specific provisioned frame.

This parameter must be specified when the **frm** parameter is specified, to display the power information for one frame.

**Range:**        **power**

**power** — Display frame power information in the command output.

**:frm=** (optional)

Frame ID. The command displays information for the specified provisioned frame.

**Range:**        **cf00, ef00, ef01, ef02, ef03, ef04**

**cf00** — Control Frame identifier

**ef00** — Identifier for the first Extension Frame

**ef01** — Identifier for the second Extension Frame

**ef02** — Identifier for the third Extension Frame

**ef03** — Identifier for the fourth Extension Frame

**ef04** — Identifier for the fifth Extension Frame

**:gpl=** (optional)

Generic program load. The parameter is specified to display hardware configuration information for all card locations equipped with cards that are running the specified GPL.

This parameter must be specified when the **ver** parameter is specified, to display information for a specific version of the GPL.

**Range:**        **xyyyyyyy**

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

**atmansi**—Used by the LIM cards to support the high-speed ATM signaling link feature

**atmhc**—Supports functionality for the E5-ATM card. The E5-ATM card runs either the ATMANSI or ATMITU application. The GPL allows the card to support up to 2 signaling links.

**atmitu**—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

**blbepm**—Flash GPL containing the BIOS ROM image on E5-E1T1 and E5-ENET cards

**blbios**—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

**blbsmg**—Flash GPL containing the BIOS ROM image on E5-SM4G cards

**bldcpld**—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, and E5-ENET cards that are used for E1 or T1 signaling links.

**bldiag6**—Flash GPL containing the diagnostic code on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blixp**—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ENET, and E5-SM4G cards

**blmcap**—Flash GPL containing a tar image with all code required on E5-MCAP cards

**blvxw6**—Flash GPL containing the VxWorks operating system on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blrom1**—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

**bpdcm**—Used to support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design

**bpdcm2**—Used to support the flash memory Board PROM for DCM and GPSM boards, revised design

**bphcap**—Used to support Board PROM for HCAP flash memory

**bphcapt**—Supports Board PROM for HCAP-T flash memory

**bphmux**—Supports Board PROM for HMUX flash memory

**bpmpl**—Supports Board PROM for MPL flash memory

**bpmplt**—Supports Board PROM for E1/T1 flash memory

**cdu**—Used in the card manufacturing process.

**eoam**—Used by the GPSM-II card for enhanced OAM functions

**eroute**—Used by the STC card for EAGLE 5 Integrated Monitoring Support functions

**erthe**—Used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

**gls**—Used by TSM cards to download gateway screening to LIM cards

**glshc**—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

**hipr**—Communication software used on the High Speed IMT Packet Router (HIPR) card

**hipr2**—Communication software used on the High Speed IMT Packet Router (HIPR2) card

**imt**—Communication processor on the logical processing element (LPE)

**imtpci**—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, and E5-ENET cards

**ipghc**—Used by E5-ENET cards to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes

**ipgwi**—Used by SSED CM cards for TCP/IP point-to-point connectivity for ITU point codes

**iplhc**—Used by E5-ENET cards for TCP/IP point-to-point connectivity for both ANSI and ITU point codes

**iplim**—Used by SSED CM cards for TCP/IP point-to-point connectivity for ANSI point codes

**iplimi**—Used by SSED CM cards for TCP/IP point-to-point connectivity for ITU point codes

**ips**—Used by IPSM cards for the IP User Interface feature

**ipsg**—Used by E5-ENET cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

**ipshc**—Used by E5-IPSM cards to support the IPS application

**mcp**—Used by MCPM cards for the Measurements Platform feature

**oamhc**—Used by E5-MCAP cards for enhanced OAM functions

**pldpmc1**—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

**sccphc**—Used by E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

**slanhc**—Used by E5-ENET cards to support the STPLAN application

**ss7hc**—Supports the functionality for HC-MIM or E5-E1T1 cards. The HC-MIM and E5-E1T1 cards run the SS7ANSI or CCS7ITU application; the GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

**ss7ipgw**—Used by SSEDCEM cards to support TCP/IP point-to-multipoint connectivity

**ss7ml**—Support functionality for MPL and the E1/T1 MIM cards. MPL cards run the SS7ANSI application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. MPL cards support only the DS0 interface. E1/T1 MIM card runs either the SS7ANSI or CCS7ITU application; the GPL allows the card to support 8 signaling links for E1 and T1 functions.

**utility**—Used by the factory for testing, and when directed by the Customer Care Center

**vcdu**—Used in the card manufacturing process

**vscpp**—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a Service Module card is present, then the SCCPHC GPL processes normal GTT traffic.

**vxwslan**—Used by SSEDCEM cards to support the STP LAN application

**:partnum=** (optional)

Display the hardware configuration for all card locations that contain a card with the specified Board Part Number.

**Range:** *zzz-zzzz-zz*

Specify the Board Part Number in the format xxx-xxxx-xx. See the Hardware Baseline appendix in the *Feature Notice* for a list of Board Part Numbers that are supported for the EAGLE 5 ISS release.

**:shelf=** (optional)

Display the hardware configuration information for all card locations in the specified EAGLE shelf.

**Range:** **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**:type=** (optional)

Display the hardware configuration information for all card locations that contain cards of the specified card type.

**Range:** **dcm, dsm, ipsm, limatm, limch, limds0, lime1, limt1, mcpcm, stc, tsm, enet, lime1atm**

**:ver=** (optional)

Display the hardware configuration information for all the card locations that have cards with the specified GPL Type and the specified GPL Version. The version format is *major-minor-fix*.

**Range:** *major-minor-fix*

*major*—Range **0-255**

*minor*—Range **0-255**

*fix*—Range **0-255**

### Example

Retrieve the frame power information for all provisioned frames of the STP.

**rtrv-stp:display=power**

Retrieve the card level power information for the control frame in the STP.

**rtrv-stp:display=power:frm=cf00**

Retrieve the hardware configuration information for the STP control shelf (shelf 1100).

**rtrv-stp:shelf=1100**

Retrieve the hardware configuration information for all cards equipped in the STP that have the specified Board Part Number.

**rtrv-stp:partnum=870-1275-01**

Retrieve the hardware configuration information for all provisioned TSM cards in the STP.

**rtrv-stp:type=tsm**

Retrieve the hardware configuration information for all cards in the STP that are running the imt communication GPL with GPL version 126-039-043.

**rtrv-stp:gpl=imt:ver=126-039-043**

Retrieve the hardware configuration information for all provisioned frames in the STP.

**rtrv-stp**

Retrieve the hardware configuration information for all cards in the STP that are running the atmhc GPL.

**rtrv-stp:gpl=atmhc**

### Dependencies

The **display** parameter must be specified when the **frm** parameter is specified.

The **gpl** parameter must be specified when the **ver** parameter is specified.

Only one optional parameter can be specified in the command, except for the following parameter combinations:

- The **display** parameter must be specified when the **frm** parameter is specified.
- The **gpl** parameter must be specified when the **ver** parameter is specified.

The **frm** parameter value must specify a provisioned frame.

The value specified for the **gpl** parameter must be supported. See the **gpl** definition for a list of supported GPLs.

### Notes

When the power threshold value has not been provisioned for a provisioned frame, the default frame power threshold value is displayed and prefixed with a plus sign (+).

For an un-provisioned card that is present in the frame, the card power consumption value is displayed prefixed with a plus sign (+).

For the TDM and MDAL cards in the Control Frame and for the HMUX/HIPR cards in all the frames, "TDM", "E5-TDM", "MDAL", "E5-MDAL" or "MUX", respectively, is displayed as the Part Number of the card.

For HIPR2 cards in all the frames, the actual Board Part Number is displayed. If a MUX card is not present, then "Empty" is displayed.

If the Board Part Number received in the BIP response from a card is not present in the Assembly Power table, then the Part Number for the card is displayed with a prefix of a plus sign (+).

If the Card power value is not present in the BIP data and the Assembly Power table, then the default card power value of **1563 milliAmps** is displayed for the card.

If board information is not available from a card,

- **BIP Data inv** is displayed as the Part number for the card.
- The default card power value of **1563 milliAmps** is displayed for the card.

If a card location is empty (no card is present in that slot),

- **Empty** is displayed as the Part Number for the card
- A card power value of **0** is assumed and displayed.

For Standby GPSM-II, E5-MCAP, and TDM cards, “Unavailable” is displayed as the Part Number if either the card is absent. In this case, the card power of the Active GPSM-II or E5-MCAP card is shown for the card power of the standby card also.

If a flash or communication GPL is specified with the **rtrv-stp** command, then the GPL output displays the version of the application GPL that is running on the card and not the version of the specified flash or communication GPL.

An unequipped MUX location does not have any type of MUX card in the slot. If a HIPR2, HIPR or HMUX card is present in the slot, then the location is equipped. When a location is unequipped, the “EMPTY” is displayed for the slots, and an error message is generated. Locations 1109 and 1110, which support the control shelf, must contain MUX cards before the EAGLE 5 ISS is considered fully operational.

The **rtrv-stp** command can be used to display the power consumption of HMUX/HIPR/HIPR2 cards within a frame. The power consumption displays **0** for an unequipped MUX location. A MUX location with HIPR or HMUX cards displays the default power consumption value. If the location contains a HIPR2 card, then the Part Number, Revision, and Power Consumption obtained from the BIP data associated with the HIPR2 card are displayed.

The EAGLE 5 ISS can have a mixture of HIPR2 cards and any other type of MUX card in the same shelf and can also contain a mixture of MUX cards on the same Bus.

## Output

If a flash or communication GPL is specified, then the output displays the GPL version of the application GPL running on the card instead of the GPL version of the specified flash or communication GPL.

The power consumption values that are displayed in the **rtrv-stp:display=power** or the **rtrv-stp:display=power:frm=** commands indicate the maximum calculated power for the frame. The calculation is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

The following example retrieves the hardware configuration information for a specific shelf containing a HIPR2 card at **loc = 1109**.

### **rtrv-stp:shelf=1100**

### Legend

**FRAME**—Frame ID for the control shelf or an extension shelf

**POWER THRESHOLD**—The power threshold (in Amps or Milliamps and Watts) at which an alarm is generated to indicate that power consumption is approaching a maximum allowed level. (See the **ent-frm-pwr** command.)

**POWER CONSUMPTION**—The current calculated power consumption (in Amps or Milliamps and Watts) of the frame or card

**CARD**—Card Location

**PART NUMBER**—Board Part Number

**REV**—Board Part Number revision

**SERIAL NUMBER**—Card serial number

**TYPE**—Card type

**DB**—Daughterboard memory

**APPL**—Application that has been provisioned on the card

**GPL VERSION**—GPL version of the Application GPL being used by the card

## rtrv-stpopts

### Retrieve STP Options

Use this command to retrieve the current value of the system's node-level processing option indicators maintained in the system's options table.

**Keyword:** rtrv-stpopts

**Related Commands:** chg-stpopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-stpopts**

### Dependencies

None

### Notes

The timer output for this command is in milliseconds, even though the timer could have been entered in seconds on the **chg-stpopts** command.

## Output

The following example displays MTP STP options with no affecting features on. Certain features that are shown in other examples control changes and additional options in this option list:

### rtrv-stpopts

```
rlghncxa03w 08-09-17 16:02:05 EST EAGLE 39.2.0
STP OPTIONS
-----
MTP31CTL          1
MTP31TI           yes
MTP31TCTDPCQ      3
MTP31TST          10000

**Legend**

**MTPT31CTL**—MTP T31 congestion trigger level. The signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.

**MTPLTI**—MTP loop test indicator. Specifies whether the MTP loop detection procedures are enabled or disabled at the system.

**MTPLTCTDPCQ**—MTP loop test congestion trigger DPC quantity. The number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

**MTPLTST**—MTP loop test supervision timer. The amount of time, in milliseconds, that the MTP loop test detection procedures run when started.

**MTPXLQ**—MTP x-list quantity. The number of dynamic status exception list (x-list) entries the system maintains.

**MTPXLET**—MTP x-list expiration time. The maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.

**MTPXLOT**—MTP x-list occupancy threshold. The dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

**MTPDPCQ**—MTP destination point code quantity. The maximum number of DPCs that can be provisioned in the system.

**TFATFRPR**—TFA/TFR pacing rate. The amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly-recovered linksets.

**MTPRSIT**—MTP Restart isolation timer. The minimum duration of node isolation, in milliseconds, before the MTP Restart procedure is deemed necessary.

**MTPRSI**—MTP Restart indicator. Specifies whether ANSI or ITU MTP Restart procedures are enabled or disabled at the STP.

**MTPLPRST**—MTP low priority route set test. Specifies whether low priority route set polling is enabled or disabled at the STP.

**MTPT10ALT**—MTP T10 alternate timer. Specifies the interval at which the STP performs a route set test on low priority routes.

**SLSCNV**—Per node SLS conversion indicator. Specifies whether SLS conversion is on, off, or performed per linkset (perls).

**UIMRD**—Unsolicited Information Message (UIM) redirect. Specifies whether specific UIMs are redirected to this output group.

**CRITALMINH**—Indicates whether the option that allows the inhibiting of critical alarms is enabled (yes) or disabled (no).

**DISPACTALMS**—Indicates whether to display active or total alarms in the alarm status area of the VT320 screen.

**NPCFMTI**—Defines how the ITU national point code is entered into the database and how it is displayed in any outputs from the system.

**GSMDFLT**—Indicates whether the GSM MAP screening default action is set to pass or discard.

**GSMDECERR**—Indicates whether the GSM MAP screening decode error action is set to pass or discard.

**DEFCC**—Defines the default country code.

**DEFNDC**—Defines the default network destination code.

**DSMAUD**—Indicates whether the DSM audit is running (on) or disabled (off).

**RANDSLS**—Displays the Random SLS setting.

**RTPLNPMRSS**—Displays the setting for reporting or suppressing UIM 1049 for LNP MR with missing subsystems.

**RSTRDEV**—Allow or disable restoration of device states when an **init-sys** command is executed, an OAM role changes, or a card reload occurs.

**SECMTPMATE**—Indicates Network Security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.

**SECMTPSID**—Indicates Network Security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the **chg-sid** command) that is not a route-set-congestion-message. The EAGLE 5 ISS should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked.)

**SECMTPSNM**—Indicates Network Security screening for MTP SNM messages. The EAGLE 5 ISS should not receive an MTP network management message unless:

- The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)
- The EAGLE 5 ISS has a route to the OPC of the MTP network management message on the linkset which the message was received.
- The EAGLE 5 ISS has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule is not applicable to RST messages.)

**SECSCCPSCMG**—Indicates Network Security screening for SCCP SCMG messages. This value applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected. The EAGLE 5 ISS should not receive an SCCP network management message unless:

- The EAGLE 5 ISS has a route to the OPC of the SCMG message on the linkset on which the message was received.
- The EAGLE 5 ISS has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE 5 ISS) in the message on the linkset on which the message was received.

**CNVCGDA**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ANSI, and the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDI**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-I, and the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDN**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-N, and the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDN24**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is 24-bit ITU-N, and the PC or ALIAS PC of the destination network type is not defined.

**ANSIGFLEX**—Indicates enable or disable of ANSI G-Flex to execute at 1700 TPS per DSM card

**GTCNVDFLT**—Indicates enable or disable of routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion table.

**HSCLKLL**—High speed master clock line length option (SHORTHAUL, LONGHAUL)

**HSCLKSRC**—High speed master clock source

**ARCHBLDID**—Archive build ID

**PCT**—Indicates whether PCT is applied to MSUs

## rtrv-subnetid

## Retrieve Subnet ID

Use this command to retrieve a list of Subnet ID entries from the SUBNETID table, for the ISUP NP with EPAP feature.

**Keyword:** rtrv-subnetid

**Related Commands:** dlt-subnetid, ent-subnetid

**Command Class:** Database Administration

### Parameters

**:subnetnum=** (optional)

Subnet Number

**Range:** 1-5

### Example

**rtrv-subnetid**

**rtrv-subnetid : subnetnum = 1**

### Dependencies

The ISUP NP with EPAP feature must be enabled before this command can be entered.

### Notes

None.

### Output

When the command is entered with no parameter, the Subnet IDs for Subnet number 1 are listed in numerical order, followed by the Subnet IDs for Subnet number 2 in numerical order, and so on.

#### rtrv-subnetid

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
```

| ID | Subnet<br>Number |
|----|------------------|
|----|------------------|

-----

|        |   |
|--------|---|
| 886932 | 1 |
| 886936 | 1 |
| 886935 | 2 |
| 886938 | 2 |
| 886939 | 2 |

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;

When a Subnet number is specified, the Subnet IDs for the specified Subnet number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

#### rtrv-subnetid:subnetnum=2

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0
```

| ID | Subnet<br>Number |
|----|------------------|
|----|------------------|

| 886935 | 2 |
| 886938 | 2 |
| 886939 | 2 |

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;

**rtrv-t1****Retrieve T1 Information**

Use this command to retrieve information for a specified T1 interface or for all T1 interfaces that have been defined by the **ent-t1** command for an E1/T1 MIM card or an HC-MIM or E5-E1T1 card that is used as a T1 or ST-HSL-A card.

**NOTE: The following information can be retrieved: card location, T1 port number, encoding/decoding, channel bridging, timing source, framing, line length, and link class with minimum signal unit rate for unchannelized links.**

**Keyword:** rtrv-t1

**Related Commands:** chg-t1, dlt-t1, ent-t1, tst-t1

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If not specified, all T1 card locations are listed.

**:t1port=** (optional)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified T1 card (**loc** parameter).

**Range:** 1-8

Ports 3-8 are valid only for HC-MIM and E5-E1T1 cards.

**Default:** If not specified, all T1 ports are listed.

**Example**

**rtrv-t1**

**rtrv-t1: loc=1307: t1port=2**

**rtrv-t1: loc=1311: t1port=1**

**Dependencies**

The **loc** and **t1port** parameters must be specified together, if any parameters are specified for the command.

The T1 interface of the T1 card specified by the **loc** parameter must already be defined (see the **ent-t1** command) before this command can be entered.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter on the card specified by the **loc** parameter must be already equipped with a T1 interface.

**Notes**

None.

## Output

**rtrv-t1**

;

**Legend**

**LOC**—T1 card location in an EAGLE 5 ISS shelf.

**T1PORT**—T1 port number on a T1 card.

**ENCODE**—Indicator for use of B8ZS or AMI encoding/decoding.

**T1TSEL**—T1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair).

**FRAMING**—Framing format (SF or ESF).

**LL**—Line length; T1 cable length in feet between the EAGLE 5 ISS and the connecting node

**CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

**LINKCLASS**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" T1 Card (CHAN) or an "unchannelized" ST-HSL-A card (UNCHAN).

**MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.

**TSx**—Timeslot.

**rtrv-tatr-msg**

**Retrieve Configured TATR messages**

Use this command to display the configured Triggerless ANSI TCAP Relay message parameter values.

**Keyword:** rtrv-tatr-msg

**Related Commands:** chg-tatr-msg, tst-msg

**Command Class:** Database Administration

**Parameters**

**:msgn=** (optional)

Message number. This parameter specifies the number of the TATR message.

**Range:** 1-10

**Example**

**rtrv-tatr-msg:msgn=1**

**Dependencies**

None.

**Notes**

None.

**Output**

```

**rtrv-tbl-capacity****Retrieve Table Capacity**

Use this command to retrieve table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value.

**Keyword:** **rtrv-tbl-capacity**

**Related Commands:** **rept-stat-xlist**, **rtrv-appl-rtkey**, **rtrv-as**, **rtrv-assoc**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtmod**, **rtrv-gtt**, **rtrv-gttact**, **rtrv-gttapath**, **rtrv-gttaset**, **rtrv-ip-host**, **rtrv-ip-lnk**, **rtrv-ls**, **rtrv-map**, **rtrv-scrset**, **rtrv-slk**, **rtrv-spc**, **rtrv-vflx-cd**, **rtrv-vflx-rn**, **rtrv-vflx-vmid**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-tbl-capacity
```

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

XLIST table information is shown only if the CRMD feature is ON.

Secondary Point Code (SPC) table information is shown only if the MPC feature is ON.

If the EGTT feature is ON then table name is GTA instead of GTT.

Additional information for each listed table can be displayed using the commands listed in Table 5-41.

Though the ASP table entries are now part of the IPAPSOCK table, EAGLE 5 ISS command entry and output still appear as though they are separate tables. The **rtrv-tbl-capacity** command shows the number of ASPs in the 4000-entry IPAPSOCK table.

**Table 5-41.** Retrieve Commands for Additional Table Information

| <b>Command</b>         | <b>Table name</b> | <b>Description of table</b>              |

| <b>rtrv-npp-srs</b>    | NPP-SRS           | Numbering Plan Processor                 |
| <b>rtrv-scrset</b>     | SCRSET            | Gateway Screening Screen Set             |
| <b>rtrv-slk</b>        | SLK               | Signal Link                              |
| <b>rtrv-spc</b>        | SPC               | Secondary Point Code                     |
| <b>rtrv-vflx-cd</b>    | VFLXCD            | V-Flex Call Decision                     |
| <b>rtrv-vflx-rn</b>    | VFLXRN            | V-Flex Routing Number                    |
| <b>rtrv-vflx-vmsid</b> | VFLXVID           | V-Flex VMSID                             |
| <b>rtrv-gttact</b>     | GTT-ACT           | GTT Action                               |
| <b>rtrv-gttaset</b>    | GTT-ASET          | GTT Action Set                           |
| <b>rtrv-gttapath</b>   | GTT-PATH          | GTT Action Path                          |
| <b>rtrv-gtmod</b>      | GTMOD             | GT Modification                          |

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service.

V-Flex Call Decision (VFLXCD), Routing Number (VFLXRN) and VMSID (VFLXVID) table information is shown only if the V-Flex feature is enabled.

## Output

The following example shows the output for the minimum table sizes in the system when CRMD, MPC, EGTT and VFLEX features are off.

### rtrv-tbl-capacity

```
tekelecstp 010-03-06 13:57:06 EST  EAGLE 42.0.0

DSTN      table is (      8 of      2000)  1% full
LS         table is (      6 of      1024)  1% full
SLK        table is (     12 of      1200)  1% full
IP-LNK     table is (      0 of       512)  0% full
IP-HOST    table is (      2 of     2048)  1% full
MAP        table is (      8 of      1024)  1% full
MRN        table is (      0 of     3000)  0% full
SCCPSRV    table is (      0 of       384)  0% full
GTT        table is (      0 of    269999)  0% full
GTT-SET    table is (     21 of      2000)  2% full
SSNSELID   table is (      0 of    100000)  0% full
SCRSET     table is (      0 of       255)  0% full
RTEKEY     table is (      0 of      1000)  0% full
APPLSOCK   table is (      0 of     4000)  0% full
AS         table is (      0 of       250)  0% full
NPP-AS     table is (      0 of      1024)  0% full
NPP-SRS    table is (      0 of     8192)  0% full
GTMOD      table is (      1 of    100000)  1% full
```

;

The following example shows the output for the maximum table sizes in the system. For the DSTN, SLK, GTT, and MAP tables, maximum values depend on the enabled feature quantity value applicable to the table in the system. GTT, MPC, CRMD, VFLEX and FGTTLS features are turned on.

### rtrv-tbl-capacity

```
rlghncxa03w 10-08-17 08:29:15 EST  EAGLE 43.0.0

DSTN      table is (     600 of    10000)  6% full

```

**rtrv-tps****Retrieve Provisioned System TPS Allocation**

Use this command to display the total provisioned system TPS for IPGWx, IPLIMx, IPSG and ATM/E5-ATM cards. The total of these four values, and the maximum allowed system TPS value, are also displayed.

**Keyword:** rtrv-tps

**Related Commands:** chg-ctrl-feat, chg-ls, ent-ls, rept-stat-iptps, rtrv-ctrl-feat, rtrv-ls

**Command Class:** Database Administration

**Parameters****Example**

```
rtrv-tps
```

**Dependencies**

None

**Notes**

The maximum total provisioned System TPS is based on whether the HIPR2 High Rate feature is turned on. The maximum total provisioned System TPS is 500,000 if the HIPR2 High Rate feature is turned off and 750,000 if the feature is turned on.

**MAX TPS calculations**

The provisioned (max) system TPS calculation is calculated by summing the SIGTRAN TPS values (values for the IPGW and IPSG linksets + IPLIM cards TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPGW linksets using the value of the **iptps** parameter (see the **ent/chg-ls** commands).
- Sum all TPS values for IPSG linksets using the (num\_ipsg\_links \* the value of the **maxslktps** parameter (see the **ent/chg-ls** commands)).
- For each IPLIM card that has at least 1 link provisioned, add 4000 to the provisioned System TPS value, regardless of card type.

- Sum all ATM over T1 links ((ATM ANSI links) \* per ATM ANSI links TPS (1630))
- Sum all ATM over E1 links ((ATM ITU links) \* per ATM ITU links TPS (2038))

#### RSVD TPS Calculations

The reserved TPS calculation is calculated by summing the SIGTRAN TPS values (values for the IPGW and IPSG linksets + IPLIM cards TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPGW linksets using the number of IPGW links provisioned plus the value of the **iptps** parameter (see the **ent/chg-ls** commands).
- Sum all TPS values for IPSG linksets using the (num\_ipsg\_links \* the value of the **slktps** or **rsvdsstktps** parameter (see the **ent/chg-ls** commands)).
- For each IPLIM card that has at least 1 link provisioned, add 4000 to the provisioned System TPS value, regardless of card type.
- Sum all ATM over T1 links ((ATM ANSI links) \* per ATM ANSI links TPS (1630))
- Sum all ATM over E1 links ((ATM ITU links) \* per ATM ITU links TPS (2038))

## Output

Output when the HIPR2 High Rate Mode feature is turned off.

#### rtrv-tps

```

**rtrv-trbl****Retrieve Trouble**

Use this command to display detailed information for one or more troubles that are currently logged into the system.

**Keyword:** **rtrv-trbl**

**Related Commands:** **act-alm-trns, dact-alm-trns, rept-stat-alm, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The address of the card that is running the OAM from which logged trouble reports are to be displayed.

**Range:** **1113, 1115**

**:mode=** (optional)

Display mode

**Range:** **c, m**

**c**—Continuous mode; shows troubles already logged and new troubles as they occur.

**m**—Manual mode; shows troubles on demand only

**Default:** **c**

**:num=** (optional)

Indicates how many troubles to display.

**Range:** **1-99**

**Example**

**rtrv-trbl:loc=1113:num=2**

**Dependencies**

At least one trouble must be in the trouble log, or the command is rejected.

Only one **rtrv-trbl** or **rtrv-obit** command can be in progress at a time.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

The card specified by the **loc** parameter must be **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

The **num** parameter must be between **1** and **99**.

**Notes**

When a trouble is generated in the system, it is logged into the RAM storage area of the active OAM. Each OAM can store up to 99 troubles in a queue. If the OAM resets, logged troubles are lost.

## Output

The output from this command should be reviewed with a member of the Customer Care Center. See the "Customer Care Center" section in Chapter 1 of this manual.

## rtrv-trbltx

## Retrieve Trouble Text Table Entries

Use this command to retrieve Alarm and UIM message information including MRN (message reference number), level (for Alarms), Output Group, and text.

The default report displays all Alarms (in numerical order) and then all UIMs.

The optional parameters can be used to:

- Display a range of Alarms or UIMs (ranges spanning both Alarms and UIMs are not supported)
- Search for Alarms, UIMs, or both message types matching a specific Output Group
- Sort all entries by Output Group

**Keyword:** rtrv-trbltx

**Related Commands:**

**Command Class:** Database Administration

## Parameters

**:enum=** (optional)

The ending Message Reference Number (MRN) when specifying a range.

**Range:** 1-1499

1-999 for Alarms (UAMs)

1000-1499 for UIMs

**Default:** when **enum** is not specified,

If **snum** is specified, the **enum** value defaults to the specified **snum** value.

If **snum** is not specified and **type=all**, **type=uim**, or **type** not specified, the **enum** value defaults to **1499**

If **snum** is not specified and **type=alarm**, the **enum** value defaults to **999**

**:outgrp=** (optional)

The Output Group to sort or filter the Alarm/UIMs on.

**Range:** appserv, appss, card, clk, db, dbg, gtt, gws, link, meas, mon, mps, pu, sa,

seas, slan, sys, traf

**appserv** — Application Server

**appss** — Application Subsystem

**card** — Card

**clk** — Clock  
**db** — Database  
**dbg** — Debug  
**gtt** — GTT Maintenance  
**gws** — GWS Maintenance  
**link** — Link Maintenance  
**meas** — Measurements Maintenance  
**mon** — Monitoring (Sentinel or IMF) Maintenance  
**mps** — MPS Maintenance  
**pu** — Program Update  
**sa** — System Administration  
**seas** — SEAS (Sentinel or IMF)  
**slan** — SLAN Maintenance  
**sys** — System Maintenance  
**traf** — Traffic  
**all**—retrieve information for all Output Groups  
**Default:** No sorting or filtering is done on Output Groups.

**:snum=** (optional)

A single Message Reference Number (MRN), or the starting MRN when specifying a range.

**Range:** **1-1499**

**1-999**—For Alarms (UAMs)

**1000-1499**—For UIMs

**Default:** All message entries for the specified **type** are displayed.  
 For **type=all**, **type=alarm**, or **type** not specified—**snum** Default: **1**  
 For **type=uim**—**snum** Default: **1000**

**:type=** (optional)

The type of trouble text entry—Alarm, UIM, or both types—to display.

**Range:** **all**, **alarm**, **uim**

**all** — Both types are displayed

**alarm** — Only Alarm entries are displayed

**uim** — Only UIM entries are displayed

**Default:** **all**

### Example

```

rtrv-trbltx
rtrv-trbltx:type=alarm
rtrv-trbltx:outgrp=sys
rtrv-trbltx:type=alarm:outgrp=all
rtrv-trbltx:snum=1002
  
```

### Dependencies

If **enum** is specified, **snum** must be specified in the command.

The specified **enum** value must be greater than or equal to the specified **snum** value.

The specified **enum** value must be in the same range as the specified **snum** value (**1-999** for Alarms and **1000-1499** for UIMs). The range cannot span both types.

The specified **snum** and **enum** values must be in the range of the specified **type** (**1-999** for Alarms and **1000-1499** for UIMs).

When the **outgrp** parameter is specified, the **snum** and **enum** parameters cannot be specified.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To display a single Alarm or UIM, enter the Alarm or UIM MRN as the value of the **snum** parameter. Either do not specify the **enum** parameter or specify the **enum** parameter with the same value as the **snum** value.

If an unused MRN is specified as an **snum** parameter value, the header information is displayed without any Output Group header or MRN information.

If an **snum/enum** range is specified, and there are unused MRNs within that range, only the used MRNs are displayed.

## Output

The following example shows output when the command has no parameters. All entries are not shown; the list is long:

### rtrv-trbltx

## **rtrv-trm**

## **Retrieve Terminal**

Use this command to show the port configuration for all TDM terminals or a specified terminal. These ports are used to connect modems, printers, and terminals to the system. This command displays the following information: device type, data transmission rate, parity, type of flow control used, number of stop bits, number of data bits, and the type of unsolicited messages to be received.

**Keyword:** rtrv-trm

**Related Commands:** act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm

**Command Class:** Database Administration

### **Parameters**

**:trm=** (optional)

Specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

**Range:** 1-40

**Default:** Display all

**Example**

```
rtrv-trm
```

```
rtrv-trm:trm=17
```

**Dependencies**

The IP User Interface feature must be enabled and turned on, and at least one IPSM card must be equipped, before **telnet** or **emsalm** type terminals with IDs 17 - 40 can be specified.

The specified terminal must be equipped.

**Notes**

None

## Output

The following example shows the display of the terminal settings for 16 terminal ports (no IPSM cards are equipped):

## rtrv-trm

```

;

The following example shows the display of the terminal settings with the IP User Interface feature enabled, one IPSM card equipped, and the OA&M IP Security Enhancements feature turned on.

- Terminals 17,18 and 19 are of type TELNET.
- Terminals 20,21 and 22 are of type EMSALM.
- Terminal 23 is of type NONE.
- Terminal 24 is of type SEAS.

The *LOGINTMR* and *LOGOUTTMR* fields apply to terminals 17 - 19. The *PNGTIMEINT* and *PNG FAILCNT* fields apply to terminals 17 - 22. None of the fields apply to terminals 23 and 24.

### Legend

Part one of the **rtrv-trm** report contains these fields:

**TRM**—The TDM terminal port number associated with the output device.

**TYPE**—The type of output device that is connected.

**COMM**—This field is composed of four communication attributes in the format *baud-dbts-prty-sb*. The parts are:

**BAUD**—The serial port baud rate of the output device

**DBTS**—The number of data bits used by the output device

**PRTY**—The parity of the output device

**SB**—The number of stop bits used in communications with the output device

**FC**—The type of protocol used between the system and the output devices.

**TMOUT**—Shows the maximum amount of time (in minutes) that a login session can remain idle.

**MXINV**—Shows the login/unlock failure threshold.

**DURAL**—Shows the length of time (in seconds, minutes, and hours) the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured with the **mxinv** parameter.

**SECURE**—Indicates whether the OA&M IP Security Enhancements feature is turned on or off for Telnet terminals.

Part two of the **rtrv-trm** report contains these fields:

**LOGINTMR**—Shows the maximum time for logging on to the telnet terminal after selecting the terminal.

**LOGOUTTMR**—Shows the maximum time the telnet session remains open after the user manually or automatically logs out.

**PNGTIMEINT**—Shows the time period after which IPSM card initiates new ping cycle.

**PNGFAILCNT**—Shows the number of consecutive ping fails waited before dropping the telnet connection.

Part three of the **rtrv-trm** report contains these fields:

**TRM**—The TDM terminal associated with the output device.

**TRAF**—Shows whether traffic-related unsolicited messages are received by the output device.

**LINK**—Shows whether link-related unsolicited messages are received by the output device.

**SA**—Shows whether security administration-related unsolicited messages are received by the output device.

**SYS**—Shows whether system maintenance-related unsolicited messages are received by the output device.

**PU**—Shows whether program update-related unsolicited messages are received by the output device.

**DB**—Shows whether database-related unsolicited messages are received by the output device.

**UIMRD**—Shows whether Unsolicited Information Messages (UIMs) specific to the group are received by the output device.

Part four of the **rtrv-trm** report contains these fields:

**APP SERV**—Shows whether Application Server unsolicited messages are received by the output device.

**APP SS**—Shows whether Application Subsystem unsolicited messages are received by the output device.

**CARD**—Shows whether Card unsolicited messages are received by the output device.

**CLK**—Shows whether Clock unsolicited messages are received by the output device.

**DBG**—Shows whether Debug unsolicited messages are received by the output device.

**GTT**—Shows whether GTT unsolicited messages are received by the output device.

**GWS**—Shows whether GWS unsolicited messages are received by the output device.

**MEAS**—Shows whether Measurements Maintenance unsolicited messages are received by the output device.

**MON**—Shows whether Monitor unsolicited messages are received by the output device.

**MPS**—Shows whether MPS unsolicited messages are received by the output device.

**SEAS**—Shows whether SEAS Maintenance unsolicited messages are received by the output device.

**SLAN**—Shows whether STP LAN unsolicited messages are received by the output device.

**rtrv-tt****Retrieve Translation Type**

Use this command to show the translation types that are currently defined in the system database for global title translations.

**NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gtt sel), GTT Set (ent/dlt/rtrv-gtt set), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.**

**Keyword:** rtrv-tt

**Related Commands:** dlt-tt, ent-tt

**Command Class:** Database Administration

**Parameters**

**:alias=** (optional)

The alias of the global title translation type

**Range:** 0-255

**Default:** Display all

**:ovrlapd=** (optional)

Overlapped GTT Selectors. This parameter displays the overlapped GTT selectors.

**Range:** Yes

**Default:** No

**:ttn=** (optional)

Translation type name.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** Display all

**:type/typea/typei/typen/typen24/typeis/typens=** (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typeen/typeen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

**Range:** 0-255

**Default:** No translation type is specified

### Example

```
rtrv-tt
rtrv-tt:type=230
rtrv-tt:ttn=lidb
rtrv-tt:type=230:ttn=lidb
rtrv-tt:type=230:ttn=lidb:alias=012
rtrv-tt:typeis=2
rtrv-tt:ovrlapd=yes
```

### Dependencies

If a translation type is specified, it must already exist in the database for the network type and cannot be an alias.

If both translation type and translation type name are specified, the translation type name must correspond to the specified translation type.

If an alias is specified with a translation type and/or translation type name, the alias must exist in the database for the specified network type, and it cannot be a translation type.

If an alias is specified without a translation type or translation type name, the alias must exist in the database for at least one of the network types. If it exists, the entries and the mapped translation type entries that exist in the database for all network types are displayed.

The value specified for the **alias** parameter must be associated with the value specified for the **type/typea/typei/typeen/typeen24/typeis/typens** parameter and cannot be the value of an existing translation type.

The value specified for the **type/typea/typei/typeen/typeen24/typeis/typens** parameter cannot be an alias value.

The value specified for the **ttn** parameter must already exist in the database.

The value specified for the **ttn** parameter must correspond to the value specified for the **alias** parameter.

The GTTSET associated with the translation type specified by the **ttn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The **ttn=none** parameter cannot be specified.

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command).

### Notes

If a translation type, translation type name, or both, are specified, the translation type entry and all aliases mapped to that translation type are displayed.

The **rtrv-tt** command retrieves only selector entries that were provisioned by GTT Selector commands, have a GTI value of 2, and a set type of CdGTA.

## Output

**rtrv-tt**

**Legend****TYPEA/TYPEI/TYPEN/TYPEN24**—Global title translation type**TTN**—Name of the global title translation type**NDGT**—Number of digits in the global title translation type**ALIAS**—Alias global title translation type**rtrv-ttmap****Display Translation Type Mapping**

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. This command can be used to display the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping, see which linkset the mapping applies to, and see whether the mapping applies to incoming or outgoing messages.

**Keyword:** rtrv-ttmap**Related Commands:** chg-ttmap, dlt-ttmap, ent-ttmap**Command Class:** Database Administration**Parameters****:ett=** (optional)

Translation type before mapping. The identification of the type of allowed global title translation in the SS7 message *prior to* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** 0-255**Default:** Display all types allowed**:io=** (optional)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

**Range:** i, o

i — incoming

o — outgoing

**Default:** Both incoming and outgoing**:lsn=** (optional)

Linkset name

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all**Example****rtrv-ttmap****rtrv-ttmap:lsn=nc001****rtrv-ttmap:lsn=nc001:io=i:ett=128****rtrv-ttmap:io=i:ett=128****rtrv-ttmap:ett=128****rtrv-ttmap:ett=40**

**Dependencies**

The linkset must be defined.

The memory space accounting report (MSAR) is not produced when the **io** parameter, **ett** parameter, or both are specified, because the statistics presented may be misleading.

**Notes**

The order of display is by linkset index + I/O + ETT.

## Output

|--------------------------------------|------------------------|
| 0=Broadcast                          | 0=Disabled , 1=Enabled |
| 1=Response Method                    | 0=Disabled , 1=Enabled |
| 2-5=Reserved                         |                        |
| 6=Broadcast Congestion Status Change | 0=Disabled , 1=Enabled |
| 7-31=Reserved                        |                        |

PARM 2: ASP/AS Notification options. Each bit is used as an enabled/disabled flag for a particular ASP/AS Notification option. Not supported on IPSP application.

PVALUE : Valid range = 32-bits

| BIT                          | BIT VALUE              |
|------------------------------|------------------------|
| 0=ASP Active Notifications   | 0=Disabled , 1=Enabled |
| 1=ASP Inactive Notifications | 0=Disabled , 1=Enabled |
| 2=ASP AS State Query         | 0=Disabled , 1=Enabled |
| 3-31=Reserved                |                        |

PARM 3: UA Serviceability Options. Each bit is used as an enabled/disabled flag for a particular UA Serviceability option. Supported on IPSP, SS7IPGW, and IPGWI applications. UA Graceful Shutdown supported on IPSP for M3UA only.

PVALUE : Valid range = 32-bits

| BIT                    | BIT VALUE              |
|------------------------|------------------------|
| 0=UA Heartbeats        | 0=Disabled , 1=Enabled |
| 1=UA Graceful Shutdown | 0=Disabled , 1=Enabled |
| 2-31=Reserved          |                        |

PARM 4: SCTP Payload Protocol Indicator byte order option. Bit indicates PPI value is RCV/TX in Big Endian or Little Endian byte format.

Supported on IPSP-M2PA associations only.

PVALUE : Valid range = 32-bits

|                              |                                |
|------------------------------|--------------------------------|
| BIT                          | BIT VALUE                      |
| 0=Payload Protocol Indicator | 0=Big Endian , 1=Little Endian |
| 1-31=Reserved                |                                |

## rtrv-uim-acthresh

## Retrieve Activity Level Threshold for STP UIM Activity Reporting

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

**Keyword:** **rtrv-uim-acthresh**

**Related Commands:** **dlt-uim-acthresh**, **set-uim-acthresh**

**Command Class:** Database Administration

### Parameters

**:uimn=** (optional)  
The UIM number.  
**Range:**     **1000-1499**  
**Default:**    Display all

### Example

Display UIM number 1333 threshold:

**rtrv-uim-acthresh:uimn=1333**

Display the threshold for all UIMs that have been set:

**rtrv-uim-acthresh**

### Dependencies

If specified, the **uimn** parameter value must be four numeric characters in the range **1000–1499**.

The **uimn** parameter value, if specified, must exist in the system Trouble Text Table.

### Notes

None

### Output

**rtrv-uim-acthresh:uimn=1333**

```
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100         5
The UIM Threshold Table is (1 of 499) 1% full.
```

**rtrv-uim-acthresh**

```
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100         5
1444      200        15
1155      50         30
The UIM Threshold Table is (3 of 499) 1% full.
```

## rtrv-user

## Retrieve User

Use this command to show the information about the user currently logged on to the terminal from which this command was entered.

**Keyword:** rtrv-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user

**Command Class:** Basic

### Parameters

This command has no parameters.

### Example

**rtrv-user**

### Dependencies

None

### Notes

The password is not shown.

This command shows the command class privileges for the user logged onto the system. No other users are shown.

All users have access to this command.

## Output

The following example shows the display when the Command Class Management feature is turned on:

### rtrv-user

```
rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
user id          age page uout rev link sa  sys pu  db  dbg
manny            36  60   60   NO  YES  YES YES YES YES YES

u01 u02 u03 u04 u05 u06 u07 u08 u09 u10 u11 u12 u13 u14 u15 u16
NO  NO  NO  NO  YES YES YES YES YES YES YES YES YES YES YES YES

u17 u18 u19 u20 u21 u22 u23 u24 u25 u26 u27 u28 u29 u30 u31 u32
YES YES YES YES YES YES YES YES YES YES YES NO  NO  NO  NO  YES
```

;

The following example shows the display when the Command Class Management feature is not turned on:

### rtrv-user

```
rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
USER ID          LINK  SA SYS  PU  DB DBG
eagle            YES YES YES YES YES YES

USER ID          AGE PAGE UOUT REV
eagle            750 0    0    NO
```

;

## Legend

**USER ID**—The name of the user.

**AGE**—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.

**PAGE**—Shows the maximum password age established for this user ID. When **AGE** becomes greater than **PAGE**, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**UOUT**—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default uout parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**REV**—Shows whether the user ID is denied login (revoked). **YES** indicates that the user ID is revoked, **NO** indicates that the user ID is not revoked.

**LINK**—Shows whether the user has access to all commands in the Link Maintenance command class.

**SA**—Shows whether the user has access to all commands in the Security Administration command class.

**SYS**—Shows whether the user has access to all commands in the System Maintenance command class.

**PU**—Shows whether the user has access to all commands in the Program Update command class.

**DB**—Shows whether the user has access to all commands in the Database Administration command class.

**DBG**—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled and turned on, the following fields are displayed:

**U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following field is displayed:

**LNPBAS**—Shows whether the user has access to all commands in the LNP Basic command class.

## rtrv-vendid

### Retrieve Vendor ID

Use this command to retrieve a list of Vendor ID entries from the VENDID table, for the GSM MAP SRI Redirect to Serving HLR feature.

**Keyword:** rtrv-vendid

**Related Commands:** dlt-vendid,

**Command Class:** Database Administration

#### Parameters

**:vendnum=** (optional)

Vendor Number

**Range:** 1-3

#### Example

**rtrv-vendid**

**rtrv-vendid:vendnum=1**

#### Dependencies

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

#### Notes

None.

**Output**

When the command is entered with no parameter, the Vendor Types are listed in numerical order. The Vendor Numbers for each Vendor Type are listed in numerical order, followed by the Vendor ID for each Vendor Number.

**rtrv-vendid**

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
Vendor      Vendor      Vendor
Type        Number      ID
-----
1           1           123123123456789
1           1           1234567890abcde
1           2           112233445566778
1           2           214365870912543
2           3           098765432112345
2           3           098767890143251

VENDID table is (5 of 200) 3% full
```

;

When a Vendor number is specified, the Vendor Type and Vendor IDs for the specified Vendor number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

**rtrv-vendid: vendnum=2**

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0
Vendor      Vendor      Vendor

-----
1           2           112233445566778
1           2           214365870912543

VENDID table is (5 of 200) 3% full
```

;

**rtrv-vflx-cd****Retrieve V-Flex Call Decision Entry**

Use this command to retrieve call decision information.

**NOTE:** The V-Flex feature must be enabled before this command can be entered.

**Keyword:** rtrv-vflx-cd

**Related Commands:** chg-vflx-cd, dlt-vflx-cd, ent-vflx-cd

**Command Class:** Database Administration

**Parameters**

**:cdn=** (optional)

Call decision name. This parameter specifies the name of the call decision entry.

**Range:** ayyy

1 alphabetic character followed by 3 alphanumeric characters

**:vmdig=** (optional)

Voice mail number or voice mail prefix digits. This parameter specifies a voice mail number or voice mail digits that is associated with the call decision entry.

**Range:** 1-15 digits

Valid digits are 0-9, A-F, a-f.

**Example**

The following command retrieves all entries from the Call Decision table.

**rtrv-vflx-cd**

The following command retrieves a specific Call Decision entry.

**rtrv-vflx-cd:cdn=cdn1**

The following command retrieves all call decision entries with a specified voice mail number or voice mail prefix digits.

**rtrv-vflx-cd:vmdig=123456789abcd2**

**Dependencies**

The **cdn** and **vmdig** parameters cannot be specified together in the command.

The value specified for the **cdn** parameter cannot be a reserved word, such as **none**.

The value specified for the **cdn** parameter must already exist in the Call Decision table.

The V-Flex feature must be enabled before this command can be entered.

**Notes**

This command can be cancelled using the **F9** function key or the **canc-cmd** command.

## Output

**rtrv-vflx-cd**

tekelecstp 08-05-01 09:36:55 EST EAGLE 39.0.0

VFLEX Call Decision table is (7 of 4950) 1% full.

;

**Legend**

**RDI**—The Redirection Indicator - whether the call has been redirected or not (0 - Not redirected: VM retrieval or direct dial VM deposit, 1 - Redirected: VM deposit).

**DN STATUS**—The status of the DN lookup in the RTDB - found in the RTDB, not found in the RTDB, don't care whether found in the RTDB or not.

**BCAP**—The INAP/CAP Bearer Capabilities.

**VM NUMBER/PREFIX**—The Voice Mail Numer or Voice Mail Prefix associated with a Call Decision entry.

**VMRN INDEX**—Index into the list of Routing Numbers associated with a specific VMSID entry.

**CD NAME**—The name of the Call Decision entry.

## rtrv-vflx-opts

## Retrieve V-Flex Options

Use this command to retrieve the data that is used for number conditioning.

**NOTE: The V-Flex feature must be enabled before this command can be entered.**

**Keyword:** rtrv-vflx-opts

**Related Commands:** chg-vflx-opts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

The following command displays V-Flex Options Table data.

**rtrv-vflx-opts**

### Dependencies

The V-Flex feature must be enabled before this command can be specified.

### Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 0.

If the DRANAIV value has a corresponding DRANAI mnemonic string mapped to it, then that mnemonic string is displayed, otherwise the provisioned numeric value is displayed. For DRANAI and DRANAIV mapping refer to in the **chg-vflx-opts** command.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANPV default value of 0.

If the DRANPV value has a corresponding DRANP mnemonic string mapped to it, then that mnemonic string is displayed, otherwise the provisioned numeric value is displayed. For DRANP and DRANPV mapping refer to in the **chg-vflx-opts** command.

**Output**

The following example shows output with default V-Flex Options.

**rtrv-vflx-opts**

```
tekelecstp 08-05-04 07:53:46 EST EAGLE 39.0.0
```

```
VFLEX OPTIONS
-----
DRANPV      = 0
DRANAIV     = 0
DRA         = RN
NEQUERYONLY = OFF
NETYPE      = VMSID
```

```
;
```

The following example shows output with some V-Flex Options provisioned.

**rtrv-vflx-opts**

```
tekelecstp 08-05-04 07:55:30 EST EAGLE 39.0.0
```

```
VFLEX OPTIONS
-----
DRANP       = E164
DRANAI      = SUB
DRA         = RN
NEQUERYONLY = ON
NETYPE      = GRN
```

```
;
```

**Legend**

**DRANP**—The numbering plan for the destination routing address.

**DRANAI**—The nature of address indicator for the destination routing address.

**DRA**—The format of the destination routing address.

**NEQUERYONLY**—The Network Entity Query Only option.

**NETYPE**—The Network Entity Type for the NEQUERYONLY option.

**rtrv-vflx-rn****Retrieve V-Flex Routing Number**

Use this command to retrieve voice mail routing numbers and routing number names and to view the associated reference count.

**NOTE: The V-Flex feature must be enabled before this command can be entered.**

**Keyword:** rtrv-vflx-rn

**Related Commands:** chg-vflx-rn, dlt-vflx-rn, ent-vflx-rn

**Command Class:** Database Administration

**Parameters**

**:refcnt=** (optional)

Reference count. This parameter specifies whether to display the reference count.

**Range:** yes

yes — display the reference count

**:rn=** (optional)

Routing number. This parameter specifies a voice mail routing number.

**Range:** 1-15 digits

Valid digits are **0-9, A-F, a-f**.

**:rnname=** (optional)

Routing number name. This parameter specifies the name associated with a voice mail routing number.

**Range:**        *ayyyyyyy*

1 alphabetic character followed by 7 alphanumeric characters.

### Example

```
rtrv-vflx-rn:rnname=rn01
```

```
rtrv-vflx-rn:rn=123456789ABC
```

```
rtrv-vflx-rn
```

```
rtrv-vflx-rn:rnname=rn01:refcnt=yes
```

```
rtrv-vflx-rn:rn=123456789ABC:refcnt=yes
```

### Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **rnname** parameter must already exist in the Routing Number table.

The **rn** and **rnname** parameters cannot be specified together in the command.

The value specified for the **rnname** parameter cannot be a reserved word, such as **none**.

The value specified for the **rn** parameter must already exist in the Routing Number table.

### Notes

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following command displays information for specified routing number name.

**rtrv-vflx-rn:rnname=rn01**

```
tekelecstp 08-05-29 15:07:01 EST EAGLE 39.0.0
```

| RN Name | Routing Number  |
|---------|-----------------|
| -----   | -----           |
| rn01    | 123456789abcdef |

VFLEX Routing Number table is (2 of 10000) 1% full.

;

The following command displays all of the entries in the Routing Number table.

**rtrv-vflx-rn**

```
tekelecstp 08-05-29 15:07:01 EST EAGLE 39.0.0
```

**Legend**

- **RN Name**—Voice mail routing number name
- **Routing Number**—Voice mail routing number digits
- **Ref Count**—Number of VMSID table entries that refer to an routing number entry

**rtrv-vflx-vmsid****Retrieve V-Flex VMSID Entry**

Use this command to retrieve information for voice mail server IDs.

**NOTE:** The V-Flex feature must be enabled before this command can be entered.

**Keyword:** rtrv-vflx-vmsid

**Related Commands:** chg-vflx-vmsid, dlt-vflx-vmsid, ent-vflx-vmsid

**Command Class:** Database Administration

**Parameters**

**:id=** (optional)

This parameter specifies the voice mail server ID.

**Range:** 1-15 digits, **dflt**

Valid digits are **0-9**, **A-F**, **a-f**.

**dflt**—a default set of routing numbers that is used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB

**:rname=** (optional)

This parameter specifies a routing number name associated with the voice mail server ID.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters.

**Example**

```
rtrv-vflx-vmsid
```

```
rtrv-vflx-vmsid:id=123456789012345
```

```
rtrv-vflx-vmsid:rname=rn90
```

**Dependencies**

The value specified for the **rname** parameter cannot be a reserved word, such as **none**.

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **rname** parameter must already exist in the Routing Number table.

The value specified for the **id** parameter must already exist in the VMSID table.

The **rname** and **id** parameters cannot be specified together in the command.

**Notes**

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following command retrieves all of the entries from the VMSID table.

**rtrv-vflx-vmsid**

```

## rtrv-x25-dstn

## Retrieve X.25 Destination

Use this command to show the associations between X.25 network addresses and SS7 point codes. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address. X.25 destinations are shown in order of entry.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-x25-dstn

**Related Commands:** chg-x25-dstn, dlt-x25-dstn, ent-x25-dstn

**Command Class:** Database Administration

### Parameters

**:dpc=** (optional)

Specifies the value used to set the destination point code field in the routing label of the MSU. The point code is an ANSI point code in the format *ofnetwork indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** dpca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:xaddr=** (optional)

The X.25 network address of the X.25 destination entity or the SS7 node

**Range:** 1-15 digits

**Default:** Display all

### Example

**rtrv-x25-dstn**

**rtrv-x25-dstn:xaddr=220525586456772**

**rtrv-x25-dstn:dpc=133-13-1**

### Dependencies

If an X.25 address is specified, it must contain a minimum of four digits and must be in the X.25 destination table.

If a destination point code is specified, it must be assigned to at least one X.25 address.

The X.25 SS7 ANSI destination point code must be a full point code (ni-nc-ncm).

**Notes**

None

**Output****rtrv-x25-dstn**

**Legend****X25 ADDR**—The X.25 address of the X.25 destination or the SS7 node**SS7 DPC**—The SS7 destination point code.**SSN**—The subsystem number associated with the SS7 DPC.**rtrv-x25-rte****Retrieve X.25 Route**

Use this command to show the routing parameters needed by the gateway portion of the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system.

**NOTE: This command is obsolete.****Keyword:** **rtrv-x25-rte****Related Commands:** **chg-x25-rte**, **dlt-x25-rte**, **ent-x25-rte****Command Class:** Database Administration**Parameters****:lc=** (optional)

The number of the logical channel on the X.25 signaling link that the PVC connection is assigned to. For automatic virtual circuits and remote virtual circuits, the logical channel number is arbitrary and cannot be specified.

**Range:** **1-255****Default:** Display all**:lc2nm=** (optional)

Generates network management for failures and recoveries of logical channels. When the logical channel being used to carry data fails, the Database Transport Access (DTA) feature requires that traffic be diverted to alternate routes. The Logical Channel to Network Management Mapping (LC2NM) feature handles this process.

**Range:** **yes, no**

**Default:** Display all

**:loc=** (optional)

The card location containing the X.25 signaling link that will sustain the connection. For an automatic virtual circuit, this link is the link on which the system initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card locations are shown.

**:port=** (optional)

The port on the card containing the X.25 signaling link.

**Range:** a

**Default:** a

**:rt=** (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) route on X.25 destination point code (XPC), and (2) route using X.25 origination and destination point code combinations (PC).

**Range:** xpc, pc

**Default:** Display all

**:saddr=** (optional)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

**Range:** 1-15 digits

**Default:** All X.25 addresses assigned to the SS7 destination entity are shown.

**:type=** (optional)

The type of X.25 connection that the link is expected to maintain.

**Range:** pvc, svca, svcr

**pvc** — Permanent virtual circuit

**svca** — Automatic virtual circuit

**svcr** — Remote virtual circuit

**Default:** Display all

**:xaddr=** (optional)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

**Range:** 1-15 digits

**Default:** All X.25 addresses assigned to the SS7 destination entity are shown.

### Example

**rtrv-x25-rte**

**rtrv-x25-rte:xaddr=345454**

**rtrv-x25-rte:saddr=4545434**

**rtrv-x25-rte:xaddr=345454:saddr=4545434**

**rtrv-x25-rte:loc=1201:port=a:lc=2**

**rtrv-x25-rte:loc=1201:port=a**

**rtrv-x25-rte:type=avc**

**rtrv-x25-rte:rt=xpc**

**rtrv-x25-rte:lc2nm=no****Dependencies**

Each X.25 address must have at least four digits.

If the **port** parameter is specified, the **loc** parameter must be specified.

If the **lc** parameter is specified, both the **loc** and **port** parameters must be specified.

The **limds0**, **limocu**, and **limv35** card types are the only valid card types for this command. These card types must be running the ss7gx25 GPL type.

The shelf and card must be equipped.

If **lc2nm=yes** is specified, **rt=pc** cannot be specified.

**Notes**

None

Use this command to set the date in the system.

**Keyword:** set-date

**Related Commands:** set-time

**Command Class:** Security Administration

### Parameters

**:date=** (mandatory)

The system date, to be reflected on all reports and output messages.

**Range:** 000101-991231

(in the form *yymmdd*, where *yy*=year, *mm*=month, *dd*=day)

### Example

**set-date : date = 010307**

### Dependencies

None

### Notes

None

### Output

**set-date : date = 010307**

```
rlghncxa03w 03-11-07 11:11:28 EST EAGLE 31.3.0
Date set complete.
```

## set-gtwy-acthresh

## Set Gateway Thresholds

Use this command to set or change the level of activity thresholds to be used when reporting gateway screening activity. The STP reports screening activity only if the threshold is set and only if the threshold is reached. The thresholds are set on a linkset basis.

**Keyword:** set-gtwy-acthresh

**Related Commands:** rtrv-gtwy-acthresh

**Command Class:** Database Administration

### Parameters

**:intrvl=** (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:** 5, 10, 15, 20, 30

**System**

**Default:** 0 - Indicates that thresholds are not set

**:lsn=** (mandatory)

Linkset name

**Range:** ayyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:recv=** (optional)

Received message threshold. The threshold for MSUs received on the gateway linkset.

**Range:** 0-999999

**Default:** The current value

**System****Default:** 0**:rej=** (optional)

Reject threshold. The threshold for MSUs rejected on the gateway linkset because of screening.

**Range:** 0-999999**Default:** The current value**System****Default:** 0**Example**

The following example shows how to set the linkset wy644368 rejection threshold to 100, with a 15 minute interval.

```
set-gtwy-acthresh: lsn=wy644368:rej=100:intrvl=15
```

The following example shows how to set the linkset wy644368 message threshold to 1000 and the rejection threshold to 300, with an interval of 20 minutes.

```
set-gtwy-acthresh: lsn=wy644368:intrv=20:rej=300:recv=1000
```

The following example shows how to set the linkset wy644368 so that no activity messages are produced.

```
set-gtwy-acthresh: lsn=wy644368:intrv=5:rej=0:recv=0
```

**Dependencies**

At least one optional parameter must be specified.

The linkset specified must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

The value specified for INTRVL parameter is not one of 5, 10, 15, 20 or 30 minutes.

**Notes**

None

**Output**

```
set-gtwy-acthresh: lsn=wy644368:rej=100:intrvl=15
```

```
rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-GTWY-TRHSHLD: MASP A - COMPLTD
```

```
;
```

**set-scrrej-prmtrs****Set Parameters for SS7 Message-Rejection Reporting**

Use this command to change the STP values that limit the display of MSUs rejected because of gateway screening notification messages that could become excessive. The new values overwrite the existing values.

**Keyword:** set-scrrej-prmtrs

**Related Commands:** rtrv-gtwy-acthresh, rtrv-gtwy-prmtrs, set-gtwy-acthresh

**Command Class:** Database Administration

**Parameters****:intrvl=** (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:** 5, 10, 15, 20, 30  
**System**  
**Default:** 5

**:limit=** (mandatory)  
 Threshold not to be exceeded.  
**Range:** 0-9999  
**System**  
**Default:** 9999

### Example

```
set-scrrej-prmtrs:limit=200:intrvl=10
```

### Dependencies

The value specified for INTRVL parameter is not one of 5, 10, 15, 20 or 30 minutes.

### Notes

None

### Output

```
set-scrrej-prmtrs:limit=200:intrvl=10

rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-SCRREJ-PRMTRS: MASP A - COMPLTD
;
```

## set-time

## Set Time

Use this command to set the system clock. The clock is used to determine when measurements collection takes place as well as several other time-driven events.

**Keyword:** set-time

**Related Commands:** set-date

**Command Class:** Security Administration

### Parameters

**:time=** (mandatory)  
 The system time that is to be reflected on all reports and output messages.  
**Range:** 0000-2359  
*hhmm* where *hh* = 00-23 (hour) and *mm* = 00-59 (minute)

**:tz=** (optional)  
 The time zone  
**Range:** est, edt, cst, cdt, mst, mdt, pst, pdt, hst, hdt, ast, adt, gmt, wet, west, utc, bst, cet, cest, met, mest, fwt, fst, eet, eest, sast, msk, msd, ist, idt, cct, awst, awdt, rok, acst, acdt, aest, aedt, nzst, nzdt, akst, akdt, nst, ndt, bra  
 The time zones are described in Table 5-42.  
**Default:** Current value

**Table 5-42.** Time Zones Set by the **set-time** command

| <b>Abbreviation</b> | <b>Time Zone</b>                 | <b>Abbreviation</b> | <b>Time Zone</b>                 |

rlghncxa03w 02-11-07 14:32:28 EST EAGLE 30.0.0
Time set complete.
;
```

**set-uim-acthresh****Set Activity Level Thresholds for STP UIM  
Activity Reporting**

Use this command to set or change the level-of-activity threshold for reporting UIM messages. The system suppresses the generation of UIM messages when message generation exceeds the threshold that was defined for the interval period. The values are set within five seconds after the command was entered. Any previous count is cleared and the new or changed threshold and limit is enforced. Refer to “Configuring the UIM Threshold” in the *Database Administration Manual – System Management* for more information about UIM threshold configuration.

**Keyword:** set-uim-acthresh**Related Commands:** dlt-uim-acthresh, rtrv-uim-acthresh**Command Class:** Database Administration**Parameters****:intrvl=** (mandatory)

The monitor interval in minutes.

**Range:** 5, 10, 15, 20, 25, 30**Default:** Current value**:uimn=** (mandatory)

The UIM number.

**Range:** 1000-1499**:force=** (optional)Required to set the **limit** parameter to 0 for a given interval.

**CAUTION:** Setting the limit to 0 turns off all occurrences of the specified UIM. Use this manner of creating thresholds only if you are certain you have specified the correct UIM.

CAUTION

**Range:** yes, no  
**Default:** no force specified

**:limit=** (optional)  
 The message threshold.

CAUTION

**CAUTION:** Setting the limit to 0 will turn off all occurrences of the specified UIM. This can be dangerous if the wrong UIM number is specified by mistake. It is highly recommended that thresholds for UIMs are not set in this manner, but the ability is provided for certain extreme cases. The force parameter must be specified to set the limit to 0, and an additional scroll area message is issued.

**Range:** 0-9999  
**Default:** Current value

### Example

Sets UIM number 1333 threshold to 100 in a 5-minute interval:

**set-uim-acthresh:uimn=1333:limit=100:intrvl=5**

Sets UIM number 1444 threshold to 200 in a 15-minute interval:

**set-uim-acthresh:uimn=1444:limit=200:intrvl=15**

### Dependencies

At least one optional parameter must be specified.

The **uimn** parameter value must be a numeric value in the range **1000–1499**.

The **limit** parameter value must be a numeric value in the range **0–9999**.

The **intrvl** parameter value must be one or two numeric characters with the following values: **5, 10, 15, 20, 25, 30**.

The **force=yes** parameter must be specified to set the **limit** parameter to **0** for a given interval. Setting the **limit** to **0** turns off all occurrences of the specified UIM. See the cautions under the **force** and **limit** parameters.

When creating a new UIM threshold, both the **limit** and **intrvl** parameters must be specified.

The specified **uimn** parameter value must exist in the system Trouble Text table.

### Notes

None

### Output

**set-uim-acthresh:uimn=1333:limit=100:intrvl=5**

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
SET-UIM-ACTHRESH: MASP A - COMPLTD
;
```

## tst-bip

### Test Board Identification PROM

Use this command to test each byte of the specified board identification PROM (BIP) by reading and writing to the PROM. The test is performed for the main assembly.

**Keyword:** **tst-bip**

**Related Commands:** **chg-bip-fld, chg-bip-rec, rtrv-bip**

**Command Class:** System Maintenance

### Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**NOTE:** Locations **xy09** and **xy10** are valid only if they are equipped with a HIPR2 card.

### Example

**tst-bip:loc=1211**

### Dependencies

The card location, frame, shelf, or slot must be within the allowed range.

The card location must be valid for the command.

The card specified by the **loc** parameter must be equipped in the database.

The card specified by the **loc** parameter must be in the OOS-MT-DSBLD state prior to BIP testing.

### Notes

The specified card must be inhibited.

The **tst-bip** command verifies that the PROM is good by writing and reading to the PROM. The **rtrv-bip** command show the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communications to the card has failed, and the card should be replaced.

### Output

**tst-bip:loc=1211**

```
tekelecstp 10-02-20 17:10:32 CST EAGLE 42.0.0
Test Board Identification PROM Location: 1211 - MBD Packet: 1
-----
BIP Passed
```

;

## tst-disk

## Test Disk

Use this command prior to an upgrade, or as a diagnostic tool, to test the integrity of an EAGLE 5 ISS fixed drive or removable cartridge or drive, at the specified location. The test is non-intrusive and non-destructive to the disk. A read-only test is executed for all logical blocks (LBAs) used on the specified target disk and a report identifying any bad or questionable LBAs is output.

**Keyword:** **tst-disk**

**Related Commands:** **copy-disk**

**Command Class:** System Maintenance

## Parameters

**:loc=** (mandatory)

The location of the disk to be tested.

**Range:**     **1114, 1116, 1117, 1113, 1115**

**1114**— The TDM

**1116**— The TDM

**1117**— The removable cartridge drive

**1113**— The latched USB port

**1115**— The latched USB port

**:disk=** (optional)

This parameter specifies the disk that is being tested.

**Range:**     **remove, fixed, usb**

**remove**— The removable drive

**fixed**— The fixed drive

**usb**— Argument to be used by Tekelec personnel only.

**:partition=** (optional)

Portion of disk to be tested. This parameter specifies the individual physical disk partition (1, 2, 3, or 4) or all defined partitions for a given disk size up to a maximum of 4 partitions.

**Range:**     **1, 2, 3, 4, all**

**1, 2, 3, 4**—Tests the specified existing partition on the disk. Only the number or numbers for the partition or partitions that exist on the disk are valid. (For example, if the disk size allows only 2 partitions, **partition=3** and **partition=4** are invalid for that disk.)

**all**—Tests all existing partitions on the fixed disk or on one side of the removable cartridge or drive

**Default:**   **all**

## Example

**tst-disk:loc=1116**

## Dependencies

The card in the specified location (**loc**) must be a TDM or MDAL card.

The disk to be tested must be in service.

If a TDM location is specified, the TDM cannot be reserved (as when a copy-disk command is running).

The target drive must have low level format.

The **tst-disk** command can be run simultaneously on both TDMs, if entered from different terminals.

The removable disk can be tested simultaneously with the standby TDM but not with the active TDM.

To test the removable cartridge when **loc=1117** is specified, the disk must be inserted in the removable cartridge drive on the MDAL card.

The **partition=3** and **partition=4** values are invalid for a 4GB fixed drive. The only valid value for the 2.3 GB and 4.1 GB removable disks is **partition=1**. An error message will be generated for a disk that has been Formatted (**format-disk** command) but does not yet contain a DOS directory structure (created with the **copy-disk** command) when **partition= 1, 2, 3, 4, or all** is specified.

If an E5-MCAP card is installed, then the **tst-disk** command cannot be entered when other database commands are running.

If an E5-TDM card is installed, then the **disk=fixed** parameter cannot be specified.

## Notes

A physical fixed disk (TDM) or removable cartridge or drive is formatted and given a DOS directory structure to define the number of physical partitions that the disk size can accommodate. (The logical partitions that contain database, backup, GPL, and measurements files are placed in these physical partitions, with no correlation between the physical numbers and the logical contents.)

For a fixed TDM disk, the **partition** parameter specifies the individual partition (1, 2, 3, or 4) or all existing partitions to be tested.

- One partition = 2 GB.
- The 4 GB drive contains two 2 GB partitions.
- The 9 GB drive and the 18 GB drive each contain four 2 GB partitions.
- The 9 GB drive contains four 2 GB partitions.
- Any disk space beyond the four 2 GB partitions is unused disk space (and always has been due to EAGLE DISK FAT structure used).

For a removable cartridge or drive, each side of the disk will contain the maximum number of partitions (up to 4) that the disk size can accommodate. Only one side of the disk is tested with one **tst-disk** command. For example, a 2.3 GB removable disk has one partition on each side that is slightly larger than 1 GB. A 4.1 GB removable disk has one 2 GB partition on each side. Only **tst-disk:partition=1** is valid for either of these disks.

The **partition=all** value implies that testing starts with the first partition, then second, and so on, until the last existing disk partition is detected without skipping any non-existing or defined partitions.

Table 5-43 outlines execution time estimates based on disk capacity.

**Table 5-43.** Test Disk Execution Times

| Capacity                         | Nominal Execution Time                                                                                                                  | Maximum Execution Time for 100% Errors |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| 4.0 GB                           | 40 minutes                                                                                                                              | 27.5 hours                             |
| 9.0 GB                           | 1 hour 45 minutes                                                                                                                       | (Not determined)                       |

| 2.0 GB                           | 20 minutes                                                                                                                              | 13.5 hours                             |

**Table 5-43.** Test Disk Execution Times

| Capacity                  | Nominal Execution Time | Maximum Execution Time for 100% Errors |
|---------------------------|------------------------|----------------------------------------|
| 4.0 GB                    | 40 minutes             | 27.5 hours                             |
| Magneto Optical Removable | 20 minutes             | 7.4 hours                              |
| Removable Drive           | 30 seconds             | Less than 1 minute                     |

Nominal times for **tst-disk** command execution depend on the capacity of the disk being tested and assume that few or no errors are found. Maximum execution times are based on disk capacity, retry count, and retry delay. Each read error and retry may cause a delay of up to three seconds. If a TDM has 100% error sectors, the MASP will likely reset, terminating the disk test. A termination and reset will not occur, however, when testing the removable cartridge or drive.

Because of the intense, sustained disk activity created when **tst-disk** is executed, concurrently performing other disk-based activities, such as prolonged LNP command entry or database backups, will result in performance degradation up to twice the usual execution time.

Because of the extended processing time required for large disks, a progress message is displayed every five minutes providing the current LBA and the total LBA count for the partition.

Specific errors are reported for the first 10 error occurrences. Thereafter, only the error count is tracked and summary results are reported upon completion.

**Output****tst-disk:loc=1116**

**tst-dlk****Test Data Link**

Use this command to test the specified TCP/IP data link. The TCP/IP data link is tested with an ethernet test that is an echo test type called ping.

**Keyword:** **tst-dlk**

**Related Commands:** **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk**

**Command Class:** Link Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:type=** (mandatory)

The type of test to run.

**Range:** ping

**:ipaddr=** (optional)

The IP address of the remote host. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:**       **1-223, 0-255**

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:**    Host IP

**:rc=** (optional)

The number of times the test is repeated.

**Range:**       **1-15**

**Default:**    **1**

**Example**

**tst-dlk: loc=1206:type=ping**

**Dependencies**

No other action command can be in progress when this command is entered.

The card location must contain an ACM card.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If a test repeat count (**rc**) is not entered, the test is not repeated.

If a data link test is in progress, another data link test cannot be started.

The card location, frame, shelf, or slot must be within the allowed range.

A card location that is valid and defined in the database must be specified.

The **ipaddr** parameter must specify a valid IP address.

**Notes**

None

**Output****tst-dlk: loc=1206:type=ping**

**tst-e1****Test E1 Port**

Use this command to test HC-MIM and E5-E1T1 E1 ports. The **tst-e1** command is rejected if a loopback test is not compatible with the port type.

**Keyword:** **tst-e1**

**Related Commands:** **chg-e1, dlt-e1, ent-e1, rtrv-e1**

**Command Class:** System Maintenance

## Parameters

**:e1port=** (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified HC-MIM or E5-E1T1 E1 card.

**Range:** **1-8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:loc=** (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:** **start, stop**

**Default:** **start**

**:loopback=** (optional)

Select loopback test type.

**Range:** **line, lxvr, payload**  
**lxvr** — local transceiver

**Default:** **lxvr**

## Example

**tst-e1:e1port=1:loc=1203:loopback=lxvr**

**tst-e1:e1port=1:loc=1203:action=stop**

## Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **lime1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified E1 port (**e1port** parameter) on the card (**loc** parameter) must have a defined E1 interface.

All signaling links that provide timeslots serviced by E1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl**) when this command is entered.

Only one port test can be running on an E1 port (**e1port** parameter) at one time.

When the **action=stop** parameter is specified, the **loopback** parameter cannot be specified.

The **action=stop** parameter can be specified only when a port test is running.

## Notes

This command can be used for only HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on an E1 port. When a port test is in progress on an E1 port, subsequent test requests are rejected.

### Output

**tst-e1:e1port=1:loc=1203:loopback=lxvr**

Command Completed.
;
```

### tst-imt

### Test IMT Bus

Use this command to:

- Perform a Fault Isolation test to determine the location of faults on a failed or abnormal IMT bus. The Alternate Bus must be in the IS-NR state. The Target Bus must be in the OOS-MT-DSBLD state.
- Perform an Extended Bit Error Rate Test (BERT) on all HIPR2 IMT Buses. The Target Bus must be in the IS-NR or IS-ANR state. The Alternate Bus must be in the IS-NR state.
- Cancel an Extended BERT

**NOTE:** At least one card must be populated in each EAGLE 5 ISS shelf to allow the command to successfully execute a Fault Isolation Test. See the "Notes" section for this command for more information about executing the command.

**NOTE:** No physical status change can be made to the IMT Bus (e.g. unplugging HIPR2 cards) while an Extended BERT is running.

**Keyword:** **tst-imt**

**Related Commands:** **clr-imt-stats, init-imt-gpl, rept-imt-lvl1, rept-imt-lvl2**

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)

The IMT bus to test.

**Range:** **a, b**

**:type=** (mandatory)

This parameter specifies the type of test to perform.

**Range:** **faulttest, extbert**

**faulttest**— perform a Fault Isolation test

**extbert**— perform an Extended BERT on an all HIPR2 cards on an IMT Bus

**:action=** (optional)

Indicator of command action to stop or start a test.

Currently, only the cancellation of an Extended BERT is supported by this parameter.

**Range:**        **start, stop**

**Default:**     **start**

**:maxerr=** (optional)

This parameter specifies the number of errors allowed for the period during which an Extended BERT is being performed.

**NOTE: This value is the Bit error threshold.**

**Range:**        **0-1000**

**Default:**     **20**

**:time=** (optional)

This parameter specifies the time, in minutes, for which an Extended BERT runs in order to determine success or failure.

**Range:**        **1-60**

### Example

**tst-imt:bus=a:type=faulttest**

**tst-imt:bus=b:type=extbert:time=50**

**tst-imt:bus=b:type=extbert:time=50:maxerr=30**

**tst-imt:bus=a:type=extbert:action=stop**

### Dependencies

A related IMT command cannot be in progress. Only one Fault Isolation Test or Extended BERT can be active at a time. An Extended BERT cannot be performed if the **init-sys**, **act-upgrade**, **init-flash**, **act-flash**, **init-network**, **flash-card** or **init-card** (when initializing multiple cards using the **appl** parameter) commands are running.

This command cannot be entered if the alternate bus is other than in-service normal (IS-NR).

The target bus must be in the out of service - maintenance disabled (OOS-MT-DSBLD) state before this command can be entered for a Fault Isolation test.

This command cannot be entered during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The target bus must be in the in-service normal (IS-NR) or in-service abnormal (IS-ANR) state before this command can be entered for an Extended BERT.

If the **type=extbert** parameter is specified, then the **time** parameter must be specified.

If the **type=faulttest** parameter is specified, then the **time**, **maxerr** and **action** parameters cannot be specified. If the **action=stop** parameter is specified, then the **time** and **maxerr** parameters cannot be specified.

This command cannot be entered for an Extended BERT if the target bus contains HMUX or HIPR cards.

If an Extended BERT is about to complete, then the **action=stop** parameter cannot be specified.

If an Extended BERT is not in progress, then the **action=stop** parameter cannot be specified.

### Notes

Probable causes are listed in order of most probable to least probable. The listed components should be replaced in order listed by the output of the **tst-imt** command.

Multiple, masking points of failure can occur in the same bus segment. Such faults are reported as a single bus segment fault. Because running this command on a system with no IMT bus faults prints an indication that no faults were found, you can iteratively replace components and run this test until all components in the segment are ruled out.

A detection of an IMT address mismatch indicates a faulty backplane or card.

A detection of an inconsistency with a particular card's IMT card list indicates an error of unknown origin, probably due to one or more lost messages.

When the **tst-imt** command completes, either through normal termination of the command or because the command was ended for another reason, you must administratively enable the target bus. If all faults have meanwhile been isolated and corrected, the target bus becomes operational.

When a fault is detected, the possible error sources are listed in order from the most likely to the least likely. This ordering is based on operational experience.

At least one card must be populated in each EAGLE 5 ISS shelf to allow the **tst-imt** command to execute successfully. The card does not need to be a provisioned card; the card must be in IS-NR state on both IMT busses before the **tst-imt** command is entered. If an empty shelf does exist in the EAGLE 5 ISS, the following text is displayed when the **tst-imt** command is entered:

Notice: IMT Fault test terminated.

.

Non-Standard cabling or IMT Bus-X state change detected.

### ***Extended BERT***

The **tst-imt** command for an Extended BERT allows a BERT to be executed for a longer period of time during installation to verify there are no signal integrity issues. The standard BERT is used as a basic sanity test during bring-up of the ring.

When an Extended BERT is started, the target bus is inhibited. The bus is allowed when the test completes either through normal termination of the command or because the command was ended for another reason.

When the Extended BERT completes, the output is generated as a maintenance report indicating the test passed or failed. An error rate less than or equal to 1 error in 10E12 bits determines whether the test passed.

The **maxerr** parameter allows the Extended BERT to be performed for the longer duration even if the test fails for any of the HIPR2 cards.

An on-going Extended BERT can be cancelled using the **tst-imt** command with **action=stop**.

Hourly report generation is not allowed if the request comes during an Extended BERT. Notification of the hourly boundary is multicast to all IMT processors to age out the least-recent error bucket and advance the current error bucket. The following notice is displayed if the Hourly report is bypassed during Extended BERT:

- *Extended BERT: Hourly Report is bypassed*

One of the following notices is displayed if an Extended BERT terminates prematurely:

- *Extended BERT: Test aborted, Loss of Heartbeat*—Failure observed for the Extended BERT Heartbeat communication maintained between the Active OAM and the Control shelf HIPR2 card.

- *Extended BERT: Test aborted, Alternate IMT Bus [A|B] abnormal*—Alternate IMT Bus becomes abnormal.
- *Extended BERT: Test terminated, Command cancelled*—Test is cancelled using **tst-imt** command with **action=stop**.
- *Extended BERT: Error in results retrieval, HIPR2 card(s) failure*—Extended BERT results are not displayed if an error is encountered during results retrieval from HIPR2 card.
- *Extended BERT: Active MASP failed to disconnect on IMT Bus [A|B]*—Active MASP did not disconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: Active MASP failed to reconnect on IMT Bus [A|B]*—Active MASP did not reconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: ACK for Extended BERT not received from IMT Bus [A|B]*—The acknowledgement for an Extended BERT is not received from HIPR2 card.
- *Extended BERT: Test aborted, Card failure detected at X location*—Failure detected on a card due to both IMT Buses becoming unavailable.

**Output**

The Connectivity test fails for the Fault Isolation test.

**tst-imt:bus=a:type=faulttest**

```

```
Extended BERT: Test terminated, Command cancelled
```

```
;
```

### Legend

- **MAX ERROR**—Bit error threshold. Displays the number of errors allowed for the specific time period during which the BERT is being performed. If this threshold is exceeded in the specified time period, the Extended BERT is prematurely terminated.
- **TIME**—Specified length of time (*hr:min:sec*) to run the test in order to determine success or failure
- **START TIME**—Time at which the test was started (*hr:min:sec*)
- **TEST STATUS**—PASS if the BERT Status is PASS for all the HIPR2 cards, FAIL otherwise
- **CARD**—MUX Card location that contains the BERT being tested
- **TYPE**—MUX Card type
- **SERIAL\_NUMBER**—Serial number of the main assembly board of the MUX card obtained from board identification PROM (BIP) data
- **BERT\_STATUS**—Extended BERT PASS/FAIL status
- **BIT\_ERROR**—Number of bit errors observed during the test
- **ERRORED\_SEC**—Number of seconds that contained bit errors during the test. Bit errors are sampled once per second; each sample that contains bit errors adds one second to this count.
- **DURATION**—Length of time (*hr:min:sec*) that the test runs for the BERT. For a successful test, the TIME and DURATION should be the same. If a test runs for less than the specified amount of time, the DURATION is less than the TIME.

**tst-msg****Test Tool Test message**

Use this command to invoke the Test Tool to test the feature call flow for the specified test message from the TESTMSG table.

The command sends the specified message from the TESTMSG table to an EAGLE 5 ISS feature. The test message that is sent does not create a new raw MSU. The test message is used only to modify the internal data structures of the Feature to study the call flow behavior when a message with the specified parameters is injected into the call path. The test message is never sent out to the network.

**Keyword:** **tst-msg**

**Related Commands:** **chg-gsm-msg, chg-is41-msg, chg-isup-msg, chg-sccp-msg, chg-tatr-msg, chg-ttr-msg, rtrv-gsm-msg, rtrv-is41-msg, rtrv-isup-msg, rtrv-sccp-msg, rtrv-tatr-msg, rtrv-ttr-msg**

**Command Class:** Database Administration

**Parameters**

**:feat=** (mandatory)

Feature. This parameter specifies the EAGLE 5 ISS Service Feature where the message is processed on the network card.

**Range:** **ttr, tif, tif2, tif3, mosmsnpp, gtt, iar**

**ttr**— Service Feature for processing Prepaid IDP Query Relay test messages

**tif**— Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF.

**tif2**— Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF2.

**tif3**— Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF3.

**mosmsnpp**— Service Feature for processing MO SMS NPP test messages

**gtt**— Service feature for processing GTT test messages.

**iar**— Service Feature for processing IAR test messages

**:loc=** (mandatory)

Card location. The location of the network card where the message is to be sent.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:msgn=** (mandatory)

Message number. This parameter specifies the message number of the test message to be sent for feature service processing.

**Range:** **1-10**

**:prot=** (mandatory)

Protocol. This parameter specifies the protocol of the test message that is sent to the feature for processing.

**Range:** **ttr, isup, is41, gsm, sccp, tatr**

**:mode=** (optional)

Output mode. This parameter specifies the mode in which output is shown while processing is performed on the specified test message.

**NOTE:** The most complete and accurate test results are obtained when **mode=debug** is used.

**Range:**      **brief, full, debug**  
                  **brief**— summary format  
                  **full**— full format  
                  **debug**— debug format  
**Default:**    **brief**

### Example

```
tst-msg:loc=1103:prot=is41:feat=mosmsnpp:msgn=1:mode=full
tst-msg:loc=1103:prot=ttr:feat=ttr:msgn=1:mode=full
tst-msg:loc=1103:prot=gsm:feat=mosmsnpp:msgn=1:mode=debug
tst-msg:msgn=1:prot=isup:loc=1215:feat=tif:mode=debug
tst-msg:loc=1103:prot=sccp:feat=gtt:msgn=1
```

### Dependencies

The Prepaid IDP Query Relay feature must be enabled before the **feat=ttr** parameter can be specified.

The card in the location that is specified in the **loc** parameter must be equipped in the system.

The card in the location specified by the **loc** parameter must be a Service Module card running the **vsccp** application (a DSM card or an E5-SM4G card).

The card in the location specified in the **loc** parameter must be in the Active state.

The values specified for the **prot** and **feat** parameters must be compatible as shown:

- **feat=ttr—prot=ttr**
- **feat=iar—prot=tatr**
- **feat=tif, tif2, tif3—prot=isup**
- **feat=mosmsnpp—prot=gsm, is41**
- **feat=gtt—prot=sccp**

If the specified test message is defined with ACTIVE=YES (see the **chg-isup-msg** command), then the message is sent to the specified network card for test processing. (Test messages are never sent out to the live network.)

The MO SMS ASD, MO SMS GRN, MO SMS IS41-to-GSM Migration, or MO-based IS1 SMS NP feature must be enabled before the **feat=mosmsnpp** and **prot=is41** parameters can be specified.

The MO SMS ASD, MO SMS GRN, Prepaid SMS Intercept Ph1, MO-based GSM SMS NP, or Portability Check for MO SMS feature must be enabled before the **feat=mosmsnpp** and **prot=gsm** parameters can be specified.

At least one TIF feature must be enabled before a value of **tif**, **tif2**, or **tif3** can be specified for the **feat** parameter.

For an ANSI message, the CDPA GTI must be **2** and the CGPA GTI must be **0** or **2** (see the **chg-sccp-msg** command). For an ITU message, the CDPA GTI must be **2** or **4** and the CGPA GTI must be **0**, **2**, or **4**.

The linkset specified by the **lsn** parameter must already exist.

The network domain of the values specified for the OPC, CGPA PC, CDPA PC and DPC must match.

The IAR Base feature must be enabled before the **feat=iar** parameter can be specified.

### Notes

None

## Output

When the **mode=full** or **mode=debug** parameter is specified, the FORMAT field indicates whether formatting actions are executed. If formatting actions are not executed, then the OUTG DIGITS field displays a value of UNMODIFIED. If any digit string is blank, then the associated field displays a value of EMPTY.

The following example displays the command output in brief format.

**tst-msg:feat=ttr:prot=ttr:msgn=1:mode=brief**

```

## tst-npp-msg

## Change NPP Test Service Parameters

Use this command to provision and test the NPP provided service, NPPT. The NPP Test Service allows customers to provision NPP Action Sets and Rules associated with the NPPT Service Rule Set. Customers can inject test messages to a provisioned NPPT Service Rule to verify proper digit string processing.

**Keyword:** **tst-npp-msg**

**Command Class:** Database Administration

### Parameters

**NOTE:** As of Release 42.0, the **srvn** parameter is no longer supported.

**:digs=** (mandatory)

Digits. This parameter specifies the incoming digit string for NPP to process.

**Range:** 1-32 digits

**:loc=** (mandatory)

This parameter specifies the Service Module card to which the test message is issued.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:nai=** (mandatory)

Incoming digit string Nature of Address Indicator (NAI) mapping value.

**Range:**     **0-255**

**:mode=** (optional)

This parameter specifies the generated output format.

**Range:**     **brief, full, debug**

**brief** — summary format

**full** — full format

**debug** — debug format

**Default:**   **brief**

**:srvn=** (obsolete)

Service name. This parameter specifies the name of the NPP service that should receive the NPP Test message.

**Range:**     **nppt**

**nppt** — NPP Test Service

### Example

**tst-npp-msg:loc=1101:mode=full:digs=0ab4041234567:nai=3**

### Dependencies

None.

## Output

When the **mode=full** or **mode=debug** parameter is specified, the FORMAT field indicates whether formatting actions are executed. If formatting actions are not executed, then the OUTG DIGITS field displays a value of UNMODIFIED. If any digit string is blank, then the associated field displays a value of EMPTY.

The numbers shown to identify Conditioning Actions, Service Actions, and Formatting Actions are either the individual parameter numbers or the position of the value in the parameter list when the command was entered. For example, CA2 identifies either the value for the **ca2** parameter or the second CA value in the **ca** parameter list in the command (such as **ac3** in the **ca=cc2, ac3** parameter).

**tst-slk****Test Signaling Link**

Use this command for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select from among the following loopback tests: local transceiver (**lxvr**), **oam**, **line**, **payload**, and either low-speed signaling links or ATM high-speed signaling links (**sltc**).

- The **tst-slk** command is not valid on TCP/IP point-to-multipoint links (SSEDCM cards or E5-ENET cards equipped as SS7IPGW and IPGW1 links).
- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- On LIM-ATM cards, the **lxvr**, **sltc**, **payload**, **line**, and **oam** tests are allowed.
- On TCP/IP point-to-point links (SSEDCM cards or E5-ENET cards equipped as IPLIM or IPLIMI links), **sltc** is the only supported test. The **sltc** test is allowed only for links configured with **ipliml2=m2pa**.
- On E1/T1 MIM cards, the **sltc** test is the only supported test.
- On E1 ATM cards (**atmitu** application), the **lxvr**, **oam**, and **sltc** tests are allowed.
- On E5-ENET cards running the **ipsg** application, the command is only supported for IPSPG-M2PA signaling links, and only the **sltc loopback** test is allowed.

See "Summary of Loopback Testing Commands and Functions" in Appendix A.

**Keyword:** **tst-slk**

**Related Commands:** **act-lpo**, **act-slk**, **blk-slk**, **canc-lpo**, **canc-slk**, **dact-slk**, **inh-slk**, **rept-stat-tstslk**, **rtrv-slk**, **ublk-slk**, **unhb-slk**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:** **start, stop**

**Default:** **start**

**:force=** (optional)

The **force=yes** parameter must be specified to start a test when there are 256 or more tests already running.

**Range:**     **yes, no**

**Default:**   **no**

**:loopback=** (optional)

Specifies the type of loopback test to run.

**Range:**     **line, lxvr, oam, payload, sltc**

**line** — This test is similar to the payload loopback test, but the data transmitted to the remote system is received by the remote system's ATM driver. This test is prohibited for the E1 ATM card.

**lxvr** — Loopback at the local transceiver without involving the remote STP. For the ADS0, AINF, AOCU, and AV35 appliques, the MTP-2 protocol stack and ISCC hardware are tested. For AATM applique and DS1 interface, the AATM hardware, ATM level 2 protocol stack, and AAL5CP portion of ATM driver are tested.

**oam** — Messages are passed between local and remote systems to guarantee that the ATMM portion of ATM driver is functioning.

**payload** — This test is similar to the local transceiver loopback test. The wire is also tested because the loopback is at the remote's DS1 interface instead of the local's DS1 interface. This test is prohibited for the E1 ATM card.

**sltc** — This test can be run on either the low-speed signaling links or the ATM high-speed signaling links. This is the only test that is supported for links on the E1/T1 MIM card, and for **m2pa** links on IPLIMx cards.

**Default:**   **sltc**

**:time=** (optional)

The time duration for testing the link.

**Range:**     **1-240000**

*hhmmss*—*hh*=hours (**00-24**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

For example, **time=1** or **time=000001** is one second; **time=240000** is 24 hours; **time=200** or **time=000200** is 2 minutes.

**Default:**   **1**

## Example

```
tst-slk:loc=1203:link=a
```

```
tst-slk:loc=1203:link=a:loopback=lxvr
```

```
tst-slk:loc=1205:link=b:time=000200:force=yes:action=start
```

```
tst-slk:loc=1205:link=b:action=stop
```

```
tst-slk:loc=1205:link=b:time=200
```

## Dependencies

A card location that is valid and defined in the database must be specified.

The card must be equipped and in service, and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application

- A LIM ATM card running the **atmansi** application

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCM card running the **thiplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

If the signaling link is an ATM HSL signaling link, only the **link=a** parameter can be specified.

This command is not supported for cards running the **ss7ipgw** application.

If IPSG-M2PA signaling links or IPLIMx signaling links are used, and the **thipliml2=m2pa** parameter is specified, then only the **loopback=sltc** test is allowed.

The **payload** and **line** values are not valid for the **loopback** parameter when the card is an E1 ATM.

Only the **sltc** test can be run on card types **lime1**, **limt1**, and **limch**.

The card must contain the specified signaling link.

The specified signaling link must be provisioned in the database.

The specified signaling link must be an SS7 signaling link.

The signaling link that is used for LFS (Link Fault Sectionalization) testing cannot be active.

A command is already in progress. The previously entered command for a link test must be accepted before another link test command can be entered.

This command cannot be entered if the LFS test is running on the specified link.

The specified link cannot be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link. (See the **act-cdl** and **dact-cdl** commands).

The **force=yes** parameter must be specified to start a test when 256 or more tests are already running in the system.

This command cannot be entered if the maximum number of LFS or link tests are already running in the system. At least one active test must complete before the command can be entered again.

Only one link test can be running on a signaling link at one time.

The **action=stop** parameter cannot be specified when there is no active link test running on the specified link.

When the **action=stop** parameter is specified, the **loopback**, **time**, and **force** parameters cannot be specified.

If an IPSG-M3UA signaling link is used, then this command cannot be entered.

If an IPSG-M2PA signaling link is used, the **loopback=sltc** parameter must be specified.

The card must be equipped and in service, and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application

- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCEM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

### Notes

The **lxvr** and **sltc** loopback tests can be run on low-speed signaling links. All the loopback tests can be run on the ATM high-speed signaling links.

**Output**

If the card is inhibited, not in service, the following message appears when you try to test the links on the card:

**tst-slk:loc=1203:link=a**

```
rlghncxa03w 03-11-07 16:19:08 EST EAGLE 31.3.0

LOOPBACK = SLTC TIME = 00:00:53
TEST STATUS = Loopback failed
```

;

**Legend**

**LOC**—Card location that contains the signaling being tested.

**LINK**—Signaling link being tested on the card.

**LSN**—Name of the linkset that contains the link being tested.

**START TIME**—Time that the test started.

**LOOPBACK**—Type of loopback test being run.

**TIME**—Length of time that the test ran. This value can exceed the value that was specified in the **time** parameter if the test requires more than the specified time to complete.

**TEST STATUS**—

- When a **tst-slk** command with **action=start** (specified or default) is entered, any one of the following *TEST STATUS* values can appear:
  - Loopback success
  - Loopback failed
  - Loopback aborted
  - Loopback in-progress
  - Loopback prevented
  - Loopback invalid
- When a **tst-slk** command with **action=stop** is entered, any one of the following *TEST STATUS* values can appear:
  - Loopback cleared
  - Loopback could not be cleared

## tst-t1

## Test T1 Port

Use this command to test T1 Ports on the HC-MIM and E5-E1T1 cards. The command is rejected if a loopback test is not compatible with the port type.

**Keyword:** **tst-t1**

**Related Commands:** **chg-t1, dlt-t1, ent-t1, rtrv-t1**

**Command Class:** System Maintenance

### Parameters

**:loc=** (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:t1port=** (mandatory)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified HC-MIM or E5-E1T1 T1 card.

**Range:** 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:** start, stop

**Default:** start

**:loopback=** (optional)

Select loopback test type.

**Range:** **line**, **lxvr**, **payload**, **feline**, **fepayload**

**lxvr** — local transceiver

**feline** — far end line

**fepayload** — far end payload

**Default:** **lxvr**

### Example

```
tst-t1:t1port=1:loc=1203:loopback=lxvr
```

```
tst-t1:t1port=1:loc=1203:action=stop
```

### Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **limt1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified T1 port (**t1port** parameter) on the card (**loc** parameter) must have a defined T1 interface.

All signaling links that provide timeslots serviced by T1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl** commands) when this command is entered.

Only one port test can be running on a T1 port (**t1port** parameter) at one time.

The **action=stop** parameter can be specified only when a port test is running.

If the **action=stop** parameter is specified, a value of **feline** or **fepayload** must be specified for the loopback parameter.

If the **action=stop** parameter is specified, and a value of **feline** or **fepayload** is specified for the **loopback** parameter, then there cannot be an active loopback for the T1 span, or the active loopback must be the one specified in the **tst-t1:action=stop** command.

### Notes

This command can be used only for HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on a T1 port. When a port test is in progress on a T1 port, subsequent test requests are rejected.

If a loopback type of **feline** or **fepayload** is specified, then the loopback requests are sent to the far end. No response is given from the far end indicate if the request was acted upon or received. The local card which hosts the T1 span in the EAGLE 5 ISS does not instrument the loopback locally but maintains a knowledge of the far end loopback request. If the local card boots, this knowledge is lost by the card.

To maintain the far end loopback states, if the T1 card with an active **feline** or **fepayload** test boots, the card loses any knowledge of the Far End loopback request, but the OAM retains that knowledge. If the OAM boots, the T1 card updates the OAM with its last known loopback state. If both the T1 card and the active OAM card boots while a Far End Loopback is active, then there is no way of determining the T1 state: however, a **tst-t1:action=stop:action= (feline or fepayload)** command can still be sent.

**Output**

**tst-t1:t1port=1:loc=1203:loopback=lxvr**

```
rlghncxa03w 05-01-07 16:19:08 EST EAGLE5 33.0.0
Command Accepted: Test Port message is sent.
```

;

```
rlghncxa03w 05-01-07 16:19:08 EST EAGLE5 33.0.0
Command Completed.
```

;

**tst-t1:t1port=1:loc=1203:action=stop**

```
rlghncxa03w 05-01-07 16:19:08 EST EAGLE5 33.0.0
Command Accepted: Stop Port test message is sent.
```

;

```
tekelecstp 03-12-16 14:31:23 EST EAGLE5 33.0.0
Command Completed.
```

;

**ublk-slk****Unblock Signaling Link**

Use this command to cancel a local processor outage (LPO) and restore the link to its previous state. Link status signal units (LSSU) with status of processor outage are stopped, and the link begins sending MSUs again. IPSG-M3UA signaling links are allowed to enter service by allowing received AS-ACTIVE messages to be accepted.

**NOTE: The blocked status of the signaling link is not preserved across a LIM reboot.**

**Keyword:** ublk-slk

**Related Commands:** act-lpo, blk-slk, canc-lpo

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

**ublk-slk:loc=2311:link=b**

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- An SSEDCEM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- An E1/T1 MIM card or an HC-MIM card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim**, **iplimi**, or **ipsg** application
- An E1/T1 MIM, an HC-MIM or and E5-E1T1 card running the **ss7ansi** or **ccs7itu** application

This command can be entered only for IPLIMx signaling links that have **aipliml2** parameter setting of **m2pa**.

The **ublk-slk** command is not valid for SSEDCEM cards or E5-ENET cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCEM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

This command is not valid for links belonging to proxy linksets.

## Notes

Unblocking a signaling link removes a Level 2 failure resulting from a **blk-slk** of an ATM high-speed signaling link.

The function of this command is the same as the **canc-lpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

**ublk-slk: loc=2311: link=b**

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
Local processor outage being cleared.
;
```

**ublk-slk: loc=1113: link=a**

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
Command Rejected : Location is not valid for command.
;
```

**unhb-alm****Restore Alarm Reporting**

Use this command to restore the reporting of alarms for the given device.

**Keyword:** unhb-alm

**Related Commands:** inh-alm, rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls,, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log

**Command Class:** System Maintenance

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dev=** (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be restored.

**Range:** **applsock**, **as**, **card**, **cdt**, **clock**, **dlk**, **e1port**, **ls**, **lsmsconn**, **route**, **slk**, **t1port**, **trm**, **rtx**, **enet**, **tps**  
**applsock** — IP gateway application socket  
**as** — IP gateway application Application Server  
**card** — Cards in the database  
**cdt** — Customer defined troubles  
**clock** — System clock  
**dlk** — IP ports on the VSCCP, EROUTE, SLAN, VXWSLAN, MCP, and FC-capable cards  
**e1port** — E1 port on E1/T1 MIM or HC-MIM cards  
**ls** — Linksets  
**lsmsconn** — Communication link between the LSMS and the EMS  
**route** — Route  
**slk** — Signaling links  
**t1port** — T1 port on E1/T1 MIM or HC-MIM cards  
**trm** — Terminals  
**rtx** — Exception Route  
**enet** — Ethernet  
**tps** — TPS subsystem

**:asname=** (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to uninhibit alarms for the named Application Server.

**Range:** *aaaaaaaaaaaaa*  
 Up to 15 alphanumeric characters; the first character must be a letter

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **cic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

**Range:** **0-16383**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpc**

**Range:** **p-**, **000-255**, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code for inhibiting alarms for routes.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:e1port=** (optional)

Port ID. This parameter specifies the E1 port on the specified HC-MIM card. This parameter is mandatory if **dev=e1port** is specified.

**Range:**       **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter is used with the **cic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

**Range:**       **0-16383**

**:id=** (optional)

Customer Defined Trouble (CDT) ID. Customer Defined Trouble IDs 1 through 4 are generated critical alarms. Because critical alarms cannot be turned off, Customer Defined Trouble IDs 1 through 4 cannot be specified as values for the **id** parameter. This parameter is mandatory if **dev=cdt** is specified.

**Range:**       **5-16**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**       ayyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:link=** (optional)

Signaling link on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:**       **a, b, a1-a31, b1-b31**

**a, b**—For **dev=dlk**, **dev=slk** for a two-port LIM

**a1, a2, b1, b2**—For **dev=lsmsconn**

**a, b, a1, b1, a2, b2, a3, b3**—For **dev=slk** for a multi-port LIM

**a, b, a1-a31, b1-b31**—For **dev=slk** for an HC-MIM

**a1, b1**—For **dev=dlk** for an FC-capable card

**a, b**—For **dev=enet**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:**       **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:lsn=** (optional)

Linkset name. The name of the linkset containing the device where alarm reporting is to be restored.

**Range:**       ayyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:opc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Origination point code

**:opci=** (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national origination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

**Range:** **0-15**

**:sname=** (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to uninhibit alarms for the named IP<sup>7</sup> application socket.

**Range:**        ayyyyyyyyyyyyyy  
                 1 to 15 alphanumeric characters

**:t1port=** (optional)

Port ID. T1 port on the specified HC-MIM card. This parameter is mandatory if **dev=t1port** is specified.

**Range:**        1-8  
                 Ports 3 through 8 can be specified only for HC-MIM cards.

**:trm=** (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose alarms are to be uninhibited.

**Range:**        1-40  
**Default:**      Report displays on the terminal where the command was issued.

### Example

**unhb-alm:dev=route:dpc=1-1-1**

**unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx**

**unhb-alm:loc=1102:dev=dlk:port=a1**

### Dependencies

This command is not allowed in the upgrade mode.

No other action command can be in progress when this command is entered.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **doc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

The STP Options table must be accessible.

The Device Alarm Inhibit table must be accessible.

The parameters that can be specified with the **dev** parameter vary, depending on the value specified for the **dev** parameter as shown:

- **dev**=(any value)—**dur** or **lvl**
- **dev**=**asname**—**as**
- **dev**=**dpc/dpca/dpci/dpcn/dpcn24**—**route**
- **dev**=**id**—**cdt**
- **dev**=**loc**—**card, dlk, e1port, slk, t1port, enet**
- **dev**=**lsn**—**ls**
- **dev**=**e1port**—**e1port**
- **dev**=**link (link=a, b)**—**dlk, slk, enet**
- **dev**=**link (link=a1, b1)**—**dlk** (For FC-capable cards)
- **dev**=**link (link=a, b, a1, a2, b1, b2, a3, b3)**—**slk**
- **dev**=**link (link=a1, a2, b1, b2)**—**lmsconn**
- **dev**=**sname**—**applsock**
- **dev**=**t1port**—**t1port**
- **dev**=**trm**—**trm**

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be enabled and turned on before specifying the **dev=rtx** parameter.

The **link** parameter must be valid for the selected device type.

The card specified by the **loc** parameter must have an IPS, MCP, STPLAN, EROUTE, VSCCP, IPSG, IPLIM, IPLIMI, SS7IPGW, or IPGWI application.

## Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

### **unhb-alm:dev=route:dpc=1-1-1**

```
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Alarms are inhibited.
```

```
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Command Completed.
```

```
;
```

### **unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx**

```
stdcfg2b 06-05-27 20:22:02 EST EAGLE 35.0.0
Alarms are enabled
Command Completed.
```

```
;
```

**unhb-slk****Uninhibit Signaling Link**

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

**NOTE: The inhibited status of the signaling link is not preserved across a LIM reboot.**

**Keyword:** unhb-slk

**Related Commands:** act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

**unhb-slk:loc=1301:link=a**

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The inhibit and uninhibit actions are valid for links on IPLIMx SSEDCEMs that have **ipliml2=m2pa**.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL),
- An SSEDCEM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

This command is not valid on TCP/IP point to multipoint links (DCM cards equipped as SS7IPGW links).

If an IPSG-M3UA signaling link is used, then this command cannot be entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCEM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

## Notes

This command is not valid on TCP/IP point to multipoint links (SSEDCEM cards or E5-ENET cards equipped as SS7IPGW or IPGWI links or E5-ENET cards equipped as IPSG-M3UA links). TCP/IP point to point links (IPLIM and IPLIMI) can be uninhibited.

The function of this command is the same as the **canc-lpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

```
unhb-slk:loc=1301:link=a
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Allow Link message sent to card
;
```

Use this command to unlock a previously locked terminal keyboard. Anyone attempting to use the keyboard is prompted to enter the password of the currently logged-in user.

**Keyword:** unlock

**Related Commands:** lock

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**unlock**

**Dependencies**

You must enter the password of the logged in user to unlock the keyboard.

This command is valid only if the keyboard is locked.

The port must not be in an unlock disabled state because of excessive successive unlock failures.

**Notes**

None

**Output**

**unlock**

Enter LOGIN password to unlock keyboard :

# Debug Commands

## Introduction

This chapter contains information about debug commands used in troubleshooting and debugging the system. These commands are intended only for Tekelec Technical Services personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to personnel who have access to the command class Debug.

**CAUTION:** These commands are to be used precisely as they are described in this chapter, and only under the direction of Tekelec Technical Services personnel. Any other use of these commands can result in a system failure.

This chapter contains the debug commands in alphabetical order.

## act-upgrade

### Activate Upgrade

Use this command to perform a software upgrade from a source release to the target release on an in-service system.

**CAUTION:** It is strongly recommended that this command be used only in conjunction with the system Upgrade Procedure for your target release. The Upgrade Procedure provides step-by-step information on performing an upgrade.

**Keyword:** act-upgrade

**Related Commands:** rept-stat-db

**Command Class:** Debug

### Parameters

**NOTE:** As of Release 42.0, the appl, dest, and force parameters are obsolete.

**:action=** (mandatory)

This parameter specifies the action to be performed for the upgrade process.

**CAUTION:** The converttoam and netcomplete actions should be used only under the direction of Tekelec personnel.

**Range:** yyyyyyyyyy

Up to 10 alphabetic characters. Valid actions are:

- **chkrel**—Validates the stored upgrade target release on the physical disk as specified by the **src** parameter with the software access key.
- **converttoam**—Converts the standby OAM database.
- **convertstp**—Performs all OAM and network conversions necessary for an upgrade. This command transitions through all of the upgrade phases to upgrade completion. If measurement collection is turned on, this command automatically inhibits measurements during the upgrade. Upon completion of the upgrade, this command returns the MASPs to full-function mode with measurement collection turned back on.
- **dbstatus**—Reports the status of all database partitions on the TDM fixed disks and the removable drive(s) (similar to the **rept-stat-db:display=version** command).
- **getrel**—Retrieves the upgrade target release file from either the EAGLE 5 ISS software release distribution server or the credit card USB. It then expands the data on the inactive partition group of the hard disks.
- **netcomplete**—Indicates upgrade completion and places the system in a fully functional mode.
- **oamcomplete**—Sets the upgrade phase number to 3, and enables the beginning of controlled card loading.

**:release=** (optional)

This parameter specifies the name of the EAGLE 5 ISS software release file to be downloaded. This file contains the upgrade target release on the EAGLE 5 ISS software release distribution server or credit card USB.

**Range:** xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

1 alphabetic character followed by up to 29 alphanumeric characters. One or more periods can be used.

**NOTE: The value must be at least 11 characters in length and must contain a hyphen (-). The format of the value must be xx.xx.xx-yy.yy.yy, where xx.xx.xx is the release number, and yy.yy.yy is the engineering build number.**

**:src=** (optional)

This parameter specifies the physical disk that contains the upgrade target release.

**Range:** **fixed, remove, usb, server**

**fixed**— The upgrade target release is on the fixed disk

**remove**— The upgrade target release is on the removable cartridge

**usb**— The upgrade target release is on the credit card drive

**server**— The upgrade target release is on the remote server

The **src=remove** parameter cannot be specified for E5-MDAL or E5-MCAP cards.

**:thres=** (optional)

Network Threshold value. This parameter specifies the percentage of signaling links that are to remain in service (IS) during the network conversion phase and enables SCCP thresholding and flashing on non-provisioned cards during the upgrade.

**Range:** **50 - 90**

**Default:** The network cards are updated serially.

**:appl=** (obsolete)

This parameter specifies the name of the GPL on which to perform the network upgrade.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Use the **rept-stat-gpl** command or the **rtrv-gpl** command to obtain the valid GPLs.

**Default:** All GPLs

**:dest=** (obsolete)

This parameter specifies the disk that is used as the physical work area for the conversion of the database.

**Range:** **fixed**, **remove**

**fixed**— Convert the database on the fixed disk

**remove**— Convert the database on the removable cartridge

This parameter cannot be specified for E5-MDAL or E5-MCAP cards.

**:force=** (obsolete)

This parameter forces a command to be executed if the **action=convertnet** parameter is specified.

If the **action=convertnet** parameter is specified, and if all cards of the specified GPL type are not in the In-Service Normal state or Out-Of-Service Maintenance-Disabled state, then the **force** parameter must be specified. In this case, minimum service may not be maintained when the command is executed with the **force** parameter.

If the **action=convertnet** parameter is not specified, then the **force** parameter is ignored.

**Range:** **yes**, **no**

**Default:** **no**

**Example**

**act-upgrade:action=convertstp**

**act-upgrade:action=dbstatus**

**act-upgrade:action=convertstp:thres=75**

The following shows a variation of the getrel option that finds the release on the credit card usb instead of through the E5-IPSM card.

**act-upgrade:action=getrel:release="37.5.2-58.41.2":src=usb**

**act-upgrade:action=chkrel:src=fixed**

**Dependencies**

The value specified for the **action** parameter must correspond to a specific upgrade phase as shown:

- **action=converttoam**—upgrade phase=0 and 1
- **action=oamcomplete**—upgrade phase=2
- **action=convertnet**—upgrade phase=3
- **action=netcomplete**—upgrade phase=3
- **action=convertstp**—upgrade phase=0-3

The Measurements Collection function must be turned off (**chg-meas:collect=off**) or the Measurements Platform feature must be turned on (**chg-measopts:platformenable=on**) before a value of **converttoam**, **oamcomplete** or **netcomplete** can be specified for the **action** parameter.

A valid upgrade release must reside on the removable cartridge, credit card drive, or the inactive partition of the fixed disk.

The standby OAM database must be the source release.

The current OAM database must be the source release.

The database partition must be coherent.

The database partition must be in the correct functional mode.

The **action=convertstp** parameter and the **thres** parameter must be specified together in the command.

The destination of a static IP route or the local interface network address of an IP card cannot be the same as the EAGLE 5 ISS PVN, FCNA, or FCNB network address.

Upgrade conversion cannot be initiated from a telnet-type terminal (terminal IDs 17-40).

TALI sockets cannot be configured in the system.

ISUP Normalization feature-related configuration cannot be present in the system.

The dual-slot DCM card (card type **dcm**) is obsolete for **ss7ipgw**, **ipgwi**, **iplim**, and **iplimi** applications.

TALI links cannot be configured in the system.

The **action=getrel** parameter and the **release** parameter must be specified together in the command.

An E5-IPSM card must be provisioned and in service before a value of **getrel** or **chkrel** can be specified for the **action** parameter.

The **ent-ftp-serv:app=dist** command must be entered before a value of **getrel** or **chkrel** can be specified for the **action** parameter.

An E5-MCAP card must be provisioned in the system before the **src=usb** parameter can be specified.

If the **src=fixed** parameter is specified, then a removable cartridge or credit card drive cannot be inserted.

If the **src=remove** parameter is specified, then a removable cartridge must be inserted in the system.

If an E5-MCAP or E5-MDAL card is used, then the **src=remove** parameter cannot be specified.

Invalid hardware configuration alarms are set or an HMUX alarm must be addressed.

All cards that are in the auto-inhibited state must be removed before this command can be entered.

Cards that prevent the IMT buses from being inhibited during the upgrade cannot exist in the system.

The specified source drive is not at the correct database version for the upgrade to proceed.

The removable cartridge cannot contain an EAGLE 5 ISS backup image.

If the **src=usb** parameter is selected, then the credit card USB upgrade media must be inserted in the Active OAMs flush mount USB slot.

The internal ramdisk is not available for the credit card USB upgrade image to be unpackaged.

The disk that contains the upgrade target release is in an unknown upgrade mode.

If the **src=usb** or **src=server** parameter is specified, then the **action=getrel** parameter must be specified. If the **src=remove** or **src=fixed** parameter is specified, then the **action=getrel** parameter cannot be specified.

The EAGLE 5 ISS PVN address in the source database cannot be identical to the EAGLE 5 ISS FCNA or FCNB network address in the target database.

The **icdpnunknx** and **icdpnunknX** and the **gcdpnunknx** and **gcdpnunknX** NPP Action Sets cannot co-exist in the source release.

The value specified for the **release** parameter must be at least 11 characters in length and contain a hyphen (-). The format of the value must be **xx.xx.xx-yy.yy.yy**, where **xx.xx.xx** is the release number, and **yy.yy.yy** is the engineering build number.

If an OAP terminal is configured in the system, then this command cannot be entered.

The AMGTT data in the GTT table cannot exceed the capacity of the GTMOD table (100 K).

## Notes

For the **appl** parameter, the list of valid GPLs varies from release to release. The **actrv-gpl** command can be used (when in full function mode) to obtain a list of the GPLs currently resident on the TDMs. The **rept-stat-gpl** command can be used to obtain a list of the GPLs currently active on provisioned network cards.

The **act-upgrade:action=convertstp** command executes all four upgrade phases consecutively.

If the **act-upgrade:action=convertstp** command is entered following a command abort, the upgrade processing determines the last upgrade phase that was successfully completed. The upgrade processing then attempts to restart from that point to successful completion. Re-entering the **act-upgrade:action=convertstp** command following a command abort is the recommended method for recovery.

The TDMs and removable cartridge have upgrade phase indicators. The upgrade command expects the disks to be in certain phases before executing a specific action. If the disks are not in the correct phases, an error is generated.

The command **act-upgrade:action=dbstatus** generates output similar to that provided by the command **rept-stat-db:display=version**.

The **thres** parameter is used for the following purposes:

- Allows multiple cards to be upgraded together, as long as the specified percentage of links remain in service. The value is applied to groups of links based upon the link-supporting group or the entire system. The grouping is set by the **chg-upgrade-config:threstype=** command.
- Enables SCCP thresholding, which allows multiple Service Module cards to be upgraded together. The specified **thres** parameter value is not used to determine the number of Service Module cards to upgrade. The peak SCCP load since the last OAM boot is used to determine the number of cards that must remain in service (at least half of the cards must remain in service).
- Enables the non-provisioned flash function, which flash-downloads any boot-prom type card if the card is in the system but not provisioned.

The **act-upgrade:action=getrel** action defaults to getting the release from the provisioned E5-IPSM card using the provisioned FTP Server. If the **src=usb** parameter is specified, and an E5-MCAP card is used, then the release is obtained from the credit card USB upgrade media.

## Output

**NOTE:** The `act-upgrade:action=convertstp` command performs the OAM conversion and the network conversion. During the conversion, this command broadcasts the current activity in the scroll area. Refer to Appendix B of the EAGLE 5 ISS Release Software Upgrade Procedure for a sample of message output.

The action `dbstatus` reports the current database status.

## cdu

### CAP Downloadable Utility

The CAP Downloadable Utility (CDU) is a diagnostic program that can be downloaded to any card including the DSM/DCM cards on the system by entering `thalw/rst-card:loc= xxxx :code=utility` command.

This command is used to enter commands to perform diagnostic functions. The command syntax is as follows:

**`cdu:loc=xxxx:cmd="command string"`**

where the `loc` and `cmd` parameters are mandatory parameters for the `cdu` command. The command string, which is enclosed in double quotes (" "), specifies the diagnostic function to perform and includes any optional or mandatory parameters for the specified `cmd` keyword.

The **cdm** command uses the VCDU or CDU GPL. The DSM board can hold up to 4 GB of memory. The CDU or the VCDU utility is downloaded automatically depending on the type of the board. For the DSM the VCDU utility is downloaded; for the TSM the CDU utility is downloaded.

**Keyword:** `cdu`

### Related Commands:

**Command Class:** Debug

## Parameters

**:cmd=** (mandatory)

The commands that are used to perform diagnostic functions. The command string contains a keyword (listed in the following Range section) and one or more parameters (listed in the Subrange section that follows the Range section). The command string must be enclosed in double quotes (“”).

[illegible]

The keywords used in the command strings are:

- **act-memtest**—Starts the memory test.
- **canc-memtest**—Stops the memory test. This command has no parameters.
- **dump-memtest**—Displays the memory test results continuously without any other output messages. This command has no parameters.
- **rtrv-memtest**—Displays the memory test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.
- **act-qcktest**—Implements a quick go/no-go test to check the basic integrity of the memory within ten minutes. The VDCU utility verifies the address, the data lines to memory, and the accessibility of each memory chip of 4 GB. This command applies to the DSM card only.
- **canc-qcktest**—Aborts the quick test. This command applies to the DSM card only and has no parameters.
- **rtrv-qcktest**—Displays the quick test results. This command applies to the DSM card only and has no parameters.
- **fill-mempat**—Fills a section of memory with a specific data pattern.
- **tst-mempat**—Tests the memory pattern that was initialized by the fill-mempat command.
- **dump-mempat**—Displays the memory pattern test results continuously without any other output messages. This command has no parameters.
- **rtrv-mempat**—Displays the memory pattern test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.
- **act-checkbit**—Tests the M256 checkbit DRAM.
- **rtrv-checkbit**—Displays the M256 checkbit test results. This command has no parameters.
- **act-memflt**—Tests M256 error detection and correction capabilities (fault insertion test).
- **rtrv-memflt**—Displays the fault insertion test results. This command has no parameters.

- **act-cachetst**—Starts the cache test on the specified memory range.
- **dump-cachetst**—Displays the results of the cache test. This command has no parameters.
- **act-pingtst**—Implements a network test in the VCDU utility only. The ping test is applicable to DCM/DSM cards only and will not work in the other cards.
- **canc-pingtst**—Aborts the ping test. This command has no parameters.
- **rtrv-pingtst**—Displays the results of the ping test. This command has no parameters.

Subrange: The keywords used in the command strings use the following parameters.

**Table 6-1.** Subrange Parameters for cmd Keywords

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 6-1. Subrange Parameters for cmd Keywords

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>:loop=</b> (optional)</p> <p>The number of times a test is performed. The value is a hexadecimal or a decimal number. This parameter is used with the following keywords: <b>act-memtst</b>, <b>act-cachetst</b>, <b>act-memflt</b>, <b>actcheckbit</b>, <b>act-qcktst</b>, and <b>act-pingtst</b>.</p> <p>Range: <b>h'0–h'ffff</b></p> <p>The value <b>h'0</b> indicates that an infinite number of tests is performed.</p> <p>Default: <b>h'1</b></p>                                                                               |
| <p><b>:data=</b> (mandatory)</p> <p>The hexadecimal of the data pattern. This parameter is used only with the keywords <b>act-cachetst</b>, <b>fill-mempat</b>, and <b>tst-mempat</b>.</p> <p>Range: <b>h'0000–h'ffff</b></p>                                                                                                                                                                                                                                                                                                               |
| <p><b>:port=</b>(mandatory)</p> <p>The port address from which to start the ping. This parameter is used only with the keyword <b>act-pingtst</b>.</p> <p>Range: <b>a, b</b></p>                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>:dest=</b> (mandatory)</p> <p>The destination IP address to be pinged. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number. This parameter is used only with the keyword <b>act-pingtst</b>.</p> <p>Range: 4 numbers separated by dots, with each number in the range of <b>0–255</b>.</p>                      |
| <p><b>:router=</b>(optional)</p> <p>The router through which the network interface can be tested. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number. This parameter is used only with the keyword <b>act-pingtst</b>.</p> <p>Range: 4 numbers separated by dots, with each number in the range of <b>0–255</b>.</p> |
| <p><b>:type=</b>(optional)</p> <p>Indicates the type of memory test to perform: a comprehensive high-memory test or a fast high-memory test. The fast test performs two tests: the Write/Read block and the Address Write/Read. The comprehensive test performs the fast</p>                                                                                                                                                                                                                                                                |

**Table 6-1.** Subrange Parameters for cmd Keywords

|                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| test as well as a Write/Read Walking 1/0s. This parameter is used only with the <b>act-memtst</b> keyword.<br>Range: <b>full, fast</b><br>Default: <b>full</b>                                                                                                                                   |
| : <b>addr</b> = (mandatory)<br>Indicates the physical address to test. This parameter must be dword aligned and must not be the first or last dword of the installed M256 expansion DRAM. This parameter is used only with the <b>act-memflt</b> keyword.<br>Range: <b>h'80000004–h'bffffff8</b> |

:**loc**= (mandatory)

The card location of the card as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113-1117

### Example

```
cdu: loc=1215: cmd="act-
memtst: beg=h'00100000: end=h'00100002: loop=3: type=fast"
cdu: loc=1215: cmd="canc-memtst"
cdu: loc=1215: cmd="rtrv-memtst"
cdu: loc=1215: cmd="fill-
mempat: beg=h'00100000: end=h'c0000000: data=h'ffff"
cdu: loc=1215: cmd="tst-
mempat: beg=h'00100000: end=h'c0000000: data=h'ffff"
cdu: loc=1215: cmd="act-qcktst: loop=h'2"
cdu: loc=1215: cmd="canc-qcktst"
cdu: loc=1215: cmd="rtrv-qcktst"
cdu: loc=1215: cmd="act-
pingtst: port=a: dest=215:200:100.6: router=150.1.1.105: loop=h'2"
cdu: loc=1215: cmd="canc-pingtst"
cdu: loc=1215: cmd="rtrv-pingtst"
cdu: loc=1107: cmd="act-
cachetst: beg=h'01400000: end=h'01440000: data=h'ffff"
cdu: loc=1107: cmd="dump-cachetst"
cdu: loc=1215: cmd="act-
checkbit: beg=h'80000000: end=h'80000004: loop=h'2"
cdu: loc=1215: cmd="rtrv-checkbit"
cdu: loc=1215: cmd="act-memflt: addr=h'80000004: loop=h'3"
cdu: loc=1215: cmd="rtrv-memflt"
```

### Dependencies

If the **act-cachetst** keyword is entered, the address range should not be less than 256 KB.

The **fill-mempat** keyword must be entered before the **act-cachetst** keyword can be entered.

The quick memory test commands can be entered only on DSM cards.

The ping test commands can be entered only on DSM or DCM cards.

### Notes

The **act-memtst:type=full** test takes approximately 21 hours to run on a 1 GB TSM. The **actmemtst:type=fast** test takes approximately 1 hour. The VCDU utility has the capability to test the 4 GB of memory in 4 hours if the **act-memtst** command is entered with the **type** parameter set to **fast**.

**Output****cdu: loc=1107:cmd="dump-memtst"**

cdu: paced memtst output begins

| address          | written | read   | address     | written | read   |
|------------------|---------|--------|-------------|---------|--------|

## chg-bip-fld

### Change Board Identification Field

Use this command to manually update the board identification PROM (BIP) data during an upgrade in the field.

**NOTE: Initial programming of the BIP data occurs during manufacturing.**

**Keyword:** chg-bip-fld

**Related Commands:** `chg-bip-rec`, `disp-bip`, `rtrv-bip`, `tst-bip`

**Command Class:** Debug

## Parameters

**NOTE:** As of Release 42.0, the `dbdloc` parameter is obsolete.

**:data=** (mandatory)

Board Identification (BID) record field data.

[illegible]

A character string, specifying board identification field data based on the value of the **fld** parameter.

**:fld=** (mandatory)

Board identification field.

Range: rev, sm

**rev**—revision

**sm** — software match

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1112, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

**NOTE:** xy09 and xy10 locations are valid only if they are equipped with HIPR2 card.

**Range:** 1101-1112, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

**NOTE:** xy09 and xy10 are valid locations only if they are equipped with HIPR2 card.

**:init=** (optional)

This parameter initializes the contents of a PROM to contain only the record specified in the **data** parameter, if that record is a board identification record.

**Range:** yes, no

**yes** — The contents of the PROM are initialized.

**no** — The contents of the PROM are not initialized.

**Default:** no

**:type=** (optional)

The type of board.

**Range:** mbd

**mbd** — main assembly

**:dbdloc=** (obsolete)

Applique location. This parameter specifies the location of the applique.

This parameter is valid only with cards that support multiple appliques.

This parameter is obsolete.

**Range:** 1-2

**Default:** 1

### Example

The following example initializes the contents of a main assembly BIP to contain only the record specified in the **data** parameter.

```
chg-bip-rec:loc=1105:data=xxxx:init=yes
```

The following example displays the programming of the DCM Ethernet Addresses for Port A (ENT01).

```
chg-bip-rec:loc=1102:data="ENT01,AD00001704000D,cs104"
```

### Dependencies

The value of the **loc** parameter cannot specify a location for a fixed disk or removable cartridge.

If the **init=yes** parameter is specified, then the value of the **data** parameter must be a Board IDentification (BID) record.

### Notes

The card in the specified location must be inhibited.

### Output

```
chg-bip-rec:loc=1107:data=xxx:init=yes
```

```
tekelecstp 10-04-01 12:05:44 IST EAGLE 42.0.0
```

```
Board ID Prom updated.
```

```
;
```

## chg-tbl

### Change Table

Use this command to create, rename, or reset any table on a fixed disk, removable cartridge, or removable drive.

**CAUTION:** Before entering the **chg-tbl** command, contact the Customer Care Center.

**Keyword:** **chg-tbl**

**Related Commands:** **disp-disk-dir**

**Command Class:** Debug

### Parameters

**:action=** (mandatory)

This parameter specifies the desired action to perform on the table.

**Range:** **create, rename, reset**

**create**— Creates a DOS entry in the FAT table and updates the DOS directory table.

**rename**— Changes the name of an existing system table to a new DOS file name (does not update the **dms.cfg** file).

**reset**— Initializes an existing table to the value designated by the **resetchar** parameter.

**:disk=** (mandatory)

Target disk. This parameter specifies the disk that contains the file.

**Range:** **remove, fixed, usb**

**remove**— Removable cartridge or drive

**fixed**— Fixed disk

**usb**— Argument to be used by Tekelec personnel only.

**:ext=** (optional)

Extension. This parameter specifies the three character DOS filename extension.

**Range:** **azz**

0–3 ASCII characters

**Default:** No file name extension is specified

**:filelength=** (optional)

This parameter specifies the amount of space the file occupies on the disk.

**Range:** **1-32505856**

**Default:** The file length is not specified

**:id=** (optional)

This parameter specifies the table identification number.

**Range:** **0-499**

**Default:** No table identification number is specified

**:name=** (optional)

This parameter specifies the name of the file.

**Range:** **azzzzzzz**

1–8 ASCII characters.

**Default:** No file name is specified

**:prtnggrp=** (optional)

Partition group. This parameter specifies the disk partition group to be changed.

**Range:** **active, inactive**

**Default:** **active**

**:resetchar=** (optional)

Reset character. This parameter specifies the table reset character that is written to every byte of the table.

**Range:** **0-255**

**Example**

```

chg-
tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000
chg-tbl:action=reset:disk=remove:id=0
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old

```

**Dependencies**

If the **action=create** parameter is specified, then the **name**, **ext**, and **filelength** parameters must be specified.

If the file type is a directory, the **filelength** parameter is not required. The directory entry file length is always 1 cluster in length.

The attributes used during file creation are: current date and time of the active MASP, readable/writable, files are allocated contiguously from the last free FAT cluster.

If the **action=reset** parameter is specified, then the **id** parameter must be specified.

If the **action=rename** parameter is specified, then the **id**, **name**, and **ext** parameters must be specified.

This command cannot be used to modify the security log.

**Notes**

None

**Output**

```

chg-
tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000

chg-tbl: CREATE OK : filename = test.sys, byte length = 150000
chg-tbl: command complete
;

chg-tbl:action=reset:disk=remove:id=0

chg-tbl: RESET OK : Table 0, DMS.CFG
chg-tbl: command complete
;

chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old

chg-tbl: RENAME OK : Table 0, DMS.CFG to DMS.OLD
chg-tbl: command complete
;

```

**chg-upgrade-config****Change Upgrade Configuration**

Use this command to configure data used by the upgrade software during an upgrade of an in-service EAGLE 5 ISS from a source release to the target release.

**NOTE: This command stores data that will be used during the software upgrade. The command does not start the software upgrade.**

**Keyword:** chg-upgrade-config

**Related Commands:** act-upgrade, rtrv-upgrade-config

**Command Class:** Debug

**Parameters****:sak=** (optional)

Software access key. This parameter specifies the software access key that is used to allow the EAGLE 5 ISS to upgrade to the target release.

**Range:** *zzzzzzzzzzzzzz*

13-character alphanumeric text

**:src=** (optional)

Source. This parameter specifies the disk that physically contains the upgrade target release.

**Range:** **fixed, remove****fixed** — The upgrade target release is on the fixed disk**remove** — The upgrade target release is on the removable cartridge**:threstype=** (optional)

This parameter specifies the type of thresholding to be used during the upgrade.

**Range:** **system, group****system** — upgrade threshold value applied at a system level**group** — upgrade threshold value applied at group level**Example****chg-upgrade-config:addtblcnv=327****chg-upgrade-config:deltblcnv=327****chg-upgrade-config:sak=vbjyapdpbtejb:src=fixed****Dependencies**

One, but not both, of the optional parameters must be specified in the command.

**Output****chg-upgrade-config:addtblcnv=327**

rlghncxa03w 07-03-13 08:15:45 EST EAGLE 37.5.0

Command Completed.

;

**clr-disk-stats****Clear Disk Statistics**

Use this command to clear the disk performance statistics. All associated disk statistics are zeroed.

**Keyword:** **clr-disk-stats****Related Commands:** **disp-disk-stats****Command Class:** Debug**Parameters****:loc=** (mandatory)

Location. This parameter specifies the location of the card.

**Range:** **1113, 1115****Default:** None**Example****clr-disk-stats:loc=1113****Dependencies**

The specified card location must contain a card that is running an OAM (1113 or 1115).

A related command must not be in progress.

**Notes**

None

**Output****clr-disk-stats:loc=1113**

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0
Disk performance statistics cleared.
;
```

**copy-tbl****Copy Table**

Use this command to copy a single table from one source to another. A table can be copied to any verifiable location in the system; however, the source and destination tables must have identical configurations (same number of entries, same entry size, both 1- dimensional and 2-dimensional).

**NOTE: A table cannot be copied onto itself.**

**Keyword:** copy-tbl

**Related Commands:**

**Command Class:** Debug

**Parameters**

**:dloc=** (mandatory)

Destination location. This parameter specifies the location of the destination table.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

1114—The TDM

1116—The TDM

1117—The removable cartridge drive

1113—The latched USB port

1115—The latched USB port

**:sloc=** (mandatory)

Source location. This parameter specifies the location of the source table.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

1114—The TDM

1116—The TDM

1117—The removable cartridge drive

1113—The latched USB port

1115—The latched USB port

**:stbl=** (mandatory)

Source table. This parameter specifies the identifying number of the source table.

**Range:**     **0-1023**

**:ddrv=** (optional)

Destination drive. This parameter specifies the identification of the disk to which the table is copied.

**Range:**     **fixed, remove, usb**

**fixed** — The fixed disk

**remove** — The removable cartridge or drive

**usb** — Argument to be used by Tekelec personnel only.

**Default:**   **fixed**

**:dprtnggrp=** (optional)

Disk partition group. This parameter specifies the disk partition group of the destination table.

**Range:**     **active, inactive**

**Default:**   **active**

**:dtbl=** (optional)

Destination table. This parameter specifies the identifying number of the destination table.

**Range:**     **0-1023**

**Default:**   The **stbl** parameter value

**:sdrv=** (optional)

Source drive. This parameter specifies the identification of the disk from which the table is copied.

**Range:**     **fixed, remove, usb**

**fixed** — The fixed disk

**remove** — The removable cartridge or drive

**usb** — Argument to be used by Tekelec personnel only.

**Default:**   **fixed**

**:sprtnggrp=** (optional)

Source partition group. This parameter specifies the disk partition group of the source table.

**Range:**     **active, inactive**

**Default:**   **active**

### Example

**copy -tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed**

### Dependencies

Only one table copy command can be executed at a time.

The source and destination tables must exist and be compatible.

This command cannot be used to modify the security log.

The same value cannot be specified for the **sloc** and **dloc** or the **stbl** and **dtbl** parameters.

If a value of **fixed** is specified for the **sdrv** or **ddrv** parameter, then a value of **1114** or **1116** must be specified for the **sloc** or **dloc** parameter, respectively.

### Notes

None

**Output**

**copy-tbl:stbl=25:dtbl=24:slc=1114:dloc=1116:sdv=fixed**

```
rlghncxa03w 01-03-04 16:11:53 EST Rel 28.1.0
Table copy command complete.
;
```

**dbg-ddb****Debug Dynamic Database**

Use this command to display the checksum, statistics, and wild write audit (WWA) updates of dynamic database (DDB) table entries, audit a specific table, and reset the DDB statistics on the cards.

**Keyword:** **dbg-ddb**

**Related Commands:** **rept-stat-ddb**

**Command Class:** Debug

**Parameters**

**:action=** (mandatory)

This parameter specifies the action taken by the **dbg-ddb** command.

**Range:** **stats, aud, disp, wwa, rststat**

**stats**— display dynamic database statistics

**aud**— audit a specific table

**disp**— display a table entry

**wwa**— display any entries updated by WWA task

**rststat**— reset following DDB audit statistics:

- Number of DDB updates
- Number of consecutive DDB update in progress
- Maximum DDB updates in 100 msec
- Idle period
- Maximum and minimum idle period

**:audtype=** (optional)

Audit type. This parameter specifies whether a unicast or multicast audit is performed.

**Range:** **mc, uc**

**mc**— multicast

**uc**— unicast

**Default:** **mc**

**:dpc=** (optional)

This parameter specifies the destination point code value.

The Route table entry corresponding to the **dpc** value is displayed.

**Range:** **p-, 000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

Enter **none** to delete the point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** No change to current value.

**:link=** (optional)

This parameter displays the entry in the Link table that corresponds to the specified link value.

**Range:** **a, b, a1, b1, a2, b2, a3, b3, a4, b4, a5, b5, a6, b6, a7, b7, a8, b8, a9, b9, a10, b10, a11, b11, a12, b12, a13, b13, a14, b14, a15, b15, a16, b16, a17, b17, a18, b18, a19, b19, a20, b20, a21, b21, a22, b22, a23, b23, a24, b24, a25, b25, a26, b26, a27, b27, a28, b28, a29, b29, a30, b30, a31, b31**

**:loc=** (optional)

This parameter specifies the location of the MTP card that is being debugged.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:lsn=** (optional)

Linkset name. This parameter displays the entry in the Linkset table that corresponds to the specified linkset name.

**Range:** ayyyyyyyy

**:rloc=** (optional)

Reference card location. This parameter audits the table where the reference card is located.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:tbl=** (optional)

This parameter specifies the table that is used as the source of the audit data.

**Range:** **lnk**, **ls**, **rte**  
**lnk** — Link table  
**ls** — Linkset table  
**rte** — Route table

**:tidx=** (optional)

Table index. This parameter displays the corresponding table entry.

**Range:** 0-16000  
**System**  
**Default:** 0

## Example

This command displays the 126th entry in the Link table.

**dbg-ddb: loc=1105: tbl=lnk: action=disp: tidx=126**

This command displays the entry in the Link table corresponding to link=a and rloc=1107.

**dbg-ddb: loc=1105: tbl=lnk: action=disp: rloc=1107: link=a**

This command audits the Link table in multicast mode.

**dbg-ddb: loc=1105: tbl=lnk: action=aud: audtype=mc**

This command audits the Link table in unicast mode.

**dbg-ddb: loc=1105: tbl=lnk: action=aud: audtype=uc**

This command audits the Link table at the card location 1105 using the reference card 1107.

**dbg-ddb: loc=1105: tbl=lnk: action=aud: audtype=uc: rloc=1107**

This command displays the statistics of a specified card.

**dbg-ddb: loc=1201: action=stats**

This command displays the WWA entries on a specified card.

**dbg-ddb: action=wwa: loc=1201**

This command resets the statistics of a specified card.

**dbg-ddb:action=rststat:loc=2100**

This command resets the statistics of all active MTP cards.

**dbg-ddb:action=rststat**

### Dependencies

The **dpc**, **tidx**, **lsn**, and **rloc** parameters cannot be specified together in the command. The **dpc**, **tidx**, **lsn**, and **link** parameters cannot be specified together in the command. The **action=disp** and **tbl=rte** parameters must be specified before the **dpc** parameter can be specified. The **action=disp** and **tbl=ls** parameters must be specified before the **lsn** parameter can be specified. The **action=disp** and **tbl=lnk** parameters must be specified before the **link** parameter can be specified. The **action=disp** parameter must be specified before the **tidx** parameter can be specified. The **action=aud** parameter must be specified before the **audtype** parameter can be specified. The **action=disp** and **tbl=lnk** parameters or the **action=aud** and **audtype=uc** parameters must be specified before the **rloc** parameter can be specified. If the **action** parameter has a value of **wwa**, **stats**, or **rststat**, then the **loc** parameter is the only other parameter that can be specified.

If the **action=disp** and **tbl=lnk** parameters are specified, then the **rloc** and **link** parameters must be specified together in the command.

The card location specified by the **loc** or **rloc** parameter must be equipped.

The value specified for the **loc** or **rloc** parameter must indicate an MTP card.

The status of the card at the location specified by the **loc** or **rloc** parameter must be active.

The linkset specified by the **lsn** parameter must already exist in the Linkset table.

The link specified by the **link** parameter must already be equipped.

The value specified for the **dpc** parameter must already exist in the Route table.

The value specified for the **dpc** parameter must be a full point code, network point code, or a cluster point code.

Values of **1113 - 1118** cannot be specified for the **loc** or **rloc** parameters.

If the **action** parameter has a value of **disp**, **aud**, **stats**, or **wwa**, then the **loc** parameter must be specified. If the **action=aud** parameter and the **rloc** parameter are specified, then the **audtype** parameter must be specified. If the **action** parameter has a value of **disp** or **aud**, then the **tbl** parameter must be specified.

### Notes

For a multicast audit, the card that receives the message sends the audit request to all other MTP cards simultaneously. For a unicast audit, the card that receives the message sends the audit request to another MTP card, which sends the request to next MTP card, etc. This process continues until the last MTP card in the system receives the request.

A maximum of the last 10 entries of WWA updates are displayed.

**Output**

A maximum of 20 entries with mismatched card values can be displayed as necessary.

If mismatched card entries occur, the *SeqNo* field can be used to correlate the entries between two cards (e.g. *SeqNo: 1* of card 1 can be compared against *SeqNo: 1* of card 2.)

**Legend**

- **WWA**—Wild Write Audit
- **DDB**—Dynamic Database
- **TIME STAMP**—Card time stamp when the checksum was detected and updated by wild write audit. The time stamp is in *YY-MM-DD hh:mm:ss:msec* format.
- **TABLE**—Table where the checksum is being performed
- **ENTRY IDX**—Index of entry that is updated by wild write audit
- **ORIG CHKSUM**—Original Checksum
- **UPD CHKSUM**—Checksum after update by wild write audit
- **IDLE PERIOD**—The time elapsed, in milliseconds, since the last DDB update was received by this card. All idle periods are displayed in *dd:hh:mm:ss:msec* format.
- **NUMBER OF WWA UPDATED ENTRIES**—Number of entries updated by the WWA

**disp-bip****Display Board Identification PROM**

Use this command to display the Board Identification PROM (BIP) hex and ASCII data for the specified card type and location. The PROM data consists of the board ID, part number, revision, date of manufacture, power, serial number, software match ID, and check sums.

**Keyword:** disp-bip

**Related Commands:** chg-bip-fld, chg-bip-rec, rtrv-bip, tst-bip

**Command Class:** Debug

**Parameters**

**NOTE:** As of Release 42.0, the dbdloc parameter is obsolete.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**NOTE:** Locations xy09 and xy10 are valid only if they are equipped with a HIPR2 card.

**:type=** (optional)

This parameter specifies the board type to be displayed.

**Range:** mbd  
mbd — Displays the main assembly.

**:dbdloc=** (obsolete)

Applique location. This parameter specifies the location of the applique.

**NOTE:** This parameter is obsolete.

**Range:** 1-2

**Example**

The following example displays the BIP data for the main assembly of the specified card location.

**disp-bip: loc=1105**

**Dependencies**

The value of the **loc** parameter cannot specify the location of a fixed disk or removable cartridge.

## Notes

## Output

The following example displays the BIP data for the main assembly.

**disp-bip:loc=1105**

```

**disp-bp****Display Breakpoint**

Use this command to display currently active breakpoints in the communication and application processors.

**Keyword:** disp-bp

**Related Commands:** dlt-bp, ent-bp

**Command Class:** Debug

## Parameters

**:card=** (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

**Range:** *GPLID–Subsystem ID*

*GPLID*—atmansi, atmitu, atmhc, bpdcm, bpdcm2, bphcap, bphcapt, bphmux, bpmpl, bpmplt, eoam, eroute, erthc, gls, hipr, hipr2, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, pktgen, sccphc, slanhc, ss7epm, ss7hc, ss7ipgw, ss7ml, utility, vsccp, vxutil, vxwslan

*Subsystem ID*—a, b, act, stb, all

The **oam** GPL can be specified with any of the subsystem IDs. For all other GPLs, only the **all** subsystem ID is valid.

**:imt=** (optional)

This parameter specifies the IMT address of the card.

**Range:** 0-251

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**:proc=** (optional)

This parameter specifies the processor type.

**Range:** appl, com

**appl**— Application processor

**com**— Communication processor

**Default:** appl

**:ueng=** (optional)

This parameter specifies the microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

**Range:** 0-5

## Example

**disp-bp:card=atmansi-all**

**disp-bp:loc=1214**

**disp-bp:loc=1109**

**disp-bp:loc=1109:ueng=3**

## Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

The **ueng** parameter can be specified only for IXP-based cards.

The **coam** GPLID accepts all subsystem values; all other GPLIDs accept only the **all** subsystem value.

The card location specified by the **loc** parameter must be in the database.

Values of **1114**, **1116**, **1117**, and **1118** cannot be specified for the **loc** parameter.

**Notes**

None

**Output**

The following examples are for x86-based cards:

**disp-bp:card=ss7ansi-all**

**disp-disk-dir****Display Disk Directory**

Use this command to display the DOS directory on the specified disk. This command can display the creation date for each file or for selected files and applies to fixed disks and removable cartridges or drives.

**NOTE:** This command can be used to verify that the correct version of a file is on the disk.

**Keyword:** `disp-disk-dir`

**Related Commands:** `act-gpl`, `chg-db`, `chg-gpl`, `copy-gpl`, `copy-meas`, `init-sys`, `rept-stat-db`

**Command Class:** Debug

## Parameters

**:file=** (optional)

This parameter specifies the name of the file to be displayed.

**Range:** `zzzzzzzzzzzz`

1–12 ASCII characters

**Default:** All files are displayed

**:loc=** (optional)

This parameter specifies the card location in the system.

**Range:** `1114`, `1116`, `1117`, `1113`, `1115`

`1114` — The TDM

`1116` — The TDM

`1117` — The removable cartridge drive

`1113` — The latched USB port

`1115` — The latched USB port

**:prtnggrp=** (optional)

Partition group. This parameter specifies the disk partition group to be displayed.

**Range:** `active`, `inactive`

**Default:** `active`

**:src=** (optional)

Source. This parameter specifies the identification of the disk containing the files to be displayed.

**Range:** `fixed`, `remove`, `usb`

`fixed` — The fixed disk

`remove` — The removable cartridge or drive

`usb` — The credit card drive

**Default:** The fixed disk

## Example

```
disp-disk-dir:loc=1117:file="dms.cfg"
```

```
disp-disk-dir:src=remove:file="fta"
```

```
disp-disk-dir:src=remove:file="*. *"
```

## Dependencies

Valid filenames must be in the format, *filename.extension*, with the following requirements:

File name—1–8 ASCII Characters

Extension—0–3 ASCII Characters

Wildcards (asterisks) are allowed when the wildcard pattern is enclosed in parentheses.

\*—Matches all characters in either filename or extension

?—Matches one character in either filename or extension

file="\*. \*"—Matches all files on disk

file="\*.tbl"—Matches all files on disk with `.tbl` as a extension

An E5-MCAP card must be installed before the **src=usb** parameter can be specified.

The **src** parameter must be specified.

The **1117** location is used by MDAL cards. The **1113** and **1115** locations are used by E5-MCAP cards. The **1114** and **1116** locations are used by TDM or E5-TDM cards.

A removable cartridge or drive must be inserted in the slot indicated by the value specified for the **loc** or **src** parameter.

The card specified by the **loc** parameter must be connected to at least one IMT bus.

## Notes

None

### **Legend**

**FILENAME**—The name of the file in the directory

**EXT**—The extension of the file name (for example, for the file MFC.BIN, MFC is the file name and BIN is the extension of the file name).

**LENGTH**—The amount of space, in bytes, the file occupies on the disk.

**LAST MODIFIED**—The data and time the file was changed.

**CLUSTER**—A 2-byte, 16-digit binary number that represents the first section of the disk occupied by the file.

**LBA**—The starting logical block address that corresponds to the **CLUSTER**.

**FILE(S)**—The number of files on the disk that match the search criteria.

**BYTES**—The amount of space, in bytes, the displayed files occupy on the disk

**VOLUME**—An 11-character name for the disk.

**BYTES FREE**—The number of bytes that are available on the disk for file storage.

**DISK SIZE**—The total capacity of the specified disk.

## **disp-disk-stats**

## **Display Disk Performance Statistics**

Use this command to display the disk performance statistics.

**NOTE:** The OAMs maintain disk read/writer access times as well as per table and per application statistics on the number of disk accesses and cache accesses. Per application and

per table statistics that have zero values are not displayed if an application ID or table ID is not specified; only nonzero statistics are displayed in the default report.

**Keyword:** disp-disk-stats

**Related Commands:** clr-disk-stats

**Command Class:** Debug

### Parameters

**:loc=** (mandatory)

Location. This parameter specifies the card location in the system.

**Range:** 1113, 1115

**:applid=** (optional)

Application ID. This parameter specifies the application IDs that are used to define tasks.

**Range:** 0-255

**Default:** all

**:tblid=** (optional)

Table ID. This parameter specifies the table IDs that are used to define tables.

**Range:** 0-1023

**Default:** all

### Example

**disp-disk-stats:loc=1113:applid=29**

**disp-disk-stats:loc=1113:applid=93**

**disp-disk-stats:loc=1113**

### Dependencies

The specified card location must contain a card that is running an OAM (1113 or 1115).

GPSM-II and E5-MCAP cards cannot co-exist in the system.

### Notes

None

**disp-lba****Display Logical Block Access**

Use this command to display the contents of a logical block of data at a specified logical block address of a fixed disk or removable cartridge.

**Keyword:** disp-lba

**Related Commands:**

**Command Class:** Debug

### Parameters

**:lba=** (mandatory)

This parameter specifies the logical block address.

**Range:** 0-1953125

**:loc=** (mandatory)

Location. This parameter specifies the card location in the system. A fixed disk or removable cartridge location must be specified.

**Range:** 1114, 1116, 1117

1114 — The standby TDM

1116 — The standby TDM

1117 — The removable cartridge

**Default:** Active fixed disk

### Example

**disp-lba:lba=676:loc=1117**

### Dependencies

The requested disk must be available.

The logical block address specified must be within the valid range for the disk specified.

If E5-MCAP, E5-MDAL, or E5-TDM cards are installed, then this command cannot be entered.

### Notes

None

**Output****disp- lba: lba=676: loc=1117**

**disp-mem****Display Memory**

Use this command to display memory in communication and application processors. This display is in byte format.

**Keyword:** disp-mem

**Related Commands:** set-mem

**Command Class:** Debug

**Parameters**

**:addr=** (optional)

This parameter specifies the address in the form of *segment-offset*.

**Range:**       *segment-offset*  
               *segment—h'00-h'ffff*  
               *offset—h'00-h'ffff*

**:bc=** (optional)

Byte count. This parameter specifies the number of data bytes to display.

**Range:**       **1-65535**

**Default:**     **96**

**:card=** (optional)

Card location. This parameter specifies the card location in the form of *GPLID-Subsystem ID*.

**Range:** *GPLID-Subsystem ID*

*GPLID*—**atmansi**, **atmitu**, **atmhc**, **bpdcm**, **bpdcm2**, **bphcap**, **bphcapt**, **bphmux**,  
**bpmpl**, **bpmplt**, **eoam**, **eroute**, **erthc**, **gl**, **hipr**, **hipr2**, **ipghc**, **ipgwi**, **iplhc**, **iplim**,  
**iplimi**, **ips**, **ipsg**, **ipshc**, **mcp**, **pktgen**, **sccphc**, **slanhc**, **ss7epm**, **ss7hc**, **ss7ipgw**,  
**ss7ml**, **utility**, **vsccp**, **vxutil**, **vxwslan**  
*Subsystem ID*—**a**, **b**, **act**, **stb**, **all**

**:dformat=** (optional)

This parameter specifies the memory dump format.

**Range:** **byte**, **word**, **dword**

**Default:** **byte**

**:imt=** (optional)

This parameter specifies the IMT address.

**Range:** **0-251**

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** **1101-1108**, **1111-1112**, **1201-1208**, **1211-1218**, **1301-1308**, **1311-1318**, **2101-2108**,  
**2111-2118**, **2201-2208**, **2211-2218**, **2301-2308**, **2311-2318**, **3101-3108**, **3111-3118**,  
**3201-3208**, **3211-3218**, **3301-3308**, **3311-3318**, **4101-4108**, **4111-4118**, **4201-4208**,  
**4211-4218**, **4301-4308**, **4311-4318**, **5101-5108**, **5111-5118**, **5201-5208**, **5211-5218**,  
**5301-5308**, **5311-5318**, **6101-6108**, **6111-6118**, **1109**, **1110**, **1209**, **1210**, **1309**, **1310**,  
**2109**, **2110**, **2209**, **2210**, **2309**, **2310**, **3109**, **3110**, **3209**, **3210**, **3309**, **3310**, **4109**, **4110**,  
**4209**, **4210**, **4309**, **4310**, **5109**, **5110**, **5209**, **5210**, **5309**, **5310**, **6109**, **6110**, **1113**, **1115**

**:paddr=** (optional)

This parameter specifies the physical offset of the memory address.

**Range:** **h'00-h'ffffff**

**:proc=** (optional)

This parameter specifies the processor type.

**Range:** **appl**, **com**

**appl**—Application processor

**com**—Communication processor

**Default:** **appl**

### Example

**disp-mem: loc=1204: paddr=h'103abc: bc=8: dformat=word**

**disp-mem: loc=1204: paddr=h'103abc: bc=8: dformat=dword**

**disp-mem: card=ss7ansi-all: addr=h'03a-h'001: bc=8**

### Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The value specified for the **bc** parameter cannot exceed **65535**.

The card location specified by the **loc** parameter must be in the database.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Card locations **1114**, **1116**, **1117**, and **1118** are not valid for memory commands.

The GPL specified in the **card** parameter must be supported.

The **addr** and **paddr** parameters cannot be specified together in the command.

### Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

### Output

**disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word**

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0
SDS Memory Dump from IMT Address H'000a
Source-Address = H'00103abc      Length = 8 bytes
0000 ffff 00ff 00ff 0000          .....
;
```

**disp-mem:card=psm-a:addr=h'03a-h'001:bc=8**

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0
SDS Memory Dump from IMT Address H'00f6
Source-Address = H'003a0001      Length = 8 bytes
0000 04 0d 3d 1c 04 0d 3d 1c    ..=...=.
;
```

## disp-trace

## Display Trace

Use this command to display trace entries.

**Keyword:** disp-trace

**Related Commands:** dlt-trace, ent-trace

**Command Class:** Debug

### Parameters

**:traceid=** (optional)

Trace ID. Identifier of the trace entry to be displayed.

**Range:** 1-10

### Example

**disp-trace**

**disp-trace:traceid=5**

### Dependencies

None

### Output

**disp-trace**

```
stdcfg2b 07-10-05 12:55:32 EST EAGLE 37.5.0
Trace Request 1:
CARD=      SS7ANSI      OPC=      001-001-001
TRACE DISPLAY COMPLETE.
;
```

## dlt-bp

## Delete Breakpoint

Use this command to delete breakpoints in the communication or application processors.

**Keyword:** dlt-bp

**Related Commands:** disp-bp, ent-bp

**Command Class:** Debug

## Parameters

**:addr=** (optional)

This parameter specifies the address in the form of *segment–offset*.

**Range:** *segment–offset*  
*segment—h'00–h'ffff*  
*offset—h'00–h'ffff*

**:card=** (optional)

Card location. This parameter specifies the card location in the form of *GPLID–Subsystem ID*.

**Range:** *GPLID–Subsystem ID*  
*GPLID—atmansi, atmitu, atmhc, bpdcm, bpdcm2, bphcap, bphcapt, bphmux, bpmpl, bpmplt, eoam, eroute, erthc, gls, hipr, hipr2, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, pktgen, sccphc, slanhc, ss7epm, ss7hc, ss7ipgw, ss7ml, utility, vsccp, vxutil, vxwslan*  
*Subsystem ID—a, b, act, stb, all*  
 The **oam** GPL can be specified with any of the subsystem IDs. For all other GPLs, only the **all** subsystem ID is valid.

**:imt=** (optional)

This parameter specifies the IMT address of the card.

**Range:** **0-251**

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115**

**:paddr=** (optional)

This parameter specifies the physical offset of the memory address.

**Range:** **h'00–h'ffffff**

**:proc=** (optional)

This parameter specifies the processor type.

**Range:** **appl, com**  
**appl**—Application processor  
**com**—Communication processor  
**Default:** **appl**

**:ueng=** (optional)

This parameter specifies the microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

**Range:** **0-5**

## Example

```
dlt-bp:loc=1109
dlt-bp:loc=1209:ueng=2
dlt-bp:card=hipr-all
```

**Dependencies**

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **ueng** parameter can be specified only for IXP-based cards.

The card location specified by the **loc** parameter must be in the database.

Values of **1114**, **1116**, **1117**, and **1118** cannot be specified for the **loc** parameter.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

The **addr** and **paddr** parameters cannot be specified together in the command.

**Notes**

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

**Output**

```
dlt-bp:card=oam-all:proc=com
```

```
Command Accepted - Processing
```

```
tekelecstp 97-01-20 19:21:10 EST Rel 37.0.0
```

```
dlt-bp:card=oam-all:proc=com
```

```
Command entered at terminal #1.
```

```
;
```

**dlt-trace****Delete Trace**

Use this command to delete provisioned MSU tracing criteria from the database.

**Keyword:** **dlt-trace**

**Related Commands:** **disp-trace**, **ent-trace**

**Command Class:** Debug

**Parameters**

**:traceid=** (optional)

Trace ID. Identifier of the trace entry to be deleted.

**Range:** **1-10**

**Example**

```
dlt-trace:traceid=5
```

```
dlt-trace
```

**Dependencies**

None

**Output**

```
dlt-trace:traceid=1
```

```
stdcfg2b 07-10-05 13:03:29 EST EAGLE 37.5.0
```

```
dlt-trace:traceid=1
```

```
Command entered at terminal #4.
```

```
;
```

**ent-bp****Enter Breakpoint**

Use this command to add breakpoints in communications and application processors in the system.

**Keyword:** **ent-bp**

**Related Commands:** **disp-bp, dlt-bp**

**Command Class:** Debug

**Parameters**

**:access=** (optional)

This parameter specifies the access type, in the form of *access type-format*.

Use the **data** parameter to set the format on IXP-based cards.

**Range:** *access type-format*

*access type*—**r, w, rw** (read, write, read-write)

*format*—**byte, word, dword, any**

**Default:** For x86-based cards—**rw-byte**

For IXP-based cards—**rw-any**

**:addr=** (optional)

This parameter specifies the memory location in the form of *segment-offset*.

**Range:** *segment-offset*

*segment*—**h'00–h'ffff**

*offset*—**h'00–h'ffff**

**:bc=** (optional)

This parameter specifies the number of data bytes to display.

For IXP-based cards, **bc** represents the number of bytes of memory. The number of bytes of stack to be displayed is 255 – **bc**. For example, if **bc=128**, then 128 bytes of memory and 127 bytes of stack are displayed. If **bc=0**, then 0 bytes of memory and 255 bytes of stack are displayed. The exception to this rule is that 1 byte of stack is never displayed.

**Range:** **0-255**

For x86-based cards, the maximum number of bytes is **96**.

For IXP-based cards, the maximum number of bytes is **255**.

**:ca=** (optional)

This parameter specifies condition “a” in the form of *register-condition-integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

**Range:** *register-condition-integer*

*register*—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r1-r15**

*condition*—**eq, neq, gt, lt, gte, lte**

*integer*—**h'00–h'ffffff**

**:card=** (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

**Range:** *GPLID-Subsystem ID*  
*GPLID*—**atmansi, atmitu, atmhc, bpdcm, bpdcm2, bphcap, bphcapt, bphmux, bpmpl, bpmplt, eoam, eroute, erthc, gls, hipr, hipr2, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, pktgen, sccphc, slanhc, ss7epm, ss7hc, ss7ipgw, ss7ml, utility, vsccp, vxutil, vxwslan**

*Subsystem ID*—**a, b, act, stb, all**

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:cb=** (optional)

This parameter specifies condition “b” in the form of *register-condition-integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

**Range:** *register-condition-integer*  
*register*—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r0-r15**  
*condition*—**eq, neq, gt, lt, gte, lte**  
*integer*—**h'00–h'ffffff**

**:ctx=** (optional)

This parameter specifies the bit-mapped microengine context mask.

**Range:** **1-15**

**:da=** (optional)

This parameter specifies the dump address, in the form of *segment-offset*.

**Range:** *segment-offset*  
*segment*—**h'00–h'ffff**  
*offset*—**h'00–h'ffff**

**:data=** (optional)

This parameter instructs a data breakpoint to qualify on a match of the data.

This parameter is valid only on IXP-based cards.

**Range:** *value-mask*  
*value*—**0-0xFFFFFFFF**  
*mask*—**0-0xFFFFFFFF**

**Default:** **0-0**

**:dformat=** (optional)

Memory dump format (byte, doubleword, word).

**Range:** **byte, dword, word**

**Default:** **byte**

**:dpaddr=** (optional)

Memory dump address (physical offset).

**Range:** **h'00–h'ffffff**

**:dr=** (optional)

The data register indirect memory dump, in the form *register-register-integer*.

The *register-register* value is the CPU internal register.

The *integer* value is the offset value.

**Range:** *register-register-integer*

*register*—sp, bp, ss, ds, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx

*register*—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx

*integer*—h'00–h'ffffff

**:drarm=** (optional)

ARM register indirect memory dump.

**Range:** *ARM register-integer*

*ARM register*—r0-r15, sp, lr, pc

*mask*—0-65535

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

**Default:** 0-0

**:dur=** (optional)

Breakpoint duration.

**Range:** temp, perm

**Default:** temp

**:imt=** (optional)

IMT address of the card.

**Range:** 0-251

**:ind=** (optional)

Indirection count.

**Range:** 0-3

**Default:** 0

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**:paddr=** (optional)

The physical offset of the memory address.

**Range:** h'00–h'ffffff

**:proc=** (optional)

Processor type.

**Range:** appl, com

**appl**—Application processor

**com**—Communication processor

**Default:**     **appl**

**:rep=** (optional)

Repetitions for this breakpoint.

**Range:**       **0-255**

**Default:**     **0**

**:type=** (optional)

Breakpoint type in the form of processor type-breakpoint type

**Range:**       *processor type-breakpoint type*

*processor type*—**p186, p286, p486, arm, ixp**

*breakpoint type*—**code, codehw, codesw, data**

**Default:**     For x46-based cards—**p486-code**

For IXP-based cards—**arm-codesw**

**:ueng=** (optional)

Microengine number. This parameter is valid only on IXP-based cards.

If this parameter is not specified for an IPX-based card, then the command is assumed to be intended for the ARM processor in the IXP chip.

**Range:**       **0-5**

### Example

```
ent-bp:loc=1204:paddr=h'27c3c:type=p486-data:access=rw-word
```

```
ent-bp:loc=1109:paddr=h'401000:type=arm-codesw:access=rw-  
any:ca=r7-eq-0
```

```
ent-bp:loc=1209:paddr=h'402000:type=arm-data:access=w-  
any:data=h'1111-h'ff
```

```
ent-bp:loc=1309:paddr=h'403000:type=ixp-codesw:ueng=2:ctx=1
```

```
ent-bp:card=hipr-all:paddr=h'404000:type=arm-  
codehw:drarm=r3-0:bc=64
```

```
ent-bp:loc=1113:addr=h'03a-0001
```

### Dependencies

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Values of **1114**, **1116**, **1117**, and **1118** cannot be specified for the **loc** parameter.

The **loc** parameter, the **imt** parameter, or the **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **dr** parameter and the **da** parameter cannot be specified together in the command.

The **dur=perm** parameter and the **rep** parameter cannot be specified together in the command.

The **dur=perm** parameter cannot be specified when the value of the processor type portion of the **type** parameter is **p186** or **p286**.

When the **da** parameter, the **dr** parameter, or the **drarm** parameter is specified, the **dpaddr** parameter cannot be specified.

When the **paddr** parameter and the **bc** parameter are specified, either the **dpaddr** or **dr** parameter must be specified in the command.

The **access** parameter can be specified only when the **type** parameter value is **p486-data** or **arm-data**.

The **bc** parameter value cannot be greater than **96** for x86-based cards.

The **ind** parameter value cannot be greater than **3**.

The specified card must be in use.

For 80286 processors, registers for 80386 processors cannot be specified.

For 80286 processors, **integer** values for registers and conditions must be less than **65535**.

The **ueng** parameter is valid only on IXP-based cards (the value **ixp** is specified for the processor type portion of the **type** parameter).

The **cts** parameter is valid only on IXP-based cards (the value **ixp** is specified for the processor type portion of the **type** parameter).

The **data** parameter is valid only on IXP-based cards.

The **data** parameter is valid only when the value is **data** for the breakpoint type portion of the **type** parameter.

The register values **sp**, **lr**, **pc**, and **r0-r15** for the **ca**, **cb**, and **drarm** parameters are valid on an IXP-based card ARM processor.

The **ca** and **cb** parameters cannot be specified when the value **ixp** is specified for the processor type portion of the **type** parameter.

The **drarm** parameter can be specified only on IXP-based cards.

The **drarm** parameter can be specified only when the value **arm** is specified for the processor type portion of the **type** parameter.

The **dr** parameter cannot be specified for IXP-based cards.

The **data** and **codesw** values for the breakpoint type portion of the **type** parameter cannot be specified when the value **ixp** is specified for the processor type portion of the **type** parameter.

The **arm** and **ixp** values for the processor type portion of the **type** parameter are valid only on IXP-based cards.

The value **any** for the format portion of the **access** parameter can be specified only on IXP-based cards. The format value must be set to **any** on IXP-based cards.

When the value **ixp** is specified for the processor type portion of the **type** parameter, the **ueng** and **cts** parameters must be specified.

The **addr** parameter can be specified only when the **proc=com** parameter is specified for DS0 cards with PROM-based COM processors (such as TSMs).

When the **ca**, **cb**, and **dr** parameters are used with 80186 and 80286 processors, the register values **ip**, **fs**, **gs**, **esi**, **edi**, **ebp**, **esp**, **eip**, **efl**, **eax**, **ebx**, **ecx**, and **edx** cannot be specified. These registers can be used only with 80486 processors. The integer values for these parameters when used with 80186 and 80286 processors must be less than **h'ffff (65535)**.

The **data** value for the breakpoint type portion of the **type** parameter cannot be specified with the values **p186**, **p286**, and **ixp** for the processor type portion of the **type** parameter.

The **da** parameter cannot be specified for IXP-based cards.

An ARM register value must be specified for an IXP-based card with an ARM processor.

The **addr** or **paddr** parameter must be specified in the command. Both parameters cannot be specified in the command.

## Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

**Output****ent-bp:loc=1113:addr=h'03a-0001**

SDS Response from IMT Address H'000a - command complete.

;

**ent-trace****Enter Trace**

Use this debug command to trace MSUs sent to Service Module cards (DSM or E5-SM4G), or LIM cards running the **ss7ansi**, **ccs7itu**, **vsccp**, **atmitu**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw** or **ipgwi** applications.

The EAGLE 5 ISS traps MSUs that meet the provisioned tracing criteria, and the MSU remains in the trapped state for the life span of that MSU. The life span varies depending on the type of MSU. For MTP-Routed or GTT MSUs, the life span lasts until the MSU travels out of the EAGLE 5 ISS or is discarded. For LNP MSUs, the life span lasts until the request is processed. The response is not part of the LNP MSU. Trapping a response requires the provisioning of another MSU trace.

The **ent-trace** command uses different parameters depending on the card type sending the MSU as shown:

- Service Module—**error**, **gt**, **lrn**, **tn**, **ssp/sspa/sspi/sspn/sspn24**, **dn**, **entityid**, **imei**, **imsi**
- LIM card running ANSI applications—**error**, **ssp/sspa**, **opc/opca**, **dpc/dpca**, **tlnpisuptype**, **gt**
- LIM card running ITU applications—**error**, **sspi/sspn/sspn24**, **opci/opcn/opcn24**, **dpci/dpcn/dpcn24**, **gt**

The following parameters are mutually exclusive: **lrn**, **tn**, **dn**, **entityid**, **imsi**, **imei**, **error**.

The following parameters can be used once in a single MSU trace request with ONE of the mutually exclusive parameters specified above: **opc**, **dpc**, **ilsn**, **si**, **gt**, **ssp**, **h0h1**, **cpc**, **cic/ecic**.

The **cic/ecic** parameters can be used only for ISUP traffic. The **cic** parameter must be specified with the **cic** parameter.

For all cards supported by the **ent-trace** command, the **error** parameter can be provisioned as the only optional parameter or in addition to any other optional parameter to trace any messages that fail verification or processing. If the **error** parameter not specified, the default value is **error=no**.

**CAUTION**

**CAUTION:** If the system configuration approaches the maximum number of provisioned Service Module cards (DSM and E5-SM4G cards), entering this command might cause an OAM to reset because of the amount of information that may be returned.

**Keyword:** **ent-trace**

**Related Commands:**

**Command Class:** Debug

**Parameters**

**:card=** (mandatory)

This parameter specifies the card location in the form of *APPL CLASS-Subsystem ID*.

**Range:** *APPL CLASS-Subsystem ID*  
*APPL CLASS—atmansi, atmitu, ccs7itu, iplim, iplimi, ss7ansi, ss7ipgw, ipgwi, vsccp*  
*Subsystem ID—all*

**:brief=** (optional)

This parameter specifies whether all information is provided for each MSU as it moves through the EAGLE 5 ISS.

**Range:** **no, yes**  
**no** — All information, including data sections for the MSU, is displayed.  
**yes** — The data sections for the MSU are not displayed.

**:cic=** (optional)

This parameter specifies the beginning value for a CIC range.

**Range:** **0-16383**

**:cpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **cpc**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:cpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone—0-7*

*area—000-255*

*id—0-7*

**:cpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:cpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:dn=** (optional)

Directory Number. The **dn** parameter is used for the ANSI41 AIQ, ATINP, G-Flex, G-Port, INP, PPSMS, or V-Flex features.

The **tn** parameter is used as the directory number for LNP.

**Range:**       5-15 digits

Valid digits are **0-9, a-f, A-F**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-nm)*

**Synonym:** **dpca**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**       **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned **on** (*nnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:ecic=** (optional)

This parameter specifies the end value for a CIC range.

**Range:** 0-16383

**:entityid=** (optional)

This parameter specifies the entity ID.

**Range:** 1-15 digits

1-15 digits; valid digits are 0-9, a-f, A-F

**:error=** (optional)

This parameter specifies whether to perform a trace on any message verification error and message processing error

**Range:** yes, no

**Default:** no

**:gt=** (optional)

Global title. This parameter specifies the global title digits.

**Range:** 1-21 digits

Valid digits are 0-9, a-f, A-F

**:h0h1=** (optional)

This parameter specifies a combination of values contained in some MSUs. The **h0** value is the code for a message group, and **h1** is the code for a message within that group.

**Range:** 0-255

**:ilsn=** (optional)

This parameter specifies the incoming linkset name.

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters.

**:imei=** (optional)

This parameter specifies the International Equipment Identifier.

**Range:** 14 digits

Exactly 14 digits; valid digits are 0-9, a-f, A-F.

**:imsi=** (optional)

This parameter specifies the International Mobile Station Identifier.

**Range:** 5-15 digits  
Valid digits are **0-9, a-f, A-F**.

**:loc=** (optional)

Location. This parameter specifies the card location of the card as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:lrn=** (optional)

The local routing number.

**Range:** *Exactly 14 digits*  
Valid digits are **0-9**.

**:mode=** (optional)

This parameter specifies the type of output that is displayed.

**Range:** **brief, default, detail, debug**  
**brief**— Abbreviated information is displayed when an MSU matches the request.  
**default**— The default value of this parameter.  
**detail**— Detailed information is displayed when an MSU matches the request.  
**debug**— Complete information is displayed when an MSU matches the request.

**:opc= or :opca=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-ncncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix subfield* indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:rep=** (optional)

The number of MSUs to trap.

**Range:** **0-255**

**:service=** (optional)

This parameter specifies the service that is offered by the EAGLE 5 ISS.

**Range:** **gflex, gport, inpmr, inpq, smsmr, mnpsms, eir, idpr, idps, tif, tif2, tif3, tobr, aiq, none**

**:si=** (optional)

Service indicator.

**Range:** **0-15**

**:sls=** (optional)

Signaling link selector.

**Range:** **0-255**

**:ssp= or :sspa=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:sspi=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:sspn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:sspn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:tlnpisuptype=** (optional)

The ISUP message type.

**Range:** **0-255**

**:tn=** (optional)

The directory number.

**Range:** 10 digits

Exactly 10 digits. Valid digits are **0-9**.

**Example**

**ent-trace:opc=1-1-1:card=SS7ANSI-ALL:rep=2**

**ent-trace:tlnpisuptype=01:card=SS7ANSI-ALL**

```

ent-trace:dn=98912345:loc=1105

```

### Dependencies

The **card** parameter or the **loc** parameter must be specified.

At least one optional parameter must be specified. The **error** parameter can be specified as the only optional parameter or with any of the other optional parameters in the command.

The following parameters cannot have a value of **none**: **gt**, **entityid**, **dn**, **imei**, and **imsi**.

For the **card** parameter, only the following values are allowed: **vsccp**, **ss7ansi**, **atmitu**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, or **ccs7itu**.

The only qualifier allowed for the **card** parameter is **-all**.

The following parameters are invalid for LIM cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, and **tn**.

The following ITU point code parameters are invalid for LIM cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **opci**, **opcn**, **opcn24**, **dpci**, **dpcn**, **dpcn24**, **sspi**, **sspn**, and **sspn24**.

The following parameters are invalid for LIM cards running the **atmitu** or **iplimi** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, **tn**, and **tlnpisuptype**.

The following ANSI point code parameters are invalid for LIM cards running the **iplimi** GPL: **opc**, **opca**, **dpc**, **dPCA**, **ssp**, and **sspa**.

The following parameters are invalid for Service Module cards running the **vsccp** application: **opc**, **dpc**, and **tlnpisuptype**.

The G-Flex feature or the Equipment Identity Register feature must be turned on before the **imsi** parameter can be specified.

If the ITU Duplicate Point Code (ITUDUPPC) feature is turned on, the ITU national point code must be specified as a full point code.

The Equipment Identity Register (EIR) feature must be turned on before the **imei** parameter can be specified.

The AINPQ, G-Flex, G-Port, IDP Relay, INP, PPSMS, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the **dn** parameter can be specified. The G-Flex, G-Port, INP, or V-Flex feature must be turned on or the ATINP, IDP Relay or any TIF feature must be enabled before the **entityid** parameter can be specified.

The **loc** and **card** parameters are mutually exclusive. Only one of the following parameters can be specified in a single MSU trace request: **lrn**, **tn**, **dn**, **entityid**, **imsi**, **imei**, or **error**.

A maximum of 10 traces can be entered in the system at a time.

Values **1113** - **1118** cannot be specified for the **loc** parameter. These values are not supported by the **ent-trace** command.

**Output**

The following example displays output for an MTP trace.

**ent - trace: loc=1101:dpc=7-1-0**

```

## rtrv-upgrade-config

## Retrieve Upgrade Configuration

Use this command to retrieve provisioned data used by the upgrade software during an upgrade of an in-service EAGLE 5 ISS from a source release to the target release.

**Keyword:** **rtrv-upgrade-config**

**Related Commands:** **act-upgrade**, **chg-upgrade-config**

**Command Class:** Debug

### Parameters

**:display=** (optional)

Display Indicator. This parameter indicates what type of output is to be displayed.

**Range:** **tblcnv**, **prtnstat**, **all**

**tblcnv**— Displays a list of DMS tables that will be converted during the next upgrade.

These tables are selected for conversion using the **chg-upgrade-config** command.

**prtnstat**— This parameter is not implemented at this time.

**all**— Display all upgrade configuration data.

**Default:** **all**

### Example

Display a list of DMS tables that will be converted during the next upgrade.

```
rtrv-upgrade-config:display=tblcnv
```

```
rtrv-upgrade-config
```

### Dependencies

None

### Output

```
rtrv-upgrade-config:display=tblcnv
```

```
rlghncxa03w 07-03-13 08:15:45 EST EAGLE 37.5.0
```

```
The following tables will be converted:
```

```
FEAT_CTRL Table, ID=327
```

```
Command Completed.
```

```
;
```

```
rtrv-upgrade-config
```

```
rlghncxa03w 10-02-13 08:15:45 EST EAGLE 42.0.0
```

```
Software Access Key entered on system: VBJYAPDPBTEJB
```

```
Configured Upgrade Threshold Type: GROUP
```

```
Command Completed.
```

```
;
```

## send-msg

## Send Message

Use this debug command to manually simulate a system generated message from a user terminal. The parameters (not entered by the user) are defaulted to:

- Origination subsystem = **cam\_active**
- Destination subsystem = **orig application ID=appl\_ID\_ui**
- Violation= **no report**
- Bus = **imt choice**
- Message length = **computed**

**Keyword:** send-msg

**Related Commands:**

**Command Class:** Debug

### Parameters

**:da=** (mandatory)

This parameter specifies the destination application ID.

**Range:** 0-255

**:ds=** (mandatory)

This parameter specifies the destination subsystem.

**Range:** 0-255

**:f=** (mandatory)

This parameter specifies the function ID.

**Range:** 0-255

**:loc=** (mandatory)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318,  
2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108,  
3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118,  
4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208,  
5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:alt=** (optional)

This parameter specifies whether to use the alternate bus bit.

**Range:** on, off

**Default:** on

**:bus=** (optional)

This parameter specifies the IMT bus.

**Range:** a, b

**Default:** a

**:d0=** (optional)

This parameter specifies the application data.

**Range:** 0-255

**:d1=** (optional)

This parameter specifies the application data.

**Range:** 0-255

**:d2=** (optional)

Application Data.

**Range:** 0-255

- :d3=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d4=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d5=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d6=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d7=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d8=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :d9=** (optional)  
This parameter specifies the application data.  
**Range:**     **0-255**
- :len=** (optional)  
This parameter specifies the message length in bytes.  
**Range:**     **0-65535**  
**Default:**    Calculated
- :oa=** (optional)  
This parameter specifies the originating application ID.  
**Range:**     **0-255**  
**Default:**    **2**
- :os=** (optional)  
This parameter specifies the originating subsystem.  
**Range:**     **0-255**  
**Default:**    **0**
- :sut=** (optional)  
This parameter specifies the signal unit type.  
**Range:**     **0-9**  
**Default:**    **2**

### Example

```
send-msg: loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7  
send-msg: loc=1113:ds=2:oa=h'17:da=h'30:f=11  
send-msg: loc=1116:ds=2:oa=h'17::da=h'30:f=12
```

### Dependencies

The value of the **da** parameter must be valid.

The destination location must be equipped to receive messages.

Card locations **xy 09** and **xy 10** cannot be used with bus **b** and bus **a**, respectively.

The value of the **ds** parameter must be valid.

### Notes

Both the **bus** and **sut** parameters must be used when sending a message to an HMUX or HIPR card.

If the **bus** parameter is not specified with an HMUX or HIPR card location on **imt b** (such as **xy 10**), the bus **b** parameter value is used instead of the bus **a** parameter value.

### Output

```

send-msg: loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7

## set-mem

## Set Memory

Use this command to set values in memory in the communication and application processors. If a card is reloaded, these memory changes are lost.

**Keyword:** set-mem

**Related Commands:** disp-mem

**Command Class:** Debug

### Parameters

**:addr=** (optional)

This parameter specifies the address, in the form of *segment-offset*.

**Range:**        *segment-offset*  
                  *segment—h'00—h'ffff*  
                  *offset—h'00—h'ffff*

**:byte=** (optional)

This parameter specifies the byte value to write to the specified memory location(s).

**Range:** 0–h'00–h'ff

**:card=** (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

**Range:** *GPLID–Subsystem ID*

*GPLID*—atmansi, atmitu, atmhc, bphcap, bphmux, bpdcm, bpdcm2, ccs7itu, eoam, eroute, erthc, gls, hipr, hipr2, ipghc, ipgwi, iplhc, iplim, iplimi, ips, ipsg, ipshc, mcp, mplga, mplgi, pktgen, sccp, sccphc, slanhc, ss7ansi, ss7epm, ss7hc, ss7ipgw, ss7ml, stplan, utility, vsccp, vxutil, vxwslan

*Subsystem ID*—a, b, act, stb, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:dword=** (optional)

This parameter specifies a double word value to write to the specified memory location(s).

**Range:** 0–h'00–h'ffffff

**:fill=** (optional)

This parameter specifies the number of times that the value is to be written to successive addresses.

**Range:** 0–65535

**Default:** 1

**:imt=** (optional)

This parameter specifies the IMT address.

**Range:** 0–251

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1112, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**:mask=** (optional)

This parameter specifies the mask that selects the bits that are to be included in the operation (op).

**Range:** 0–0xFFFFFFFF

**Default:** 0xFFFFFFFF

**:op=** (optional)

Operation. This parameter specifies the operation that is performed in order to arrive at the final value in the memory location.

**Range:** replace, and, or, x

**Default:** replace

**:paddr=** (optional)

This parameter specifies the physical offset of the memory address.

**Range:** h'00–h'ffffff

**:proc=** (optional)

This parameter specifies the processor type.

**Range:** appl, com

**appl**—Application processor

**Default:** **com** — Communication processor  
**appl**

**:word=** (optional)

This parameter specifies a word value to write to the specified memory location(s).

**Range:** **h'00–h'ffff**

### Example

```
set-mem:loc=1109:paddr=h'201000:byte=0:fill=1024
```

```
set-mem:card=hipr-all:paddr=h'202000:word=h'2a:op=and:mask=h'fff
```

### Dependencies

Either the **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The card location specified by the **loc** parameter must be in the database.

All of the subsystem values can be specified with the **oam** GPLID. The other GPLID values can be specified only with the **all** subsystem value.

Values of **1114**, **1116**, **1117**, and **1118** cannot be specified for the **loc** parameter.

Either the **byte**, **word**, or **dword** parameter must be specified.

Only one of the **byte**, **word**, and **dword** parameters can be specified in the command.

The **paddr** parameter cannot be specified for an SS7 LIM card.

The **addr** and **paddr** parameters cannot be specified together in the command.

The value specified for the **fill** parameter cannot exceed **65535**.

### Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

### Output

```
set-mem:card=ss7ansi-all:addr=h'03a-h'001:byte=4
```

```
rlghncxa03w 01-03-22 21:14:03 EST Rel 28.1.0
```

```
SDS Response Code 22 from IMT Address H'00f6 - command complete.

# Pass-Through Commands

This chapter introduces the pass-through commands and describes the command conventions. The pass-through commands are listed in alphabetical order starting on page 7-2.

## Introduction

The pass-through commands are used within the **pass** command (see Chapter 5). Pass-through commands are passed through the OAM and sent to individual cards for processing. Pass-through commands reduce the need to add card-specific and application-specific code to the OAM build.

## Command Conventions

The following is an example of a **pass** command:

```
pass:loc=1201:cmd="connmgr -c"
```

The **cmd** parameter contains the pass-through command (**connmgr -c**) within the double quotes.

Pass-through commands consist of two types of tokens: command name and command options. Tokens are whitespace-delimited and null-terminated. The generalized format of a pass-through command is:

```
command_name option1 option2....option n-1.... option n
```

In the example, the *command\_name* is '**connmgr**' and the option is '-c'.

Options and option parameters are made up of a specific character string or a variable. The variable is to be replaced with a value selected from a range of values. Option variables and option parameter variables are underlined. For example, the **arp** command option **-d** has the parameter variable **IP address**. Specify the IP address as in the command **arp -d 192.9.200.44**. Do not enter the underlined text; enter a value instead.

Help information for each pass-through command can be obtained by using the option **-h** on any command.

**arp****Address Resolution Protocol**

This command is used to display and modify the internet to ethernet address translation tables used by the address resolution protocol.

**Keyword:** arp

**Command Class:** IP Stack Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the arp command option-**d** has the parameter IP address. The IP address must be specified for which an ARP entry will be deleted, as in the command **arp -d 192.9.200.44**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a**

This option displays all entries in the ARP table.

**-d IP address**

This option deletes an ARP entry for the specified IP address.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

**-f**

This option flushes all entries from the ARP table.

**-h**

This option displays help (usage) information for the command.

**-s IP address MAC address**

This option creates an ARP entry for the specified IP address and ethernet address.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. For example, **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

6 hexadecimal numbers separated by colons; each number in the range **0 - FF**.

The MAC (media access control) address is an ethernet address with the format **x:x:x:x:x:x**, where **x** is a hexadecimal integer from **0** to **FF**. For example, **08:00:20:1b:0f:f2**.

**Example**

**arp -a**

**arp -s 192.9.200.44 08:00:20:1b:0f:f2**

**arp -d 192.9.200.44**

**arp -f**

**Dependencies**

Only one of the options can be specified at a time.

The **arp** command with no options displays all of the current ARP cache entries.

### Notes

The **arp** command is executed through the **pass** command.

### Output

**pass:loc=1105:cmd="arp" or**

**pass:loc=1105:cmd="arp -h"**

```

## aslog

## SCTP Application Server Log

This command is used to display the state changes for a specified Application Server (AS).

**Keyword:** aslog

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **aslog** command has the parameter asname. The Application Server name must be specified for which the log will be displayed, as in the command **aslog as1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asname

This option specifies the Association Server name for the display.

**-h**

This option displays help (usage) information for the command.

### Example

**aslog as1**

### Dependencies

None

### Notes

None

**Output**

**pass:loc=1105:cmd="aslog as1"**

**asplog****SCTP Application Server Process Log**

**NOTE: This command is obsolete. The functions have been updated and moved to the ualog command.**

This command is used to display the UA state history for a specified Application Server Process (ASP).

**Keyword:** **asplog**

**Command Class:** Application Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **asplog** command has the parameter asp name. The Application Server Process must be specified for which the log will be displayed, as in the command **asplog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asp name

This option specifies the Application Server Process name for the display.

**-h**

This option displays help (usage) information for the command.

**-i event group**

This option includes groups of events in the state machine history.

**Range:** service, ua

**-x event group**

This option excludes groups of events from the state machine history.

**Range:** service, ua

### Example

**asplog s7000**

```

When a received M3UA or SUA PDU contains errors, a response error message is transmitted containing an error code. Error codes are recorded to and displayed in the **asplog** output only when the UA peer-to-peer message logging option (**-i ua**) is enabled.

The following output example shows error code 0x0000015:

**pass:loc=1303:cmd="asplog asp1303a"**

```

## Error Codes

**NOTE: The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18**

The following error codes can appear in the error messages:

### 0x01—Invalid Version

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

### 0x03—Unsupported Message Class

A message was received with an unexpected or unsupported Message Class.

### 0x04—Unsupported Message Type

A message was received with an unexpected or unsupported Message Type.

### 0x05—Unsupported Traffic Handling Mode

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic

Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

**0x06—Unexpected Message**

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

**0x07—Protocol Error**

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

**0x09—Invalid Stream Identifier**

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

**0x0d—Refused - Management Blocking**

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

**0x0e—ASP Identifier Required**

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

**0x0f—Invalid ASP Identifier**

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier.

**0x11—Invalid Parameter Value**

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

**0x12—Parameter Field Error**

A message is received with a parameter that has a wrong length field.

**0x13—Unexpected Parameter**

A message contains an invalid parameter.

**0x14—Destination Status Unknown**

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

**0x15—Invalid Network Appearance**

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

**0x16—Missing Parameter**

A message is received, and a mandatory parameter is not included in the message.

**0x19—Invalid Routing Context**

A message is received from a peer with an invalid (unconfigured) Routing Context value. The invalid Routing Context is included in the error message.

**0x1a—No Configured AS for ASP**

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

## assocrtt

### SCTP Association Round Trip Time

This command is used to display the SCTP round trip times for a specified association. Minimum, maximum, and average times are kept for each open association. The Retransmission Mode (RFC or LIN) and the configured Minimum and Maximum Retransmission Timeout limits are also displayed.

**Keyword:** `assocrtt`

**Command Class:** Application Maintenance

#### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `assocrtt` command has the parameter aname. The association name must be specified for which the information will be displayed, as in the command `assocrtt c7000`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

**-r**

This option resets all statistics for the specified association name.

#### Example

`assocrtt c7000`

`assocrtt c7000 -r`

#### Dependencies

None

#### Notes

This command does not indicate whether or not the socket is congested.

**Output****pass:loc=1105:cmd="assocrtt" or****pass:loc=1105:cmd="assocrtt -h"**

## connmgr

## Connection Manager

This command is used to generate reports about the status of the connection manager.

**Keyword:** connmgr

**Command Class:** Application Maintenance

### Options

#### -d

This option displays a connection manager data summary. For IPSG cards, this report contains summary information and does not contain information for individual signaling links.

#### -h

This option displays help (usage) information for the command.

#### -i

This option displays SCTP instance and association data.

#### -l

This option displays the connection manager event log.

#### -n

This option displays the SCTP notification log.

#### -r

This option resets the connection manager event log.

**Example****connmgr -r****connmgr -c****connmgr -s****Dependencies**

Only one of the options can be specified at a time.

If no options are specified, usage information is displayed.

**Notes**

The **connmgr** command is executed through the **pass** command.

**Output****pass:loc=1107:cmd="connmgr" or****pass:loc=1304:cmd="connmgr -h"**

```
Command Accepted - Processing
```

```

rlghncxa03w 08-01-21 15:29:46 EST  EAGLE5 38.0.0
pass:loc=1304:cmd="connmgr -h"
Command entered at terminal #1.
;
rlghncxa03w 08-01-21 15:29:46 EST  EAGLE5 38.0.0
PASS: Command sent to card
;
rlghncxa03w 04-07-02 15:29:46 EST  EAGLE5 31.6.0
Usage: CONNMGR [-d] [-h] [-i] [-l] [-n] [-r]
Options:
  -d    Display connection manager data summary
  -h    Displays this message
  -i    Displays instance data
  -l    Display the connection manager event log
  -n    Display the SCTP notification log
  -r    Reset the connection manager event log
;

```

**pass:loc=1107:cmd="connmgr -d"**

The Connection Manager Data Summary displays all provisioned signaling link ports.

In the following example, signaling link port (slk) B is valid only for IPLIMx cards.

Command Accepted - Processing

```

    rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
    pass:loc=1107:cmd="connmgr -d"
    Command entered at terminal #1.
;
    rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
    PASS: Command sent to card

Event descriptions for **connmgr -l**

- **lnk-act**-The signaling link (slk) was activated.
- **lnk-deact**-The signaling link (SLK) was deactivated.
- **adptr-cls**-An association was closed.
- **admin-open**-An association was opened via admin and available for connection.
- **admin-cls**-An association was closed via admin and not available for connection.
- **conn-rcvd**-A connection request has been received from a client.
- **conn-rfsd**-Connection request was refused by the server.

- conn-grnt-Connection was granted by the server.
- conn-fail-Connection request made by the client has failed.
- conn-made-A connection has been made between the client and server.
- pause-rcv-A connection received a pause event.
- resume-rcv-A connection received a resume event.
- conn-cngsd-An association has become congested.
- conn-uncng-An association is no longer congested.
- host-unreslvd-A remote host is unresolved.
- undef-evnt-An undefined event has come in.

Event reasons for **connmgr -l**

- lnk-not-actv-The SLK (signaling link) is not active.
- no-sock-avail-No association is available.
- unknown-sock-Unknown association.
- addr-in-use-Address is in use.
- net-unreach-The network is unreachable.
- net-reset-Network dropped connection on reset.
- sw-abort-Software caused connection abort.
- conn-reset-The connection was reset by the peer.
- no-buffers-No buffer space available.
- is-connected-Association is already connected.
- not-connected-Association not connected.
- shutdown-Can't send after association shutdown.
- too-many-refs-Too many references : can't splice.
- timed-out-Connection timed out.
- refused-connection refused.
- net-down-The network is down.
- txt-busy-Text file is busy.
- loop-Too many levels of symbolic links.
- host-unreachb-Host unreachable.
- not-blk-Block device required.
- host-down-Host is down.
- host-unreslvd-Host is unresolved.
- host-mismatch-Remote Host validation rule fails.
- undef-reason-Undefined reason.

## ftptest

## FTP Test

Use this command to send a test file to a configured FTP server that is used for the Measurements Platform feature

**Keyword:** **ftptest**

**Command Class:** System Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ftptest** command option **-a** has the parameter **appl**. The FTP registered application to be tested can be specified, as in the command **ftptest -a meas**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option provides help information for the command.

#### **-a appl**

This option specifies the FTP registered application to be tested.

#### **Range: meas**

**meas**—The Measurements Platform application

### Example

**ftptest**

**ftptest -h**

**ftptest -a meas**

### Dependencies

None

### Notes

The **ftptest** command is executed through the **pass** command.

The specified card location must have an IP port configured to an FTP server using the **ent-ftp-serv** command, and the card must have its IP port configured using the **chg-ip-lnk** command.

## Output

```
pass:loc=1105:cmd="ftpptest-h"
```

or

```
pass:loc=1105:cmd="ftpptest"
```

Command Accepted - Processing

```

;
```

## linkinfo

## Link State and Event Log

This command is used to display the state of a signaling link and to retrieve/clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card. For IPLIMx cards, the following signaling links are supported: **a, a1, a2, a3, b, b1, b2, or b3**. For the IPSG cards, the following signaling links are supported: **a:a15-b:b15**

**Keyword:** linkinfo

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **linkinfo** command option **-i** has the parameter event. The event to be included in the report can be specified, as in the command **linkinfo a -a -i m2pa**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option provides help information for the command.

#### **port**

This option specifies the signaling link port.

**Range:** a, b, a1, b1, a2, b2, a3, b3

#### **-a**

This option displays the adapter layer interface (ALI) log for the specified signaling link. For M3UA associations the **link -a** option is used to display the UA event log. This command logs information on an association basis. The **link** parameter is used to obtain this report on IPSG instead of the association name. This information is currently provided by the ualog command on IPGWx cards.

#### **-c**

This option displays congestion tuning parameters for M3UA and M2PA links. The report is enhanced to include card level congestion thresholds and the high-water mark for IPSG cards.

#### **-i event**

This option includes (does not filter) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are **ua, service**

**Range:** **ali, all, data, l2l3, l3l2, m2pa, state, ua, service**

**all**—include all events

**-l**

This option displays the IPLIM ALI event log for the specified signaling link

**-m**

This option displays acknowledgment times on an M2PA connection (minimum, maximum, weighted average, last recorded). For IPSPG cards, this measurement is supported for only IPSPG-M2PA links.

**-r**

This option resets (clears) the event log for the specified signaling link. This option is valid only with the **-a** option or **-l** option.

**-s**

This option displays the state information for the specified signaling link. For the IPSPG cards, this option is enhanced to display M3UA signaling link status.

**-v**

This option displays the link event filter configuration.

**-x event**

This option excludes (filters) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are **ua, service**

**Range:** **ali, all, data, l2l3, l3l2, m2pa, state, ua, service**

**all**—exclude all events

### Example

Provide help information for the command.

**pass:loc=1301:cmd="linkinfo -h"**

Set the filter to include ua events in the ua log report.

**pass:loc=1304:cmd="linkinfo a -i ua"**

Set the filter to include service events in the ua log report.

**pass:loc=1304:cmd="linkinfo a -i service"**

Display the ua log report for signaling link **a**.

**pass:loc=1304:cmd="linkinfo a -a"**

Display the ALI event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -a"**

Display the IPLIM application event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -l"**

Reset/clear the link event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -l -r"**

Clear the ua log report for signaling link **a**.

**pass:loc=1304:cmd="linkinfo a -a -r"**

Display the state information for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -s"**

Display acknowledgement times for an M2PA connection on signaling link **b1**.

**pass:loc=3315:cmd="linkinfo b1 -m"**

Display congestion tuning information for an IPSG-M3UA signaling link.

**pass:loc=1301:cmd="linkinfo a -c "**

## Dependencies

None

## Notes

None

## Output

Example of help for using the command:

**pass:loc=1301:cmd="linkinfo" or**

**pass:loc=1301:cmd="linkinfo -h"**

```

rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0

PASS: Command sent to card
;

rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0

Usage: LINKINFO port [-a [-r]] [-h] [-l [-r]] [-m [-r]] [-s] [-v]
Options:

link      Signaling link port: a, b, a1, b1, a2, b2, a3, b3
-a        Display the ALI event log for a signaling link
-c        Display Congestion Tuning Information for a signaling link
-h        Displays this message
-i event  Include (do not filter) a link event type in the log
           where 'event' is: ali, all, data, l2l3, l3l2,
                           m2pa, state
-l        Displays the event log for a signaling link
-m        Display Link Measurements
-r        Resets the specified event log for a signaling link
-s        Displays the state information for a signaling link
-v        View the link event filter configuration
-x event  Exclude (filter) a link event type from the log
           where 'event' is: ali, all, data, l2l3, l3l2,
                           m2pa, state

## msucount

## Message Signaling Unit (MSU) Count

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and IP connections. These counts can be reported and reset at the same time to get accurate counts for longer periods of time. In addition to MSUs transmitted and received, the command also reports statistics on packets related to MTP Primitives and on discarded transmit and receive data.

**Keyword:** **msucount**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msucount** command option **-l** has the parameter **port**. The link for which counts will be displayed can be specified, as in the command **msucount -l a1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-a**

This option is used to display IP connection statistics for a specific association. When **-a aname** is specified on the same line as **-k rtkey**, the output is assumed to be routing key output. When **-a aname** is specified on the command line without **-k rtkey**, association statistics output is generated. For IPSG cards, this option is enhanced to include receive and transmit counts for M3UA SSNMs (DAUD messages and M3UA SSNM PDUs) and replicated M3UA PDUs.

#### **-b**

This option is used to display signaling link bytes statistics. The signaling link bytes report displays data for measurements on a per-signaling-link basis for both the transmit and receive directions. The report can display link statistics for a specified signaling link number. If a link is not specified, the report displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx and IPSG cards. If a signaling link is valid for the card and application type, but is unequipped, then the report displays all zeros.

**-h**

This option is used to provide help information for the command.

**-f**

This option is used to display a full report (IPGWx application only).

**-k rtkey**

This option is used to specify the routing key for which the counts will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

This option is not supported for the IPSG cards.

The **-p** modifier can be specified to identify the point code type of the routing key that follows the **-k** option in the command.

The **-p** modifier is not supported for IPLIMx and IPSG cards.

The **rtkey** variable is optional when used with **-t default**, and mandatory for all other cases.

The following formats are valid for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (s) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.
- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (s) is in the range **0-2**, **4**, or **6-15**. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (s) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range **0** to **16363**.

**-l**

For IPSG cards, this option displays the link report for all equipped signaling links on the card.

**-l link**

This option is used to display counts for links. The link report optionally allows display of link statistics for a specified port.

The link report contains data, per link, for MSUs (tx/rev), MSU bytes (tx/rev), MGMT msgs (tx/rev), and discarded data (tx/rev).

For the IPSG card, the M2PA link report is the same as the IPLIMx M2PA report. The M3UA link report contains an additional detail line for non-discard pegs for SS7 SNM and Replicated M3UA PDU counts.

**Range: a, b, a1, b1, a2, b2, a3, b3 a:a15-b:b15**

Ports **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** are allowed only on SSEDCEM IPLIMx cards.

If a port is not specified, **msucount** displays link statistics for port **a** for IPGWx links, and port **a** and port **b** for IPLIMx links.

The **msucount** link statistics report contains all zeros for a port that is valid for the card and application type but is unequipped.

The range **a:a15-b:b15** is valid for IPSG cards.

**-l**

**link -f**

This option displays the full link report. For IPSG-M2PA links, this option displays the same report as the **-l <link>** option. For IPSG-M3UA links the report includes the data from the **-l <link>** report and includes an additional detail line displaying tx/rx discards counts and discard data.

**-p point code type**

This option modifier can be specified along with the **-k** option to identify the point code type (ANSI, ITU international, ITU-national, 24-bit ITU national, ITU international spare, and ITU national spare) in the routing key that follows the **-k** option in the command.

**Range:** ansi, itui, itun, itun24, ituis, ituns

**-r**

This option is used with other options to reset counts at the same time of reporting them.

**-t keytype**

This option is used to display the routing key type (IPGWx only).

**-x**

The routing context is an index that uniquely defines a routing key associated with an SUA or M3UA AS. For the IPSP card, the option displays a link report for all signaling links on the card that are members of the linkset that contains the specified routing context value (equivalent to the **msucount -lreport**). **-x** option is used as an alternative to the **-k** option to identify the routing key by specifying its routing context in the command line.

**NOTE: The -x rc option can only be used to specify routing keys containing M3UA/SUA associations.**

### Example

Link counts only. Displays brief count for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

**msucount -l**

Link counts only, for signaling link port **a1**.

**msucount -l a1**

Full/detail report for signaling link **a** for IPGWx.

**msucount -l -f**

Counts for the specified association only.

**msucount -a association name**

Counts for first matching routing key

**msucount -k 10-10-10:3:16**

Counts for the routing key report using the routing context.

**msucount -x 5**

Counts for first matching routing key and an associated association.

**msucount -a association name -k rtkey**

Counts for the default routing key

**msucount -k -t default**

Counts for a matching partial routing key.

**msucount -k 3-3-3 -t partial**

Counts for counts for link only. Displays brief report for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

**msucount**

Resets the signaling link count measurements.

**msucount -r**

Brief version of help text.

**msucount -h**

Full version of help text.

**msucount -h full**

Counts for link and first matching routing key

**msucount -b**

Byte report for signaling link A for IPGWx cards. Byte report for all equipped signaling links for IPLIMx cards.

**msucount -b -link**

Byte report for specified signaling link.

**msucount -l -k 10-10-10:3:16**

Use with other parameters to display and reset counts. Valid with the above combinations.

**msucount -l -r****msucount -r****msucount -x 5 -r**

The following examples provide a correct syntax to specify partial or default keys, or to specify a key by routing context.

**pass:loc=1105:cmd="msucount -k 5-5-1:5:6-6-6 -t partial**

**pass:loc=1105:cmd="msucount -k 5-5-1:5 -t partial"**

**pass:loc=1105:cmd="msucount -p ITUI -t partial -k 1-235-1"**

**pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351"**

**pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351-gr**

**pass:loc=1105:cmd="msucount -t partial -k :2 "**

**pass:loc=1105:cmd="msucount -k -t default"**

**pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"**

**pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"**

Examples of other valid routing key inputs:

**pass:loc=1105:cmd="msucount -r -k 5-5-6:5:5-5-7:1:1000"**

**pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:4:5-5-7:1:1000"**

**pass:loc=1105:cmd="msucount -k 5-5-1:3:5 -a assoc1"**

**pass:loc=1105:cmd="msucount -r -p ITUN24 -k 15-105-16:5:15-105-17:1:1000"**

**Dependencies**

At least one option must be specified.

**Notes**

The **msucount** command is executed through the **pass** command.

Combinations of the **-l**, **-a**, **-k**, **-t**, **-x** and **-b** options provide count information based on the entered combination.

If no parameters are specified, then the **-l** brief report is output.

Multiple reports are not supported with the IP Signaling Serviceability feature.

For the SS7IPGW and IPGWI GPLs, 4 types of reports can be generated: the link report, the routing key report, the IP connection statistics report, and the signaling link bytes report. For the IPLIM/ IPLIMI card, the routing key report is not supported.

The 4 reports are the following:

1. The link report (**-l** option) contains statistics per link—data about MSUs (transmit/receive), MSU bytes (transmit/receive), MGMT messages (transmit/receive), and discarded data (transmit/receive).
2. The routing key report (**-k** option) contains statistics for a specific routing key—data about MSUs (transmit), MSU bytes (transmit), and discards on the transmit path for the routing key. A list of one or more IP connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also displayed. If **-aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. If **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed. The **-p** (point code type) modifier option can be used with the **-k** option to specify the point code type of the routing key that follows the **-k** option in the command. For the **-k** options, the routing key must be an exact match of a routing key that exists in the static Routing Key table.
3. The IP connection statistic report (**-a aname** option) contains statistics for a specified IP connection—data about MSUs (transmit/receive), MSU bytes (transmit/receive), and discarded data (transmit/receive).  
When the **-a aname** option is specified in the command with the **-k** option, the output type is assumed to be routing key output.  
When **-a aname** is specified on the command line without **-k**, association statistics output is generated.
4. The signaling link bytes report (**-b** option) provides the following information for both IPGWx and IPLIMx cards: bytes/sec for the last second, average MSU size during the last second, and maximum one-second average MSU size since card load time or reset. For the IPLIMx cards, the report also provides the following information: sum of bytes/sec for the last second for all signaling link, average MSU size for last second for all signaling links, maximum average MSU size since load time or reset for all signaling links, and maximum MSU size since load time or reset for all signaling links.

The link report, routing key report, and IP connection statistic report (IPGWx only) can display individual transmit MSUs that were discarded at layer 2. The first 32 bytes of the MSU transmit data that is discarded is stored beginning at the SIO bytes. If the MSU is not 32 bytes long, the remaining bytes are set to 0.

The signaling link bytes report optionally allows display of link statistics for a specified signaling link number. If a link is not specified for the bytes report, the *msucount* command displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx cards.

The signalling link bytes report contains all zeros for a signaling link that is valid for the card and application type but that is unequipped.

The link and IP connection statistics reports can display individual receive packets that were discarded at layer 2. If the storage space is larger than the service data, the extra bytes are set to 0.

The reset option (**-r**) resets the specified measurements. This option can be added to any command.

## Output

In the examples that follow, the hexadecimal output for discarded ~~transmit~~ data represents data stored beginning at the SIO bytes through the first 32 bytes of the MSU. If the MSU was less than 32 bytes, the remaining bytes are represented by zeros.

Stored *receive* data takes the following format:

Bytes 13-x = Service data. If the storage space is greater than the size of the service data, the remaining bytes are zeroed.

## Output Specific to SS7IPGW and IPGWI

Either brief or full help reports can be displayed. A full help report is generated by adding the **full** (**-f**) option to the command line.

Example of a brief help report:

**pass:loc=1105:cmd="msucount -h"**

```
tekelecstp 10-09-10 11:50:34 EST  EAGLE 43.0.0

```

#### -k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| -----   | -----     | -----                                  |
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

| SS7 Traffic Partition             | RTKEY Parameter Example      |
|-----------------------------------|------------------------------|
| -----                             | -----                        |

## Routing Key Report Output Examples

The routing key report contains data about MSUs (tx), MSU bytes (tx), and discards on the transmit path for the routing key. A list of one or more connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also presented. If **-a aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. If **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed.

**NOTE: For IPGWx, -krtkey is optional when used with -tdefault, and mandatory for all other cases.**

The report output itself does not display the routing key that was entered, other than an exact copy of the command line being generated as part of the output.

Partial routing keys (where some fields in the MSU are ignored with respect to finding a routing key to use for the MSU) and default keys can be specified in the command. The output does not change for these key types; the only difference is the routing key syntax (**-p**) that must be processed as part of identifying the partial and default keys. (See the Example section of this command description for syntax examples.)

Example of a routing key report for an ANSI routing key that specifies the Routing Key table:

**pass:loc=1105:cmd="msucount -k 5-5-1:3: -t partial"**

```

MSUCOUNT: command complete

### Output Specific to IPLIM and IPLIMI

**NOTE:** The routing key report is not supported for IPLIMx applications. The -k, -t, -p, -x options are not supported because the IPLIMx card does not use routing keys.

**NOTE:** The IPLIMx reports include all equipped signaling links instead of just ports A and B. These reports include the transmit/receive counts alongside each other for the link case.

Example of help for using the command:

**pass:loc=1103:cmd="msucount -h" or**

**pass:loc=1103:cmd="msucount"**

```
tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0

Usage: msucount [ [-l [link]] | [-b [link]] ] |
               [ [-a aname] ]
               [-r] [-h]

Options: -l  display signaling link report
         -b  display signaling link bytes report
         -a  display association report
         -r  resets the specified counts
         -h  display command help

tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0
MSUCOUNT command complete
```

;

Example of a link report for an IPLIMx card with 2 M2PA links:

The report does not contain MTPP or RKRPMGMT statistics, because those capabilities are not supported on the IPLIMx applications. The report also does not contain tx/rcv discard data, because there are no discards performed at layer 2 of the IPLIMx applications. The IPLIMx card can also contain 2 links per card; the output contains link data for each link.

**pass:loc=1301:cmd="msucount"**

or

**pass:loc=1301:cmd="msucount -l"**

MSUCOUNT: command complete

### Enhanced Reset Option

The reset option resets the specified measurements without displaying **msucount** output. The default is to reset the link measurements report.

Example displays resetting link measurements:

**pass:loc=1305:cmd="msucount -l -r"**

or

**pass:loc=1305:cmd="msucount -r"**

eagle10212 06-06-01 08:50:47 EST EAGLE 35.0.0

MSUCOUNT: MSU Count Report

Link measurements have been reset.

MSUCOUNT: command complete

Example displays resetting Routing Key measurements:

**pass:loc=1305:cmd="msucount -x -5 -r"**

```
eagle10212 06-01-05 08:50:47 EST EAGLE 35.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Routing Key measurements have been reset.
```

```
MSUCOUNT: command complete
```

### Output specific to IPSG Cards

The option to display a full help report is not supported for IPSG cards.

**pass:loc=1304:cmd="msucount -h**

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
Usage: msucount [ [-l [link]] | [-b [link]] | [-l link -f] ] |
               [ [-a aname] ]
               [ [-x rc] ]
               [-r] [-h]
```

```
Options: -l  display signaling link report
          -b  display signaling link bytes report
          -a  display association report
          -x  display routing context report
          -f  display full report
          -r  resets the specified counts
          -h  display command help
```

```
;
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
MSUCOUNT: command complete
```

For link reports on IPSG signaling links, if a specific link is not requested, then counts for all equipped signaling links on the card are displayed. The report includes counts for up to 32 links per card. The **-l <link>** report adds counts for *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, and *SS7 SNM Counts sent* for M3UA links.

Example of a brief measurements report:

**pass:loc=1303:cmd="msucount -l"**

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
pass:loc=1303:cmd="msucount -l"
```

| slk                 | rate | msus | bytes | rate               | msus | bytes |
| B                   | 0    | 62   | 1916  | 0                  | 62   | 1916  |

MSUCOUNT: command complete

The **msucount -l <link> f** report displays the same information as the brief report (**msucount -l <link>**) for IPSG-M2PA links. For IPSG-M3UA links, the **msucount -l <link> -f** report displays both the information from the brief report and the *discarded tx due to M3UA Conversion Error*, *discarded rcv due to M3UA PDU Error*, *discarded rcv due to Management Blocking*, and *discarded rcv due to Lrg BICC not supported* discard counts.

Example of a full report for an IPSG-M3UA signaling link when discard counts are not received:

**Pass:loc=1303:cmd="msucount -l a -f"**

rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

MSUCOUNT: MSU Count Report

## Routing Context Report

The **msucount -x <routing context>** report for an IPSG card displays the equivalent of the **msucount -l** report for all signaling links on the card that are members of the linkset containing the specified routing context.

Example of a routing context report:

**pass:loc=1303:cmd="msucount -x 74565"**

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
MSUCOUNT: MSU Count Report
```

```
-----
Routing Context Measurements
-----
```

| SLK Transmit counts |      |      |       | SLK Receive counts |      |       |
|---------------------|------|------|-------|--------------------|------|-------|
| slk                 | rate | msus | bytes | rate               | msus | bytes |
| A                   | 0    | 3    | 72    | 0                  | 0    | 0     |
|                     | 0    | 3    | 72    | 0                  | 0    | 0     |

```
MSUCOUNT: command complete
```

```
;
```

## IP Connection Report

The IP connection statistic report for an IPSG card contains data regarding MSUs (tx/rcv), MSU bytes (tx/rcv), and discarded data (tx/rcv) for a specific socket or an association. The **-a <aname>** report for M3UA links adds the *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, *SS7 SNM sent*, *Discarded rcv due to SS7 SNM not supported*, and *Discarded rcv due to no SS7 SNM capacity*.

The existing *Discarded rcv due to M3UA PDU error* and *Invalid rcontext counts* are also supported.

Example of an aname report:

```
pass:loc=1303:cmd="msucount -a a1303a"
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
-----
IP Association Measurements
-----
```

| Transmit PDUs |       | Receive PDUs |       |

```

```
Usage: msucount  [[-l [link]] | [-f]] |
                 [-r] [-h]]
```

```
Options:  -l display signaling link report
           -f display full report
           -r resets the specified counts
           -h display command help
           -l link -r resets the counts for specified link
```

```
tekelecstp 10-01-19 11:50:34 EST EAGLE 41.1.0
MSUCOUNT command complete
```

## Link Reports

The link report contains the statistics of the equipped links (TDM/ATM) on the SS7HC/ATMHC cards collected on a per link basis.

An SS7HC/ATMHC generic link report is reported if the MSUCOUNT command is entered without any parameters. The output contains data regarding MSU bytes (tx/rcv), %bandwidth used (tx/rcv), MSUs (tx/rcv) collected during the last full second per link. Total MSU counts (tx/rcv) per link since the card load time or the last reset are also displayed.

MSUCOUNT: command complete
```

;

If the **-lslk** option is specified, then the statistics for the specified link is shown (if the link is equipped).

On cards running SS7HC GPL, in addition to the information shown in the Generic and Full reports, data is collected for the error counts (MSUs and SUs) and retransmits pegged during the last full second. Averages for the MSUs, percent bandwidth, bytes transmitted and received for the last rolling sampling period, and the maximum of these averages since the card was loaded or the data was reset is also displayed.

## msuroute

## Message Signaling Unit (MSU) Routing Information

This command is used to provide a list of all routing keys currently configured on an SS7IPGW/ IPGWI card that could be used to route a particular MSU. With 3 types of routing keys (fully specified,

partial and default) the complexity associated with figuring out how a particular MSU would be routed at any point in time is not trivial. This command provides output to help determine how MSUs will be routed based on current conditions.

**Keyword:** **msuroute**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msuroute** command option **-k** has the parameter rtkey. The *full routing key* must be specified for the MSU for which the summary will be displayed, as in the command **msuroute -k 5-5-5:5:6-6-6:1100**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option is used to provide help information for the command.

#### **-k rtkey**

This option is mandatory in the command to specify the full routing key for the MSU for which the summary will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

The **-p point code type** modifier is used to identify the format of the routing key that follows the **-k** option in the command.

The following are valid formats for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **3** or **sccp**. The subsystem (n) is in the range **0-255**.
- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is in the range **0-2**, **4**, or **6-15**. There is no subsystem.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (no-co-mo) are in the range **0-255**. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range **0** to **16363**.

#### **-p point code type**

This option modifier is used to identify the point code type (ANSI, ITU international, ITU national, ITU international spare, ITu national spare) in the routing key that follows the **-k** option in the command.

**Range:** **ansi, itui, itun, itun24, ituis, ituns**

**Default:** **ansi**

#### **-x routing context**

This option modifier is used to display the routing key report using routing context.

### Example

**msuroute -h**

**msuroute -p ansi -k 5-5-5:5:6-6-6:1100**

**msuroute -p ansi -k 5-5-5:5:6-6-6:1100:1100**

**msuroute -k 5-5-5:5:6-6-6:1100**

**msuroute -k 5-5-5:5:6-6-6:1100:1100**

```
msuroute -p ansi -k 5-5-5:8
msuroute -p itun -k 345:5:678:100:200
msuroute -p itun -k 345-gr:5:678-gr:100:200
msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100
```

## Dependencies

The **-k** option must be specified in the command, and must specify a full routing key.

This command is not supported for IPLIM/IPLIMI cards.

## Notes

The **msuroute** command is executed through the pass command.

The **-p point code type** modifier option can be used with the **-k** option to specify the format of the routing key that follows the **-k** option in the command.

## Output

The output for each **msuroute** command consists of a list of all of the routing keys that exist on the IPGWx card that could be used to route the MSU. The list of routing keys is presented in the hierarchical search order in which the keys would be used. The list of routing keys indicates keys that have IP connections available for traffic, and indicates which routing key would currently be used to route the MSU (marked with \*\*\*).

For the routing key that is selected to route the MSU, the list of IP connections associated with the key is also displayed.

**NOTE: Most of the following output examples show command entries for ANSI MSUs. Because, other than echoing the input command back to the screen, there is nothing in the output that contains specific fields from any configured keys. The output would not be different if the user entered ITUI MSUs instead of ANSI MSUs.**

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h full** option to the command line.

Example of a brief help report:

```
pass:loc=1105:cmd="msuroute -h"
```

```
Command Accepted - Processing
```

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
              [-h [full]]
```

```
Options: -x routing key report using routing context
          -k routing key report using MTP3 parameters
            rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
          -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
          -h display command help (brief or full)
```

```
;
```

Example of a full help report:

```
pass:loc=1305:cmd="msuroute -h full"
```

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
               [-h [full]]

```

```

Options: -x routing key report using routing context
         -k routing key report using MTP3 parameters
           rtkey :: dpc:si:opc:cics:cice | dpc:si:ssn | dpc:si
         -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
         -h display command help (brief or full)

```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGW default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

| SS7 Traffic Partition             | RTKEY Parameter Example |
|-----------------------------------|-------------------------|
| SCCP SSN 5 to DPC 1-1-1           | -k 1-1-1:3:5            |
| ISUP CIC 1 to 1-1-1 from 2-2-2    | -k 1-1-1:5:2-2-2:1      |
| TUP CIC 1 to 1-1-1 from 2-2-2     | -k 1-1-1:4:2-2-2:1      |
| QBICC CIC 1 to 1-1-1 from 2-2-2   | -k 1-1-1:13:2-2-2:1     |
| ISUP CIC 0-5 to 1-1-1 from 2-2-2  | -k 1-1-1:5:2-2-2:0:5    |
| TUP CIC 0-5 to 1-1-1 from 2-2-2   | -k 1-1-1:4:2-2-2:0:5    |
| QBICC CIC 0-5 to 1-1-1 from 2-2-2 | -k 1-1-1:13:2-2-2:0:5   |

```

## msutrace

## MSU Trace

This command provides filter and trace capability for MSUs passing through the IP<sup>7</sup> GPLs. This command provides a view of MSU data as it exists in the PSTN network and its corresponding format as it exists in the IP network.

**Keyword:** **msutrace**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msutrace** command option **-a** has the parameter **action**. The action that the command is to take can be specified, as in the command **msutrace -a acttrace**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a action**

Action option.

**Range: acttrace, clrtrace, dacttrace, chgfilter****acttrace**—Activate (turn on) MSU tracing**clrtrace**—Clear all data from trace buffers**dacttrace**—Deactivate (turn off) MSU tracing**chgfilter**—Change filter used to indicate which MSUs are placed in the trace buffers**-g get option**

The get option.

**Range: config, trace****config**—Displays the current **msutrace** settings: trace ON/OFF status, filter settings, and trace buffers used/available**trace**—Displays contents of trace buffers containing captured MSU data**-h help**

This option is used to display help information about this command.

**Range: full**If **full** is specified, the detailed version of the help information is displayed.If **full** is not specified (just **-h**), the simple version of the help information is displayed.**-m mode**

This option is used to indicate which MSUs are captured.

**Range: normerr, all****normerr**—trace only MSUs with normalization errors**all**—trace all MSUs regardless of MSU contents**-p point code type**

This option is used to specify which type of point code (ANSI, ITU international, ITU national, 24-bit ITU national, ITU-I spare, or ITU-N spare) is contained in the filter key, when the key contains a DPC or OPC.

**Range: ansi, itui, itun, itun24, ituis, ituns****Default: ansi****-k filter key**The **-k**, **-c**, and **-p** options are used to specify the filter key used to determine which MSUs will have data placed in the trace buffers.**Range:****-k filter key [-p] [-c pcType]**The syntax for the **filter key** portion of the **-k filter key** option is specified as a single string parameter with up to five colon-separated fields. The **filter key** can contain one or more of the following fields:*n-c-m*—represents an ANSI DPC in the format *network-cluster-member**no-co-mo*—represents an ANSI OPC in the format *network-cluster-member**z-a-i*—represents an ITU-I DPC in the format *zone-area-id**zo-ao-io zone-area-id*—represents an ITU-I OPC in the format*msa-ssa-sp*—represents a 24-bit ITU-N DPC in the format *main sigaling area-sub signaling area-signaling point**nnnnn*—represents an ITU-N DPC*nnnnn-gc*—represents an ITU-N DPC with Group Code when the Duplicate Point Code feature is ON*no*—represents an ITU-N OPC*no-gc*—represents an ITU-N OPC with Group Code when the Duplicate Point Code feature is ON*s*—represents an SI (Service Indicator)*cs*—represents a CIC Start value (start of the CIC range)*ce*—represents a CIC End value (end of the CIC range)

*n*—represents an SSN (Subsystem Number)

The following examples show valid formats:

- *n-c-m:s:n*—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.
- *n-c-m:s*—For DPC, SI type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is in the range **0-2**, **4**, or **6-15**. There is no subsystem number. As a default, counts for all routing keys within the option combination are displayed.
- *n-c-m:s:no-co-mo:cs:ce*—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range **0** to **16363**.
- *z-a-i*—For DPCN and DPCI routing keys, the zone, area and ID (*z-a-i*) are in the range of **000-007** (zone and ID) and **000-255** (area).
- *msa-ssa-sp*—For 24-bit DPCN routing keys, the main signaling area, sub signaling area and signaling point (*msa-ssa-sp*) are in the range of **000-255**.

#### **-t**

This option is used to denote the routing key type (IPGWx only).

#### **-x rc**

This option is used to generate a routing key report using routing context.

### **Example**

```
pass:loc=1105:cmd="msutrace -h"
```

```
pass:loc=1105:cmd="msutrace -h full"
```

```
pass:loc=1105:cmd="msutrace -g config"
```

```
pass:loc=1315:cmd="msutrace -g trace"
```

```
pass:loc=1105:cmd="msutrace -a clrttrace"
```

```
pass:loc=1105:cmd="msutrace -a acttrace"
```

```
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
```

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -t partial -k 1-3-3:5:2-4-4"
```

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -t partial -k 1536:5"
```

```
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
```

```
pass:loc=1105:cmd="msutrace -a chgfilter -m all"
```

### **Dependencies**

If no options are specified, the simple version of the help information is displayed.

The point code type defaults to ANSI when the **-p** option is not specified.

The **-p** option is allowed only on key types that contain a DPC or OPC.

### **Notes**

The **msutrace** command is executed through the **pass** command.

The **msutrace** command captures the data portion of the PSTN packet, starting at the SIO bytes.

The **msutrace** command captures the entire TALI, M3UA, or SUA packet. This includes the TALI, M3UA, or SUA header and additional data stored inside system buffer chain elements. The **msutrace** command currently does not support the trace and capture of TALI MTP Primitives or M3UA / SUA SSNM (Class 2) messages.

The **msutrace** command captures data in trace buffers. If the set of trace buffers becomes full with captured MSU data after MSU tracing is activated, no more data capturing will take place. The **-a clrtrace** option must be specified to reset (clear) the content of the trace buffers. After the trace buffers are empty again, **msutrace** will restart capturing qualified MSUs.

If MSU tracing is activated with the **-a acttrace** option before a properly formatted filter key is entered, **msutrace** will not capture any data due to lack of a proper filter. When the **-a chgfilter** option is specified to enter a properly formatted filter, **msutrace** will start capturing qualified MSUs.

## Output

**NOTE: The msutrace pass command exists on the IPLIM/IPLIMI cards as a debug-only pass command. All command syntax and output are identical to the SS7IPGW and IPGWI commands described in this section.**

Both brief and full versions of IPGW reports can be requested. A full report is requested by including the **-f** in the command line.

Example of a brief help report:

**pass:loc=1305:cmd="msutrace -h"**

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
              [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              [-m mode] [-h [full]]

Options:
  -a    action_cmd: an Action Command
  -g    get_cmd: a Get Command
  -x    routing key report using routing context
  -k    routing key report using MTP3 parameters
        rtkey :: ([dpc][:sil][:opc | :ssn][:cics][:cice])
  -p    pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
  -t    routing key type
        keytype :: (<full>, partial, default)
  -m    mode: mode for qualifying MSUs captured=[normerr | all]
  -h    displays this message (brief or full)

get_cmd:      [config | trace]
config        config
trace         trace

action_cmd:    [acttrace | chgfilter | clrtrace | dacttrace]
acttrace      acttrace
chgfilter     chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
                                     (valid fltrkey should be present either before
                                     specifying mode or in the same command)

clrtrace      clrtrace
dacttrace     dacttrace

<fltrkey>:    [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
               (see 'msutrace -h full' for complete description)

MSUTRACE command complete

;
```

Example of a full help report:

**pass:loc=1305:cmd="msutrace -h full"**

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
              [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]

-p    pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t    routing key type
      keytype :: (<full>, partial, default)
-m    mode: mode for qualifying MSUs captured = [normerr | all]
-h    displays this message (brief or full)
```

```
get_cmd:    [config | trace]
config      Display the current MSUTRACE settings:
            trace On/Off status, filter settings, and
            trace buffers used/available.
            ex:  msutrace -g config

trace       Display content of trace buffers containing captured
            MSU data
            ex:  msutrace -g trace

action_cmd: [acttrace | chgfilter | clrtrace | dacttrace ]
acttrace    Activate (turn-on) MSU-tracing.
            ex:  msutrace -a acttrace

chgfilter   chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
            (valid fltrkey should be present either before
            specifying mode or in the same command)
            Change filter used to qualify which MSUs are placed in
            trace buffers:
            Flow of command should be
            Either entering filter key before specifying mode :
            ex: To trace MSUs based on MSU content:
                msutrace -a chgfilter <fltrkey>
            ex: To only trace MSUs with Normalization errors:
                msutrace -a chgfilter -m normerr
            ex: To trace all MSUs regardless of error conditions:
                msutrace -a chgfilter -m all
            Or entering filter key along with mode:
            ex: To trace MSUs based on MSU content
                with Normalization errors:
                msutrace -a chgfilter <fltrkey> -m normerr
            ex: To trace MSUs based on MSU content
                regardless of error conditions:
                msutrace -a chgfilter <fltrkey> -m all

clrtrace    Clear all data from trace buffers.
            ex:  msutrace -a clrtrace

dacttrace   Deactivate (turn-off) MSU-tracing.
            ex:  msutrace -a dacttrace
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW and IPLIM default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

For IPSPG both ANSI and ITU network point code formats are eligible for trace when the default filter or an SI only filter is specified. The IPSPG default pctype is ANSI when the filter contains OPC or DPC and the -p option is not specified.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| -----   | -----     | -----                                  |
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key or LS.

| SS7 Traffic Partition             | RTKEY/MTP3 Parameter  | Example      |
|-----------------------------------|-----------------------|--------------|
| -----                             | -----                 | -----        |
| Any User Part to DPC 1-1-1        | -k 1-1-1              | -t partial   |

#### Examples for Entering a Filter Key

The output shown at the end of the following command examples is the same for each example, except for the echo of the entered command.

Command with the **-a chgfilter** option to insert a fully specified ANSI PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 5
- OPC = 4-4-4 (ANSI)
- CIC = [10..1000]

**pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"**

Command with the **-a chgfilter** option to insert a fully specified ANSI SCCP filter.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 3
- SSN = 230

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:3:230"**

Command with the **-a chgfilter** option to insert a fully specified ANSI DPC SI filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 6

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:6"**

Command with the **-a chgfilter** option to insert a fully specified ITUN24 PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-103-3 (ITUN24)

- SI = 5
- OPC = 14-104-4 (ITUN24)
- CIC = [10..1000]

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-103-3:5:14-104-4:10:1000"**

Command with the **-a chgfilter** option to insert a partial ITUI DPC SI OPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1-3-3 (ITUI)
- SI = 5
- OPC = 2-4-4 (ITUI)

**pass:loc=1105:cmd="msutrace -a chgfilter -p itui -k 1-3-3:5:2-4-4"**

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned off:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536 (ITUN)
- SI = 5

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536:5"**

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned on:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536-bb (ITUN)
- SI = 5

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536-bb:5"**

Command with the **-a chgfilter** option to insert a partial ANSI DPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3"**

Command with the **-a chgfilter** option to insert a partial SI filter key. Because no DPC or OPC field is specified, point code type does not have to be indicated.

This filter key qualifies for capture MSUs with the following properties:

- SI = 5

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-113-3 (ITUN24)

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-113-3"**

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:57 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
Command entered at terminal #1.
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
PASS: Command sent to card
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command in progress
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command completed
;
```

The following commands include the **-m mode** option to change the trace capture mode.

Mode to have a 'capture-on-normalization error' property such that only MSUs with normalization processing errors are traced:

**pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"**

Set a default filter key and the filter's mode at the same time:

**pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"**

Command Accepted - Processing

```
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
Command entered at terminal #1.

;
```

The following commands insert a partial DPC-SI filter key with ITU-I spare point code and show the **msutrace getfilter** command output with the filter key after the **chgfilter** command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPCI = (ITU-I Spare) 2-11-1
- SI=5

**pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"**

Command Accepted - Processing

## netstat

## Network Statistics

This command is used to display network statistics from the TCP/IP stack. This command allows troubleshooting of network interface and routing configuration problems within the private EPAP-DSM IP network.

**Keyword:** netstat

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **netstat** command option **-m** has the parameter buffer pool. The pool for which information will be displayed can be specified, as in the command **netstat -m sys**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a**

This option displays socket information for all protocols.

**-d**

This option displays driver measurement data.

The *-m* modifier displays multicast information. The *-p* modifier displays PHY registers. The *-z* modifier clears driver measurements. The *-h* modifier displays history measurements for the past 24 hours or the measurements collected a user defined hour ago. The *-f* modifier displays driver measurement data in full format (for GPLs that are loaded on E5-based cards only).

The *-m*, *-p*, and *-h* modifiers are not supported for GPLs that are loaded on E5-based cards.

**-e**

This option displays DPL driver measurement data. This option is supported only for GPLs that are loaded on E5-based cards.

**-f**

**-h**

This options provides help information for the command.

**-i**

This option displays interface information for all interfaces.

**-m buffer pool**

This option displays buffer pool information for the specified pool.

**Range: data, sys, dd**

**data**—SENS protocol stack data buffer pool

**sys**—system buffer pool

**dd**—Ethernet device driver buffer pool

**Default:** All three buffer pools are displayed.

**-p protocol**

This option displays information for the specified protocol.

**Rnage: tcp, udp, ip, icmp, sctp**

**tcp**—transmission control protocol

**udp**—user datagram protocol

**ip**—internet protocol

**icmp**—internet control message protocol

**sctp**—stream control transmission protocol

**Default:** None

**-r**

This option displays the Route table.

**Example**

pass:cmd="netstat -i":loc=1105

pass:cmd="netstat -a":loc=1111

pass:cmd="netstat -p tcp":loc=1111

pass:cmd="netstat -m data":loc=1105

```
pass:cmd="netstat -r":loc=1105
```

```
pass:cmd="netstat -e":loc=1111
```

```
pass:cmd="netstat -d 0 -f":loc=1111
```

### Dependencies

Only one of the options can be specified at a time.

### Notes

The **netstat** command is executed through the **pass** command.

The options {-m,-p,-h} are not supported for GPLs that are loaded on E5-based cards.

### Output for GPLs that are NOT loaded on E5-based cards

```
pass:loc=1107:cmd="netstat"
```

or

```
pass:loc=1107:cmd="netstat -h"
```

```
Command Accepted - Processing
```

```

```

```
PASS: Command sent to card
```

```
Usage: netstat [-a] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp]
        [-i] [-r] [-d 0|1] [-m] [-p] [-z] [-h 1..24]]
```

```
Options:
```

```
-a      display socket information for all protocols
-h      Displays this message
-m      display buffer pool information for 1 of the system pools
-p      display socket information for 1 of the protocols
-i      display interface information for all interfaces
-r      display the route table information
-d      display driver measurement data
```

```
;

Usage: netstat [-a] [-e] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp
]
                [-i] [-r] [-d 0|1] [-m] [-p] [-z] [-h 1..24] [-f]]

Options:
-a            display socket information for all protocols
-e            display DPL driver measurement data
-d            display Ethernet driver measurement data
-h            display this message
-m            display buffer pool information for 1 of the system pools
-p            display socket information for 1 of the protocols
-i            display interface information for all interfaces
-r            display the route table information

Output for the **netstat -i** command varies based on the card type. The GEI interfaces are the ports that carry signaling and monitoring traffic external to the EAGLE 5 ISS. The number of these ports varies with the IP connection. Information for all 4 GEI interfaces is displayed on only FC Capable cards as shown below.

The interfaces listed in the netstat - i output correspond to a card's ports as follows:

- For Signalling GPLs (IPSG, IPLIMx, IPGWx):
- gei 2 = IP signaling interface A
- gei 0 = IP signaling interface B
- gei 3 = Fast Copy interface A
- gei 1 = Fast Copy interface B
- DPLend = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- LO = local loopback interface

For SCCPx GPLs:

- gei 0 = IP interface A
- gei 1 = IP interface B
- DPLend = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- LO = local loopback interface
- BOND = interface formed by bonding the two IP interfaces

## nslookup

## Nameserver Lookup

This command returns the IP address for a given hostname, or returns a hostname for a given IP address.

**Keyword:** nslookup

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, then**nslookup** command has the optiondestination. An IP address

or hostname can be specified for the destination, as in the commands **nslookup 192.168.100.3** and **nslookup dcm1107a**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

**Range:**

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**-h**

This options provides help information for the command.

### Example

**nslookup 192.9.200.44**

**nslookup nc.tekelec.com**

### Dependencies

The actual **nslookup** text string must be followed by a destination (either a hostname or IP address).

Whether a host is found depends on the configuration of the host table and domain name servers.

### Notes

The **nslookup** command is executed through the **pass** command.

### Output

**pass:loc=1105:cmd="nslookup"**

or

**pass:loc=1105:cmd="nslookup -h"**

```

## pct

### Point Code and CIC Translation

This command is used to maintain per-translation statistics and to test Point Code and CIC Translation (PCT) functionality. The command can use Stats mode to reset or display per-translation statistics or Test mode to test PCT behavior.

**Keyword:** **pct**

**Command Class:** IP Stack Maintenance

#### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option is used to provide help information for the command.

The following options are common to both Stats mode and Test mode:

#### **-p pctype**

Point Code Type. This option applies to all point codes in the option list.

#### **Range:** **ansi (default), itui, itun**

The following options apply to only Stats mode:

#### **-a realpc**

Real Point Code

**-c cic**

CIC range. This option can be specified only if SI is 4, 5, or 13.

**Range:**

The option can be in one of these forms: wildcard(\*), **ecics-ecice:rcics-rcice**, e.g., **5-10:15-20**, or **ecics:rcics**, (e.g., **5:6**, which is equivalent to **5-5:6-6**)

**-e epc**

Emulated Point Code

**-f fpc**

Filter Point Code. This option can be a wildcard (\*).

**-l**

List the stats for the selected rules. The **-e** or **-a** option must be supplied. Both of these options can be specified.

**-r**

Resets the stats for selected rules. If no other options are specified, then this option resets stats on all rules. If other options are specified, then the **-e** or **--a** option must be specified.

**-s si**

**Range:**

**0, 3, 4, 5, 13**, or wildcard (\*)

**-u ssn**

Subsystem Number. The **si=3** option must be specified before this option can be specified. This option can be a wildcard (\*)

The following options apply only to Test mode.

**-c cic**

CIC in simulated MSU. If a value of 4, 5, or 13 is specified for the **si** option, then the **-c** must be specified.

**-d dpc**

Destination Point Code in simulated MSU.

**-o opc**

Originating Point Code in simulated MSU.

**-s si**

SI in simulated MSU.

**-u ssn**

Subsystem number in CgPA and CdPA in simulated MSU. The **si=3** option must be specified before the **-u** option can be specified. If **-u** is not specified, and the **si=3** is specified, then the route on SSN is off.

**pass:loc=1201:cmd="pct -h"**

**pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"**

**pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"**

## Dependencies

None

## Notes

None

## Output

Example of a help report.

**pass:loc=1201:cmd="pct -h"**

Command Accepted - Processing

```
Usage:
  pct -m stats [-l | -r] [-p pctype] [-e epc] [-f fpc] [-a realpc] [-s si] [-u ssn] [-c cicr]
  pct -m test [-p pctype] -d dpc -o opc -s si [-c cic] [-u ssn]
  pct -h
Modes:
  stats - reset or display per-rule stats
  test  - test PCT behavior for a message with the specified field values
Common Options:
  -p pctype is ANSI, ITUI, or ITUN
stats Mode Options:
  -r reset the stats for selected rules
      with no other options, resets stats on all rules
      if other options present, -e or -a must be supplied
  -l list the stats for selected rules (default)
      the -e or -a option must be supplied
      both -e and -a may be supplied
  -e emulated point code
  -a real point code
  -c cicr is in these forms:
      * (see Note 1)
      ecics-ecice:rcics-rcice, e.g., 5-10:15-20
      ecics:rcics, e.g., 5:6 which is equiv to 5-5:6-6
      allowed only if SI is 4, 5, or 13
  -f filter pc; may be * (see Note 1)
  -s si; can be 0, 3, 4, 5, 13, or * (see Note 1)
  -u ssn; may be * (see Note 1)
      allowed only if SI is 3
test Mode Options:
  -d DPC in simulated MSU
  -o OPC in simulated MSU
  -s SI in simulated MSU
  -u SSN in CgPA and CdPA in simulated MSU;
      if absent and si is 3, indicates that route on SSN is off;
      allowed only if SI is 3
  -c CIC in simulated MSU;
      required if SI is 4, 5, or 13
Notes:
  1. an explicit * will match only with rule containing a wildcard; to match
      on wildcard or a specific value, do not specify the associated option
```

## Stats Mode

With the -l option, all matching translations are displayed along with the following three statistics for each translation:

- DPCLKP – Number of successful translations of the DPC and/or CIC of a message (the number of successful DPC lookups).
- OPCLKP – Number of successful translations of the OPC and/or CIC of a message (the number of successful OPC lookups).

- MSUDISC – Number of messages discarded after successfully translating the DPC of a message from an emulated point code to a real point code, but where the real point code is unreachable.

The IDX (index) column is the unique row number of the entry in the PCT table. The index for a particular translation is the same across all cards.

The output for a single translation consists of two or three lines.

For translations with an SI of 4, 5, or 13, the CIC range field is displayed only for translations with a specific value for the CIC range.

The following example lists all translations with an EPC of 4-3-1 (ANSI).

**pass:loc=1201:cmd="pct -m stats -l -e 4-3-1"**

Command Accepted - Processing

| idx | epc           | rpc           | fpc         | si | ssn |

|     | dpclkp: 0     | opclkp: 0     | msudisc: 0  |    |     |
| 22  | 004-003-001   | 007-003-076   | -----       | 5  | --- |
|     | ecic: 100-105 | rcic: 200-205 |             |    |     |
|     | dpclkp: 0     | opclkp: 0     | msudisc: 0  |    |     |
| 23  | 004-003-001   | 007-003-081   | -----       | 3  | *   |
|     | dpclkp: 0     | opclkp: 0     | msudisc: 0  |    |     |
| 24  | 004-003-001   | 007-003-086   | -----       | 5  | --- |
|     | dpclkp: 0     | opclkp: 0     | msudisc: 0  |    |     |
| 25  | 004-003-001   | 007-003-091   | -----       | *  | --- |
|     | dpclkp: 0     | opclkp: 0     | msudisc: 0  |    |     |

The following example resets counters for all translations with an EPC of 4-3-1 (ANSI).

**pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"**

```
Command Accepted - Processing
Stats reset on 20 rules
```

### Test Mode

Test mode allows determination of whether an incoming message with the specified field values would result in a match on an entry in the PCT table. The command output includes the content of the message, as specified on the command line, the lookup result, and the matching entry if a match exists.

The following example shows a match on the DPC lookup.

**pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"**

```
Command Accepted - Processing

Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    007-002-030
  DPC:    004-003-001
  SI:      3
  SSN:     26
Lookup result:
  Match on DPC was found
Matching entry:
idx      epc          rpc          fpc si ssn
  7      004-003-001    007-003-002    007-002-030 3 26
```

The following example shows a match on the OPC lookup.

**pass:loc=1201:cmd="pct -m test -d 7-2-30 -o 7-3-2 -s 3 -u 26"**

```
Command Accepted - Processing

Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    007-003-002
  DPC:    007-002-030
  SI:      3
  SSN:     26
Lookup result:
  Match on OPC was found
Matching entry:
idx      epc          rpc          fpc si ssn
  7      004-003-001    007-003-002    007-002-030 3 26
```

The following example shows a match on a DPC lookup where the matching translation has a wildcard Filter PC and a wildcard SI.

**pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 9-9-9 -s 4 -c 106"**

```

Command Accepted - Processing

Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    009-009-009
  DPC:    004-003-001
  SI:      4
  CIC:      106
Lookup result:
  Match on DPC was found
Matching entry:
idx      epc      rpc      fpc si ssn
25      004-003-001  007-003-091  ----- * ---

```

## ping

## Packet Internetwork Groper

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

**Keyword:** ping

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ping** command has the option destination. An IP address or hostname can be specified for the destination, as in the commands **ping 192.9.200.44** and **ping nc.tekelec.com**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

**Range:**

any string of characters beginning with a letter and comprising (‘a’..‘z’, ‘A’..‘Z’, ‘0’..‘9’, ‘-’, ‘.’) up to 120 characters in length.

**-i**

This option specifies the number of ping requests to send.

**Range: 1 - 5**

**Default: 3**

**-n**

This option specifies the size of message to use in test.

**Range: 12 - 2048**

**Default: 64**

**-h**

This options provides help information for the command.

**Example****ping 192.9.200.44****ping nc.tekelec.com****ping 192.9.200.44 -i 5 -n 2048****Dependencies**

The actual **ping** text string must be followed by a destination (either a hostname or IP address) prior to the options.

**Notes**

The **ping** command is executed through the **pass** command.

**Output****pass:loc=1105:cmd="ping" or****pass:loc=1105:cmd="ping -h"**

Command Accepted - Processing

```
rlghncxa03w 04-07-27 08:29:35 EST  EAGLE5 31.6.0
pass:loc=1105:cmd="ping"
Command entered at terminal #1.

rlghncxa03w 04-07-27 08:32:10 EST  EAGLE5 31.6.0
PING tekral (192.168.100.3): 192 data bytes
200 bytes from tekral.nc.tekelec.com(192.168.100.3):icmp_seq=0.time=5. ms
200 bytes from tekral.nc.tekelec.com(192.168.100.3):icmp_seq=1.time=0. ms
----tekral PING Statistics----
  2 packets transmitted, 2 packets received, 0% packet loss
round-trip (ms)  min/avg/max = 0/2/5

PING command complete
;

```

**NOTE:** In the above example, the response shows eight bytes less than the entry (192 as opposed to 200) because the ping command may use eight bytes automatically.

## sctp

## Stream Control Transmission Protocol

This command is used to provide a view of SCTP instance and association information.

**Keyword:** sctp

**Command Class:** SCTP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-a aname**

This option is used to retrieve the measurements and information for a specific association.

#### **-l**

This option is used to display logging details for associations. The logging details are independent of the association state (close or open).

#### **-p <port>**

This option is used to retrieve the measurements for a specified SCTP port.

#### **-r**

This option is used to reset specified measurements. The associated report is not displayed.

#### **-h**

This option is used to display help information for the command. Either brief or full help reports can be generated.

#### **-m**

This option is used to display SCTP incoming/outgoing (IO) header audit reports for common and dedicated IO header pools. The IO header is a transmission sequence number (TSN) control block used in processing SCTP chunks. The report shows total, currently available, and minimum IO header counts for the IO header pool shared by all associations (common pool) and the IO header pool for each association (dedicated pool).

**Example**

```
pass:cmd="sctp -a aname":loc=1307
pass:cmd="sctp -l":loc=1307
pass:cmd="sctp -l aname":loc=1307
pass:cmd="sctp -p port":loc=1307
pass:cmd="sctp -r -a aname":loc=1307
pass:cmd="sctp -r -l aname":loc=1307
pass:cmd="sctp -m"
pass:cmd="sctp"
```

**Dependencies**

The **-r** option can be specified in the same command as the **-a**, **-p**, or **-l** options. Otherwise, only one option can be specified at a time.

**Notes**

None

**Output**

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h** option to the command line.

Example brief help report:

```
pass:loc=1305:cmd="sctp -h"
```

```
Usage: [ [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]]] | [-m] | [-h
[full]] ]
```

## Options:

|                 |                                       |
|-----------------|---------------------------------------|
| (no parameters) | display list of SCTP ports            |
| -a aname        | display association report            |
| -p port         | display SCTP port report              |
| -r              | reset specified SCTP measurements     |
| -m              | display IO header usage report        |
| -l aname        | display association event log         |
| -l              | display all event logs                |
| -r -l           | reset all SCTP event logs             |
| -r -s           | reset all SCTP measurements and pegs  |
| -h              | displays command help (brief or full) |

```
;
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

```
SCTP command complete
```

```
;
```

Example of a full help report:

**pass:loc=1307:cmd="sctp -h full"**

Usage: sctp [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]]] | [-m] | [-h [full]]]

Options:

|                 |                                       |
|-----------------|---------------------------------------|
| (no parameters) | display list of SCTP ports            |
| -a aname        | display association report            |
| -p port         | display SCTP port report              |
| -r              | reset specified SCTP measurements     |
| -m              | display IO header usage report        |
| -l aname        | display association event log         |
| -l              | display all event logs                |
| -r -l           | reset all SCTP event logs             |
| -r -s           | reset all SCTP measurements and pegs  |
| -h              | displays command help (brief or full) |

no parameters option

Summary list of all SCTP instances. To list all the SCTP ports issue the following command:  
sctp

-a aname option details

Retrieves detailed information and measurements for a specific association. For example the following SCTP command will get the measurements and detailed information for the association with association name = assoc1.

sctp -a assoc1

In remote address field of output configured RHOST or ARHOST or both IP address will be displayed based on the presence in association remote network array

-p port option details

Retrieves detailed information for a specified SCTP port. For example the following SCTP command will get the detailed information for the SCTP port with a local port of 200.

sctp -p 200

In remote address field of output configured RHOST or ARHOST or both IP address will be displayed based on the presence in association remote network array

-r option details

Resets specified SCTP Measurements. See examples below.

Resets measurements for specified association:

sctp -r -a assoc

Resets measurements for all associations on port 2000:

sctp -r -p 2000

Resets measurements and event logs for all ports/associations:

sctp -r

Resets event logs for specified association:

sctp -r -l assoc

Resets event logs for all associations:

sctp -r -l

Resets measurements for all associations:

sctp -r -s

-m

This option displays SCTP IO header audit report for common and dedicated IO header pools. The report shows total, currently available and minimum (low water mark) IO header counts for common and each association's dedicated pool.

IO header is a TSN control block used in processing SCTP chunks.

Common pool is IO header pool shared by all associations.

Dedicated pool is a per-association IO header pool.

sctp -m;

```
-l option details
  This option displays logging details for associations. The logging
  details are independent of the association state (close or open).
  See examples below:
  The following Sctp command will get the logging details
  for all associations on the specified card.
      sctp -l
  The following Sctp command will get the logging
  details for the association with association name = assoc1.
      sctp -l assoc1
```

```
;
```

```
rlghncxa03w 08-02-01 08:32:09 EST  EAGLE5 38.0.0
```

```
Sctp command complete
```

```
;
```

Example summary list of all Sctp ports. All Sctp ports and number of associations associated with each port is displayed.

**pass:loc=1307:cmd="sctp"**

```

SCTP command complete

;
```

#### Field Descriptions for **sctp -a** Output

- Local Address-IP Address of the near end. The address that the local SCTP endpoint should bind.
- Local Port-SCTP port number, if ULP wants it to be specified.
- Remote Address-IP Address of the far end/destination. Destination address for transporting DATA.
- Remote Port-Port number of the destination.

Configuration:[Following rows are SCTP configured values]

- Retransmission Mode-Configured retransmission mode. Values are “LIN” or “RFC”.
- Min. Retransmission Timeout-Minimum Retransmission Timeout value configured.
- Max. Number of Retries-Configured maximum number of retries.
- Min. Congestion Window-Minimum and initial congestion window.
- Inbound Streams-The maximum number of inbound streams this association allows the peer end to create. The value can not be 0.
- Outbound Streams-The maximum number of outbound streams this association allows the peer end to create. The value can not be 0.

State: [Following rows are association state values]

- State-State of the association.
- ULP association id-Upper Layer Protocol association id.
- Number of nets-Number of networks.
- Inbound Streams-Number of Inbound streams the far end can support. Min(requested,offered)
- Outbound Streams-Number of Outbound streams the far end can support. Min(requested,offered)

- Checksum Algorithm-32 bit checksum field that is included in the SCTP common header. The CRC32c checksum should be set by the sender of each SCTP packet to provide additional protection against data corruption in the network.
- Send/Rcv Buffer Size-The maximum size of data to be transmitted/received in bytes.
- Nets Data-All of the available remote IP addresses and if they are reachable or not.
- Last Net Sent To-IP address of the last network sent on.
- Last Net Rcvd From-IP address of the last network received on.
- Over All Error Count-Total error count on the association.
- Peers Rwnd-The peers receive window.
- My Rwnd-My receive window.
- Max Window-Maximum receive window (the peers receive window is set to this value until it is learned).
- Initial Seq Number-Initial sequence number started at.
- Next Sending Seq Number-Next Sending sequence number.
- Last Acked Seq Number-Highest consecutive TSN that has been Acked.
- Maximum Outbound Char Count-Maximum outbound byte count (high water mark).
- Current Outbound Char Count-Current outbound byte count.
- Number Unsent Char Count-Number of unsent bytes.
- Outbound Data Chunk Count-Number of data chunks that were sent.
- ip datagrams rcvd-Number of IP packets received.
- ip datagrams with data chunks rcvd-Number of IP packets containing SCTP data chunks received.
- data chunks rcvd-Number of SCTP data chunks received.
- data chunks read-Number of SCTP data chunks read.
- dup tsns rcvd-Number of duplicate data chunks received.
- sacks rcvd-Number of selective acknowledgements received.
- gap ack blocks rcvd-Indicates the number of GAP Ack Blocks included in a SACK. This value informs the peer endpoint of gaps in the received sequences of DATA chunks as represented by their TSNs.
- heartbeat requests rcvd-Number of heartbeat requests received.
- heartbeat acks rcvd-Number of heartbeat acknowledges received.
- heartbeat requests sent-Number of heartbeat requests sent.
- ip datagrams sent-Number of IP packets transmitted.
- ip datagrams with data chunks sent-Number of IP packets containing SCTP data transmitted.
- data chunks sent-Number of data chunks sent.
- retransmit data chunks sent-Number of retransmitted data chunks for this association.
- sacks sent-Number of selective acknowledgements sent.
- send failed-Number of selective acknowledgements failed.

- retransmit timer count-Reports the retransmit timer count. Number of times the transmit timer has expired.
- consecutive retransmit timeouts-Count of the number of times consecutive timeouts occurred.
- RTT between RMIN and RMAX inclusive-If the calculated RTT is between the configured RMIN value and the RMAX value inclusively, then increment this peg count. This peg serves as an indication that the RMIN value may be configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- RTT greater than RMAX-If the calculated RTT is above the configured RMAX value, then increment this peg count. This peg serves as an indication that the RMAX value is configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- fast retransmit count-Number of retransmits due to fast retransmit.
- recv timer count-Number of times the receive timer has expired.
- heartbeat timer count-Number of times the heartbeat timer has expired.
- none left tosend-Number of times a transmit is attempted and there is no data chunks to send.
- none left rwnd gate-Number of times a transmit is denied due to no receive window space at peer.
- none left cwnd gate-Number of times a transmit is denied due to exceeding the local congestion window.
- UNKNOWN-Number of retransmit Datagrams for this assoc for error monitoring.

Example SCTP port measurements:

**pass:loc=1307:cmd="sctp -p 2222"**

```

rlghncxa03w 09-05-01 08:32:09 EST  EAGLE5 41.0.0

SCTP: command complete

;

Event descriptions for the **sctp -l** command

- Shutdwn ACK tmr exp No shutdown complete was received in response to the shutdown acknowledgement within the timer's limits.
- PathMTU tmr expr-Indicates the PathMTU daemon timer has expired. At the expiration of this timer, path MTU for each path of each association that is not at the default of 1500 bytes is marked for retesting by raising that path's MTU. The MTU will be adjusted accordingly when the next frame that exceeds the updated MTU occurs, thereby allowing the path MTU to reflect dynamic network conditions.

- INIT tmr expr-If the T1-initialized timer expires, the endpoint must retransmit INIT and restart the T1-init timer without changing state.
- RECV tmr expr-If the receive timer expires, then a stand alone SACK is sent to the peer and this timer is moved back to idle.
- Send tmr expr-This retransmission timer will expire when outstanding data sent to an address has not been acknowledged.
- Shutdwn tmr expr-No shutdown acknowledgement was received in response to the transmitted shutdown within the timer's limits.
- HB tmr expr-No heartbeat acknowledgement was received in response to the transmitted heartbeat within the timer's limits.
- Cookie tmr expr-No cookie acknowledgement was received in response to the transmitted cookie echo within the timer's limits.
- New Cookie tmr expr-When this occurs, time to schedule another timer for the cookie change.
- Tx CHK tmr expr-Transmit check timer expired.
- Unknwn tmr expr-An unknown timer expired.
- INIT Rcv-An INIT was received for an association.
- Datagram Ignored-When an unrecognized chunk time is encountered.
- Assoc Down-An association is taken out of service.
- INTF Down-Interface on an association is down and out of consideration for selection.
- INTF Up-Interface on an association is up and now back in consideration for selection.
- Datagram Send Fail-IP Packet failed to send.
- Ignore Cookie-Happens when the cookie is not received first.
- Ignore INIT-If the INIT message is not received first, is not the only chunk, is received with a non-zero Verification tag, if the T bit value is 1 or if mandatory parameters are missing then the INIT message is discarded/ignored.
- Ignore INIT ACK-If the INIT ACK is not first, not the only chunk or too small (missing mandatory parameters), then the INIT ACK chunk is ignored.
- Ignore Shutdwn ACK-The SHUTDOWN Complete MUST be the only chunk, otherwise the packet is ignored.
- Ignore HB ACK-The received HB acknowledgement was ignored due to asymmetric routing (HBA not received on the same interface the original HB was transmitted on).
- Op Error Rcv-Occurs when the peer notifies that we are using an invalid stream or we received a Stale cookie.
- Assoc UP-Association up notification was generated for the upper layer.
- Assoc Restart-Association restart notification was generated for the upper layer.
- Shutdn ack send fail-Attempt to transmit a shutdown acknowledgement chunk failed.
- Shutdown ack send-A shutdown acknowledgement chunk was transmitted to the far end.
- Cookie ack send fail-An attempt to send a Cookie ACK to a specified address failed.
- Cookie ack send-A Cookie ACK was sent to a specified address.
- Stale Cookie send fail-Attempt to send a stale cookie error to the far end failed.

- Stale Cookie send-A stale cookie error was sent to the far end.
- HB req send fail-Attempt to send a HB to the far end failed.
- HB resp send fail-Attempt to send a HB acknowledgement to the far end failed.
- Shutdown send fail-The Shutdown chunk sent to a specified association failed.
- Shutdown send-A Shutdown chunk was sent to a specified association.
- Abort send fail-The Abort chunk sent to a specified association failed.
- Abort send-An Abort chunk was sent to a specified association.
- Abt W cause snd fail-The Abort chunk sent with the Cause parameter to a specified association failed.
- Abort wth cause send-An Abort chunk was sent to a specified association with the Cause parameter.
- SACK send fail-Attempt to send a SACK to the far end failed.
- Initiate send fail-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT send has failed.
- Initiate send-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT was successfully sent.
- OprErr send-An endpoint sends this chunk to its peer endpoint to notify it of certain error conditions. It contains one or more error causes. This event occurs when the OPPErr was successfully sent.
- OprErr send Fail-This event occurs when the OPPErr send failed.
- Init ack send fail-This event occurs when an INIT ACK send has failed.
- Init ack sent-This event occurs when an INIT ACK was successfully sent.
- Ck echo ack snd fail-An attempt to send a Cookie-Echo has failed.
- Cookie echo ack send-A cookie echo was sent to the far end in response to an accepted init-ack.
- Chunks send fail-This event occurs when a chunk that was sent has failed.
- Chunks send-This event occurs when a chunk has been successfully sent.
- Cookie send fail-Attempt to transmit a cookie to the far end during the four-way handshake failed.
- Init ack rcv-Init acknowledgement chunk was received.
- Shutdown ack rcv-Shutdown ack chunk was received.
- Shutdown ack sent-Shutdown ack chunk was transmitted to the far end in response to a received shutdown chunk.
- Abort sent-An Abort message was sent to ungracefully shutdown an association.
- Shutdn complete sent-Shutdown complete chunk was transmitted to the far end.

Example clears the logged events for an association:

**pass:loc=1307:cmd="sctp -r -l assoc1"**

```
Command Accepted - Processing

rlghncxa03w 08-02-01 08:32:09 EST  EAGLE 38.0.0

All event logs for specified association have been reset.

;

rlghncxa03w 08-02-01 08:32:09 EST  EAGLE 38.0.0

SCTP command complete

;
```

Example resets association measurements:

**pass:loc=1307:cmd="sctp -r -a assoc1"**

```
rlghncxa03w 08-02-01 08:32:09 EST  EAGLE5 38.0.0
PASS: Command sent to card

Association measurements have been reset.

SCTP command complete
```

Example resets port measurements:

**pass:loc=1307:cmd="sctp -r -p 4001"**

```
rlghncxa03w 08-02-01 08:32:09 EST  EAGLE5 38.0.0
PASS: Command sent to card

Port measurements have been reset.

;

## sockrtrt

## Socket Round Trip Time

This command is used to report and reset the round-trip time statistics for application sockets. Minimum, maximum, and average times are kept for each open socket. The Retransmission Mode (BSD, FIXED, or MOD) and the Fixed Round Trip Time are also displayed.

**Keyword:** sockrtrt

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **sockrtrt** command has the option socket name. The socket name must be specified for which statistics will be displayed, as in the command **sockrtrt socyellow**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

socket name

This option is **mandatory** and specifies the socket name for which statistics are to be displayed.

**Range:**

up to 15 alphanumeric characters.

**-r**

This option resets all statistics for the given socket name.

**-h**

This option provides help information for the command.

### Example

**sockrtrt**

**sockrtt -h**

**sockrtt socyellow**

**sockrtt socyellow -r**

## Dependencies

None

## Notes

The **sockrtt** command is executed through the **pass** command.

## Output

**pass:loc=1105:cmd="sockrtt" or**

**pass:loc=1105:cmd="sockrtt -h"**

Command Accepted - Processing

```
rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0

## soipdata

## SEAS Over IP Data

This command is used to display the SOIP operational data captured for the last 24 hours.

**Keyword:** soipdata

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

**-f**

This option displays full operational data (all counts).

**-s**

This option is used to display the number of errors received with error type Bad Source.

**-d**

This option is used to display the number of of errors received with error type Bad Destination.

**-v**

This option is used to display the number of errors received with error type Bad Version.

**-g**

This option is used to display the number of Good Day messages received.

**-e**

This option is used to display the number of error messages sent (Sum of Bad Version, Bad Source and Bad Destination).

**-u**

This option is used to display the number of UPL messages received.

**-t**

This option is used to display the number of UPL messages transmitted.

**-r**

This option is used to reset the specified error count.

**-h**

This option is used to display help for the command.

**Example**

**soipdata -h**

**soipdata -f**

**soipdata -r**

**soipdata -u**

**Dependencies**

None

**Notes**

None

**Output**

**pass:loc=1305:cmd= "soipdata -h"**

```
Usage: soipdata [[-f ] |
                [[-s] [-d] [-v] [-g] [-e] [-u] [-t]
                [-r] [-h]]

Options:
-f  Display Full Operational data (all the counts)
-s  Display number of SR-5129 Messages received with Bad Source
-d  Display number of SR-5129 Messages received with Bad Destination
-v  Display number of SR-5129 Messages received with Bad Version
-g  Display number of Good Day Messages Received.
-e  Display number of error messages sent (Sum of BadVersion, BadSource and
BadDestination)
-u  Display number of Number of UPL messages received
-t  Display number of Number of UPL messages transmitted.
-r  Reset the Specified Error Count
-h  display command help
```

**pass:loc=1305:cmd="soipdata -f"**

SOIPDATA: SR-5129 Operational Data Report

Operational Data

| reason                               |   | count |
|--------------------------------------|---|-------|

|---------------------------------|---|-------|
| Number of UPL Messages Received | 0 |       |

## soiplog

## SEAS Over IP Log

This command is used to display the logs for the SR-5129 messages for a particular SEAS terminal.

**Keyword:** soiplog

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

**-l**

This option is used to enable and disable logging.

**-d**

This option is used to display live message logs

**-n X**

This option is used to display the last X number of messages.

**-h**

This option is used to display the help for this command.

### Example

**soiplog -h**

**soiplog -l enable":loc=XXXX**

### Dependencies

None

### Notes

With two active connections to the CCS MR, logging must be enabled on each E5-IPSM card that has an active SEAS terminal in order to properly log all SR-5129 communication data.

Assuming a message size of 500 bytes, each E5-IPSM card can log approximately 2000 messages.

If an attempt is made to enable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

*Warning: SOIP Logging Enabled from Terminal: <New logging enabled terminal>*

If an attempt is made to disable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal

*"Warning: SOIP Logging disabled from Terminal: <New logging enabled terminal>"*

If an attempt is made to turn on logging on a terminal when it is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

*"Warning: SOIPLOG Started on Terminal: <New logging enabled terminal>"*

### Output

**pass:loc=1305:cmd= "soiplog -h"**

```
Usage: SOIPLOG [[-l option] |
                                [-d] [-n] [-h]]

Options:
  -l <enable/disable>      Enable/Disable the logs
  -d                        Display live message logs
  -n <num>                  Display last <num> number of messages.
Range=1..2000
  -h                        Display Command Help
```

To Enable Real time logging and display, the following commands must be entered one after the other:

**pass:cmd="soiplog -l enable":loc=XXXX**

**pass:cmd="soiplog -d":loc=XXXX**

To enable logging and to display the last N number of logged messages, the following commands must be entered one after the other:

pass:cmd="soiplog -l enable":loc=XXXX

pass:cmd="soiplog -n N":loc=XXXX

## tracerroute

## IP Tracing Utility

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

**Keyword:** tracerroute

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **tracerroute** command has the option IP address. The IP address can be specified for the remote host to which the UDP message is sent, as in the command **tracerroute 208.55.20.177**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

### IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

### Range:

4 numbers separated by dots, with each number in the range of **0-255**.

### hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

### Range:

String of characters, beginning with a letter, up to 120 characters in length. Valid characters are **a-z**, **A-Z**, **0-9**, **-** (hyphen), **.** (period)

**-h**

This option provides help information for the command.

**-m maximum hops**

This option specifies the maximum number of hops before the trace is terminated.

**Range: 1-30**

**Default: 10**

**-n**

This option specifies that only the IP Address of each host will be displayed (not the hostname).

**-p port**

This option provides the user port number.

**Range: 1-65535**

**Default: 33434**

**Example**

```
traceroute
```

```
traceroute www.remotedest.com
```

```
traceroute www.remotedest.com -m 20
```

```
traceroute www.remotedest.com -m 20 -n
```

```
traceroute 208.55.20.177
```

```
traceroute 208.55.20.177 -m 20 -p 40000
```

**Dependencies**

If a Domain Name is specified, either the Domain Name must exist in the IP Host table or the Domain Name Server A or B must be provisioned.

**Notes**

The **traceroute** command is executed through the **pass** command.

**Output**

The following example illustrates the help information for the command.

**pass:loc=1103:cmd="traceroute" or**

**pass:loc=1103:cmd="traceroute -h"**

```

Command entered at terminal #1.

PASS: Command sent to card
;

rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0

Usage: traceroute <hostname | ipaddr> [-h] [-m maxhops] [-n] [-p port]
Options:
  -h           Displays this message
  -m maxhops   Maximum number of hops to destination.  Range=1..30. Default= 10.
  -n names     Inhibits the display of intermediate host names
  -p port      Port number. Range=1..65535. Default=33434.
  hostname     Name of machine to trace
  ipaddr       IP Address of machine to trace (d.d.d.d)
Errors:
  *           Timeout
  !N          Unreachable Network
  !H          Unreachable Host
  !?nn        Unknown Failure (nn = ICMP Code)

## ualog

### User Adapter Log

Use this command to report on the user adapter (UA) state machine history for a specified association name. State machine history is kept in a circular buffer in memory. The **-i** and **-x** options are used to include or exclude groups of events from the state machine history.

**Keyword:** ualog

**Command Class:** Application Maintenance

#### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ualog** command has the parameter aname. The association name must be specified for which the user adapter log will be displayed, as in the command **ualog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

**-h**

This option displays help (usage) information for the command.

**-i event group**

This option includes groups of events in the state machine history.

**Range:** service, ua

**-x event group**

This option excludes groups of events from the state machine history.

**Range:** service, ua

#### Example

```
pass:loc=1105:cmd="ualog s7000"
```

#### Dependencies

None

**Notes**

None

**Output****pass:loc=1105:cmd="ualog s7000"**

## Error Codes

**NOTE: The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18**

The following error codes can appear in the error messages:

### 0x01—Invalid Version

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

### 0x03—Unsupported Message Class

A message was received with an unexpected or unsupported Message Class.

**0x04—Unsupported Message Type**

A message was received with an unexpected or unsupported Message Type.

**0x05—Unsupported Traffic Handling Mode**

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

**0x06—Unexpected Message**

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

**0x07—Protocol Error**

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

**0x09—Invalid Stream Identifier**

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

**0x0d—Refused - Management Blocking**

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

**0x0e—ASP Identifier Required**

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

**0x0f—Invalid ASP Identifier**

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier

**0x11—Invalid Parameter Value**

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

**0x12—Parameter Field Error**

A message is received with a parameter that has a wrong length field.

**0x13—Unexpected Parameter**

A message contains an invalid parameter.

**0x14—Destination Status Unknown**

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

**0x15—Invalid Network Appearance**

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

**0x16—Missing Parameter**

A message is received, and a mandatory parameter is not included in the message.

**0x19**—Invalid Routing Context

A message is received from a peer with an invalid (unconfigured) Routing Context value.  
The invalid Routing Context is included in the error message.

**0x1a**—No Configured AS for ASP

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

## Summary of Range Values for :link Parameter

Table A-1 lists the valid **link** parameter range values signaling links assigned to each type of card for which a location can be specified in the command **loc** parameter. The commands that use these values refer to this table in their **link** parameter description.

**NOTE: The link parameter is a synonym for the port parameter in signaling link definitions for a few EAGLE 5 ISS releases. Then the port parameter will be removed.**

Table A-1. Summary of Ranges for **link** Parameter

| Card                          | Link                               | Supported Application                                                                                                                                                                                                     |

## Possible Values for PST/SST/AST

This section lists the possible values for the primary state (PST), secondary state (SST), and associated state (AST) shown in the output of the Report Status (rept-stat-) commands.

### PST

Primary state possible values are the following:

**IS-ANR**—(IN SERVICE - ABNORMAL) The entity is in service but only able to perform a limited subset of its normal service functions.

**IS-NR**—(IN SERVICE - NORMAL) The entity is in service and handling all its normal service functions.

**OOS-MA**—(OUT OF SERVICE - MEMORY ADMINISTRATION) The entity is out of service because it has not been equipped.

**OOS-MT**—(OUT OF SERVICE - MAINTENANCE) The entity is out of service and is not available to perform its normal service function. The maintenance system is actively working to restore the entity to service.

**OOS-MT-DSBLD**—(OUT OF SERVICE - MAINTENANCE - DISABLED) The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

### SST

Secondary state possible values are the following:

**ACTIVE**—(ACTIVE) The entity is currently in use and is handling its normal service function as the primary service provider. **MASTER** The entity is currently in a master state in relation to its redundant unit.

**ALLOWED**—(ALLOWED) The entity is handling its normal service function.

**AVAIL**—(AVAILABLE) Entity service is available to another entity.

**BLOCKED**—(BLOCKED) The entity has been manually prohibited from handling traffic.

**BUSY**—(BUSY) The entity is handling the maximum traffic capacity and has no spare capacity for new service requests.

**CONN**—(CONNECT) The card's entity status is in connected state.

**DDL HUNT**—(DDL HUNTING) The entity is currently in a state where the DDL is hunting for crossload info.

**DDL INHIB**—(DDL INHIBITED) The entity is currently in a state where the DDL is inhibited from crossload.

**DDL NoXLD**—(DDL Unable to XLOAD) The entity is currently in a state where the DDL is unable to crossload.

**DDLUNSTB**—(DDL UNSTABLE) The entity is currently in DDL unstable state.

**Disc**—(Disconnect) The card's entity status is in disconnected state.

**FAULT**—(FAULT) The entity has failed.

**IDLE**—(IDLE) The entity is in use and has spare capacity for service.

**INHIBITED**—(INHIBITED) The entity has been manually prevented from performing its normal service function.

**ISOLATED**—(ISOLATED) The entity cannot be detected through software or hardware.

**LPBK**—(LOOPBACK) The entity is currently in the Loopback state.

**MANUAL**—(MANUAL) The entity has manually been removed from service and is not carrying any traffic.

**MEA**—(Maintenance Equipment Administration) The entity has been auto-inhibited and has been restricted from functioning because it has not met the minimum hardware requirements for the current configuration.

**MPS UNAVL**—(MPS unavailable). MPS is required, but unavailable for the entity.

**OVFLW-1**—(OVERFLOW) One entity cannot provide service to another entity due to service denial.

**PROHIBIT**—(PROHIBITED) The entity is not handling traffic because of a failure in the network.

**PROH-BLK**—(PROHIBITED and BLOCKED) The entity has been prohibited and blocked from handling traffic.

**RESTART**—(RESTART) The entity is in MTP Restart.

**RESTRICT**—(RESTRICTED) Normal operation for the entity is restricted. The normal capacity or configuration is not being used because of a failure in the network. The normal capacity, functionality or configuration of an entity may be restricted during loading or synching of data. This can occur when the Measurements Platform has not yet been enabled.

**STANDBY**—(STANDBY) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. (SLAVE) The entity is currently in a slave state in relation to its redundant unit.

**TEST**—(TEST) The entity is currently in a test state.

**UNAVAIL**—(UNAVAILABLE) Entity service is unavailable to another entity.

**UEQ**—(UNEQUIPPED) The entity is not equipped.

**UNBLOCKED**—(UNBLOCKED) The entity is handling its normal service function.

## AST

Associated state possible values are the following:

---- (BLANK)—The field may be left blank.

**ACCESS**—(ACCESSIBLE) Traffic is being carried between the local entity and an adjacent, or remote, service provider. A full connection has been completed.

**ALMINH**—(ALARM INH) The alarms on the entity are inhibited.

**BRDG MSTR**—(MASTER) The E1/T1 channel bridge is in Master mode.

**BRDG SLAVE**—(SLAVE) The E1/T1 channel bridge is in Slave mode when the adjacent odd-numbered channel bridge is provisioned in Master mode.

**CDL**—(COMMAND DRIVEN LOOPBACK) The entity is in command driven loopback state.

**DB DIFF**—(DATABASE DIFFERENT) The entity has a database difference.

**ENET FLT**—(ETHERNET FAULT) An Ethernet fault exists.

**EXT BERT**—(EXTENDED BERT TEST) The entity is undergoing Extended BERT.

**FE LINE**—(FAR END LINE LOOPBACK) The entity is in far end line loopback.

**FE PAYLD**—(FAR END PAYLOAD LOOPBACK) The entity is in far end payload loopback.

**FLT CHK**—(FAULT ISOLATION TEST) The entity is undergoing a fault isolation test.

**INACCESS**—(INACCESSIBLE) Traffic is not being carried from the local entity to another service provider. A breakdown in a complete circuit has been detected.

**LFS**—(LINK FAULT SECTIONALIZATION) The entity is in Link Fault State.

**LINE**—(LINE LOOPBACK) The entity is in line loopback state.

**LOCAL**—(LOCAL) The entity has become locally isolated.

**LXVR**—(LXVR LOOPBACK) The entity is in local transceiver loopback state.

**M BIP ERR**—(MOTHERBOARD IDENTITY PROM) The entity has a motherboard prom error.

**NOT BRDGD**—(NOT BRIDGED) The E1/T1 port channel is not bridged.

**OAM F5 FM**—(OAM LOOPBACK) The entity is in OAM initiated loopback state.

**PAYLOAD**—(PAYLOAD LOOPBACK) The entity is in payload loopback state.

**SLTM**—(SPECIAL MAINTENANCE TEST MESSAGES) The entity is in SLTM testing state.

## Point Code Formats and Conversion

Many of the commands used for database configuration use point codes. This section describes the point code formats that the system supports. If you need additional information or procedural information, refer to the *Database Administration Manual - SS7*.

The system supports four different point code formats:

- ANSI point codes
- ITU International point codes
- ITU National point codes
- ITU National 24-bit point codes

Each format is described in further detail in the following sections.

## ANSI Point Codes

ANSI point codes are made up of three groups of digits called the network indicator (*ni*), network cluster (*nc*), and network cluster member (*ncm*). The values for ANSI point codes depend on the value of the **pctype** parameter of the **chg-sid** command, either **ansi** or **other**.

If the **chg-sid:pctype** parameter is set to **ansi**, the range of values for an ANSI point code is as follows:

*ni*—**001-255**  
*nc*—**001-255** (if *ni* = **001-005**)  
 —**000-255, \*** (if *ni* = **006-255**)  
*ncm*—**000-255**

The following rules apply to provisioning ANSI point codes if the **chg-sid:pctype=ansi** parameter is specified:

- An *ni* value of **0** is not allowed (for example, **dpc=0-1-1** and **dpc=0-0-0** are not valid point codes).
- If the *ni* value is **1, 2, 3, 4**, or **5**, then the *nc* value cannot be **0** (for example, **dpc=5-0-1** is rejected).
- If the *ni* value is **1, 2, 3, 4** or **5**, then network routing point codes are not allowed (for example, **dpc=4-\*-\*** is rejected).

If the **chg-sid:pctype** parameter is set to **other**, the ANSI point codes do not meet ANSI standards. The range of values for these ANSI point codes is as follows:

*ni*—**000-255**  
*nc*—**000-255, \***  
*ncm*—**000-255, \***

The following rules apply to provisioning ANSI point code if the **chg-sid:pctype=other** parameter is specified:

- An *ni* value of **0** is allowed, however **dpc=0-0-0** is rejected (for example, **dpc=0-1-1** is accepted).
- The *nc* value can be **0** for all values of *ni* (for example, **dpc=5-0-1** is accepted).
- Network routing point codes are allowed for all values of *ni* (for example, **dpc=4-\*-\*** is accepted).

An ANSI point code containing all zeros (**0-0-0**) is not a valid point code and cannot be entered into the database.

ANSI point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code subfield values to indicate a Private Point Code. For example, **p-5-0-1**. See "Spare and Private Point Code Subtype Prefixes".

**NOTE: Point codes specified by many commands, including those for site identification, routing keys, and LNP, are required to be full point codes. The asterisk values are not valid in**

**the commands that specify these point codes. The command Dependencies sections identify the point codes that must be full point codes in the commands.**

A range of values for a subfield is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** through **100**.

The asterisk (\*) point code value indicates a single cluster address for a cluster point code (for example, **20-2-\***) or a network routing destination (**20-\*-\***). If \* is used for the *nc* subfield, then \* must also be used for the *ncm* subfield.

A double asterisk (\*\*) and a triple asterisk (\*\*\*) can also be used for the *nc* and *ncm* subfields of the ANSI point code, but only for the **rtrv-dstn**, **rept-stat-dstn**, **rtrv-rte**, and **rept-stat-rte** commands. If \*, \*\*, or \*\*\* is used for the *nc* subfield, then \*, \*\*, or \*\*\* must be used for the *ncm* field.

For examples of all of these point code values, see the **rtrv-dstn** command output in Chapter 5 of the *Commands Manual*.

## ITU International Point Codes

The ITU international point codes are made up of three groups of digits called *zone*, *area*, and *id*. The range of values for ITU International point codes are:

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

An ITU international point code containing all zeros (**0-000-0**) is not a valid point code and cannot be entered into the database.

ITU international point codes support the Spare Point Code subtype prefix (**s-**). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-5-222-1**, for example). See "Spare and Private Point Code Subtype Prefixes".

## ITU National Point Codes

The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers (members) separated by dashes.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is on, ITU national point codes can have group codes assigned to them. The point code is a 1- to 5-digit number. The group code is a two-character field ranging from **aa** to **zz** that is entered as the last subfield of the point code and is separated by a dash from the rest of the point code. An example is **12345-az**.

If the flexible point codes option is enabled (see the **chg-stpopts** command, **:npcfmti** parameter), an ITU national point code format consists of 2, 3, or 4 numbers separated by dashes (formatted as *m1-m2-m3-m4*). When the ITUDUPPC feature is also on, the format is *m1-m2-m3-m4-gc* with a group code. If one of the *m1*, *m2*, *m3*, *m4* members is set to zero bits, no value is entered for that position in the point code. For example, if the **npcfmti** parameter value is set to **3-8-3-0**, valid point codes would be **1-100-1-aa** with a group code, or **7-255-7** with no group code. See the tables in the **chg-stpopts** command description for valid member values and additional examples.

The following ranges of values are valid:

*nnnnn*—**0-16383**

*nnnnn-gc*—**0-16363**; group code is *aa-zz* (the ITUDUPPC feature must be on)

*m1-m2-m3-m4*—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14.

*m1-m2-m3-m4-gc*—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14. Group code is *aa-zz* (the ITUDUPPC feature must be on).

An asterisk value (\*) is allowed only for the **rtrv-dstn** and **rtrv-rte** commands to retrieve ITU-N DPCs if the ITUDUPPC feature is on (for point codes with group codes). The node and group code cannot both be \*. For example, **dpcn=12345-\*** and **dpcn=aa** are allowed, but **dpcn=\*-\*** is not allowed.

If flexible point codes are also used, all valid *m1*, *m2*, *m3*, and *m4* must all be either a number or an \*. For example, **1-100-1-aa** and **\*-\*-\*-aa** are allowed, but **1-\*-\*-aa** is not allowed.

ITU national point codes support the Spare Point Code subtype prefix **s-0**. The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-12345** or **s-1-3-5-5-gc**, for example). See "Spare and Private Point Code Subtype Prefixes".

## **Converting ITU National Point Code Formats**

### **Introduction**

Gateway screening only allows ITU national point codes to be provisioned in the database by the enter, delete, or change gateway screening commands, and displayed by the gateway screening retrieve commands as a single number. If a format other than a single number (**4-0-0-0**) for the ITU national point code has been defined by the **npcfmti** parameter of the **chg-stpopts** command, the ITU national point code must be converted into a single number so that it can be used by gateway screening.

For example, the format of the ITU national point code is **4-4-4-2** and you would like to add point code **7-7-7-1** into the allowed OPC screen. The point code **7-7-7-1** would have to be converted to a single number so that the point code can be added to the allowed OPC screen. To determine what multiple-part ITU national point code is represented by the single number ITU national point code in the gateway screening table, the single number point code must be converted to a multiple-part point code.

To convert a single number ITU national point code to a multiple-part point code, go to "Converting Single Number ITU National Point Codes".

To convert a multiple-part ITU national point code to a single number point code, go to "Converting Multiple-Part ITU National Point Codes".

For a definition of the different formats that can be used for ITU national point codes, see "ITU National Point Codes".

**Converting Single Number ITU National Point Codes**

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the NPCFMTI field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **14781** and **695** are converted to point codes using the **3-8-3-0** format.

Convert a single number ITU national point code to a multiple-part ITU national point code as follows.

**Procedure - Converting a Single Number ITU national point code to a multiple-part ITU national point code**

- 1 Convert the point code to a binary number. This can be done with most scientific calculators. The number **14781** converts to the binary number 11100110111101.  
The number **695** converts to the binary number 1010110111.

**NOTE: Make sure the binary number contains 14 digits. If it does not, add leading zeros to the binary number to bring the total number of digits in the number to 14.**

In this example, the binary equivalent for the decimal number 695 (1010110111) contains 10 digits; four zeros must be added to the beginning of the binary number. The resulting binary number is now 00001010110111.

- 2 Divide the binary number into the number of parts required by the format of the ITU national point code. For this example, the format is **3-8-3-0**. Because the last part of the point code format is **0**, the point code format contains only three parts. Divide the point code into three parts, the first part of the point code contains the first three digits of the 14-digit binary number, the second part of the point code contains the next eight digits of the 14-digit binary number, and the third part of the point code contains the last three digits of the 14-digit binary number. For this example, the binary numbers would be divided like this:

11100110111101 = 111 00110111 101

00001010110111 = 000 01010110 111

- 3 Convert each part of the point code into a decimal number using the same scientific calculator used in step 1 and separate each part of the point code with dashes. The results are as follows.  
111 00110111 101 = **7-55-5**  
000 01010110 111 = **0-86-7**

When the ITU national point codes are converted from single numbers to multiple-part point codes, the resulting value of the multiple-part point code depends on the point code format specified by the **npcfnti** parameter of the **chg-stpopts** command. When converting the single number point code **14781** to the point code format **3-8-3-0**, the resulting point code value is **7-55-5**. If point code **14781** is converted to the point code format **4-4-4-2**, the resulting point code value is **14-6-15-1**.

**Converting Multiple-Part ITU National Point Codes**

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the **npcfnti** field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **7-55-5** and **0-86-7**, using the **3-8-3-0** point code format, are converted into a single number.

Convert multiple-part ITU national point codes to a single number as follows.

### **Procedure - Converting Multiple-Part ITU National Point Codes to a Single Number**

---

- 1 Convert each part of the point code into a binary number using a scientific calculator. The results are as follows.

**7-55-5** = 111 00110111 101

**0-86-7** = 000 01010110 111

---

- 2 Combine each part of the point code into a single binary number as follows.

111 00110111 101 = 11100110111101

000 01010110 111 = 00001010110111

**NOTE: If the binary number has any zeros at the beginning of the number, remove these zeros as they are not necessary.**

In this example, the binary equivalent for the point code **0-86-7** (00001010110111) contains four zeros at the beginning of the binary number. When the leading zeros are removed from the binary number, the resulting binary number is now 1010110111.

---

- 3 Convert the binary number to a decimal number using the same scientific calculator used in step 1.

The binary number 11100110111101 converts to the decimal number **14781**.

The binary number 1010110111 converts to the decimal number **695**.

---

## **24-bit ITU-National Point Codes**

The 24-bit ITU national point codes are made up of three groups of digits called *main signaling area*, *sub signaling area*, and *signaling point*. The valid values for 24-bit ITU national point codes are:

*main signaling area* —**000-255**

*sub signaling area* —**000-255**

*signaling point*—**000-255**

24-bit ITU national point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code field values to indicate a Private Point Code (**p-2055-222-2011**, for example). See "Spare and Private Point Code Subtype Prefixes".

## **Spare and Private Point Code Subtype Prefixes**

The Spare Point Code Support feature and the Internal Point Code Support feature provide optional point code subtype prefixes. The Spare Point Code feature must be enabled before a point code subtype prefix can be specified for a point code.

**NOTE: The SEAS interface does not support point code subtype prefixes.**

The values **p-**, **s-**, and **ps-** are valid point code subtype prefixes. The dash “-” separates the point code subtype prefix from the remainder of the point code. The prefixes are displayed in lower case. The syntax for the remainder of the point code remains the same.

The Spare Point Code prefix (**s-**) applies only to ITU-I and ITU-N point code domains (ITU-N24 point codes do not support the Spare Point Code prefix), to allow the EAGLE 5 ISS to fully support ITU National and International Spare Point Codes. Table A-2 lists the commands that support the Spare Point Code subtype prefix.

The Private (Internal) Point Code prefix (**p-**) applies to all point code domain types (including ITU-N24 point codes), to allow messages destined to the End Office Node to be routed from the inbound LIM to the outbound IPGWx. Table A-3 lists the commands that support the Private Point Code subtype prefix.

The subtype prefix **ps-** can be specified when the point code parameter supports both the spare and private point code prefixes.

**Table A-2.** Commands that support the Spare Point Code Prefix

| Command             | Description                                      | Applicable Point Code Parameters                                                                                                                  |
|---------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>alm</b>          | Alarm                                            | <b>dpci</b> and <b>dpcn</b>                                                                                                                       |
| <b>appl-rtkey</b>   | Application Route Key                            | <b>dpci</b> and <b>dpcn</b> ; <b>opci</b> and <b>open</b>                                                                                         |
| <b>cspc</b>         | Concerned Signaling Point Code                   | <b>pci</b> and <b>pcn</b>                                                                                                                         |
| <b>dstn</b>         | Destination                                      | <b>spci</b> and <b>spcn</b> ; <b>dpci</b> and <b>dpcn</b> ; and Alias combinations.                                                               |
| <b>ent-trace</b>    | Enter Trace                                      | <b>dpci</b> and <b>dpcn</b> ; <b>opci</b> and <b>open</b>                                                                                         |
| <b>gsmmap-scrn</b>  | GSM MAP Screening                                | <b>npci</b> and <b>npcn</b>                                                                                                                       |
| <b>gsmopts</b>      | GSM Options                                      | <b>ppsmspci1</b> , <b>ppsmspci2</b> , <b>ppsmspcn1</b> , <b>ppsmspcn2</b>                                                                         |
| <b>gsm-s-opcode</b> | GSM Short Message Services OP-Code               | <b>pci</b> and <b>pcn</b>                                                                                                                         |
| <b>gtt/gta</b>      | Global Title Translation/Global Title Address    | <b>pci</b> and <b>pcn</b>                                                                                                                         |
| <b>ls</b>           | Linkset                                          | <b>apci</b> and <b>apcn</b>                                                                                                                       |
| <b>map</b>          | Mated Application                                | <b>pci</b> and <b>pcn</b> ; <b>mpci</b> and <b>mpcn</b>                                                                                           |
| <b>mrn</b>          | Mated Relay Node                                 | <b>pci</b> and <b>pcn</b> ; <b>pci1</b> and <b>pcn1</b> ; <b>pci2</b> and <b>pcn2</b> ; <b>pci3</b> and <b>pcn3</b> ; <b>pci4</b> and <b>pcn4</b> |
| <b>na</b>           | Network Appearance                               | <b>type=ituis</b> , <b>type=ituns</b>                                                                                                             |
| <b>pass</b>         | Pass Commands                                    | Syntax for routing keys                                                                                                                           |
| <b>rmt-appl</b>     | Remote Application                               | <b>ipci</b> and <b>ipcn</b>                                                                                                                       |
| <b>rte</b>          | Route                                            | <b>dpci</b> and <b>dpcn</b>                                                                                                                       |
| <b>scr-aftpc</b>    | Gateway Screening Allowed Affected Point Code    | <b>pcst</b> and <b>pctype</b>                                                                                                                     |
| <b>scr-blkdpc</b>   | Gateway Screening Blocked Destination Point Code | <b>pcst</b> and <b>pctype</b>                                                                                                                     |

**Table A-2.** Commands that support the Spare Point Code Prefix

| <b>Command</b>     | <b>Description</b>                                              | <b>Applicable Point Code Parameters</b>                                                      |
|--------------------|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>scr-blkopc</b>  | Gateway Screening Blocked Origination Point Code                | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>scr-cdpa</b>    | Gateway Screening Called Party (CDPA PC Destination) Point Code | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>scr-cgpa</b>    | Gateway Screening Calling Party (Origination) Point Code        | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>scr-destfld</b> | Gateway Screening Affected Destination (Concerned) Point Code   | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>scr-dpc</b>     | Gateway Screening Destination Point Code                        | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>scr-opc</b>     | Gateway Screening Origination Point Code                        | <b>pcst</b> and <b>pctype</b>                                                                |
| <b>sid</b>         | Site ID                                                         | True <b>pci</b> and <b>pcn</b> ; <b>cpci</b> and <b>cpn</b> ; <b>ncpci</b> and <b>ncpn</b> . |
| <b>spc</b>         | Secondary Point Code                                            | <b>spci</b> and <b>spcn</b>                                                                  |

**Table A-3.** Commands that support the Private Point Code Prefix

| <b>Command</b>           | <b>Description</b>        | <b>Applicable Point Code Parameters</b>                                                                             |
|--------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>dstn</b>              | Destination               | <b>spci</b> and <b>spcn</b> ; <b>dpc</b> , <b>dpca</b> , <b>dpci</b> , and <b>dpcn</b><br>Does not apply to Aliases |
| <b>ls</b>                | Linkset                   | If <b>ipgwape</b> = yes, <b>apc</b> , <b>apcn</b> , <b>apci</b> , and <b>apcn</b>                                   |
| <b>gtt/gta</b>           | Global Title Translation  | <b>pc</b> , <b>pca</b> , <b>pci</b> , and <b>pcn</b>                                                                |
| <b>inh/unhb-alm</b>      | Destination alarm inhibit | <b>dpc</b> , <b>dpca</b> , <b>dpci</b> , and <b>dpcn</b>                                                            |
| <b>rept-stat-cluster</b> | Report Cluster Status     | <b>dpc</b> and <b>dpca</b>                                                                                          |
| <b>rept-stat-dstn</b>    | Report Destination Status | <b>dpc</b> , <b>dpca</b> , <b>dpci</b> , and <b>dpcn</b>                                                            |
| <b>rmt-appl</b>          | Remote Application        | <b>ipc</b> , <b>ipca</b> , <b>ipci</b> , and <b>ipcn</b>                                                            |
| <b>rst-dstn</b>          | Restore Destination       | <b>dpc</b> and <b>dpca</b>                                                                                          |
| <b>rte</b>               | Route                     | <b>dpc</b> , <b>dpca</b> , <b>dpci</b> , and <b>dpcn</b>                                                            |

## Valid CIC Ranges for SI and MSU Types in Routing Key Static Entries

Table A-4 lists the valid CIC ranges for use with SI and MSU types in Routing Key table static entries.

**Table A-4.** Valid CIC Ranges for SI and MSU Types

| SI         | MSU for ANSI DPC                          | MSU for ITU DPC                     | Comments                                       |
|------------|-------------------------------------------|-------------------------------------|------------------------------------------------|
| 4 (TUP)    | N/A                                       | CIC is 12 bits.<br>Range is 0-4095. | The TUP protocol is used only in ITU networks. |
| 5 (ISUP)   | CIC is 14 bits.<br>Range is 0-16383.      | CIC is 12 bits.<br>Range is 0-4095. |                                                |
| 13 (QBICC) | CIC is 32 bits.<br>Range is 0-4294967295. |                                     |                                                |

## DRANAIV/DRANAI Mapping

Table A-5 shows the mapping between the **drainaiv** and **dranai** parameters.

**Table A-5.** DRANAIV/DRANAI Mapping

| DRANAIV | DRANAI  | Description                 |
|---------|---------|-----------------------------|
| 1       | sub     | Subscriber Number           |
| 2       | unknown | Unknown                     |
| 3       | natl    | National significant number |
| 4       | intl    | International number        |
| 5       | ntwk    | Network                     |

## DRANPV/DRANP Mapping

Table A-6 shows the mapping between the **dranpv** and **dranp** parameters.

**Table A-6.** DRANPV/DRANP Mapping

| DRANPV | DRANP | Description                   |
|--------|-------|-------------------------------|
| 1      | E164  | ISDN/telephony numbering plan |
| 3      | X121  | Data numbering plan           |
| 4      | F69   | Telex Numbering Plan          |

## NAIV/NAI Mapping

Table A-7 shows the mapping between the **naiv** and the **nai** parameters.

**Table A-7.** NAIV/NAI Mapping

| NAIV  | NAI  | Description                 |
|-------|------|-----------------------------|
| 0     | –    | Unknown                     |
| 1     | Sub  | Subscriber Number           |
| 2     | Rsvd | Reserved for national use   |
| 3     | Natl | National significant number |
| 4     | Intl | International number        |
| 5–127 | –    | Spare                       |

## NPV/NP Mapping

Table A-8 shows the mapping between the **npv** and the **np** parameters.

**Table A-8.** NPV/NP Mapping

| NPV | NP      | Description                   |
|-----|---------|-------------------------------|
| 0   | –       | Unknown                       |
| 1   | E164    | ISDN/telephony numbering plan |
| 2   | Generic | Generic numbering plan        |
| 3   | X121    | Data numbering plan           |

Table A-8. NPV/NP Mapping

| NPV  | NP      | Description                                        |
|------|---------|----------------------------------------------------|
| 4    | F69     | Telex numbering plan                               |
| 5    | E210    | Maritime mobile numbering plan                     |
| 6    | E212    | Land mobile numbering plan                         |
| 7    | E214    | ISDN/mobile numbering plan                         |
| 8    | Private | Private network or network-specific numbering plan |
| 9–15 | –       | Spare                                              |

## Cards that use the ent-card Command

Table A-9 contains information about cards that use the **ent-card** command for provisioning.

Table A-9. Valid ent-card Applications (appl) and Card Types (type)

| <p>* Though the system allows 250 MCPM cards, practical usage is 2.</p> <p>*** If any MPS-based features are running in the system, up to 25 DSMs are allowed in the system. If only GTT is running, up to 32 DSMs can be used in the system with the 50,000 GTT feature.</p> <p>† DSM cards or E5-SM4G cards are required for the LNP feature.</p> <p>† † For the E1 or T1 interface, either SS7 application (SS7ANSI or CCS7ITU) can be assigned to these cards. For more information on the E1 or T1 interface go to Appendix A "E1 Interface" or Appendix B "T1 Interface" in the <i>Database Administration Manual - SS7</i>.</p> <p>Part numbers followed by (R) are ROHS numbers. These numbers are equivalent to the non-ROHS numbers that they are paired with.</p> <p>***Connectivity to a TekServer 3 T1200 with EPAP 13.0 or higher is required for more than 25 Service Module cards.</p> |                                                                                   |                      |                             |                                  |

## Summary of Loopback Testing Commands and Functions

Table A-10 and Figure A-1 summarize the loopback testing commands and functions in the system.

The **tst-slk** command provides several methods for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select **lxvr** (local transceiver), **oam**, **line**, **payload**, and **sltc** loopback tests. The **tst-slk** command will be rejected if a loopback test is not compatible with the link type.

- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- For high-speed links (ATM and E5-ATM), the **lxvr**, **oam**, **line**, **payload**, and **sltc** tests are allowed.
- For SS7IPGW and IPGWI DCMs, the **tst-slk** command is not supported.
- For IPLIMx DCMs, only the **loopback=sltc** test is allowed, and is allowed only for links having IPLIML2 type of M2PA.
- For LIME1, LIMT1, or LIMCH cards, or for the E5-ENET card running the IPSG application, only the **loopback=sltc** test is allowed.
- The E5-E1T1 and HC-MIM cards can function as either an E1 MIM card or a T1 MIM card, depending on how the card is provisioned. **loopback=sltc** test is allowed.

The **act-lbp** command activates test on one or more loopback points for testing data signaling link elements in one CCS7 transmission path. The maximum number of loopback points is 32.

For a single loopback point test, the parameters can be entered on the command line. If the parameters are not entered at the command line, the LFS database is used. For multiple loopback point tests, the LFS database must be used.

The **ent-lbp** command is used to create the loopback points in the LFS database. The LBP's may be entered in any order.

See the command descriptions in this manual for details on entering parameters and using the commands.

| <b>A-Port</b>  | ANSI-41 Mobile Number Portability                                                              |
| <b>AINPQ</b>   | ANSI-41 INP Query                                                                              |
| <b>AAL</b>     | ATM Adaptation Layer                                                                           |
| <b>AAL5</b>    | ATM Adaptation Layer 5                                                                         |
| <b>AAL5CP</b>  | ATM Adaptation Layer 5 Common Port                                                             |
| <b>AATM</b>    | ATM Applique                                                                                   |
| <b>ACG</b>     | Automatic Call Gapping                                                                         |
| <b>ACM</b>     | Application Communications Module                                                              |
| <b>ADJ DPC</b> | Adjacent Destination Point Code                                                                |
| <b>AI</b>      | Address Indicator                                                                              |
| <b>AIN</b>     | Advanced Intelligent Network                                                                   |
| <b>AINF</b>    | Application Interface Applique                                                                 |
| <b>ANSI</b>    | American National Standards Institute                                                          |
| <b>AP</b>      | Application Processor                                                                          |
| <b>APC</b>     | Adjacent Point Code                                                                            |
| <b>ARP</b>     | Address Resolution Protocol                                                                    |
| <b>AS</b>      | Application Server; a logical entity serving a specific Routing Key                            |
| <b>ASM</b>     | Application Services Module                                                                    |
| <b>ASP</b>     | Application Server Process                                                                     |
| <b>ATI</b>     | Any Time Interrogation                                                                         |
| <b>ATM</b>     | Asynchronous Transfer Mode                                                                     |
| <b>ATMANSI</b> | The application software for the ATM (high-speed) SS7 signaling links                          |
| <b>ATM HSL</b> | Asynchronous Transfer Mode High Speed Link                                                     |
| <b>ATMM</b>    | ATM Layer Management                                                                           |
| <b>AVL</b>     | Availability Measurements report                                                               |
| <b>AVLD</b>    | Daily Availability measurements report                                                         |
| <b>AVLDTH</b>  | Day-to-Hour Availability measurements report                                                   |
| <b>BCSM</b>    | Basic Call State Model                                                                         |
| <b>BIP</b>     | Board Identification PROM                                                                      |
| <b>BITS</b>    | Building Integrated Timing System                                                              |
| <b>BLM</b>     | Bulk Load Module                                                                               |
| <b>BPHCAP</b>  | The application software used by the application processor and the IMT processor of the LIMATM |
| <b>BPDCM</b>   | The application software for flash memory management on the DCM card.                          |
| <b>BSD</b>     | Berkeley Software Distribution                                                                 |
| <b>BSN</b>     | Backward Sequence Number                                                                       |
| <b>CAS</b>     | Channel Associated Signaling                                                                   |
| <b>CCM</b>     | Command Class Management                                                                       |

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| <b>CCS</b>     | Common Channel Signaling                                                     |
| <b>CCS7</b>    | Common Channel Signaling System #7                                           |
| <b>CCS7ITU</b> | The application software for the ITU SS7 signaling links                     |
| <b>CDPA</b>    | Called Party Address                                                         |
| <b>CDPN</b>    | Called Party Number                                                          |
| <b>CGPA</b>    | Calling Party Address                                                        |
| <b>CF</b>      | Control Frame                                                                |
| <b>CIC</b>     | Circuit Identification Code                                                  |
| <b>CLLI</b>    | Common Language Location Identifier                                          |
| <b>CLU</b>     | Network Cluster                                                              |
| <b>CM</b>      | Cluster Management                                                           |
| <b>CNCF</b>    | Calling Name Conversion Facility                                             |
| <b>CP</b>      | Communication Processor                                                      |
| <b>CPU</b>     | Central Processing Unit                                                      |
| <b>CRC</b>     | Cyclic Redundancy Check                                                      |
| <b>CRMD</b>    | Cluster Routing and Management Diversity                                     |
| <b>CRP</b>     | Circular Route Prevention                                                    |
| <b>CSL</b>     | Common Screening List                                                        |
| <b>CSPC</b>    | Concerned Signaling Point Code Group                                         |
| <b>CSU</b>     | Channel Service Unit                                                         |
| <b>DB</b>      | Database                                                                     |
| <b>DCM</b>     | Database Communications Module                                               |
| <b>DIP</b>     | Dual In-Line Package                                                         |
| <b>DIX</b>     | Digital/Intel/Xerox de facto standard for Ethernet Media Access Control Type |
| <b>DN</b>      | Dialed or Directory Number                                                   |
| <b>DPC</b>     | Destination Point Code                                                       |
| <b>DRAM</b>    | Dynamic Random Access Memory                                                 |
| <b>DS0</b>     | Digital Signal Level - 0                                                     |
| <b>DSM</b>     | Database Services Module                                                     |
| <b>DSU</b>     | Data Service Unit                                                            |
| <b>DTA</b>     | Database Transport Access                                                    |
| <b>E5-E1T1</b> | EPM-based E1/T1 Multi-Channel Interface Module                               |
| <b>E5-ENET</b> | EPM-based Ethernet card                                                      |
| <b>ESIS</b>    | Eagle 5 Integrated Monitoring Support                                        |
| <b>EBDA</b>    | Enhanced Bulk Download and Audit                                             |
| <b>EDR</b>     | Efficient Data Representation                                                |
| <b>EF</b>      | Extension Frame                                                              |
| <b>EGTT</b>    | Enhanced Global Title Translation                                            |
| <b>EIA</b>     | Electronic Industries Association                                            |
| <b>EILA</b>    | Enhanced Integrated LIM Applique                                             |
| <b>EIR</b>     | Equipment Identity Register                                                  |
| <b>ELAP</b>    | Eagle LNP Application Processor                                              |
| <b>EMP</b>     | Eagle Monitoring Protocol                                                    |
| <b>EMSALM</b>  | Element Management System Alarm Monitor                                      |
| <b>ENET</b>    | Ethernet                                                                     |
| <b>EOAM</b>    | Enhanced Operations, Administration, and Maintenance                         |
| <b>EOAP</b>    | Enhanced OSS Application Process                                             |
| <b>EPAP</b>    | Eagle Provisioning Application Processor                                     |
| <b>EPM</b>     | Embedded Processor Module (E5-E1T1 and E5-ENET cards are EPM-based cards)    |
| <b>EPROM</b>   | Erasable PROM                                                                |
| <b>ESP</b>     | Extended Services Platform                                                   |
| <b>FAK</b>     | Feature Access Key                                                           |
| <b>FAP</b>     | Fuse and Alarm Panel                                                         |
| <b>FAS</b>     | Frame Alignment Signal                                                       |

## Acronyms and Abbreviations

|               |                                                    |
|---------------|----------------------------------------------------|
| <b>FISU</b>   | Fill In Signal Unit                                |
| <b>FPBA</b>   | Frame Power Budget Alarm                           |
| <b>FPCR</b>   | Full Point Code Routing                            |
| <b>FPT</b>    | Frame Power Threshold                              |
| <b>FSN</b>    | Forward Sequence Number                            |
| <b>FTA</b>    | File Transfer Area                                 |
| <b>FTP</b>    | File Transfer Protocol                             |
| <b>FTRA</b>   | FTP-based Table Retrieve Application               |
| <b>GDB</b>    | GSM Real-Time Database                             |
| <b>G-Flex</b> | GSM Flexible Numbering                             |
| <b>G-Port</b> | GSM Mobile Number Portability                      |
| <b>GLS</b>    | Generic Loading Service                            |
| <b>GMSC</b>   | Gateway MSC                                        |
| <b>GPL</b>    | Generic Program Load                               |
| <b>GPSM</b>   | General Purpose Service Module                     |
| <b>GSL</b>    | Generic Software Load                              |
| <b>GSM</b>    | Global System for Mobile Communications            |
| <b>GTA</b>    | Global Title Address                               |
| <b>GTI</b>    | Global Title Indicator                             |
| <b>GTT</b>    | Global Title Translation                           |
| <b>GTWY</b>   | Gateway Administration measurements report         |
| <b>GWS</b>    | Gateway Screening                                  |
| <b>GWSA</b>   | Gateway Screening Application                      |
| <b>GWSM</b>   | Gateway Screening Messages                         |
| <b>HC-MIM</b> | High Capacity Multi-Channel Interface Module       |
| <b>HDB3</b>   | High Density Bipolar 3 encoding                    |
| <b>HIPR</b>   | High Speed IMT Packet Router                       |
| <b>HLR</b>    | Home Location Register                             |
| <b>HOMERN</b> | Home Network Routing Number Prefix                 |
| <b>HMUX</b>   | High-Speed Multiplexer                             |
| <b>HRN</b>    | Home Routing Number                                |
| <b>HSL</b>    | High-Speed Links                                   |

| <b>SIB</b>          | Status Indication "Busy"                             |

## Acronyms and Abbreviations

|                |                                                                                         |
|----------------|-----------------------------------------------------------------------------------------|
| <b>SIE</b>     | Status Indication “Emergency” Alignment                                                 |
| <b>SIN</b>     | Status Indication “Normal Alignment”                                                    |
| <b>SIO</b>     | Service Information Octet                                                               |
| <b>SIO</b>     | Status Indication “Out of Alignment”                                                    |
| <b>SIOS</b>    | Status Indication “Out of Service”                                                      |
| <b>SK</b>      | Service Key                                                                             |
| <b>SKTS</b>    | Service Key/TeleService List                                                            |
| <b>SLK</b>     | Signaling Link                                                                          |
| <b>SLS</b>     | Signaling Link Selection                                                                |
| <b>SLSCI</b>   | Signaling Link Conversion Indicator                                                     |
| <b>SLTA</b>    | Signaling Link Test Acknowledgement                                                     |
| <b>SLTM</b>    | Signaling Link Test Message                                                             |
| <b>SMS</b>     | Short Message Service                                                                   |
| <b>SMSC</b>    | Short Message Service Center                                                            |
| <b>SMSMR</b>   | Prepaid Short Message Service                                                           |
| <b>SNAI</b>    | Service Nature of Address Indicator                                                     |
| <b>SNM</b>     | Signaling Network Management                                                            |
| <b>SNR</b>     | Subsystem Normal Routing                                                                |
| <b>SOR</b>     | Support for Optimal Routing                                                             |
| <b>SORP</b>    | Socket Option Registration Primitive                                                    |
| <b>SPC</b>     | Secondary Point Code Signaling Point Code                                               |
| <b>SRF</b>     | Signaling Relay Function                                                                |
| <b>SRI</b>     | Send Routing Information                                                                |
| <b>SRVSEL</b>  | Service Selector                                                                        |
| <b>SS7</b>     | Signaling System #7                                                                     |
| <b>SS7ANSI</b> | The application software for the ANSI SS7 signaling links                               |
| <b>SS7GX25</b> | The application software for the X.25/SS7 gateway feature                               |
| <b>SS7IPGW</b> | The application software used by the DCM card for TCP/IP point-to-multipoint capability |
| <b>SSA</b>     | Subsystem Allowed (An SCCP management message)                                          |
| <b>SSEL</b>    | Session Selector                                                                        |
| <b>SSN</b>     | SS7 Subsystem Number                                                                    |
| <b>SSP</b>     | Service Switching Point                                                                 |
| <b>SSU</b>     | Status Signal Unit                                                                      |
| <b>ST</b>      | Stop Digit—BCD value 15 (0xF)—used to indicate the end of dialing in some applications  |
| <b>STC</b>     | Signaling Transport Card                                                                |
| <b>STP</b>     | Signal Transfer Point                                                                   |
| <b>STP LAN</b> | The application software for the STP LAN feature                                        |
| <b>SUA</b>     | SS7 SCCP-User Adaptation Layer                                                          |
| <b>SVC</b>     | Switched Virtual Circuit                                                                |
| <b>TALI</b>    | Transport Adapter Layer Interface (RFC 3094)                                            |
| <b>TCP</b>     | Transmission Control Protocol                                                           |
| <b>TCAP</b>    | Transaction Capabilities Application Part                                               |
| <b>TDM</b>     | Terminal Disk Module                                                                    |
| <b>TFA</b>     | Transfer Allowed                                                                        |
| <b>TFC</b>     | Transfer Congested (traffic)                                                            |
| <b>TFP</b>     | Transfer Prohibited                                                                     |
| <b>TFR</b>     | Transfer Restricted                                                                     |
| <b>TLNP</b>    | Triggerless LNP                                                                         |
| <b>TOS</b>     | Type of Service                                                                         |
| <b>TPS</b>     | Transactions Per Second                                                                 |
| <b>TRA</b>     | Traffic Restarting Allowed                                                              |
| <b>TRBL</b>    | Trouble                                                                                 |

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <b>TRW</b>     | Traffic Restarting Waiting                                |
| <b>TSC</b>     | Time Slot Counter Synchronization                         |
| <b>TSM</b>     | Translation Services Module                               |
| <b>TT</b>      | Translation Type                                          |
| <b>TUP</b>     | Telephone User Part                                       |
| <b>TV</b>      | Ticket Voucher                                            |
