If the **gti/gtia/gtii/gtin/gtin24/gtiis/gtins=2** parameter is specified, then the **np/npv** and **nai/naiv** parameters cannot be specified.

If the **gtii/gtin/gtin24/gtiis/gtins=4** parameter is specified, the **np(v)** and **nai(v)** parameters must be specified. These parameters can be specified in any combination: **np/naiv**, **npv/nai**, **np/nai**, or **npv/naiv**.

A value of **none** cannot be specified for the **gttsn**, **cdgtasn**, **cggtasn**, **cgpcsn**, **cdgttsn**, and **cggttsn** parameters.

At least one GTT set name parameter must be specified. These parameters include:

- **cdgtasn**, **cggtasn** or **cgpcsn** if the OBSR feature is enabled
- **cdgttsn** or **cggttsn** if the FLOBR feature is turned on
- **gttsn** if the OBSR feature is not enabled and the FLOBR feature is not turned on

The OBSR feature must be enabled before the **cggtasn**, **cgpcsn**, **cgssn**, or **cdgtasn** parameters can be specified.

The SSNSELID Table cannot contain more than 100,000 entries.

The linkset specified by the **lsn** parameter must already exist.

The FLOBR feature must be turned on before the **thdsn**, **eaglelegn**, **cdgttsn** and **cggttsn** parameters can be specified.

If the FLOBR feature is turned on, then the **cdgtasn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

The value specified for the **cdgtasn** or **gttsn** parameter must match the name of an existing GTT set.

The GTT set specified by the **cdgtasn** or **gttsn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

An entry cannot already exist that matches the **eaglelegn**, **gti**, **tt**, and **np(v)** and **nai(v)** parameter combination for the specified CdPA and/or CgPA selector.

The GTT set specified by the **gttsn**, **cdgtasn**, or **cdgttsn** parameter must already exist in the GTT Set table.

The network domain of the specified GTT selector must match the domain of the GTT set that is specified by the **gttsn**, **cdgtasn**, or **cdgttsn** parameter, unless the domain of the GTT set has a value of **cross**.

The GTT set specified by the **cggttsn**, **cggtasn** or **cgpcsn** parameter must already exist in the GTT Set table.

The network domain of the GTT set that is specified by the **cggttsn**, **cggtasn**, or **cgpcsn** parameter must match the domain specified by the **gti(x)** parameter.

The set type of the GTT set specified by the **cggtasn** or **cgpcsn** parameter must match the set type of the corresponding entry in the GTT Set table.

The GTT Set specified by the **cdgtasn** or **gttsn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The **gttsn** parameter cannot be specified if the OBSR feature is enabled or the FLOBR feature is turned on.

The GTTDBMM Table cannot contain more than 42,502 entries.

The domain specified by the **gti(x)** parameter must match the domain of the linkset specified by the **lsn** parameter.

If the **gti(x)=4** parameter is specified, then the GTT selector table cannot have more than **nai** entries per **tt/np** combination.

The **cggtasn**, **cgpcsn**, and **cggttsn** parameters cannot be specified together in the command.

The **gttsn**, **cdgtasn**, and **cdgttsn** parameters cannot be specified together in the command.

If the **gttsn**, **cdgttsn**, or **cdgtasn** parameter is specified, then the **cgssn** parameter cannot be specified.

If the **cggtasn**, **cgpcsn** or **cggttsn** parameter is specified, then the **cgssn** parameter must be specified.

If the **cdgttsn** or **cggttsn** parameter is specified, then the **lsn** parameter must be specified.

If the **eaglelegn=yes** parameter is specified, then the **lsn**, **selid**, **gttsn**, **cdgtasn**, **cgssn**, **cggttsn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

If the **gti(x)=0** parameter is specified, then the **eaglegen**, **tt**, **np/npv**, and **nai/naiv** parameters cannot be specified.

If a value of **2** or **4** is specified for the **gti(x)** parameter, then the **tt** parameter must be specified.

For existing TTs with **gtii/gtin/gtin24/gtiis/gtins=4**, the domain of the new entry must match the existing domain.

Notes

For **gtii/gtin=4**, although DFLT may appear in the **rtrv-gttset** output, **dflt** cannot be specified as value for the **np** or **nai** parameters when the **ent-gttset** command is entered. If a new GTT selector is specified that matches an existing GTT selector's **gti** and **tt** and the existing selector has **dflt** as the value for the **np** and/or **nai** parameters, a new entry is created with the new **np** and **nai** parameter values. The existing GTT selector entry with the **dflt** value is also retained. The **np/nai** parameter value **dflt** can be specified for the **chg/dlt/rtrv-gttset** commands.

The Origin-based SCCP Routing feature allows two GTT sets to be assigned to a GTT selector: **cdgtasn** and **cggtasn** or **cdgtasn** and **cgpcsn**. The **cggtasn** and **cgpcsn** GTT sets are mutually exclusive and cannot be assigned to the same GTT selector.

Output

```
ent-gttset:gti=0:cdgttsn=acdgtat
tekelecstp 10-04-05 15:41:49 EST Eagle 42.0.0
ent-gttset:gti=0:cdgttsn=acdgtat
Command entered at terminal #4.

```

ent-gttset

Enter GTT Set

Use this command to specify the attributes of a new GTT set (a set of global title translations). A GTT set consists of a GTT set name, the number of digits allocated for the GTA (global title address), the domain of the point codes used in the translation, and a pointer to a GTA tree. After the GTT set is provisioned, you can enter subsequent GTT Selector commands and GTA commands.

Keyword: **ent-gttset**

Related Commands: **chg-gttset**, **dlt-gttset**, **rtrv-gttset**

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *aaaaaaaa*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:netdom= (mandatory)

Network domain. This command does not distinguish between ITU national or ITU international because the Enhanced Global Title Translation (EGTT) feature does not discriminate between the ITU-I and ITU-N translations.

The **netdom** parameter refers to the incoming message network domain.

Range: **ansi**, **itu**, **cross**

:ndgt= (optional)

Number of digits. This parameter specifies the number of digits required for GTAs associated with the GTT set.

Range: **1-21**

Default: **6**

:settype= (optional)

GTT set type.

Range: **cdgta, cggtta, cgpc, cgssn, opc, cdssn, opcode, dpc**

Example

```
ent-gttset:gttsn=lidb:ndgt=10:netdom=ansient-
gttset:gttsn=t800:netdom=ansi
ent-gttset:gttsn=setint000:netdom=itu:ndgt=15
ent-gttset:gttsn=setcdgt:netdom=cross:ndgt=10:settype=cdgta
ent-gttset:gttsn=setcgg:netdom=ansi:ndgt=11:settype=cggtta
ent-gttset:gttsn=setxyz:netdom=ansi:ndgt=11:settype=cggtta
ent-gttset:gttsn=setopc:netdom=itu:settype=opc
ent-gttset:gttsn=setcgp:netdom=ansi:settype=cgpc
ent-gttset:gttsn=setssn:netdom=ansi:settype=cgssn
ent-gttset:gttsn=setopcode:settype=opcode
ent-gttset:gttsn=setcdssn:netdom=ansi:settype=cdssn
ent-gttset:gttsn=setdpc:netdom=ansi:settype=dpc
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The GTT Set table cannot contain more than 2000 entries.

The **gttsn=none** parameter cannot be specified.

If the VGTT (Variable Length GTT) feature is turned on, the **ndgt** parameter cannot be specified.

The **gttsn** parameter must be specified and must not match an existing **gttsn**.

If the **settype** parameter has a value of **cgssn, opc, cgpc, cdssn, opcode, or dpc**, then the **ndgt** parameter cannot be specified.

The **netdom=cross** parameter can be specified only if the **settype=cdgta** parameter is specified.

The Origin-based SCCP Routing feature must be turned on if the value of the **settype** parameter is **cggtta, cgssn, opc, or cgpc**.

If the OBSR feature is enabled or the FLOBR feature is turned on, then the **settype** parameter must be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **netdom=cross** parameter can be specified.

The TOBR feature must be turned on before the **settype=opcode** parameter can be specified.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the **settype** parameter can be specified and before more than 950 GTT set entries can be provisioned.

The FLOBR feature must be turned on before a value of **cdssn** or **dpc** can be specified for the **settype** parameter.

Notes

When the Origin-based SCCP Routing feature is turned on, VGTT is supported only for CdPA GTA and CgPA GTA. The **cross** network domain is supported only for CdPA GTA.

Output

```
ent-gttset:gttsn=setcdssn:netdom=ansi:settype=cdssn
```

```
tekelecstp 10-03-12 18:28:54 EST EAGLE 42.0.0

ent-gws-redirect**Enter Gateway Screening Redirect Command**

Use this command to provision the gateway screening redirect function. The Redirect table must be provisioned before configuring gateway screening to redirect received MSUs. The values that are specified with this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the **ri=gt** parameter is specified, the value **gt** is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Keyword: ent-gws-redirect

Related Commands: chg-gws-redirect, dlt-gws-redirect,

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The ANSI point code has subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range: 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code 0-000-0 is not a valid point code.

zone—0–7

area—000–255

id—0–7

:dpcn= (mandatory)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the **chg-stpopts:npcfnti** flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:gta= (mandatory)

Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.

Range: **1-21 digits**

:ri= (mandatory)

Specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected. Use the **gt** value to route by global title digits or use the **ssn** value to route by subsystem number.

Range: **gt, ssn**

:ssn= (mandatory)

Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.

Range: **000-255**

:tt= (mandatory)

Identifies the type of the global title translation (GTT). This value is the decimal representation of the 1-byte field used in SS7 and is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.

Range: **000-255**

:enabled= (optional)

Specifies whether MSUs that have passed gateway screening are to be redirected (**enabled=on**) or routed as normal (**enabled=off**).

Range: **on, off**

Default: **on**

Example

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=
on
ent-gws-redirect:dpc=1-40-1:ri=ssn:ssn=10:tt=1:gta=1800833:enable
d=off
```

Dependencies

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must be defined in the Destination table or defined as the STP site point code.

If the **dpc/dpca/dpci/dpcn/dpcn24** parameter is defined as a destination, it must have at least one route defined.

The redirect function data can be entered only once.

Notes

The SCCP screening functions (CGPA, TT, CDPA, and AFTPC) cannot select an MSU to be redirected.

Do not apply a Redirect Stop Action on the Adjacent Node point code for the BLKOPC and OPC screening functions.

Do not apply a Redirect Stop Action for an allowed DPC screen rule if the rule contains the self-identity point code of EAGLE 5 ISS where the screening rule is applied. This is because the redirection of SLTAs and SLTMs (Signal Link Test Messages and Acknowledgements) will not return to the originating EAGLE 5 ISS and will cause the link to fail.

If **gwsa=off** and **gwsn=off** are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

Output

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=
on
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENT-GWS-REDIRECT: MASP A - COMPLTD
;
```

ent-home-smsc**Enter HOME SMSC Address**

Use this command to enter HOME SMSC specific addresses, currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Keyword: ent-home-smsc

Related Commands: dlt-home-smsc, rtrv-home-smsc

Command Class: Database Administration

Parameters

:smc= (mandatory)

Identifies the type of the Short Message Service Center address.

Range: 1-21 digits

1-21 hexadecimal digits. Valid digits are **0-9, a-f, A-F**

Example

```
ent-home-smsc:smc=256489
ent-home-smsc:smc=256489a98bccee56ad237
```

Dependencies

The Portability Check for Mobile Originated SMS (MNPSMS) feature must be turned on or one of the following features must be enabled before this command can be entered.

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP

The specified HOME SMSC address cannot already exist in the HOME SMSCADDR table.

The HOME SMSCADDR table can contain a maximum of 500 entries.

Notes

None

Output

ent - home - smsc : smsc=256489

```
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ENT-HOME-SMSC: MASP A - COMPLTD
```

;

ent-homern

Enter Home Routing Number Prefix

Use this command to enter up to 100 routing number prefixes for the operating network into the HOMERN table.

Keyword: ent-homern

Related Commands: dlt-homern, rtrv-homern

Command Class: Database Administration

Parameters

:rn= (mandatory)

The home routing number prefix.

Range: 1-15 digits
1-15 hexadecimal digits (**0-9, a-f, A-F**)

Example

ent - homern : rn=C441234

Dependencies

The HOMERN table cannot be full.

The routing number must not already exist in the HOMERN table.

A value of **none** cannot be specified for the **rn** parameter.

The A-Port, AINPQ, G-Port, INP, or V-Flex feature must be turned on before this command can be entered.

Notes

None

The **ipaddr=0.0.0.0** parameter cannot be specified.

The value specified for the **host** parameter cannot already exist in the IP Host table.

The IP Host table can have a maximum of 2048 host entries.

If a remote host is used (the **type=remote** parameter is specified), then the value specified for the **ipaddr** parameter cannot already exist in the IP Link table.

If a local host is used (the **type=local** parameter is specified), then the value specified for the **ipaddr** parameter must already exist in the IP Link table.

Notes

None

Output

```
ent-ip-
host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001:type=local
rlghncxa03w 05-07-17 15:35:05 EST EAGLE 34.0.0
ENT-IP-HOST: MASP A - COMPLTD
;
```

ent-ip-node

Enter IP Node

Use this command to define the IP address of a node that will be receiving messages from the STPLAN application.

Keyword: ent-ip-node

Related Commands: dlt-ip-node, rtrv-ip-node

Command Class: Database Administration

Parameters

:cap= (mandatory)

This parameter specifies the maximum percentage of ethernet capacity for the node connection. This capacity is added to other connections to this node for the total capacity of the node.

The value specified for the **cap** parameter can be used to calculate throughput for DCM and E5-ENET cards. Refer to the *Notes* section for more information.

Range: 1-100

:ipaddr= (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:ipappl= (mandatory)

The IP application supported by the node.

Range: stplan

:ipport= (mandatory)

The logical IP port that addresses the application on the node.

Range: 1024-5000

:loc= (mandatory)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:iprte= (optional)

The default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: 1-223, 0-255
 4 numbers separated by dots
1-223—first number
0-255—the other three numbers

Example

```
ent-ip-
node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=1
5:iprte=193.4.201.84
```

Dependencies

The shelf and card must be equipped.

The node IP address cannot be **127.x.x.x**, where **x** is a number from **1** to **254**.

The specified card location must be equipped with a TCP/IP data link.

The IP address must be unique to the TCP/IP link table and to the TCP/IP nodes.

Only one node can be connected for each data link and each application. The IP address, IP application, and card location combination must be unique in the database.

The IP port on each node cannot be assigned to another application. The IP address and IP port combination must always use the same IP application.

The class of the IP address (**ipaddr**) must match the class of the assigned TCP/IP data link's IP address. The system supports three classes of IP addresses, Class A, Class B, and Class C. Class A IP addresses can contain only the values **1** to **126** in the first field of the IP address. Class B IP addresses can contain only the values **128** to **191** in the first field of the IP address. Class C IP addresses can contain only the values **192** to **223** in the first field of the IP address.

The network portion of the IP address (**ipaddr**) must match the network portion of the IP address assigned to the TCP/IP data link. The network portion of the IP address is based on the class of the IP address. If the IP address is a Class A IP address, the first field is the network portion of the IP address. If the IP address is a Class B IP address, the first two fields are the network portion of the IP address. If the IP address is a Class C IP address, the first three fields are the network portion of the IP address.

If the network portion and class of the IP address of the TCP/IP node matches the class of the assigned TCP/IP data link's IP address, the **iprte** parameter cannot be specified. The **iprte** parameter can be specified only with the **ent-ip-node** command when the network portion and class of the TCP/IP node does not match the class of the assigned TCP/IP data link's IP address. The values of the **ipaddr** parameter, the IP address of the TCP/IP node, and the **iprte** parameter cannot be the same.

The capacity of all connections to the given node cannot be greater than 100%.

Notes

If the IP address is a Class A IP address, do not use the IP addresses **127.x.x.x**, where x is a number from **1** to **254**. These addresses are reserved for loopback.

Determining the correct CAP value for ECAP

The STPLAN uses a TVG (grant) rate value, while the ECAP uses an MSUs per second value. These values do not have a 1-to-1 correlation. Therefore, the average number of MSUs per TVG can vary depending on the average MSU size. When calculating the **cap** parameter value, the average number of MSUs per TVG must be factored. The formula for determining the **cap** value is as follows:

$$\text{cap value} = (\text{Host capacity} / (175 \text{ [or } 17.5] * \text{MSU/TVG})) .$$

CAUTION: The 175 multiplier is used only when the link negotiates to 100 Mbits/second full duplex. If the link is a different value than 100 Mbits/second full duplex, then a multiplier of 17.5 is used.

NOTE: The **cap** value is rounded down.

- **HOST CAPACITY**—capacity of the ECAP server
- **MSU/TVG**—average number of MSUs a single system buffer can transfer to Remote Host

If the MSU/TVG value is not known, then 2 should be used as the MSU/TVG value. If a value of 2 is used, then the network must be monitored to determine if the **cap** value requires adjustment.

Using the CAP Value to Calculate Throughput for DCM and E5-ENET Cards

The value specified for the **cap** parameter can be used to calculate the throughput in transactions per second (TPS) for DCM and E5-ENET cards. The TPS value is the smaller of the following values:

- **GPL_CARD_CAPACITY**
 - E5-ENET card—15000
 - DCM card—2870
- 175 [or 17.5] * **cap** parameter value

CAUTION: The 175 multiplier is used only when the link negotiates to 100 Mbits/second full duplex. If the link is a different value than 100 Mbits/second full duplex, then a multiplier of 17.5 is used.

Output

```
ent-ip-
node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=1
5:iprte=193.4.201.84
    rlghncxa03w 04-01-18 08:50:12 EST  EAGLE 31.3.0
    ENT-IP-NODE: OAM A - COMPLTD
;
```

ent-ip-rte

Enter IP Route

Use this command to configure the destination IP address, subnet mask, and the gateway IP address for the specified card in the Static IP Route table.

Keyword: ent-ip-rte

Related Commands: dlt-ip-rte, rtrv-ip-rte

Command Class: Database Administration

Parameters

:dest= (mandatory)

Destination IP Address. The IP Address of a remote destination host or network to be reached.

Range: 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

:gtwy= (mandatory)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (**dest**) to the next-hop gateway router or final destination host.

Range: 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

:loc= (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:submask= (mandatory)

The subnet mask of the destination IP address, in the form of an IP address with a restricted range of values. This parameter is required if the **ipaddr** parameter is entered.

Range: The value must be valid for the class of the entered IP address.

Table 5-22. Valid Subnet Mask Values

Valid for Class A Networks	Valid for Class A or B Networks	Valid for Class A, B, or C Networks
255.0.0.0	255.255.0.0	255.255.255.0
255.192.0.0	255.255.192.0	255.255.255.192
255.224.0.0	255.255.224.0	255.255.255.224
255.240.0.0	255.255.240.0	255.255.255.240
255.248.0.0	255.255.248.0	255.255.255.248
255.252.0.0	255.255.252.0	255.255.255.252
255.254.0.0	255.255.254.0	
255.255.128.0	255.255.255.128	

The value **255.255.255.255** must be specified if the destination IP address represents a host address.

If the destination IP address represents a network address, a value must be specified that identifies the network ID and host ID portions of the address.

Example

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

Dependencies

The specified destination IP address (**dest** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must be unique per card
- Must not reside on this card's A or B local network

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must correspond to a host IP address that resides on this card's A or B local network

The IP address must be defined for the A or B network, or both, for the card before this command can be entered. (See the **chg-ip-card** command.)

Each destination IP address entered into the Static IP Route table must be unique for the card.

A maximum of 64 static IP routes can be defined for a card.

A maximum of 1024 static IP routes can be defined in the IP Route table.

The **loc** parameter value must correspond to a SSED CM card running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application.

The network address specified by the **dest** and **submask** parameters must be different from the network address specified by the **pvn** and **pvnmask**, **fcna** and **fcnamask**, and **fcnb** and **fcnbmask** parameters of the NETOPTS table.

Notes

The Static IP Route table is used to store static IP route entries. Static routes are maintained across card initialization, failures, and reloads. These types of routes are used when the IP Layer cannot determine routes dynamically. Static IP route entries can be added or deleted dynamically.

Output

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
IP Route table is (1 of 256) 1% full
ENT-IP-RTE: MASP A - COMPLTD
```

```
;
```

ent-lbp

Enter Loopback Point

Use this command to assign a far-end loopback point for testing data signaling link elements in a SS7 transmission path.

Keyword: ent-lbp

Related Commands: act-lbp, chg-lbp, dact-lbp, dlt-lbp, rtrv-lbp

Command Class: Database Administration

Parameters

:lbp= (mandatory)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to *and including* the target device).

Range: 1-32

:lfst= (mandatory)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range: llt, nlt

llt — latching loopback test

nlt — nonlatching loopback test

:link= (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:rle= (mandatory)

Remote link element. The link element to be looped back for testing.

Range: ds0, ocu, csu, dsu, nei

:cli= (optional)

The Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

Range: aaaaaaaaaa

1 alphabetic character followed by up to 10 alphanumeric characters.

:rep= (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: 0-31

Default: 0—If the link element to be looped back for testing is NEI (**rle=nei** is specified)

0—If the LFS test is NLT (non-latched); **lfst=nlt** is specified

0—If no other LBP for this link has the same **rle** value

1-30—Next sequential number for subsequent loopback points of the link to be tested (**rle** is specified as anything but **nei**)

Example

ent -

lbp: loc=1101: link=a: lbp=1: rle=ds0: lfst=llt: rep=0: cli=rlghncxa05w

```
ent - lbp: loc=1101: port=a: lbp=2: rle=nei: lfst=llt
ent -
lbp: loc=1205: port=a1: lbp=1: rle=ds0: lfst=llt: clli=r lghncxa05w: rep=
1
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location (**loc** parameter) must be equipped.

The **rle=ds0** parameter and the **rle=nei** parameter cannot be specified when the **lfst=nl** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

Each specified **rep** parameter value must be greater than any previously specified **rep** value and less than any subsequent specified **rep** value.

The specified **clli** cannot be a reserved word.

The loopback point (LBP) cannot have been previously defined.

The value specified for the **lbp** parameter cannot exceed the **lbp** parameter value previously defined for a loopback point with **rle=nei** specified.

For each SS7 signaling link, only one loopback point with **rle=nei** specified can be defined.

The **rep** parameter must be specified if taking the default value results in duplicate **rep** values for loopback points.

The loopback point with **rle=nei** specified must be the terminating SS7 signaling link element.

The card location must contain a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card that is running an **ss7ansi** or **ccs7itu** application.

The card location (**loc** parameter) must not be reserved by the system.

Notes

None

Output

```
ent - lbp: loc=1101: link=a: lbp=2: rle=nei: lfst=llt
r lghncxa03w 05-02-17 15:35:05 EST EAGLE5 33.0.0
ENT-LBP: MASP A - COMPLTD
;
```

ent-lnp-serv

Enter LNP Service

Use this command to reserve an LNP translation type for a unique LNP service. The available services include up to six query services (**ain**, **in**, **pcs**, **lnpqs**, **wnp**, and **lrnqt**) and any combination of six message relay or user-defined services. Translation type names can also be defined and are defaulted to the corresponding reserved service type names.

A maximum of 10 LNP services can be assigned in systems with up to 12 million numbers, and a maximum of 15 LNP services can be assigned in systems with more than 12 million numbers (using ELAP). Two of these assigned services will always be reserved for administration of AIN and IN Translation Types. Administration of Message Relay user defined services will also be allowed.

Keyword: ent-lnp-serv

Related Commands: chg-lnp-serv, dlt-lnp-serv, rtrv-lnp-serv

Command Class: Database Administration

Parameters

:serv= (mandatory)

Reserved service type name.

Range: **ain, in, pcs, wnp, class, lidb, cnam, isvm, lnpqs, wsmcsc, udf1, udf2, udf3, udf4, lrnqt**

:alias= (optional)

The alias translation type.

Range: **000-255**

:dfltact= (optional)

This parameter specifies the default action associated with the LNP TT Service entry.

Range: *aaaaaaaa*

1 leading alphabetic followed by up to 8 alphanumeric characters

The **dfltact** parameter can have one of the following values:

- a valid GTT Action ID of type **disc/udts/tcaperr** that already exists in the GTT Action table
- **fallback**—Fallback to the relay data for MSUs relayed by LNP using relay data from the LNP database provided by the LNP Message Relay service. For an LNP Query message, the MSU is sent to the LNP local subsystem.
- **falltogtt**—Fallback to GTT. The GTT selector search is performed again, using **gttselid=none**.

Default: **fallback**

:dv= (optional)

Digits valid.

Range: **sccp, tcap**

Default: **sccp**—If **serv= class, lidb, cnam, isvm, wsmcsc, udf1, udf2, udf3, udf4**

tcap—If **serv= ain, in, pcs, wnp, lnpqs, lrnqt**

:gttselid= (optional)

This parameter specifies the GTT Selector ID used to perform GTT on the MSU processed by the LNP Message Relay or LNP Query Service.

Range: **0-65534**

Default: none

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range: **gttrqd**

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range: **gttrqd**

:tt= (optional)
Translation type.
Range: 000-255

:ttn= (optional)
User defined TT name.
Range: ayyyyyyyyy
1 to 8 alphabetic characters, the value **none** is not allowed.
Default: Reserved service type name (**serv** parameter)

Example

```
ent - lnp-  
serv:serv=class:tt=10:ttn=class1:dfltact=disc1:on=gttrqd:gttselid  
=100  
ent - lnp-serv:serv=lidb:tt=16:dv=tcap:ttn=mr lidb  
ent - lnp-serv:serv=lrnqt:tt=239:dv=tcap
```

Dependencies

The same value cannot be specified for the **on** and **off** parameters.

The **dfltact=none** parameter cannot be specified.

The EGTT feature must be turned on before the **gttselid**, **dfltact** or **on/off=gttrqd** parameter can be specified.

If a GTT Action ID is specified as the value for the **dfltact** parameter, then the Action ID must already exist in the GTT Action table.

If a GTT Action ID is specified as a value for the **dfltact** parameter, then the GTT Action ID must have a value of **disc**, **udts**, or **tcaperr**.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The PLNP feature must be turned on before the **serv=pcs** parameter can be specified.

The WNP feature must be turned on before the **serv=wnp** parameter can be specified.

The LNP SMS feature must be turned on before the **serv=wsmc** parameter can be specified.

If a value of **udf1**, **udf2**, **udf3**, or **udf4** is specified for the **serv** parameter, then the **dfltact**, **gttselid** and **on/off=gttrqd** parameters cannot be specified.

The **tt** parameter must be specified if the **alias** parameter is not specified in the command.

The **ttn=none** parameter cannot be specified.

If a value of **udf1**, **udf2**, **udf3**, **udf4**, or **wsmc** is specified for the **serv** parameter, then the **dv=sccp** parameter must be specified.

If the **lnpqs**, **ain**, **in**, **pcs**, **wnp**, or **lrnqt** values are specified for the **serv** parameter, then the **dv=tcap** parameter must be specified.

A reserved service type name can be specified for the **ttn** parameter only if it matches the **serv** parameter value.

The value of the **tt** parameter cannot already exist in the LNP database.

If the **tt** parameter is specified, then the value of the **serv** parameter cannot exist in the LNP database.

A maximum of 6 Message Relay services are allowed.

If the **alias** parameter is specified, then the **serv** parameter must already have an assigned translation type.

When the **alias** parameter is specified, its value cannot already exist in the LNP database as a true translation type for this service.

If the **alias** parameter is specified, then the specified alias cannot be in use.

If the **tt** parameter is specified, then its value cannot already exist in the LNP database as an alias for this service.

The value of the **ttn** parameter cannot exist in the LNP database.

The LRNQT feature must be turned on (see the **chg-ctrl-feat** command) before the **serv=lrnqt** parameter can be specified.

If the **alias** parameter is specified, then the **tt**, **ttn**, and **dv** parameters cannot be specified.

Notes

on/off options

gttrqd—GTT required. Specifies whether GTT is performed after the successful completion of an LNP Message Relay service and before initiation of an LNP Query service. This option has a default of OFF.

Translation type names must be unique for LNP services.

A translation type name can be a reserved service type name only if it matches the specified service.

Output

```
ent - lnp - serv : tt = 1 : serv = lldb : on = gttrqd : dfltact = falltogett
```

```
rlghncxa03w 10-11-08 08:50:12 EST EAGLE 43.0.0
```

```
ENT-LNP-SERV: MASP A - COMPLTD
```

```
;
```

ent-loopset

Enter Loop Set Command

Use this command to enter the loopset information into the database. This command updates the Loopset table.

Keyword: ent-loopset

Related Commands: chg-loopset, dlt-loopset, rtrv-loopset

Command Class: Database Administration

Parameters

:name= (mandatory)

Loopset name. This parameter specifies an entry in the Loopset table.

The **name=none** parameter cannot be specified.

Range: ayyyyyy

1 alphabetic and up to 7 alphanumeric characters.

:pcl= (mandatory)

ANSI point code list with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym: pcla

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pcli= (mandatory)

ITU international point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcln= (mandatory)

ITU national point code list in the format of a 5-digit number (*nnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcln24= (mandatory)

24-bit ITU national point code list with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:mode= (optional)

Mode of operation. This parameter specifies whether the message is discarded when an SCCP loop is detected.

Range: **notify, discard**

notify — Generates a UIM without discarding the message.

discard — Generates a UIM and discards the message.

Default: **notify**

Example

This example creates a new loopset using the default mode of notify.

ent-loopset:name=rtp1:pcl=3-3-3,5-5-5,7-7-7,3-4-3

This example creates a new loopset and sets the mode to discard.

ent-loopset:name=rtp2:mode=discard:pcl=3-3-3,5-5-5,7-7-7,3-4-3

Dependencies

The value of the **name** parameter cannot already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The Loopset table can hold a maximum of 1,000 loopset entries, with each entry containing up to 12 point codes. Additional loopset entries and point codes cannot be added when the table is full.

The values for the **pcl** parameter must be unique.

The **name=none** parameter cannot be specified.

At least one valid point code must be specified as a value for the **pcl** parameter.

The values for the **pcl** parameter cannot consist of any invalid point codes. The valid point codes must be consecutively specified and separated by commas.

Output

The following example creates a new loopset and sets the mode to **discard**.

ent-loopset:name=rtp2:mode=discard:pcl=3-3-3,5-5-5,7-7-7,3-4-3

```
rlghncxa03w 07-02-10 08:31:28 EST EAGLE Rel 35.6.0
LOOPSET table is (12 of 1000) 1% full
ENT-LOOPSET: MASP A - COMPLTD
;
```

ent-ls**Enter Linkset**

Use this command to add a linkset, with its assigned far-end point code and other linkset attributes, to the database.

Keyword: ent-ls

Related Commands: chg-ls, dlt-ls, rtrv-ls

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:apc= (mandatory)

ANSI adjacent destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: apca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code **000-000-000** is not a valid point code.

:apc/apca/apci/apcn/apcn24= (mandatory)

Adjacent point code. The DPC of the adjacent signaling node at the far end of the linkset.

:apci= (mandatory)

ITU international adjacent destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:apcn= (mandatory)

ITU national adjacent destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcn24= (mandatory)

24-bit ITU national adjacent destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range: **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

:lst= (mandatory)

Linkset type. This parameter specifies the linkset type of the specified linkset as defined in Telcordia GR-246-CORE, T1.111.5.

Range: **a, b, c, d, e, prx**
 a — Access links
 b — Bridge links
 c — Cross links
 d — Diagonal links
 e — Extended links
 prx — Proxy links

:adapter= (optional)

This parameter specifies the adapter layer for links provisioned in a IPSG linkset.

Range: **m3ua, m2pa**

Default: **m2pa**

:apcentype= (optional)

ITU-N Adjacent Point Code Type. This parameter specifies the format that will be used for changeover and changeover acknowledgement messages.

Range: **itun, itunchina**

itun — ITU National Adjacent Point Code Type

itunchina — ITU National China Adjacent Point Code Type

Default: **itun**

:asl8= (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSs.

Range: **yes, no**

Default: **no**

:asnotif= (optional)

AS notification. This parameter specifies whether AS notifications should be sent for IPSG-M3UA linkset.

Range: **yes, no**

Default: **yes**

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range: **yes, no**

yes — TFPs are not broadcasted.

no — TFPs are broadcasted.

Default: **no**

:cggtmod= (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required for the specified linkset.

Range: **yes, no**

Default: **no**

:clli= (optional)

Far-end Common Language Location Identifier (CLLI). This parameter specifies the CLLI assigned to the linkset.

Range: *aaaaaaaaaa*

1 alphabetic character followed by up to 10 alphanumeric characters

Default: CLLI of the adjacent point code

:gsmscrn= (optional)

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range: on, off

Default: off

:gttmode= (optional)

Global title translation mode. This parameter selects a GTT Mode hierarchy for each link set.

Range: cd, cg, acdcd, acdcgcd, acdcdeg, cgacdcd, cgcd, sysdflt, fcd, fcg, fcgfd, fcdfcg, cdcg
 cd — CdPA GTT only
 cg — CgPA GTT only
 acdcd — Advanced CdPA GTT, CdPA GTT
 acdcgcd — Advanced CdPA GTT, CgPA GTT, CdPA GTT
 acdcdeg — Advanced CdPA GTT, CdPA GTT, CgPA GTT
 cgacdcd — CgPA GTT, Advanced CdPA GTT, CdPA GTT
 cgcd — CgPA GTT, CdPA GTT
 sysdflt — System wide default value
 fcd — FLOBR CdPA only
 fcg — FLOBR CgPA only
 fcgfd — FLOBR CgPA, FLOBR CdPA
 fcdfcg — FLOBR CdPA, FLOBR CgPA
 cdcg — CdPA GTT, CgPA GTT

Default: sysdflt

:gwsa= (optional)

Gateway screening action. This parameter specifies whether gateway screening (GWS) is on or off for the specified linkset.

Range: on, off

Default: on—if **scrn** is specified
 off—if **scrn** is not specified

:gwsd= (optional)

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if **gwsd=on** is specified.

Range: on, off

Default: off

:gwsm= (optional)

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range: on, off

Default: off

:ipgwape= (optional)

IP gateway adjacent point code. Specifying **ipgwape=yes** indicates that the linkset is entered for a card of application type SS7IPGW or IPGWI and the adjacent point code specified is an IP gateway adjacent point code.

Range: yes, no

Default: no

:ipsg= (optional)

IP signaling gateway adjacent point code. This parameter specifies whether a linkset is entered for an IPSG card. The specified adjacent point code is an IPLIM or IP gateway adjacent point code.

Range: yes, no

Default: no

:iptps= (optional)

IPGWx Linkset TPS.

This parameter is a user-defined portion of the total system IP Signaling TPS. This parameter is allowed and required only for IPGWx linksets (the **ipgwape=yes** parameter is specified).

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

Range: **100-32000**

The specified value must be divisible by 10.

:islsrsb= (optional)

Incoming rotated signaling link selection (SLS) bit. This parameter specifies the bit (**1–4**) for ITU and (**1–8**) for ANSI link sets to rotate as the new SLS LSB (Least Significant Bit) of the incoming linkset. The SLS is not modified in the outgoing message.

Table 5-23 shows how the rotation affects the four bits of the ITU SLS during linkset selection:

Table 5-23. Incoming SLS Bit Rotation for ITU

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

Table 5-24 shows how the rotation affects the eight bits of the ANSI SLS during linkset selection:

Table 5-24. Incoming SLS Bit Rotation for ANSI

If This Bit is Selected...	Then Bit Locations 8 7 6 5 4 3 2 1 Are Rotated To...	
Bit 8	7 6 5 4 3 2 1 8	SLS = 10010110 becomes Rotated SLS = 00101101 SLS = 11001011 becomes Rotated SLS = 10010111
Bit 7	6 5 4 3 2 1 8 7	SLS = 10010110 becomes Rotated SLS = 01011010 SLS = 11001011 becomes Rotated SLS = 00101111
Bit 6	5 4 3 2 1 8 7 6	SLS = 10010110 becomes Rotated SLS = 10110100 SLS = 11001011 becomes Rotated SLS = 01011110
Bit 5	4 3 2 1 8 7 6 5	SLS = 10010110 becomes Rotated SLS = 01101001 SLS = 11001011 becomes Rotated SLS = 10111100
Bit 4	3 2 1 8 7 6 5 4	SLS = 10010110 becomes Rotated SLS = 11010010 SLS = 11001011 becomes Rotated SLS = 01111001
Bit 3	2 1 8 7 6 5 4 3	SLS = 10010110 becomes Rotated SLS = 10100101 SLS = 11001011 becomes Rotated SLS = 11110010
Bit 2	1 8 7 6 5 4 3 2	SLS = 10010110 becomes Rotated SLS = 01001011 SLS = 11001011 becomes Rotated SLS = 11100101
Bit 1	No rotation is performed because bit 1 is the existing LSB.	

This parameter is used for ITU or ANSI messages on a per-linkset basis.

Range: **1-8**

ITU linksets—**1-4**

ANSI linksets—**1-8**

The **rsls8=yes** parameter must be specified (see the **chg-lsopts** command) before a value greater than **5** can be specified for the **islsrsb** parameter.

Default: 1

:itutfr= (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range: on, off

Default: off

:l3tset= (optional)

Link timer set. This parameter value is the value that is defined with the **chg-l3t** command.

Range: 1

Default: 1

:lsusealm= (optional)

IPTPS linkset alarm threshold percent. This parameter specifies the percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

Range: 10-100

Default: 100

:maxslktps= (optional)

Maximum per signaling link TPS. This parameter specifies the maximum capacity a link is permitted when sufficient unused capacity is present on the host card.

NOTE: This parameter cannot be specified for links in non-IPSG linksets.

Range: 100-5000

System

Default: value of **slktps/rsvdslktps** parameter

:mtprse= (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range: yes, no

yes — equipped

no — not equipped

Default: no

:multgc= (optional)

Multiple group codes. This parameter specifies whether multiple group codes can be specified.

Range: yes, no

Default: no

:nis= (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range: on, off

Default: off

:ppc= (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

Synonym: ppca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:ppc/ppca/ppci/ppcn/ppcn24= (optional)

Proxy Point Code

The proxy point code must be a full point code.

:ppci= (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code.

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

:ppcn= (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ppcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:randsls= (optional)

Random SLS (signaling link selection). This parameter is used to apply random SLS generation for the specified linkset.

Specifying the **randsls** parameter in the **ent-ls** command enables random SLS generation on a per linkset basis only if the **randsls=perls** parameter has been specified in the **chg-stpopts** command.

Range: **off, class0, all**

off— Disables random SLS generation on a specified linkset.

class0— Enables random SLS generation for Class0 SCCP traffic on a specified linkset.

all— Enables random SLS generation for Class0 and Class1 SCCP traffic on a specified ITU linkset and for Class0 and ISUP traffic on a specified ANSI linkset.

Default: **off**

:rcontext= (optional)

Routing context. This parameter specifies whether to assign a new routing context to an IPSG-M3UA linkset.

Range: **0-4294967295**

System

Default: **none**

:scrn= (optional)

Gateway screening screen set. This parameter specifies the gateway screening screen set assigned to this linkset.

Range: **ayyy, none**

1 alphabetic character followed by up to 3 alphanumeric characters, or **none**

none—Deletes screen set association with the linkset

:slktps= (optional)

Reserved per signaling link TPS for IPSG Linkset. This parameter specifies the capacity guaranteed to each link in the linkset.

NOTE: This parameter is required for each link in an IPSG linkset. The parameter cannot be specified for links in non-IPSG linksets. The guaranteed capacity for the links hosted by an IPSG card cannot exceed the IPSG card capacity.

NOTE: If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

Synonym: **rsvdslktps**

Range: **0-5000**

:slkusealm= (optional)

IPTPS signaling link alarm threshold percent. This parameter specifies the percent of the link TPS at which an alarm is generated to indicate that the actual link TPS is approaching the alarmed IPTPS (**slktps/rsvdslktps** or **maxslktps**) configured for the link.

System

Default: **80**

:slsci= (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range: **yes, no**

yes — enabled

no — disabled

Default: no**:slsobit=** (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5–16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (**:slsobit=9**). The new SLS is 0100.

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS								0				1	0	0	

Range: 5-16 none**Default:** none**:slrsb=** (optional)

Rotated signaling link selection (SLS) bit. This parameter specifies the bit (1–4) to rotate as the new SLS Least Significant Bit (LSB). The SLS is not modified in the outgoing message. Table 5-25 shows how the rotation affects the four bits of the SLS during linkset selection:

Table 5-25. SLS Bit Rotation

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

This parameter is used for ITU messages on a per-linkset basis.

Range: 1-4

Default: 1

:sltset= (optional)

SLTM record. This parameter specifies the SLTM record to be associated with the linkset.

Range: 1-20

Default: 1 for ANSI
2 for ITU

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tpsalmttype= (optional)

IPSG IPTPS threshold alarm type. This parameter specifies which IPTPS threshold can be alarmed.

Range: **slktps, maxslktps**

slktps— the SLKTPS/RSVDSLKTPS threshold is alarmed

maxslktps— the MAXSLKTPS threshold is alarmed

System

Default: **slktps**

Example

Adds linkset wy644368 with apc 144-201-1 with lstc:

ent-ls: lsn=wy644368:apc=144-201-001:lst=c

Adds linkset lsitua1 with apcn5-5-5-1 with lstc. The apcn parameter is using a four-part format where the maximum number of bits in each position is defined by the chg-stpopts:npcfinti parameter :

ent-ls: lsn=lsitua1:apcn=5-5-5-1:lst=c

In this example, the ITU national duplicate point code (ITUDUPPC) feature is turned on, so the ITU national point code contains a group code. Adds linkset exp123 with apcn2-3-4-5-aa, which has a duplicate point code group of aa and linkset type a:

ent-ls: lsn=exp123:apcn=2-3-4-5-aa:lst=a

Add a linkset in which all applicable MSUs arriving on the linkset are screened using the GSM MAP screening feature:

ent-ls: lsn=lsitu1:apcn=5000:lst=a:gmscrn=on

Adds a link set lsn24 with 24-bit ITU-N apcn2410-100-10 and linkset type a:

ent-ls: lsn=lsn24:apcn24=10-100-10:lst=a

Adds link set lsa2 with private APC p-1-2-4

ent-ls: lst=a: lsn=lsa2:apc=p-1-2-4

Adds link set lsn410234 with private and spare APCN ps-1-1-1-2047-aa:

ent-ls: lst=b: lsn=lsn410234:apcn=ps-1-1-1-2047-aa

Adds link set lsi00001 with spare APCI s-1-1-209-7:

ent-ls: lst=b: lsn=lsi00001:apci=s-1-1-209-7

Adds link set lsn24 with APCN24 10-100-10 with apcntype=itunchina and linkset type a.

ent-ls: lsn=lsn24:apcn24=10-100-10:lst=a:apcntype=itunchina

Adds link set lsa using the global title translation mode cgacdcd.

ent-ls: lsn=lsa:lst=a:apca=1-1-1:gttmode=cgacdcd

Enables random SLS generation for Class0 and Class1 SCCP traffic on ITU linkset lsa.

ent-ls: lsn=lsa:lst=a:apci=1-1-2:randsls=all

Adds a linkset in which calling party global title modification is required for all GT routed MSUs arriving on the linkset:

ent-ls:lsn=ls2:apc=2-2-2:lst=a:cggmod=yes

Adds an IPSG-M3UA linkset.

ent-

ls:lsn=ls1201:apc=10-10-10:lst=a:adapter=m3ua:ipsg=yes:slktps=100

Adds an IPSG-M2PA linkset.

ent-ls:lsn=lsm2pa:apc=5-6-7:lst=c:ipsg=yes:slktps=300

Adds a linkset and sets the Incoming SLS Bit Rotation on the 2nd Bit.

ent-ls:lsn=lsa:lst=a:apci=1-1-2:islsrsb=2

Adds linkset lsa using the GTT mode fcdfcg when the Flexible Option Based Routing (FLOBR) feature is turned on.

ent-ls:lsn=lsa:lst=a:apca=1-1-1:gttmode=fcdfcg

Adds ANSI link set lsa and sets the Incoming SLS Bit Rotation to the 6th bit (the 6th bit in the SLS is used as the LSB)

ent-ls:lsn=lsa:lst=a:apca=1-1-1:islsrsb=6

Dependencies

The value specified for the **apc** parameter must be a full point code.

The specified adjacent point code cannot exist as an alias point code.

If the **gwsa=on**, **gwsn=on**, and **gwsd=on** parameters are specified, the **scrn** parameter must be specified.

The specified adjacent point code cannot be the same as the self-ID destination point code of the STP.

The specified adjacent point code cannot be the same as any self-ID capability point codes of the STP.

If the system is configured for ANSI point codes, and the **anc=0** parameter is specified, then the value of the **ni** parameter must be 6 or greater.

The specified linkset name cannot already exist in the database.

The specified adjacent point code cannot be assigned to any other linkset.

Private (**p-**) and private and spare (**ps-**) point codes can be assigned only to IPGW linksets (the **ipgwape=yes** parameter is specified).

The maximum number of linksets that can be defined in the system is 1024.

The specified screen set (**scrn** parameter) must exist in the database.

If the **gwsd=on** parameter is specified, the **gwsa=on** parameter must be specified.

If a destination point code matching the specified far-end point code exists, the far-end CLI for the given linkset must match the destination identifier (DI) of that matching destination.

The **mtprese** parameter can be specified only if the MTP Restart feature MTPRS (for ANSI) is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (mtpre=yes in the output).

If the **ipgwape=yes** parameter is specified or the **ipsg=yes** and the **adapter=m3ua** parameters are specified, then the **mtprese=yes** parameter cannot be specified.

The **asl8=yes** parameter can be assigned only to an ANSI linkset (a linkset containing an adjacent point code in the SS7 domain).

The **apcntype** parameter can be specified only for ITU-N and ITU-N24 linksets.

The Other CIC (Circuit Identification Code) Bit Used feature (SLSOCB) feature must be turned on before the **slsochbit** parameter can be specified.

The **slsochbit** parameter is valid only for ITU linksets.

The **slsrsb** parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) before the **gsmscrn** parameter can be specified.

The **itutfr** parameter is valid only for ITU national linksets on the EAGLE 5 ISS STP or ITU linksets on the IP⁷ Secure Gateway.

The ITU National Duplicate Point Code (ITUDUPPC) feature must be turned on before the **multgc=yes** parameter can be specified.

The **multgc=yes** parameter is valid only for ITU-N or ITU-I point codes.

The **iptps** parameter must be specified for IPGWx linksets.

The **iptps** parameter cannot be specified for linksets that are not IPGWx.

The specified **iptps** parameter value must be divisible by 10.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

The **ipgwape=yes** or the **ipsg=yes** parameter must be specified before the **lsusealm** parameter can be specified.

The **ipgwape=yes** or the **ipsg=yes** parameter must be specified before the **slkusealm** parameter can be specified.

The Enhanced GSM Map Screening feature must be turned on before the **gsmscrn=on** parameter can be specified for an ANSI linkset.

The **mtprse** parameter can be specified only if the MTP Restart feature ITUMTPRS (for ITU), is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (itumtprs=yes in the output).

A point code cannot be assigned to a linkset as an APC if the point code has been provisioned with exception routes.

An APC cannot be assigned to an IPGWx linkset that is already assigned to a route involving another linkset.

The Origin-based SCCP Routing feature must be turned on before the **gttmode** parameter can have a value of **acded**, **cgacded**, **acdeged**, **acdedeg**, **cgcd**, **cddeg**, or **cg**.

A new IPGW link set cannot be entered if it contains an APC that is already configured in a routing key. An SAPC cannot be added to an existing IPGW link set if the new SAPC is already configured in a routing key.

If APCN is specified for the Adjacent Point Code then the format of APCN must match the format dictated by the NPCFMTI parameter via the CHG-STPOPTS command.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter must exist in the Destination Point Code table.

The **gsmscrn** parameter can be specified only for ITU linksets.

The value specified for the **spc** parameter must be a full point code.

If the Multiple Linksets to a Single Adjacent Point Code (MLS) feature is enabled and turned on, then a maximum of 6 non-IPGW linksets can be created using the same adjacent point code.

The values specified by the **spc** and **apc** parameters must have the same network type.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the **spc** parameter can be specified.

The value specified by the **spc** parameter must already exist in the SPC table.

The specified combination of the **apc** and **spc** parameters must be unique for each linkset.

The value specified for the **spc** parameter cannot already be specified as a secondary point code for an adjacent destination point code.

The Proxy Point Code feature must be enabled before the **lst=prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The value specified for the **ppc** parameter must be a full point code.

The **lst=prx** parameter must be specified before the **ppc** parameter can be specified. If the **lst=prx** parameter is specified, then the **ppc** parameter must be specified.

The values specified for the **apc** and **ppc** parameters must have the same network type.

The values specified for the **apc** and **ppc** parameters must have the same group code.

The **spc** and **ppc** parameters cannot be specified together in the command.

The **ppc** parameter cannot be specified for more than 10 linksets.

Two adjacent point codes cannot reference each other as proxy point codes.

Only one IPGWx linkset can be created for an adjacent destination point code.

The **apc** parameter and the **prx=yes** parameter must be specified before the **ppc** parameter can be specified.

If the **ipgwapc=yes** parameter is specified, then the **ppc** parameter cannot be specified.

If an IPGW linkset is used, then the **lst=prx** parameter cannot be specified.

If the **ipgwapc=yes** parameter is specified, then the **spc** parameter cannot be specified.

The **spc** and **ppc** parameters cannot be specified together in the command.

All of the linksets for an adjacent destination point code must be of the same type.

The specified combination of the **apc** and **ppc** parameters must be unique for each linkset.

The value specified for the proxy point code must be defined in the Destination table before the **lst=prx** parameter can be specified.

If multiple linksets are defined for the **apc** parameter, and if a proxy point code is defined for the **apc** parameter, then the first linkset defined in the **ent-ls** command must use the proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

The **ipgwapc=yes** and the **ipsg=yes** parameter cannot be specified together in the command.

The **ipsg=yes** parameter must be specified before the **adapter** parameter can be specified.

The **ipsg=yes** and the **adapter=m3ua** parameter must be specified before the **asnotif** parameter can be specified.

The **ipsg=yes** and the **adapter=m3ua** parameters must be specified before the **rcontext** parameter can be specified.

The **ipgwapc=yes** parameter must be specified before an invalid point code (ANSI network = 0) can be specified as an APC.

If the **ipsg=yes** parameter is specified, then the **slktps/rsvdslktps** or **maxslktps** parameter must be specified.

The **ipsg=yes** parameter must be specified before the **slktps/rsvdslktps** or **maxslktps** parameter can be specified.

The **ipsg=yes** and **adapter=m3ua** parameters must be specified before the **lst=a** parameter can be specified.

A maximum of one IPGW linkset or a maximum of 6 of any other linksets are allowed between any APC and the EAGLE 5 ISS.

If the **ipsg=yes** and **adapter=m3ua** parameters are specified, then the **multgc=yes** parameter cannot be specified.

The ISLSBR feature must be enabled before the **islsrsb** parameter can be specified.

The FLOBR feature must be turned on before a value of **fed**, **fcg**, **fcgfd**, or **fcdfcg** can be specified for the **gttmode** parameter.

The **rsls8=yes** parameter (see the **chg-lsopts** command) must be specified for an ANSI linkset before a value greater than **5** can be specified for the **islsrsb** parameter.

If an ITU linkset is used, then a value of **1–4** must be specified for the **islsrsb** parameter.

The value specified for the **slktps/rsvdslktps** parameter must be less than or equal to the value specified for the **maxslktps** parameter.

The value specified for the **ppc** parameter must already exist in the DSTN table and the **prx=yes** parameter must be assigned (see the **ent-dstn** command).

Notes

Of the 1024 maximum linksets supported, up to 255 of the linksets can be gateway linksets.

The system supports a maximum of 700 links. If more than 700 linksets are defined, a maximum of 700 of the defined linksets can be in use at any one time.

The links that directly connect the system with an adjacent node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standards) signaling links, depending on how the system was configured when the network was created.

Each linkset must be assigned the same physical links at both ends of the link (local and adjacent signaling points) and each link must be assigned the same link number.

Signaling link acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

If the **gwsa=off** and **gwsm=off** parameters are specified, all MSUs are passed.

If the **gwsa=off** and **gwsm=off** parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the **gwsa=off** and **gwsm=on** parameters are specified, all MSUs pass, but MRNs are generated if an MSU matches a screening condition.

If the **gwsa=on** and **gwsm=off** parameters are specified, MSUs are screened but messages are not generated.

If the **gwsa=on** and **gwsm=on** parameters are specified, MSUs are screened and MRNs are generated at the rate of one MRN every 20 seconds per link.

If the **asl8=yes** parameter is specified with the **lst=a** parameter (a linkset containing access signaling links), this indicates that the originator of the MSUs is generating 8-bit SLSSs. For other linkset types, the **asl8=yes** parameter indicates that the adjacent STP is converting 5-bit SLSSs to 8-bit SLSSs. The SLSS in MSUs received by the system on a linkset that has the **asl8=yes** parameter assigned to it will not be converted. These MSUs are assumed to contain 8-bit SLSSs.

The Network Indicator Spare (**nis**) parameter can be specified only for ANSI and ITU-N links.

The **mtprse** parameter value can be specified independently of the value specified on the **mtprsi** parameter of the **chg-stpopts** command.

The MTP restart option (**mtprse**) is not a valid option on TCP/IP point-to-multipoint links (DCM cards equipped as SS7IPGW links).

When two linksets are used as a combined linkset, each linkset must have the same **slsci** and **asl8** values and the same **slsobit** and **slsrbsb/slsrsb** values.

CAUTION: This is not enforced in the system and there is no warning mechanism if the values of these parameters are not the same for each linkset.

MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent as shown:

- up to 64 LIMs—62 seconds (Link Alignment Delay)
- 64 - 127 LIMs—97 seconds
- 128 - 191 LIMs—132 seconds
- more than 191 LIMs—167 seconds

The **slsrbsb** parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field are still not realized. The **slsobit** parameter must also be specified to provide an even distribution across all links within the linkset. If both parameters are specified for a given linkset, the SLS field is processed in the following order.

1. The SLS is modified using the Other CIC Bit option.
2. The modified SLS is modified again using the Rotated SLS Bit option.
3. The modified SLS is used by the existing linkset and link selection algorithms to select a link.
4. The ISUP message is sent out the link containing the original, unmodified SLS field.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is turned on, for each group that is defined, a separate ITU national C linkset must be provisioned. The C linkset is used as the alternate route for point codes in the group.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The **randsls** parameter value applies to SCCP ITU-T messages and Class0 and ISUP ANSI messages when random SLS generation is set to occur on a per linkset basis (the **randsls=perls** parameter is specified in the **chg-stpopts** command).

If the **randsls=perls** parameter is specified in the **chg-stpopts** command, it is recommended that the linksets in a combined linkset be provisioned with the same **randsls** value to avoid undesired SLS distribution.

The value specified for the **ppc** parameter must be a full point code. Cluster point codes and private point codes are not supported.

Invalid point codes (ANSI network = 0) can be used for the adjacent point code of an IPGWx linkset. Private point codes (**p-**) can be used for either IPGWx linksets, as either adjacent point codes (**ent-ls:apc=xxx**) or internal point codes (**ent-rmt-appl:ipc=xxx**). Ordinary point codes can be used in all cases as APCs or IPCs.

If the ISLSBR feature is turned on, and Incoming SLS Bit Rotation is applied to an MSU, then the outgoing SLS bit rotation is not applied for that MSU. If the ISLSBR feature is turned off, or Incoming SLS Bit Rotation is not applied to an MSU, then the outgoing SLS bit rotation is applied for that MSU.

The valid ISLSRSB values for ITU link sets are **1–4** and for ANSI link sets are **1–8**.

The **randsls** parameter is applied on an incoming linkset for ANSI messages and on an outgoing linkset for ITU messages.

Output

Adds linkset **lsa** using the GTT mode **fcdfcg** when the FLOBR feature is turned on.

ent-ls:lsn=lsa:lst=a:apca=1-1-1:gttmode=fcdfcg

```
tekelecstp 09-03-22 12:14:11 EST EAGLE 41.0.0

```

;

ent-map

Enter Mate Applications

Use this command to create new entries in the MAP table, which allow the assignment of mated applications and Alternate RI Mate searches for use with SCCP network management. A mated application is used if the local application becomes unavailable. An Alternate RI Mate is used if all mated applications within a MAP Set become unavailable or congested.

NOTE: A MAP set is a logical grouping of a set of PC/SSNs that already exist in the EAGLE 5 ISS MAP table. The Flexible GTT Load Sharing (FGTTLS) feature allows a PC/SSN combination to be part of more than one load-sharing group, with each PC/SSN combination defined by a different MAP set.

NOTE: If the FGTTLS feature is enabled, then all existing entries in the MAP table and all existing GTA translations in the GTT table with ri=ssn are stored in default MAP sets. Additional MAP sets can be provisioned, and GTT entries can be associated to the MAP sets.

NOTE: The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

Keyword: ent-map

Related Commands: chg-map, dlt-map, rtrv-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Primary remote point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ssn= (mandatory)

Subsystem number. This parameter identifies the application's subsystem number. This attribute is composed of the decimal representation of the 1-byte field used in the SS7 protocol.

Range: 2-255

:grp= (optional)

Concerned point code broadcast list (CSPC) group name. This parameter specifies the name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE 5 ISS broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA. This parameter must be provisioned for a node if the node is to receive SSP or SSA broadcasts, even if the node is a mated application.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No broadcast list for this mated application.

:mapset= (optional)

MAP Set ID.

Range: dflt, new

Default: dflt - If the FGTTLS feature is not enabled, the default value is dflt.

:materc= (optional)

Mate relative cost. This parameter specifies the RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the rc and materc parameters) of the subsystem.

Range: 0-99

Default: 50

:mpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: mpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: 000-000-000

:mpc/mpca/mpci/mpcn/mpcn24= (optional)

Mate remote point code.

:mpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Default: **0-000-0**

:mpcn= (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: **00000**

:mpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: **000-000-000**

:mrc= (optional)

Message routing under congestion. This parameter defines the handling of Class 0 messages during congestion conditions.

This value can be provisioned in any of the multiplicity modes, but its value only affects traffic if the multiplicity mode is *DOM*. See the *Notes* section for more information on multiplicity modes.

Range: **yes, no**

Default: **yes**—if ANSI

no—if ITU

:mrnpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **mrnpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Default: **000-000-000**

:mrnpc\mrnpca\mrnpci\mrnpcn\mrnpcn24= (optional)

Alternate RI Mate point code.

:mrnpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

Default: **0-000-0**

:mrnpcn= (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: **00000**

:mrnpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: **000-000-000**

:mrnset= (optional)

Alternate RI Mate MRN Set ID. This parameter specifies the MRN Set where the Alternate RI Mate search is performed.

Range: **1-3000 dflt**

dflt—default MRN Set

If the **mrnpc** parameter is specified, and the **mrnset** parameter is not specified, then the value for the **mrnset** parameter is automatically set to **dflt**.

:mssn= (optional)

Mate subsystem number. This parameter specifies the mate application's subsystem number. This attribute is the decimal representation of the one-byte field used in the SS7 protocol.

Range: **2-255**

Default: Parameter is not used

:mwt= (optional)

Mate point code weight. This parameter specifies the weight assigned to the mate PC/SSN that is being added to a weighted entity set.

Range: 1-99

:rc= (optional)

Relative cost. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the **rc** and **materc** parameters) of the subsystem. (See Notes for additional information on multiplicity modes.)

Range: 0-99

Default: 10

:srm= (optional)

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

This value can be provisioned in any of the multiplicity modes, but its value only affects traffic if the multiplicity mode is *DOM* or *COM*. See the *Notes* section for more information on multiplicity modes.

Range: yes, no

Default: yes—if ANSI

no—if ITU

:sso= (optional)

Subsystem status option. This parameter specifies whether or not the PC/SSN is to initiate a subsystem test when a RESUME is received for the PC.

Range: on, off

Default: off

:thr= (optional)

Threshold. This parameter specifies the in-service threshold assigned to each PC/SSN in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If the **thr** parameter is not specified, a value of 1% is assigned to each weighted PC/SSN.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the weight assigned to the primary PC/SSN that is being added to the weighted entity set.

Range: 1-99

Example

As shown in the following example, the **rc** parameter is not required for a solitary pc/ssn pair. If the **rc** parameter is not specified, the relative cost defaults to 10.

ent-map:pc=1-1-1:ssn=10:grp=xyz

The following example enters both 1-1-0/10 and 1-1-1/10 into the map table. both the **rc** and **materc** parameter are required for this command, which defines a map group.

ent-

map:pc=1-1-0:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:grp=xyz:srm=on

The following example enters a solitary point code in the MAP table with the Subsystem Status Option (sso) set to on.

ent-map:pc=1-1-3:ssn=20:grp=abc:sso=on

ent-map:pc=2-2-3:ssn=20:grp=abc

The following example sets the Subsystem Status Option (sso) set to on for the primary and mate.

ent-map:pc=1-1-4:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:sso=on

The following command enters a solitary point code in the MAP table with the Subsystem Status Option (sso) set to off (the default).

ent-map:pc=1-1-6:ssn=10:rc=10:mpc=1-1-7:mssn=10:materc=20

The following example creates a new MAP Set with Alternate RI Mate 1-1-3/1.

ent-

**map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=new:
mrnset=1:mrnpc=1-1-3**

The following example creates a new MAP set, and enters 1-1-1/10 and 1-1-2/20 into the newly created MAP set.

ent-

map:pc=1-1-1:ssn=10:rc=10:mpc=1-1-2:mssn=20:materc=20:mapset=new

The following example enters both 1-1-1/15 and 1-1-2/25 into the default MAP set.

ent-

map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=df lt

The following example creates a new MAP set and enters a solitary PC/SSN value of 1-1-1/10.

ent-map:pc=1-1-1:ssn=10:mapset=new

The following example enters a solitary PC/SSN of 1-1-1/15 into the default MAP set.

ent-map:pc=1-1-2:ssn=15:mapset=df lt

The following example creates a new MAP set and enters a solitary PC/SSN 1-1-1/10 with the subsystem option ON. It specifies the sso=on parameter for all instances of PC/SSN 1-1-4/10.

ent-map:pc=1-1-1:ssn=10:sso=on:mapset=new

The following example enters a solitary PC/SSN of 1-1-1/15 into the default MAP set with the subsystem option ON. The sso=on parameter is specified for all instances of PC/SSN 1-1-4/10.

ent-map:pc=1-1-3:ssn=15:sso=on:mapset=df lt

The following examples create a weighted shared PC/SSN pair.

ent-

**map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=2
0**

ent-

**map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=2
0:thr=40**

The following example creates a new MAP Set with a different ITU network type point code for the Alternate RI Mate PC.

ent-

**map:pci=1-001-1:ssn=15:rc=10:mpci=1-001-2:mssn=25:materc=20:mapse
t=new:mrnpcn=00126:mrnset=2**

Dependencies

The PC/SSN pair cannot already exist in the MAP table.

The specified MPC/MSSN pair cannot already exist in the MAP table.

The **apca** and **pcn24** parameters cannot be specified for the same MAP set. The **pci** and **pcn** parameters cannot be specified for the same MAP set if the MAP set contains a true point code.

If a subsystem is configured for a subsystem number (SSN) value in the SS-APPL table, then the specified MAP table entry for that subsystem must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I or ANSI point code.
- For the EIR subsystem, the True Point code cannot be an ANSI point code.
- For the AIQ, ATINPQ, or VFLEX subsystem, the True Point code can not be an ITU-N24 point code.

The ANSI/ITU SCCP Conversion feature must be enabled before the network type of the CPC broadcast group can be different from the network type of the point code.

If the **pci**, **pcn**, or **pcn24** parameter is specified, then the **srn=yes** parameter cannot be specified.

The primary remote point code must already exist in the Route table, as a destination in the ordered route entity set, or in a cluster destination for which ordered routes are specified.

If a CSPC broadcast list group name is specified, it must already exist.

A maximum of 1024 unique remote point codes are allowed.

A maximum of 12 SSNs per remote point code can be entered.

The primary subsystem DPCs must be full point codes.

The mate subsystem DPCs must be full point codes.

The LNP or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the **pca/mpca** parameter.

The AINPQ, EIR, INP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the **pcn/mpcn** parameter.

The EIR or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the **pci/mpci** parameter.

If the **mpc/mpca/mpci/mpcn/mpcn24** parameter is specified, then the value must exist in the Routing table.

If the **mssn** or **materc** parameter is specified, then the **mpc** parameter must be specified.

If the **pc** parameter value is an EAGLE 5 ISS true point code, the subsystem must have a lower relative cost than all other mated subsystems in the group.

The **sso** parameter cannot be specified with a point code value that is the system true point code.

A true point code cannot be routed to itself.

The **mpc** and **mssn** parameters cannot have the same values as the **pc** and **ssn** parameters.

The point code (**pc**) must already exist in the Concerned Point Code (CSPC) group.

The number of MPC Subsystem entries must not exceed the table capacity.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified. If the Flexible GTT Load Sharing feature is enabled, then the **mapset** parameter must be specified.

The EAGLE 5 ISS True PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the **wt**, **mwt**, or **thr** parameters can be specified.

If the **thr** parameter is specified, the **wt** and **mwt** parameters must be specified.

If the **mpc** parameter is specified, the **rc** parameter must be specified.

The **wt** and **mwt** parameters must be specified together in the same command.

If the **materc** parameter value equals the **rc** parameter value, a Loadshared Group is indicated, and the **rc**, **mpc** **materc**, and **mwt** parameters must be specified.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

Both OAM cards must be running GPSM II.

If the **mpc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the entity set.

One or more point codes in the command will exceed the maximum number of entries in the MAP table.

The MAP table contains the maximum number of possible entries for the specified True Point Code. Maximum entries for the ANSI, ITU-I, and ITU-N point codes are:

- ANSI—2 (ANS41 AIQ and LNP), 3 (ANSI41 AIQ, ATINPQ, and V-FLEX)
- ITU-I—4 (ANSI41 AIQ, ATINPQ, EIR, V-FLEX)
- ITU-N—5 (for ANSI41 AIQ, ATINPQ, EIR, INP, and V-FLEX)

NOTE: LNP is mutually exclusive with ATINPQ and V-FLEX

If the **mwt** parameter is specified, the **mpc** parameter must be specified.

If the **mpc** parameter is specified, the **mssn** and **materc** parameters must be specified.

The entity set being created must be either solitary or dominant to use the true point code as a point code.

If the **thr** parameter is specified, the **rc1**, **rc2**, **rc3**, and **rc4** parameters must be of equal value.

If the **mpc** parameter is specified, then the **mssn** parameter must be specified.

SRM=YES cannot be entered with ITU point codes.

If the **mpc** or **mssn** parameter is specified, then the **materc** parameter must be specified.

If the **pc/ssn** parameters and the **mpc/mssn** parameters are specified, then the **rc** parameter must be specified.

If the **pcn** or **mpcn** parameter is specified, then the format of the parameter must match the format dictated by the **chg-stpopts:npcfmti** command.

True PC cannot be routed to itself.

The Spare Point Code support feature must be enabled to allow provisioning of an ITU-I or ITU-N spare point code.

The True Point Code can be provisioned only in default MAPSET.

Unable to access database. Severe database failure.

Failed reading SS APPL table.

The values specified for the **pc** and **mpc** parameters cannot be associated with proxy point codes.

If the **mrnset** parameter is specified, then the **mrnpc** parameter must be specified.

The GTT LS ARI feature must be enabled before the **mrnset** or **mrnpc** parameters can be specified.

The value specified for the **mrnpc**, **mrnpca**, **mrnpci**, **mrnpcn**, or **mrnpcn24** parameter must be full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare

- ANSI—ANSI
- ITUN-24—ITUN-24

The value specified for the **mrnset** parameter must already exist in the MRN table.

The value specified for the **mrnpc** parameter must already exist in the specified MRN Set.

The **mrnset** parameter cannot be specified if the MAP Set specified by the **mapset** parameter contains a True Point Code.

Notes

Up to 32 PC/SSN pairs can be entered into a mated PC/SSN group.

Multiplicity Modes

For the **-map** commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined loadsharing /dominant mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following multiplicity modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* (SOL) mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* (DOM) mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* (SHR) mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* (COM) mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

If the XMAP feature is enabled, the MAP table can have up to either 2000 or 3000 entries, depending on the controlled feature Part Number that is enabled. If XMAP is not enabled, the MAP table can contain up to 1024 user entries.

The **sso** parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE 5 ISS previously marked the subsystem status “allowed” for each PC/SSN entry. The **sso** parameter marks the subsystem status “prohibited” for each new entry that has **sso=on**. This causes the EAGLE 5 ISS to generate an SST to the remote point-code when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each set is identified by the **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

When the GTT Load Sharing with Alternate Routing Indicator feature is enabled, an Alternate RI Mate can be provisioned.

ent-mrn

Enter Mated Relay Node

Use this command to assign point codes and Alternate RI Mates in the Mated Relay Node (MRN) table. The Intermediate GTT Loadsharing feature must be on before this command can be entered. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

If the Flexible GTT Loadsharing feature is enabled, use this command to create a new MRN set, or to add entries to an existing MRN set in the MRN table. If the Flexible GTT Loadsharing feature is turned on, then MRN sets are used.

NOTE: If only the Intermediate GTT Loadsharing feature is turned on, the MRN table can contain a maximum of 3000 entries. If the Intermediate GTT Loadsharing feature is on and the Flexible GTT Loadsharing feature is enabled, the MRN table can contain a maximum of 6000 entries.

CAUTION: If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Check the rtrv-sccp-serv command output to see if entries exist in the SCCP-SERV table.

NOTE: An MRN set is a logical grouping of PCs that already exist in the EAGLE 5 ISS MRN table. The Intermediate GTT Loadsharing feature allows PCs to be part of more than one load-sharing group, with each PC defined by a different MRN set. If the Intermediate GTT Loadsharing feature is enabled, then all existing entries in the MRN table and all existing GTA

translations in the GTT table with *ri=gt* are stored in default MRN sets. Additional MRN sets can be provisioned, and GTT entries can be associated to the MRN sets.

Keyword: ent-mrn

Related Commands: chg-mrn, dlt-mrn, rtrv-mrn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

If a point code is being added to an existing weighted entity set, and the **dfltw** parameter is not specified, the **wt1/wt2/wt3/wt4** parameter must be specified.

The **wt1/wt2/wt3/wt4** parameter can only be specified if at least two of the **rc/rc1/rc2/rc3/rc4** parameters are equal, creating a weighted entity set.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:dflwt= (optional)

Default weight. This parameter specifies the weight to be assigned to a specified PC that is not assigned a weight with the **wt/wt1/wt2/wt3/wt4** parameter.

If a PC weight is specified with the **wt/wt1/wt2/wt3/wt4** parameter and the **dflwt** parameter is specified, the default weight is ignored, and the PC is assigned the weight specified by its respective weight parameter.

Range: 1-99

:mappc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: mappca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: 000-000-000

:mappc\mappca\mappci\mappcn\mappcn24= (optional)

Alternate RI Mate point code.

:mappci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

Default: **0-000-0**

:mappcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: **00000**

:mappcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: **000-000-000**

:mapset= (optional)

Alternate RI Mate MAP Set ID. This parameter specifies the MAP Set where the Alternate RI Mate search is performed.

Range: **1-36000 dflt**

dflt—default MAP Set

If the **mappc** and **mapssn** parameters are specified, and the **mapset** parameter is not specified, then the **mapset** parameter is automatically set to a value of **dflt**.

:mapssn= (optional)

Alternate RI Mate subsystem number.

Range: **2-255 *, none**

Default: **none**

:mrnset= (optional)

MRN set ID.

Range: **1-3000 dflt, new**

dflt—Default MRN set.

new—Create a new MRN set

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca1**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca2**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca3**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca4**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:pcn243= (optional)

24-bit ITU national point code with subfield *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000–255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:pcn244= (optional)

24-bit ITU national point code with subfield *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000–255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:rc= (optional)

Relative cost. This parameter specifies the relative cost of the route for the primary PC.

Range: **0-99**

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for mate PC 1.

Range: **0-99**

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for mate PC 2.

Range: **0-99**

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for mate PC 3.

Range: **0-99**

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for mate PC 4.

Range: **0-99**

:thr= (optional)

Threshold. This parameter specifies the in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If a threshold value is not specified when creating a new RC group in an existing entity set, the new RC group is assigned a threshold value of 1%.

Range: **1-100**

:wt= (optional)

Weight. This parameter specifies the weight assigned to the primary PC. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If PCs are being added to an existing entity set, the **wt** parameter cannot be specified. If a new entity set is being created, the **wt** parameter can only be specified if at least two of the specified RC values are equal, which creates a weighted entity set.

Range: **1-99**

:wt1= (optional)

Weight 1. This parameter specifies the weight assigned to the mate PC 1 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: **1-99**

:wt2= (optional)

Weight 2. This parameter specifies the weight assigned to the mate PC 2 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: **1-99**

:wt3= (optional)

Weight 3. This parameter specifies the weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt4= (optional)

Weight 4. This parameter specifies the weight assigned to the mate PC 4 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

Example

The following example enters point code 1-1-0 into the MRN table with a relative cost of 10 and associates point code 1-1-1 with it as a point code with a relative cost of 20.

ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20

The following example updates the group containing point code 1-1-0 in the MRN table, to add point code 1-1-2 with relative cost of 20 and point code 1-1-10 with relative cost of 30 to the group.

ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30

The following examples include spare point codes.

ent-mrn:pci=s-2-2-1:rc=10:pci1=s-2-2-2:rc1=11:pci2=2-100-1:rc2=12

ent-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3

ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=10:mrnset=dflt

ent-

mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=20:pc2=1-1-3:rc2=30:apc3=1-1-4:rc3=40:apc4=1-1-5:rc4=50:mrnset=new

ent-mrn:pc=1-1-3:pc1=1-1-6:rc1=60:pc2=1-1-7:rc2=70:mrnset=111

The following examples create a new weighted entity set.

ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10

ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10:thr=50

mrn:pci=1-001-0:rc=10:pci1=1-001-1:rc1=20:pci2=1-001-10:rc2=30:mapset=1:mappcn=00126:mapssn=12

Dependencies

The Intermediate Global Title Translation Loadsharing feature must be turned on before this command can be entered.

The **apca** and **pcn24** parameters cannot be specified for the same MRN set.

When a point code parameter is specified, its relative cost parameter must be specified.

Point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

ITU-N point codes must be in the format set by the **apcfmti** parameter of the **chg-stpopts** command. (Use the **rtv-stpopts** command to display the STP option settings.)

Remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

One or more point codes in the command will exceed the maximum number of point codes that can be entered into the MRN table (3000 if the IGTTLS feature is turned on and 6000 if the IGTTLS and FGTTLS features are turned on)..

The Flexible GTT Load-Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the Flexible GTT Loadsharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

When creating a new weighted entity set, the **mrnset=new** or **mrnset=dflt** parameter must be specified.

Each point code group can contain a maximum of 32 point codes.

The Weighted GTT Loadsharing feature must be turned on before the **wt/wt1/wt2/wt3/wt4**, **thr**, and **dflwt** parameters can be specified.

If the **wt/wt1/wt2/wt3/wt4** parameter is specified, the corresponding **pc/pc1/pc2/pc3/pc4** parameter must be specified.

When creating or modifying a weighted entity set, the **dflwt** parameter must be specified, or an individual weight must be specified for each PC.

Entity sets in a solitary or dominant loadsharing mode cannot have weights assigned to the PCs. When creating an entity set, if all of the RC values are unique, the **wt/wt1/wt2/wt3/wt4** and **thr** parameters cannot be specified.

If the **thr** parameter is specified, the **rc1**, **rc2**, **rc3**, and **rc4** parameters must be of equal value.

If the **thr** parameter is specified, the associated **wt/wt1/wt2/wt3/wt4** parameter or the **dflwt** parameter must be specified.

At least one additional point code must be specified.

Any specified point code must be a full point code.

If the **chg-sid:pctype=ansi** command is entered, a value of **ni=000** cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of **ni=001 – 005** is specified, a value of **nc=000** cannot be specified.

If a new point code is being added to the MRN table, the **pc** and **rc** parameters must be specified together in the command. If the Flexible GTT Loadsharing feature is enabled, and the **mrnset=new** parameter is specified, the **pc** and **rc** parameters must be specified together in the command.

If the **pc1/pc2/pc3/pc4** parameter is specified, the **pc** parameter value must already exist in the MRN table.

A new point code that is specified in the command must not already exist in the MRN table.

If the **rc** parameter is not specified, the **wt** parameter cannot be specified.

If PCs are being added to a weighted entity set, the **wt/wt1/wt2/wt3/wt4** parameter or the **dflwt** parameter must be specified.

If PCs are being added to a non-weighted entity set, the **wt/wt1/wt2/wt3/wt4** and the **dflwt** parameters cannot be specified.

At least one optional parameter must be specified.

If the **wt/wt1/wt2/wt3/wt4** parameters are specified, the **dflwt** parameter cannot be specified.

The value specified for the **pc/pc1/pc2/pc3/pc4** parameter cannot be associated with a proxy point code.

The GTT LS ARI feature must be enabled before the **mapset**, **mappc**, or **mapssn** parameter can be specified.

The value specified for the **mappc**, **mappca**, **mappci**, **mappcn**, or **mappcn24** parameter must be full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24

The specified MAPSET must already exist in the MAP table.

If the **mapset** parameter is specified, then the **mappc** and **mapssn** parameters must be specified.

The **mappc** and **mapssn** parameters must be specified together in the command.

The values specified for the **mappc** and **mapssn** parameters must already exist in the specified MAP Set.

The values specified for the **mapset** and **mappc** parameters must already exist in the MAP table.

The value specified for the **mappc** parameter cannot match an STP point code.

The **ent-mrn** command cannot be used to change an Alternate RI Mate that has already been specified for an MRN Set. Use the **chg-mrn** command to modify the Alternate RI Mate.

Notes

For the **-mrn** commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes and subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem.

When the congestion subsides, messages are again routed to the primary (dominant) subsystem.

- A group of replicated PCs are *inload sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The **ent-mrn** command cannot be used to change the relative cost value for a point code; the **chg-mrn** command must be used.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If the **ent-mrn** command is used to add PCs to an existing weighted entity set, and the threshold is specified, all RC group values specified with **rc**, **rc1**, **rc2**, **rc3** and **rc4** parameters for the alternate post-GTT-translated point codes must be equal.

The following rules apply when the **ent-mrn** command is used to add PCs to RC groups:

- If a threshold value is specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold is changed to the specified threshold value and both pre-existing and new PCs in the RC group assume the new threshold value.
- If a threshold value is specified and the PCs are creating a new RC group in the existing entity set, the new RC group assumes the specified threshold value.
- If a threshold value is not specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold does not change and the PC assumes the threshold value of the existing RC group.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Entries cannot be provisioned in the MRN table unless routes are also provisioned for corresponding point codes. However, an entry without a configured route may result from upgrading to a new EAGLE 5 ISS release. If such an entry occurs, then traffic will not be routed to the corresponding point code. The entry can be deleted, or a route for the entry can be configured.

When a node is marked congested in the MRN or MAP table, traffic continues to be routed to that node. When the congested node becomes prohibited, traffic is diverted to another node.

Output

ent-na**Enter Network Appearance**

Use this command to enter a new network appearance in the Network Appearance table.

Keyword: ent-na

Related Commands: dlt-na, rtrv-na

Command Class: Database Administration

Parameters

:na= (mandatory)

Network appearance.

Range: 0-4294967295

:type= (mandatory)

Type of the network appearance.

Range: ansi, itui, ituis, itun, ituns, itun24

:gc= (optional)

Group Code of the network appearance.

Range: yy

Example

ent-na:type=ansi:na=10

ent-na:type=itun:na=11:gc=fr

Dependencies

The value specified for the **na** parameter cannot already exist in the Network Appearance table.

The Network Appearance table can contain a maximum of 45 entries.

The value specified for the **gc** or **na** parameter cannot already be equipped.

A value of **itun** or **ituns** must be specified for the **type** parameter before the **gc** parameter can be specified.

If the ITUDUPPC feature is turned on, and a value **dfun** or **ituns** is specified for the **type** parameter, then the **gc** parameter must be specified.

If the ITUDUPPC feature is turned off, then the **gc** parameter cannot be specified.

The value specified for the **gc** parameter must already exist in the SID or SPC table.

The Spare Point Code Support feature must be enabled before the **ctuis** or **ituns** network type can be specified.

The specified network appearance cannot already exist in the Network Appearance table.

Notes

Network Appearance identifies the SS7 network context of the message, for the purposes of logically separating signaling traffic between the SGP and ASP over a common SCTP association. A unique network appearance value can be associated with ANSI, ITUI, 14-bit ITU-N or 24-bit ITU-N networks. When the ITUDUPPC (ITU National Duplicate Point Code) feature is turned on, network appearance can be associated with a specific 14-bit ITU-N group code.

Output

ent-npp-as

Enter an NPP Action Set

Use this command to enter a Numbering Plan Processor (NPP) Action Set (AS). An AS is a collection of Conditioning Actions (CAs), Service Actions (SAs), and Formatting Actions (FAs).

Keyword: ent-npp-as

Related Commands: chg-npp-as, dlt-npp-as, rtrv-npp-as

Command Class: Database Administration

Parameters

NOTE: Release 41.1 introduces the ability to provision the CA, FA, and SA values using either a comma-separated list or individual caX, saX, and faX parameters.

NOTE: CAs and FAs are processed in consecutive order. If the comma-separated list is used, then the CAs and FAs are processed in the order that they are specified in the list. If individual parameters are used, then the CAs and FAs do not have to be specified in consecutive numerical order in the command. However, the parameters specified in the command must be consecutively numbered and must contain ca1 or fa1, respectively.

NOTE: SAs are processed in order of high-to-low precedence. If the comma separated list is used, then the SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list. If multiple SAs in the list have the same precedence, then those SAs are processed in the order in which they appear in the list. If individual parameters are used, then the SA with the highest precedence must be assigned as the value for sa1, and additional SAs must be assigned in descending precedence to consecutively numbered parameters after sa1 (sa2 through sa8). The SA parameters do not have to be specified in consecutive numerical order in the command. However, they must be consecutively numbered within the

command and must include **sa1**. If multiple SAs have the same precedence, then those SAs are processed in consecutive numerical order of the parameters that specify them.

NOTE: The **ac***, **dn***, **sn***, and **cc*** values refer to all CAs that begin with *ac*, *dn*, *sn*, or *cc*, respectively.

NOTE: Refer to the *Numbering Plan Processor (NPP) Overview* and to the Feature Manual for the feature of interest for more information on provisioning Action Sets and for definitions for the CA, FA, and SA values.

:asn= (mandatory)

Action set name. This parameter specifies the name of the AS.

Range: ayyyyyyyyy
 1 alphabetic character followed by up to 9 alphanumeric characters

:ca= (optional)

Conditioning Action list. This parameter specifies a comma-separated CA list that can be applied to an incoming digit string. Up to 12 CAs can be specified in the list. The CAs are processed in the order in which they are specified in the list.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn

:ca1= (optional)

Conditioning action 1. This parameter specifies the first CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn

:ca10= (optional)

Conditioning action 10. This parameter specifies the tenth CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn

Conditioning action 4. This parameter specifies the fourth CA that can be applied to an incoming digit string.

Conditioning action 5. This parameter specifies the fifth CA that can be applied to an incoming digit string.

Conditioning action 6. This parameter specifies the sixth CA that can be applied to an incoming digit string.

Conditioning action 7. This parameter specifies the seventh CA that can be applied to an incoming digit string.

5-921

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa12= (optional)

Formatting action 12. This parameter specifies the twelfth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa2= (optional)

Formatting action 2. This parameter specifies the second FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa3= (optional)

Formatting action 3. This parameter specifies the third FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa4= (optional)

Formatting action 4. This parameter specifies the fourth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa5= (optional)

Formatting action 5. This parameter specifies the fifth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa6= (optional)

Formatting action 6. This parameter specifies the sixth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa7= (optional)

Formatting action 7. This parameter specifies the seventh FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn

:fa8= (optional)

Formatting action 8. This parameter specifies the eighth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospozn, rnosposn

:fa9= (optional)

Formatting action 9. This parameter specifies the ninth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospozn, rnosposn

:ofnai= (optional)

Outgoing filter nature of address indicator. This parameter specifies the filter nature of address indicator (FNAI) class of the outgoing digit string.

Range: intl, natl, nai1, nai2, nai3, unkn, inc
intl — intl value provisioned in the **chg-npp-serv** command
natl — natl value provisioned in the **chg-npp-serv** command
nai1 — nai1 value provisioned in the **chg-npp-serv** command
nai2 — nai2 value provisioned in the **chg-npp-serv** command
nai3 — nai3 value provisioned in the **chg-npp-serv** command
unkn — unkn value provisioned in the **chg-npp-serv** command
inc — NAI of the incoming digit string

Default: inc

:sa= (optional)

Service Action list. This parameter specifies a comma-separated SA list that can be applied to an incoming digit string. Up to 8 SAs can be specified in the list. The SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list.

SAs are service-specific.

Range: rtddbtrn, rtddbtsps, rtddbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscedpn, blklstqry, blklstly, cgpnrty, inprty, skgtartg

:sa1= (optional)

Service action 1. This parameter specifies the first SA that can be applied to an incoming digit string. SAs are service-specific.

Range: rtddbtrn, rtddbtsps, rtddbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscedpn, blklstqry, blklstly, cgpnrty, inprty, skgtartg

:sa2= (optional)

Service action 2. This parameter specifies the second SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: rtddbtrn, rtddbtsps, rtddbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscedpn, blklstqry, blklstly, cgpnrty, inprty, skgtartg

:sa3= (optional)

Service action 3. This parameter specifies the third SA that can be applied to an incoming digit string. SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

:sa4= (optional)

Service action 4. This parameter specifies the fourth SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

:sa5= (optional)

Service action 5. This parameter specifies the fifth SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

:sa6= (optional)

Service action 6. This parameter specifies the sixth SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

:sa7= (optional)

Service action 7. This parameter specifies the seventh SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

:sa8= (optional)

Service action 8. This parameter specifies the eighth SA that can be applied to the incoming digit string.

SAs are service-specific.

Range: rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstrly, cgpnrtdg, inprtdg, skgtartg

Dependencies

The value specified for the **asn** parameter cannot already exist in the NPP AS table.

One of the following combinations of CA values must be specified for the AS:

- **znx**
- **cc***, **dn***
- **cc***, **ac***, **sn***

The FAs specified for the AS must contain the corresponding FA that a CA will populate or load.

The AS must contain a CA that can load or populate the specified FA.

If specified, the **caX** parameters must be consecutively numbered, always including **ca1**. The parameters do not have to be entered in sequential order in the command.

If specified, the **saX** parameters must be consecutively numbered, always including **sa1**. The parameters do not have to be entered in sequential order in the command. The SA with the highest precedence must be assigned as the value for **sa1**.

If specified, the **faX** parameters must be consecutively numbered, always including **fa1**. The parameters do not have to be entered in sequential order in the command.

The CAs within an AS cannot condition more than 32 digits.

The AS cannot contain CAs that load or populate the same FA.

If the ZNX CA is specified, then the AC*, and DNX CAs cannot be specified in the same Action Set. Each AC*, CC*, DN*, and SN* CA can be specified only once in the Action Set.

The same value cannot be specified for the **faX** parameters within an AS.

The AS cannot contain the following combinations of FAs:

- If the DN FA is specified, then the AC*, SN*, and ZN FAs cannot be specified.
- If the ZN FA is specified, then the AC*, CC*, SN*, and DN FAs cannot be specified.
- If the SN FA is specified, then the ZN and DN* FAs cannot be specified.
- If the RNOSPODN, RNOSPOSN, or RNOSPOZN FA is specified, then the RN, SP, SN, DN, and ZN FAs cannot be specified.
- The RNOSPODN, RNOSPOSN, and RNOSPOZN FAs cannot be specified together in the command.

If specified, the FPFx CA must be the first value (**fpfx**) in the **ca** list or **caX** parameter sequence.

If specified, the ZNX, SNX, or DNX CA must be the final value (**znx**, **snx**, or **dnx**) in the **ca** list or **caX** parameter sequence.

A maximum of 1024 (1K) AS entries can be specified in the NPP system.

The same value cannot be specified for the **saX** parameters within an AS.

The **ca** and **caX**, **fa** and **faX**, and **sa** and **saX** parameters cannot be specified together in the command.

Notes

None.

ent-npp-srs

Create a NPP Service Rule Set

Use this command to enter a Numbering Plan Processor (NPP) Service Rule Set entry. A Service Rule Set (SRS) is a collection of NPP Rules that are associated with a NPP Service. A NPP Rule is an association between a single NPP filter and a single NPP Action Set.

Keyword: ent-npp-srs

Related Commands: chg-npp-as, chg-npp-srs, dlt-npp-srs, ent-npp-as, rtrv-npp-as, rtrv-npp-srs

Command Class: Database Administration

Parameters

:asn= (mandatory)

Action set name. This parameter specifies the name of the AS.

Range: aaaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

:fdl= (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

Range: 1-32 *
 *—multiple lengths of digit strings can be filtered

:fnai= (mandatory)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

Range: intl, natl, nai1, nai2, nai3, unkn
intl— filter messages with NAI=INTL
natl— filter messages with NAI=NATL
nai1— filter messages with NAI=NAI1
nai2— filter messages with NAI=NAI2
nai3— filter messages with NAI=NAI3
unkn— filter messages when NAI=UNKN
 The **chg-npp-serv** command is used to assign values to the various FNAI classes.

:fpfx= (mandatory)

Filter prefix. This parameter specifies the prefix used to filter incoming digit strings.

Range: 1-16 digits, *, ?
 1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

:srvn= (mandatory)

Service name. This parameter specifies the name of the NPP service.

Range: nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4
nppt— NPP Test Service
idprcdpn— IDPRCDPN Service
idprcgpn— IDPRCGPN Service
tif— TIF NPP Service
tif2— TIF2 NPP Service
tif3— TIF3 NPP Service
mosmsicgpn— MOSMSICGPN Service
mosmsicdpn— MOSMSICDPN Service
mosmsgcgpn— MOSMSGCGPN Service
mosmsgcdpn— MOSMSGCDPN Service
iarcdpn— IARCDPN Service
iarcgpn— IARCGPN Service
idprcdpn2— IDPRCDPN2 Service
idprcdpn3— IDPRCDPN3 Service
idprcdpn4— IDPRCDPN4 Service

Example

```
ent-npp-srs:srvn=nppt:fpfx=a:fdl=10:fnai=intl:asn=asn2
ent-npp-srs:srvn=tif:fnai=INTL:fpfx=9090:fdl=:asn=set1
ent-npp-srs:srvn=nppt:asn=testzn1:fnai=nai2:fdl=:fpfx=1?2?3
```

Dependencies

The value specified for the **asn** parameter must exist in the NPP AS table.

The AS specified by the **asn** parameter cannot contain Conditioning Actions that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain Service Actions that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain Formatting Actions that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain Service Actions that do not conform to the precedence order supported by the service specified by the **srvn** parameter.

The Conditioning Actions in the AS specified by the **asn** parameter cannot condition more digits than allowed by the **fdl** parameter.

If the **fdl=*** parameter is specified, then the AS specified by the **asn** parameter must contain Conditioning Actions that support variable digit string conditioning.

A maximum of 8192 (8K) rules can be specified in the NPP system.

A maximum of 4096 (4K) service rules can be specified in the NPP system.

The NPP Rule cannot already exist within the NPP Rule table.

If the values specified for the **fpfx** and the **fdl** parameters are not *, then the value specified for the **fpfx** parameter cannot be greater than the value specified for the **fdl** parameter.

All of the features that are associated with the Service Actions in the AS specified by the **asn** parameter must be turned on before the AS can be used.

The Service Actions in the AS specified by the **asn** parameter cannot violate mutual exclusivity rules defined by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain an OFNAI class with a value of **none**.

At least one TIF feature must be turned on before an AS containing the CDIAL Service Action can be specified as a value for the **asn** parameter.

The TIF SCS Forwarding feature must be turned on before an AS containing the FWDSCS Service Action can be specified.

The TIF Simple Number Substitution feature must be turned on before an AS containing the SNSCGPN Service Action can be specified as a value for the **asn** parameter.

The TIF Number Portability feature must be turned on before an AS containing the CRP, NPNRLS, CGPNNPRQD, NPRELA, or NPRLS Service Action can be specified as a value for the **asn** parameter.

The IDPR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the **asn** parameter with the IDPRCDPN(X) or IDPRCGPN service.

The IDPR GRN feature must be enabled before an AS containing the GRNLKUP or GPNGRNRQD Service Action can be specified as a value for the **asn** parameter with the IDPRCDPN(X) or IDPRCGPN service.

An AS containing the **asdlkup** and **cgpnasdrqd** SAs cannot be specified as a value for the **asn** parameter.

An AS containing the GRNLKUP and CGPNGRNRQD Service Actions cannot be specified as a value for the **asn** parameter.

The TIF GRN feature must be enabled before an AS containing the **grnlkup** or **cgpngnrnrqd** SAs can be specified as a value for the **asn** parameter with the TIF services.

The TIF ASD feature must be enabled before an AS containing the **asdlkup** or **cgpnasdrqd** SA can be specified as value for the **asn** parameter with the TIF services.

If a value of **mosmsgcdpn**, **mosmsgcgpn**, **mosmsicdpn**, or **mosmsicgpn** is specified for the **srvn** parameter, then the MO SMS ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **mosmsgcdpn**, **mosmsgcgpn**, **mosmsicdpn**, or **mosmsicgpn** is specified for the **srvn** parameter, then the MO SMS GRN feature must be enabled before an AS containing the CGPNGRNRQD or GRNLKUP Service Action can be specified as a value for the **asn** parameter.

If the **fpfx=*** parameter is specified, then an AS containing the PPFX Conditioning Action cannot be specified as value for the **asn** parameter.

The value specified for the **fpfx** parameter cannot have a **?** as the final character.

The TIF Number Substitution feature must be enabled before an AS containing the NSCGPN or NSCDPN Service Action can be specified.

The AS specified by the **asn** parameter cannot contain both the NSCGPN and SNSCGPN Service Actions.

If a value of **mosmsgcdpn** or **mosmsgcgpn** is specified for the **srvn** parameter, then the Prepaid SMS Intercept Ph1 feature must be enabled before an AS containing the PPRELAY Service Action can be specified as a value for the **asn** parameter.

If the **srvn=mosmsgcgpn** parameter is specified, then the Portability Check for MO SMS feature must be enabled before an AS containing the FRAUDCHK Service Action can be specified as a value for the **asn** parameter.

If the **srvn=mosmsicdpn** parameter is specified, then the MO SMS IS41-to-GSM Migration feature must be enabled before an AS containing the MIGRATE Service Action can be specified as a value for the **asn** parameter.

If the **srvn=mosmsicdpn** parameter is specified, then the MO-based IS41 SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the **asn** parameter.

If the **srvn=mosmsgcdpn** parameter is specified, then the MO-based GSM SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the **asn** parameter.

The IDP A-Party Routing feature must be enabled before the **saX=cgpnrtg** parameter can be specified.

The IDP A-Party Blacklist feature must be enabled before the **saX=blklstqry** or **saX=blklstlry** parameter can be specified.

If the **sa1=blklstqry** parameter is specified, then no other Service Action can be specified.

A single digit wildcard (?) can be specified as a value for the **fpfx** parameter a maximum of 25 times across all of the rules for an NPP service.

The **caX=accgpn** and **caX=cccgpn** parameters cannot be specified together in the command.

If a value of **iarcdpn** or **iargcgn** is specified for the **srvn** parameter, then the IAR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcdpn** or **iargcgn** is specified for the **srvn** parameter, then the IAR GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcdpn** or **iargcgn** is specified for the **srvn** parameter, then the IAR Base feature must be enabled before an AS containing the CCNCCHK, CDIAL, or CGPNSRVRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcdpn** or **iargcgn** is specified for the **srvn** parameter, then the IAR NP feature must be enabled before an AS containing the CDNNP or CGNNP Service Action can be specified as a value for the **asn** parameter.

ent-pct

Enter a Point Code and CIC Translation entry

Use this command to enter Point Code and CIC Translations.

Keyword: ent-pct

Related Commands: dlt-pct, rtrv-pct

Command Class: Database Administration

Parameters

:epc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: epca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:epci= (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range: 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code 0-000-0 is not a valid point code.

zone—0-7

area—000-255

id—0-7

:epcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:realpc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **realpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:realpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:realpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ecice= (optional)

This parameter specifies the end of the Emulated Circuit Identification Code range.

Range: **0-16383, 0-4095, 0-4294967295 ***

- **0-4095**—ITU TUP/ISUP

- **0-16383**—ANSI ISUP

- **0-4294967295**—ANSI Q.BICC

Default: *****

:ecics= (optional)

This parameter specifies the start of the Emulated Circuit Identification Code range.

Range: 0-16383, 0-4095, 0-4294967295 *

- 0-4095—ITU TUP/ISUP
- 0-16383—ANSI ISUP
- 0-4294967295—ANSI Q.BICC

Default: *

:filtpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **filtpca**

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:filtpci= (optional)

ITU international destination point code with subfields *zone-area-id*.

Range: 0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:filtpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:rcice= (optional)

This parameter specifies the end of the Real Circuit Identification Code range.

Range: 0-16383, * 0-4095, * 0-4294967295 *

- 0-4095—ITU TUP/ISUP
- 0-16383—ANSI ISUP

- **0-4294967295**—ANSI Q.BICC

Default: *

:rcics= (optional)

This parameter specifies the start of the Real Circuit Identification Code range.

Range: **0-16383**, * **0-4095**, * **0-4294967295** *

- **0-4095**—ITU TUP/ISUP
- **0-16383**—ANSI ISUP
- **0-4294967295**—ANSI Q.BICC

Default: *

:relcause= (optional)

Release Cause

Range: **0-127**

Default: **0**

:si= (optional)

Service Indicator

Range: **0, 3, 5, 4, 13**, *

0, * — NM

3, * — SCCP

5, * — ISUP

4, * — TUP

13, * — ANSI Q. BICC

Default: *

:ssn= (optional)

SCCP Subsystem number

Range: **0-255** *

Default: *

Example

ent-pct:epc=1-1-1:realpc=2-2-2:si=5:ecics=100:ecice=200

ent-pct:epc=1-1-2:realpc=2-2-3:si=3:ssn=10:filtpc=5-5-5

Dependencies

If the **ecice** or **rcice** parameter is specified, then the **ecics** or **rcics** parameter must be specified, respectively.

The value specified for the **ecice/rcice** parameter must be equal to or greater than the value specified for the **ecics/rcics** parameter, respectively.

Full point codes must be specified as the values for the **realpc/realpca/realpci/realpcn** and **epc/epca/epci/epcn** parameters.

The PCT table cannot contain more entries than the amount specified by the FAK for the PCT quantity feature.

The **si=3** parameter must be specified before the **ssn** parameter can be specified.

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must already exist in the Route table.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters must have the same domain.

A PCT quantity feature must be enabled before this command can be specified.

If the **ssn** or **ecics** parameter is specified, then the **si** parameter must be specified.

Duplicate values for the following Key combinations are not allowed:

- **epc/epca/epci/epcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(ecics/ecice)**
- **realpc/realpca/realpci/realpcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(rcics/rcice)**

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must have at least one route for each value defined in the Route table.

If the ITUDUPPC feature is turned on, and ITU-N Point codes are specified, then the values specified for the **epcn**, **realpcn**, and **filtpcn** parameters must have the same group code.

A total of 250 unique **epc** and **rpc** values are supported in the PCT table.

A total of 100 PCT Translations with a single **epc** and **realpc** value are supported in the PCT table.

A spare point code cannot be specified as a value for the **epci/epcn**, **filtpci/filtpcn**, and **realpci/realpcn** parameters.

The **ecics** parameter must be specified before the **relcause** parameter can be specified.

A value of **4**, **5**, or **13** must be specified for the **si** parameter before the **ecice/ecics** and **rcice/rcics** parameters can be specified.

If the **rcics** parameter is specified, then the **ecics** parameter must be specified.

If the **ecics**, **ecice**, and **rcics** parameters are specified, then the **rcice** parameter must be specified.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be the same as the STP point code.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be the same as the STP capability point code.

The value specified for the **ecics/ecice** and **rcics/rcice** parameters must be within the range specified by the parameter definition.

The difference between the values specified for the **ecice** and **ecics** parameters must be equal to the difference between the values specified for the **rcice** and **rcics** parameters.

A value of **5** or **13** must be specified for the **si** parameter before the **relcause** parameters can be specified.

The **ssn** and **cic** parameters cannot be specified together in the command.

If the **ecics**, **rcics** and **rcice** parameters are specified, then the **ecice** parameter must be specified.

If the same value is specified for the **epc** and **realpc** parameters, then the values specified for the **ecics/ecice** and **rcics/rcice** parameters cannot indicate the same range.

Only one of the **filtpc/a**, **filtpci**, and **filtpcn** parameters can be specified in the command.

The value specified for the **epc/epci/epcn** parameter cannot be the same as a secondary point code.

Output

ent -

ENT-PCT: MASP A - COMPLTD

;

ent-rmt-appl**Enter Remote Application**

Use this command to assign user parts to an internal point code that, in turn, assigns user parts to an End Office node.

Keyword: ent-rmt-appl

Related Commands: dlt-rmt-appl, rtrv-rmt-appl

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ipc= (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: ipca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:ipc/ipca/ipci/ipcn/ipcn24= (mandatory)

End Node's internal point code.

:ipci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:ipcn= (mandatory)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ipcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (mandatory)

Service indicator value that designates which user part is assigned to the IPC.

Range: **3-15**

:ssn= (optional)

SCCP subsystem number. Valid **only** if **si=3**. Use **ssn** as the starting value of the range if **ssne** is specified.

Range: **0-255**

:ssne= (optional)

Specifies the end of the range of subsystem numbers.

Range: **1-255**

Example

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
```

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5:ssne=100
```

```
ent-rmt-appl:ipc=0-0-1:si=5
```

```
ent-rmt-appl:ipcn24=1-100-1:si=5
```

```
ent-rmt-appl:ipc=p-1-1-1:si=3:ssn=5:ssne=102
```

```
ent-rmt-appl:ipci=ps-2-2-2:si=5
```

Dependencies

Partial point codes are not allowed.

The **ssn** parameter is required if **si=3**.

The **ssn** and **ssne** parameters are not allowed unless **si=3**.

The **ssne** parameter value must be greater than the **ssn** parameter value.

The specified IPC **must** be previously defined in the destination table.

The new entry cannot conflict with an existing entry.

Notes

To specify a range of subsystem numbers, specify the **ssn** parameter value as the start of the range and the **ssne** parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-RMT-APPL: MASP A - COMPLTD
;
```

ent-rte

Enter Route

Use this command to add a route to the system.

CAUTION: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Keyword: ent-rte

Related Commands: chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:lsn= (mandatory)

The linkset name associated with this route.

Range: aaaaaaaaaa

1 alphabetic character followed by 9 alphanumeric characters

:rc= (mandatory)

The relative cost of the route

Range: 0-99

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn= (optional)

Destination point code.

:dpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:force= (optional)

This parameter allows a route to be added to the database even if the linkset to be assigned to the route does not have any signaling links in it.

Range: **yes**

Example

Adds route for dpc1-1-1 to linkset we123642:

ent-rte:dpc=1-1-1:lsn=we123642:rc=25

Adds route for dpc21-*-* to linkset we123642:

ent-rte:dpc=21-*-*:lsn=we123642:rc=25

Adds route for dpcn2410-100-14 to linkset we123624:

ent-rte:dpcn24=10-100-14:lsn=we123624:rc=10

Adds route for private dpcp-1-1-1 to linkset we123642.

ent-rte:dpc=p-1-1-1:lsn=we123642:rc=25

Adds route for private and spare dpcnps-4082-ge to linkset e1ntitun.

ent-rte:dpc=ps-4082-ge:lsn=e1ntitun:rc=10

Adds route for private dpcn24p-10-100-14 to linkset we123642.

ent-rte:dpcn24=p-10-100-1:lsn=we123642:rc=10

Adds route for private and spare dpcis-1-100-1 to linkset ue123642.

ent-rte:dpci=s-10-100-1:lsn=ue123642:rc=10

Dependencies

The value of the **lsn** parameter must exist in the STP database.

The DPC must be in the Destination Point Code table.

The destination point code of a route must be a full point code (*ni-nc-ncm*), a cluster point code (*ni-nc-**), or a network point code (*ni-*-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether ordered routes can be assigned is determined by the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, destinations comprising a cluster inherit their ordered routes from the cluster.
- If the **ncai=yes** parameter is specified, then the destination address is a member of a provisioned nested cluster where ordered routes can be assigned to a provisioned member.

If the specified destination address is a network cluster address (*ni-nc-**), the assignment of the specified ordered route attributes is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, the collection of signaling point codes having the same network identifier (the **ni** parameter) and network cluster (the **nc** parameter) code are assigned the specified ordered route.
- If the **ncai=yes** parameter is specified, then the specified destination is a network cluster address where provisioned members's signaling point codes can be assigned the same or different ordered routes from the cluster.

If the **dpcn** parameter is specified, the format of the point code(s) must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be specified with a private point code (**p**) unless the route is an IPGW route.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

If the **ipgwape=yes** parameter is specified for the linkset, then the associated **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot have a cluster route assigned.

The linkset must be defined with at least one link. To override this requirement, specify **force=yes**.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost.

A linkset can be entered only once as a route for each destination or for a routeset.

If the specified destination address is a network address (*ni-*-**), or network cluster address (*ni-nc-**), the linkset type (see the **chg-ls** command) used in the route must be **b**, **c**, or **d**.

All routes with ANSI DPCs must use ANSI linkset APCs. A route with an ITU-I DPC can go over an ITU-N APC and an ITU-N DPC can go over an ITU-I APC.

If the link set name (the **lsn** parameter) references a link set that has the **ipgwapc=yes** parameter specified, the DPC must not be a cluster route.

The NRT feature must be turned on before the **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the DPC has a value of * in the *nc* field, the *ncm* field must also be * (for example, **dpc= 21-*-***).

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be the same as the EAGLE 5 ISS capability point code.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be the same as the EAGLE 5 ISS capability point code.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot have already been assigned to an APC or SAPC for an IPGWx linkset. The entered route must include the APC or SAPC's linkset with the destination equal to the APC or SAPC.

If **dpcn** is specified then the format of **dpcn** must match the format dictated by the **apcfmti** parameter via the **chg-stpopts** command

The STP shall ensure that the ITU-N ordered route destination's group code must match the route's Link Set Adjacent PC's group code for all linksets other than IPGWI and IPLIMI.

The group code must match for all linksets because the ITU Duplicate Point Code feature is on.

All linksets in a routeset must have the same network type. The network type of the routeset must be the same as the network type of the destination point code.

If multiple routes are defined for the destination point code, and if a proxy point code is assigned to the destination point code, then the first route defined in the **ent-rte** command must use the proxy linkset.

If the **dpc** parameter has a network cluster address (*ni-nc-**) or network address (*ni-*-**), then the **lst=prx** parameter cannot be specified.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
  rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  ENT-RTE: MASP A - COMPLTD
;
```

ent-rtx

Enter Exception Route

Use this command to enter an exception route entry. An exception route is associated with an entry in the Routing table. When the Origin-Based MTP Routing feature is enabled and turned on, the least cost route available for an MSU to be routed to a Destination Point Code over a specified linkset is used. See the *Database Administration - Features* manual for more information about determining routes for linksets.

Up to 6 routes can be defined to a single entry in the Routing table. Up to 8000 routesets can be defined for an STP. This total must include at least one normal route (not an exception route). The remaining 7999 routesets can include any combination of normal and exception routes.

NOTE: A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.

Keyword: ent-rtx

Related Commands: chg-rtx, dlt-rtx, rept-stat-rtx, rtrv-rtx

Command Class: Database Administration

Parameters

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset Name. This parameter specifies the name of the linkset that is associated with the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:rc= (mandatory)

Relative Cost. This parameter is the relative cost associated with the specified exception route.

Range: **0-99**

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:force= (optional)

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **lsn** parameter value.

Range: **yes**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **opca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating Point Code

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: **3-15**

Example

ent-rtx:dpca=1-1-1:opca=2-3-3:lsn=lset1:rc=30

ent-rtx:dpca=1-3-1:ilsn=lset2:lsn=lset3:rc=20

ent-rtx:dPCA=2-100-1:si=5:lsn=1set5:rc=50

Dependencies

Only one of the **opc**, **ilsn**, **cic**, or **si** parameters can be specified for a exception route entry.

For an ANSI origination point code that is defined using asterisks (**nnn-*-***), the value of the *network identifier* subfield (*nnn*) must be greater than 5.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc/opca/opci/opcn/opcn24** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The point code specified by the **dpc**, **dPCA**, **dpci**, **dpcn**, or **dpcn24** parameter must already exist in the Route table.

The value specified for the **dpc** parameter cannot already be used as an adjacent point code (APC).

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

An exception route entry cannot already exist with the same input parameter values, other than the relative cost.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost for a given exception route criteria.

A maximum of 6 exception routes can be associated with the specified DPC and criteria.

A maximum total of 8000 exception routes and normal routes can be defined for the EAGLE 5 ISS. At least one route must be a normal (not exception) route. The remaining routes (up to 7999) can be all normal routes, all exception routes, or any combination of normal and exception routes.

The network domain of the adjacent point code in the linkset or of the routes in the specified routeset must be the same as the network domain of the specified destination point code or its alias.

The adjacent or secondary point code type and group code of the linkset or linksets in the specified routeset must match the point code type and group code of the destination point code.

The specified CIC/ECIC range must not overlap an existing range.

If the **ilsn** and **lsn** parameter have the same value, or if the value specified for the **opc/opca/opci/opcn/opcn24** parameter is the same as the APC of the linkset specified by **thlsn** parameter, then the **force=yes** parameter must be specified.

The **opcn** parameter must be in the same ITU-N group as the **dpcn** parameter.

The Group Code of the APCN in the **ilsn** parameter must be the same as the Group Code of the **dpcn** parameter.

ANSI network routing and cluster point codes as OPC exception route criteria are not allowed for ITU destinations.

ITU point codes as OPC exception route criteria are not allowed for ANSI Network and Cluster destination.

If the **lsn** parameter is specified, then the **rc** parameter must be specified.

If a proxy destination is used, then this command cannot be entered.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

The destination point code specified by the **dpc** parameter must have routes provisioned.

The Nested Cluster Routing feature must be turned on (see the **chg-feat** command) before an exception route can be assigned to cluster members.

The value specified for the **oppc/opca/opci/open/opcn24** parameter cannot be the same as the adjacent point code of the linkset specified by the **lsn** parameter.

Output

```
ent-rtx:dpci=2-100-1:si=5:lsn=lset5:rc=50
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
ENT-RTX: MASP A - COMPLTD
```

ent-scr-aftp

Enter Allowed Affected Point Code

Use this command to add a specific allowed affected point code (AFTPC) screening reference in the AFTPC entity set.

Keyword: ent-scr-aftp

Related Commands: chg-scr-aftp, dlt-scr-aftp, rtrv-scr-aftp

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: stop

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **Ifsf=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format **msa-ssa-sp**. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format **zone-area-id**. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

Example

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
ent-scr-
aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop:actname=copy
ent-scr-aftpc:nsfi=stop:sr=af01:ssn=1:msa=255:ssa=255:sp=255
ent-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsm=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACTNAME** field of the **trv-gws-actset** command output.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **ssa=*** is specified, **sp=*** must be specified.

If specified, the **nsfi** parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the screening reference exists (**sr**), the new affected point code and subsystem number to be added cannot already exist in the AFTPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screening reference is valid, but does not exist, a new AFTPC screen is created.

If the screening reference exists, a new rule is added to the AFTPC screening table.

If asterisks or ranges are specified for the allowed AFTPCs, nothing that matches the specified range of AFTPCs can already exist in the AFTPC screen for the screening reference.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-aftpc** command.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix to has the spare point code prefix.

Output

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-AFTPC: MASP A - COMPLTD
;
```

Legend

ENT-SCR-AFTPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-blkdpc

Enter Blocked DPC

Use this command to add a specific blocked destination point code (BLKDPC) screening reference, and associated attributes, to the BLKDPC's table. The associated attributes are: destination point code, next screening function identifier, and next screening reference. The destination point codes listed on this screen are prohibited from sending SS7 messages to the network.

Keyword: ent-scr-blkdpc

Related Commands: chg-scr-blkdpc, dlt-scr-blkdpc, rtrv-scr-blkdpc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cgpa, destfld, fail, isup, stop**

cgpa — Allowed CGPA is the next screening category.

destfld — Allowed destination field (DESTFLD) is the next screening category.

fail — Discard the received message.

isup — ISUP message type (ISUP) is the next screening category.

stop — The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000–255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0–7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000–255 *, C**

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000–255 *, C**

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *, C

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *, C

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 00000-16383 *, C

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be specified if **nsfi** is **stop** or **fail**.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *, C

Example

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop:actname=copy

ent-scr-blkdpc:sr=iec:ni=240:nc=:ncm=:nsfi=fail

ent-scr-blkdpc:sr=bdp1:zone=1:area=2:id=3:nsfi=fail:pcst=none

ent-scr-blkdpc:sr=bdp1:zone=2:area=2:id=3:nsfi=fail:pcst=s

ent-scr-blkdpc: sr=bdp1: npc=128: nsfi=fail: pcst=s

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsm=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362, 700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

When a blocked DPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **sr** does not exist, then the **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** parameters must equal **c-c-c**, or the **npc=c** parameter must be specified, and the **nsfi=fail** parameter cannot be specified.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm zone-area-id** , or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail** .
- The **nsr** parameter cannot be specified.
- The blocked DPC, given by **ni-nc-ncm** (or **zone-area-id** or **npc**), to be added to the BLKDPC screening table for the blocked DPC screening reference cannot exist as defined or within an existing range of DPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

The value of the **nsfi** parameter must be valid for the BLKDPC entity type.

If a blocked screen reference exists, then the **ni**, **zone**, **msa**, and **npc** parameters cannot have a value of **c**.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or of subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** parameters can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, : **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkdpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefixs- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

;

Legend

ENT-SCR-BLKDPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - SS01—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-blkopc

Enter Blocked OPC

Use this command to add a specific blocked originating point code (BLKOPC) screening reference and associated attributes OPC, **nsfi**, and **nsr** to the BLKOPC entity set. Any messages received on the link assigned to this screening reference that match the attributes in this table are blocked from entering the network.

Keyword: ent-scr-blkopc

Related Commands: chg-scr-blkopc, dlt-scr-blkopc, rtrv-scr-blkopc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cgpa, dpc, fail, sio, stop**

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

dpc—Allowed DPC is the next screening category.

fail—Discard the received message.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *, C

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C, && (Allow intervals)

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *, C, && (Allow intervals)

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *, C, && (Allow intervals)

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383** *, C

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 *, C**

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 *, C**

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 *, C**

Example

```
ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds
ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop
ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop:actname=copy
ent-scr-blkopc:sr=iec:ni=240:nc=*:ncm=*:nsfi=fail
ent-scr-blkopc:sr=bo30:nsfi=stop:msa=c:ssa=c:sp=c
ent-scr-blkopc:sr=bo30:nsfi=fail:msa=1:ssa=2:sp=3
ent-scr-blkopc:sr=bo30:nsfi=fail:msa=3:ssa=*:sp=*
ent-scr-blkopc:sr=bo30:nsfi=fail:msa=255:ssa=2:sp=3
ent-scr-blkopc:sr=bop1:zone=1:area=2:id=3:nsfi=fail:pcst=none
ent-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s
ent-scr-blkopc:sr=bop1:npc=128:nsfi=fail:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The ANSI point code value **000-000-000** and the ITU-International point code value **0-000-0** cannot be specified.

At least one optional parameter must be specified.

When a blocked OPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If asterisks or ranges are specified for the blocked OPCs, nothing that matches the specified range of blocked OPCs can already exist in the BLKOPC screening table for the screening reference.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must exist in the Gateway Screening Stop Action table.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the value of the **nsfi** parameter is not **stop** or **fail**, then the **nsr** parameter must be specified.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **sr** does not exist, then the **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** parameters must equal **c-c-c**, or the **npc=c** parameter must be specified, and the **nsfi=fail** parameter cannot be specified.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail**.
- The **nsr** parameter cannot be specified.
- The blocked OPC, specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc**, to be added to the BLKOPC screening table for the blocked OPC screening reference cannot exist as defined or within an existing range of OPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

The specified **nsfi** parameter value must be valid for the BLKOPC entity type.

If a blocked screen reference exists, then **ni**, **zone**, **msa**, and **npc** parameters cannot have a value of **c**.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkopc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

ENT-SCR-BLKOPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-cdpa**Enter Allowed Called Party Address**

Use this command to add a specific allowed called party address (CDPA) screening reference in the CDPA entity set.

Keyword: ent-scr-cdpa

Related Commands: chg-scr-cdpa, dlt-scr-cdpa, rtrv-scr-cdpa

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: aftpc, stop

aftpc— Allowed affected point code is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the screening reference name for the CdPA.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters.

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **If nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:scmgfid= (optional)

The SCMG Format ID. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1–255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

Range: **1-255 ***

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Example

ent-scr-

cdpa: sr=iec: ni=240: nc=010: ncm=: ssn=224: nsfi=aftp: nsr=wrds

ent-scr-

cdpa: sr=iec: ni=240: nc=010: ncm=: ssn=224: nsfi=stop: actname=copy

ent-scr-

cdpa: sr=cdp1: zone=1: area=2: id=3: ssn=1: nsfi=stop: scmgfid=1: pcst=s

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new CDPA entry to be added cannot match any specific, range, or asterisk entry already existing in the specified screening table.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**

When **nsfi=aftpc** is specified, the **ssn=1** parameter must be specified.

When **nsfi** is a value other than **stop**, the **nsr** parameter must be specified.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

When **ssn=1** is specified, the **scmgfid** parameter must be specified.

When **ssn** is not **1**, the **scmgfid** parameter cannot be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The specified value for the **nsfi** parameter is not valid for **cdpa** screen.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

Notes

If the screening reference is valid, but does not exist, a new CDPA screen is created.

If the screening reference exists, a new rule is added to the CDPA screening table.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cdpa** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

ent-scr-

  ENT-SCR-CDPA: SCREEN SET AFFECTED - IEC 25% FULL
  ENT-SCR-CDPA: MASP A - COMPLTD
;

```

Legend

ENT-SCR-CDPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-cgpa**Enter Allowed Calling Party Address**

Use this command to add a specific allowed calling party address (CGPA) screening reference in the CGPA entity set.

Keyword: ent-scr-cgpa

Related Commands: chg-scr-cgpa, dlt-scr-cgpa, rtrv-scr-cgpa

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop, tt

cdpa— Allowed called party address is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

tt— Allowed translation type is the next screening category.

:ri= (mandatory)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: dpc, gt, *

dpc— Allow a called party address with a routing indicator value of “DPC/SSN.”

gt— Screening stops and gateway screening is bypassed as a forced pass.

*****— A full range of values.

:sr= (mandatory)

Screening reference. This parameter specifies the screening reference name for the CgPA.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: 1-255 *

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383** *

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **Ifsf=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given.

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:sccpmt= (optional)

The SCCP message type. An asterisk (*) indicates all possible allowed values.

Range: **9, 10, 17, 18, ***
9, * — UDT
10, * — UDTS
17, * — XUDT
18, * — XUDTS

Default: *****

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

Example

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds:ri=dpc
```

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:ri=dpc:actname=copy
```

```
ent-scr-
cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=9:nsfi=sdpa:nsr=cdp1
```

```
ent-scr-
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The new CGPA point code, **ri**, **sccpmt**, and subsystem number (**ssn**) to be added can not already exist in the CGPA entity set.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The screen referenced by **nsfi** and **nsr** must already exist.

The **nsr** parameter must be specified, if **nsfi** is not equal to **stop**.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

The **nsfi=tt** parameter can be specified only if the **ri=gt** parameter or the **ri=*** parameter is specified.

The **nsfi=cdpa** parameter can be specified only if the **ri=dpc** parameter or the **ri=*** parameter is specified.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

The specified value for the **nsfi** parameter is not valid for **cgpa** screen.

The **nsccpmt** and **sccpmt** parameter value must be specified in the range of {**9, 10, 17, 18**, and *****}.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screening reference is valid, but does not exist, a new CGPA screening table is created.

If the screening reference exists, a new rule is added to the CGPA screening table. Only one rule may exist for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**) combination. This implies that for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**), only one value of **ri** may be specified. The **ri** for a given combination can be **dpc**, **gt**, or *****, but not **dpc** and **gt** independently.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cgpa** command.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds:ri=dp

ENT-SCR-CGPA: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-CGPA: MASP A - COMPLTD
;
```

Legend

ENT-SCR-CGPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-destfld

Add an Allowed DESTFLD

Use this command to add an allowed affected destination field (DESTFLD) screening reference and associated attributes (destination point code, next screening function identifier, and next screening reference) to the allowed DESTFLD entity set. One or more point codes can be associated with the allowed DESTFLD screening reference. MTP Network Management messages regarding the DESTFLDs listed in this entity set are accepted from another network.

Keyword: **ent-scr-destfld**

Related Commands: **chg-scr-destfld**, **dlt-scr-destfld**, **rtrv-scr-destfld**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter indicates that the gateway screening process should stop. If this parameter is specified for this command, it must have the value of **stop**.

Range: **stop**

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*
1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383** *

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **If nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none**, **s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *

Example

ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop

ent-scr-destfld:sr=iec1:ni=1:nc=1:ncm=1:nsfi=stop:actname=copy

ent-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsm=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The **nsfi=stop** parameter must be specified in the command.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **ncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-destfld** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop

```

ENT-SCR-DESTFLD: MASP A - COMPLTD
```

;

ent-scr-dpc

Enter Allowed DPC

Use this command to add an allowed DPC screening reference and associated attributes (destination point code, next screening function identifier, next screening function reference) to the allowed DPC entity set. One or more DPCs may be associated with the allowed DPC screening reference. The DPCs listed in this entity set are allowed to receive SS7 messages from another network.

Keyword: **ent-scr-dpc**

Related Commands: **chg-scr-dpc**, **dlt-scr-dpc**, **rtrv-scr-dpc**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cgpa, destfld, isup, stop**

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

The allowed DPC screening reference name. This parameter identifies a set of one or more allowed destination point codes.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: **00000-16383 ***

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (*s-*).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling points(*p*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, *, C**

Example

ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf

ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=blkdpc:nsr=bdp1

ent-scr-dpc:sr=dpc1:zone=1:area=2:id=3:nsfi=fail:pcst=none

ent-scr-dpc:sr=dpc1:zone=2:area=2:id=3:nsfi=fail:pcst=s

ent-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The value of the **nsfi** parameter must be valid for the BLKDPC entity type.

Notes

When a DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the DPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-dpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-dpc: sr=iec: ni=240: nc=010: ncm=010: nsfi=stop: actname=cncf
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-DPC: MASP A - COMPLTD
;
```

Legend

ENT-SCR-DPC—Command entered that caused this output. This is echoed to the printer.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-isup

Enter Allowed ISUP Screening Reference

Use this command to add an allowed ISUP or TUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Keyword: **ent-scr-isup**

Related Commands: **chg-scr-isup**, **dlt-scr-isup**, **rtrv-scr-isup**

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP message type or TUP message type. A single value or range of values can be entered. An asterisk (*) indicates the entire range of **000-255**. TUP is not valid for SEAS.

Range: **000-255 ***

:sr= (mandatory)

The the individual ISUP screening reference to which this rule will be added. If the specified **sr** does not exist, it will be created

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: **stop**

stop— The gateway screening process ends and the message proceeds through normal routing.

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **If nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

ent-scr-isup:sr=iec:isupmt=1:nsfi=stop

ent-scr-isup:sr=iec:isupmt=9:nsfi=stop

ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop

ent-scr-isup:sr=iall:isupmt=*:nsfi=stop

ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop

Dependencies

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

The specified **isupmt** parameter or **tupmt** parameter value must not already exist in the specified **sr**.

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

Notes

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-isup** command.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value.

To use ISUP message type screening, an SIO screening reference with **si=05** (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (**nsr**) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (**nsr**) value.

Output

When a screen reference is specified that is not yet associated with a screen set, the following output appears:

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
tekelecstp 04-09-02 09:39:13 EST EAGLE 31.3.0
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

When a screen reference is specified that is already associated with one or more screen sets, the following output appears:

```
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
tekelecstp 04-11-17 16:22:27 EST EAGLE 31.4.0
Extended Processing Time Required -- Please Wait
Notice: The number of screensets affected is 2.
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

ent-scr-opc

Enter Allowed OPC

Use this command to add an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference) to the allowed OPC entity set. One or more OPCs may be associated with the allowed OPC screening reference. Each OPC listed in this entity set is allowed to send SS7 messages to the customer's network.

Keyword: ent-scr-opc

Related Commands: chg-scr-opc, dlt-scr-opc, rtrv-scr-opc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, blkopc, cgpa, dpc, sio, stop**

blkdpc— Blocked DPC is the next screening category.

blkopc— Blocked OPC is the next screening category.

cgpa— Allowed CGPA is the next screening category.

dpc— Allowed DPC is the next screening category.

sio— Allowed SIO is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter identifies a set of one or more allowed OPCs.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more nc values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more ncm values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling points(*p*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Example

```
ent-scr-opc:sr=iec:nsfi=stop
```

```
ent-scr-opc:sr=iec:ni=240:nsfi=sio:nsr=iec
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=copy
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=dpc:nsr=iec
```

```
ent-scr-opc:sr=opc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
```

```
ent-scr-opc:sr=opc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

ent-scr-opc: sr=opc1: npc=128: nsfi=fail: pcst=s

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsm=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The OPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **trv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The **nsr** parameter must be specified if **nsfi** is not equal to **stop**.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The value of the **nsfi** parameter must be valid for the OPC entity type.

Notes

When an OPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the OPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-opc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix- is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-opc:sr=iec:nsfi=stop
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-OPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-OPC: MASP A - COMPLTD
;
```

Legend

ENT-SCR-OPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-sio**Enter Allowed SIO**

Use this command to add an allowed SIO screening reference and associated attributes (network indicator, service indicator, message priority, H0 heading code, H1 heading code, next screening function identifier, next screening function reference) to the allowed SIO entity set.

NOTE: To use TUP message type screening, an SIO screening reference with `si=04` (TUP) must be defined in the SIO table. This SIO screening reference is specified in the `ent-scr-isup` command as the next screening reference (`nsr`) value in a screening reference for TUP message types

Keyword: ent-scr-sio

Related Commands: chg-scr-sio, dlt-scr-sio, rtrv-scr-sio

Command Class: Database Administration

Parameters

:nic= (mandatory)

Network indicator code (NIC). This parameter specifies an NIC for the SIO screening reference specified in the **sr** parameter. The NIC is the last 2 bits of the subservice field of an SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: 0-3 *

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, cdpa, cgpa, destfld, dpc, isup, stop

blkdp— Blocked DPC is the next screening category.

cgpa— Allowed CGPA is the next screening category.

destfld— Allowed destination field (DESTFLD) is the next screening category.

dpc— Allowed DPC is the next screening category.

isup— ISUP message type (ISUP) is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:pri= (mandatory)

Message priority. This parameter specifies a single priority, or the beginning of a range of priorities for the SIO screening reference specified by the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: 0-3 *

:si= (mandatory)

Service indicator. This parameter specifies an SI for the SIO screening reference specified in the **sr** parameter. The SI is the first 4 bits of an SIO. The SS7 code directs the message to the MTP-user at the destination code.

Range: 00-15

:sr= (mandatory)

The allowed SIO screening reference name. This parameter identifies a set of one or more **si/nic/pri** combinations.

Range: ayyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:h0= (optional)

H0 heading code. This parameter specifies a new H0 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–15**.

Range: **0-15 ***

Default: Value given if **si** value is **00**, **01**, or **02**

:h1= (optional)

H1 Heading Code. This parameter specifies an H1 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–15**.

Range: **0-15 ***

Default: Value given if **si** value is **00**, **01**, or **02**

:nsr= (optional)

Next screening reference (NSR). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

ent-scr-

sio:sr=iec:nic=1:si=1:h0=01&&03:h1=:pri=:nsfi=dpc:nsr=abc

ent-scr-sio:sr=iec:nic=1:si=3:pri=2:nsfi=stop

ent-scr-sio:sr=iec:nic=1:si=4:pri=3:nsfi=stop:actname=cncf

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If the **si** parameter is equal to **00**, **01**, or **02**, the **h0** and **h1** parameters must be specified. Otherwise, the **h0** parameter cannot be specified.

Valid combinations for the **h0/h1** and **nh0/nh1** parameters are:

- **h0 (nh0)** is a single value—**h1 (nh1)** can be a single value, range, or an asterisk (*) entry
- **h0 (nh0)** is a range—**h1 (nh1)** can be an asterisk (*) entry

- **h0 (nh0)** is an asterisk (*) entry—**h1 (nh1)** can be an asterisk (*) entry

When the **chg-scr-sio** command is entered with the **nh0** or **nh1** parameters, the specified values must be valid with the **h0** or **h1** values currently in the database.

If the screening reference exists, the **nic**, **si**, **h0/h1**, and priorities to be added to the allowed SIO entity set for the SIO screening reference cannot exist in that allowed SIO entity set.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of **nic**, **si**, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

If the screening reference does not exist, a new screening reference for the allowed SIO entity set is created.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

The values specified for the **nsfi** and **si** parameters must meet the mapping requirements as shown:

- **nsfi=destfld—si=00**
- **nsfi=cdpa—si=03**
- **nsfi=cgpa—si=03**
- **nsfi=isup—si=05**

Use Table 5-26 to determine the acceptable combination of the specified parameter values:

Table 5-26. Additional Valid **ent-scr-sio** Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
00	s, *	s, *, r	s	s, *, r
00	s, *	s, *, r	*, r	*
01, 02	s, *	s, *, r	s	s, *, r
01, 02	s, *	s, *, r	*, r	*
03-15	s, *	s, *, r	u	u
Legend s = single value r = range * = asterisk u = unspecified				

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter must be specified.

If the **si** parameter is greater than 2, the **h0** and **h1** parameters must not be specified.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **pri=0&&2** specifies all message priorities for the range **0** to **2**.

If the screen set reaches 100% capacity (indicated by the **100% Full** message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with **si=05** (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references.

The **h0** and **h1** parameters cannot be specified if **si** is not equal to **00**, **01**, or **02**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-sio** command.

Output

ent-scr-

sio:sr=iec:nic=1:si=1:h0=01&&03:h1=:pri=:nsfi=dpc:nsr=abc

```
rlghncxa03w 04-02-14 16:45:50 EST EAGLE 31.3.0
ENT-SCR-SIO: SCREEN SET AFFECTED - SS01 25% FULL
ENT-SCR-SIO: SCREEN SET AFFECTED - SS04 35% FULL
ENT-SCR-SIO: MASP A - COMPLTD
```

;

Legend

ENT-SCR-SIO—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - SS01—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-tt

Enter Allowed Translation Type

Use this command to add a specific allowed translation type (TT) screening reference in the TT entity set.

Keyword: **ent-scr-tt**

Related Commands: **chg-scr-tt**, **dlt-scr-tt**, **rtrv-scr-tt**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cdpa**, **stop**

cdpa— Allowed CDPA is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Name of the screening reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. The translation type identifies the global title translation type value in the called party address. It is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **000-255** *, && (Allow intervals)

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wrds

ent-scr-tt:sr=iec:type=012:nsfi=stop:actname=copy

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

If the screening reference is valid, but does not exist, a new TT screen is created.

If the screening reference exists, a new rule is added to the TT screening table.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-tt** command.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

If the **nsr** parameter is specified, the specified screening reference must exist.

If the screening reference (**sr**) exists, the single value or range specified for the allowed **type** to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

If an asterisk is specified for the allowed **type**, nothing can already exist in the TT screen for the screening reference.

The specified value for the **nsfi** parameter is not valid for TT screen.

The screen referenced by **nsfi** and **nsr** must already exist.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The value specified for the **type** parameter must be within the allowed range.

Notes

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wrds

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-TT:  SCREEN SET AFFECTED - IEC  25% FULL
ENT-SCR-TT:  MASP A - COMPLTD
```

;

Legend

ENT-SCR-TT—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scrset

Enter Screen Set

Use this command to create a new screen set and point it to its first screen. A screen set is a set of screens (filters) that can be assigned to a linkset. SS7 messages transmitted on a linkset assigned to a screen set require screening by the system, if screening is enabled.

Keyword: ent-scrset

Related Commands: chg-scrset, dlt-scrset, rtrv-scrset

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, blkopc, dpc, opc, sio, stop

blkdp—Blocked DPC is the next screening category.

blkopc—Blocked OPC is the next screening category.

dpc—Allowed DPC is the next screening category.

opc—Allowed OPC is the next screening category.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

:scrn= (mandatory)

Screenset name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*
1 alphabetic character followed by up to 5 alphanumeric characters.

:destfld= (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is **on**, the automatic screening is applied at the end of the provisioned screen set.

Range: **yes, no**

Default: **yes**

:nsr= (optional)

Next screening reference (**nsr**). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. **If nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
ent-scrset:scrn=ss02:nsfi=stop
ent-scrset:scrn=empt:nsfi=stop:destfld=yes
ent-scrset:scrn=scr1:nsfi=stop:actname=copy
```

Dependencies

Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The **nsfi=stop** parameter must be specified before the **actname** parameter can be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

The specified screen set name cannot be in use by another screen set.

A maximum of 63 user-defined screen sets can be defined in the database.

The **nsfi** and **nsr** parameters must point to one or more existing entities in another entity set, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The Gateway Screening (GWS)/Global Title Translation (GTT) shared database resource (DBMM.TBL) may not be full.

Notes

Entering a new screen set may take a few minutes of processor time. The following message appears in the scroll area:

Extended processing time required-please wait

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCRSET: SCREEN SET AFFECTED - SS01 25% FULL
ENT-SCRSET: MASP A - COMPLTD
;
```

Legend

ENT-SCRSET—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

ent-serial-num**Enter Serial Number**

Use this command to enter and lock the NT serial number into the database for an EAGLE 5 ISS STP.

You must enter the serial number at least once without specifying the **lock** parameter. As long as you enter the command without the **lock** parameter, you can enter the system serial number as many times as needed. After the correct serial number is entered, you must use the **lock=yes** parameter to lock the serial number table. You cannot change the serial number with administration commands after the table is locked.

Keyword: ent-serial-num

Related Commands: rtrv-serial-num

Command Class: Database Administration

Parameters

:serial= (mandatory)

The system NT Serial Number.

Range: aaaaaaaaa

Up to 10 alphanumeric characters; mixed case is allowed.

The first two characters (the prefix) must be letters.

The remaining characters must be numbers.

The serial number cannot contain spaces or special characters.

:lock= (optional)

This parameter is used to lock the Serial Number table when the serial number is entered for the system.

CAUTION: After the serial number is locked, you cannot enter it again or change it in the database. You can use the command without the **lock** parameter to enter the serial number as many times as needed; then enter the command with the **lock** parameter and the correct serial number to lock the serial number table.

Range: yes
Default: Not locked

Example

```
ent - serial - num : serial = nt00000123
ent - serial - num : serial = nt00000123 : lock = yes
```

Dependencies

The serial number must be entered at least once without specifying the **lock** parameter.

The system serial number that is entered when the **lock** parameter is specified must match the serial number that was previously entered in the Serial Number table by using the command without the **lock** parameter.

The system serial number cannot be entered again after the Serial Number table is locked.

Notes

None

Output

```
ent - serial - num : serial = nt00000123
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
ENT-SERIAL-NUM: MASP A - COMPLTD
;
```

ent-shlf

Enter Shelf

Use this command to add an equipment shelf to the database.

Keyword: ent-shlf
Related Commands: dlt-shlf, rtrv-shlf
Command Class: Database Administration

Parameters

:loc= (mandatory)
 The shelf location.
Range: 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

:type= (mandatory)
 The type of equipment shelf to be configured.
Range: ext

Example

```
ent - shlf : type = ext : loc = 1200
```

Dependencies

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

The specified shelf location must not have been configured previously.

Notes

None

Output

```
ent-shlf:type=ext:loc=1200
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-SHLF: MASP A - COMPLTD
;
```

ent-sid

Enter Self Identification

Use this command to define additional true point codes for an STP. This command allows newly defined true point codes to be distributed to the cards without requiring system initialization.

Keyword: ent-sid

Related Commands: chg-sid, rtrv-sid

Command Class: Database Administration

Parameters

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

STP true point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfield *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

To create a site identification STP PC for ITU-N and ITU-I:

ent-sid:pcn=123:pci=1-1-1

To create a site identification STP PC for ITU-N Spare and ITU-I Spare:

ent-sid:pcn=s-123:pci=s-1-1-1

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the **pc** parameter must be **6** or greater when the specified cluster value is **0** (*nc*).

The **pcn** and **pcn24** parameters cannot be specified together in the command.

The specified STP point code must not have been previously defined as a capability point code.

An STP point code cannot exist that is the same type (ANSI, ITU-I, ITU-N, ITU-N24, ITU-ISpare, or ITU-NSpare) as the specified STP point code or must not have been previously defined as a capability point code.

The value of the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

ITU-N STP destination point codes can be specified only as full point codes.

Invalid parameter was specified.

Notes

The SID Table can simultaneously contain the node's true point codes of any following point code types: ANSI, ITU-I, ITU-N or ITU-N24, ITU-ISpare, and ITU-NSpare. (Only ITU-N or ITU-N24, not both, can be defined in the SID Table.)

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

```
ent-sid:pcn=123:pci=1-1-1
  rlghncxa03w 05-01-07 11:11:28 EST  EAGLE 31.12.0
  ENT-SID: MASP A - COMPLTD
;
```

ent-slk**Enter Signaling Link**

Use this command to add a low-speed or high-speed (ATM or IP) signaling link to a linkset in the database.

Signaling links are the only elements in the database directly supported by a hardware device. When a link is added to a linkset, the link remains in the state OOS-MT-DSBLD (out of service maintenance disabled) until it is activated.

For E1/T1 MIM cards, HC-MIM cards, Channel cards, or E5-E1T1 cards, use this command to associate a signaling link and a timeslot with the E1 or T1 interface that will service the timeslot.

For HC-MIM cards used for SE-HSL links, use this command to assign links A and B on any 2 of the 8 HC-MIM card ports. For E5-E1T1 cards used for SE-HSL links, use this command to assign link A on any 1 of the 8 E5-E1T1 card ports.

Up to 8 signaling links can be assigned to one E1/T1 MIM card, allowing links A, A1 - A3, B, and B1 - B3 to be provisioned. Up to 64 signaling links can be assigned to one HC-MIM card, allowing links A, A1 - A31, B, and B1 - B31 to be provisioned. Up to 32 signaling links can be assigned to one E5-E1T1 card, allowing links A, A1 - A15, B, and B1 - B15 to be provisioned.

One signaling link can be assigned to a LIMATM or E1-ATM card, allowing link A to be provisioned. Up to 3 signaling links can be assigned to an E5-ATM card, allowing links A, A1, and B to be provisioned.

NOTE: The link parameter has been added as a synonym for the port parameter. Either port or link can be used for a few more EAGLE 5 ISS releases; then the port parameter will be removed.

Keyword: ent-slk

Related Commands: act-slk, blk-slk, canc-slk, dact-slk, dlt-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Database Administration

Parameters

The following parameters are valid for all types of links: **loc, lsn, link, slc, bps, ecm**

The following parameters are valid for low-speed links: **l2tset, pcn1, pcn2**

The following parameter is valid only for IP links: **iplim12**

The following parameters are valid for ATM ANSI high-speed links: **atmtsel, ll, lpset, vci, vpi**

The following parameters are valid for E1 ATM links: **atmtsel, e1atmcrc4, e1atmsi, e1atmsn, lpset, vci, vpi**

The following parameters are valid for E1 links: **l2tset, ecm, pcn1, pcn2, e1loc, e1port, ts**

The following parameters are valid for T1 links: **l2tset, ecm, pcn1, pcn2, t1loc, t1port, ts**

The following parameters are valid for SE-HSL links: **l2tset, e1port**

The following parameters are valid for ST-HSL-A links: **l2tset, t1port, ecm, pcn1, pcn2**

The following parameter is valid only for IPSG links: **aname**

NOTE: As of Release 41.1, the `lmode` and `tset` parameters are obsolete.

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: `port`

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

If the signaling link is being assigned to an E1 or T1 card for a Channel card, specify the location of the Channel card. If the link is being assigned for the E1 or T1 card itself, specify the location of the E1 or T1 card.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:lsn= (mandatory)

The name of the linkset. The linkset name must be unique.

Range: `ayyyyyyyyy`

1 alphabetic character followed by up to 9 alphanumeric characters

:slc= (mandatory)

The signaling link code.

The SLC must be unique within the linkset. It must be the same at both the system location and the distant node.

Range: **0-15**

:aname= (optional)

Association name. This parameter specifies the association assigned to the signaling link added in an IPSG linkset.

Range: `ayyyyyyyyyyyyyyy`

Up to 15 alphanumeric characters; the first character must be a letter

:atmtsel= (optional)

ATM timing selector. The timing source for the ATM signaling link—internal, line, or external.

Internal timing is derived from an internal clock source operating at 1.544 MHz $\pm$ 200 Hz for ANSI links and 2.048 MHz $\pm$ 103 Hz for ITU links. External timing is derived from the High-Speed Master Clock (T1 or E1). Line timing is derived from its received data stream, if present.

CAUTION

CAUTION: The internal timing source is used for debug purposes only, and is not to be used for production operation.

If you are using the 2.048 MHz reference clock as the timing source for E1 signaling links, the **atmtsel=external** parameter must be specified for high-speed ATM signaling links. The **atmtsel** parameter is not valid in the command when the **elloc** or **elport** parameter is specified for an E1

signaling link. For information on the E1 interface, see Appendix A, “E1 Interface” in the *Database Administration Manual - SS7*.

Range: external, internal, line

Default: line

:bps= (optional)

This parameter specifies the transmission rate for the link in bits per second.

NOTE: Links with different speeds can be mixed within a linkset. Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Range: 1536000, 1544000, 1984000, 2048000, 56000, 64000

The value specified for the **bps** parameter must be supported for the associated card application:

- **ss7ansi**—56000 or 64000
- **ccs7itu**—56000 or 64000
- **atmansi**—1544000
- **ss7ansi, ccs7itu** (E1 SE-HSL cards)—1984000
- **ss7ansi, ccs7itu** (T1 SE-HSL-A cards)—1536000
- **atmitu**—2048000

Default: 56000

:e1atmcrc4= (optional)

CRC4 multi-frame structure enable/disable indicator.

Range: on, off

Default: on

:e1atmsi= (optional)

Value of two Spare International bits of NFAS data.

Range: 0-3

Default: 3

:e1atmsn= (optional)

Value of five Spare National bits of NFAS data.

Range: 0-31

Default: 0

:e1loc= (optional)

Card location of an E1 card with an E1 interface that will service the link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:e1port= (optional)

The port for the E1 interface on the E1 card to which a signaling link and timeslot are being assigned, or to which an SE-HSL link is being assigned.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2, but no more than 2, of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Any 1, but no more than 1, of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

Default: 1

:ecm= (optional)

Error correction method.

Range: basic, pcr

Default: basic

:ipliml2= (optional)

IPLIM level 2 stack.

Range: m2pa

Default: m2pa

:l2tset= (optional)

Level 2 timer set

A signaling link can be assigned to any of the thirty-five timer sets.

Range: 1-35

1-10 for ANSI low speed links

11-20 for ITU low speed links

21-25 for ITUN China high speed links

26-30 for ITUN Q703.A high speed links

31-35 for Unchannelized T1 high speed links

Default: 1 for ANSI low speed links

11 for ITU low speed links

21 for ITUN China high speed links (SE-HSL link in a linkset defined with the **apctype=ituchina** parameter)

26 for ITUN Q703.A high speed links (SE-HSL link in a linkset defined with the **apctype=itun** parameter)

31 for Unchannelized T1 high speed links

:ll= (optional)

ATM line length in feet.

Range: 0-7

0—0-110 feet

1—110-220 feet

2—220-330 feet

3—330-440 feet

4—440-550 feet

5—550-660 feet

6—More than 660 feet

7—Allows use of external line buildout networks

Default: 0

:lpset= (optional)

Link parameter set identifier.

Range: 1-30

Default: 1—for ANSI

21—for ITU

:pcrn1= (optional)

The threshold of the number of MSUs available for retransmission. If the error correction method being used is PCR and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range: **1-1023**

For low speed E1/T1 links: **1 - 127**

For unchannelized T1 links: **1 - 1023**

Default: **76** - For low speed E1/T1 links.

608 - For unchannelized T1 links.

:pcrn2= (optional)

The threshold of the number of MSU octets available for retransmission. If the error correction method being used is PCR, and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range: **300-287744**

For low speed E1/T1 links: **300 - 35500**

For unchannelized T1 links: **7200 - 287744**

Default: **3800** - For low speed E1/T1 links.

32224 - For unchannelized T1 links.

:t1loc= (optional)

Card location of a T1 card with a T1 interface that will service the signaling link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:t1port= (optional)

The port for the T1 interface on the T1 card to which a signaling link and timeslot are being assigned, or to which an ST-HSL-A link is being assigned.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2, but no more than 2, of the 8 ports on an HC-MIM card can be specified when the card is used as an ST-HSL-A card.

Any 1, but no more than 1, of the 8 ports on an E5-E1T1 card can be specified when the card is used as an ST-HSL-A card.

Default: **1**

:ts= (optional)

E1 or T1 timeslot for the assigned signaling link.

Range: **1-31**

E1 range: **1—31**

T1 range: **1—24**

:vci= (optional)

Virtual channel identifier.

Range: **5, 32-65535**

0-4 and **6-31** are reserved values; they cannot be specified in the command.

Default: **5**

:vpi= (optional)

Virtual path identifier.

Range: 0-4095

Default: 0

:llmode= (obsolete)

The mode of operation used to select the link clocking source at layer 1. One end of a V.35 link must be DTE and the other end must be DCE.

This parameter is obsolete.

Range: dte, dce

Default: dte

:tset= (obsolete)

Transmitter signal element timing.

This parameter is obsolete.

Range: on, off

Default: off

Example

ent -

slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:bps=64000:ecm=basic

ent -

slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:ecm=pcr:pcrn1=50:pcrn2=4000

The following example adds signalling link a to linkset lshcap on an HCAP card.

ent-slk:loc=1304:link=a:slc=0:lsn=lshcap:lpset=3:vci=5:vpi=15

ent -

slk:loc=1302:link=a:slc=5:lsn=atm1302a:lpset=3:vci=10:vpi=15:ll=0:atmtsel=external

The following example adds a link to linkset ls1 at 56 KB for a multi-port LIM:

ent-slk:loc=1205:link=a1:slc=0:lsn=ls1

The following example assigns a timeslot for the signaling link on an E1 card that uses E1 port 1.

ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=1

The following example assigns a timeslot for a signaling link on an E1 card that uses E1 port 2.

ent-slk:loc=1205:link=b:slc=0:lsn=e1typ:ts=1:e1port=2

The following example assigns a timeslot for a signaling link on a Channel card in the location specified by the loc parameter. The Channel card is serviced by the E1 assigned to the E1 card in the location specified by the e1loc parameter.

ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=2:e1loc=1205

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using E1 port 2 and signaling link b2.

ent-slk:loc=1205:link=b2:slc=0:lsn=e1typ:ts=1:e1port=2

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an E1 Channel card in card location 1206. The command specifies signaling link port a1. The E1 interface that services the Channel card is on the E1 card in card location 1205 (e1loc parameter).

ent-slk:loc=1206:link=a1:slc=1:lsn=e1jwk:ts=2:e1loc=1205

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using signaling link a2. The T1 interface defaults to the interface defined for T1 port 1 (t1port parameter not specified)

ent-slk:loc=1207:link=a2:slc=0:lsn=t1jwk:bps=64000:ts=1

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using T1 port 2 and signaling link b2.

ent-slk:loc=1207:link=b2:slc=0:lsn=t1typ:ts=1:t1port=2

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an T1 Channel card in card location 1208. The command specifies signaling link a1. The T1 interface that services the Channel card is on the T1 card in card location 1207 (t1loc parameter).

ent-

slk:loc=1208:link=a3:slc=1:lsn=t1jwk:bps=64000:ts=2:t1loc=1207

The following example adds a signaling link to linkset ls1 at 2048000 bps for an E1 ATM card that will use the CRC4 multi-frame structure

ent-

slk:loc=1205:link=a:slc=0:lsn=ls1:bps=2048000:atmsel=line:e1atmcrc4=on

The following example adds a link to link set ls1 at 56 Kbps for an HC-MIM card that is provisioned as an E1 card:

ent-slk:loc=1205:link=a31:slc=0:lsn=ls1:e1port=4:ts=4

The following example adds a link to link set ls2 at 64 Kbps for an HC-MIM card that is provisioned as a T1 card:

ent-slk:loc=1207:link=b27:slc=3:lsn=ls2:t1port=8:ts=6:bps=64000

The following example adds signalling link b to linkset lse5atm on an E5-ATM card.

ent-slk:loc=1305:link=b:slc=1:lsn=lse5atm:lpset=3:vci=5:vpi=15

The following example adds a signaling link to an IPSG linkset for an E5-ENET card that is running the ipsg application and hosting an association.

ent-slk:loc=1204:port=b:lsn=lsipsg:slc=3:aname=assocsg1204

The following example adds signaling link A1 to linkset L2E5ATM on an E5-ATM card.

ent-slk:loc=1303:link=a1:slc=1:lsn=l2e5atm:lpset=3:vci=5:vpi=15

Dependencies

Card locations **1113 - 1118** cannot be specified.

The **ecm=pcr** parameter must be specified before the **pcrn1** and **pcrn2** parameters can be specified for the SS7ANSI and CCS7ITU applications.

The value specified for the **bps** parameter must be supported for the associated card application.

If the card application is SS7ANSI or CCS7ITU, then a value of **56000** or **64000**, respectively, must be specified for the **bps** parameter. If SE-HSL or ST-HSL-A cards are used, then a value of **1984000** or **1536000**, respectively, must be specified for the **bps** parameter.

The value of the **bps** parameter must be **56000** if the card type is LIMDS0.

A value of **1544000** must be specified for the **bps** parameter if the card application is ATMANSI.

A value of **56000** must be specified for the **bps** parameter if the card is a multi-port LIM.

A value **2048000** must be specified for the the **bps** parameter if the card type is LIME1ATM.

The card application must be ATMANSI before the **bps=1544000** parameter can be specified. The card application must be ATMITU before the **bps=2048000** parameter can be specified.

A value of **1984000** or **1536000** must be specified for the **bps** parameter if the card is an HC-MIM or E5-E1T1 card used for SE-HSL or ST-HSL-A links (the **linkclass=unchan** parameter is specified in the **ent-e1** or **ent-t1** command) respectively.

The values **0 -4** and **6 -31** cannot be specified for the **vci** parameter; these values are reserved system values.

The linkset type must be valid for the card:

- The linkset adjacent point code (APC) type must be the same as the card application type (ANSI or ITU).
- IPSP-M2PA linksets cannot contain IPGWx and IPSP-M3UA link types. During migration to an IPSP-M2PA linkset, link types other than IPGWx or IPSP-M3UA can be added to the linkset. After the linkset is transitioned to IPSP-M2PA, only IPSP-M2PA and IPLIMx links can be added.
- IPSP-M3UA linksets cannot contain SS7IPGW, IPGWI, and IPGHC link types. After the linkset is transitioned to IPSP-M3UA, only IPSP-M3UA links can be added to the linkset.

The specified linkset name must exist in the database.

The value of the **slc** parameter cannot be used by more than one link in the linkset.

A card must be equipped in the specified card location.

The card in the specified card location must be a LIM or MIM and must exist.

A link is already assigned to the specified port.

The parameters that are specified for the command must be valid for the type of card in the specified card location.

If a low-speed link is assigned to a card (card application is not ATMANSI or ATMITU), then the ATM high-speed link and E1 ATM parameters (**atmtsel**, **e1atmcrc4**, **etatmsi**, **e1atmsn**, **ll**, **lpset**, **vci**, and **vpi**) cannot be specified.

If an ATM high-speed link is assigned to a card (card application is ATMANSI), then the low-speed link parameters (**ecm**, **l2tset**, **pcrn1**, and **pcrn2**) cannot be specified.

If an IP link is assigned to a card (card application is SS7IPGW, IPGWI, IPLIM, or IPLIMI), then the following low-speed link parameters, ATM high-speed link parameters, and E1 ATM high-speed link parameters cannot be specified: **lpset**, **vci**, **vpi**, **ll**, **atmtsel**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **ecm**, **l2tset**, **pcrn1** and **pcrn2**.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the IPLIM or IPLIMI application with links having **ipliml2=m2pa**, or an E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the IPLIM or IPLIMI application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the IPSP application.

The A1, B1, A2, B2, A3, and B3 links can be specified when:

- The card type is LIMDS0, and the card application is SS7ANSI.

- The card type is LIME1, LIMT1, or LIMCH, and the card application is SS7ANSI or CCS7ITU.
- The card is an SSEDCEM, and the card application is IPLIM or IPLIMI.
- The card type is LIME1, LIMT1, or LIMCH (and the card is not an SE-HSL or ST-HSL-A card), and the card application is SSANSI or CCS7ITU.
- The card is an SSEDCEM card (IPLIM to 8 points) and the card application is IPLIM, IPLIMI, or an E5-ENET card and the card application is IPLIM, IPLIMI, or IPSG.

The A4 - A15 and B4 - B15 links are valid when the card type is LIME1 or LIMT1 for an E5-E1T1 card or for an HC-MIM card that is used as an E1 or T1 card, and the card application is SS7ANSI or CCS7ITU. The A16 - A31 and B16 - B31 links are valid when the card type is LIME1 or LIMT1 for an HC-MIM card that is used as an E1 or T1 card, and the card application is SS7ANSI or CCS7ITU. The A4 - A31 and B4 - B31 links cannot be specified for a Channel card, an SE-HSL, card or an ST-HSL-A card. The A, B, A1 - A7, and B1 - B7 links are valid for E5-ENET cards running the IPLIM or IPLIMI application. The A, A1 - A15, B, and B1 - B15 links are valid for E5-ENET cards running the IPSG application.

HIPR cards must be in card locations xy **09** and xy **10** on any shelf that contains one or more HC-MIM, E5-E1T1, or E5-ENET cards. When links A4 - A31 or B4 - B31 are specified, the system verifies that HIPR cards are in card locations xy **09** and xy **10** on the same shelf with the specified HC-MIM, E5-E1T1, or E5-ENET card.

Links A16 - A31 and B16 - B31 cannot be specified for even-numbered card locations. HC-MIM cards are dual-slot cards. These links are assigned only to the cards in odd-numbered locations.

If the card application is SS7IPGW or IPGWI, then the **link=a** parameter must be specified.

If an HC-MIM card is used for SE-HSL or ST-HSL-A links, then only the **link=a** parameter or **link=b** parameter can be specified. If an E5-E1T1 card is used for SE-HSL or ST-HSL-A links, then only the **link=a** parameter can be specified.

If the specified linkset has a mate linkset, only 1 SS7IPGW or IPGWI signaling link can be assigned to the specified linkset. The assigned link must be an SS7IPGW or IPGWI link.

Up to 8 IPGWx signaling links can be assigned to one linkset if the linkset is not mated.

The associated location must be empty, or an E5-ATM card must be provisioned in the location before the **link=b** parameter can be specified. Upon initialization, the E5-ATM card is in **boot phase-0** for up to 30 secs. During this period, the E5-ATM hardware is not detected, which may result in a lack of support for signalling link **b**.

If an IP link is assigned to a card running the SS7IPGW application, then the **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

If an IP link is assigned to a card running the IPGWI application, then **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

If the **multgc=yes** parameter is specified, then all links assigned to the linkset must be of the same type.

If **multgc=yes** parameter is specified, then the card in the specified location must be running the IPGWI, IPLIMI, or IPSG application.

The **ipliml2** parameter can be specified only for IPLIM cards.

Linksets with 14-bit ITU-N and 24-bit ITU-N APCs or SAPCs can contain only IPGWI or IPLIMI M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously. Linksets containing 24-bit ITU-N APCs or SAPCs cannot contain E1 ATM links. These links do not support 24-bit ITU-N traffic.

A maximum of 1200, 1500, 2000, or 2800 links is allowed in the system. The maximum depends on the enabled Large System # Links quantity (see the **rtrv-ctrl-feat** command output). A FAK is required to enable support for more than 1200 links. A mixture of T1 ATM high-speed, E1 ATM high-speed, SE-HSL, IP, and low-speed signaling links is supported.

HC-MIM and E5-E1T1 cards cannot be used as or with Channel cards. The **e1loc** and **t1loc** parameters cannot be specified for HC-MIM or E5-E1T1 cards.

If a card location is specified for a Channel card (card type LIMCH) assigned to an E1 or T1 interface, then the **e1loc** or **t1loc** parameter, respectively, must be specified. If a card location is specified for an E1, T1, or Channel card (card type LIME1, LIMT1, or LIMCH), then the **ts** parameter must be specified.

A specific timeslot can be assigned in the **ts** parameter to only one E1 signaling link for the E1 interface that services that timeslot.

A specific timeslot can be assigned in the **ts** parameter to only one T1 signaling link for the T1 interface that services that timeslot.

The **ts** parameter value for a T1 link must be in the range **1-24**.

The **ts** parameter cannot be specified for HC-MIM or E5-E1T1 cards that are used for SE-HSL or ST-HSL-A links (the **linkclass=unchan** parameter is specified in the **ent-e1** or **ent-t1** command).

If the E1 interface has CAS multi-framing enabled for an E1 card or a Channel card, timeslot 16 cannot be specified.

If the card is an IPSG card, then the **ipsg=yes** parameter must be specified (see the **ent-ls** command).

If an IPSG linkset and card are used, then the **aname** parameter must be specified.

If the **aname=m3ua** parameter is specified, then a maximum of 16 signaling links can be assigned.

If the **aname=m2pa** parameter is specified, then only one signaling link can be assigned.

The resulting total TPS of all signaling links configured for an IPSG card cannot exceed 5000 TPS.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values must be less than or equal to 750,000. The total provisioned system TPS is equal to SIGTRAN TPS + ATM TPS.

The value specified for the **aname** parameter must already exist in the database.

The adapter assigned to the association must be the same as the adapter assigned to the linkset.

The value specified for the **aname** parameter must be associated with the value specified for the **loc** parameter.

Linksets must have same routing context to share an association.

The **aname** parameter can be specified only for IPSG links.

The **e1loc** and **t1loc** or **e1port** and **t1port** parameters cannot be specified together in the command.

The **e1port** parameter is valid only for E1/T1 MIM, HC-MIM, or E5-E1T1 cards used as E1 cards. The **t1port** parameter is valid only for E1/T1 MIM, HC-MIM, or E5-E1T1 cards used as T1 cards. The **e1loc** and **t1loc** parameters are only valid for E1/T1 MIM cards used as E1/T1 channel cards. The **ts** parameter is only valid for E1/T1 MIM, HC-MIM or E5-E1T1 cards used as E1/T1 cards, and E1/T1 MIM cards used as E1/T1 channel cards. The **lsn**, **slc**, **loc**, **port**, **bps**, **lpset**, **atmsel**, **vci**, **vpi**, **e1atmcre4**, **e1atmsi**, and **e1atmsn** parameters are only valid for LIM E1 ATM cards. Low-speed link parameters (**ecm**, **l2tset**, **pcrn1**, and **pcrn2**) cannot be specified. The **e1port** and **l2tset** parameters are allowed for HC-MIM or E5-E1T1 cards used as SE-HSL cards. The **t1port** and **l2tset** parameters are allowed for HC-MIM or E5-E1T1 cards used as ST-HSL-A cards.

The E1 interface for the card at the location specified by the **loc** parameter must be defined (see the **ent-e1** command) before a signaling link can be assigned to the port.

If an E1/T1 MIM card is used as an E1 channel card, then the **e1port=1** parameter must be specified.

If an E1/T1 MIM card is used as a T1 channel card, then the **t1port=1** parameter must be specified.

The same value must be specified for the **e1loc** or **t1loc** parameter for all provisioned links on an E1 or T1 channel card, respectively.

The card location specified by the **e1loc** parameter must contain an HC-MIM, E5-E1T1, or E1/T1 MIM card that is used as an E1 card.

The specified card slot must be equipped with the valid card type.

If the value specified for the **loc** parameter indicates a Channel card, then the Channel card must be installed on the same shelf as the E1 card that is specified by the **e1loc** parameter.

The E1 interface for the E1 port specified by **e1loc** parameter must already be defined (see the **ent-e1** command) before a signaling link can be assigned to the card.

A channel bridged slave port (see the **chg-e1** or **chg-t1** command) cannot be specified as a value for the **e1port** or **t1port** parameter.

The value specified for the **ts** parameter cannot already be in use by the E1 card.

The T1 interface of the T1 card specified by the **t1loc** parameter must already be defined (see the **ent-t1** command) before a signaling link can be assigned to the card.

If the value specified for the **loc** parameter indicates a Channel card, then the card must be installed on the same shelf as the T1 card that is indicated by the **t1loc** parameter.

The T1 interface for the T1 port specified by **t1loc** parameter must already be defined (see the **ent-t1** command) before a signaling link can be assigned to the card.

All available links on the specified IPLIM card have already been provisioned.

If a multi-port LIM card is used, then the **bps=56000** parameter must be specified.

If the **loc** parameter indicates an ST-HSL-A card, then the **t1port** parameter must be specified.

The Fan feature must be turned on (see the **chg-feat** command) before links A16 - A31 and B16 - B31 can be specified.

If the **loc** parameter indicates an SE-HSL card, then the **e1port** parameter must be specified.

If the link is In-Service, then this command cannot be entered.

Links must be available in the linkset that is specified by the **lsn** parameter.

The domain of the linkset specified by the **lsn** parameter must match the domain of the link specified by the **link** parameter.

The link capacity cannot exceed the maximum allowed by the SE-HSL or ST-HSL-A FAK (see the **rtrv-ctrl-feat** command output).

The L2 timer range must be valid for the type of signaling link being provisioned as shown:

- ANSI LSL—1 - 10
- ITU LSL—11 - 20
- E1-HSL (China)—21 - 25
- E1-HSL (ITUN)—26 - 30
- T1-HSL-A—31 - 35

The same value cannot be specified for the **aname** parameter for multiple links in the same linkset.

The same value must be specified for the **ecm** parameter for all links in a linkset.

The T1 interface on the card at the location specified by the **loc** parameter must be defined (see the **ent-t1** command) before a signaling link can be assigned to the port.

The N1/N2 thresholds for PCR Error Correction Mode (ECM) specified by the **pcrn1** and **pcrn2** parameters must be within the range specified for the link type. Only low speed E1/T1 (LSL) and Unchannelized T1 links support PCR ECM.

The E5-ATM card must be inhibited before the card can support an A1 link.

If a 3 Links per E5-ATM Card feature quantity is enabled, and an E5-ATM card is used, then the value specified for the **vci** parameter must be less than or equal to **16383**.

A 3 Links per E5-ATM Card feature quantity must be enabled before the **link=a1** parameter can be specified for an E5-ATM card.

The maximum number of E5-ATM cards with 3 links cannot exceed the value that is set by the 3 Links per E5-ATM Card quantity feature.

The A4 - A7 and B4-B7 links can be specified for E5-ENET cards when the card application is IPLIM or IPLIMI, and for E1/T1 MIM cards when the card application is SS7ANSI or CCS7ITU.

The A4 - A15 and B4 - B15 links can be specified when the card type is LIME1 or LIMT1 for E5-E1T1 cards and the card application is SS7ANSI or CCS7ITU or for E5-ENET cards when the card application is IPSG.

The A4 - A31 and B4 - B31 links can be specified when the card type is LIME1 or LIMT1 for an HC-MIM card and the card application is SS7ANSI or CCS7ITU.

The A, A1, and B links can be specified for E5-ATM cards when the card application is ATMANSI or ATMITU.

Notes

The **ll** parameter is not available in the SEAS database.

If a signaling link is assigned to a card that is running the ATMANSI or ATMITU application, and the **bps**, **vci**, **vpi**, **elatmcr4**, **elatmsi**, **elatmsn**, **ll**, **atmsel**, and **lpset** parameters are not specified, then the ATM default values are assigned for these parameters.

The MTP Level 2 timers (**l2tset** parameter) are not valid for IP links or for ATM links.

A link is *equipped* when it is physically operational, that is, when the hardware is in place that is needed to support the link.

Signaling Links for E1/T1 MIM Cards

One E1/T1 MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

When configuring signaling links for an E1, T1, or Channel card, each signaling link must be associated with a timeslot assigned in the command. Each signaling link/timeslot assigned for an E1, T1, or Channel card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E1/T1 MIM card (see the **ent-e1** or **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot, the signaling link port (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, or **b3**), the timeslot number, and the card location and port for the servicing E1 or T1 interface on the E1 or T1 card (**e1loc** and **e1port** or **t1loc** and **t1port** parameters). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for different signaling links.

If the link and timeslot are for a Channel card, the Channel card location is specified in the **loc** parameter, and the associated E1 or T1 card is specified in the **e1loc** or **t1loc** parameter.

If the link and timeslot are for the E1 or T1 card itself, the E1 or T1 card location is specified in the **loc** parameter, and the E1 or T1 interface port (1 or 2) that will service the link is specified in the **e1port** or **t1port** parameter.

The E1/T1 MIM used as an E1 card can service 8 timeslots assigned to signaling links for itself, and 1-31 timeslots assigned to signaling links for Channel cards on the same shelf. If the E1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the E1 card is servicing Channel card links, the links for the E1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each E1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by an the E1 card must be serviced by the interface on port 1. Each Channel card can have up to 8 links assigned to the E1 interface on port 1, for a total of up to 31 links (Timeslot 0 cannot be used). used.) All links for a Channel card must be assigned to the same E1 card. If the E1 card is servicing any Channel cards, the 8 links for the E1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

The E1/T1 MIM used as a T1 card can service 8 timeslots assigned to signaling links for itself, and 1-24 timeslots assigned to signaling links for Channel cards on the same shelf. If the T1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the T1 card is servicing Channel card links, the links for the T1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each T1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by the T1 card must be serviced by the interface on port 1. Each Channel card can have up to 8 links assigned to the T1 interface on port 1, for a total of up to 24 links. All links for a Channel card must be assigned to the same T1 card. If the T1 card is servicing any Channel cards, the 8 links for the T1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

Signaling Links for HC-MIM Cards

An HC-MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the HC-MIM card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a 1-a31**, **b**, **b1-b31**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each HC-MIM used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on an HC-MIM card can service 1-31 timeslots.

Each HC-MIM used as an T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on an HC-MIM card can service 1-24 timeslots.

Signaling Links for E5-E1T1 Cards

An E5-E1T1 card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E5-E1T1 card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a1-a15**, **b**, **b1-b15**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each E5-E1T1 used as an E1 card can have up to 32 signaling links assigned to the card. Each E1 interface on an E5-E1T1 card can service 1-31 timeslots.

Each E5-E1T1 used as a T1 card can have up to 32 signaling links assigned to the card. Each T1 interface on an E5-E1T1 card can service 1-24 timeslots.

Signaling Links for E5-ATM Cards

An E5-ATM card can support either E1 or T1 card functions; however, the card cannot support both functions at the same time. E5-ATM cards running E1 and T1 functions can coexist in the same EAGLE 5.

Each E5-ATM card can have up to 3 signaling links assigned to the card. Only the A, A1, or B link can be used. The E5-ATM card must be inhibited, a 3 Links per E5-ATM Card feature quantity must be enabled, and the value specified for the **vci** parameter must be less than or equal to **16383** before the A1 link can be provisioned.

The A, A1, and B links can be provisioned for a location if a card is not seated in that location. However, if a card other than the E5-ATM card is inserted in this location, then the card is auto-inhibited.

Signaling Links for IPSG Cards

An IPSG card supports both M2PA and M3UA signaling links.

The card supports up to 32 signaling links per card, 16 M3UA links per association, and 32 associations per card.

Multiple M3UA signaling links with routing context (different linksets/AS, up to 16) can use a single association.

Each M3UA AS-ASP instance maps to a signaling link. Signaling link state depends upon AS-ASP state, as well as administrative action.

The IPSG card **can** share M2PA linksets with IPLIM, IPLIMI, and IPLHC cards, but the card **cannot** share M3UA linksets with SS7IPGW, IPGWI, and IPGHC cards.

The IPSG card supports ANSI and ITU and ITUN/ITUN24 signaling links simultaneously on one card and on one association. Each signaling link resides in a set of networks determined by the APC and SAPCs of the assigned linkset.

The **slktps** parameter specified for the IPSG linkset (see the **ent-ls/chg-ls** command) specifies the TPS for each link provisioned for that linkset.

Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Card Locations and Requirements

See Table A-1 for the permitted ranges for the link parameter.

Signaling links and scheduled UI measurement reports

If the Integrated Measurements feature is turned on, then the measurements subsystem automatically disables the scheduled UI measurements reports, including the daily scheduled reports, if the entered link causes the provisioned link count to exceed 700.

Output

The following example adds signaling link A1 to linkset L2E5ATM on an E5-ATM card.

```
ent -slk:loc=1303:link=a1:slc=7:lsn=l2e5atm:lpset=3:vci=5:vpi=15
eagle1 10-10-11 13:15:03 EST EAGLE 43.0.0
ent-slk:loc=1303:port=a1:slc=7:lsn=l2e5atm:ts=1:elport=1
Command entered at terminal #4.
ENT-SLK: MASP A - COMPLTD

```

ent-spc**Enter Secondary Point Code**

Use this command to enter an SPC (secondary point code) into the database.

Keyword: ent-spc

Related Commands: dlt-spc, rtrv-spc

Command Class: Database Administration

Parameters

:spc= (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym: spca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:spc/spca/spci/spcn/spcn24= (mandatory)

Secondary point code.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:spci= (mandatory)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:spcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:spcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Example

The following example adds a secondary point code:

ent - spc : spc=10-20-30

The following example adds a 24-bit ITU-N secondary point code:

ent - spc : spcn24=99-99-99

The following example adds a spare ITU-N secondary point code:

ent - spc : spcn=s-12345

Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix s-) can be specified in the command.

The value specified for the **spc** parameter must be a full point code.

The ANSI point code range requirements have been violated for an ANSI SID. For the ANSI secondary point code with subfields *ni-nc-ncm*, the *ni* component cannot equal **000**, the *nc* component cannot equal **000** if the *ni* component is **001 - 005**.

The specified secondary point code to be added must not already exist as a secondary point code.

A maximum of 40 secondary point codes may be defined.

The MPC feature must be turned on before a secondary point code can be added using this command.

The value specified for the **spc** parameter cannot already exist in the Destination table as a destination point code, true point code, or concerned point code.

The specified secondary point code cannot match an existing true point code or capability point code in the Site Identification table.

The value specified for the **spc/spca/spci/spcn/spcn24** parameter cannot be the same as any Emulated Point Code value in the PCT table.

Notes

If the **spcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent - spc : spc=10-20-30
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full
ENT-SPC: MASP A - COMPLTD
;
```

ent-srvsel

Enter Service Selector

Use this command to assign the applicable service selectors required to specify a service entry for DSM services.

Keyword: ent-srvsel

Related Commands: chg-srvsel, dlt-srvsel, rtrv-srvsel

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

NOTE: The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and the nai parameter values.

NOTE: The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-8 shows the mapping between the npv and the np parameter values.

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined **gti** and **gtia** (ANSI), **gtii** (ITU international), and **gtin** (ITU national). For the service selector commands **gti** and **gtia** are equivalent.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii= 2, 4 ; gtin= 2, 4 ; gtin24 = 2, 4**

:serv= (mandatory)

DSM service.

NOTE: The **gport** service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) or the Portability Check for Mobile Originated SMS feature; use the **smsmr** service. The **mnp** service includes the G-Port, A-Port, and IS41 GSM Migration services.

Range: **eir**, **gflex**, **gport**, **inpq**, **inpmr**, **smsmr**, **idps**, **idpr**, **mnp**, **vflex**, **atinp**, **ttr**, **aiq**
eir — Equipment Identity Register
gflex — GSM flexible numbering

gport — GSM number portability
inpq — INP query
inpmr — INP message relay
smsmr — MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO-based GSM SMS NP, MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migration, Portability Check for MO SMS, Prepaid SMS Intercept Phase 1
idps — IDP Screening for Prepaid
idpr — Prepaid IDP Query Relay
mnp — Mobile Number Portability
vfex — Voice Mail Router
atinp — ATI Number Portability Query (ATINP)
ttr — Triggerless TCAP Relay
aiq — ANSI41 AnalyzedInformation Query

:ssn= (mandatory)

Subsystem number.

Range: **0-255 ***

:tt= (mandatory)

Translation type.

Range: **0-255**

:dftact= (optional)

This parameter specifies the default Action ID associated with the service selector entry.

Range: *ayyyyyyy*

1 leading alphabetic followed by up to 8 alphanumeric characters

The **dftact** parameter can have one of the following values:

- a valid GTT Action ID of type **disc/udts/tcaperr** that must already exist in the GTT Action table
- **fallback**—Fallback to the Relay data. The relayed MSU is routed as per routing data provided by the service.
- **falltogtt**—Fallback to GTT. If the **gttselid** parameter has a value other than **none**, and the GTT selector search fails, then the GTT selector search is performed again using **gttselid=none**.

Default: **fallback**

:gttselid= (optional)

This parameter specifies the GTT Selector ID used for performing GTT on messages relayed by the service.

Range: **0-65534**

:nai= (optional)

Nature of Address indicator.

Range: **sub, rsvd, natl, intl**

:naiv= (optional)

Nature of Address indicator value.

Range: **0 -127**

:np= (optional)

Numbering Plan.

Range: **e164, generic, x121, f69, e210, e212, e214, private**

- :np=** (optional)
 Numbering Plan value.
Range: **0-15**
- :off=** (optional)
 Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.
Range: **gttrqd**
- :on=** (optional)
 Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.
Range: **gttrqd**
- :snai=** (optional)
 The service nature of address indicator.
Range: **sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn**
 natl— National significant number
 intl— International number
 rnidn— Routing number prefix and international dialed/directory number
 rnndn— Routing number prefix and national dialed/directory number
 rnsdn— Routing number prefix and subscriber dialed/directory number
 ccrndn— Country code, routing number, and national directory number
 sub—Subscriber number
- :snp=** (optional)
 The service numbering plan.
Range: **e164, e212, e214**

Example

```
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*
ent-
srvsel:gtin24=4:tt=4:np=e164:nai=intl:serv=gport:snp=e164:snai=intl:ssn=9
ent-srvsel:gtii=4:tt=4:np=e164:nai=intl:serv=eir:ssn=11
ent-
srvsel:gtin=4:tt=9:np=e214:nai=natl:snp=e164:snai=intl:serv=gflex:ssn=250
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*
ent-srvsel:gtii=4:tt=0:np=e164:nai=intl:serv=atinp:ssn=11
ent-srvsel:gtii=2:tt=6:snai=intl:snp=e164:serv=smsmr:ssn=10
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=aiq:ssn=*
ent-
srvsel:gtii=2:tt=6:snai=intl:snp=e164:serv=gport:ssn=10:on=gttrqd:gttselid=4:dfltact=act2
```

Dependencies

- The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.
- The INP feature must be turned on before the **serv=inpqr** or **serv=inpq** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **serv=eir** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The **gtia=4** parameter cannot be specified. The value **4** is not valid for the **gtia** parameter.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, then the **np(v)** and **nai(v)** parameter combinations cannot be specified.

If the **gtii/gtin/gtin24=4** parameter is specified, then an **np(v)** and **nai(v)** parameter combination must be specified. The parameters can be specified in the following combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

If the **serv** parameter has a value of **inpmr**, **inpq**, **gport**, or **eir**, then the **gtia** and **gti** parameters cannot be specified.

If the **serv=inpmr** parameter is specified, then the **snp=e164** parameter must be specified.

If the **serv=inpq** parameter is specified, then the **gtii** parameter cannot be specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the value specified for the **serv** parameter must be **inpmr**, **gport**, or **smsmr**.

If the value specified for the **serv** parameter is **gflex**, **gport**, **inpmr**, or **smsmr**, then the **snai** and **snp** parameters must be specified.

If the value specified for the **serv** parameter is **aiq**, **atinp**, **eir**, **idpr**, **inpq**, **ttr**, or **vflex** then the **snai** and **snp** parameters cannot be specified.

If the **snai=ccrndn** parameter is specified, then the value specified for the **serv** parameter must be **gport** or **smsmr**.

If the value specified for the **serv** parameter is **gport** or **smsmr**, then the **snp=e164** parameter must be specified.

An entry cannot already exist that matches the new **gti/gtia/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn=*** parameters, an entry matching a specific **ssn** cannot already exist.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn** parameters, an entry matching the **ssn=*** parameter cannot already exist.

If the **ansigflex** STP option is enabled (see the **chg-stpotps** command), then an ITU service selector cannot be entered.

The IDP Screening for Prepaid feature must be on before the **serv=idps** parameter can be specified.

If the **serv=idps** parameter is specified, then the supported mandatory parameters are **tt**, **serv**, **ssn**, **gtin**, and **gtii**. Supported optional parameters are **np** and **nai**.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the **serv=ttr** parameter can be specified.

If a value of **idpr** or **ttr** is specified for the **serv** parameter, then the only valid mandatory service parameters are **tt**, **serv**, **ssn**, **gtii**, and **gtin**, and the only valid optional parameters are **np** and **nai**.

If the A-Port or IGM feature is enabled, then the **serv=gport** parameter cannot be specified.

An entry cannot already exist that matches the new **gti/gtia/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry cannot already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry cannot already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

The V-Flex feature must be turned on before the **serv=vflex** parameter can be specified.

The ATINP feature must be enabled before the **serv=atinp** parameter can be specified.

The PPSMS or Portability Check for Mobile Originated SMS feature must be turned on, or the MO SMS ASD, MO SMS GRN, MO SMS B-Party Routing, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the **serv=smsmr** parameter can be specified.

If a value of **aiq** or **atinp** is specified for the **serv** parameter, then the **gtin24** parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **serv=aiq** parameter can be specified.

The A-Port or IGM feature must be turned on, or the A-Port or IGM feature must be enabled and the G-Port feature must be turned on before the **serv=mnpr** parameter can be specified.

If a DSM4G card is active in the system, then the **on=gttrqd** parameter cannot be specified.

The **dflfact**, **gttselid**, and **on/off=gttrqd** parameters are supported for only the IDPR, TTR, MNP, GPORT, SMSMR, GFLEX, and INPMR services.

If a GTT Action ID is specified as the value for the **dflfact** parameter, then the Action ID must already exist in the GTT Action table.

The value specified for the **dflfact** parameter must be **fallback**, **falltogtt**, or a valid GTT Action of type **disc/udts/tcaperr**.

The EGTT feature must be turned on before the **gttselid** or **dflfact** parameter can be specified.

The same value cannot be specified for the **on** and **off** parameters.

The **dflfact=none** parameter cannot be specified.

Notes

on/off options

- **gttrqd**—GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.

Output

```
ent-srvsel:gtia=4:tt=10:ssn=25:snai=natl:serv=aiq
tekelecstp 09-12-03 16:40:40 EST EAGLE 42.0.0
Service Selector table is (114 of 1024) 11% full
ENT-SRVSEL: MASP A - COMPLTD

ent-ss-appl

Enter Subsystem Application

Use this command to reserve a subsystem number for an application and set the application status to be online or offline. You can define only one subsystem per application. The application must be unique.

Keyword: ent-ss-appl

Related Commands: chg-ss-appl, dlt-ss-appl, rtrv-ss-appl

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: lnp, inp, eir, vflex, atinpq, aiq

:ssn= (mandatory)

Primary subsystem number.

Range: 2-255

:stat= (optional)

Status.

Range: offline, online

Default: offline

Example

ent-ss-appl:appl=lnp:ssn=16:stat=online

ent-ss-appl:appl=inp:ssn=15:stat=offline

ent-ss-appl:appl=aiq:ssn=18:stat=online

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **ent-ss-appl:appl=lnp** command can be entered.

The INP feature must be turned on before the **ent-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **ent-ss-appl:appl=eir** command can be entered.

The specified application (**appl** parameter) must not already be assigned.

The maximum number of applications must not already be assigned.

For LNP, the STP true point code and LNP subsystem must exist in the MAP table.

For INP, the STP true point code and INP subsystem must exist in the MAP table.

For EIR, the STP true point code and EIR subsystem must exist in the MAP table.

STP True Point Code must exist in MAP table

If the V-Flex feature is turned on, then the STP true point code and V-Flex subsystem must exist in the MAP table.

The V-Flex feature must be turned on before the **appl=vflex** parameter can be specified.

The ATINP feature must be enabled before the **appl=atinpq** parameter can be specified.

For ATINP, the STP true point code and ATINPQ subsystem must exist in the MAP table.

The value specified for the **ssn** parameter cannot already exist in the SS-APPL table.

The specified MAP table entry for a subsystem number (SSN) value in the SS-APPL table, must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I or ANSI point code.
- For the EIR subsystem, the True Point code cannot be an ANSI point code.

- For the AIQ, ATINPQ, or VFLEX subsystem, the True Point code can not be an ITU-N24 point code.

The ANSI41 AIQ feature must be enabled before the **appl=aiq** parameter can be specified.

The STP true point code and a MAP entry for the AIQ subsystem must be provisioned in the MAP table before the **appl=aiq** parameter can be specified.

Notes

If not specified, the application subsystem status defaults to **offline**. When the application is **offline**, the application subsystem is down.

The LNP application status applies to both message relay and LNP query.

Output

```
ent-ss-appl:appl=aiq:ssn=18:stat=online
tekelecstp 09-12-03 16:40:40 EST EAGLE 42.0.0
ENT-SS-APPL: MASP A - COMPLTD
;
```

ent-subnetid

Enter Subnet ID

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (**subnetidlen** parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

Keyword: ent-subnetid

Related Commands: dlt-subnetid, rtrv-subnetid

Command Class: Database Administration

Parameters

:subnetid= (optional)

Vendor Subnet ID

Range: 1-15 digits

This number must contain the number of digits defined by the **subnetidlen** parameter value.

Valid digits are **0-9, a-f, A-F**.

:subnetidlen= (optional)

Subnet ID Length.

Range: 1-15

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

:subnetnum= (optional)

Subnet Number. The Subnet Number is used as a reference to the prefix number for the ISUP NP with EPAP feature.

Range: 1-5

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

- 3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).
- 4—Corresponds to the prefix defined with prefix number 4 (see the **chg-prefix** command).
- 5—Corresponds to the prefix defined with prefix number 5 (see the **chg-prefix** command).

Example

ent-subnetid:subnetidlen=6

ent-subnetid:subnetid=886933:subnetnum=1

Dependencies

The value **none** cannot be specified for the **subnetid** parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

All SUBNETID table entries must have the number of digits defined by the **subnetidlen** parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The **subnetidlen** parameter cannot be specified in the same command with the **subnetid** and **subnetnum** parameters.

Notes

None.

Output

The Subnet ID length must be entered first.

ent-subnetid:subnetidlen=6

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-SUBNETID: MASP A - COMPLTD
```

;

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

ent-subnetid:subnetid=886933:subnetnum=1

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 50) 11% full
ENT-SUBNETID: MASP A - COMPLTD
```

;

ent-t1

Enter T1 Interface

Use this command to enter an interface for an E1/T1 MIM card, an HC-MIM or E5-E1T1 card used as a T1 card or an ST-HSL-A card.

NOTE: The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

NOTE: Framing, line length, encoding, master/slave clocking options, and the signaling bit setting can be set with this command.

NOTE: On an HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through.

NOTE: Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified when the card is used as a standard HC-MIM or E5-E1T1 card, respectively. No more than 2 ports on the HC-MIM card or 1 port on the E5-E1T1 card when used as an ST-HSL-A card can have defined T1 interfaces.

Keyword: ent-t1

Related Commands: chg-t1, dlt-t1, rtrv-t1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an ST-HSL-A card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an ST-HSL-A card.

:chanbrdg= (optional)

Port bridging status. This parameter specifies whether an odd-numbered T1 port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even-numbered T1 port for non-signaling data pass through.

Range: on, off

Default: off

:encode= (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range: b8zs, ami

Default: b8zs

:force= (optional)

This parameter specifies to provision an odd-numbered T1 port to channel bridging mode if the adjacent next higher even-numbered port is already provisioned with a T1 interface.

Range: yes, no

:framing= (optional)

Indicator for framing format.

Range: sf, esf, esfperf

Default: **esfperf** — **esf** framing format with performance monitoring
sf

:linkclass= (optional)

This parameter specifies the link class for links that are assigned to HC-MIM and E5-E1T1 cards (channelized links) or ST-HSL-A cards (unchannelized links).

Range: **chan, unchan**

Default: **chan**

:ll= (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

Range: **0-655**

Default: **133**

:minsurate= (optional)

Minimum signal unit rate. This parameter specifies the minimum number of SUs present on a link uniformly distributed.

The **linkclass=unchan** parameter must be specified for an ST-HSL-A card before this parameter can be specified.

Range: **400-1600**

Default: **1000**

:t1tsel= (optional)

Timing source

Range: **line, external, recovered**

line — slave timing source

external — master timing source

recovered — timing source recovered from the paired master port for channel bridged slave ports

Default: **line**

Example

ent -

t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100

ent - t1:loc=1205:t1port=2:encode=b8zs:t1tsel=external:framing=esf

ent - t1:loc=1203:t1port=1:chanbrdg=on:t1tsel=recovered

ent - t1:loc=1203:t1port=3:chanbrdg=on:t1tsel=external

ent - t1:loc=1203:t1port=2:linkclass=unchan:minsurate=1200

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter must not be already equipped with a T1 interface.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered T1 ports (**t1port** parameter).

The timing source parameter **t1tsel** must be specified if the **chanbrdg=on** parameter is specified.

The **t1tsel=line** parameter cannot be specified for a T1 port (**t1port** parameter) when the **chanbrdg=on** parameter is specified.

The **t1tsel=recovered** parameter cannot be specified for a T1 port (**t1port** parameter) unless the **chanbrdg=on** parameter is specified.

When provisioning an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card to channel bridging mode using the **chanbrdg=on** parameter, the **force=yes** parameter must be specified if the adjacent even-numbered port is already provisioned with a T1 interface.

Before the **chanbrdg=on** parameter can be specified for an odd-numbered T1 port on an HC-MIM or E5-E1T1 card, all signaling links assigned to the adjacent even-numbered T1 port must be deleted (see the **dlt-slk** command).

The **fan** feature bit must be on (see the **chg-feat** command) before HC-MIM cards (used as T1 or ST-HSL-A cards) can be used in an EAGLE 5 ISS shelf.

HIPR cards must be equipped in card locations *xy09* and *xy10* (*x* is the frame, *y* is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards that are used as T1 cards or ST-HSL-A cards.

T1 ports **3 - 8** (**t1port** parameter) can be specified only for HC-MIM and E5-E1T1 cards.

If the **linkclass=unchan** parameter is specified, then the **chanbrdg=on** parameter cannot be specified. The **linkclass=unchan** parameter must be specified before the **minsrate** parameter can be specified.

An ST-HSL-A feature quantity (**enable-ctrl-feat** command) must be enabled before the **linkclass=unchan** parameter can be specified for an ST-HSL-A card.

The **linkclass=unchan** parameter can be specified only for HC-MIM and E5-E1T1 cards.

Channelized and unchannelized T1 ports (mixed mode) cannot be specified on a single HC-MIM or E5-E1T1 card (the card cannot be used as a T1 card and an ST-HSL-A card at the same time).

Only 2 of the 8 ports can be used for T1 interfaces on an HC-MIM card that is used as an ST-HSL-A card.

Only 1 of the 8 ports can be used for T1 interfaces on an E5-E1T1 card that is used as an ST-HSL-A card.

The ST-HSL-A feature must be turned on before the **framing=esfperf** parameter can be specified.

Notes

One or two T1 interfaces must be defined on a T1 card after the T1 and any associated Channel card types (**limt1** and **limch**) are defined in the database (see the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card and any associated Channel cards (see the **ent-slk** command).

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a T1 card after the T1 card type (**limt1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card.

On an HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg=on** parameter must be specified for the odd-numbered T1 port.

For an ST-HSL-A card, the **minsrate** parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is the **minsrate** parameter value (without link traffic) and the **minsrate** parameter value minus the number of MSUs (with link traffic).

Output

```

ent -
t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
    rlgncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0
    ENT-T1: MASP A - COMPLTD
;

```

ent-tt**Enter Translation Type**

Use this command to add a translation type to the system database.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: ent-tt

Related Commands: dlt-tt, rtrv-tt

Command Class: Database Administration

Parameters

:type/typea/typei/typen/typen24/typeis/typens= (mandatory)

This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range: 000-255

Default: No translation type is specified

:alias= (optional)

The alias of the global title translation type

Range: 000-255

Default: No alias assignment is made.

:ndgt= (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

Range: 1-21

Default: 6

(not applicable if the VGTT feature is on)

:ttn= (optional)

Translation type name.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

Default: No translation name is given

Example

ent-tt:type=230:ttn=lidb:ndgt=5

ent-tt:type=230:ttn=lidb:alias=007

ent-tt:type=2:ndgt=5

ent-tt:type=3

ent-tt:typens=2

ent-tt:typeis=1:ttn=setitu001

Dependencies

The translation type specified by **type/typea/typei/typen/typen24/typeis/typens** cannot already exist in the database containing the ANSI and ITU types.

The **alias** parameter and the **ndgt** parameter cannot be specified together in the command.

The translation type name must be unique.

The **ndgt** parameter is not valid if the VGTT (variable length GTT) feature is turned on.

The value specified for the **type/typea/typei/typen/typen24/typeis/typens** parameter cannot be an alias value.

The value specified for the **type/typea/typei/typen/typen24/typeis/typens** parameter must already exist in the database for the network type.

The value specified for the **ttn** parameter must already exist in the database.

The values specified for the **type/typea/typei/typen/typen24/typeis/typens** and **ttn** parameters must refer to the same entity.

The value specified for the **alias** parameter must be associated with the specified translation type and cannot be the value of an existing translation type.

The value specified for the **alias** parameter cannot be an existing alias value for the specified network type.

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command) when entering an alias entry for that **ttn**.

The **ttn=none** parameter cannot be specified.

Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The **ttn** parameter always refers to a translation type. Aliases do not have translation type names.

If the OBSR or FLOBR feature is turned on, then the **ent-tt** command can be used to provision only CdGTA GTT sets and GTT selectors. NP and NAI values cannot be specified for GTT selectors using the **ent-tt** command as **gtti=4** entries cannot be provisioned with this command.

Output

```
ent-tt:typeis=1:tt=setitu001
tekelecstp 10-04-28 16:45:34 EST Eagle 42.0.0
ENT-TT: MASP A - COMPLTD
;
```

ent-ttmap**Enter Translation Type Mapping**

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

Keyword: ent-ttmap

Related Commands: chg-ttmap, dlt-ttmap, rtrv-ttmap

Command Class: Database Administration

Parameters

:ett= (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 000-255

:io= (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: i, o
i — incoming
o — outgoing

:lsn= (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: ayyyyyyyyy
 1 alphabetic character followed by 9 alphanumeric characters

:mtt= (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message *after* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 000-255

Example

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

Dependencies

The linkset must be defined.

The Translation Type Mapping table must not be full for the linkset specified in the **lsn** parameter.

Notes

None

Output

```
ent-ttmap: lsn=nc001:io=i:ett=128:mtt=16
rlghncxa03w 04-02-21 13:09:27 EST EAGLE 31.3.0
ENT-TTMAP: MASP A - COMPLTD

TTMAP table for nc001 is (2 of 64) 3% full
;
```

ent-user

Enter User

Use this command to add a user to the database. When you first enter the command, the system prompts you for the user's password, which must follow the administered password guidelines. For security reasons, the password is not displayed. After successfully entering a user password, you are prompted to verify it by entering it again.

Keyword: ent-user

Related Commands: `act-user`, `chg-pid`, `chg-user`, `dact-user`, `dlt-user`, `login`, `logout`, `rept-stat-user`, `rtrv-secu-user`, `rtrv-user`

Command Class: Security Administration

Parameters

:uid= (mandatory)

User ID

Range: *a*zzzzzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters (including asterisks, single quotes, and commas)

:all= (optional)

Specifies whether or not the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP).

Range: yes, no

Default: no

:cc1= (optional)

Configurable command class name (*qyy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc2= (optional)

Configurable command class name (*qyy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *configmdclassname*, *bool*
 configmdclass—; value
 bool—; value **yes**, **no**

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc8= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:db= (optional)

Access to all commands in command class Database Administration.

Range: **yes, no**

Default: **no**

:dbg= (optional)

Access to all commands in command class Debug.

Range: **yes, no**

Default: **no**

:link= (optional)

Access to all commands in command class Link Maintenance.

Range: **yes, no**

Default: **no**

:page= (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.

Range: **0-999** days

Default: The value specified for the **page** parameter on the **chg-secu-dflt** command

:pu= (optional)

Access to all commands in command class Program Update.

Range: **yes, no**

Default: **no**

:revoke= (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range: **yes, no**

Default: **no**

:sa= (optional)

Access to all commands in command class Security Administration.

Range: **yes, no**

Default: **no**

:sys= (optional)

Access to all commands in command class System Maintenance.

Range: **yes, no**

Default: **no**

:uout= (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

Range: **0-999**

Default: The value specified for the **uout** parameter on the **chg-secu-dflt** command

Example

```
ent-user:uid=john:db=yes
ent-user:uid=john*mayer:db=yes
ent-user:uid=user123:cc5=u21-yes:cc8=u32-yes
```

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **lnpbas** parameter can be specified.

If the **all=yes** parameter is specified, and the LNP feature has not been turned on, then the **lnpbas** parameter value defaults to **no**.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1-cc8** parameters.

The **cc1-cc8** parameter values must have valid default or provisioned configurable command class names. Default names are **u01-u32**.

Notes

To disable user ID aging, specify the **uout=0** parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

As a default, the command class Basic is assigned to all users. If no other command class is assigned, the user still has access to commands in the Basic class.

Output

```

ent-user:uid=john*mayer:db=yes
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  ENT-USER: MASP A - COMPLTD
;

```

ent-vendid**Enter Vendor ID**

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (**vendidlen** parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

Keyword: ent-vendid

Related Commands: dlt-vendid, rtrv-vendid

Command Class: Database Administration

Parameters

:vendid= (optional)

Vendor ID

Range: 1-15 digits

:vendidlen= (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

Range: 1-15

:vendnum= (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

Range: 1-3

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

:vendtype= (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

Range: 1-2

Example

```
ent-vendidvend:len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

Dependencies

The value **none** cannot be specified for the **vendid** parameter.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 200 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the **vendidlen** parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The **vendidlen** parameter cannot be specified in the same command with the **vendid**, **vendidlen**, and **vendtype** parameters. Either the **vendidlen** parameter, or the **vendid**, **vendidlen**, and **vendtype** parameters can be specified in one command.

Notes

None.

Output

The Vendor ID length must be entered first, before any Vendor IDs can be entered.

ent-vendid:vendidlen=6

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-VENDID: MASP A - COMPLTD
```

;

ent-vendid:venid=886933:vendnum=1:vendtype=1

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 200) 3% full
ENT-VENDID: MASP A - COMPLTD

;

ent-vflx-cd

Enter VFLEX Call Decision Entry

Use this command to provision the call decision criteria that is used to create a voice mail routing number. This command creates a new entry in the V-Flex Call Decision Table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: ent-vflx-cd

Related Commands: chg-vflx-cd, dlt-vflx-cd, rtrv-vflx-cd

Command Class: Database Administration

Parameters

:bcap= (mandatory)

This parameter specifies the INAP/CAP bearer capabilities for the call.

The INAP/CAP bearer capabilities are used to determine the type of mail that is used by the call, such as voice, video, multimedia, etc.

Range: 0-31, none

none—BCAP is not present in the incoming MSU.

:cdn= (mandatory)

Call decision name. This parameter specifies an entry in the call decision table.

Range: ayyy

1 alphabetic character followed by 3 alphanumeric characters

:dnstat= (mandatory)

Dialed number status. This parameter specifies whether the MSISDN is found in the EPAP RTDB.

Range: fnd, nfnd, *

fnd — DN found in RTDB

nfnd — DN not found in RTDB

***** — It does not matter whether the DN is found in RTDB

:rnidx= (mandatory)

Routing number index. This parameter specifies the index associated with the generated voice mail routing number.

Range: **0-9**

:vmdig= (mandatory)

Voice mail number or voice mail prefix digits. This parameter specifies a voice mail number or voice mail digits for the call decision entry.

If the call is redirected (the **rdi=redir** parameter is specified), then the value specified for the **vmdig** parameter represents a voice mail number. If the call is not redirected (the **rdi=dir** parameter is specified), then the value specified for the **vmdig** parameter represents a set of voice mail digits.

Range: 1-15 digits

Valid digits are **0-9, A-F, a-f**.

:rdi= (optional)

Redirection indicator. This parameter specifies whether the call is redirected.

Range: **dir, redir**

dir — call is not redirected

redir — call is redirected

Default: **dir**

Example

ent-vflx-

cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **cdn** parameter cannot be a reserved word, such as **none**.

The value specified for the **cdn** parameter cannot already exist in the Call Decision table.

An entry with the specified **dnstat**, **rdi**, **bcap** and **vmdig** parameters cannot already exist in the Call Decision table.

The value specified for the **vmdig** parameter cannot differ from a value that already exists in the Call Decision table by only the value of the **dnstat** parameter. The values specified for the **rdi** and **bcap** parameters must differ as well.

The maximum number of 25 entries cannot already be provisioned for a given **rdi**, **dnstat**, and **bcap**.

Output

```

ent-vflx-
cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn
=cdn1
    rlghncxa03w 08-05-07 11:11:28 EST  EAGLE 39.0.0
    ENT-VFLX-CD: MASP A - COMPLTD
;

ent-vflx-
cd:dnstat=nfnd:bcap=none:vmdig=dadbeefeed:rnidx=9:cdn=cdn2
    rlghncxa03w 08-05-07 11:11:28 EST  EAGLE 39.0.0
    ENT-VFLX-CD: MASP A - COMPLTD
;

```

ent-vflx-rn**Enter VFLEX Routing Number**

Use this command to associate a routing number name to a set of voice mail routing numbers. This command creates an entry in the Routing Number table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: ent-vflx-rn

Related Commands: chg-vflx-rn, dlt-vflx-rn, rtrv-vflx-rn

Command Class: Database Administration

Parameters

:rn= (mandatory)

Routing number. This parameter specifies the voice mail routing number.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

:rnname= (mandatory)

Routing number name. This parameter specifies the name associated with the voice mail routing number.

Range: ayyyyyyy
1 alphabetic character followed by 7 alphanumeric characters.

Example

```
ent-vflx-rn:rnname=rn01:rn=123ABCDF012
```

Dependencies

The V-Flex feature must be enabled before this command can be specified.

The Routing Number table cannot contain more than 10,000 entries.

The value specified for the **rnname** parameter cannot already exist in the database.

The value specified for the **rn** parameter cannot already exist in the database.

The value specified for the **rnname** parameter cannot be a reserved word, such as **none**.

Output

```

ent-vflx-rn:rnname=rn01:rn=1234ABCDF56
    rlghncxa03w 08-05-07 11:11:28 EST  EAGLE 39.0.0
    ENT-VFLX-RN: MASP A - COMPLTD
;

```

ent-vflx-vmsid**Enter VFLEX VMS ID Entry**

Use this command to provision a voice mail server ID and associate up to 10 routing number names with the ID. This command creates an entry in the VMSID table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: ent-vflx-vmsid

Related Commands: chg-vflx-vmsid, dlt-vflx-vmsid, rtrv-vflx-vmsid

Command Class: Database Administration

Parameters

:id= (mandatory)

This parameter specifies the ID of the voice mail server.

Range: 1-15 digits, **dflt**

Valid digits are **0-9, A-F, a-f**.

dflt—a set of routing numbers that is used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB.

:idx0= (optional)

Index 0. This parameter specifies the routing number name for index 0.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx1= (optional)

Index 1. This parameter specifies the routing number name for index 1.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx2= (optional)

Index 2. This parameter specifies the routing number name for index 2.

Range: ayyyyyyy

1 alphabetic character followed by upto 7 alphanumeric characters

:idx3= (optional)

Index 3. This parameter specifies the routing number name for index 3.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx4= (optional)

Index 4. This parameter specifies the routing number name for index 4.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx5= (optional)

Index 5. This parameter specifies the routing number name for index 5.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx6= (optional)

Index 6. This parameter specifies the routing number name for index 6.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:idx7= (optional)

Index 7. This parameter specifies the routing number name for index 7.

Range: *ayyyyyyy*
 1 alphabetic character followed by up to 7 alphanumeric characters

:idx8= (optional)

Index 8. This parameter specifies the routing number name for index 8.

Range: *ayyyyyyy*
 1 alphabetic character followed by up to 7 alphanumeric characters

:idx9= (optional)

Index 9. This parameter specifies the routing number name for index 9.

Range: *ayyyyyyy*
 1 alphabetic character followed by up to 7 alphanumeric characters

Example

The following command provisions a VMS ID and associates a routing number name with index 0.

ent-vflx-vmsid:id=123456abcdef123:idx0=RN45

The following command provisions a VMS ID and associates routing number names with index 0 and index 5.

ent-vflx-vmsid:id=DADBEEFEED:idx0=rn15:idx5=rn30

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The values specified for the **idx*** parameters must already exist in the Routing Number table.

The value specified for the **id** parameter cannot already exist in the VMSID table.

The **idx*=none** parameter cannot be specified.

The VMSID table contains a maximum of 1000 entries.

The value specified for the **rnname** parameter must already exist in the Routing Number table.

Output

ent-vflx-vmsid:id=123456abcdef123:idx0=rn45

rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0

ENT-VFLX-VMSID: MASP A - COMPLTD

;

ent-x25-dstn

Enter X.25 Destination

Use this command to associate an X.25 network address with an existing SS7 point code in the routing table, and optionally, a subsystem within that point code. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

NOTE: This command is obsolete.

Keyword: ent-x25-dstn

Related Commands: chg-x25-dstn, dlt-x25-dstn, rtrv-x25-dstn

Command Class: Database Administration

Parameters

:dpc= (mandatory)

This parameter is the real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity. The value for this parameter is a point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym: **dpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:xaddr= (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

Range: 1-15 digits

:ssn= (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

Range: **1-255**

Default: **5**

Example

ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123

ent-x25-dstn:xaddr=255864567:dpc=033-001-013

Dependencies

Each X.25 address must have at least four digits.

The DPC must exist in the destination table.

The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-ncm*).

The X.25 address cannot exist in X.25 destination table.

The maximum number of X.25 destinations is 1024.

Notes

None

Output

ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123

```
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0
X.25 DSTN TABLE 45 % FULL
ENT-X25-DSTN: MASP A - COMPLTD
```

;

ent-x25-rte

Enter X.25 Route

Use this command to define the routing parameters needed by the gateway portion of the LIMs with the LIMs with the **ss7x25** application for establishing a virtual circuit that is permanently maintained by the system STP.

NOTE: This command is obsolete.

Keyword: ent-x25-rte

Related Commands: chg-x25-rte, dlt-x25-rte, rtrv-x25-rte

Command Class: Database Administration

Parameters

:saddr= (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: 1-15 digits

:type= (mandatory)

The type of X.25 connection that the link is expected to maintain.

Range: pvc, svca, svcr

pvc — Permanent virtual circuit

svca — automatic virtual circuit

svcr — remote virtual circuit

:xaddr= (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

:lc= (optional)

The number of the logical channel on the X.25 signaling link to which the PVC connection is assigned.

This parameter is mandatory if the **type=pvc** parameter is specified. If the **type=svca** or **type=svcr** parameters are specified, the logical channel number is arbitrary and cannot be specified.

Range: 1-255

Default: The logical channel is not given.

:lc2nm= (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

Range: yes, no

Default: yes—if **rt=xpc** is specified

no—if **rt=pc** is specified

no—if **rt** is not specified

:loc= (optional)

The card location containing the X.25 signaling link that will maintain the connection. For an automatic virtual circuit, this link is the link on which the system STP initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: The card location is not given

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: a

Default: The port is not given

:rt= (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) Route on X.25 destination point code (XPC) and (2) Route using X.25 origination and destination point code combinations (PC).

Range: xpc, pc

Default: pc

Example

ent-x25-

rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3

ent-x25-rte:xaddr=225255:saddr=133132:type=svca:loc=1201:port=a

ent-x25-rte:xaddr=225255:saddr=133132:type=svcr

ent-x25-rte:xaddr=225255:saddr=133132:type=svcr:rt=xpc:lc2nm=yes

Dependencies

Each X.25 address must have at least four digits.

The **limds0**, **limdscs**, **limocu** and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL type.

The shelf and card must be equipped.

The logical channel number cannot be specified if the connection type is an automatic virtual circuit or a remote virtual circuit (**type=svca** or **type=svcr**).

The logical channel number must be specified if the connection type is PVC (**type=pvc**).

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

The **loc** and **port** parameters cannot be specified if the connection type is a remote switched virtual circuit (**type=svcr**). The far end initiates a remote switched virtual circuit and sends the system the location and port information.

The card location (**loc**) must be specified if the connection type is a permanent virtual circuit or an automatic virtual circuit (**type=pvc** or **type=svca**).

Each X.25 address must exist in X.25 destination table.

The X.25 address must be assigned to a destination in the X.25 domain.

The SS7 address must be assigned to a destination in the SS7 domain.

The combination of the two X.25 addresses must be unique in the X.25 route table.

The combination of point code/SSNs assigned to the two X.25 addresses must be unique in the X.25 route table.

The maximum number of X.25 routes in a system is 1024.

The point codes assigned to each of the X.25 destinations must also be assigned to routes.

The signaling link must be assigned to a LIM with the **ss7gx25** application.

The signaling link assigned to the X.25 route must be in the database and must be assigned to a linkset. The linkset must be assigned to a route associated with an X.25 destination and must contain an APC in the X.25 domain. This can be verified by entering the following commands:

- **rtrv-slk**—Displays the signaling links
- **rtrv-ls**—Displays the linksets
- **rtrv-rte**—Displays the routes

- **rtrv-x25-dstn**—Displays the X.25 destinations
- **rtrv-dstn**—Displays the destination point codes.

The logical channel number cannot be greater than the maximum number of permanent virtual circuits allowed for the signaling link. For example, if the total number of permanent virtual circuits allowed for the signaling link is 15, the logical channel number for this signaling link cannot be greater than 15.

The logical channel of the signaling link cannot already be assigned to an X.25 route.

The number of permanent virtual circuits cannot exceed the maximum number of permanent virtual circuits defined for the signaling link.

The number of automatic virtual circuits cannot exceed the maximum number of switched virtual circuits defined for the signaling link.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

Notes

The connection can be one of three types, a permanent virtual circuit, an automatic virtual circuit, or a remote virtual circuit.

Permanent virtual circuits are permanent X.25 virtual connections between two signaling points established on one of the logical channels of an X.25 signaling link. This connection is setup by the network, therefore no setup is required by the system to establish a permanent virtual circuit connection.

Automatic virtual circuits are essentially the same as permanent virtual circuits, except that the connection must be established by either the system or the X.25 destination entity.

Remote virtual circuits are also essentially the same as automatic virtual circuits, except that the connection can be established only by the X.25 destination entity.

All LIMs with the **ss7gx25** application share this information. Even though these connections apply to only one card, they are used by all cards.

Output

```
ent-x25-
rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3

flash-card

Flash-Card

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the **init-flash** and the **act-flash** commands.

Keyword: flash-card

Related Commands: act-flash, init-flash

Command Class: System Maintenance

Parameters

:code= (mandatory)

The GPL type to be loaded.

Range: appr, trial

appr — Approved GPL

trial — Trial GPL

:loc= (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:force= (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

Range: yes, no

Default: no

Example

```
flash-card:loc=1105:code=trial
```

```
flash-card:loc=1105:code=appr:force=yes
```

Dependencies

Cards do not have to be provisioned to use the **flash-card** command. However, if the specified card is provisioned and not inhibited, use of the **force** parameter is required.

The specified card locations must be running a flashable software image.

This command cannot be used to load flash images for HMUX or HIPR cards. Use the **init-flash** command.

If the even-numbered TDM (1114,1116) is specified, the flash occurs on the odd-numbered GPSM-II running OAM (1113,1115).

The specified card location cannot be the active MASP (either the active GPSM-II or the active TDM).

No other action command can be in progress when this command is entered.

The card specified in the location parameter must be present and able to communicate over the IMT. The card do not have to be provisioned in the database.

If the card is already running the specified code load, it cannot be loaded by this command.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the **force** parameter. The **act-flash** and **init-flash** commands must then be used to reload the same code level.

Output

```

flash-card: loc=1105:code=appr:force=yes

format-disk**Format Disk**

Use this command to format and initialize a removable cartridge, removable drive, or standby Terminal Disk Module (TDM).

NOTE: The **format-disk** command leaves the disk unusable until the **chg-db** and **copy-gpl** commands are entered.

Keyword: **format-disk**

Related Commands: **chg-db**, **copy-disk**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**, **rtrv-gpl**

Command Class: System Maintenance

Parameters

:type= (mandatory)

This parameter specifies the type of fixed drive, removable drive, or removable cartridge to format.

Range: **fixed**, **meas**, **system**, **usb**

fixed — The standby fixed disk on the standby TDM

meas — The measurement cartridge

system — The removable system cartridge or drive

usb — Argument to be used by Tekelec personnel only.

:force= (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

Range: **yes**, **no**

Default: **no**

:loc= (optional)

This parameter specifies the location of the disk that is being formatted.

Range: **1114**, **1116**, **1117**, **1113**, **1115**

1114 — The TDM

1116 — The TDM

1117 — The removable cartridge drive

1113 — The latched USB port

1115 — The latched USB port

:low= (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying **low=no** can be used to decrease formatting time.

Range: **yes**, **no**

Default: **yes**

:prtnggrp= (optional)

Partition group. This parameter indicates which disk partition group is to be formatted. Specifying the inactive group is relevant only when **type=fixed** is specified.

CAUTION

CAUTION: Do not enter the **format-disk:prtnggrp=inactive** command unless directed to by the Customer Care Center to avoid possible loss of a previously archived software release.

Range: **active**, **inactive**

Default: **active**

Example

format-disk:type=system

format-disk:type=meas:force=yes

Dependencies

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

To format a cartridge that already contains system data, the **force=yes** parameter must be specified.

The **force=yes** parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have a **dms.cfg** file are recognized as system removable cartridges. A removable cartridge must be inserted and made ready before the **type=meas** or **type=system** parameter can be specified in the command.

Measurements collection must be inhibited during execution of the **format-disk** command. If measurements are not inhibited, **format-disk** cannot be executed.

- Do not enter the **chg-measopts:collect=on** command while the **format-disk** command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter **format-disk** until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The **type=fixed** parameter must be specified before the **prtnggrp** parameter can be specified. If the **prtnggrp** parameter is specified, then the **low=no** parameter must be specified.

A value of **1114** or **1116** must be specified for the **loc** parameter, before the **type=fixed** parameter can be specified.

Notes

The **low=no** parameter should be specified when upgrading a spare TDM. The **low=yes** parameter should be specified when there is a suspected hardware problem.

When the **type=meas** parameter is specified, a measurements removable cartridge or removable drive is built.

When the **type=system** parameter is specified, a system removable cartridge, removable drive, or credit card drive is built.

A system removable cartridge or drive can contain only GPLs and the database, not measurement data. After formatting, the cartridge or drive does not contain any data, but can be used as the destination disk of the **copy-gpl** and **chg-db:action=backup:dest=remove** commands. The **copy-gpl** command copies all approved GPLs from the fixed disk on the active TDM to the system removable cartridge or drive, providing a backup copy of the approved GPLs. The **chg-db:action=backup:dest=remove** command copies the database from the current partition of the fixed disk on the active TDM to a system removable cartridge or drive, providing a backup copy of the database.

A measurements removable cartridge or drive can contain only measurement data, not database information and GPLs. After formatting, the cartridge or drive does not contain any data, but can be used as the destination disk of the **copy-meas** command. The **copy-meas** command copies all

measurement data from the fixed disk on the active TDM to a measurements removable cartridge or drive for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the **format-disk** command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
Standby MASP initialization timed out - continuing...
```

The **dms.cfg** file on either the active TDM or a system formatted removable cartridge is used by the **format-disk** command when formatting the target disk. The location of the **dms.cfg** file cannot be specified by the **format-disk** command. The value of the **type** parameter is used to determine the target disk to format and the location of the **dms.cfg** file on which to base the format. Table 5-27 shows the location of the **dms.cfg** file based on the value of the **type** parameter for the **format-disk** command.

Table 5-27. DMS.CFG File Location for format-disk Command

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
fixed	Standby TDM (1114 or 1116)	Removable Cartridge Drive (1117) Latched USB Port (1113 or 1115)
system	Removable Cartridge Drive (1117) Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)
meas	Removable Cartridge Drive (1117)Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)

The **format-disk** command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

Table 5-28 shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

Table 5-28. Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of the Partition
Magneto-Optical Removable Cartridge	1117	1096 Mbytes*	1	1024 Mbytes
Latched USB Port	1113 or 1115	2 Gigabytes	1	1.9 GB
TDM	1114 or 1116	540 Mbytes	1	507 Mbytes
TDM	1114 or 1116	2 Gigabytes	1	2014 Mbytes
TDM	1114 or 1116	4 Gigabytes	2	2047 Mbytes
* The magneto-optical removable cartridge is a double-sided cartridge that contains 2.3 gigabytes of data. Only one side of the disk can be formatted and used when the cartridge is inserted into the removable cartridge drive. The target capacity given for the magneto-optical removable cartridge is for one side of the disk in the cartridge and is approximately one half of the total capacity of the magneto-optical removable cartridge.

inh-alm**Inhibit Alarm Reporting**

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All **rept-stat-xxx** commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

Keyword: inh-alm

Related Commands: rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls,, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log, unhb-alm

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dev= (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be inhibited.

Range: **applsock**, **as**, **card**, **cdt**, **clock**, **dlk**, **e1port**, **ls**, **lsmsconn**, **route**, **slk**, **t1port**, **trm**, **rtx**, **enet**, **tps**
applsock— IP gateway application socket
as— IP gateway application Application Server
card— Cards in the database
cdt— Customer defined troubles
clock— System clock
dlk— IP ports on the VSCCP, EROUTE, SLAN, VXWSLAN, MCP, and FC-capable cards
e1port— E1 port on E1/T1 MIM or HC MIM cards
ls— Linksets
lsmsconn— Communication link between the LSMS and the EMS
route— Route
slk— Signaling links
t1port— T1 port on E1/T1 MIM or HC MIM cards
trm— Terminals
rtx— Exception Route
enet— Ethernet
tps— TPS subsystem

:asname= (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to inhibit alarms for the named Application Server.

Range: *aaaaaaaaaaaaa*
 Up to 15 alphanumeric characters; the first character must be a letter.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used with the **ecic** parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

Range: **0-16383**

:dpc= (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-**, **000-255**, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination Point Code

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:dur= (optional)

Duration. The period for which the alarms are inhibited. If the **dur=temp** parameter is specified, the clearing of the event that caused an alarm also clears the alarm inhibit, and the alarms become uninhibited on the device.

Range: **perm, temp, timed**

perm — A permanent inhibition of an alarm.

temp — A temporary inhibition of an alarm.

timed — An inhibition of an alarm for a specified duration.

Default: **perm**

:e1port= (optional)

Port ID. The E1 port on the specified E1 card.

The **e1port** parameter is mandatory if the **dev=e1port** parameter is specified.

Range: **1-8**

Ports **3 - 8** can be specified only for HC-MIM cards and E5-E1T1 cards.

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **ecic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:edate= (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the **etime** parameter value.

The **edate** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **101-991231**

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yymmdd*).

:etime= (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the **edate** parameter value.

The **etime** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **0-2359**

Specify the time in the format of *hour* followed by *minute* (*hhmm*).

:force= (optional)

Allows critical alarms to be inhibited on a device.

The **force** parameter is mandatory if the **lvl=crit** parameter is specified.

The **criticalminh** STP option must be turned on before the **force** parameter can be specified.

Range: **yes, no**

Default: **no**

:id= (optional)

Identification number of the customer-defined trouble (**5 - 16**). Customer-defined troubles **1 - 4** are generated critical alarms and cannot be specified as values for the **id** parameter.

Range: **5-16**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

:link= (optional)

Signaling link on the card specified in the **loc** parameter.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

a, b—For **dev=dlk**, **dev=slk** for a two-port LIM

a1, a2, b1, b2—For **dev=lsmsconn**

a, b, a1, b1, a2, b2, a3, b3—For **dev=slk** for a multi-port LIM

a, b, a1-a31, b1-b31—For **dev=slk** for an HC MIM

a1, b1—For **dev=dlk** for an FC-capable card

a, b—For **dev=enet**

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318,
3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118,
5201-5218, 5301-5318, 6101-6118

:lsn= (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range: ayyyyyyyyy
1 alphabetic character followed by up to 9 alphanumeric characters.

:lvl= (optional)

The alarm severity level (critical, major, or minor).

Range: crit, majr, minr
Default: majr

:opc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: opca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Origination point code.

:opci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:opcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s**-, **p**-, **ps**-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p**-, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**-

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range: **0-15**

:sname= (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to inhibit alarms for the named application socket.

Range: *aaaaaaaaaaaaa*
1 to 15 alphanumeric characters.

:t1port= (optional)

Port ID. This parameter is mandatory if the **dev=t1port** parameter is specified.

Range: **1-8**

Ports **3 - 8** can be specified only for HC MIM cards.

:trm= (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

Range: **1-40**

Example

inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes

inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4

inh-

alm:dev=route:dpc=1-1-1:dur=timed:lvl=crit:edate=050515:etime=2300:force=yes

inh-alm:dev=enet:loc=1201:port=a

inh-alm:dev=enet:loc=1101:port=a:dur=temp:lvl=minr

inh-alm:loc=1102:dev=dlk:port=a1

Dependencies

This command is not allowed in upgrade mode.

The parameters that can be specified with the **dev** parameter vary, depending on the value specified for the **dev** parameter as shown:

- **dev=(any value)—dur or lvl**
- **dev=asname—as**
- **dev=dpc/dpca/dpci/dpcn/dpcn24—route**
- **dev=id—cdt**
- **dev=loc—card, dlk, e1port, slk, t1port, enet**
- **dev=lsn—ls**
- **dev=e1port—e1port**
- **dev=link (link=a, b)—dlk, slk, enet**
- **dev=link (link=a1, b1)—dlk** (For FC-capable cards)
- **dev=link (link=a, b, a1, a2, b1, b2, a3, b3)—slk**
- **dev=link (link=a1, a2, b1, b2)—lsmsconn**
- **dev=sname—applsock**
- **dev=t1port—t1port**
- **dev=trm—trm**

No other action command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option **criticalminh** must be enabled. The **chg-stpopts:criticalminh=yes** command enables this option.

Alarms already inhibited for the specified device.

When the **lvl=crit** parameter is specified, the **force=yes** parameter must be specified.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the **dev=rtx** parameter can be specified.

Permanent alarm inhibit is not allowed on the cluster PC because either the cluster or a member PC of the cluster is already alarm inhibited.

When the **dur=timed** parameter is specified, the **edate** and **etime** parameters must be specified.

When a **dur** parameter value other than **timed** is specified, the **edate** and **etime** parameters cannot be specified.

The **edate** parameter value must be a date equal to or later than the current system date. If the current system date is specified, then the **etime** parameter value must be a time later than the current system time. If a date later than the current system date is specified, then the **etime** parameter value can be any valid time in the format *hhmm*.

The **inh-alm** command cannot be used to change the level of inhibition on a device.

If the **dev=enet** parameter is specified, then the **loc** parameter and the **port** parameter must be specified.

The card specified by the **loc** parameter must be provisioned with an IPS, MCP, STPLAN, EROUTE, VSCCP, IPSG, IPLIM, IPLIMI, SS7IPGW, or IPGWI application.

The value specified for the **port** parameter is out of range.

The **link** parameter must be valid for the selected device type.

Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The **dur** parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```

```

inh-card

Inhibit Card

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the card or physically remove it from the shelf.

Keyword: inh-card

Related Commands: alw-card, dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

:force= (optional)

Force indicator. This parameter is required for the following conditions:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-DSM connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified HC MIM card or E5-E1T1 card is in channel bridging mode
- The specified card has the last in-service SEAS terminal configured.

Range: yes, no

Default: no

Example

inh-card:loc=1101

inh-card:loc=1201:force=yes

Dependencies

No other action commands can be in progress when this command is entered.

The card must be a TSM, DCM, Service Module, GPSM-II, E1/T1 MIM, HC MIM, E5-E1T1, or E5-ATM. The card location cannot be 1114, 1116, or 1117.

If the card is the only linkset, SCCP, Service Module, or GLS card remaining, the **force=yes** parameter must be specified in the command to inhibit the card.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type **elime1**, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

If the card is type **elimt1**, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

The shelf and card must be equipped.

If the specified card is the only in-service MPS-DSM, the **force=yes** parameter must be specified.

If the specified card is the only in-service TSM, LIM, or MCPM, the **force=yes** parameter is required.

If the specified HC-MIM or E5-E1T1 card is in channel bridging mode, the **force=yes** parameter is required.

If inhibiting the Service Module card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the **force=yes** parameter must be specified.

The card that is specified cannot be running the active OAM.

If the specified card has the last in-service SEAS Terminal configured, then the **force=yes** parameter must be specified to inhibit the card.

The card location (**loc**) must be within the allowed range.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The card cannot be inhibited as the terminals are still in use.

Notes

The function of this command is the same as the **rmv-card** command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

CAUTION: This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the `chg-measopts:platformenable=on` command. To disable collection, ALL MPCM cards in the system must be inhibited. **THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS.** Use the `alw-card` command to enable measurements collection after the MPCM cards have been inhibited.

When an E5-IPSM Card is inhibited, the active SEAS terminals are set to the state OOS-MT/FLT.

Output

```
inh-card:loc=1101
  rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  Card has been inhibited.
;
```

inh-imt

Inhibit IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

CAUTION: Use this command only when directed by the Customer Care Center.

Keyword: `inh-imt`

Related Commands: `alw-imt`, `clr-imt-stats`, `conn-imt`, `disc-imt`, `rept-imt-lvl1`, `rept-imt-lvl2`, `rept-stat-imt`, `rmv-imt`, `rst-imt`

Command Class: System Maintenance

Parameters

:bus= (mandatory)

IMT bus to be inhibited

Range: a, b

:force= (optional)

This parameter forces inhibition of a specified bus where an IMT Rate change sequence is in progress.

Range: yes, no

Default: no

Example

```
inh-imt:bus=a
```

```
inh-imt:bus=a:force=yes
```

Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

The **force=yes** parameter must be specified to inhibit a bus where an IMT Rate Change sequence is in progress.

If an IMT Rate Change sequence is in progress on the alternate bus, then this command cannot be entered.

Notes

Cards not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the alternate IMT bus.

The function of this command is the same as the **rmv-imt** command.

Output**inh-imt:bus=a**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit IMT Bus A command issued

rlghncxa03w 04-01-07 13:12:41 EST EAGLE 31.3.0
3116.0098      IMT BUS A          IMT inhibited
;
```

inh-map-ss**Inhibit Mated Application Subsystem**

Use this command to shut down (inhibit) a mated application subsystem. Currently, the AIQ, ATINPQ, EIR, INP, INPQS, LNP, and V-Flex and subsystems can be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the **force** parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

Keyword: inh-map-ss

Related Commands: alw-map-ss, rept-stat-lnp, rept-stat-sccp

Command Class: System Maintenance

Parameters

:ssn= (mandatory)

This parameter specifies the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem number.

Range: 2-255

:force= (optional)

This parameter forces the shutdown of the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

Range: yes, no

Default: no

Example

inh-map-ss:ssn=10

inh-map-ss:ssn=10:force=yes

Dependencies

The EIR, INP, LNP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before this command can be entered.

No other action command can be in progress when this command is entered.

The specified **ssn** parameter value must represent the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

The EAGLE 5 ISS must be configured with at least one card running the **sccp** application.

Notes

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE 5 ISS to generate a TFP for the EAGLE 5

ISS CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

Table 5-29. Route Set Test When LNP is Offline

Network Management	Concerned PC	Network Management
RSP	CPC	TFA concerning CPC
RSP	LNP CPC	None
RSP	TPC	TFA concerning TPC
RSR	CPC	TFA concerning CPC
RSR	LNP CPC	TFP concerning LNP CPC
RSR	TPC	TFA concerning TPC

Table 5-30 shows what actions EAGLE 5 ISS takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

Table 5-30. Receiving Messages when LNP is Offline

Routing Indicator in Incoming Message	DPC	Result of GTT	Message Handling	Network Management
rt-on-gt	Capability PC	rt-on-ssn, LNP subsystem	Reroute to mate	TFP concerning CPC
rt-on-gt	True PC	rt-on-ssn, LNP subsystem	Reroute to mate	None
rt-on-gt	Capability PC	Message Relay required	Generate UDTS	TFP concerning CPC
rt-on-gt	True PC	Message Relay required	Generate UDTS	None
rt-on-ssn	Capability PC	Not applicable	Generate UDTS	None
rt-on-ssn	True PC	Not applicable	Generate UDTS	SSP concerning True PC

Output**inh-map-ss:ssn=30**

```
rlghncxa03w 04-02-24 10:37:22 EST EAGLE5 31.0.0
Inhibit map subsystem command sent to all SCCP cards.
Command Completed.
```

;

inh-map-ss:ssn=30:force=yes

```
rlghncxa03w 04-02-24 10:37:22 EST EAGLE5 31.0.0
Inhibit map subsystem command sent to all SCCP cards.
Command Completed.
```

;

inh-slk**Inhibit Signaling Link**

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

NOTE: The signaling link's inhibited status is not preserved across a LIM reboot.

Keyword: inh-slk

Related Commands: act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card that is specified in the **doc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 in Appendix A for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
inh-slk:loc=1307:link=b
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E5 ATM card running the **atmansi** or **atmitu** application

- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card. The link parameter values **a4-a15** and **b4-b15** can be specified only for the E5-ENET card.

If an IPSG-M3UA signaling link is used, then this command cannot be entered.

This command is not valid on TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as IPGWI links).

Notes

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, the inhibit request is denied. If a command request is denied, it is because the SS7 changeover procedure cannot take place.

If the **inh-slk** command is followed by the **init-card** command, the inhibition of the signaling link is not preserved after the **init-card** command completes.

Card locations are illustrated in the *Installation Manual – EAGLE 5 ISS*.

The **inh-slk** command might time out if a far-end remote does not respond to the inhibit message.

Output

```
inh-slk: loc=1301: link=a
rlghncxa03w 05-01-07 11:11:28 EST EAGLE5 33.0.0
Inhibit Link message sent to card
;
```

inh-trm

Inhibit Terminal

Use this command to set the primary state of a serial port to OOS-MT-DSBLD. It sets the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

Keyword: inh-trm

Related Commands: act-echo, alw-trm, canc-echo, chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: System Maintenance

Parameters

:trm= (mandatory)

The ID of serial port to be inhibited

Range: 1-40

:force= (optional)

This parameter forces the removal of a specified terminal, even if it is last in-service SEAS terminal available.

Range: yes, no

Default: no

Example

```
inh-trm:trm=5
```

```
inh-trm:trm=1:force=yes
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

This command cannot be used to inhibit the terminal from which the command is entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

Output

```
inh-trm:trm=5
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0  
Inhibit message sent to terminal

Inhibit message sent to terminal
```

```
;
```

init-card**Initialize Card**

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued to the OAM software, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

CAUTION: When a LIME1 or LIMT1 card has associated channel cards (LIMCH) with provisioned links, the **init-card** command entered for the LIME1 or LIMT1 card causes all links on the associated channel cards to go out of service.

CAUTION: Resetting more than 8 Service Module cards via the **at** once may result in an extended reload time for the Service Module cards.

Keyword: **init-card**

Related Commands: **dlt-card**, **ent-card**, **init-sys**, **rept-stat-card**, **rmv-card**, **rst-card**, **rtrv-card**

Command Class: System Maintenance

Parameters

:appl= (optional)

Application. This parameter specifies the type of application residing on the card.

CAUTION: Because the **appl** parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.

Range:

xyyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

atmansi—This application is used by LIM-ATM cards and E5-ATM cards to support high-speed ATM signaling links. It is also used by the E5-ATM card to support T1 functions.

atmitu—This application is used by E1-ATM cards and E5-ATM cards to support E1 high-speed signaling links. It is also used by the E5-ATM card to support E1 functions.

ccs7itu—This application is used by E1/T1 MIM cards, HC-MIM cards, and E5-E1T1 cards for ITU-TSS MTP functions.

eroute—This application is used by STC cards and E5-STC cards for EAGLE 5 Integrated Monitoring Support functions.

gls—This application is used by TSM cards and E5-TSM cards for downloading gateway screening to LIM cards and Service Module cards.

ipgwi—This application is used by SSED CM cards and E5-ENET cards for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 125 cards to be assigned the **ipgwi** application.

iplim—This application is used by SSED CM cards and E5-ENET cards for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi—This application is used by SSED CM cards and E5-ENET cards for TCP/IP point-to-point connectivity for ITU point codes.

ips—This application is used by IPSM cards and E5-IPSM cards for the IP User Interface feature.

ipsg—This application is used by E5-ENET cards (IPSG cards) to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—This application is used by MCPM cards for the Measurements Platform feature.

ss7ansi—This application is used by E1/T1 MIM cards, HC-MIM cards, and E5-E1T1 cards for the MTP functions.

ss7ipgw—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 125 cards to be assigned the **ss7ipgw** application.

stplan—This application is used by DCM cards and E5-ENET cards to support the STP LAN functions.

vsccp—This application is used by Service Module cards to support EPAP-based features and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the **vsccp** GPL processes normal GTT traffic.

Default: The application assigned to the card

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP feature or an EPAP-based feature is on or the ATINP feature is enabled. This parameter is applicable only to Service Module cards that run the **vsccp** application and contain an RTDB.

Range: **refresh, persist**

refresh— Causes data to be reloaded to the specified card.

persist— Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place. The **force** parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

Default: **refresh**

:force= (optional)

Force indicator. Enables the command to be processed under the following conditions:

- If **serial=yes** and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If **initclk=yes** and the TDM card specified in the **loc** parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If **initclk=yes** and **appl=eoam** is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

Range: **yes, no**

Default: **no**

:initclk= (optional)

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

Range: **yes, no**

If **initclk=yes** is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If **initclk=yes** is specified with **appl=eoam** and **force=yes**, the bitfile reloads on both TDMs.

:loc= (optional)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1116, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2301-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

When the **initclk** parameter is not specified, the listed card locations are valid.

When the **initclk** parameter is specified with the **loc** parameter, only card locations **1113, 1114, 1115, and 1116** are valid. Entering locations **1114** and **1116** results in the same action as entering **1113** and **1115**.

Default: All valid card locations are initialized.

:prtnggrp= (optional)

Partition group. This parameter specifies the disk partition group that is used as the source for downloading the appropriate GPL.

A value of **1113** or **1115** must be specified for the **thdoc** parameter before this parameter can be specified.

Range: **active, inactive**

active — the active partition group

inactive — the inactive partition group

Default: **active**

:serial= (optional)

Controls the manner in which cards are initialized. If **serial=yes** is specified, cards of the specified APPL type are initialized one at a time. If **serial=no** is specified, cards of the specified APPL type are initialized simultaneously.

Range: **yes, no**

Default: **no**

Example

```
init-card:Loc=1113:prtnggrp=inactive
init-card:loc=1101:data=persist
init-card:loc=1113:initclk=yes
init-card:appl=eoam:initclk=yes:force=yes
init-card:appl=ipsg
```

Dependencies

The shelf and card must be equipped.

Either the **loc** or **appl** parameter, but not both parameters, must be specified in the command.

The following card locations (**loc** parameter) are not allowed for this command: **1117, 1118**, and all **xy09** and **xy10** card locations (where **x** is the frame and **y** is the shelf).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

If TDM reload would cause system clocks to fail that are required to keep links active or TSCSYNC available, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.
- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A&B) are required.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

The **force** parameter must be specified for the cards that are not in the In-service Normal state.

The **serial** parameter is valid only when used with the **appl** parameter.

The **appl=all** parameter can be specified only when the **serial=yes** parameter is also specified.

The following applications are valid for the **appl** parameter: **ss7ansi**, **gls**, **ccs7itu**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vsccp**, **atmitu**, **ipgwi**, **ips**, **eroute**, **ipsg**, or **mcp**.

The **force** parameter can be specified only when the **initclk**, **appl**, and **data** parameters are specified.

The **data** parameter is valid only for SCCP card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

The card location (**loc**) must be within the allowed range.

The specified card does not exist or is not a logical processing element.

An EPAP-based feature or an LNP feature that is warm-restart-capable must be enabled before this command can be entered with the **data=persist** parameter.

If the **serial=yes** parameter is specified, the **appl** parameter must specify a network type application value or must be equal to **all**.

The A-Port, EIR, G-Flex, G-Port, INP, IS41 GSM Migration (IGM), LNP ELAP Configuration, PPSMS, Prepaid IDP Relay Query (IDP Relay), or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **data** parameter can be specified.

If a removable cartridge is inserted in the system, then the **prtngrp=inactive** parameter cannot be specified.

The **loc** parameter must be specified with a value of **1113** or **1115** before the **prtngrp** parameter can be specified.

If an Extended BERT is running, the **appl** parameter cannot be specified in this command to initialize multiple cards.

Notes

The TDM card has a processor but no application.

init-ext-stats**Initialize Extended Statistics**

Use this command to cause the HIPR2 cards to collect Extended Statistics for later retrieval.

Keyword: init-ext-stats

Related Commands: copy-ext-stats

Command Class: System Maintenance

Parameters

:bus= (optional)

This parameter specifies the IMT bus that contains the HIPR2 card where extended statistics are collected.

Range: **a, b, both**

a — collect statistics for HIPR2 cards on the A bus

b — collect statistics for HIPR2 cards on the B bus

both — collect statistics for HIPR2 cards on both buses

Default: **both**

:delay= (optional)

This parameter specifies the number of milliseconds to wait before collecting HIPR2 Extended Statistics.

Range: **0-10000**

NOTE: The specified value is automatically rounded to a 10 ms boundary.

Default: **0**

:eloc= (optional)

This parameter specifies the ending card location for a range of HIPR2 cards where extended statistics are collected.

Statistics are collected from only valid In-Service Normal HIPR2 cards within the range.

Range: **1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110**

Default: **6110**

:loc= (optional)

This parameter specifies the location of a single HIPR2 card where statistics are collected.

Range: 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default: all HIPR2 cards within the range specified by the **sloc** and **eloc** parameters

:sloc= (optional)

This parameter specifies the starting card location for a range of HIPR2 cards where extended statistics are collected.

NOTE: Statistics are collected from only valid In-Service Normal HIPR2 cards within the location range.

Range: 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default: 1109

Example

```
init-ext-stats
init-ext-stats:bus=a
init-ext-stats:sloc=1109:eloc=1110
init-ext-stats:loc=1109
```

Dependencies

The value specified for the **loc** or **sloc** and **eloc** parameters must indicate a valid card location. See the description of the desired parameter for a list of valid values.

The range specified by the **sloc** and **eloc** parameters must include an MUX card location.

The value specified for the **loc** parameter must be a valid MUX card location or the range specified by the **sloc** and **eloc** parameters must include an MUX card location.

The value specified for the **delay** parameter must be between **0** and **10000**.

A value of **a**, **b**, or **both** must be specified for the **bus** parameter.

The **loc** parameter cannot be specified in the same command with the **sloc** and **eloc** or **bus** parameters.

An **init-ext-stats** or **copy-ext-stats** command cannot already be in progress when this command is entered.

Output

```

CARD Location: 1110
;

e5oam 10-02-06 00:56:54 EST EAGLE 42.0.0
Command Completed.
;
```

init-flash**Initialize Flash**

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

Keyword: **init-flash**

Related Commands: **act-flash**, **clr-imt-stats**, **flash-card**, **init-imt-gpl**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**

Command Class: System Maintenance

Parameters

NOTE: As of Release 43.0, the BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1 GPLs are replaced with the BLIXP GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

:code= (mandatory)

The version of the GPL being loaded onto the card.

Range: **appr**, **trial**

appr — The approved GPL version

trial — The trial GPL version

:boot= (optional)

This parameter indicates whether the HC-MIM or EPM based card should boot or not boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the HC-MIM or EPM based card, this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card.

Range: **yes**, **no**

yes — Reboot the card after the command completes successfully

no — Do not reboot the card after the command completes successfully.

Default: **yes**

:eloc= (optional)

End location. Location of the last card of a range of cards to be initialized.

Range: **1101-1113**, **1115**, **1201-1218**, **1301-1318**, **2101-2118**, **2201-2218**, **2301-2318**, **3101-3118**, **3201-3218**, **3301-3318**, **4101-4118**, **4201-4218**, **4301-4318**, **5101-5118**, **5201-5218**, **5301-5318**, **6101-6118**

:force= (optional)

This parameter is required to force the TDM-GTI bitfile reload if a clock outage will occur when **initclk=yes** is specified.

Range: **yes**, **no**

Default: **no**

:gpl= (optional)

Generic program load. This parameter specifies the flash GPL type that is running on the cards in the specified range of cards.

Range: **xyyyyyy**

1 alphabetic character followed by up to 6 alphanumeric characters.

Valid GPLs are: **blbios**, **blbepm**, **blbsmg**, **blepld**, **bldiag6**, **blxp**, **blmcap**, **blrom1**, **blvxw6**, **bpdcm**, **bpdcm2**, **bphcap**, **bphcapt**, **bphmux**, **bpmpl**, **bpmplt**, **hipr**, **hipr2**, **imtpci**, and **pldpmc1**.

:initclk= (optional)

If this parameter is specified for an EOAM card location (1113 or 1115), it determines whether or not the TDM-GTI bitfile should be reloaded, causing a clock initialization.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

Range: **yes, no**

Default: **no**

:loc= (optional)

The location of a single card to be initialized.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

:sloc= (optional)

Start location. Location of the first card of a range of cards to be initialized.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

Example

```
init-flash:loc=1105:code=trial
init-flash:sloc=1101:eloc=1112:gpl=bpdcm:code=appr
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
```

Dependencies

The specified card must be an HCAP, HCAP-T, DCM, E1/T1 MIM, HC-MIM, E5-E1T1, E5-ENET, GPSM-II, MPL, E5-TSM, or Service Module card. An HMUX, HIPR, or HIPR2 card can be specified, but only for locations xy09 and xy10 (x is the frame and y is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, the card must be inhibited before this command is entered (unless the card is an HMUX, HIPR, or HIPR2 card).

If the target card is an HMUX, HIPR, or HIPR2 card, then both card locations specified in the **sloc** and **eloc** parameters must contain HMUX, HIPR, or HIPR2 cards on the same IMT bus. For these cards, the bus is implicit based on the specified location. Locationxy09 specifies an HMUX, HIPR, or HIPR2 A Bus, and locationxy10 specifies an HMUX, HIPR, or HIPR2 B Bus (x is the frame and y is the shelf). For example, **sloc=1109:eloc=6109** specifies all HMUX, HIPR, or HIPR2 cards on the A Bus only; **sloc=1110:eloc=6110** specifies all HMUX, HIPR, or HIPR2 cards on the B Bus only. HMUX, HIPR, or HIPR2 cards from both the A bus and B bus cannot be flash downloaded simultaneously.

If the target card is an HC-MIM or EPM based card, the **gpl** parameter must be specified when the **loc** parameter is specified.

The **boot** parameter can be specified only if the target is an HC-MIM or EPM based card.

The **boot** parameter cannot be specified for the **blepld** HC-MIM GPL.

A card location that contains the active MASP cannot be specified for **thloc**, **sloc**, or **eloc** parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

If the **eloc** and **sloc** parameters are specified, the **gpl** parameter must be specified. The cards in the locations specified in the **sloc** and **eloc** parameters must be running the specified general program load (**gpl**). Other cards in the range of card locations can be running other GPLs, but will not be initialized. Only the cards within the range that are running the specified GPL will be initialized.

The **sloc** parameter value must be less than the **eloc** parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed.

If **initclk** is specified, the card location parameter value must be **1113** or **1115**.

If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

CAUTION: The resulting clock outage will probably cause loss of traffic on all links.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

EPM-based cards cannot support a valid trial version of the **blbepm** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded. The HC-MIM card cannot support a valid trial version of the **blbios** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

No other related command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The **eloc** and **sloc** parameters must be specified together in the command; one parameter cannot be specified without the other parameter.

The cards specified in the **sloc** and **eloc** location parameters must be running the specified general program load (**gpl**).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.

- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

Notes

Card locations **1114**, **1116**, and **1117** are not valid and cannot be specified.

For the HC-MIM or EPM based cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the **boot=no** parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the **init-flash** command with the **boot=yes** parameter or by entering the **init-card** command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

Output

```

init-imt-gpl

Initialize IMT GPL

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

Keyword: **init-imt-gpl**

Related Commands: **alw-card**, **inh-card**, **init-card**, **rept-stat-card**

Command Class: System Maintenance

Parameters

:code= (mandatory)

Specifies which IMT GPL to load to the card.

Range: **appr**, **refresh**, **trial**

appr — The approved GPL version

refresh — Reload approved GPL version without card reset

trial — The trial GPL version

:loc= (optional)

Specifies the address of the card to be initialized.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: All locations

Example

```
init-imt-gpl:loc=1201:code=trial
```

```
init-imt-gpl:code=refresh
```

```
init-imt-gpl:code=appr
```

Dependencies

The card location shelf must be within the allowed ranges as specified on the **loc** parameter. The shelf is the first two digits of the **loc** parameter.

The card location slot must be within the allowed ranges as specified on the **loc** parameter. The slot is the second two digits of the **loc** parameter.

The card location cannot contain a card with flash memory (HCAP, HCAP-T, DCM, MPL, HC MIM, HIPR, or HMUX).

When this command is entered, no other action command can be in progress.

If the **code=appr** or **code=trial** parameter is specified, the **loc** parameter must be specified.

If the **code=trial** parameter is specified, the **loc** parameter must be specified, and the specified card location must be equipped and in service.

If the **code=appr** or the **code=refresh** parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

The **init-imt-gpl** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**.

This command must not be entered during IMT statistics collection following an hourly boundary.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

None

Output

;

```

init-mux**Initialize High-Speed Multiplexer**

Use this command to reset a single HMUX, HIPR, or HIPR2 card or all HMUX, HIPR, or HIPR2 cards on the specified bus.

The command boots the HMUX, HIPR, or HIPR2 processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the HMUX, HIPR, or HIPR2 card or cards come back into service.

NOTE: When a card is disconnected from the IMT Bus, it may take several seconds for the card IMT Status to be updated. If aninit-mux or disc-imt command is entered for the alternate IMT Bus before the card IMT Status is updated, then the card may reboot. After disconnecting the card from the IMT bus, use the rept-stat-imt or rept-stat-card command to determine whether the card IMT status is updated. Do not issue the disc-imt or init-mux command for the alternate IMT bus until the card status is updated.

Keyword: init-mux

Related Commands: act-flash, init-flash

Command Class: System Maintenance

Parameters

:bus= (optional)

This parameter specifies the HMUX, HIPR, or HIPR2 bus to be reset. All HMUX, HIPR, or HIPR2 cards on the specified bus are reset.

Range: a, b

Default: a

:force= (optional)

This parameter is specified to override normal safeguards. The **force=yes** parameter can be used to reset an entire HMUX, HIPR, or HIPR2 bus when the alternate bus is non-functional or to reset one HMUX, HIPR, or HIPR2 card during a fault isolation test (see the **tst-imt** command).

CAUTION: If the force=yes parameter is specified, and the alternate IMT bus is OOS, then all of the cards on the IMT that are running a GPL will initialize. If one or more cards are not aligned on the alternate bus, placing the alternate IMT in IS-ANR, only the non-aligned cards will initialize. Either occurrence could result in nodal isolation.

Range: yes, no

Default: no

:loc= (optional)

The card location of a single HMUX, HIPR, or HIPR2 card to be reset.

Range: 1109-1110, 1209-1210, 1309-1310, 2109-2110, 2209-2210, 2309-2310, 3109-3110, 3209-3210, 3309-3310, 4109-4110, 4209-4210, 4309-4310, 5109-5110, 5209-5210, 5309-5310, 6109-6110

Default: If not specified, all HMUX or HIPR cards on bus A or bus B are reset

Example

```
init-mux:bus=a
init-mux:loc=1109
```

Dependencies

An **act-flash** or **init-flash** command cannot be in progress when this command is entered.

Either the **bus** parameter or the **loc** parameter, but not both, must be specified.

The **force=yes** parameter must be specified before this command can be entered during an IMT Fault Isolation test. This command cannot be entered during an Extended Bit Error Rate Test (BERT) even if the **force=yes** parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The STP options **hmuxabus** or **hmuxbbus** must have their value set to **yes** before this command can be executed.

This command cannot be entered if an IMT Rate Change sequence is in progress.

Notes

None

Output

```
init-mux:loc=1109
rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0
Command Completed.
;
```

init-network

Initialize the Network

Use this command to reset all the network cards. The network cards are ACMs, TSMs, and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

CAUTION

CAUTION: Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

Keyword: init-network

Related Commands:

Command Class: System Maintenance

Parameters

:force= (optional)
Force the resetting of all the network cards.

Range: yes, no
Default: no

Example**init-network****Dependencies**

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with either the **ss7ansi** or the **ccs7itu** application installed must exist with an in-service active signaling link.

The **force=yes** parameter must be specified to override the required four-card **ss7ansi** or **ccs7itu** configuration. The system then selects the best available of the remaining **ss7ansi** or **ccs7itu** cards.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes***Upgrade Phase 3***

Upgrade Phase 3 mode means that the MASPs are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

Full Function

Full Function mode means that all MASPs are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

Output

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

init-oap

Initialize OAP Processor

Use this command to send a hardware signal to the indicated OSS/Application Processor (OAP), causing it to reset and reinitialize its operational software.

NOTE: This command cannot be used for EOAPs (Enhanced Operation System Support Application Processes).

NOTE: As of Release 42.0, this command is obsolete.

Keyword: init-oap

Related Commands: chg-trm, rept-stat-seas

Command Class: System Maintenance

Parameters

:oap= (mandatory)

The OAP that is to be initialized. Any value (**a**, **b**, or **both**) can be specified, regardless of the actual or intended OAP configuration.

Range: **a, b, both**

:force= (optional)

If the specified OAP is operational (that is, if its state is IS-NR or IS-ANR), and it is the only operational OAP, then the **force=yes** parameter must be specified to reset it. If the specified OAP is not operational, then **force=yes** is not required.

Range: **yes, no**

Default: **no**

Example

```
init-oap:oap=a
```

```
init-oap:oap=both:force=yes
```

Dependencies

The SEAS feature must be turned on before this command can be entered.

No other action command can be in progress when this command is entered.

The **force=yes** parameter must be specified to reset the last OAP.

The SEAS Over IP feature must be turned off before this command can be entered.

Notes

The EAGLE 5 ISS determines the OAP configuration (single vs. dual) by querying the OAP. If one or both of the OAPs are not operational, then the EAGLE 5 ISS might receive incorrect information about the OAP configuration. Furthermore, if no OAP terminals are defined, no OAP queries are sent, the OAM defaults to a single configuration, and this information may be incorrect.

To allow an OAP to be reset by an OAM not configured for it or when no OAP terminals are yet defined, the **init-oap** command can be used to specify either OAP or both OAPs, even if doing so conflicts with the actual OAP configuration.

Output

```
init-oap:oap=a
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Command Completed.
```

```
init-oap:oap=both:force=yes
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

In the following example, assume that the MDAL is malfunctioning when the command is entered.

```
init-oap:oap=b
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Info: MDAL is not operational. OAP initialization may not occur.
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

```
;
```

init-sys**Initialize System**

Use this command to reset all cards in the system (except HMUX and HIPR cards). When you first enter this command, a caution message is displayed in the scroll area requesting that you re-enter the command to confirm the operation. You have 30 seconds to re-enter the command. The only valid commands that you can enter after entering the **init-sys** command the *second* time are the commands **login** and **act-user**.

CAUTION: This command causes a complete system reload, and should be used only during periods of low traffic. Use this command only when directed by the Customer Care Center.

CAUTION: When the **init-sys** command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. You will need to manually put each device back into its previous state after the system is back on line. It is, therefore, advisable to print or electronically capture the output of the **rept-stat-slk**, **rept-stat-card**, and **rept-stat-trm** commands for reference prior to issuing the **init-sys** command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above **rept-stat** commands.

Keyword: **init-sys**

Related Commands: **act-gpl**, **chg-db**, **chg-gpl**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**

Command Class: System Maintenance

Parameters

NOTE: The **force** parameter is no longer available.

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the G-Flex, G-Port, INP, or LNP feature is on, or the ATINP feature is enabled. This parameter is applicable only to network cards containing the MPS database (VSCCP).

Range: **refresh**, **persist**

refresh — Causes data to be reloaded to the specified card.

persist — Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

Default: **refresh**

Example

init-sys

init-sys:data=persist

Dependencies

When this command is entered, another **init-sys** command cannot be in progress on another port.

The G-Flex, G-Port, INP, LNP, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **data** parameter can be specified.

The value specified for the **data** parameter for the confirmation command must be the same value that was specified the first time.

Notes

When the **init-sys** command is entered the first time, you have 30 seconds to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the **init-sys** command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicate that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the **init-sys** command, the MASP that was active before the **init-sys** command was entered will be the active MASP when the system has finished reinitializing. TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require the TSM cards to be reloaded.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

Output

The following example shows what happens when you enter the **init-sys** command once and enter the **init-sys** command a second time within 30 seconds, causing the system to start resetting all of its cards.

init-sys

```
rlghncxa03w 04-01-07 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

init-sys

```
rlghncxa03w 04-01-07 07:05:16 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:17 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

The following example shows what happens when you enter the **init-sys** command once and allow more than 30 seconds to pass with no other keyboard entry.

init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3.

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when you enter the **init-sys** command once and enter a different command (**rls-alm:lvl=minr**), letting the 30-second timer expire for the second entry of the **init-sys** command.

init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

rls-alm:lvl=minr

```
rlghncxa03w 04-01-05 07:05:10 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:11 EST  EAGLE 31.3.0
All the minor alarms are released

rlghncxa03w 04-01-05 07:05:12 EST  EAGLE 31.3.0
Command Completed

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when the **init-sys** command is entered twice within 30 seconds, and specifies the **data=persist** parameter to perform a warm restart of the requested cards without reloading the database to the cards.

init-sys:data=persist

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and will result in
traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
init-sys:data=persist
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Init System command issued at terminal #3
```

lock

Lock Keyboard

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the **unlock** command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

Keyword: lock

Related Commands: unlock

Command Class: Basic

Parameters

This command has no parameters.

Example

lock

Dependencies

The terminal cannot be an **mgmt** terminal used for Network Surveillance.

The terminal cannot be a **telnet** terminal (terminal IDs 17-40).

Notes

A locked terminal can also be unlocked by entering the **inh-trm** command, followed by the **alw-trm** command.

Output

lock

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

login

Login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

Keyword: login

Related Commands: act-user, chg-pid, chg-secu-dflt, chg-user, dact-user, dlt-user, ent-user, logout, rept-stat-user, rtrv-secu-dflt, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

:uid= (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

Range: azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Example

login:uid=john

Dependencies

The user cannot be logged onto any terminal while changing the password.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the **uout** parameter of the **ent-user** command.

The OA&M IP Security Enhancements feature must be turned on before the password can be changed from a Telnet terminal (IDs 17-40) if the user is logging in with the assigned ID and password for the first time, or the password has expired.

The password can contain up to 12 characters.

The password must contain at least the number of characters specified by the **minlen** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of alphabetic characters specified by the **alpha** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of numeric characters specified by the **num** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of punctuation characters specified by the **punc** parameter in the **chg-secu-dflt** command.

The password cannot contain the associated User ID.

The number of days specified by the **minintrvl** parameter in the **chg-secu-dflt** command must pass between password changes.

The password must contain fewer duplicate characters from the existing password than the number specified by the **pchreuse** parameter in the **chg-secu-dflt** command.

The password cannot be the same as a previous password if the limit in the password history, specified by the **preuse** parameter of the **chg-secu-dflt** command, has been reached.

The current password cannot be entered as the new password.

The values specified for the **uid** parameter and for the password must already exist.

Notes

The **act-user** command can be used in place of **login**. The **act-user** command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

Output

When the **login** command is entered, a password prompt occurs. If the password and User ID are valid, then the login is processed. When a password change is required, password rules are displayed, and a new password is requested. The login is granted if the change is successful, then or if no password change is necessary.

After login is granted, a banner is displayed. This banner consists of the warning text provided on the **chg-secu-dflt** command, indications about the last login, and any unsuccessful login attempts.

Normal login path with no request for new password.

login:uid=eagle

```
eagle5 10-02-19 19:37:16 EST  EAGLE5 42.0.0

login:uid=user1
Command entered at terminal #3.
;

e5oam 10-02-19 23:30:59 EST  EAGLE 42.0.0
New password must contain:
- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. $%&#)
New password must:
- be unique from the old password
- be unique from the last 2 historical password(s)
- not reuse more than 4 character(s) from the old password
;

```

logout**Logout**

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** and **canc-user** commands.

Keyword: logout

Related Commands: act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Basic

appl — Application processor
com — Communication processor
Default: **appl**

Example

pass:loc=1201:cmd="ping 198.89.1.2"

pass:loc=1201:cmd="help"

pass:loc=1111:cmd="soipdata -f"

Dependencies

The **loc** parameter value must correspond to a card location for:

- An SSEDCM or E5-ENET card that runs the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application
- An STC card or E5-STC card that runs the **eroute** application
- An IPSM card or E5-IPSM card that runs the **ips** application
- An SSEDCM card or E5-SLAN card that runs the **stplan** application
- A Service Module card that runs the **vsccp** application
- An E5-TSM card that runs the **gls** application

The specified card location is out of range.

Syntax error found in the **pass** command.

Card is not in service

Pass command not found.

Notes

See "Pass-Through Commands" for information on pass-through commands.

Output

The following example is not definitive of the output of the **ping** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1201:cmd="ping 198.89.1.2"

rept-ftp-meas

Report Measurements to FTP

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM or Integrated Measurements enabled E5-OAM to an FTP server.

Keyword: rept-ftp-meas

Related Commands: rept-meas

Command Class: Link Maintenance

Parameters

:enttype= (mandatory)

Entity type to report on in the measurements report.

Range: **eir**, **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **origninc**, **stp**, **stplan**, **tt**, **sctpasoc**, **sctpcard**, **ua**, **vflex**, **atinpq**, **aiq**, **gttaph**, **idpr**
eir — Measurements for Equipment Identity Register
link — Measurements for signaling links
lnkset — Measurements for linksets
lnp — Measurements for local number portability

lsdestni— Measurements for linkset destination network identifiers
lsonismt— Measurements for ISUP message type screening
lsorigni— Measurements for linkset originating network identifiers
mapscrn— Measurements for GSM MAP message screening
np— Measurements for INP, INP CRP, G-Port, A-Port, MO-based GSM SMS NP, MO-based IS41 SMS NP, IGM, MT-Based GSM SMS NP, and MT-Based IS41 SMS NP
origni— Measurements for originating network identifiers greater than 5
origininc— Measurements for originating network identifiers (less than 5, small networks) for network clusters
stp— Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP
stplan— Measurements for STP Local Area Network data links
tt— Measurements for translation types
sctpasoc— Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
sctpcard— Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
ua— Measurements per application server/association for the M3UA and SUA protocols
vflex— Measurements for V-Flex
atinpq— Measurements for ATINP
aiq— Measurements for ANSI41 AIQ
gttaph— Measurements for GTT Actions Per-Path
idpr— Measurements for IDPR

:type= (mandatory)

The measurement report type.

Range: **avl, avld, avldth, comp, gtwy, mtcd, mtcddth, mtch, mtcs, nm, rbase, systot**

avl— Availability measurements

avld— Daily availability measurements

avldth— Day to hour availability measurements.

comp— Component measurements

gtwy— Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd— Daily maintenance measurements

mtcdth— Day-to-hour maintenance measurements

mtch— Hourly maintenance measurements

mtcs— Link/linkset maintenance status

nm— Network management, on-demand

rbase— Schedule-report type record base measurements

systot— STP system totals

:day= (optional)

Day of the week for the specified daily measurement report.

Range: **mon, tue, wed, thu, fri, sat, sun**

Default: If not specified, the previous single day is reported.

:hh= (optional)

The specific half-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **hh=0300** generates a report for the interval 2:30-3:00.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

:period= (optional)

The relative period for the report.

Range: **active, last, specific**

:qh= (optional)

The specific quarter-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **qh=0315** generates a report for the interval **3:00-3:15**.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

Example

rept-ftp-meas:type=systot:enttype=stp

rept-ftp-meas:type=mtch:enttype=lnp

rept-ftp-meas:type=mtcd:enttype=sctpasoc

rept-ftp-meas:type=mtch:enttype=aiq

rept-ftp-meas:type=mtcd:enttype=gttapath

rept-ftp-meas:type=systot:enttype=idpr

Dependencies

The **rept-ftp-meas** command cannot be used to specify a report type if that report type is currently printing.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (**chg-measopts:collect15min=on** command) must be on before the **qh** parameter can be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before:

- The **mtchlnp=on** parameter or the **mtcdlnp=on** parameter can be specified
- Entity type **lnp** can be specified

The GSM Map Screening feature (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) must be turned on before:

- The **mtcdmap=on** parameter can be specified.
- Entity type **mapscrn** can be specified

The Equipment Identity Register (EIR) feature must be enabled and turned on before the **enttype=eir** parameter can be specified,.

If a value of **avld**, **avld**, **comp**, **gtwy**, **mtcd**, or **systot** is specified for the **type** parameter, then the value specified for the **hh** parameter must indicate a half-hour boundary (the end of the requested half-hour for the report). If the **type=mtch** parameter is specified, then the value specified for the **hh** parameter must indicate an hourly boundary (half hours ending in 00, such as 0100, etc).

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types **avld(th)**, **mtcd(th)**, **mtch**, **nm**, **rbase**, and **mtcs** cannot be specified.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type **mtcd** is specified

- When report type **mtcdth** is specified

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

The **day** parameter can be specified only for report type **mtcd** and entity types **aiq**, **eir**, **lnp**, **np**, **vflex**, **mapscrn**, **atinpq**, and **gttath**.

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=active** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified.

Table 5-31 indicates with an X valid parameter combinations for measurements reports; invalid combinations will generate an error message.

Table 5-31. rept-ftp-meas Valid Parameter Combinations

Parameter Value	:type Parameter Values											
	avl	avld	avldth	comp	gtwy	mtcd	mtcdth	mtch	mtcs	nm	systot	rbase
:entity												
aiq						X		X				
atinpq						X		X				
eir						X		X				
link	X	X	X	X		X	X		X	X		X
lnkset				X	X	X	X		X	X		X
lnp						X		X				
lsdestni					X							
lsorigni					X							
lsonismt					X							
mapscrn						X		X				
np						X		X				
origni					X							

Table 5-31. rept-ftp-meas Valid Parameter Combinations

Parameter Value	:type Parameter Values											
	avl	avld	avldth	comp	gtwy	mtcd	mtcdth	mtch	mtcs	nm	systot	rbase
origninc					X							
sctpasoc				X		X	X					
sctpcard				X		X	X					
stp					X	X	X			X	X	X
stplan	X					X	X				X	
tt											X	
ua				X		X	X					
gttath						X		X				
idpr											X	
:period												
last	X	X	X	X	X	X	X	X		X	X	
specific	X			X	X	X		X			X	
active									X			X

An hourly boundary must be specified for report type **mtch**.

The **oamhcmes=on** or **platformenable=on** parameter must be specified (see the **chg-measopts** command) before this command can be entered.

The V-Flex feature must be turned on before the **enttype=vflex** parameter can be specified.

The A-Port, G-Port, IS41 GSM Migration, Prepaid SMS Intercept Ph1, TIF ASD, TIF GRN, TIF Number Portability, or TIF Simple Number Substitution feature must be enabled, or the INP, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the **mtchnp=on** parameter or the **mtcdnp=on** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **enttype=aiq** parameter can be specified.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The GTT Action - DUPLICATE, GTT Action - DISCARD, or GTT Action - FORWARD feature must be enabled before the **enttype=gttath** parameter can be specified.

Period/type parameter combinations:

- If the **period=specific** parameter is specified, then a value of **avl**, **mtcd**, **comp**, **systot**, **gtwy**, or **mtch** must be specified for the **type** parameter.
- If the **type=mtcd** and **period=specific** parameters are specified, then a value of **lnp**, **mapscrn**, **np**, **eir**, **vflex**, **atinpq**, **aiq**, or **orgttath** must be specified for the **enttype** parameter.

- If the **period=active** parameter is specified, then a value of **mtcs** or **rbase** must be specified for the **type** parameter.
- If the **period=last** parameter is specified, then a value of **mtcs** or **rbase** cannot be specified for the **type** parameter.

Notes

None

Output

NOTE: Refer to the *Measurements Manual* for the current release for rept-ftp-meas output examples.

rept-imt-info

Display IMT Error and Use Statistics

Use this command to display the following statistics:

- The IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- The current IMT bus use statistics. Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.
- The HMUX, HIPR, and HIPR2 card error statistics

Keyword: rept-imt-info

Related Commands: clr-imt-stats, init-imt-gpl, rept-imt-lvl1, rept-imt-lvl2, tst-imt

Command Class: System Maintenance

Parameters

:report= (mandatory)

This parameter specifies the type of report that is generated.

Range: **err**, **util**, **hmutexerr**, **hiprerr**, **hipr2err**
err — IMT bus error statistics
util — IMT bus use (utilization) statistics
hmutexerr — HMUX card error statistics
hiprerr — HIPR card error statistics
hipr2err — HIPR2 card error statistics

:ebucket= (optional)

End bucket. This parameter specifies the last one-hour time period (*bucket*) for which error statistics are reported.

Range: **0-15**

Default: If **sbucket** is specified—current **sbucket** value; information for only that time period is displayed.
If **sbucket** is not specified—**15**, the report includes statistics for all 16 time periods

:eloc= (optional)

End location. Specifies the card location of the last card in the range for the report.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

Default: If **sloc** is specified—current **sloc** value; displays information for one card
If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**=251**); displays information for entire range of locations.

:erronly= (optional)

This parameter filters the output to display only non-zero counts in the error report.

Range: **yes, no**

Default: **yes**

:eshelf= (optional)

This parameter specifies the end shelf location for HMUX, HIPR, or HIPR2 statistics. This shelf location is the last shelf in the range.

Range: **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

Default: **sshelf** is specified—the report starts with the **sshelf** value
sshelf and **eshelf** are not specified—the report is generated for all equipped shelves

:eslot= (optional)

This parameter specifies the end slot location for HIPR or HIPR2 statistics for the cards in the HIPR or HIPR2 shelf.

Range: **1-18**

Default: **sslot** is specified—current **sslot** value
sslot is not specified—not used

:mode= (optional)

This parameter specifies the display mode used in the error report.

Range: **full, stats, summary**

full—Displays information for each card along with a summary report

stats—Displays only individual card statistics

summary—Displays the summary portion of the report

Default: **summary**

:sbucket= (optional)

Start bucket. This parameter specifies the first one-hour time period (bucket) for which error statistics are reported.

Range: **0-15**

Default: **0**

:sloc= (optional)

Start location. Specifies the card location of the first card in the range for the report.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

Default: **eloc** is specified—current **eloc** value
eloc and **sloc** are not specified—displays information for entire range of card locations

:sshelf= (optional)

This parameter specifies the starting shelf location for HMUX, HIPR, or HIPR2 statistics. This location is the first shelf in the range.

Range: 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default: **eshelf** is specified—current **eshelf** value
eshelf and **sshelf** are not specified—displays information for entire range of shelves

:sslot= (optional)

This parameter specifies the starting slot location for HIPR or HIPR2 statistics for the cards in the HIPR or HIPR2 shelf.

Range: 1-18

Default: **eslot** is specified—current **eslot** value
eslot and **sslot** are not specified—not used

:trm= (optional)

This parameter specifies the serial port (printer location) where the report is sent.

Range: 1-16

Default: Report displays on the terminal where the command is issued

Example

```
rept-imt-info:report=err
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no
rept-imt-info:report=util
rept-imt-info:report=hmuxerr
rept-imt-info:report=hiprerr:sbucket=0
rept-imt-info:
report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0
rept-imt-info:report=hipr2err
```

Dependencies

No related IMT command can be in progress when the **rept-imt-info** command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

The **rept-imt-info** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

If the **report=util** parameter is specified, then the **ebucket**, **erronly**, **mode**, and **sbucket** parameters cannot be specified.

The ending hourly time period cannot be less than the starting hourly time period. For example **rept-imt-info:report=err:sbucket=5:ebucket=3** cannot be specified.

If the **sslot** and **eslot** parameters are specified, then the **sshelf** parameter must be specified and the **eshelf** parameter cannot be specified (slot information is reported for a single shelf).

A value of **hmuxerr**, **hiprerr**, or **hipr2err** must be specified for the **report** parameter before the **sshelf** and **eshelf** parameters can be specified.

The HIPR or HIPR2 card slots (**09** and **10**) cannot be specified for the **sslot** and **eslot** parameter values.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The shelf locations specified by the **sshelf** and **eshelf** parameters must be provisioned in the frame.

If a value of **hmutexerr**, **hiprerr**, or **hipr2err** is specified for the **report** parameter, then the **erronly** and **mode** parameters cannot be specified.

The **erronly** and **mode** parameters can be specified only if the **report=err** parameter is specified.

If a value of **err**, **util**, or **hmutexerr** is specified for the **report** parameter, then the **sslot** and **eslot** parameters cannot be specified.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Hourly Bucket Statistics

Hourly Bucket Statistics apply to cards on the IMT bus and to HMUX, HIPR, and HIPR2 cards. Each hourly time period (*bucket*) contains the statistics for a single hour. A total of 16 hourly time periods, numbered **0** to **15**, exist. Hourly time period **0** is the most-recent (current), and hourly time period **15** is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period **0** are now reported in the hourly time period **1**, and so on. The statistics reported in the hourly time period **15** are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period **0** and changes to hourly time period **1** at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

IMT Bus Use Statistics

The statistics are calculated for all cards in the specified range and summarized. Only the summarized statistics are displayed. *IMT bus use* is the percentage of the capacity of the IMT bus that is used for data during a particular time.

HMUX, HIPR, or HIPR2 Statistics

An HMUX, HIPR, or HIPR2 card stores the statistics separately for each card on its shelf. If the **sloc** and **eloc** parameters are specified, then the card sends the statistics for each card to the OAM application for display. If the **sloc** and **eloc** parameters are not specified, then the card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

Low Speed Summary

Table 5-32. rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Packet CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors

Table 5-32. rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
	corrupted data within the received packet. Detected by hardware.	and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	continue, a hardware issue is present. Contact the Customer Care Center.
IMT Rx Packet Format Error	Receive Format error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware/software.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a hardware issue is present. Contact the Customer Care Center.
IMT Rx Violation Error	Violation Error: Received an illegal character from the physical IMT transport (TAXI Interface). Detected by hardware	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Command Error	Reserved.	Reserved.	Reserved.
IMT Rx FIFO Full	Receive FIFO Full: Watermark indication that this interface receiving data off the TAXI line is receiving traffic in excess of what it can handle. Some traffic will have been discarded. May cause retransmissions, CRC errors and Format errors.	Relatively heavy traffic on this interface can cause these counts to increment. If these counts occur in the field, a software problem may exist.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.

Table 5-32. rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmxerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that the interface receiving data off the TAXI line has received substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication; no action is required.
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	Relatively heavy traffic on this interface can cause these counts to increment. This condition should never occur. These events may indicate a software problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.

IMT Tx Packet Discard Error	Number of packets that were discarded by the transmit interface.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. if stats are clear then there is no action to perform. If errors continue, a problem exists. Contact the Customer Care Center.

Miscellaneous Summary

Table 5-34. rept-imt-info Statistics, Miscellaneous Summary

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
Shelf ID UART Framing Error	The Mux card at this location detected a framing error within the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
Shelf ID UART Overrun Error	The Mux card at this location detected a overrun error in the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.

Output

An asterisk (*) is appended to each statistic in the output when one or more MUX cards are unable to report statistics during the collection of IMT statistics.

IMT statistics are displayed as '-' instead of zero for counts when the IMT bus is down or inhibited in the output for **rept-imt-info** reports for MUX cards.

Legend

IMT Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.**STATISTIC**—The error statistic type for the IMT buses A and B.**BUS A VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.**BUS B VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**MISC SPEED STATISTICS**—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**BUCKET SUMMARY**—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the **rept-imt-info** command.)

CUMULATIVE—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HMUX Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTIC—The miscellaneous error statistic type.

BUS A—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

HIPR Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.

LOC—The card location (shelf and slot) for which information is displayed.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTIC—The miscellaneous error statistic type.

BUS A—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

HIPR2 Statistics:

BUCKET—The hourly time periods (*buckets*) for which a report was requested.

LOC—The card location (shelf and slot) for which information is displayed.

LOW SPEED STATISTIC—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HIGH SPEED STATISTIC—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MISC SPEED STATISTIC—The miscellaneous error statistic type.

BUS A—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

BUS B—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

rept-imt-lvl1

Report IMT Level 1

Use this command to display the IMT level 1 statistics for a card or a range of cards. A summary report of totals for all cards is also generated.

Keyword: rept-imt-lvl1

Related Commands: clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt, tst-imt

Command Class: System Maintenance

Parameters

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-35 to map the values by card location).

Range: 0-251

The value can be specified in decimal (0–251) or hexadecimal (h'00–h'fb).

Default: If the start address (s) value is specified, the e parameter default value is the specified s parameter value.

If the s parameter is not specified, the e parameter is not specified and the sloc parameter must be specified.

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: If sloc is specified—current sloc value; displays information for one card

If sloc is not specified—1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

:eshelf= (optional)

End Shelf location. This parameter specifies the shelf location of the last shelf in the range.

Range: 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default: if the sshelf parameter is specified—current sshelf value

if the sshelf parameter is not specified—6100, which displays information for entire range of shelves

:filter= (optional)

This parameter specifies the filter that determines the information that is displayed in the report.

Range: error, perf, error-only, full

error — display all error counts

perf — display performance counts

error-only — display non-zero error counts

full — display zero and non-zero error counts and performance counts

Default: full

:hs= (optional)

This parameter specifies whether to include High Speed interface counts in the report.

Range: no, yes

no — do not include High Speed interface counts

yes — include High Speed interface counts

Default: no

:r= (optional)

Report type value

Range: **full, stats, summary**
full— Displays information for each card along with a summary report.
stats— Displays only individual card statistics.
summary— Displays the summary portion of the report.

Default: **full**

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-35 to map the values by card location).

Range: **0-251**
The value can be specified in decimal (**0–251**) or hexadecimal (**h'00–h'fb**).

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: If **eloc** is specified—current **eloc** value
If **eloc** is not specified—**1201**, which corresponds to IMT address 0 (**s=0**).

:sshelf= (optional)

Start Shelf location. This parameter specifies the shelf location of the first shelf in the range.

NOTE: The sshelf option specified alone is the equivalent to specifying the IMT address range. For example, “sshelf=1200” is equivalent to specifying the IMT address range as “s=h'00:e=h'0f”.

Range: **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

Default: if the **eshelf** parameter is specified—the current **eshelf** value
if the **eshelf** parameter is not specified—**1100**, which displays information for the entire range of shelves

:trm= (optional)

This parameter specifies the terminal port where the report is sent.

Range: **1-40**
Default: Report displays on the terminal where the command was issued

Example

This example requests low speed interface counts.

rept-imt-lvl1:s=h'00:e=h'00

This example requests a summary report of low speed interface counts.

rept-imt-lvl1:s=h'00:e=h'00:r=summary

This example requests low speed interface counts.

rept-imt-lvl1:sshelf=1200

This example requests low speed interface counts for individual cards.

rept-imt-lvl1:sshelf=1200:r=stats

This example requests low speed and high speed interface counts.

rept-imt-lvl1:sshelf=1200:hs=yes

This example requests low speed and high speed interface counts.

rept-imt-lvl1:s=h'00:e=h'00:hs=yes

This example requests an error report for non-zero error counts.

rept-imt-lvl1:s=h'00:e=h'00:filter=error-only

This example requests an error report for zero and non-zero error counts.

rept-imt-lvl1:s=h'00:e=h'00:filter=error

Dependencies

Only one report status command can be in progress at a time.

The **s**, **sloc**, or **sshelf** parameter must be specified in the command.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The command cannot be entered if the **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl2**, or **tst-imt** command is running.

Only one of the **sloc/eloc**, **s/e**, and **sshelf/eshelf** parameter combinations can be specified in the command.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

Table 5-35 maps each card location to the decimal and hexadecimal values that can be specified for the **s** and **e** parameters.

Table 5-35. Hexadecimal/Decimal Values for s and e parameters

Low speed ring counts and performance counts

If an HMUX card is not present in the shelf, then HMUX low speed ring counts are not displayed.

If HIPR or HIPR2 cards are not present in the shelf, then performance counts are not displayed.

Table 5-36 describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

These statistics are displayed when the **rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full** command is entered.

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Rx CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received	Maintenance activity: Card	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	discarded. May cause retransmissions, CRC errors and Format errors. Detected by hardware	a software problem.	the Customer Care Center.
CPU Rx FIFO Half Full	CPU Receive FIFO Half Full: Communication CPU on the card is becoming congested. Detected by hardware. This stat is only meaningful for cards that contain a BPxxxx GPL.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	None: FIFO Half Full is an indication; no action required.
CPU Rx FIFO Full	CPU Receive FIFO Full: Communication CPU on the card is becoming congested. Data has been dropped. May cause retransmissions, format and large packet errors. Detected by hardware. This stat is only meaningful for cards that contain a BPxxxx GPL.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
CPU Rx MSU FIFO Full	CPU Receive MSU FIFO Full: Watermark indication that the MSU traffic is in excess of what the card can handle. Traffic will have been discarded. Expect retransmissions and possibly other errors. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a MSU with no CRC error.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
CPU Rx LSSU FIFO Full	CPU Receive LSSU FIFO Full: Watermark indication that the LSSU traffic is in	May indicate a hardware failure (i.e.: a defective board), although a software issue is also possible.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	excess of what the card can handle. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a LSSU with no CRC error.		issue exists. Contact Customer Care Center.
CPU Rx XSU FIFO Full	CPU Receive XSU FIFO Full: Watermark indication that the XSU traffic is in excess of what the card can handle. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined not to be a MSU, LSSU or ASU, and no CRC error. Data internal to this card has been lost.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
ASU Rx FIFO Half Full	CPU Receive ASU FIFO Half Full: Watermark indication that this interface has received substantial ASU traffic. This stat is only meaningful for cards that contain a BPxxxx GPL; the FIFO stores data determined to be an ASU with no CRC error.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action required.
ASU Rx FIFO Full	CPU Receive ASU FIFO Full: Watermark indication that the ASU traffic is in excess of what the card can handle. ASUs will have been lost resulting in retransmission and other possible LVL1 errors. This stat is only meaningful for cards that contain a BPxxxx or IMTPCI GPL; the FIFO stores data	Relatively heavy traffic on this interface can cause these counts to increment. Seeing these counts in the field may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	determined to be an ASU with no CRC error.		
SSU Packet Rx	Safety Packets Received: This message type detects the loss of a card in the system if virtual connections between cards are lost.	Card insertion, removal, or boot, heavy traffic, abnormal conditions and/or software/hardware problems can result in these packets being generated.	None. These counts are an indication. No action required.
ASU Safety Pkt	ASU Safety Packets: ASU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
TSU Safety Pkt	TSU Safety Packets: TSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
BSU Safety Pkt	BSU Safety Packets: BSU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
SSU Safety Pkt	SSU Safety Packets: SSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Other Safety Pkt	Other Safety Packets Received: Possible message types are MSU, DSU, ISU, and/or HSU.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Pri Ctrl Rx Error	Primary control receive error: Corrupted packet received. Detected by hardware	Card insertion, removal, or boot	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Pri Ctrl Sanity Err	Primary Control Sanity Error: Internal hardware monitoring self check failed. Detected by hardware	Indicates that the hardware receive logic was unable to successfully process the	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
		incoming packet. May indicate a hardware problem.	continue, a problem may exist. Contact Customer Care Center.
IMT Receive FIFO Full	Deprecated.		None.
Pri Ctrl No SOM	Primary Control No Start of Message Error: Incoming data was detected without a start of message (SOM.) This stat is only meaningful for cards that contain a BPxxxx GPL.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Pri Ctrl Tx Err	Primary Control Transmit Error: Transmit logic encountered a problem sending a packet. Detected by hardware. This stat is only meaningful for application cards.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.
Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a software problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
FC Tx FIFO Half Full	Reserved	Reserved	Reserved
FC Tx FIFO Full	Reserved	Reserved	Reserved

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	May indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO 3/4 Full	Reserved	Reserved	Reserved
IMT By-pass FIFO Half Full	Watermark indication that this interface has backed to fill half on the FIFO. This stat is only meaningful for cards that contain a BLMCAP GPL.	May indicate that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.
IMT By-pass FIFO Full	By-pass FIFO overflowed data has been lost. This stat is only meaningful for cards that contain a BLMCAP GPL.	Very little if any data flows through this FIFO. May indicate a hardware problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced
Pass thru CRC Error	Reserved	Reserved	Reserved
Lost Multicast Pkt	Lost Multicast Packets: This counter increments when the interface detects that one of	Card insertion, removal, or boot. These events may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	these packets has not been delivered to a card in the list. This stat is only meaningful for application card columns.		exist. Contact Customer Care Center.
Invalid Interrupt	The interface generated a spurious interrupt. This stat is only meaningful for cards that contain an IMTPCI GPL.	May indicate a software or hardware defect.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced
Error Int Overflow	Deprecated	Deprecated	Deprecated
Large Pkt Error	Large Packet Error: The interface has detected packets larger than allowed in the data stream. This stat is meaningful for all cards except those containing the IMTPCI GPL.	Card insertion, removal, boot, or a hardware error. May indicate a hardware problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
MSU Retransmitted	Retransmissions occur when a transmitted MSU does not receive an acknowledgment (ASU) within an engineered timeout value. Detected by software. This stat is only meaningful for application cards.	Card insertion, removal, or boot. May indicate hardware, software or configuration problems.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
MSU Ret on error	MSU Returned On Error: Number of MSUs returned to the application as undeliverable. Each application is responsible for indicating their need for MSUs to be returned if undeliverable. This count is for messages that the application has deemed	Destination card is not available to receive packets.	None. MSU Returned on Error is an indication. No action is required.

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	important and requested that they be returned if undeliverable. Detected by software.		
VC OS Count	Virtual Circuit Out of Service Count: Count of times a Virtual Circuit (VC) on this card has gone Out of Service. Note: The A and B bus counts will be the same. For the VC to drop, communications on both busses must be lost. This stat is only meaningful for application cards.	Destination card is not available to receive packets, or software/hardware errors that cause the virtual connection(s) to be dropped. Could occur during normal maintenance (card replacement/upgrades, or booting).	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Bus OS Count	Reserved	Reserved	Reserved
Violation Error	Received an illegal character from the physical IMT transport (TAXI Interface). Detected by hardware	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Info: MSU Dropped no Rept	MSU Dropped With No Report: Number of undeliverable MSUs that are not being returned to the application. Note: This statistic may be non-zero after executing the rept-imt-lvl1 or clr-imt-stats command. During execution of these commands, the active MASP generates MSUs to unpopulated card slots. These MSUs result in an “MSU Dropped With No Report” count. To determine	Destination card is not available to receive packets.	None. MSU Dropped is an indication. No action is required.

Table 5-36. Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	the number of unexpected “MSU Dropped With No Report” occurrences, the active MASP must be excluded from the rept-imt-lvl1 card range.		

Level 1 IMT Statistics, Low Speed Performance Counts

The probable cause for all Level 1 IMT Statistics, Low Speed Performance Counts is normal behavior. These counts are information only, and no action is required.

These statistics are displayed when the **rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full** command is entered.

- All Packets—Number of packets transmitted on the IMT, all types
- All bytes—Number of bytes transmitted on the IMT, all types
- MSU Packets—Number of reliable delivery message data packets transmitted on the IMT
- MSU Bytes—Number of reliable delivery message data bytes transmitted on the IMT
- ASU Packets—Number of acknowledgment packets transmitted on the IMT
- ASU Bytes—Number of acknowledgment bytes transmitted on the IMT
- DSU Bytes—Number of best effort delivery message data bytes transmitted on the IMT
- HSU Packets—Number of mux card data packets transmitted on the IMT
- HSU Bytes—Number of mux card data bytes transmitted on the IMT
- TSU Bytes—Number of test bytes transmitted on the IMT
- TSU Packets—Number of test packets transmitted on the IMT
- LSSU Packets—Number of virtual circuit alignment packets transmitted on the IMT
- LSSU Bytes—Number of virtual circuit alignment bytes transmitted on the IMT
- BSU Packets—Number of broadcast data packets transmitted on the IMT
- BSU Bytes—Number of broadcast data bytes transmitted on the IMT
- SSU Packets—Number of Safety packets transmitted on the IMT
- SSU Bytes—Number of safety bytes transmitted on the IMT
- Othr Packets—Number of all packets types not counted by one of the above
- Othr Bytes—Number of all data bytes not counted by one of the above
- TAXI Util—Approximate percentage utilization of Low Speed data bus

High Speed Error Summary for Level 1 IMT Statistics

Table 5-37 displays the High Speed Error Summary for Level 1 IMT Statistics.

These statistics are displayed when the **rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full** command is entered.

Table 5-37. Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Rx Packet CRC Error	Fibre Channel Receive Packet with CRC Errors: Checksum error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Packet Format Error	Fibre Channel Receive Packet with Format Errors: Format error in received packet. Usually caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Disparity Error	Fibre Channel Receive Packet with Disparity Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Sync Lost Error	Fibre Channel Receive Lost Synchronization Errors: The interface lost sync on the received stream.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Code Word Error	Fibre Channel Receive code Word Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Packet SOM Before EOM	Fibre Channel Receive Packet with Start of Message without a previous End of Message Errors: The software received detected the start of a new packet before the end of the previous packet was detected.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.

Table 5-37. Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Bypass FIFO Half Full	Fibre Channel Bypass FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Bypass FIFO Full	Fibre Channel Bypass FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx FIFO Half Full	Fibre Channel Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Rx FIFO Full	Fibre Channel Receive FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Tx FIFO Half Full	Fibre Channel Transmit FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Tx FIFO Full	Fibre Channel Transmit FIFO Full: Watermark indication that this interface has transmitted substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full is an indication. No action is required.
IXP RX FIFO Half Full	Fibre Channel IXP Receive FIFO Half full: Watermark indication that this interface	Relatively heavy traffic on this interface can cause these	None. FIFO Half Full is an indication. No action is required.

Legend

- **CARD**—The IMT address of the card in hexadecimal
- **ELAPSED TIME (day - h:m:s)**—The amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the **clr-imt-stats** command. This is shown

in the format **day - h:m:s**, where **day** is the number of days that have elapsed, and **h:m:s** is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).

- **"--" IN THE STATISTICS COLUMN**—"—" in the statistics column signifies that the statistics count is not applicable for the corresponding Card type.
- **ERROR COUNT**—The IMT level 1 error statistics displayed in this report.
- **PERF COUNT**—The IMT level 1 performance statistics displayed in this report.
- **A BUS VALUE and B BUS VALUE**—The values of the IMT level 1 statistics on IMT bus A and IMT bus B. Refer to the Notes section for descriptions of the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions. Contact the Customer Care Center if the count is excessive in relation to other cards.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Packets are included in the counts:

SAFETY PACKET—When an IMT packet goes around the IMT, a pre determined value in the packet is decremented by each card. When this value reaches zero, the card that receives the value equal to zero logs this as a safety packet and removes the IMT packet from the IMT.

MESSAGE SIGNALING UNIT (MSU)—IMT packet containing data

ACKNOWLEDGEMENT SIGNALING UNIT (ASU)—**ack** for an MSU that is sent from the destination card back to the originating card.

TEST SIGNALING UNIT (TSU)—Typically used to keep the card on the bus. There are many types of TSUs one of which performs a heartbeat function.

BROADCAST SIGNALING UNIT (BSU)—Function is the same as an MSU except that each card will process the BSU and then copy it to the next card for processing. Used for IMT maintenance functions.

SAFETY SIGNALING UNIT (SSU)—Anytime a packet times out (Safety Packet), the card that logged a safety packet sends an SSU to make sure the original destination card is still on the IMT bus.

ISOLATION SIGNALING UNIT (ISU)—These are only used by the Fault Isolation test (tst-imt), in an attempt to isolate a hard failure on an IMT bus.

OTHER PACKETS AND OTHER BYTES—These include the ISUs when Fault Isolation test (tst-imt) is run (IMT bus is inhibited) and TVG packets when the IMT bus is allowed.

rept-imt-lvl2

Report IMT Level 2

Use this command to display the IMT level 2 statistics for a card. This report displays IMT traffic statistics for either one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the **loc** or **l** parameters), whose statistics pool is queried for report information, and another card (specified with the **sloc** or **s** parameter).

- Report statistics between the source card and a range of cards (specified with both the **sloc** and **eloc** or the **s** and **e** parameter combinations).

Keyword: rept-imt-lvl2

Related Commands: clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl1, rept-stat-imt, rmv-imt, rst-imt, tst-imt

Command Class: System Maintenance

Parameters

:b= (optional)

IMT bus identification.

Range: **a, b, both**

a — Displays statistics for IMT bus A.

b — Displays statistics for IMT bus B.

both — Displays statistics for both IMT busses, A and B.

Default: **both**

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-35 to map the values by card location).

Range: **0-251**

The value can be specified in decimal (**0–251**) or hexadecimal (**h'00–h'fb**).

Default: If the **s** parameter is specified, the default is the **s** parameter value.

If the **s** parameter is not specified, the default is **251**.

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: If **sloc** is specified—current **sloc** value; displays information for one card

If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

:l= (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for report information.

Range: **0-251**

(See the *Installation Manual – EAGLE 5 ISS* for an illustration of the card locations.)

:loc= (optional)

Source card location. The location of the card whose "statistics pool" is to be queried for report information.

Range: **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-35 to map the values by card location).

Range: **0-251**

The value can be specified in decimal (**0-251**) or hexadecimal (**h'00-h'fb**).

Default: If **e** is specified—current **l** parameter value.

If **e** is not specified—**0**.

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: If **eloc** is specified—current **sloc** value.

If **eloc** is not specified—IMT address 0 (**s=0**).

:trm= (optional)

The serial port (printer location) where the report is to be sent.

Range: **1-40**

Default: The report displays on the terminal where the command was issued.

Example

```
rept-imt-lvl2:l=00:s=00:e=02:b=a
```

Dependencies

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

The **rept-imt-lvl2** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **tst-imt**.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified; but not both at the same time.

A card location must be specified that is valid and defined in the database.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

None

Output

If the source card location falls within the range of cards specified with ~~slc~~**sloc**/**eloc** or **s/e** parameters, then the output report for the source card shows zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports the values or pegs received, transmitted, or re-transmitted across the IMT bus.

rept-imt-lvl2:sloc=1101:eloc=1115:loc=1101

Legend

CARD—The IMT address of the card location specified by the **I** parameter in this command in hexadecimal

BUS—The IMT bus for which the IMT level 2 statistics are being reported

FIELD—The IMT level 2 statistics displayed in this report

00 - EF—The IMT address of the cards on the IMT bus in hexadecimal

LINK STATUS—The status of the link, either ALGN (aligned) or OS (out of service)

OS COUNT—The number of times the link has cycled between being aligned and being out of service

TRANSMIT BSN—The number of BSNs transmitted.

TRANSMIT FSN—The number of FSNs transmitted

RECEIVE BSN—The number of BSNs received

RECEIVE FSN—The sequence number for the next FSN that the source card location expects to receive

UNACK MESSAGES—The number of unacknowledged messages received

INVALID LENGTH—The number of messages received with invalid length indicators

INVALID RX BSN—The number of invalid BSNs received

INVALID RX FSN—The number of invalid FSNs received

INVALID LSSU—The number of invalid LSSUs received

INVALID ASU—The number of invalid ASUs received

RTB ADDRESS—The address of the retransmission buffer, in hexadecimal.

RETX COUNT—The number of re-transmitted MSUs

MINIMUM ACK TIME—The minimum amount of time for an acknowledgment, in milliseconds

MAXIMUM ACK TIME—The maximum amount of time for an acknowledgment, in milliseconds

rept-meas

Report Measurements

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

Keyword: rept-meas

Related Commands: chg-meas, copy-meas, rept-ftp-meas, rtrv-meas-sched

Command Class: Link Maintenance

Parameters

:enttype= (mandatory)

The entity type to report on.

Range: **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **origininc**, **stp**, **stplan**, **tt**, **sctpasoc**, **sctpcard**, **ua**, **idpr**
link — Measurements for signaling links
lnkset — Measurements for linksets
lnp — Measurements for local number portability
lsdestni — Measurements for linkset destination network identifiers
lsonismt — Measurements for ISUP message type screening
lsorigni — Measurements for linkset originating network identifiers
mapscrn — Measurements for GSM MAP message screening
np — Measurements for INP, INP CRP, G-Port, A-Port, MO-based GSM SMS NP, MO-based IS41 SMS NP, IGM, MT-Based GSM SMS NP, and MT-Based IS41 SMS NP
origni — Measurements for originating network identifiers greater than 5
origininc — Measurements for originating network identifiers (less than 5, small networks) for network clusters
stp — Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP
stplan — Measurements for STP Local Area Network data links
tt — Measurements for translation types
sctpasoc — Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
sctpcard — Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)
ua — Measurements per application server/association for the M3UA and SUA protocols
idpr — Measurements for IDPR

:type= (mandatory)

The type of measurement report.

Range: **avl**, **avld**, **avldth**, **comp**, **gtwy**, **mtcd**, **mtcdth**, **mtch**, **mtcs**, **nm**, **rbase**, **systot**
avl — Availability measurements
avld — Daily availability measurements
avldth — Day to hour availability measurements.
comp — Component measurements
gtwy — Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.
mtcd — Daily maintenance measurements
mtcdth — Day-to-hour maintenance measurements
mtch — Hourly maintenance measurements
mtcs — Link/linkset maintenance status
nm — Network management, on-demand
rbase — Schedule-report type record base measurements
systot — STP system totals

:aname= (optional)

Association name. This parameter specifies the name assigned to the association in the IPAPSOCK table.

Range: *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:appl= (optional)

The GPL to report measurements on.

This parameter can be used only with the **stplan-avl (enttype=stplan:type=avl)** measurement report.

Range: *xyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmansi—Used by the LIM cards to support the high-speed ATM signaling link feature

atmhc—Supports functionality for the E5-ATM card. The E5-ATM card runs either the ATMANSI or ATMITU application. The GPL allows the card to support up to 2 signaling links.

atmitu—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

ipghc—Used by E5-ENET cards to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes

ipgwi—Used by SSED CM cards for TCP/IP point-to-point connectivity for ITU point codes

iplhc—Used by E5-ENET cards for TCP/IP point-to-point connectivity for both ANSI and ITU point codes

iplim—Used by SSED CM cards for TCP/IP point-to-point connectivity for ANSI point codes

iplimi—Used by SSED CM cards for TCP/IP point-to-point connectivity for ITU point codes

sccphc—Used by E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

ss7ipgw—Used by SSED CM cards to support TCP/IP point-to-multipoint connectivity

ss7ml—Support functionality for MPL and the E1/T1 MIM cards. MPL cards run the SS7ANSI application on a LIMDS0 card (as in the command **ent-**

card:type=limds0:appl=ss7ansi); the GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. MPL cards support only the DS0 interface. E1/T1 MIM card runs either the SS7ANSI or CCS7ITU application; the GPL allows the card to support 8 signaling links for E1 and T1 functions.

vsccp—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a Service Module card is present, then the GPL processes normal GTT traffic.

vxwslan—Used by SSED CM cards to support the STP LAN application

:asname= (optional)

Application server name. This parameter specifies the name of the application server.

Range: *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:day= (optional)

The specific day of the week for daily measurement reports.

Range: **mon, tue, wed, thu, fri, sat, sun**

Default: The previous single day report is generated.

:hh= (optional)

The specific half-hour interval. The **hh** parameter implies the ending time for the collection interval; for example, **hh=0300** generates a report for **2:30-3:00**.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

Default: The **hh** parameter value is not given.

:link= (optional)

The link on the card specified in the **loc** parameter

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

Default: The **link** parameter value is not given.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Default: The **loc** parameter value is not given.

:lsn= (optional)

The name of the linkset for which link or linkset measurements are reported.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

Default: The **lsn** value is not given.

:nc= (optional)

The network cluster for the specified GTWY measurement report.

Range: **0-255**

Default: The **nc** parameter value is not given.

:ni= (optional)

The network indicator for the specified GTWY measurement report.

Range: **1-255**

Default: The **ni** parameter value is not given.

:nzo= (optional)

Print non-zero measurements only.

Range: **yes, no**

Default: **yes** for types **avl**, **avld**, and **avldth**.

This parameter is not used with the other report types.

:period= (optional)

The relative time period to report.

Range: **last, specific, active, all**

last— The previous collection interval
specific— A specific half-hourly interval (specified with the **hh** parameter)
active— The current collection interval
all— All collection intervals.

Default: The **period** parameter value is not given.

:qh= (optional)

The specific quarter-hour interval. The **qh** parameter implies the ending time for the collection interval; for example, **qh=0315** generates a report for **3:00-3:15**.

Range: **0000-2400**

hhmm where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

Default: The **qh** value is not given.

:trm= (optional)

The serial port (printer location) where the report is to be sent.

Range: **1-16**

Default: The **trm** value is not given.

:tt= (optional)

A specific translation type to be reported.

Range: **0-255**

Default: The **tt** parameter value is not given.

Example

```
rept-meas:enttype=link:type=avl:loc=1201:link=a
rept-meas:enttype=lnp:type=mtch:period=specific:hh=1300
rept-meas:enttype=lnp:type=mtcd:period=specific:day=tue
rept-meas:type=systot:enttype=tt:tt=26
rept-meas:type=mtcd:enttype=sctpasoc:aname=assoc01
rept-meas:type=mtcdth:enttype=ua:aname=assoc01:asname=appserv01
```

Dependencies

The **rept-meas** command cannot be used to specify a report type if that report type is currently printing.

The valid parameter combinations depend on the report type specified. These combinations are shown in Table 5-38. An X in a cell indicates that the parameter is valid for the report type shown.

Table 5-38. Valid Parameter Combinations for the **type** Parameter

Parameter Value	Report Types (type parameter)											
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase
enttype=												
stp	X		X	X		X					X	X
link		X	X	X		X	X	X	X	X		X
lnkset		X	X	X		X	X				X	X
lnp			X		X							
tt	X											
stplan	X		X	X				X				
origni											X	

Table 5-38. Valid Parameter Combinations for the **type** Parameter

Parameter Value	Report Types (type parameter)											
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase
origininc											X	
lsdestni											X	
lsonismt											X	
lsorigni											X	
np			X		X

sctpasoc		X	X	X								
sctpcard		X	X	X								
ua		X	X	X								
idpr	X											
period=												
last	X	X	X	X	X		X	X	X	X	X	
specific	X	X			X			X			X	
active		X				X	X	X				X
all			X					X				
nzo								X	X	X		

When the Enhanced GSM MAP Screening (EGMS) feature is turned on, this command cannot be used to generate EGMS measurements reports.

The entity specified by the **loc** parameter must be equipped in the database.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress when report type **mtcd** or **mtcdth** is specified.

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

If the **nc** parameter is specified for origininc reports, then the **ni** parameter must be specified.

If the **ni** parameter is specified for origin reports, then measurements data must be available at the time the command is entered.

The **day** parameter can be specified only for report type **mtcd** and entity types **lnp** and **mapscrn**.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **enttype=lnp** parameter can be specified.

The GSM Map Screening feature must be turned on before the **enttype=mapscrn** parameter can be specified.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the **qh** parameter can be specified.

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**mtcd** and **nm** are excluded with message "E2307: QH or HH is not valid for this TYPE"). An hourly boundary must be specified for report type **mtch** (that is, only half hours ending in 00, such as 0100, 0200 or 0300).

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter cannot be specified.

If the **period=active** parameter is specified, then the **hh** and **qh** parameters cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified. The **hh**, **qh**, and **day** parameters can be specified only if the **period=specific** parameter is specified.

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only quarter hours ending in 00, such as 0100, 0200 or 0300).

The **hh** and **qh** parameters cannot be specified if a value of **avld**, **mtcd**, **nm**, **rbase**, or **mtcs** is specified for the **type** parameter.

If the **link** parameter is specified, the **loc** parameter must be specified.

The **lsn** and **loc** parameters cannot be specified together in the command.

If the **enttype=link** parameter is specified, then the **loc** and **port** parameters or the **lsn** parameter must be specified.

The **enttype=stplan** and the **type=avl** parameters must be specified before the **appl** parameter can be specified.

The **period=active** parameter cannot be specified when the **enttype=stp** parameter or the **enttype=tt** parameter is specified.

If a value of **idpr**, **lnp**, **mapscrn**, **np**, **origni**, **origininc**, **stp**, **stplan**, or **tt** is specified for the **enttype** parameter, or if the **type=systot** parameter is specified, then the **lsn** parameter cannot be specified.

For entity type **avl**, if **period=all** is specified, the **loc** and **port** parameters must be specified.

A value of **avld**, **avldth**, or **avldth** must be specified for the **type** parameter before the **thenzo=yes** parameter can be specified.

The **appl** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp**, the **trm** parameter cannot be specified because LNP measurements can be written only to the FTA. To retrieve this data, use the procedure described with the **act-file-trns** command information.

The **type=systot** and **loc** parameters cannot be specified in the same command line.

If the **type=gtwy** parameter is specified, and the value of the **enttype** parameter is **lsorigni**, **lsdestni**, or **lsonismt**, then the **ni** parameter cannot be specified for ITU linksets. The **ni** parameter is allowed only for ANSI linksets.

If the **type=gtwy** parameter is specified, and a value of **lsdestni**, **lsonismt**, or **lsorigni** is specified for the **enttype** parameter for an ITU linkset, then only the **lsn** parameter can be specified.

If the **enttype=sctpcard** parameter is specified, then the card in the location specified by the **loc** parameter must be an IPLIMx, IPGWx, or IPSG card.

The **enttype=sctpasoc** or **enttype=ua** parameter must be specified before the **aname** parameter can be specified.

The **enttype=ua** parameter must be specified before the **asname** parameter can be specified.

The G-Port, INP, or AINPQ feature must be turned on before the **entitytype=np** parameter can be specified.

If the **enttype=sctpcard** parameter is specified, then the **loc** parameter must be specified.

If the **enttype=sctpcard** parameter is specified, then a card must be installed in the location specified by the **loc** parameter.

The **enttype=link** parameter must be specified before the **link** parameter can be specified.

The **type=gtwy** parameter and the **enttype=originnc** parameter must be specified before the **nc** value can be specified. If the **enttype=lnp** parameter is specified, then the **nc** value cannot be specified.

The **type=gtwy** parameter must be specified, and a value of **lsdestni**, **lsonismt**, **lsorigni**, **origni**, or **originnc** must be specified for the **enttype** parameter before the **ni** value can be specified. If the **enttype=lnp** parameter is specified, then the **ni** value cannot be specified.

The **enttype=tt** parameter must be specified before the **tt** parameter can be specified. If the **enttype=tt** parameter is specified, then the **tt** parameter must be specified.

If a value of **sctpasoc** or **ua** is specified for the **enttype** parameter, then the **aname** parameter must be specified.

The association specified by the **aname** parameter must be provisioned in the system.

If the **enttype=ua** parameter is specified, then the **asname** parameter must be specified.

The application server specified by the **asname** parameter must be provisioned in the system.

The association specified by the **aname** parameter must be assigned to the application server specified by the **asname** parameter.

The **lsn** and **link** parameters cannot be specified together in the command.

If the **period=all** parameter is specified, then the **hh** and **qh** parameters cannot be specified.

The value specified for the **lsn** parameter must already exist in the database.

The A-Port, G-Port, IS41 GSM Migration, or Prepaid SMS Intercept Ph1 feature must be enabled, or the INP, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the **mtchnp=on** parameter or the **mtcdnp=on** parameter can be specified.

The value specified for the **appl** parameter must be a supported GPL.

If the Integrated Measurements feature is turned on, then a value **lnp**, **np**, or **mapscrn** cannot be specified for the **enttype** parameter.

If the **loc** parameter is specified, then a value of **stplan**, **link**, or **sctpcard** must be specified for the **enttype** parameter. If the **enttype=lnkset** parameter is specified, then the **loc** parameter cannot be specified.

If the **enttype=link** parameter is specified, then the values specified for the **loc** and **link** parameters must already exist in the database.

Period/type combinations:

- If a value of **rbase** or **mtcs** is specified for the **type** parameter, then a value of **active** must be specified for the **period** parameter.
- If a value of **avld**, **avldth**, **mtcdth**, or **nm** is specified for the **type** parameter, then the **period=specific** parameter cannot be specified.

- If the **period=active** parameter is specified, then a value of **avld**, **avldth**, **mtcd**, **mtch**, **mtcdth**, or **systot** cannot be specified for the **type** parameter.
- The **type=avl** parameter OR the **enttype=lnp** and **type=mtcd** parameters must be specified before the **period=all** parameter can be specified.
- If the **type=mtcd** and **period=specific** parameters are specified, then a value of **lnp**, **mapscrn**, or **np** must be specified for the **enttype** parameter.

Notes

INP, GSM MAP screening, LNP, G-Port, A-Port, and IGM measurements are sent to the FTA (file transfer area) rather than to the EAGLE 5 ISS terminal.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The **rept-meas** command must be entered again.

When the **rept-meas** command is executed, the following warning message may appear:

```
Measurement data represents an incomplete interval
```

This message indicates that one or more cards did not respond to the request for measurements because the card was Out-Of-Service. The message does not indicate that data was lost.

Output

NOTE: Refer to the *Measurements Manual* for the current release for **rept-meas output examples.**

rept-stat-alm

Report Status Alarm

Use this command to provide status of all alarms.

Keyword: **rept-stat-alm**

Related Commands: **dact-alm-trns**, **rept-stat-clk**, **rept-stat-trbl**, **rtrv-obit**, **rtrv-trbl**

Command Class: System Maintenance

Parameters

:cli= (optional)

CLLI string. This parameter allows the user to see only alarms that pertain to a particular CLLI.

Range: `aaaaaaaa`

:dev= (optional)

Device. This parameter provides the type of device for which alarms are displayed. The **display=inhb** parameter must be specified when this parameter is specified.

Range: **applsock**, **as**, **card**, **cdt**, **clock**, **dlk**, **ls**, **lmsconn**, **route**, **slk**, **trm**, **rtx**, **e1port**, **t1port**, **tps**, **enet**

:display= (optional)

Type of alarms to be displayed. When the **disply=inhb** parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The **dev** parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

Range: **inhb**

:dur= (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the **display=inhb** parameter is specified.

Range: **perm, temp, timed**

:edate= (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

Range: **101-991231**

Specify the date in the format *year*, followed by *month*, followed by *day*.

Example

```
rept-stat-alm
rept-stat-alm:display=inhb:dev=card
rept-stat-alm:display=inhb:clli=slkset1:dev=ls
rept-stat-alm:display=inhb
rept-stat-alm:display=inhb:dur=timed
rept-stat-alm:display=inhb:dur=timed:edate=040520
```

Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **dur**, **dev** or **clli** parameter can be specified only if the **display=inhb** parameter is specified.

The **edate** parameter can be specified only if the **dur=timed** parameter is specified.

The **dev** parameter can have only the values **slk**, **ls**, or **route** if the **clli** parameter is specified.

The **dur** parameter must be compatible with the specified device.

The value specified for the **clli** parameter must already exist in the DSTN table.

The value specified for the **edate** parameter must be greater than the system date.

Notes

None

Output

The following example shows output when the system is clean and before a maintenance baseline has been established:

rept-stat-alm

```
rlghncxa03w 10-02-27 15:00:53 EST EAGLE 42.0.0

ALARM INHIBIT REPORT

DEVICE	DEVICE IDENTIFIER	DURATION	INH LVL	ALM LVL	DATE	TIME
CARD	1301	PERM	MAJR	MAJR	---	---

Command Completed.

;

The following example includes the Alarm Inhibit report for multiple device types. It includes point codes with point code subtype prefixes, and exception routes that require a second line of display to uniquely identify the exception class/criteria of the routes. A plus sign (+) following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

Legend

ALARM TRANSFER—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.

ALARM MODE—Displays whether the critical, major, and minor alarms are silent or audible

ALARM FRAME 1—The number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1).

ALARM FRAME 2—The number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2).

ALARM FRAME 3—The number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3).

ALARM FRAME 4—The number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4).

ALARM FRAME 5—The number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5).

ALARM FRAME 6—The number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6).

ALARM FRAME GPF—The number of critical, major, and minor alarms detected at the MPS (multi-purpose server). If the LNP feature is turned on, the number includes alarms for any applications running on the MPS. If the G-Flex, G-Port, INP, or AINP Q feature is turned on, the number includes alarms for any applications running on the GSM subsystem and the DSM/EPAP links.

PERM. INH. ALARMS—The number of alarms that are permanently inhibited per alarm level.

TEMP. INH. ALARMS—The number of alarms that are temporarily inhibited per alarm level.

TIMED. INH. ALARMS—The number of alarms that are timed inhibited per alarm level.

ACTIVE ALARMS—The number of alarms still active per alarm level.

TOTAL ALARMS—The total number of alarms per alarm level. The inhibited alarm count plus the active alarm count equals the total alarm count.

CRIT—Critical alarms with silent/audible indicator.

MAJOR—Major alarms with silent/audible indicator.

MINOR—Minor alarms with silent/audible indicator.

Range: *aaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter
Default: All IP application sockets are reported

Example

```
rept-stat-applsock
rept-stat-applsock:port=b
```

Dependencies

The **sname** parameter value, if specified, must exist in the Socket table.

The value specified for the **host** parameter must begin with an alphabetic character and can contain **a..z**, **A..Z**, **0..9**, - (hyphen), or . (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

This command displays the primary states (PST) and the secondary state (SST). Primary states are:

- IS-NR—In-service normal
- IS-ANR—In-service abnormal (congested)
- OOS-MT—Out of service
- OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Secondary states are:

- ALMINH—Alarm inhibited
- OOS—Out-of-service
- NEA—Near-end allowed
- FEA—Far-end allowed
- NEP—Near-end prohibited
- FEP—Far-end prohibited

Output

rept-stat-as**Report Status AS Association**

Use this command to generate a report of the Application Server (AS) association status.

Keyword: **rept-stat-as**

Related Commands: **chg-as**, **ent-as**, **rtrv-as**

Command Class: System Maintenance

Parameters

:aname= (optional)

Association name to report on. When the **aname** parameter is specified, the **rept-stat-as** command will report the ASP states for a given association in all of the AS's that it is assigned to.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

:asname= (optional)

Application Server name; the AS name to report on. When the **asname** parameter is specified, the **rept-stat-as** command will report the PST, SST, ASP state, and ASP-ID for each association in the AS.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
rept-stat-as
```

Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

Output

rept-stat-as

```

rept-stat-assoc

Report Status SCTP Association

Use this command to generate a report of the SCTP association's status.

Keyword: rept-stat-assoc

Related Commands: chg-assoc, ent-assoc, rtrv-assoc

Command Class: System Maintenance

Parameters

:aname= (optional)

Name of association to report on.

Range: *ayyyyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

:lhost= (optional)

The Local Host name as defined in the IP Host table.

[illegible]

~~~~~  
A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

**:link=** (optional)

The signaling link associated with this socket.

## Output

**rept-stat-assoc**

## rept-stat-card

## Report Status Card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

**Keyword:** **rept-stat-card**

**Related Commands:** **dlt-card, ent-card, init-card, rmv-card, rst-card, rtrv-card**

**Command Class:** System Maintenance

### Parameters

**:appl=** (optional)

Application. This parameter is specified to report the status of cards running the specified application.

**Range:** xxxxyyy

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

**atmansi**—The application is used by LIM-ATM cards and E5-ATM cards to support ATM high-speed signaling links. It is also used by the E5-ATM card to support T1 functions.

**atmitu**—The application is used by E1 ATM cards and E5-ATM cards to support E1 high-speed signaling links. It is also used by the E5-ATM card to support E1 functions.

**ccs7itu**—This application is used by E1/T1 MIM cards, and HC-MIM cards for ITU MTP functions.

**eroute**—This application is used by STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support functions.

**gls**—This application is used by TSM cards and E5-TSM cards for downloading gateway screening to LIM and Service Module cards.

**ipgwi**—This application is used by SSEDCCM cards and E5-ENET cards for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 125 cards to be assigned the **ipgwi** application.

**iplim**—This application is used by SSEDCCM cards and E5-ENET cards for TCP/IP point-to-point connectivity for ANSI point codes.

**iplimi**—This application is used by SSEDCCM cards and E5-ENET cards for TCP/IP point-to-point connectivity for ITU point codes.

**ips**—This application is used by IPSM cards and E5-IPSM cards for the IP User Interface feature.

**ipsg**—This application is used by E5-ENET cards (IPSG cards) to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

**mcp**—This application is used by MCPM cards for the Measurements Platform feature.

**ss7ansi**—This application is used by MPL cards, E1/T1 MIM cards, HC-MIM cards, and E5-E1T1 cards for ANSI MTP functions.

**ss7ipgw**—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 125 cards to be assigned the **ss7ipgw** application.

**stplan**—This application is used by DCM cards and E5-ENET cards to support STP LAN functions.

**vsccp**—This application is used by Service Module cards to support EPAP-based features, and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the **vsccp** GPL processes normal GTT traffic.

**:links=** (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (**loc**).

**Range:** **all, equip, unequip**

**all**— Reports the maximum number of links available on the card in the specified **loc**

**equip**— Reports only links that are equipped

**unequip**— Reports only links that are unequipped

**Default:** **equip**

**:loc=** (optional)

Card address. The card location as stenciled on the shelf of the system.

**Range:** **1101-1117, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Default:** A status of all cards is displayed.

**:mode=** (optional)

Mode. The type of report to display (full or summary).

**Range:** **full**

**Default:** A summary report is displayed.

**:stat=** (optional)

Primary state filter. This parameter cannot be used with **thloc** or **mode** parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all**— All of the primary states

**alminh**— Alarms inhibited

**anr**— In service abnormal (IS-ANR)

**dsbld**— Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**— Out of service maintenance (OOS-MT)

**nr**— In service normal (IS-NR)

**Default:** **all**

### Example

```
rept-stat-card
```

```
rept-stat-card:loc=1201
```

```
rept-stat-card:loc=1201:mode=full
```

```
rept-stat-card:stat=alminh
```

```
rept-stat-card:appl=ss7ansi
```

**rept-stat-card:loc=1205:links=equip:mode=full**

### Dependencies

No other command can be in progress when this command is entered.

The **mode** parameter can be specified only when the **loc** parameter is specified.

Only one of the **loc** parameter, the **stat** parameter, and the **appl** parameter can be specified in the command.

The shelf and card must be equipped.

The following applications are valid for the **appl** parameter: **ss7ansi**, **gls**, **ccs7itu**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vsccp**, **atmitu**, **ipgwi**, **ips**, **ipsg**, **eroute**, **mcp**.

### Notes

LIM cards show TVG results for SNM (signaling network management), SCCP, and SLAN traffic. Service Module cards show only SNM traffic statistics for TVG.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The **mode=full** parameter gives more information than the summary report.

In the output, the SCCP service card field shows which TSM is providing the specified card with GTT service.

The group ticket voucher (TVG) status for low-speed signaling links, ATM high-speed signaling links, and TSMs is displayed when the **mode=full** and **loc** parameters are specified. The status displayed is for the previous 5 minutes and the previous 24 hours.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

E1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist, the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the **links=all** parameter is specified, then the maximum number of supported SS7 links on the card is displayed as shown. If the **links=unequip** parameter is specified, then the number of links displayed is equal to the maximum supported links minus the provisioned links. If the **links=equip** parameter is specified, then only the provisioned links are displayed.

Maximum Supported Links Based on Card Type and GPL

| GPL with Card      | Maximum Supported links |                    |
|--------------------|-------------------------|--------------------|
|                    | Card is seated          | Card is not seated |
| ATMANSI on LIM-ATM | 1                       | 3                  |
| ATMHC on E5-ATM    | 3                       | 3                  |
| SS7ML on E1/T1 MIM | 8                       | 64                 |

|                  |    |    |
|------------------|----|----|
| SS7HC on E5-E1T1 | 32 | 64 |
| SS7HC on HC-MIM  | 64 | 64 |
| IPLIMx on EDCM   | 8  | 16 |
| IPLHC on E5-ENET | 16 | 16 |
| IPGWx on EDCM    | 1  | 1  |
| IPGHC on E5-ENET | 1  | 1  |
| IPSG on E5-ENET  | 32 | 32 |
| SS7ML on MPL     | 8  | 8  |

The CARD WARNING field in the command output indicates a specific condition that can hinder the normal functioning of a card. For HC-MIM and E5-E1T1 cards, the "Obsolete Framer" warning indicates that a port configured on the card may get stuck in a Loss of Frame (LOF) state. If an HC-MIM card or E5-E1T1 card displaying this warning is reloaded, and one of the ports on the card is reporting LOF, then the OAM reboots the card up to 5 times to attempt to clear the LOF condition when the card changes state from IS-ANR to IS-NR.

#### **Fast Copy Cards**

E5-ENET cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

## Output

The clock status fields are reported when the **mode=full** report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are ----, **Idle**, **Active**, and **Fault**. The meanings of these values are:

---- (dashes)—Undefined, card must be OOS

**Idle**—Clock is available but is not being used by the card

**Active**—Clock is available and is being used by the card

**Fault**—Clock is unavailable

**Idle** and **Active** are shown when the CLK or HS CLK distribution to the card is good. The **Active** value does not denote that the card is actually using the clock source for link alignment. Use the **rt rv-slk**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

If the **mode=full** parameter is specified for an FC-enabled card, and Fast Copy functionality has been provisioned for the GPL (see the **chg-eisopts** command), then Fast Copy status and FC Link status is shown. For an E5-ENET card running the IPGHC GPL, Fast Copy and Fast Copy link status is shown only when the card is in IS-NR state.

Abbreviated output is indicated by 3 vertical dots as shown:

.  
.  
.

Card TYPE "ENET" is displayed if an E5-ENET card is not installed for an IPSG application. If an E5-ENET card (IPSG card) is installed, card TYPE "E5ENET" appears.

This example displays the card status for the GPSM-II of MASP A located in slot 1113, which is currently active.

This example also shows a Hardware Verification Code. The HW VERIFICATION CODE field is shown only in the **mode=full** report. "-----" is shown for cards with valid hardware. A numerical value is shown when invalid hardware is detected. All such cards will be auto-inhibited. The numerical values are listed in Table 5-39. The MDAL and HMUX cards do not display the field in **mode=full** reports on their locations.

### Legend

- **CARD**—The location of the card.
- **VERSION**—The version number of the application loaded on the card. Dashes ( - - - - ) in the version column indicate one of the following conditions about the card:
  - The card is configured but is not physically present in the system.
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- **APPL**—The application loaded on this card.
- **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

The group ticket voucher status is displayed in these fields: SCCP TVG RESULT (for SCCP messages), SLAN TVG RESULT (for STPLAN messages), and SNM TVG RESULT (for SNM messages). Group ticket voucher status output is displayed as a series of these letters:

**G**—Service Granted. Indicates normal system behavior.

**D**—Service Denied. Indicates an overload, but the group ticket voucher hardware and software are working correctly.

**N**—No granter in the system. For GTT or STPLAN traffic, there can be no Service Module cards or STPLAN in the system. If there are Service Module cards or STPLAN in the system, then a serious failure is indicated (hardware or software bug or hardware failure).

**H**—Hardware time-out. Indicates the hardware timed out waiting for a group ticket voucher packet to return. Group ticket voucher packets can be lost when a card is plugged in or booted. This is a serious condition if cards have not been connecting or disconnecting from the IMT. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced..

**S**—Software time-out. No result was ever returned from hardware, indicating a probable hardware failure.

**I**—Invalid result from hardware. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced.

The HW VERIFICATION CODE field is shown only in the mode=full report. ----- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

\* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

**Table 5-39.** Auto-Inhibit Hardware Verification Codes

**rept-stat-cdl****Report Command Driven Loopback Status**

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receive.

**Keyword:** **rept-stat-cdl**

**Related Commands:** **act-cdl, dact-cdl**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

SS7 signaling links. The signaling links that is being tested.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** All signaling links that are in CDL testing are displayed.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All cards containing signaling links that are in CDL testing are displayed.

**:loopback=** (optional)

Loopback test type.

**Range:** **line, payload**

The **payload** value is valid only on LIM-ATM and E1-ATM cards.

**Default:** All loopback tests are displayed.

**Example**

**rept-stat-cdl**

```
rept-stat-cdl:loc=1201
rept-stat-cdl:loc=1203:link=a
rept-stat-cdl:loopback=payload
```

### Dependencies

If the **link** parameter is specified, the **loc** parameter must be specified.  
 The card location specified in the **loc** parameter must be equipped.  
 The signaling link specified in the **link** parameter must be equipped.  
 This command is not available during upgrade.  
 The card location specified in the **loc** parameter cannot be reserved by the system.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information

### Output

```
rept-stat-cdl
tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK      CDL      CDL-TIME
1102,A1   LINE      00:04:01
1201,A    PAYLOAD   01:04:11
1203,A    LINE      00:22:21
1203,B    LINE      20:04:01
1208,A    LINE      01:05:22
1211,A    PAYLOAD   00:14:01
;
```

### Legend

**SLK**—The card and assigned signaling link that is in CDL testing.

**CDL**—Command Driven Loopback test type (LINE or PAYLOAD).

**CDL-TIME**—The time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

## rept-stat-cdt

### Report Status Customer Defined Troubles

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

**Keyword:** **rept-stat-cdt**

**Related Commands:** **act-alm-trns**, **canc-alm-trns**, **dact-alm-trns**, **rept-stat-clk**, **rept-stat-trbl**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

```
rept-stat-cdt
```

**Dependencies**

No other status command can be in progress when this command is entered.

**Notes**

These troubles are customer-defined and configured by the factory.

**Output****rept-stat-cdt**

```
rlghncxa03w 04-01-07 20:20:43 EST EAGLE 31.3.0
ID          ALARM STATUS
1    *C 0058 Critical Customer Trouble detected
2    *C 0050 Critical Holdover Clock trouble detected
3    *C 0058 Critical Customer Trouble detected
4    *C 0058 Critical Customer Trouble detected
5    I ** 0059 Major Customer Trouble detected
6    ** 0052 Major Holdover Clock trouble detected
7    ** 0059 Major Customer Trouble detected
8    ** 0059 Major Customer Trouble detected
9    I * 0060 Minor Customer Trouble detected
10   * 0054 Minor Holdover Clock trouble detected
11   * 0060 Minor Customer Trouble detected
12   * 0060 Minor Customer Trouble detected
13   * 0060 Minor Customer Trouble detected
14   I * 0060 Minor Customer Trouble detected
15   * 0060 Minor Customer Trouble detected
16   * 0060 Minor Customer Trouble detected
;
```

**Legend**

**ID**—The customer defined trouble ID number followed by the status of the customer-defined trouble.

**ALARM STATUS**—The status of the alarm for the specified device.

**rept-stat-clk****Report Status Clock**

Use this command to display the clock status summary for cards in the system.

**Keyword:** rept-stat-clk

**Related Commands:** rept-stat-card, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-sccp, rept-stat-slk, rept-stat-trbl

**Command Class:** System Maintenance

**Parameters**

**:mode=** (optional)

Display mode. When **mode=full** is specified, the "Cards with bad clock source" section of the report is displayed

**Range:** full

**Example**

```
rept-stat-clk
```

```
rept-stat-clk:mode=full
```

**Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

## Notes

The clock status report includes the status of all the clocks in the system (Clock A, Clock B, Clock I, High Speed (HS) Clock A, HS Clock B, etc).

The Time Slot Counter Synchronization (TSC) clock appears only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the **chg-feat** command.

The Composite clock sections of the report are the *Primary Comp Clock (CLK)* and the *Secondary Comp CLK* fields in the COMPOSITE SYSTEM CLOCK section: the summary of the number of cards having bad status or using COMP CLKs; and the *CLK* columns in the "Cards with bad clock source" section that appears when the **mode=full** parameter is specified.

The HS clock sections of the report are the *Primary HS Clock (CLK)*, *Secondary HS CLK*, *HS CLK TYPE*, and *HS CLK LINELEN* fields in the HIGH SPEED SYSTEM CLOCK section: the summary of the number of cards having bad status or using HS CLKs; and the *HS CLK* columns in the "Cards with bad clock source" section that appears when the **mode=full** parameter is specified.

HS clock capable cards can support a link that is provisioned to use HS Master Timing. These cards include all cards with type **lime1** or **limt1** and all cards that run the **atmansi** or **atmitu** applications. The clock status values are the same as those listed in the **rept-stat-card:mode=full:loc=xxx** report.

For a complete list of the cards and their applications, see Table A-9.

If HS clock A and B status is included in the "Cards with bad clock source" section, then cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status.

The PST/SST for the Primary Composite Clock (Comp Clk) 1114, Primary Comp Clk 1116, Secondary Comp Clk 1114, Secondary Comp Clk 1116, Primary HS Clk 1114, Primary HS Clk 1116, Secondary HS Clk 1114, and Secondary HS Clk 1116 can be one of the following values:

- IS-NR/active—clock source is valid, clock chosen as source
- IS-NR/idle—clock source is valid, clock not chosen as source
- OOS-MT/fault—clock source is invalid

The PST/ SST for the Composite System Clock and High Speed System Clock can be one of the following values:

- IS-NR/Idle—all cards showing good clock, clock not required
- IS-ANR/Idle—some cards showing bad clock, clock not required
- OOS-MT/Idle—all cards showing bad clock, clock not required
- IS-NR/Active—all cards “requiring clocks” showing good clock, clocks required
- IS-ANR/Fault—some cards “requiring clocks” showing bad clock, clocks required
- OOS-MT/Fault—all cards “requiring clocks” showing bad clock, clocks required

**NOTE:** An asterisk (\*) indicates that the card requires the indicated clock.

## Output

**NOTE: A TDM card can use a local clock that is generated independently on each TDM as a clock source for the corresponding internal system clock. The system does not report the “cards bad” status for these internal clocks.**

**NOTE: The use of HS CLK I is not automatic when both the high-speed primary and secondary clocks are invalid. A LIM-ATM card must be provisioned (using the ent-  
slk:atmtsel=internal parameter) to use the high-speed internal clock.**

**NOTE: The *Using* field in the Composite Clock section describes all of the cards that are using the Composite Clock, not just LIM-DS0, MPL, or HS clock capable cards.**

The following example shows output when two GPSM-II cards are configured, and LIM-DS0 cards, MPL cards, and HS clock capable cards are not configured. The TSCSYNC feature is not turned on.

### Legend

**COMPOSITE SYSTEM CLOCK** —Composite System clock status

**ALARM STATUS** —System clock alarms; "No alarms" is shown when there are no alarms.

**PRIMARY COMP CLK** —The status of the primary Composite clock input for a particular TDM

**SECONDARY COMP CLK** —The status of the secondary Composite clock input for a particular TDM

**CLK A** — Internal Eagle Clock sourced by the 1114 TDM from the selected clock source.

**CLK B** — Internal Eagle Clock sourced by the 1116 TDM from the selected clock source.

**CLK I** — Local clock generated independently on each LIM card.

**PREFER CLOCK X FOR TSC CLOCK** —The preferred clock source of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.

**HIGH SPEED SYSTEM CLOCK** —HS system clock status

**ALARM STATUS** —HS System clock alarms; "No alarms" is shown when there are no alarms.

**PRIMARY HS CLK** —The status of the high-speed primary clock input for a particular TDM

**SECONDARY HS CLK** —The status of the high-speed secondary clock input for a particular TDM

**HS CLK TYPE** —HS clock source (see the chg-stpopts command) for a particular TDM

**HS CLK LINELEN** —HS clock line length (see the chg-stpopts command) for a particular TDM

**HS CLK A** — Internal Eagle High Speed Clock sourced by the 1114 TDM from the selected clock source.

**HS CLK B** — Internal Eagle High Speed Clock sourced by the 1116 TDM from the selected clock source.

**HS CLK I** — Local clock generated independently on each LIM card. The value for the internal high-speed clock (Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by the Xilinx on the LIM main board when the LIM card does not have a valid system clock source (eg. both A system clock and B system clock are bad at the LIM card).

## rept-stat-cluster

### Report Status Cluster-Related DPC

Use this command to report summary status and statistical information for all provisioned clusters.

Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

**NOTE: This command does not support 24-bit ITU national point codes.**

**Keyword:** rept-stat-cluster

**Related Commands:** chg-feat, chg-stpopts, rept-stat-cluster, rtrv-stpopts

**Command Class:** System Maintenance

## Parameters

**:dpc=** (optional)

ANSI destination point code of the cluster whose status is to be reported, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

**Synonym:** **dpc**

**Range:** **p-**, **000-255**, **\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**Default:** Display summary for all provisioned clusters

**:mode=** (optional)

The type of display. Specify **mode=full** to display additional information for the specified DPC.

**Range:** **full**

**Default:** Display summary report

**:stat=** (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

**Range:** **all**, **alminh**, **anr**, **dsbld**, **mt**, **nr**

**all**— All of the primary states

**alminh**— Alarms inhibited

**anr**— In service abnormal (IS-ANR)

**dsbld**— Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**— Out of service maintenance (OOS-MT)

**nr**— In service normal (IS-NR)

**Default:** **all**

## Example

```
rept-stat-cluster
```

```
rept-stat-cluster:stat=alminh
```

```
rept-stat-cluster:stat=MT
```

```
rept-stat-cluster:dpc=20-2-*
```

```
rept-stat-cluster:dpc=20-2-*:mode=full
```

```
rept-stat-cluster:dpc=20-2-5
```

## Dependencies

If the **mode=full** parameter is specified, the **dpc/dpca** parameter must be specified.

The **stat** parameter cannot be specified with the **dpc/dpca** parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\*\** or *ni-nc-\*\*\** cannot be specified for the **rept-stat-cluster** command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the **dpc/dpca** parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the **mode=full** parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format hh:mm is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "-----" are displayed.

**Output**

When no parameters are specified, summary information for all of the defined cluster DPCs is shown. Note that the report shows the number of provisioned and x-list members of each cluster.

**rept-stat-cluster**

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0

CIRCULAR ROUTING
XMIT LSN= lsnppp RC=--
RCV LSN= lsn01a
MEMBER   = ***-***-***

```

Command Completed.

;

If a circular routing alarm is raised for a cluster DPC (that is, no x-list entry could be created for the cluster member), then specifying the **dpc** and **mode=full** parameters displays information pertinent to the cluster member that is experiencing the circular routing condition. This information may be useful in correcting the problem. The value for the MEMBER field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

**NOTE: The circular routing member information shown in this output report displays as \*\*\*-\*\*\*-\*\*\* if the specified destination point code is not a cluster destination point code or the information is not known by maintenance at the time the report is generated.**

#### rept-stat-cluster:dpc=20-2-\*:mode=full

### Legend

**ORIG**—Indicates the origination of the destination point code being reported. The possible values that can appear in the column are:

**CLUST**—Entry is a provisioned cluster (*ni-nc-\**) DPC

**PROV**—Entry is a provisioned cluster member (*ni-nc-ncm*)

**X-LIST**—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member

**PST**—The primary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the cluster. The possible values are described in .

**X-REASON**—Indicates the reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:

**RT**—X-LIST entry created due to routing

**CG**—X-LIST entry created due to congestion

**CR**—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the **mode=full** detailed output report displays as "-----" if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

## rept-stat-db

### Report Status Database

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

If the AINPQ, G-Flex, G-Port, INP, LNP ELAP Configuration, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the status of the MPS databases and Service Module cards is displayed.

**Keyword:** rept-stat-db

**Related Commands:** chg-db, copy-meas, disp-disk-dir

**Command Class:** Database Administration

## Parameters

**:db=** (optional)

The report section or sections to display in the output. The content of each section depends on the specified or default value of the **display** parameter, MPS output appears only if a feature that uses the MPS is turned on in the system (G-Flex, G-Port, INP, PPSMS, or the LNP ELAP Configuration controlled feature) or the ATINP feature is enabled.

**Range:** **all, mps, stp**

**all** — Displays database and card output for both the STP and MPS report sections.

**mps** — Displays only the database and card output for the MPS report section.

**stp** — Displays only the database and card output for the STP report section.

**Default:** **all**

**:display=** (optional)

The type of output

**Range:** **all, brief, except, version**

**all** — Displays the operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

**brief** — Displays the operational status of the databases in the active and standby MASP, and of the MPS databases if a feature that uses the MPS is turned on.

**except** — Displays the operational status information contained in the **display=brief** output along with the cards whose database level does not match the active fixed disk current partition or active MPS database.

**version** — Displays all of the same information that is displayed with the **display=all** parameter except that the individual database status column is replaced with the database format version and status. In addition, details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the **rept-stat-mps** command.

**Default:** **brief**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115**

## Example

```
rept-stat-db
```

```
rept-stat-db:display=all
```

```
rept-stat-db:loc=1207
```

```
rept-stat-db:db=stp
```

## Dependencies

The **db** and **loc** parameters cannot be specified at the same time.

For EOAM cards, values of **1113**, **1115**, and **1118** cannot be specified for the **loc** parameter. For E5-OAM cards, values of **1117** and **1118** cannot be specified for the **loc** parameter.

One of the following features must be turned on, or the ATINP feature must be enabled before the **db=mps** parameter can be specified:

- A-Port
- AINPQ
- EIR
- G-Flex
- G-Port
- INP
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- V-Flex

The shelf and card must be equipped.

The card location slot must be between 1 and 18, but not 9 or 10.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

The frame value of the shelf location parameter (**loc**) must be within the valid range.

The **display** parameter can accept a value of **brief**, **all**, **version**, or **except** only.

## Notes

If the **display** parameter, the **db** parameter, or the **loc** parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the **rept-stat-db** command with no parameters specified or with the **display=brief** parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable cartridge or drive (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the EIR, G-Flex, G-Port, INP, PPSMS, or V-Flex feature is turned on, or the ATINP feature is enabled, EPAP A and EPAP B database status followed by Service Module card database status
- If the LNP ELAP Configuration controlled feature is turned on, ELAP A and ELAP B database status followed by Service Module card database status

The output of the **rept-stat-db** command with the **display=except** parameter shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=all** parameter shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=version** parameter shows the coherency and the number of updates for the active and standby databases, along with the database version and

the operational status of each of these databases. If the LNP feature is turned on (see the **enable-ctrl-feat** command), the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the **rept-stat-mps** command to display version information for these databases.

The output of the **rept-stat-db** command with the **loc** parameter specifying an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The **db** parameter is used to limit the output of the **rept-stat-db** command to either just the EAGLE STP information or just the MPS information. The information is displayed as indicated by the **display** parameter value (**display=version** is not valid for **db=mps**; the command does not display the MPS database versions). The default **db** parameter value is **all**, which displays the information for the STP and MPS databases and cards as indicated by the **display** parameter value.

## Output

**NOTE: Credit card USB database information is shown only for the Active OAM slot, whether or not a credit card drive is inserted into the standby OAM.**

**NOTE: A status of 'OK' indicates that the database has no errors.**

The report for the specified card is displayed. The report shows that the disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

**rept-stat-db:loc=1114**

The LNP ELAP Configuration controlled feature is turned on, and ELAP is used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service.

More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

**Legend**

**DATABASE STATUS**—Indicates any database alarms on the MASPs. Not used with **loc** parameter output.

>> **OK**<<—No database alarms

>>**NOT OK (DMS)**<<—Database DMS alarms are present

>>**NOT OK (DRMS)**<<—Database DRMS alarms are present

>>**NOT OK (DMS,DRMS)**<<—Database DMS and DRMS alarms are present

**(ACTV MASP)**—The specified MASP is the active processor. Not used with **loc** parameter output.

**(STDBY MASP)**—The specified MASP is the standby processor. Not used with **loc** output.

**(NOACCS)**—The specified processor is not accessible. Not used with **loc** parameter output.

**C**—Indicates whether the database is coherent

**Y**—the database is coherent

**N**—the database is not coherent

**Dash (-)**—the database is not accessible

**LEVEL**—Number of updates made to the database partitions

**TIME LAST BACKUP**—Date and time the last change was performed on the removable cartridges or drives (if inserted) and the backup partition of the fixed disk. Not used with **loc** parameter output.

**TIME LAST UPDATE**—Date and time of the last update on the card database from OAM. Not used with **loc** parameter output.

**RD BKUP**—Removable cartridge or drive backup partition

**FD BKUP**—Fixed disk backup partition

**FD CRNT**—Fixed disk current partition. This field is not used with the **loc** parameter output.

**DIFF CONTENTS**—The specified database's contents are different compared to the other database in that partition.

**DIFF LEVEL**—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).

**DIFF TIME**—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.

**CORRUPTED**—The specified database is corrupted.

**INCOHERENT**—The specified database is incoherent.

**EXCEPTION**—The following values can appear:

- The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A “-” indicates that the database was not accessible. A blank entry indicates that the database has no problems. This field is used with the **display=except**, **display=all**, and **loc** parameter outputs.
- A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.

**IN-SRVC**—Length of time the card has been in service

**CARD/APPL**—Card type or application assigned to the card specified in the **LOC** field. Not used with the **display=brief** (default) output.

**TDM-BKUP**—Backup partition on the fixed disk on the TDM

**TDM-CRNT**—Current partition on the fixed disk on the TDM

**LOC**—Card location of the database. Not used with **display=brief** (default) output.

**T**—Indicates whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM), TSM, or E5-TSM being loaded with the new screen set information after an update to the database, and the database has not reached the current reported database level. Not used with **display=brief** (default) output.

**Y**—the database is in transition

**N**—the database is not in transition.

**TIME LAST BACKUP**—The date and time the last change was performed on the specified card and its associated database. A dash (–) in this field for the fixed drive (FD) or removable cartridge or drive (RD) indicates that no backup has been created on that drive. Not used with **display=brief** (default) output.

**VERSION**—Version number of each database (including the LNP database if the LNP feature is on)

xxx-xxx-xxx—Version number of the database

**UNKNOWN**—The **rept-stat-db** command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.

A dash “-” —The database is not available. Used only with **display=version** output.

**STATUS**—Operational status of the database version. Used only with **display=version** output.

**NORMAL**—The database version is fully operational.

Blank entry—Indicates the database is not available or is unknown. A numeric value indicates the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.

**BIRTHDATE**—Date and time of creation for the database

**EPAP A (ACTV)**—The active EAGLE Provisioning Application Processor. This section appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on or the ATINP feature is enabled.

**PDB**—Provisioning database status information

**RTDB**—Provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.

**EPAP B (STDBY)**—The standby EAGLE Provisioning Application Processor. This section appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on, or the ATINP feature is enabled.

**PDB**—Provisioning database status information

**RTDB**—The provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.

**ELAP A (ACTV)**—The active EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration feature is turned on.

**RTDB-EAGLE**—ELAP resident Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

**TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS

**ELAP B (STDBY)**—The standby EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration feature is turned on.

**RTDB-EAGLE**—The ELAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

**TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS

## rept-stat-ddb

## Report Dynamic Database Status

Use this command to obtain the most recent dynamic database (DDB) audit report.

**NOTE: The DDB audit report displays the checksums of the Route, Linkset, Link, CM Card, CM Cluster, Mated Application, and MTP globals. The report displays the exact status of active MTP card after audit and cause of that status.**

**Keyword:** rept-stat-ddb

**Related Commands:** aud-data, dbg-ddb

**Command Class:** System Maintenance

### Parameters

**:display=** (optional)

This parameter specifies the type of report to display.

**Range:** brief, all

**Default:** brief

**:filter=** (optional)

This parameter provides a full DDB audit report for cards that meet the specified criteria.

**Range:** resp, nrsp, incn, cons, ncons, ndat, nddl, nddb, duip, duipt, duipc, nquiet

**resp**— Responding cards

**nrsp**— Non-responding cards

**incn**— Inconsistent cards

**cons**— Consistent cards

**ncons**— Not-consistent cards: includes cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO\_DATA

**ndat**— Cards marked as "No Data" because the checksum of dynamic tables is not available

**nddl**— Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state

**nddb**— Cards marked as "No Data" because the checksum of dynamic tables is not available due to non-initialization of DDB

**duip**— Cards returning replies marked as "DDB update in progress"

**duipt**— Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task

**duipc**— Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation

**nquiet** — Cards returning replies having idle period less than the quiet period

**:list=** (optional)

This parameter displays a list of cards that meet the specified criteria.

**Range:**    **resp**, **nrsp**, **incn**, **cons**, **ncons**, **ndat**, **nddl**, **nddb**, **duip**, **duipt**, **duipc**, **nquiet**  
**resp** — Responding cards  
**nrsp** — Non-responding cards  
**incn** — Inconsistent cards  
**cons** — Consistent cards  
**ncons** — Not-consistent cards, including cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO\_DATA  
**ndat** — Cards marked as "No Data " because the checksum of dynamic tables is not available  
**nddl** — Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state  
**nddb** — Cards marked as "No Data " because the checksum of dynamic tables is not available due to non-initialization of the DDB  
**duip** — Cards returning replies marked as "DDB update in progress"  
**duipt** — Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task  
**duipc** — Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation  
**nquiet** — Cards returning replies marked as having the idle period less than the quiet period

### Example

```
rept-stat-ddb
rept-stat-ddb:display=all
rept-stat-ddb:list=resp
rept-stat-ddb:filter=nddb
```

### Dependencies

Audit data is available only if the execution of a periodic or manual DDB audit is complete (see the **aud-data** command).

If the system is in upgrade mode, then this command cannot be entered.

The **display**, **list**, and **filter** parameters cannot be specified together in the command.

### Notes

A question mark (?) indicates that the corresponding card's status is not evaluated (Inconsistent/Consistent) when system status is marked as ABORTED.

Cards having an additional status of IGNORED responded with "DDB update in progress". These cards are not considered for calculating system status.

## Output

The MATED APPL field is displayed only for Service Module cards.

**rept-stat-ddb:display=all**

tekelecstp 09-07-21 21:10:17 GMT EAGLE 41.1.0

### **Legend**

- **SYSTEM STATUS:**
  - **OK**—DDB is consistent on all active MTP cards or no active MTP card is present in system
  - **INCONSISTENT**—DDB is inconsistent
  - **UNKNOWN**—"All active MTP cards in the system responded without the checksum of DDB table" or "No active MTP card in the system responded to audit request"
  - **ABORTED**—"Checksums collected failed to meet the quiet period requirement" or "Number of cards responded with "DDB update in progress" greater than 25% number of cards responded with data"
- **ACTIVE MTP CARDS**—Number of active MTP cards
- **NON RESPONDING CARDS**—Number of non-responding cards
- **RESPONDING CARDS**—Number of responding cards
- **CARDS WITH NO DATA**—Cards sending replies without the checksum of dynamic tables, due to incomplete DDL crossload or DDB initialization
- **CARDS WITH DATA**—Cards sending replies with checksums
- **CARDS FAILING QUIET PRD**—Cards failing quiet time requirement
- **CARDS WITH DDB UPD IN PRG**—Cards sending replies marked as "DDB update in progress" due to DDB checksum not evaluated completely or TSRC task is incomplete
- **CARDS CONSIDERED FOR CKSM**—Cards sending correct replies. Replies are not marked with "DDB update in progress" or "Reply with no data".
- **INCONSISTENT CARDS**—Cards that are inconsistent
- **CONSISTENT CARDS**—Cards that are consistent
- **AUDIT START TIME**—Time that the audit started (*DD/MM/YYYY hh:ms:ss* format)
- **QUIET PERIOD**—Minimum DDB idle time, in milliseconds, during which no DDB updates are applied
- **RTE**—Checksum of RTE Table
- **LINK SET**—Checksum of Link Set Table
- **LINK**—Checksum of Link Table
- **CM CARD**—Checksum of CM Card
- **CM CLSTR**—Checksum of CM Cluster

- **MATED APPL**—Checksum of Mated Application
- **MTP GLOBS**—Checksum of MTP Globals Table
- **IDLE (PERIOD)**—Time elapsed, in milliseconds, since the last DDB update was received by this card
- **DDB UPD**—Total DDB updates received on the card
- **ADDN'L STATUS**—Display more information for the card, including WWA updates or whether card is considered for audit calculations
- **CAUSE**—Display the reason for sending replies of type "reply with no data " or "DDB update in progress". This value can be DDL (crossload not completed), DDB (dynamic database is not initialised) , (TSRC, DDB) (TSRC task is not completed) or DDB (checksums still needs to apply on tables).
- **?**—Card status is not evaluated (inconsistent/consistent) if the system status is marked as "ABORTED"
- **IGNORED**—Card responded with "DDB update in progress" and is not considered for calculating system status
- **WWA UPD**—Number of entries that were updated by the WWA

## rept-stat-dlk

## Report Status Data Link

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

**Keyword:** **rept-stat-dlk**

**Related Commands:** **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rtrv-dlk, tst-dlk**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All data links are shown.

### Example

**rept-stat-dlk**

**rept-stat-dlk:loc=1104**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

Only one data link port on the ACM is supported. Reports are generated only on port A of the card.

The card location, frame, shelf, or slot must be within the allowed range.

The data link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

## Notes

None

## Output

### rept-stat-dlk

```
rlghncxa03w 10-01-27 17:00:36 EST EAGLE 42.0.0

## Legend

**DLK**—The card location of the TCP/IP data link

**PST**—The primary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the TCP/IP data link. The possible values are described in .

## rept-stat-dstn

## Report Status Destination

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-\**) or a network destination (*ni-\*-\**).

**Keyword:** **rept-stat-dstn**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-rte, rtrv-dstn, rtrv-rte**

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:mode=** (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

**Range:**        **full, rtx**

**full**— Comprehensive display of point code status, including **rtx**. If entered with a point code, status for that point code is displayed. If specified without a point code, the status of all routesets is displayed.

**rtx**— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:**     A summary report is displayed.

**:stat=** (optional)

The primary state filter. This parameter lets you choose the state of the destination for which you want a report. In other words, if you want a report for all destinations whose state is DSBLD, specify **:stat=dsbld**.

**Range:**        **all, alminh, anr, dsbld, mt, nr**

**all**— All of the primary states

**alminh**— Alarms inhibited

**anr**— In service abnormal (IS-ANR)

**dsbld**— Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**— Out of service maintenance (OOS-MT)

**nr**— In service normal (IS-NR)

**Default:**     **all**

### Example

```
rept-stat-dstn
rept-stat-dstn:dpci=2-004-1:mode=full
rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc:9-4-***:stat=alminh
rept-stat-dstn:dpc=9-3-*:mode=rtx
rept-stat-dstn:mode=full
rept-stat-dstn:mode=rtx
rept-stat-dstn:dpc=1-1-1
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

The **stat** parameter can be specified with the **dpc** parameter only if the **dpc** parameter specifies one of the *ni-nc-\** formats.

An x-list DPC cannot be specified in the **dpc** parameter.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

The **mode** parameter cannot be specified with the **dpc** parameter if the **dpc** parameter specifies one of the *ni-nc-\** formats.

When the **mode=full** parameter is specified then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- **rept-stat-dstn:dpc=ni-nc-ncm**—Report for fully provisioned destination *ni-nc-ncm*
- **rept-stat-dstn:dpc= ni-\*-\***—Report for provisioned network destination with the specified network indicator. If \* is specified in the *nc* field, \* must be specified in the *ncm* field.
- **rept-stat-dstn:dpc= ni-\*\*-\***—Report for the full network cluster for the specified *ni*
- **rept-stat-dstn:dpc= ni-\*\*\*-\***—Report for the full network cluster and the network cluster address (if any) for the specified *ni*
- **rept-stat-dstn:dpc= ni-nc-\***—Report for provisioned cluster destination *ni-nc-\**
- **rept-stat-dstn:dpc= ni-nc-\*\*-\***—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address on *ni-nc-\** (if it exists) is not reported.
- **rept-stat-dstn:dpc= ni-nc-\*\*\***—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-\** (if it exists) is also reported.
- **rept-stat-dstn:dpcn24=msa-ssa-sp**—Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the **mode=full** parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the **mode=rtx** parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the **mode=full** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows how, when no parameters are specified, summary information for all provisioned cluster and noncluster DPCs is reported.

```

The following example shows the circular routing alarm for a cluster destination. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for an FPC destination.

### rept-stat-dstn:dpc=9-3-\*

```

```

The following example shows how **rept-stat-dstn** displays a subsystem information header but no subsystem information, just as it would if an FPC is specified for which no subsystems are defined. In addition, because aliases cannot be defined for cluster destinations, this report shows only an empty header, just as it does when an FPC is specified for which no aliases are defined. Note that the circular routing information portion of the **mode=full** report displays “-----” for the linkset names when no circular routing condition exists for the DPC.

**rept-stat-dstn:dpc=9-3-\*:mode=full**

#### Legend

**DPC/DPCA**—The ANSI destination point code of the route

**DPCN**—The ITU-TSS national destination point code of the route

**DPCN24**—The 24-bit ITU national destination point code of the route

**DPCI**—The ITU-TSS international destination point code of the route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in .

## rept-stat-e1

## Report Status E1

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

**Keyword:** rept-stat-e1

**Related Commands:**

**Command Class:** System Maintenance

## Parameters

**:e1port=** (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

**:loc=** (optional)

Card location. The unique identifier of a specific **line1** card located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Information for all **line1** cards is reported.

## Example

```
rept-stat-e1
```

## Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **e1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

## Notes

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the **loc** parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the **loc** and **e1port** parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

**Output**

When no parameters are specified in the command, E1 port status is displayed for all cards with provisioned E1 ports. Ports 3 through 8 are on HC-MIM cards only.

**rept-stat-e1**

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0

**rept-stat-e1: loc=1203:e1port=2**

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0
LOC      E1PORT    PST          SST          AST
1203     2         IS-NR        Avail        PAIRED
ALARM STATUS      = No Alarms.
UNAVAIL REASON    = --
Command Completed.
```

;

**Legend**

**LOC**—Card location

**E1PORT**—Number of the E1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**SST**—The secondary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**AST**—The associated state of the card. The possible values are described in “Possible Values for PST/SST/AST”. The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the E1 port being unavailable

**SLK**—Signaling link assigned to the E1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

## rept-stat-enet

## Report Status Ethernet

Use this command to display a summary report of Ethernet status for all cards in the system that have configured Ethernet Interfaces.

**Keyword:** **rept-stat-enet**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

**Default:** All ENET data for the card location is displayed.

**:port=** (optional)

Ethernet interface port ID.

**Range:** a, b

**Default:** All port data for ENET is displayed.

### Example

**rept-stat-enet**

**rept-stat-enet:loc=1101:port=b**

### Dependencies

Another command is already in progress.

The **loc** and **port** parameters must be specified together in the command.

The shelf and card must be equipped, and the card specified by the **loc** parameter must have an application of IPS, MCP, STPLAN, EROUTE, VS CCP, IPSG, IPLIM, IPLIMI, SS7IPGW, or IPGWI.

The card in the location specified by the **loc** parameter must support the port specified by the **port** parameter.

**Notes**

None.

**Output**

The following example displays a report on the status of all configured Ethernet interfaces in the system.

**rept-stat-enet**

```
eagle10110 07-02-10 14:50:23 EST EAGLE 35.6.0

LOC  PORT  IPADDR          PST          SST          AST
1101  A     1.1.1.1          OOS-MT        Fault         ALMINH
1101  B     123.234.222.111  IS-ANR        Active        -----
1201  A     111.1.24.200     IS-NR         Active        -----
1201  B     2.31.234.1       OOS-MT        Fault         -----
```

Command Completed.

;

The following example displays the summary for a specific card location and port when the Ethernet error count exceeds the threshold value.

**rept-stat-enet: loc=1101:port=b**

```
eagle10110 10-01-10 14:54:23 EST EAGLE 42.0.0
LOC  PORT  IPADDR          PST          SST          AST
1101  B     123.234.222.111  IS-ANR        Active        -----
ALARM STATUS      = ** 0537 Ethernet error threshold exceeded
```

Command Completed.

;

The following example displays the Ethernet interface summary for a specified card when the Ethernet interface is up, and the IP address is not assigned by the DHCP server.

**rept-stat-enet: loc=1102:port=a**

```
tekelecstp 10-01-17 12:54:48 MST EAGLE 42.0.0
LOC  PORT  IPADDR          PST          SST          AST
1102  A     -----          IS-NR         Active        -----
ALARM STATUS      = No Alarms.
```

Command Completed.

;

The following example displays the Ethernet interface summary for a specified card when the Ethernet interface is removed, and the DHCP lease of an assigned IP address has not expired.

**rept-stat-enet: loc=1101:port=a**

```
tekelecstp 10-01-12 00:29:22 MST EAGLE 42.0.0
LOC  PORT  IPADDR          PST          SST          AST
1101  A     192.168.63.213  OOS-MT        Fault         -----
ALARM STATUS      = ** 0539 Ethernet Interface Down
```

Command Completed.

;

The following example displays the summary for a specified card when the Ethernet interface is up.

**rept-stat-enet: loc=1101:port=a**

```
tekelecstp 10-01-02 00:29:22 MST EAGLE 42.0.0
LOC  PORT  IPADDR          PST          SST          AST
1101  A     192.168.63.213  IS-NR         Active        -----
ALARM STATUS      = No Alarms.
```

Command Completed.

;

**Legend**

- CARD—The location of the card.

- **VERSION**—The version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
  - The card is configured but is not physically present in the system.
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database. (The DCM and SSEDCCM cards show card type DCM.)
- **APPL**—The application loaded on this card.
- **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in .

## rept-stat-gpl

## Report Status Generic Program Load

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

**Keyword:** **rept-stat-gpl**

**Related Commands:** **act-gpl, alw-card, chg-gpl, copy-gpl, init-card, init-sys, rtrv-gpl**

**Command Class:** Program Update

### Parameters

**NOTE:** As of Release 43.0, the **BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1** GPLs are replaced with the **BLIXP** GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

**:display=** (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

**Range:** **all**

**:gpl=** (optional)

Generic program load. This parameter specifies the type of GPL to report on.

**Range:** **xyyyyyyy**

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

**atmansi**—Used by the LIM cards to support the high-speed ATM signaling link feature

**atmhc**—Supports functionality for the E5-ATM card. The E5-ATM card runs either the ATMANSI or ATMITU application. The GPL allows the card to support up to 2 signaling links.

**atmitu**—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

**blbepm**—Flash GPL containing the BIOS ROM image on E5-E1T1 and E5-ENET cards

**blbios**—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

**blbsmg**—Flash GPL containing the BIOS ROM image on E5-SM4G cards

**blepld**—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, and E5-ENET cards that are used for E1 or T1 signaling links

**bldiag6**—Flash GPL containing the diagnostic code on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blixp**—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ENET, and E5-SM4G cards

**blmcap**—Flash GPL containing a tar image with all code required on E5-MCAP cards

**blvxw6**—Flash GPL containing the VxWorks operating system on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blrom1**—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

**bpdcn**—Used to support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design

**bpdcn2**—Used to support the flash memory Board PROM for DCM and GPSM boards, revised design

**bphcap**—Used to support Board PROM for HCAP flash memory

**bphcapT**—Supports Board PROM for HCAP-T flash memory

**bphmux**—Supports Board PROM for HMUX flash memory

**bpmpl**—Supports Board PROM for MPL flash memory

**bpmplT**—Supports Board PROM for E1/T1 flash memory

**cdn**—Used in the card manufacturing process.

**eoam**—Used by the GPSM-II card for enhanced OAM functions

**eroute**—Used by the STC card for EAGLE 5 Integrated Monitoring Support functions

**erthc**—Used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

**gls**—Used by TSM cards to download gateway screening to LIM cards

**glshe**—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

**hipr**—Communication software used on the High Speed IMT Packet Router (HIPR) card

**hipr2**—Communication software used on the High Speed IMT Packet Router (HIPR2) card

**imt**—Communication processor on the logical processing element (LPE)

**imtpci**—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, and E5-ENET cards

**ipghe**—Used by E5-ENET cards to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes

**ipgwi**—Used by SSEDCEM cards for TCP/IP point-to-point connectivity for ITU point codes

**iplhe**—Used by E5-ENET cards for TCP/IP point-to-point connectivity for both ANSI and ITU point codes

**iplim**—Used by SSEDCEM cards for TCP/IP point-to-point connectivity for ANSI point codes

**iplimi**—Used by SSEDCEM cards for TCP/IP point-to-point connectivity for ITU point codes

**ips**—Used by IPSM cards for the IP User Interface feature

**ipsg**—Used by E5-ENET cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

**ipshc**—Used by E5-IPSM cards to support the IPS application

**mcp**—Used by MCPM cards for the Measurements Platform feature

**oamhc**—Used by E5-MCAP cards for enhanced OAM functions

**pldpmc1**—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

**sccphc**—Used by E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

**slanhc**—Used by E5-ENET cards to support the STPLAN application

**ss7hc**—Supports the functionality for HC-MIM or E5-E1T1 cards. The HC-MIM and E5-E1T1 cards run the SS7ANSI or CCS7ITU application; the GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

**ss7ipgw**—Used by SSED CM cards to support TCP/IP point-to-multipoint connectivity

**ss7ml**—Support functionality for MPL and the E1/T1 MIM cards. MPL cards run the SS7ANSI application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. MPL cards support only the DS0 interface. E1/T1 MIM card runs either the SS7ANSI or CCS7ITU application; the GPL allows the card to support 8 signaling links for E1 and T1 functions.

**utility**—Used by the factory for testing, and when directed by the Customer Care Center

**vcdu**—Used in the card manufacturing process

**vsccp**—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a Service Module card is present, then the GPL processes normal GTT traffic.

**vxwslan**—Used by SSED CM cards to support the STP LAN application

**Default:** All GPL types

**:loc=** (optional)

Location. This parameter specifies the target card address and displays the versions of all GPLs running at the specified card location. For HC-MIM, E5-ENET, or STC cards, this information includes all non-activated flash GPLs. For cards that are not HC-MIM, STC, or E5-ENET or non E5-IPSM cards, there is no additional data: this parameter limits the report to the target card address.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

### Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=hipr2
```

**rept-stat-gpl:gpl=ipsg****Dependencies**

No other **rept-stat-xxxx** command can be in progress when this command is entered.

None of the following parameters can be specified together in the same command: **display=all** parameter, **loc** parameter, **gpl** parameter.

The value specified for the **gpl** parameter must be supported. See the **gpl** definition for a list of supported GPLs.

**Notes**

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the **chg-gpl** command to turn auditing on and off.

Use the **rtrv-gpl** command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge or drive, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, “ALM” is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and “ALM” is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. If GPL auditing is off, the minor alarm is not activated, but “ALM” is displayed for each GPL that does not match the GPL in the RELEASE column.

If no **gpl** parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of “-----” is displayed. This should happen only for utility and OAM GPLs when the cartridge is not inserted. A utility trial version is never displayed because it can never be run.

If the removable cartridge or drive is inserted, an “\*” (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, “-----” is displayed for the running version.

When the **gpl** parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using **init-flash** command) are not displayed.

When the **gpl=imt** parameter is specified, only the IMT GPLs for each configured card connected to the IMT are displayed.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

When a GPL is specified in the **gpl** parameter, the specified GPL for each card connected to the IMT is displayed.

## Output

The output of the **rept-stat-gpl** command is site-specific and configuration-specific. The following output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

This output appears when no parameters are defined. All GPLs for the card are listed.

### rept-stat-gpl

```
rlghncxa03w 10-03-04 07:01:08 EST EAGLE 42.0.0
GPL      CARD      RUNNING      APPROVED      TRIAL
ATMHC    1103      128-002-000      128-002-000      128-002-000
ATMHC    1107      128-002-000      128-002-000      128-002-000
GLSHC    1106      130-001-000      130-001-000      130-001-000
EOAM     1113      025-002-000      025-002-000      -----
EOAM     1115      025-002-000      025-002-000      -----
VSCCP    1103      026-001-000      026-001-000      026-001-000
ATMANSI   1205      025-001-000      025-001-000      025-001-000
ATMANSI   1211      025-001-000      025-001-000      025-001-000
IPLIM    1213      025-001-000      025-001-000      025-001-000
SS7IPGW   1215      025-001-000      025-001-000      025-001-000
SS7ML     1105      027-001-000      027-001-000      027-001-000
IPSG     1305      040-000-000      040-000-000      040-000-000
Command Completed.
```

;

The following example appears for the UTILITY GPL, whether the cartridge or drive is inserted or not inserted.

### rept-stat-gpl:gpl=utility

```
rlghncxa03w 09-01-07 10:23:93 EST EAGLE 40.1.0
GPL      CARD      RUNNING      APPROVED      TRIAL
UTILITY  1101      101-016-000      101-016-000      -----
Command Completed.
```

;

In the following example, card 3108 is running the older, approved GPL. Cards 2108 and 2208 are each running a new nonapproved version. Card 2108 has had this version activated, and card 2208 is still running this version in a trial mode (a + appears following the ALM indicator).

### rept-stat-gpl:gpl=bphcap

```
rlghncxa03w 05-01-07 10:23:93 EST EAGLE 33.0.0
GPL      CARD      RUNNING      APPROVED      TRIAL
BPHCAP   2108      101-005-001 ALM      101-016-000      101-005-001
BPHCAP   2208      101-005-001 ALM+    101-016-000      101-005-001
BPHCAP   3108      101-016-000      101-016-000      101-005-001
Command Completed.
```

;

Output for the BPHMUX, HIPR, or HIPR2 GPLs shows the GPL that is running on each card in slots 09 and 10 on each provisioned shelf. The following example shows the output for the HIPR GPL.

### rept-stat-gpl:gpl=hipr

```
rlghncxa03w 09-08-04 07:01:08 EST EAGLE5 41.1.0
GPL      CARD      RUNNING      APPROVED      TRIAL
HIPR     1109      118-020-000      118-020-000      118-020-000
HIPR     1110      118-020-000      118-020-000      118-020-000
HIPR     1209      118-020-000      118-020-000      118-020-000
HIPR     1210      118-020-000      118-020-000      118-020-000
Command Completed.
```

;

The following example specifies the **display=all** parameter to display both IMT and application GPL information.

The example also contains asterisks with the following meanings:

- \* The SS7ML entry in the GPL column at location 1105 indicates that a multi-port LIM is running on the system. The card is provisioned in the database with the **ss7ansi** application.

### rept-stat-gpl:display=all

```
rlghncxa03w 10-03-07 10:23:93 EST EAGLE 42.0.0
```

| GPL     | CARD   | RUNNING     | APPROVED         | TRIAL       |

### Legend

**GPL**—The type of GPL associated with the cards in the display.

**CARD**—The card location.

**RUNNING**—The GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.

**APPROVED**—The GPL version that is the approved GPL.

**TRIAL**—The GPL version that is the trial GPL.

**ACTIVE**—The GPL version that has been downloaded using the **thinit-flash** command and activated using the **act-flash** command..

**INACTIVE**—The GPL version that has been downloaded using the **thinit-flash** command but has not been activated using the **act-flash** command..

----- (dashes)—GPL is not present at the specified location.

\*—The trial version will run if the card boots. (Shown to the right of the TRIAL column)

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

+—The currently running flash GPL has not been activated. (Shown between the RUNNING and APPROVED columns)

## rept-stat-imt

### Report IMT Status

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

**Keyword:** `rept-stat-imt`

**Related Commands:** `clr-imt-stats`, `conn-imt`, `disc-imt`, `rept-imt-lvl1`, `rept-imt-lvl2`, `rmv-imt`, `rst-imt`

**Command Class:** System Maintenance

### Parameters

**:mode=** (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

**Range:** `full`

**Default:** Do not display additional information.

### Example

```
rept-stat-imt
```

```
rept-stat-imt:mode=full
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

**Output****rept-stat-imt**

```

**Legend**

**IMT SYSTEM**—Logical entity representing the combination of both A and B IMT busses

**IMT**—IMT bus A or IMT bus B

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the IMT System or specified IMT bus

\*—Minor Alarm

\*\*—Major Alarm

\*C—Critical Alarm

The states of the IMT bus are combined from the PST, SST and AST states as shown in Table 5-40.

**Table 5-40.** IMT Bus States

| PST          | SST    | AST      | Definition                                                          |
|--------------|--------|----------|---------------------------------------------------------------------|
| IS-NR        | Active | ----     | The IMT bus is operating normally.                                  |
| IS-ANR       | Fault  | ----     | The IMT bus has had a failure on at least one but not all cards.    |
| IS-ANR       | Manual | ----     | The IMT bus is inhibited, but some cards have been connected to it. |
| OOS-MT       | Fault  | ----     | The IMT bus has a failure on all cards.                             |
| OOS-MT-DSBLD | Manual | ----     | The IMT bus is inhibited and no cards are connected to it.          |
| OOS-MT-DSBLD | Test   | FLT CHK  | The IMT Bus is inhibited and undergoing Fault Isolation test.       |
| OOS-MT-DSBLD | Test   | EXT BERT | The IMT Bus is inhibited and undergoing Extended BERT.              |

## rept-stat-iptps

### Report Status IPGWx TPS Utilization

Use this command to display current and peak IPTPS usage for each IPSG / IPGWx linkset in the system or for each link in the IPSG / IPGWx linkset.

**Keyword:** rept-stat-iptps

**Related Commands:** chg-ctrl-feat, chg-ls, chg-sg-opts, enable-ctrl-feat, ent-ls, rtrv-ctrl-feat,, rtrv-ls, rtrv-sg-opts

**Command Class:** System Maintenance

### Parameters

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:peakreset=** (optional)

Reset peak values to the current TPS values.

**Range:** yes, no

**Default:** no

### Example

**rept-stat-iptps**

**rept-stat-iptps:lsn=lsgw1101**

**rept-stat-iptps:peakreset=yes****Dependencies**

If the linksets are not IPGWx or IPSG, then this command cannot be entered.

The specified linkset name must exist in the database.

**Notes**

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

IPSG linksets have SLKTPS linksets configured rather than IPTPS. SLKTPS configures the transactions per second for each link assigned to the IPSG linkset as opposed to IPTPS which configures the combined transactions per second for the entire IPGW linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSG-M2PA links, then the command does not report any data below the TPS header or raise alarms.

For IPSG-M3UA and IPGWx-M3UA links, the **rept-stat-iptps** command also counts the received DAUD messages and transmitted SNMs in response to DAUD audits (along with the other transmitted SNMs).

The process of updating the IP TPS counts for DAUD and DAUD response SNMs is:

- Rcv IP TPS count is updated with the total number of valid DAUD messages that are successfully queued for response processing based on the combination of RCs (Routing Contexts) and APCs (Affected Point Codes) received in the M3UA DAUD message.
- In reply to DAUD, based on the response generated (DUNA or (DAVA/DRST + SCON)), Tx IP TPS counts are updated for each RC/APC combination (either the same as the Rcv counts or twice the Rcv counts respectively).
- If no RC is present, then the Tx/Rcv IP TPS is incremented for the associated link corresponding to the lowest PORT ID for IPSG-M3UA links for the same association.
- For IPGWx-M3UA links, Tx/Rcv IP TPS are always incremented on the default PORT Index (since only one link can be configured in IPGWx GPL).
- For IPGWx-M3UA links, Rcv IP TPS count are also updated with the number of valid and non discarded Deviated DAUD message received (since Deviated DAUD always contains single RC and APC combination).

All of the transmitted SNMs are pegged in IPTPS Tx counts and are considered in the TPS algorithms.

## Output

The **rept-stat-iptps** command reports on IPSG and IPGWx linkset IP TPS. The report includes the following information for the system and for each IPSG or IPGWx linkset:

- Configured IP TPS alarm threshold
- Configured IP TPS
- Current IP TPS transmit and receive usage for 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

If the linkset is specified, then the command reports the same information for the individual links in the linkset.

If the **peakreset=yes** parameter is specified, then the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

If the linkset is specified with the **peakreset=yes** parameter, then the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

**NOTE: The peaks for transmit and receive, and for link, and linkset IP TPS may all occur at different times.**

**NOTE: The IP TPS value shown in the command may contain one extra MSU if the linkset is specified. Because the alarm calculations are implemented using integer math, rounding may occur at each entity (link, linkset) if the IP TPS value for the entity is not evenly divisible by 15. This could occur when performing an IPTPS report for a linkset that has more than one link configured.**

**NOTE: For mixed IPLIMx-M2PA and IPSG-M2PA linksets, the command does not report any data or raise alarms.**

IPGW linksets display dashes in the *CONFIG/MAX* column.

The following example shows an IPGW linkset.

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

**Keyword:** rept-stat-lfs**Related Commands:** rept-stat-slk**Command Class:** Link Maintenance

## Parameters

**:link=** (optional)

The signaling link port on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**:loc=** (optional)

This parameter is mandatory when the **port** parameter is specified.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

## Example

```
rept-stat-lfs
```

```
rept-stat-lfs:loc=1201
```

```
rept-stat-lfs:loc=1201:link=a1
```

## Dependencies

The LFS feature must be turned on before this command can be entered.

The card location specified in the **loc** parameter must be equipped.

The signaling link that is specified in the **link** parameter must be assigned to the card in the **loc** parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

The card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

If the **link** parameter is specified, the **loc** parameter must be specified.

This command cannot be entered during upgrade.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

If no parameters are specified, all links that are in LFS test are displayed.

**rept-stat-lfs**

**Legend**

**SLK**—The signaling link identifier; same as **loc** and **link** parameters of **act-lbp** command.

**LBP**—The loopback point of this test; same as **lbp** parameter of **act-lbp** command.

**PATTERN**—The test pattern; same as **pattern** parameter of **act-lbp** command.

**MAX-**

**ERRORS**—The bit-error threshold allowed for this LFS test; same as **maxerr** parameter of **act-lbp** command.

**BIT\_ERRORS**—Number of bit-errors since the beginning of this test.

**MAX-TIME**—The time window for testing each loop-back point; same as **time** parameter of **act-lbp** command.

**TEST-TIME**—Amount of time the test has run.

**rept-stat-lnp****LNP Status Report**

Use this command to generate a report of the local number portability (LNP) status information.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the **loc** parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS),

Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), LRNQT (if the ITU TCAP LRN Query feature is turned on), and Automatic Call Gap (ACG).

When the **card=sccp all** parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

**Keyword:** **rept-stat-lnp**

**Related Commands:** **chg-th-alm, rept-stat-sccp, rtrv-th-alm**

**Command Class:** System Maintenance

## Parameters

**:card=** (optional)

Specify **card=sccp-all** to display a report of the LNP status of all equipped SCCP cards. The **card** parameter is not valid with the **loc** parameter.

**Range:** **sccp-all**

**:loc=** (optional)

The card location as stenciled on the shelf of the EAGLE 5 ISS. The **loc** parameter is not valid with the **card** parameter.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** A summary for all cards is displayed.

## Example

**rept-stat-lnp**

**rept-stat-lnp:card=sccp-all**

**rept-stat-lnp:loc=1106**

## Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Only one optional parameter can be specified in the command. The **card** and **loc** parameters cannot be specified together in the same command.

The only valid value for the **card** parameter is **sccp-all**.

No other **rept-stat-xxx** command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The value specified for the **loc** parameter must identify a Service Module card.

## Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software

loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The ALARM STATUS displays the current alarm on the LNP Subsystem.
- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The **rept-stat-lnp** command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPMR usage is expressed as the average percentage of LNPMR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average LRNQT usage is expressed as the average percentage of LRNQT usage per card. LRNQT information is displayed only if the LRNQT feature is turned on.
- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMR, LNPQS, WNPQS (if turned on), TLNP (if turned on), PLNPQS (if turned on), and LRNQT (if turned on) errors for corresponding messages received across all cards.

When the **rept-stat-lnp** command is entered for a specific card (for example, **rept-stat-lnp:loc=xxxx**), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.
- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.
- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.

- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

**NOTE:** IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

**NOTE:** PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

**NOTE:** The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- LRNQT STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LRNQT USAGE, expressed as a percentage of the amount of CPU used to process LRNQT queries over the last 30-second period by the specific card.
- LRNQT ERRORS, the number of LRNQT query errors detected for the total number of LRNQT messages received by the specified card.

**NOTE:** The LRNQT STATUS, LRNQT USAGE, and LRNQT ERRORS fields are displayed only if the LRNQT feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the **:card=sccp-all** parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the **:loc=xxxx** parameter.

## Output

In the following example, the WNP, PLNP, TLNP, and LRNQT features are off.

**rept-stat-lnp**

#### Legend

**CARD**—The locations of the SCCP cards.

**VERSION**—The version number of the GPL the cards are running.

**TYPE**—The type of SCCP card.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**AST**—The associated state of the card. The possible values are described in in Appendix A.

## rept-stat-ls

## Report Status Linkset

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC).

**NOTE:** If the Multiple Linksets to Single Adjacent Point Code (MLS) feature is turned on, and an adjacent destination point code is requested, then the output displays a summary status, including the secondary point codes, of the linksets that use that adjacent point code.

**Keyword:** rept-stat-ls

**Related Commands:** chg-ls, dlt-ls, ent-ls, rtrv-ls

**Command Class:** System Maintenance

#### Parameters

**:apc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range: p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:apc/apca/apci/apcn/apcn24=** (optional)

Adjacent point code.

**:apci=** (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range: s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:apcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range: s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:apcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

**Range: p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:stat=** (optional)

The primary state filter. This parameter indicates the state of the linksets for which a report will be displayed. For example, to display a report for all linksets whose state is DSBLD, specify the **stat=dsbld** parameter.

**Range:** **all**, **alminh**, **anr**, **dsbld**, **mt**, **nr**

**all** — All of the primary states

**alminh** — Alarms inhibited

**anr** — In-Service-Abnormal (IS-ANR)

**dsbld** — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

**mt** — Out-of-Service-Maintenance (OOS-MT)

**nr** — In-Service-Normal (IS-NR)

**Default:** **all**

### Example

```
rept-stat-ls
```

```
rept-stat-ls:lsn=lsnstpa
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the **stat** parameter is specified, then the **lsn** parameter cannot be specified and vice versa.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the **apc** parameter can be specified.

The **lsn**, **stat**, and **apc** parameters cannot be specified together in the command.

At least one linkset must be associated with the value of the **apc** parameter.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If no link is equipped for the SLC, the output is “\_\_\_,\_\_\_ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

"ASP-STATE" is shown for only IPSPG-M3UA linksets.

## Output

If the Proxy Point Code feature is enabled, then proxy point code information is displayed.

**rept-stat-ls**

### Legend

**LSN**—The name of the linkset

**APCA/APCI/APCN/APCN24**—The adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**SPCA/SPCI/SPCN/SPCN24**—The secondary point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**PST**—The primary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the specified card.

**SCRN**—The name of the gateway screening screen set associated with the linkset.

**GWSA**—Shows whether gateway screening is used for the specified linkset.

**GWSM**—Shows whether gateway screening messaging is turned on for the specified linkset.

**GWSD**—Shows whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is turned on.

**SLC**—The signaling link codes associated with the links that are contained in the specified linkset.

**SLK**—The signaling links that are contained in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link.

**PPCA/PPCI/PPCN/PPCN24**—The proxy point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**ASP STATE**—The state of AS associated with each signaling link of the IPSP-M3UA linkset. The states displayed are: ACTIVE, INACTIVE, or DOWN.

## rept-stat-meas

### Report Measurement Status

Use this command to report the status of the Measurements Subsystem (Measurements Platform) or MASPs (Integrated Measurements), including card location and state, IP link status, alarm level, and subsystem state.

**NOTE: If the Integrated Measurements collection function is turned on, then the status reflects the state of the E5-OAM card(s). If the Measurements Platform collection function is turned on, then the status reflects the state of the MCPM cards.**

**Keyword:** rept-stat-meas

**Related Commands:** rept-stat-card

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

**rept-stat-meas**

**Dependencies**

At least one MCPM card must be configured in the system if the Measurements Platform feature is turned on.

No other **rept-stat-xxx** commands can be in progress when this command is issued.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The **platformenable=on** or **oamhcmeas=on** parameter must be specified (see the **chg-measopts** command) before this command can be entered.

**Notes**

The MCPM and E5-OAM card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the MCPM or E5-OAM card is in the IS-NR or IS-ANR state. The **rept-stat-card** command does not show the GPL version if the card is IS-ANR.

**Output**

Output example with one MCP card isolated:

**rept-stat-meas**

```

MEAS SS          PST          SST          AST
IS-ANR          Active        -----
ALARM STATUS =   * 0516 Degraded Mode - 1 card failed

CARD  VERSION    TYPE    PST          SST          AST
1107 P 101-009-000  EDSM    IS-NR          Active        -----
      IP Link A    IS-NR          Active        -----
1109 -----      EDSM    OOS-MT          Isolated     -----
      IP Link A    OOS-MT          Unavail       -----

CARD 1107 ALARM STATUS = No Alarms
CARD 1109 ALARM STATUS = Card is isolated from the system
Command Completed.
;

```

Output example with both MCP cards IS-NR:

**rept-stat-meas**

```

MEAS SS          PST          SST          AST
IS-NR          Active        -----
ALARM STATUS =   No Alarms

CARD  VERSION    TYPE    PST          SST          AST
1107 P 046-010-004  EDSM    IS-NR          Active        -----
      IP Link A    IS-NR          Active        -----

```

**Legend**

**VERSION**—The version number of the GPL that the specified MCPM card is running. The version is shown if the card is in the IS-NR or IS-ANR state.

**TYPE**—EDSM; the MCPM card that is running the Measurements Subsystem application.

**PST**—The primary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the Measurements Subsystem or card. The possible values are described in .

**MEAS SS**—The Measurements Subsystem application running on the MCPM card.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MCPM card and the applications running on the card.

**CARD**—The location of the MCPM card. The card with the letter “P” to the right of its card location is the primary card. The primary card transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the card is IS-NR, the secondary state (SST) indicates whether the card is active or standby.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

## rept-stat-mon

## Report Status Monitoring System

Use this command to display the status of the Fast Copy subsystem on FC-capable cards and the EROUTE subsystem on STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** **rept-stat-mon**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card location. This parameter specifies the card location that is stenciled on the shelf for an STC or E5-STC card or an FC-capable card in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Status for all STC and FC-capable cards is reported.

**:mode=** (optional)

This parameter specifies the mode of reporting for the command.

If the **mode=perf** parameter is specified, then only subsystem performance information is displayed.

**Range:** perf

**:type=** (optional)

Monitoring subsystem type. This parameter specifies the type of the subsystem for which the monitoring statistics are displayed.

**Range:** fcs, eroute

**fcs** — Display the statistics for the Fast Copy subsystem

**eroute** — Display the statistics for the EROUTE subsystem

**Default:** Display the statistics for both the EROUTE and FC subsystems

### Example

```
rept-stat-mon
```

```
rept-stat-mon:type=eroute
```

```
rept-stat-mon:type=fcs
rept-stat-mon:type=eroute:loc=1101
rept-stat-mon:type=fcs:loc=1104
rept-stat-mon:type=eroute:mode=perf
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one STC card must be configured before this command can be entered.

At least one FC-capable card must be provisioned in the system before the **type=fcs** parameter can be specified.

The **loc** and **mode** parameters cannot be specified together in the command.

The **type=eroute** parameter must be specified before the **mode** parameter can be specified.

If the **loc** or **mode** parameters are specified, then the **type** parameter must be specified.

Either an STC card or an FC-capable card must be provisioned in the system.

An FC-capable card must be provisioned in the system before the **type=fcs** parameter can be specified. An STC card must be provisioned in the system before the **type=eroute** parameter can be specified.

### Notes

#### **Fast Copy Cards**

E5-ENET cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

## Output

**NOTE: For an E5-ENET card running the IPGHC GPL, Fast Copy card and link status are displayed in the command output only when the card is in the IS-NR state.**

The following example displays card- and system-level information for the Fast Copy and EROUTE subsystems.

**rept-stat-mon**

### Legend

Information displayed in the EROUTE subsystem report:

- **STC CARDS CONFIGURED**—Total number of STC cards and E5-STC cards configured in the system

- **CARDS IS-NR**—Total number of STC cards and E5-STC cards in IS-NR state
- **EISCOPY BIT**—Indicates whether EIS copy function is turned On or Off
- **SYSTEM THRESHOLD**—% of system total capacity being used
- **SYSTEM PEAK EROUTE LOAD**—Current load in Buffers/Sec
- **SYSTEM TOTAL EROUTE CAPACITY**—Total capacity in Buffers/Sec
- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **VERSION**—The version number of the GPL loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is configured but is not physically present in the system.
  - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database
- **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **EROUTE SERVICE AVERAGE TVG CAPACITY**—Average TVG Capacity in percent.
- **AVERAGE CPU CAPACITY**—Average CPU capacity in percent.
- **TVG USAGE**—% of system current TVG rate based on the Max TVG capacity of the E5-ENET card
- **CPU USAGE**—% of system current CPU usage
- **STC IP PORT**—The status of the STC IP ports A and B

Information displayed in the Fast Copy subsystem report:

- **FC CARDS CONFIGURED**—Total number of FC-capable cards configured in the system
- **CARDS IS-NR**—Total number of FC-capable cards in IS-NR state
- **FCMODE**—Monitoring mode
- **FCGPL**—Fast Copy Application loaded on the card
- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **CPU**—% of system current CPU usage

- **CARD FCS**—The Fast Copy status for the card
- **REASON**—The Deactivation alarm reason on Card FCS. The possible values are "CPU Thrshld Exceeded" or "Auto-Neg Fails"
- **FCS IP PORT**—The status of the FCS IP ports A1 and B1
- **IPADDRESS**—The IP addresses of the IMF
- **ASSOC NAME**—Association name
- **PKT CNT**—Snapshot of packets received/sent per association
- **SERVICE MODE**—Indicate the type of service granted by the DAS to FC-enabled card

## rept-stat-mps

### Report the MPS Status

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is enabled and turned on, then the ELAP (EAGLE LNP Application Processor) subsystem status is displayed.
- If the INP/AINPQ feature is enabled and turned on, then the EPAP (EAGLE Provisioning Application Processor) subsystem status is displayed.
- If the G-Port (GSM mobile number portability), G-Flex (GSM flexible numbering), or PPSMS (Prepaid SMS Intercept Ph1) feature is enabled and turned on, then the GSM (Global System for Mobile Telecommunications) and EPAP status is displayed.
- If the EIR (Equipment Identity Register) feature is enabled and turned on, then the status of the EIR component on the card is displayed.
- If the V-Flex (Voice Mail Router) feature is enabled and turned on, then the status of the V-Flex component on the card is displayed.
- If the ATINP (ATI Number Portability Query) feature is enabled, then the status of the ATINPQ component on the card is displayed.

**Keyword:** rept-stat-mps

**Related Commands:** rept-stat-card, rept-stat-sccp

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE 5 ISS.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

**rept-stat-mps:loc=1106**

### Dependencies

The card location specified in the **loc** parameter must contain a Service Module card.

One of the following features must be turned on, or the ATINP feature must be enabled before this command can be entered:

- A-Port
- AINPQ
- G-Flex
- G-Port
- INP
- EIR
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- V-Flex

At least one Service Module card must be configured in the system before this command can be entered.

To specify the **rept-stat-mps** command, no other **rept-stat-xxxx** command can be in progress.

### Notes

When the MPS does not have an alarm on it, the **rept-stat-mps** report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

## Output

**NOTE: The status for a particular feature is shown only if that feature is enabled or turned on.**

The following example shows the possible system response if the LNP ELAP Configuration feature is turned on:

**rept-stat-mps**

### Legend

**CARD**—The location of the Service Module card. The Service Module card with the designator “P” to the right of its card location is the primary Service Module card as selected by the active ELAP/EPAP. The primary Service Module card provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.

**VERSION**—The version number of the GPL that the specified ELAP/EPAP or card is running.

**PST**—The primary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**EPAP/ELAP A/B**—The application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, G-Port, or V-Flex is turned on, the output shows EPAP A/B.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the EPAP Administration Manual or the *ELAP Administration Manual*. There are 6 categories of MPS alarms:

- Critical platform alarm data
- Major platform alarm data
- Minor platform alarm data
- Critical application alarm data
- Major application alarm data
- Minor application alarm data

**GSM STAT**—The possible states are either ACT (active) or SWDL (indicates that the GSM component on that card is currently inactive until the software download completes). The GSM STAT information is not displayed if the G-Port, G-Flex and Prepaid SMS Intercept Ph1 features are turned off.

**INP STAT**—The possible states of INP status include ACT (active), OFFL (offline) and SWDL (indicates that the INP component on that card is currently inactive until the software download completes). The INP STAT information is not displayed if the INP feature is turned off.

**LNP STAT**—The possible states of LNP status include ACT (active), OFFL (offline) and SWDL (indicates that the LNP component on that card is currently inactive until the software download completes). The LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.

**EIR STAT**—The possible states of EIR Status include ACT (active), OFFL (offline), and SWDL (Indicates the EIR component on that card is currently inactive until software download completes). The EIR STAT information is not displayed if the EIR feature is not enabled.

**VFLEX STAT**—The possible states of V-Flex Status include ACT (active), OFFL (offline), and SWDL (Indicates the V-Flex component on that card is currently inactive until software download completes). The V-Flex Status information is not displayed if the V-Flex feature is not on.

**ATINPQ STAT**—The possible states of ATINPQ Status include ACT (active), OFFL (offline), and SWDL (Indicates the ATINPQ component on that card is currently inactive until software download completes). The ATINPQ STAT information is not displayed if the ATINP feature is not enabled.

**DSM MEMORY USAGE**—The percentage of DSM memory used to store the ELAP/EPAP database.

For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on a 2G DSM card means that 1G is used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the **trv-ctrl-feat** command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

**DSM PORT A/B**—A listing of any trouble text alarm messages that have been generated for the port on the card.

**IP CONNECTION UNAVAILABLE**—Indicates the failed channels on those ports with IP Connection Unavailable alarms. The possible channels reported are:

- Prov—RTDB Provisioning Channel
- Dnld—RTDB Download Channel
- TCP—Transmission Control Protocol Channel
- UDP—User Datagram Protocol Channel

## rept-stat-mux

## Report the MPS Status

Use this command to list all the HMUX, HIPR, and HIPR2 cards and the location and status of the cards.

**Keyword:** **rept-stat-mux**

**Related Commands:** **rept-stat-card**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-mux**

### Dependencies

None

### Notes

None

**Output****rept-stat-mux**

tekelecstp 10-02-21 11:19:03 EST EAGLE 42.0.0

| CARD | TYPE  | PST   | SST    | AST   | BITRATE<br>(OPER) | BITRATE<br>(ACT) | BERT<br>STATUS |
|------|-------|-------|--------|-------|-------------------|------------------|----------------|
| 1109 | HIPR2 | IS-NR | Active | ----- | HIGH              | LOW              | PASS           |
| 1110 | HIPR2 | IS-NR | Active | ----- | HIGH              | LOW              | UNKNOWN        |
| 1209 | HIPR2 | IS-NR | Active | ----- | HIGH              | LOW              | FAIL           |
| 1210 | HIPR  | IS-NR | Active | ----- | LOW               | LOW              | UNKNOWN        |

| 1310 | HMUX  | IS-NR | Active | ----- | LOW               | LOW              | UNKNOWN        |

Command Completed.

;

**Legend****CARD**—HMUX, HIPR, or HIPR2 card location**TYPE**—Type of card (HMUX, HIPR, or HIPR2)**PST**—Primary state of the card. Possible values are described in "Possible Values for PST/SST/AST" in Appendix A.**SST**—Secondary state of the card. Possible values are described in "Possible Values for PST/SST/AST" in Appendix A.**AST**—Associated state of the card. Possible values are described in "Possible Values for PST/SST/AST" in Appendix A.**BITRATE(OPER)**—Maximum operational bit rate that the Fibre-Channel ring is capable of. If the operational bit rate is HIGH, the Fibre-Channel ring can be switched between the HIGH rate and the LOW rate.**BITRATE(ACT)**—Bit rate currently used by the Fibre-Channel ring. This rate is determined by various parameters such as the operational bit rate of the other bus, availability of a High Rate Feature Access Key, etc.**BERT STATUS**—BERT (Bit Error Rate Test) status of the HIPR2 card. BERT is a diagnostic test that is initiated by the HIPR2 cards on an all HIPR2 IMT Bus during Bus alignment. Possible values are:

- **PASS**—BERT passed for the HIPR2 card
- **FAIL**—BERT failed for the HIPR2 card
- **UNKNOWN**—BERT status is reported as Unknown for HIPR2 cards if a BERT is not conducted because HMUX and HIPR cards are present on the same Bus. BERT status is always reported as Unknown for a mixture of HMUX and HIPR cards.

**rept-stat-rtd****Report Status RTD**

Use this command to report Run Time Diagnostics (RTD) for EAGLE 5 ISS cards, including the status of internal integrity checks and the RTD subsystem alarm. This display can help determine the cause when an RTD subsystem alarm occurs, or when associated issues are reported.

This command is also used to reset MSU validation statistics and clear the RTD subsystem alarm.

**Keyword:** rept-stat-rtd**Related Commands:****Command Class:** System Maintenance

## Parameters

**:force=** (optional)

The **force** parameter is used with the **reset=yes** parameter to clear statistics for a card when the RTD subsystem alarm is present.

**Range:**        **yes**

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

The **loc** parameter can be used to either retrieve or reset statistics for a card location. To reset the statistics, the **loc** parameter and the **reset** parameter must be specified together in the command.

**Range:**        **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:reset=** (optional)

This parameter clears the statistics by setting them to zero and resets the checksum card indicator error and RTD subsystem alarm.

**Range:**        **yes**

**yes** — Clears the statistics.

If the **reset=yes** parameter is specified with the **loc** parameter, then statistics are cleared for the specified card. If the **reset=yes** parameter is specified, and the **loc** parameter is not specified, then statistics are cleared for all cards in the system.

## Example

```
rept-stat-rtd
```

```
rept-stat-rtd:loc=1107
```

```
rept-stat-rtd:reset=yes:force=yes
```

```
rept-stat-rtd:loc=1107:reset=yes
```

## Dependencies

If the **reset=yes** parameter is specified, then the **force=yes** parameter must be specified to clear the statistics and checksum failure indicators.

The card specified by the **loc** parameter must be an IPLIMx, IPGWx, IPSG, SCCP, Service Module, E1/T1 MIM, HC-MIM, E5-E1T1, LIMATM, E5-ATM, or E1-ATM card.

The card in the specified card location (**loc** parameter) must be in service.

The **reset=yes** parameter must be specified to clear the statistics.

The **force=yes** parameter must be specified.

The **loc** parameter cannot have a non-numeric value.

The following card locations are not valid for this command: 1114, 1116, 1117, 1118 (TDM, MDAL cards), and all xy09 and xy10 locations where x is the frame and y is the shelf (HMUX or HIPR cards).

The card slot must be equipped and in service.

## Notes

The statistics from internal integrity checks are displayed for all in-service LIM and SCCP cards. The reported statistics are dynamic and are not maintained when a card is re-initialized.

The displayed reports contain message validation totals since the last time the diagnostic information for the cards was reset.

The individual statistics that are reported re-start at zero after the maximum values are reached and are cleared when reset by the **rept-stat-rtd** command.

The report displayed shows the summary statistics or overall totals for MSU validation statistics for all LIM and SCCP cards in the system. It also includes the status for the RTD subsystem and the RTD subsystem alarm.

When the **loc** parameter is specified in the **rept-stat-rtd** command, the report displayed shows the detailed MSU validation statistics report for the specified card. The report shows statistics from integrity checks performed by the specified card on MSUs transferred to and from LIM/SCCP cards and includes the timestamp when the card last detected an error during integrity checks. The statistics are only displayed for cards with non-zero totals.

The integrity checks are performed on a subset of the MSUs transferred between cards. When card(s) report errors during the integrity checks, the RTD subsystem alarm is activated. The error statistics reported should be used along with the UIMs or alarms to help identify the source of the problem.

The RTD subsystem alarm is triggered when a card reports that a checksum error was detected during internal card integrity checks.

The RTD subsystem alarm remains active in the system until the statistics are reset using the **rept-stat-rtd** command, and no further indications of checksum errors are reported during internal card integrity checks.

## Output

If the **rept-stat-rtd** command is entered with no parameters, then a summary status for the RTD subsystem and alarm and summary statistics for all of the LIM/SCCP cards in the system are displayed.

If the **loc** parameter is specified in the **rept-stat-rtd** command, then detailed statistics are displayed for the specified card location. Only cards with non-zero totals are reported in the location specific report.

The following example displays a summary report on the status of the RTD subsystem and RTD subsystem alarm with MSU validation statistics for all LIM/SCCP cards in the system.

The following example displays the option for resetting MSU validation statistics and checksum failure indicators for all cards in the system and clearing the RTD subsystem alarm.

#### rept-stat-card:reset=yes:force=yes

```
eagle10110 07-02-22 20:34:06 EST  EAGLE 35.6
Clear RTD Statistics command(s) issued...
Command Completed.
```

```
eagle10110 07-02-22 20:32:58 EST  EAGLE 35.6.0
5501.0542      RTD SYSTEM           MSU cksum error threshold cleared
```

```
;
```

### Legend

This section defines the fields of the **rept-stat-rtd** reports.

**PST**—The possible values are described in "Possible Values for PST/SST/AST". For this command, IS-NR specifically means no checksum errors were found during the last reporting period; IS-ANR specifically means that a card or cards reported checksum errors during MSU integrity checks when the RTD status was previously IS-NR, and the RTD System Alarm(s) was raised.

**TOTAL RX ERROR** (for a Summary Report)—Total MSUs received with checksum errors, including MSUs with checksum errors received from all cards in the system.

**TOTAL RX ERROR** (for a Location-Specified Report)—Total MSUs with checksum errors received at the card specified by the **loc** parameter from SRC/DEST CARD.

**TOTAL RX VALIDATED** (for a Summary Report)—Total MSUs with checksum received and validated from all cards in the system.

**TOTAL RX VALIDATED** (for a Location-Specified Report)—Total MSUs with checksum received and validated at the card specified by the **loc** parameter from SRC/DEST CARD.

**TOTAL TX** (for a Summary Report)—Total MSUs with checksum applied and transmitted to all cards in the system.

**TOTAL TX** (for a Location-Specified Report)—Total MSUs with checksums transmitted from the card specified in the **loc** parameter to SRC/DEST CARD.

**LAST ALARM TIMESTAMP**—Timestamp for last reported checksum error for the card specified in the **loc** parameter.

**SRC/DEST CARD**—Source card transmitting MSUs with checksums received by the card specified in the **loc** parameter. Destination card receiving MSUs with checksums transmitted from card specified in LOC parameter.

**RTD SUBSYSTEM**—Indicates RTD Device Status (IS-NR, etc).

**RTD ALARM STATUS**—Indicates whether an alarm is present for the RTD Device. The possible values are described in .

## rept-stat-rte

## Report Status Route

Use this command to display the signaling route status for a particular destination.

**Keyword:** **rept-stat-rte**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-dstn, rtrv-rte**

**Command Class:** System Maintenance

### Parameters

**:dpc=** (optional)

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

**prefix—p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:mode=** (optional)

This parameter specifies the type of display to produce.

**Range:** **full, rtx**

**full**— Comprehensive display of point code status, including **rtx**. If specified with a point code, then the status for that point code is displayed. If specified without a point code, then the status of all routes is displayed.

**rtx**— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:** A summary report is displayed.

**:stat=** (optional)

This parameter specifies the primary state filter.

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all**— All of the primary states

**alminh**— Alarms inhibited

**anr**— In service abnormal (IS-ANR)

**dsbld**— Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**— Out of service maintenance (OOS-MT)

**nr**— In service normal (IS-NR)

**Default:** **all**

**Example**

```

rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25- **

```

**Dependencies**

An x-list DPC cannot be specified in the **dpc** parameter.

If the **mode=full** parameter is specified, then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

If the **dpc** parameter specifies an *ni-nc-\** format, then the **mode** parameter cannot be specified.

The **dpc** parameter must specify an *ni-nc-\** format before the **stat** parameter can be specified with the **dpc** parameter.

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, then the value must be the true destination point code (not an alias) and the value must be defined in the database.

The Origin-Based MTP Routing feature must be turned on before the **mode=rtx** parameter can be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

The **pst** and **mode** parameters cannot be specified together in the command.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

**Summary of DPC parameter syntaxes**

- **rept-stat-dstn:dpc=ni-nc-ncm**—Requests a report for fully provisioned destination *ni-nc-ncm*.
- **rept-stat-dstn:dpc= ni-\*. \***—Requests a report for provisioned network destination with the specified network indicator. If **\*** is specified in the *nc* field, **\*** must be specified in the *ncm* field.
- **rept-stat-dstn:dpc= ni-\*\*- \***—Requests a report for the full network cluster for the specified *ni*.
- **rept-stat-dstn:dpc= ni-\*\*\***— Requests a report for the full network cluster and the network cluster address (if any) for the specified *ni*.
- **rept-stat-dstn:dpc= ni-nc-\***—Requests a report for provisioned cluster destination *ni-nc-\**.

- **rept-stat-dstn:dpc= ni-nc-\***—Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. Note, however, that the network cluster address on *ni-nc-\** (if it exists) is not reported.
- **rept-stat-dstn:dpc= ni-nc-\*\*\***—Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address (if it exists) is also reported.
- **rept-stat-dstn:dpcn24=msa-ssasp**—Requests a report for fully provisioned 24-bit destination point *main signaling area-sub signaling area signaling point*.

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the **mode=full** parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the **mode=rtx** parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the **mode=full** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows how summary information for all provisioned cluster and noncluster DPCs is reported.

### rept-stat-rte

```
tekelecstp 10-10-15 14:59:49 EST EAGLE 43.0.0
rept-stat-rte
Command entered at terminal #4.
Extended Processing Time may be Required

Command Completed.

```

;

The following example shows how the circular routing alarm for a cluster destination is displayed. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

#### rept-stat-rte:dpc=9-3-\*

```

rlghncxa03w 04-01-07 14:59:11 EST EAGLE 31.3.0

### Legend

**DPC/DPCA**—The ANSI destination point code of the route

**DPCN**—The ITU-TSS national destination point code of the route

**DPCN24**—The 24-bit ITU national destination point code of the route

**DPCI**—The ITU-TSS international destination point code of the route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-rtkey

## Report the Status of Routing Keys

Use this command to generate a summary report of the status of the system routing keys.

**Keyword:** **rept-stat-rtkey**

**Related Commands:** **chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey, rtrv-appl-rtkey**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-rtkey**

### Dependencies

None

### Notes

The report generated by the **rept-stat-rtkey** command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table
- The current number of static routing key entries in the routing key table
- The percentage of the static routing key table entries that is provisioned

### Output

**rept-stat-rtkey**

```
rlghncxa03w 10-10-27 14:59:11 EST EAGLE 43.0.0
SRKQ = 250
```

```
Static Route Key table is (50 of 250) 20% full
```

```
Static Route Key Socket Association table is (80 of 4000) 2% full
```

```
;
```

## rept-stat-rtx

## Report Status Exception Route

Use this command to display the signaling route status for one or more exception routes to a particular destination.

**Keyword:** rept-stat-rtx

**Related Commands:** chg-rtx, dlt-rtx, ent-rtx, rtrv-rtx

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **cic** parameter as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** p-, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private

and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **ecic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** **0-16383**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:mode=** (optional)

This parameter specifies the type of display to produce.

**Range:** **full**

**full**— Displays routes from the associated routeset and exception route table for the specified destination point code per criteria.

**:opc=** (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/open24=** (optional)

Origination point code.

**:opci=** (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** **0-15**

## Example

**rept-stat-rtx**

**rept-stat-rtx:dpc=1-101-1**

**rept-stat-rtx:dpc=1-101-1:opc=1-2-1**

**rept-stat-rtx:dpc=100-100-1:opc=1-1-1:mode=full**

### Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

The **dpc** parameter and the class criteria parameters (**opc/ilsn/cic/si**) must be specified before the **mode** parameter can be specified.

The **dpc** parameter must be specified before the class criteria parameters (**opc/ilsn/cic/si**) can be specified.

### Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The following table provides a summary description of the reports that are produced by specifying various **rept-stat-rtx** parameters.

| Format                                  | Meaning                                                                                                                                                                                               |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rtx:dpc=ni-nc-ncm:si=n</b> | Requests a status report of the exception route set for fully provisioned destination <i>ni-nc-ncm</i> , which uses the specified value <i>n</i> of the exception route class <b>si</b> as criterion. |
| <b>rept-stat-rtx:dpc= ni-nc-ncm</b>     | Requests a status report of all exception route sets for fully provisioned destination <i>ni-nc-ncm</i> , regardless of the exception route class(es) used as criterion.                              |
| <b>rept-stat-rtx:dpc= ni-nc-*</b>       | Requests a status report of all exception route sets for provisioned cluster destination <i>ni-nc-*</i> , regardless of the exception route class(es) used as criterion.                              |
| <b>rept-stat-rtx</b>                    | Requests a status report of all exception route sets for provisioned destinations, regardless of the exception route class(es) used as criterion                                                      |

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following command provides the status of all exception route sets provisioned in the system, sorted by DPC.

**rept-stat-rtx**

```
stdcfg2b 09-05-24 01:54:32 EST EAGLE 41.0.0
```

| DPCA        | PST    | SST      | AST      |

### **Legend**

**DPC/DPCA**—The ANSI destination point code of the exception route

**DPCN**—The ITU-TSS national destination point code of the exception route

**DPCN24**—The 24-bit ITU national destination point code of the exception route

**DPCI**—The ITU-TSS international destination point code of the exception route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**SI**—Service Indicator used as the exception routing criterion for this exception route

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## **rept-stat-sccp**

## **Report Status SCCP**

Use this command to display the following types of reports:

- **rept-stat-sccp** (with no parameters)—displays the status of the DSM and E5-SM4G cards and the services executing on those cards:
  - A-Port (IS41 Mobile Number Portability)
  - AIQ (AnalyzedInformation Query)
  - ATINPQ (ATI Number Portability Query)
  - EIR (Equipment Identity Register)
  - G-Flex (GSM Flexible Numbering)
  - G-Port (GSM Mobile Number Portability)
  - GTT (Global Title Translation)
  - IAR (Info Analyzed Relay)
  - IDP Relay (Prepaid IDP Query Relay)

- IGM (IS41 GSM Migration)
- INP (INAP-based Number Portability)
- LNP (Local Number Portability)
- LRNQT (ITU TCAP LRN Query)
- MNPSMS (Portability Check for Mobile Originated SMS)
- MO SMS B-Party Routing
- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- PPSMS (Prepaid SMS Intercept Ph1)
- V-Flex (Voice Mail Router)

The command also displays any cards that are denied SCCP service.

- **rept-stat-sccp:mode=perf**—targets the general SCCP traffic performance for Service Module cards. The report supplies message rates for ticket voucher group (TVG) performance.
- **rept-stat-sccp:loc=nnnn**—provides a detailed view of the status of SCCP services provided by a specific Service Module card

**NOTE: The rept-stat-sccp and rept-stat-sccp:mode=perf reports include the status of DSM and E5-SM4G cards but do not differentiate between these card types.**

**NOTE: To retrieve traffic statistics for the LNP feature, the rept-stat-lnp command can also be used.**

**NOTE: Statistics are displayed for the supported features as follows:**

- **AIQ—AIQ Subsystem Report and Service Statistics**
- **APORT, GPORT, and IGM—MNP Service Statistics**
- **ATINPQ—ATINPQ Subsystem Report and Service Statistics**
- **EIR—EIR Subsystem Report and Service Statistics**
- **G-Flex—GFLEX Service Statistics**
- **GTT—GTT Service Statistics**
- **IAR—IAR Service Statistics**
- **IDP Relay—IDPR Service Statistics**
- **INPQ—INP Subsystem Report and Service Statistics (including INPQ and INPMR.AINPQ is clubbed with INPQ)**
- **LNP—LNP Subsystem Report and Service Statistics (including LNPMR, LNPQS, WNPQS, TLNP, PLNPQS and LRNQT)**
- **MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, MO-based IS41 SMS NP, PPSMS—SMSMR Service Statistics**

- V-Flex—VFLEX Subsystem Report and Service Statistics

**NOTE:** If traffic is being generated while DSM cards are loading, then superfluous counts may be displayed in Daily and Overall Peak SCCP Loads. To correct this occurrence, reset the Peak SCCP Loads using the `rept-stat-sccp:peakreset=yes` command.

**Keyword:** `rept-stat-sccp`

**Related Commands:** `chg-th-alm`, `rtrv-th-alm`

**Command Class:** System Maintenance

## Parameters

**:loc=** (optional)

Card Address. Use this parameter to specify the location of the Service Module card to be reported on.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Report a summary of all cards.

**:mode=** (optional)

Use this parameter to provide extended performance information, including output about group ticket voucher (TVG) performance and message rates for direct assignments.

**Range:** `perf`

**Default:** No extended performance information is displayed.

**:peakreset=** (optional)

Reset all Peak values to zero.

**Range:** `yes`

## Example

```
rept-stat-sccp
```

```
rept-stat-sccp:mode=perf
```

```
rept-stat-sccp:loc=1106
```

## Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

A Service Module card running the **vsccp** application must be configured in the system before this command can be entered.

Only one optional parameter at a time can be specified in the command.

The card location (**loc** parameter) must identify a configured Service Module card running the **vsccp** application.

## Notes

None

## Output

If the EIR, G-Port, INP, 1100 TPS/DSM for ITU NP, AINPQ, A-Port, IGM, E5-SM4G Throughput Capacity, IAR, or V-Flex features are enabled, then the **ansigflex** system option is disabled.

**NOTE: Output for the rept-stat-sccp command displays the status for services associated with features that are enabled and turned on. If a feature is not turned on, then the services for that feature are not displayed. The following examples display output when all possible features are turned on.**

The following example displays a summary report for all the features corresponding to EPAP-based services and subsystems.

**Legend**

This section defines the fields of the three **rept-stat-sccp** reports:

- **rept-stat-sccp** with no parameters
- **rept-stat-sccp:mode=perf**
- **rept-stat-sccp:loc=nnnn**

A dash (-) in an output field indicates that the statistic does not apply.

**NOTE: The ERRORS and TOTAL ERRORS fields indicate that errors have occurred for Service Module (SCCP) cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the *Maintenance Manual* for error explanations and recovery procedures.**

*Report Type: rept-stat-sccp with no parameters*

- **SCCP SUBSYSTEM REPORT, GFLEX/MNP SERVICE REPORT and LNP/INPQ/EIR/VFLEX/ATINPQ/AIQ SUBSYSTEM REPORT**—Summary of the SCCP subsystem status, GFLEX and MNP service status, LNP, INPQ (INP Query), EIR, VFLEX, ATINPQ and AIQ subsystem status
- **SCCP CARDS CONFIGURED**—Number of provisioned Service Module cards running the **vsccp** application
- **CARD IS-NR**—Number of Service Module cards that can be used by the system (status is In-Service Normal, IS-NR)
- **SYSTEM PEAK SCCP LOAD**—Highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS
- **SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active SCCP cards
- **SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-alm** command.
- **CARD**—Card location of the cards running the VSCCP application
- **P**—When G-Flex, GPORT, INP, APORT, EIR, V-Flex, IAR, or IGM feature is turned on, a P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE 5 ISS. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the GPL running on the Service Module card
- **PST**—Primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—Secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—Associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **MSU USAGE**—Percentage of the maximum number of MSUs received by each card during the last 30 seconds
- **CPU USAGE**—Percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks

- **SCCP SERVICE AVERAGE MSU CAPACITY**—Average MSU capacity used over the last 30-second interval. This field includes all services provided by the Service Module cards.
- **AVERAGE CPU CAPACITY**—Average CPU capacity used over the last 30-second interval. This field includes all services provided by the Service Module cards.
- **AVERAGE CPU USAGE PER SERVICE**—System-wide view of the service traffic composition.
- **TOTAL SERVICE STATISTICS**—System-wide view of per-service statistics. An "A" in the field indicates that the statistic does not apply. The report tracks the following information:
  - **SERVICE**
  - **SUCCESS**—Total number of successful messages processed by the specified card for each service. Applies to all services.
  - **ERRORS**—Total number of messages with errors for each service. Applies to all services.
  - **WARNINGS**—Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services
  - **FORWARD TO GTT**—Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR and INPMR services

*Report Type:* **rept-stat-sccp:mode=perf**

This report includes the status of DSM cards and E5-SM4G cards, but does not differentiate between these card types.

**SCCP SUBSYSTEM REPORT, LNP SUBSYSTEM REPORT and GFLEX/MNP SERVICE REPORT**—Summary status of the SCCP subsystem, GFLEX and MNP services, LNP subsystem along with their corresponding Alarm Status

**SCCP CARDS CONFIGURED**—Number of Service Module cards provisioned

**CARD IS-NR**—Number of Service Module cards that can be used by the system (status is in-service normal, IS-NR)

**SYSTEM PEAK SCCP LOAD**—Highest SCCP TPS processed by the EAGLE 5 ISS

**SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active Service Module cards

**SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP TPS capacity. This value is set by the **chg-th-alm** command.

**TPS STATISTICS**—Section of the report that provides TPS statistics on each Service Module card

**CARD**—Card location of the cards running the VSCCP application

**CPU USAGE**—Percentage of the amount of CPU used to process messages by each card during the last 30 seconds

**TOTAL MSU RATE**—Total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the Service Module card for the last 30-second period.

**CLASS 0 AND CLASS 1 TVG RATE**—Number of messages per second received

The next section of the **rept-stat-sccp:mode=perf** report provides system-wide SCCP traffic statistics.

**AVERAGE MSU USAGE**—Total of the MSU usage fields from each Service Module card divided by the number of active Service Module cards

**AVERAGE CPU USAGE**—Total of the CPU usage fields from each Service Module card divided by the number of active Service Module cards

**TOTAL MSU RATE**—Sum of all MSU rates processed by all active Service Module cards

**STATISTICS FOR PAST 30 SECONDS**—Statistics that represent the last 30-second period

**TOTAL MSUS**—Sum of all transactions on all active Service Module cards

**TOTAL ERRORS**—Sum of all errors on all active Service Module cards

*Report Type:* **rept-stat-sccp:loc= nnnn**

**CARD**—Card location of the card running the VSCCP application

**VERSION**—Version number of the GPL the card is running

**TYPE**—Type of the card

**PST**—Primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—Secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—Associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**CARD ALARM STATUS**—If there are no card alarms present, this field displays No Alarms.

The next section of the **rept-stat-sccp:loc=nnnn** report supplies the status of the individual services provided by the card and the associated CPU usage for the service.

**GTT: STAT**—Possible values are ACTIVE and SWDL (software loading)

**SMSMR: STAT**—Possible values are ACTIVE and SWDL (software loading)

**IDPR: STAT**—Possible values are ACTIVE and SWDL (software loading)

**IAR: STAT**—Possible values are ACTIVE and SWDL (software loading)

**INPMR: STAT**—Possible values are ACTIVE and SWDL (software loading)

**GFLEX: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**MNP: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading)

**INPQ: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading)

**EIR: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**VFLEX: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**LNPMR: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**LN PQS: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**WNPQS: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**TLNP: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**PLNPQS: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**LRNQT: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**ATINPQ: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**AIQ: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading)

**TOTAL**—Sum of the CPU usage for the services running over the previous 30-second period

**CARD SERVICE STATISTICS**—Card service statistics over the previous 30-second period for the specified card. The report tracks the following:

**SERVICE**

**SUCCESS**—Total number of successful messages processed by the specified card for each service. Applies to all services.

**ERRORS**—Total number of messages with errors for each service. Applies to all services.

**WARNINGS**—Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services

**FORWARD TO GTT**—Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, and INPMR services

## rept-stat-seas

## Report Status SEAS Command

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE 5 ISS. This command reports the status of the CCS MR connections if the SEAS Over IP feature is turned on. See the Maintenance Manual for information about the SEAS alarms.

**Keyword:** `rept-stat-seas`

**Related Commands:** `alw-trm`, `chg-trm`, `inh-trm`, `rept-stat-sys`, `rept-stat-trbl`, `rept-stat-trm`

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-seas**

### Dependencies

At least one SEAS terminal must be defined using the **chg-trm** command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

**Output**

The following example shows the output of the command when the SEAS Over IP feature is turned on.

**rept-stat-seas**

```
tekelecstp 07-01-11 16:47:51 EST EAGLE 37.5.0
```

| SEAS SYSTEM              |              |      | PST   | SST    | AST   |
|--------------------------|--------------|------|-------|--------|-------|
| -----                    |              |      |       |        |       |
| ALARM STATUS = No Alarms |              |      | IS-NR | Avail  | ----- |
| TERM                     | IPADDR       | PORT | PST   | SST    | AST   |
| -----                    |              |      |       |        |       |
| 18                       | 120.30.10.11 | 15   | IS-NR | Active | ----- |
| ALARM STATUS = No Alarms |              |      |       |        |       |
| 40                       | 128.30.15.12 | 16   | IS-NR | Active | ----- |
| ALARM STATUS = No Alarms |              |      |       |        |       |

**Legend**

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SEAS SYSTEM**—The overall SEAS component.

**rept-stat-seculog****Display Security Log Status Information**

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries
- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

**Keyword:** rept-stat-seculog

**Related Commands:** chg-attr-seculog, rtrv-attr-seculog

**Command Class:** Security Administration

**Parameters**

This command has no parameters.

**Example**

**rept-stat-seculog**

**Dependencies**

No other security log command can be in progress when this command is entered.

**Notes**

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are not *necessarily* displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format *ofhh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

**Output**

The following example shows the normal security log state. All of the un-uploaded records appear in the log on the active OAM.

**rept-stat-seculog**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0     No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows an abnormal situation. The active security log is full and has overflowed.

**rept-stat-seculog**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active 10000    100   Yes  No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0     No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows what happens when both logs contain un-uploaded entries. The standby log on 1116 should be uploaded.

**rept-stat-seculog**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 693       7     No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows how, if data cannot be retrieved from the standby OAM (for example, in simplex mode), blanks (-----) are displayed.

**rept-stat-seculog**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE   ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     83    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby ----- --- --- --- -----
                                     -----
```

;

**Legend**

**LOC**—The address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.

**ROLE**—The current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: **active** or **standby**.

-- **SINCE LAST UPLOAD**—This heading applies to the four columns directly below it on the output. It indicates that the fields below display information obtained since the last upload.

**ENTRIES**—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using **copy-seculog**.

**%FULL**—Shows, as a percentage, how much space in the log the ENTRIES field value occupies.

**OFLO**—The overflow indicator. Overflow is what happens if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. This field displays **No** if no overflow has occurred and **Yes** if overflow has occurred.

**FAIL**—The failed indicator. This field displays **No** if no logging failure has occurred. It displays **Yes** to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

**NOTE:** Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a **copy-disk** command is processing, the system sets the flag when the **copy-disk** command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

**OLDEST RECORD/NEWEST RECORD**—The date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The **NEWEST RECORD** for the active log is the current date, because the log will have recorded the **rept-stat-seculog** command that was just entered to produce the report.

**LAST UPLOAD**—The date and time when the log was last uploaded successfully. That is, the **copy-seculog** command successfully copied the log to the FTA.

## rept-stat-slan

## Report Status of the STPLAN

Use this command to generate a summary report of the status of the DCM and E5-ENET cards that make up the STPLAN subsystem.

**Keyword:** **rept-stat-slan**

**Related Commands:** **rept-stat-alm**, **rept-stat-card**, **rept-stat-dlk**, **rept-stat-imt**, **rept-stat-sys**, **rept-stat-trbl**

**Command Class:** System Maintenance

### Parameters

**:mode=** (optional)

Use this parameter to provide extended performance information, including group ticket voucher (TVG) message rates.

**Range:** **perf**

**Default:** No extended performance information is displayed

### Example

```
rept-stat-slan
```

```
rept-stat-slan:mode=perf
```

### Dependencies

No other **rept-stat-xxx** commands can be in progress when this command is entered.

At least one DCM or E5-ENET card that makes up the STPLAN must be configured.

**Notes**

The HOST CAP. field value is obtained by averaging the usage percentages for the data links from each DCM, and E5-ENET card to the host.

The EAGLE CAP. field value is obtained by averaging the usage percentages for the DCM and E5-ENET traffic received from LIMs.

The system level usage for host capacity (the AVERAGE USAGE PER HOST CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the data links to the host from each DCM and E5-ENET card.

The EAGLE 5 ISS level usage for DCM and E5-ENET cards capacity (the AVERAGE USAGE PER EAGLE CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the DCM and E5-ENET traffic received from LIMs.

**Output**

The following example shows output with at least one ACM in an IS-NR state:

**rept-stat-slan**

```
rlghncxa03w 04-02-27 16:53:22 EST EAGLE 31.3.0

**Legend**

**SLAN SUBSYSTEM REPORT**—The status of the STPLAN subsystem.

**STPLAN CARDS CONFIGURED**—The number of DCM and E5-ENET cards used by the STPLAN contained in the system.

**CARDS IS\_NR**—The number of DCM and E5-ENET cards contained in the system whose status is in service normal (IS-NR).

**CARD**—The locations of the DCM and E5-ENET cards.

**VERSION**—The version number of the GPL running on the STPLAN card.

**PST**—The primary state of the DCM and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the DCM and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the DCM and E5-ENET cards. The possible values are described in.

**HOST CAP**—The amount of traffic being sent to the host from each DCM and E5-ENET card, expressed as a percentage of the total amount of traffic that can be sent to the host.

**EAGLE CAP**—The amount of traffic being sent to each DCM and E5-ENET card, that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to the DCM and E5-ENET card.

**AVERAGE USAGE PER HOST CAPACITY** The amount of traffic being sent to all hosts from all DCM and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all DCM, and E5-ENET cards.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all DCM and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all DCM and E5-ENET cards.

**CARDS DENIED SLAN SERVICE**—The card locations that cannot use the STPLAN application.

**CARDS DISABLED COPY SERVICE**—The card locations that cannot use the stop and copy action of the gateway screening feature.

Instead of displaying the VERSION , PST , SST , AST , HOST CAP , EAGLE CAP, and CARDS DENIED SLAN SERVICE fields, the report displayed with the **rept-stat-slan:mode=perf** command shows these fields:

**HOST CAP**—The average of the usage percentages for the TCP/IP data links to the host from each DCM and E5-ENET card.

**EAGLE CAP**—The average of the usage percentages for the DCM and E5-ENET traffic that is received from the LIMs.

**TVG RATE**—The number of messages per second received from all SS7 links, and any other group ticket voucher paced message source. It is obtained from statistics maintained by the DCM and E5-ENET cards for the last 30-second period.

**AVERAGE USAGE PER HOST CAPACITY**—The amount of traffic being sent to all hosts from all DCM and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all DCM and E5-ENET cards.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all DCM and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all DCM and E5-ENET cards.

## rept-stat-slk

## Report Status Signaling Link

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the **e1loc** parameter (card location of the E1 card) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the **t1loc** parameter (card location of the T1 card) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is generated.

**Keyword:** **rept-stat-slk**

**Related Commands:** **act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk**

**Command Class:** System Maintenance

### Parameters

**:l2stats=** (optional)

Report L2 status

**Range:** **align, both, brief, no, service**

**align** — Display alignment data only

**both** — Display alignment and service data  
**brief** — Display up to 10 alignment events only  
**no** — Do not display level 2 status information  
**service** — Display service data only

**Default:** **no**

**:link=** (optional)

The signaling link on the card specified in the **loc** parameter. The linkss can be specified in any sequence or pattern.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All cards containing signaling links are displayed.

**:stat=** (optional)

A report on cards whose status is the same as the state indicated by the parameter

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all** — All of the primary states

**alminh** — Alarms inhibited

**anr** — In-Service-Abnormal (IS-ANR)

**dsbld** — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

**mt** — Out-of-Service-Maintenance (OOS-MT)

**nr** — In-Service-Normal (IS-NR)

**Default:** Display all

### Example

```
rept-stat-slk
```

```
rept-stat-slk:loc=1201:link=a
```

```
rept-stat-slk:stat=alminh
```

```
rept-stat-slk:loc=1203:link=b:l2stats=both
```

```
rept-stat-slk:loc=1203:link=b:l2stats=brief
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If the **loc** parameter or the **link** parameter is specified, then the **stat** parameter cannot be specified.

When the **loc** parameter is specified, the **link** parameter must be specified.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application

- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi** or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The location specified by the **loc** parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (**l2stats**).

On TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as SS7IPGW or IPGWI links), **l2stats** output is not available.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

The card in the specified card location (**loc** parameter) must be in service.

The **link=b** parameter cannot be specified for ss7ipgw TCP/IP links.

Neither the **stat** or **loc** and **port** parameters can be specified with this command.

The A1, B1, A2, B2, A3, and B3 links can be specified when:

- The card type is LIMDS0, and the card application is SS7ANSI.
- The card type is LIME1, LIMT1, or LIMCH, and the card application is SS7ANSI or CCS7ITU.
- The card is an SSEDCCM, and the card application is IPLIM or IPLIMI.
- The card type is LIME1, LIMT1, or LIMCH (and the card is not an SE-HSL or ST-HSL-A card), and the card application is SSANSI or CCS7ITU.
- The card is an SSEDCCM card (IPLIM to 8 points) and the card application is IPLIM, IPLIMI, or an E5-ENET card and the card application is IPLIM, IPLIMI, or IPSEG.

The A4 - A7 and B4-B7 links can be specified for E5-ENET cards when the card application is IPLIM or IPLIMI, and for E1/T1 MIM cards when the card application is SS7ANSI or CCS7ITU.

The A4 - A15 and B4 - B15 links can be specified when the card type is LIME1 or LIMT1 for E5-E1T1 cards and the card application is SS7ANSI or CCS7ITU or for E5-ENET cards when the card application is IPSEG.

The A4 - A31 and B4 - B31 links can be specified when the card type is LIME1 or LIMT1 for an HC-MIM card and the card application is SS7ANSI or CCS7ITU.

The A, A1, and B links can be specified for E5-ATM cards when the card application is ATMANSI or ATMITU.

### Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

### Legend

**SLK**—The card location and the signaling link.

**LSN**—The name of the linkset that contains the signaling link.

**CLLI**—The CLLI code of the destination STP of the signaling link.

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

**ALARM STATUS**—The trouble text alarm message that was generated for the specified signaling link.

**UNAVAIL REASON**—The reason that the signaling link is unavailable. More than one unavailable reason may be listed:

**BSNR**—The signaling link received 2 of 3 invalid BSNs.

**CNGT**—The signaling link has a remote congestion time-out.

**COO**—A changeover order was received.

**FC**—The signaling link is unavailable because of false congestion restart.

**FE**—The signaling link is in far end loopback mode.

**FIBR**—The signaling link received 2 of 3 invalid FIBs.

**INTR**—Too many link interrupts were received.

**LB**—The signaling link has been blocked locally.

**LD**—The signaling link received incomplete data.

**LI**—The signaling link has been inhibited locally.

**NA**—The signaling link is not aligned.

**PF**—The signaling link failed the proving period.

**RB**—The signaling link has been blocked remotely.

**RD(xx.xxx)**—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.

**RL**—The signaling link is in remote near end loopback mode.

**RMI**—The signaling link has been inhibited remotely.

**SIE**—An unexpected SIE was received.

**SIN**—An unexpected SIN was received.

**SIO**—An unexpected SIO was received.

**SIOS**—An unexpected SIOS was received.

**SLTF**—Link test failed.

**T1NR**—The level-2 T1 (not ready) timer expired.

**T1R**—The level-2 T1 (ready) timer expired.

**T2**—The level-2 T2 timer expired.

**T3**—The level-2 T3 timer expired.

**XDA**—The signaling link did not receive an acknowledgment in time.

**XER**—The SUERM threshold was exceeded.—

---The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

**TNC**—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.

**TNR**—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.

**LPO**—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.

**RPO**—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.

**ROOS**—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.

**RPE**—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.

**RMIR**—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.

**LCD**—Level 1 facility outage: Loss of Cell Delineation

**LOF**—Level 1 facility outage: Loss of Frame

**LOS**—Level 1 facility outage: Loss of Signal

**EVENT TYPE**—The type of event being logged:

**RECEIVE**—When a signal unit is received.

**TRANSMIT**—When a signal unit is transmitted.

**STATE**—When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail.

**EVENT**—The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

**SERVICE EVENT**—The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

**TIMESTAMP**—The time event processed by the system as follows:

**YY-MM-DD HH:MM:SS.TTT**, where

**YY**—The last 2 digits of the year (range 00–99)

**MM**—The month (range 01–12)

**DD**—The day of month (range 00–31)

**HH**—The hour of day (range 00–59)

**MM**—The minute of the hour (range 00–59)

**ss**—The seconds of the minute (range 00–59)

**TTT**—Milliseconds of the second (range 000–995 in increments of 5)

**E1 STATUS**—The status of the E1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is displayed.

**T1 STATUS**—The status of the T1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is displayed.

## rept-stat-sys

## Report Status System

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

**Keyword:** **rept-stat-sys**

**Related Commands:** **rept-stat-alm**, **rept-stat-card**, **rept-stat-clk**, **rept-stat-cluster**, **rept-stat-dstn**, **rept-stat-imt**, **rept-stat-ls**, **rept-stat-meas**, **rept-stat-mon**, **rept-stat-mps**, **rept-stat-seas**, **rept-stat-slk**, **rept-stat-trbl**, **rept-stat-xlist**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-sys**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

## Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

### rept-stat-sys

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.
- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.

- When the Measurements Platform collection function is enabled, the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.
- When the Origin-Based MTP Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.
- When the INAP Number Portability (INP) feature is turned on, the INP SS entry appears.
- When the ANSI41 AnalyzedInformation Query (ANSI41 AIQ) feature is enabled, the AIQ SS entry appears.
- When the FCMODE is FCOPY for an *FC- Capable* GPL, the FC IP LK and FCS entries appear. E5-ENET cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This requirement does not apply to cards running the IPSG GPL.

**Legend**

**INH**—Number of devices within each device type that have their alarms inhibited

**ALARMS**—Number of critical (**CRIT**), major (**MAJR**), and minor (**MINR**) alarms on the system when the command was executed and the count of alarm inhibited (**INH**) devices for cards, links, linksets, and terminals

**OAM**—Status of each card that is running the OAM (1113 and 1115)

**LIM CARD**—Status of the LIM cards

**SCCP CARD**—Status of the SCCP subsystem cards

**GLS CARD**—Status of the GLS subsystem cards

**SLAN CARD**—tatus of the STPLAN subsystem cards

**VXWSLAN CARD**—Status of the VXW STPLAN subsystem cards

**SS7IPGW CARD**—Status of the SS7IPGW cards

**IPGWI CARD**—Status of the IPGWI cards

**IPLIM CARD**—Status of the IPLIM cards

**IPLIMI CARD**—Status of the IPLIMI cards

**MUX CARD**—Combined status of the MUX (HMUX, HIPR and HIPR2) cards

**MCPM CARD**—Status of the MCPM cards

**EROUTE CARD**—Status of the EROUTE cards

**CLOCK**—Status of the system clocks

**HS CLOCK**—Status of the high-speed clocks

**IMT**—Status of the IMT system

**SLK**—Status of the SS7 and IPGWI signaling links in the system

**DLK**—Status of the TCP/IP data links in the system

**LINK SET**—Status of the linksets in the system

**DSM IP LK**—Status of the DSM IP linksets

**MCPM IP LK**—Status of the MCPM IP links

**FC IP LK**—Status of the Fast Copy IP links

**APPLSOCK**—Status of the application sockets

**SCTP ASSOC**—Status of the SCTP associations

**APPL SERVER**—Status of the Application Servers

**SS7 DPC**—Summary information for provisioned DPCs that are not in clusters

**CLUST DPC**—Summary information for provisioned cluster DPCs

**RTX**—Summary information for provisioned exception routes only  
**XLIST DPC**—Summary information for X-LIST DPC entries only  
**DPC SS**—Summary information for the DPC subsystem  
**SCCP SS**—Status of the SCCP subsystem  
**SEAS SS**—Status of the SEAS subsystem  
**MEAS SS**—Status of the Measurements subsystem (for Measurements Platform)  
**MPS**—Summary information on the MPS  
**TERMINAL**—Status of the terminals  
**SECURITY SS**—Status of the EAGLE OA&M IP Security subsystem  
**EIR SS**—Status of the Equipment Identity Register subsystem  
**RTD**—Status of the Run Time Diagnostic subsystem  
**VFLEX SS**—Status of the V-Flex subsystem  
**ATINPQ SS**—Status of the ATI Number Portability Query subsystem  
**INP SS**—Status of the INAP Number Portability subsystem  
**LNP SS**—Status of the Local Number Portability subsystem  
**FCS**—Status of the Fast Copy subsystem  
**AIQ SS**—Status of the ANSI41 AnalyzedInformation Query subsystem

## rept-stat-t1

## Report Status T1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

**Keyword:** **rept-stat-t1**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card address. The unique identifier of a specific **limt1** card located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Information for all **limt1** cards is reported.

**:t1port=** (optional)

The T1 port number. When this parameter is specified, information is displayed only for the specified T1 port on the card in the specified card location.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

### Example

**rept-stat-t1**

**rept-stat-t1:loc=1203**

**rept-stat-t1:loc=1203:t1port=1**

**Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **t1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations  $xy09$  and  $xy10$  where  $x$  is the frame and  $y$  is the shelf) cannot be specified in the **loc** parameter.

**Notes**

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the **loc** parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the **loc** and **t1port** parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

**Output**

When no parameters are specified in the command, T1 port status is displayed for all cards with provisioned T1 ports. Ports 3 through 8 are on HC-MIM cards only.

**rept-stat-t1**

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0

```

;

**Legend**

**LOC**—Card location

**T1PORT**—Number of the T1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST". The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the T1 port being unavailable

**SLK**—Signaling link assigned to the T1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

## rept-stat-trbl

## Report Status Trouble

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

**Keyword:** **rept-stat-trbl**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:display=** (optional)

Display type of alarms to be reported.

**Range:** **act**, **all**, **inhb**, **timestamp**

**act**— Display only active alarms

**all**— Display all alarms with no timestamps

**inhb**— Display only inhibited alarms

**timestamp**— Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the **display=timestamp** parameter is specified.

**Default:** **all**

**:level=** (optional)

The alarm level of the alarms to be displayed

**Range:** **crit**, **majr**, **minr**

**Default:** All alarms are displayed

### Example

```
rept-stat-trbl
```

```
rept-stat-trbl:level=majr
```

```
rept-stat-trbl:display=inhb
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Notes**

None

## Output

The following example lists all devices that could appear. This example is to be used as a sample only: all devices and alarms cannot coexist in the system.

## rept-stat-trbl

**AST**—The associated state of the terminal ports. The possible values are described in .

**rept-stat-tstslk****Report Signaling Link Test Status**

Use this command to generate a report of the status of the MTP signaling links currently under test.

**Keyword:** **rept-stat-tstslk**

**Related Commands:** **tst-slk**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:loopback=** (optional)

Loopback test type.

**Range:** **sltc, lxvr, oam, line, payload**

**Example**

```
rept-stat-tstslk
rept-stat-tstslk:loc=1201
rept-stat-tstslk:loc=1203:link=a
rept-stat-tstslk:loopback=lxvr
```

**Dependencies**

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

If the **link** parameter is specified, the **loc** parameter must be specified.

The signaling link specified in the **link** parameter must be an SS7 signaling link.

This command cannot be entered for SSEDCM or E5-ENET cards that are running the **ss7ipgw**, **ipgwi**, or **ipsg** application, or that have SS7IPGW, IPGWI, or IPSG-M3UA links.

This command cannot be entered for cards with **ipgwi** signaling links.

The card location specified in the **loc** parameter cannot be reserved by the system.

This command cannot be entered during upgrade.

**Notes**

None

**Output**

If no parameters are specified, all links in test are displayed.

If only the **loc** parameter is specified, all links in test on the specified card are displayed.

If the **loc** and **link** parameters are specified, the specified link on the specified card is displayed.

If the **loopback** parameter is specified, all links in the specified type of loopback test are displayed.

**rept-stat-tstslk**

```
tekelecstp 04-01-07 10:05:28 EST EAGLE 31.3.0
SLK      LOOPBACK  MAX-TIME  TEST-TIME
1102,A1   SLTC      01:00:00  00:04:01
1201,A    OAM       02:00:00  01:04:11
1203,A    LXVR      00:50:00  00:22:21
1203,B    LXVR      24:00:00  20:04:01
1208,A    PAYLOAD   01:10:00  01:05:22
1211,A    LINE      21:30:00  00:14:01
;
```

**Legend**

**SLK**—Card and signaling link that are being tested.

**LOOPBACK**—Type of loopback test being run.

**MAX-TIME**—Maximum length of time for the test to run, as specified in the **tst-slk** command **time** parameter.

**TEST-TIME**—The length of time that the test has been running when this command was entered.

**rept-stat-user****Report Status User**

Use this command to show which users are logged into the system. The command shows user names, terminal identification numbers, the time that the last valid command was issued, and the current state of the last command entered.

**Keyword:** rept-stat-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rtrv-secu-user, rtrv-user

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**rept-stat-user**

**Dependencies**

None

**Notes**

None

**Output**

**rept-stat-user**

```
e5oam 09-04-03 17:25:57 MST EAGLE 41.0.0
REPT STAT USER COMPLD
USER ID          TERM #   IDLE SINCE          COMMAND              STATE
eagle            3       02-01-03 17:19:04  rept-stat-applsock   IDLE
eagle            6       02-01-03 17:25:57  rept-stat-user       PROCESSING
REPORT COMPLETED
```

**Legend**

**USER ID**—The user ID of the users logged onto the system.

**TERM #**—The terminal port to which the user's terminal is connected.

**IDLE SINCE**—The date and time of day that the user last entered a command.

**COMMAND**—The last command the user entered.

**STATE**—The state of the command the user last entered.

**rept-stat-xlist****Report Status X-List Storage Area Statistics**

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries
- The percentage of space in the x-list reserved area currently in use

- The percentage of x-list space that must be in use before an alarm is issued

**Keyword:** rept-stat-xlist

**Related Commands:** chg-stpopts, rept-stat-cluster, rtrv-stpopts

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-xlist**

### Dependencies

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

### Notes

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:  

$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated *X-LIST* space (for example, 99.1% is not rounded up to 100%).

### Output

**rept-stat-xlist**

```
rlghncxa03w 04-02-18 03:32:42 EST   EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries      = 156
Current X-LIST occupancy   = 31 % (see "Notes")
X-LIST occupancy threshold = 80 %
;
```

## rept-x25-meas

## Report X.25 Measurements

Use this command to display the X.25 signaling link measurements. The X.25 signaling link is used in cellular networks to transport TCAP signaling messages from one mobile switching center (MSC) to another.

**NOTE:** This command is obsolete.

**Keyword:** rept-x25-meas

**Related Commands:** rept-stat-alm, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-slk, rept-stat-sys, rept-stat-trbl

**Command Class:** Link Maintenance

## Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

(Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.)

**:action=** (optional)

This parameter is used to reset the measurements counters for an X25 link.

**Range:** reset, none

**Default:** none

**:port=** (optional)

The port on the card specified in the **loc** parameter

**Range:** a

## Example

```
rept-x25-meas:loc=1211:port=a
```

```
rept-x25-meas:loc=1211:port=a:action=reset
```

## Dependencies

No other action command can be in progress when this command is entered.

The specified signaling link must be equipped and assigned to a LIM configured with the ss7gx25 GPL.

The card location cannot be out of range - **loc**.

Location invalid for hardware configuration.

The card type must be valid.

The specified location of the card is not valid.

The card must be in service.

## Notes

None

**Output****rept-x25-meas: loc=1211:port=a**

```

**T7**—SVC control timer T7

**T8**—SVC control timer T8

## rls-alm

## Release Alarm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

**Keyword:** **rls-alm**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rept-stat-trbl**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:lvl=** (optional)

The alarm level.

**Range:** **crit**, **majr**, **minr**

**Default:** All alarms are cleared

### Example

```
rls-alm
```

```
rls-alm : lvl = crit
```

### Dependencies

No other action command can be in progress when this command is entered.

### Notes

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

### Output

```
rls-alm
```

```
rlghncxa03w 04-01-07 09:27:24 EST EAGLE 31.3.0
```

```
rls-alm
```

```
Command entered at terminal #8.
```

```
;
```

**rmv-card****Remove Card**

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM, TSM, or ACM, or physically remove it from the shelf.

**Keyword:** **rmv-card**

**Related Commands:** **dlt-card, ent-card, init-card, rept-stat-card, rst-card, rtrv-card**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.

**:force=** (optional)

This parameter is required if the card is the last GLS or SCCP card.

**Range:** yes, no

**Default:** no

**Example**

**rmv-card:loc=1101**

**rmv-card:loc=1201:force=yes**

**Dependencies**

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The **force** parameter is required to force the last GLS or SCCP out of service.

If the card has active TCP/IP links, all TCP/IP data links assigned to it must be placed out of service.

**Notes**

The function of this command is the same as the **inh-card** command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the **dact-slk** command, before the command is accepted.

Inhibiting a card running the VSCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit a card that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the **canc-dlk** command, before the command is accepted.

### Output

```
rmv-card:loc=1101
```

```

## rmv-imt

### Remove IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

### CAUTION

**CAUTION:** Use this command only when directed by the Customer Care Center.

**Keyword:** **rmv-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rst-imt**

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)

The IMT bus to be inhibited.

**Range:** a, b

### Example

```
rmv-imt:bus=a
```

### Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test.

### Notes

Cards that are not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the other IMT bus.

The function of this command is the same as the **inh-imt** command.

**Output****rmv-imt:bus=a**

```

**rmv-trm****Remove Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (OUT-OF-SERVICE-MAINTENANCE-DISABLED), and to set the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

**Keyword:** **rmv-trm**

**Related Commands:** **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rst-trm, rtrv-trm**

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)

The ID of the serial port to be inhibited.

**Range:** **1-40**

**:force=** (optional)

This parameter forces the removal of the terminal, even if it is the last in-service SEAS terminal available.

**Range:** **yes, no**

**Default:** **no**

**Example**

**rmv-trm:port=5**

**rmv-trm:trm=1:force=yes**

### Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified as values for the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

You cannot inhibit the terminal from which this command was entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

### Notes

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

### Output

```
rmv-trm
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Inhibit message sent to terminal
;

rmv-trm:trm=17:force=yes

```

## rst-card

## Reset Card

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful. If the loading fails, the card status is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** rst-card

**Related Commands:** dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rtrv-card

**Command Class:** System Maintenance

### Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:code=** (optional)

The GPL type to be loaded.

**Range:** appr, trial, utility

**appr**— Approved GPL

**trial**— Trial GPL

**utility**— Utility GPL, used primarily by the factory for loading special GPLs for testing purposes

**Default:** No GPL type is given.

**Example**

```
rst-card:loc=2301:code=trial
rst-card:loc=1101:data=persist
```

**Dependencies**

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, it must have a signaling link assigned to it before it can be allowed.

No other action command can be in progress when this command is entered.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **data** parameter can be specified.

**Notes**

The function of this command is the same as the **alw-card** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of the warm restart feature.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0 0021.1493 CARD 1111 INFO
SSH Host Keys Regenerated DSA Server Host Key FTRA-formatted Fingerprint=

22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```

```

**Output**

```
rst-card:loc=2301:code=trial
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been allowed.
;
```

**rst-dstn****Reset Destination Circular Routing Status**

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-\**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

**Keyword:** rst-dstn

**Related Commands:** chg-stpopts, rept-stat-cluster, rept-stat-dstn, rtrv-stpopts

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** p-, 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (mandatory)

**:dpci=** (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:dpcn=** (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:dpcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:force=** (optional)

This parameter specifies whether to reset all dynamic data for the specified route in the Route table to the initial values.

**Range:** **yes, no**

**yes** — reset the data

**no** — do not reset the data

**Default:** **no**

### Example

```
rst-dstn:dpc=1-2-*
```

```
rst-dstn:dpc=20-2-5
```

```
rst-dstn:dpc=p-20-2-5
```

```
rst-dstn:dpc=20-2-5:force=yes
```

### Dependencies

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\*\** or *ni-nc-\*\*\** cannot be specified for the **rst-dstn** command.

### Notes

None.

### Output

```
rst-dstn:dpc=20-2-5:force=yes
```

```
rlghncxa03w 09-03-29 16:40:40 EST EAGLE 41.0.0

```

```
rlghncxa03w 09-03-29 16:40:40 EST EAGLE 41.0.0
Command Completed.
```

```
;
```

## rst-imt

## Reset IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

**Keyword:** **rst-imt**

**Related Commands:** **clr-imt-stats, conn-imt, disc-imt, rept-imt-lvl1, rept-imt-lvl2, rept-stat-imt, rmv-imt**

**Command Class:** System Maintenance

**Parameters**

**:bus=** (mandatory)  
 The IMT bus to be returned to service.  
**Range:**     **a, b**

**Example**

```
rst-imt:bus=a
```

**Dependencies**

None

**Notes**

The function of this command is the same as the **alw-imt** command.

This command returns an inhibited IMT bus to service.

**Output**

```
rst-imt:bus=a
rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
Allow IMT Bus A command issued.

rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
0100.0097    IMT    BUS A          IMT allowed
;
```

**rst-trm****Reset Terminal**

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** **rst-trm**

**Related Commands:** **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rtrv-trm**

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)  
 ID of the serial port to be put into service.  
**Range:**     **1-40**

**Example**

```
rst-trm:trm=5
```

**Dependencies**

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

An E5-IPSM card must be provisioned for the specified SEAS terminal before this command can be entered.

The SEAS Over IP feature must be turned on before this command can be entered for a SEAS terminal.

If the SEAS terminal is auto-inhibited, then this command cannot be entered.

### Notes

The function of this command is the same as the **alw-trm** command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

### Output

#### **rst-trm:trm=12**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Allow message sent to terminal

rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
;
```

## rtrv-acg-mic

### Display ACG Manually Initiated Control

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A set of controls is selected to be displayed by specifying the type of controls (**type** parameter), the service (**serv** parameter), and the digits (**dgts** parameter).

**Keyword:** **rtrv-acg-mic**

**Related Commands:** **chg-acg-mic**, **dlt-acg-mic**, **ent-acg-mic**, **rept-stat-lnp**

**Command Class:** Database Administration

### Parameters

**:dgts=** (optional)

Digits

**Range:** 3 digits, 6-10 digits

Valid values are **000-999**, **000000-9999999999**

**:serv=** (optional)

Query service

**Range:** **ain**, **in**

**:type=** (optional)

Type of control

**Range:** **all**, **sd**

### Example

Display all MICs:

**rtrv-acg-mic**

Display the MIC(s) that apply to particular services and digits:

**rtrv-acg-mic:type=sd**

Display the MIC(s) that apply to AIN queries:

**rtrv-acg-mic:serv=ain**

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

**rtrv-acg-mic: serv=in: dgts=919460**

### Dependencies

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** cannot be specified.

The **dgts** parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-acg-mic** command can be entered.

### Notes

None

### Output

#### **rtrv-acg-mic: type=sd**

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0

**INTVL**—New IN interval index

**ND**—New number of digits

**SERV**—Query service

**rtrv-acg-noc****Display ACG Node Overload Control**

Use this command to display the definitions of node overload levels. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the overload level.

**Keyword:** **rtrv-acg-noc**

**Related Commands:** **chg-acg-noc, dlt-acg-noc, ent-acg-noc, rept-stat-lnp**

**Command Class:** Database Administration

**Parameters**

**:lvl=** (optional)

Overload level

**Range:**       **1-10**

**Example**

**rtrv-acg-noc**

**rtrv-acg-noc:lvl=3**

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

None

**Output**

The following example displays all defined overload levels:

**rtrv-acg-noc**

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
LVL  QR          AND  IND  INTVL  DRTN
3    600000      10   6    3       6
4    750000      6    6    5       7
10   2147483647  10   10   15      13
RTRV-ACG-NOC: MASP A - COMPLTD
;
```

The following example displays overload level 3:

**rtrv-acg-noc:lvl=3**

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
LVL  QR          AND  IND  INTVL  DRTN
3    600000      10   10   3       6
RTRV-ACG-NOC: MASP A - COMPLTD
;
```

**Legend**

**LVL**—Overload level

**QR**—Query rate

**AND**—AIN number of digits

**IND**—IN number of digits

**INTVL**—Interval index

**DRTN**—Duration index

**rtrv-ainpopts****Retrieve AINP Options**

Use this command to retrieve AINP-specific options.

**Keyword:** rtrv-ainpopts

**Related Commands:** chg-ainpopts

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-ainpopts
```

**Dependencies**

None.

**Output**

If the RNAI or RNAIV option is not provisioned, then the RNAI mnemonic default value is displayed.  
If the RNAI or RNAIV option is provisioned, then the RNAI mnemonic string for the option is displayed.

If the RNP or RNPV option is not provisioned, then the RNP mnemonic default value is displayed.  
If the RNP or RNPV option is provisioned, and the RNPV option can be set using RNP, then the RNP mnemonic string for the option is displayed. If the RNPV option cannot be provisioned using RNP, then the RNPV numerical value is displayed.

Each DIALPFX and DIALNAI option is displayed with its associated DLTPFX and SNAI option, respectively.

If the NEC option is not provisioned, then the default is displayed.

The following example shows output with default AINP options.

**rtrv-ainpopts**

- **DIALNAI**—Dialed Party Number Nature of Address Indicator
- **DIALPFX**—Dialed Party Number Prefix

- **DLTPFX**—Delete Prefix
- **NEC**—National Escape Code
- **RFMT**—Routing Address Format
- **RNAI**—Nature of Address Indicator for the Destination Routing Address
- **RNAIV**—Nature of Address Indicator Numeric Value for the Destination Routing Address
- **RNP**—Numbering Plan for the Destination Routing Address
- **RNPV**—Numbering Plan Numeric Value for the Destination Routing Address
- **SNAI**—Service Nature of Address Indicator
- **SPORTTYPE**—Service Portability Type
- **SPRESTYPE**—AINP option to send a "Return Results with digits" message or a "Return Results without digits" message when NPREQ messages are received for AINP services, the DN digits match, and the HLR ID is present

## rtrv-aiqopts

## Retrieve AIQ Options

Use this command to retrieve AIQ specific options.

**Keyword:** rtrv-aiqopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-aiqopts**

### Dependencies

None

**Output**

If the **pfx=none** parameter is specified, then the corresponding TriggerType value is not displayed in the output.

The following example shows output with default AIQ options.

**rtrv-aiqopts**

```
tekelecstp 09-12-03 07:53:46 EST  EAGLE 42.0.0

AIQ OPTIONS
-----
DIGMINLEN      = 1
DIGMAXLEN      = 32
RESPAR         = rtdigits
RESFMT         = pfxdn
TCAPERR        = 138 (UnrecognizedParameterValue)

TRIGTYPE       PFX
-----
```

;

The following example shows output with some AIQ options provisioned.

**rtrv-aiqopts**

```
tekelecstp 09-12-03 11:53:46 EST  EAGLE 42.0.0

AIQ OPTIONS
-----
DIGMINLEN      = 2
DIGMAXLEN      = 10
RESPAR         = digits
RESFMT         = pfx
TCAPERR        = 138 (UnrecognizedParameterValue)

TRIGTYPE       PFX
-----
3              12434
5              789
7              534553512456784686531
```

;

**Legend**

- **TRIGTYPE**—TriggerType Value
- **PFX**—Digit string associated with TriggerType
- **IGMINLEN**—Minimum Length of Digit String
- **DIGMAXLEN**—Maximum Length of Digit String
- **RESPAR**—Response Digits
- **RESFMT**—Response Format
- **TCAPERR**—TCAP Error Code.

**rtrv-appl-rtkey****Retrieve Application Route Key Table**

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 2500 routing keys per system (if there are SSED CMs).

- DPC, SI, SSN routing keys, which are used to route SCCP messages

- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

**Keyword:** rtrv-appl-rtkey

**Related Commands:** chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:asname=** (optional)

Application Server (AS) name assigned to this routing key.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

**:cice=** (optional)

The end range of circuit identification codes assigned to the routing key.

**Range:** 0-4294967295

See Table A-4 for valid CIC values for specified SI and MSU types.

**:cics=** (optional)

The start range of circuit identification codes assigned to the routing key.

**Range:** 0-4294967295

See Table A-4 for valid CIC values for specified SI and MSU types.

**:display=** (optional)

This parameter specifies the type of output to display.

The output includes the type of card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

**Range:** all, brief

**all**— The KEY and the ATTRIBUTE sections of the routing key are displayed

**brief**— Only the KEY section of the routing key is displayed

**Default:** brief

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (ni-nc-ncm).

**Synonym:** dpca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:num=** (optional)

The number of entries to display.

**Range:** **1-10000**

**Default:** **50**

**:opc=** (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **opca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Originating point code.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opcn24=** (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:rcontext=** (optional)

Routing Context. The **rcontext** parameter is used to display the routing key with the specified routing context.

**Range:** **0-4294967295**

**:si=** (optional)

Service indicator.

**Range:** 0-15

The following equivalent text values can be specified:

**Number = Text—Description**

**0 = snm**—Signaling network management messages

**1 = regtest**—Signaling network testing and maintenance regular

**2 = spltest**—Signaling network testing and maintenance special

**3 = sccp**—SCCP

**4 = tup**—Telephone user part

**5 = isup**—ISDN user part

**13 = qbicc**

**:ssn=** (optional)

Subsystem number.

**Range:** 0-255

**:type=** (optional)

The type of routing key.

**Range:** all, full, partial, default

**Default:** all

### Example

```
rtrv-appl-rtkey
```

```
rtrv-appl-rtkey:dpc=123-234-255:si=3
```

```
rtrv-appl-rtkey:dpc=123-234-255
```

```
rtrv-appl-rtkey:cics=1:cice=1000:num=3
```

```
rtrv-appl-rtkey:cice=19
```

```
rtrv-appl-rtkey:opc=122-124-125
```

```
rtrv-appl-rtkey:type=partial
```

```
rtrv-appl-rtkey:display=all
```

```
rtrv-appl-rtkey:rcontext=7
```

### Dependencies

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. If the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value specified for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

The **ssn** parameter cannot be specified when **opc**, **cics**, and **cice** are specified. See Table 5-2 for valid parameter combinations.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are allowed with the **si** parameter only when **si** equals **4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**). Table A-4 shows valid CIC values for SI types 4, 5, and 13.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The **display=all** parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (**s-**).

## Output

**rtrv-appl-rtkey**

**rtrv-as****Retrieve Application Server**

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

**Keyword:** rtrv-as

**Related Commands:** chg-as, dlt-as, ent-as, rept-stat-as

**Command Class:** Database Administration

**Parameters**

**:aname=** (optional)

Name of the association.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

**Default:** Retrieve all

**:asname=** (optional)

Name of the Application Server.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

**Example**

**rtrv-as**

**rtrv-as:aname=as1**

## Dependencies

None

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

## Output

```
rtrv-as  
rlghncxa03w 05-06-05 08:40:18 EST EAGLE5 34.0.0

```

## rtrv-assoc

## Retrieve Association

Use this command to retrieve the configuration data from the IP Socket/Association (IPAPSOCK) table.

**Keyword:** rtrv-assoc

**Related Commands:** `chg-assoc`, `dlt-assoc`, `ent-assoc`, `rept-stat-assoc`

**Command Class:** Database Administration

## Parameters

**:adapter=** (optional)

The adapter layer for this association.

**Range:** m3ua, sua, m2pa

**Default:** Retrieve all

**:alhost=** (optional)

Alternate local host name as defined in the IP Host table.

[illegible]

**a-z, A-Z, 0-9, -, .** —any string of characters beginning with a letter and comprising up to 60 characters in length.

**Default:** Retrieve all

**:aname=** (optional)

Name assigned to this association (in IPASOCK table).

**Range:** *ayyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter.

**Default:** Retrieve all

**:display=** (optional)

An optional display parameter can be specified in order to display either all or brief reports for associations. The default mode is "brief" if this parameter is not entered at the command line.

**Range:** brief, all

**:lhost=** (optional)

The local host name as defined in the IP Host table.

[illegible]

**a-z, A-Z, 0-9, -, .** —any string of characters beginning with a letter and comprising up to 60 characters in length

**Default:** Retrieve all

**:link=** (optional)

The signaling link for this association.

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**:loc=** (optional)

Card location that is stenciled on the shelf of the EAGLE 5 ISS..

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:rhost=** (optional)

Name of Remote Host as defined in the IP Host table.

**Range:** **aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa**

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**Default:** Retrieve all

**:rhosttype=** (optional)

Remote host type. This parameter retrieves associations with a configured primary remote host or with configured primary and alternate remote hosts.

**Range:** **primary, alternate**

**primary** — retrieve associations with only a primary remote host

**alternate** — retrieve associations with primary and alternate remote hosts

**Default:** retrieve all associations

**:rhostval=** (optional)

Remote host validation mode. This parameter retrieves associations with the specified validation mode.

**Range:** **relaxed, match**

**Default:** retrieve all associations

## Example

```
rtrv-assoc
```

```
rtrv-assoc:aname=swbel32
```

```
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=sua
```

```
rtrv-assoc:rhosttype=alternate:display=all
```

## Dependencies

The value specified for the **host** parameter must begin with an alphabetic character and can contain **a.z, A..Z, 0..9, -** (hyphen), or **.** (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port.

When the command is entered with the **aname**, **lhost**, or **alhost** parameters, the output displays SCTP buffer usage information (used and total buffer space on the card).

## Output

AS names are displayed for IPGWx-M3UA and SUA linksets.

LS names are displayed for IPSG linksets.

The following example with the **aname** parameter shows buffer usage (used and total buffer space) and card location information.

## **rtrv-atinpopts**

## **rtrv-atinpopts**

Use this command to retrieve the data that is used for ATI number conditioning.

**Keyword:** **rtrv-atinpopts**

**Command Class:** Database Administration

### **Parameters**

This command has no parameters.

### **Example**

```
rtrv-atinpopts
```

### **Dependencies**

The ATINP feature must be enabled before this command can be entered.

**Output**

The following example shows output with default ATINPQ options.

**rtrv-atinpopts**

```
tekelecstp 09-06-04 07:53:46 EST EAGLE 41.1.0
```

```
ATINPQ OPTIONS
-----
ATIACKIMSI    = NONE
ATIACKMSISDN  = MSISDN
ATIACKRN      = RN
SNAI          = INTL
ATIDLM        = NONE
ATIDFLTRN     = NONE
ATINPTYPE     = ANY
SPORTTYPE     = NONE
```

```
;
```

The following example shows output with some ATINPQ options provisioned.

**rtrv-atinpopts**

```
tekelecstp 09-06-04 07:55:30 EST EAGLE 41.1.0
```

```
ATINPQ OPTIONS
-----
ATIACKIMSI    = IMSI
ATIACKMSISDN  = NONE
ATIACKRN      = RNSP
SNAI          = NAT
ATIDLM        = 254565819324258
ATIDFLTRN     = 731964828246917
ATINPTYPE     = ALWAYS
SPORTTYPE     = GSM
```

```
;
```

The following example shows output when the **atiackimsi**, **atiackmsisdn**, and **atiackrn** parameters are provisioned with GRN formats.

**rtrv-atinpopts**

```
tekelecstp 09-06-06 16:39:21 EST EAGLE 41.1.0
```

```
ATINPQ OPTIONS
-----
ATIACKIMSI    = GRN
ATIACKMSISDN  = GRNDLMSISDN
ATIACKRN      = GRNDLMRNSP
ATIDFLTRN     = NONE
ATIDLM        = 454555817324228
ATINPTYPE     = ANY
ENTITYLEN     = NONE
SNAI          = NAI
SPORTTYPE     = NONE
```

```
;
```

**Legend**

- **ATIACKIMSI**—IMSI parameter for ACK response message.
- **ATIACKMSISDN**—MSISDN parameter for ACK response message.
- **ATIACKRN**—Routing Number format.
- **SNAI**—The NAI of the incoming MSISDN digits.
- **ATIDLM**—Outbound message delimiter.

- **ATIDFLTRN**—Default Routing Number.
- **ATINPTYPE**—Number Portability Type.
- **SPORTTYPE**—Service Portability Type.
- **GRN**—Generic Routing Number.

## rtrv-atm-lps

### Retrieve ATM Link Parameter Set

Use this command to display the parameter values for the ATM link parameter sets in the database configured with the **chg-atm-lps** command, along with the non-configurable ATM parameters.

**Keyword:** **rtrv-atm-lps**

**Related Commands:** **chg-atm-lps**

**Command Class:** Database Administration

### Parameters

**:lpset=** (optional)

The ATM link parameter set to be displayed.

**Range:** **1-30**

**Default:** All ATM link parameter sets are displayed

### Example

```
rtrv-atm-lps:lpset=5
```

```
rtrv-atm-lps
```

### Dependencies

None

### Notes

None

## Output

**NOTE: Dashes (--) in the FC NR and FC BC fields indicate that this implementation is not supported on ATM high-speed signaling links.**

**rtrv-atm-lps:lpset=5**

### Legend

**LPSET**—The link parameter set being changed, **1** to **30**. The system default value for this parameter is **1** for ANSI and **21** for ITU.

**ACTION**—Copy a set of ATM signaling link parameters from one parameter set to another. The value of this parameter is **copy**. If this parameter is not specified, then the copy action cannot take place.

**SCRLPSET**—The ATM signaling link parameter set used as a source for the **action=copy** parameter. This parameter can only be specified with the **action=copy** parameter.

**MAXCC**—The maximum number of transmissions of a BGN, END, ER, or RS PDU. The value of this parameter is from 1 to 10 PDUs. The system default value is 4 PDUs.

**MAXPD**—The maximum number of SD PDUs that can be sent before a POLL is sent. The value of this parameter is from 5 to 2120 PDUs. The system default value is 500 PDUs.

**MAXSTAT**—The maximum number of list elements in a STAT PDU. The value of this parameter is from 3 to 67 PDUs. The system default value is 67 PDUs.

**TMRCC**—The timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs. The value of this parameter is from .1 to 2 seconds. The system default value is .2 seconds.

**TMRKALIVE**—The timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRNOSP**—The timer, in seconds, used to check that STAT PDUs are arriving often enough. The value of this parameter is from .5 to 2 seconds. The system default value is 1.5 seconds.

**TMRPOLL**—The timer, in seconds, used to guarantee that POLL PDUs are sent often enough. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRIDLE**—The timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase. The value of this parameter is from .025 to 1 seconds. The system default value is .1 seconds.

**TMRT1**—The time, in seconds, between a link release action and the next link reestablish action during alignment. The value of this parameter is from 1 to 15 seconds. The system default value is 5 seconds.

**TMRT2**—The total time, in seconds, that SSCF will attempt alignment. The value of this parameter is from 15 to 180 seconds. The system default value is 120 seconds for ANSI and 30 seconds for ITU.

**TMRT3**—The time, in seconds, between proving PDUs. The value of this parameter is from .00045 to .023 seconds. The system default value is .000925 seconds.

**N1**—The number of PDUs sent during proving. The value of this parameter is from 500 to 64552 PDUs. The system default value is 64552 PDUs for ANSI and 1000 PDUs for ITU.

**MAXNRP**—The maximum number of retransmitted PDUs during proving. The value of this parameter is from 1 to 10 PDUs. The system default value is 1 PDU for ANSI and 0 PDUs for ITU.

**TMSREC**—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring. The value of this parameter from is 60 to 10800 seconds. The system default value is 3600 seconds.

**TMNOCRED**—The timer, in seconds, used when the no credit exists and PDUs are available to be sent. The value of this parameter is from 1 to 6 seconds. The system default value is 1.5 seconds.

**TMERM**—The error rate monitor interval, in seconds. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**NBLK**—The number of monitoring intervals per block. The value of this parameter is from 1 to 10. The system default value is 3.

**TMRPROV**—The timer, in seconds, used to monitor the status of a link after it is placed into service. The value of this parameter from 60 to 1200 seconds. The system default value is 600 seconds.

**SDU SIZE**—The SSCOP SDU size (set to 272 octets).

**UU SIZE**—The SCOP UU size (set to 4 octets).

**N**—The monitoring intervals spanning a .4 second error event (set to 9).

**FC NR**—The fixed credit increment value.

**FC BC**—The fixed credit allocation frequency.

**TSUP**—The superbloc timer for layer management, in seconds.

**TLOSS**—The loss timer for layer management, in seconds.

**ERMSM**—The error rate monitor smoothing factor.

**THRES**—The error rate monitor threshold.

## rtrv-atm-prm

## Retrieve ATM Parameters

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

**Keyword:** rtrv-atm-prm

**Related Commands:** rtrv-atm-lps

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-atm-prm**

### Dependencies

None

**Notes**

None

**Output****rtrv-atm-prm**

```

tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
3622 3622 4528 4528 210 100 3 0 1 16 12
;

```

**Legend**

The ATM traffic descriptors are displayed in the following fields:

**BT**—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.

**CDVT**—The amount of cell delay variation for the VCL in the network ingress direction.

**PCR**—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.

**QOS**—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.

**SCR**—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.

The ATM interface parameters are displayed in the following fields:

**MAX VCCs**—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.

**MAX VPCs**—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).

**VCI BITS**—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.

**VPI BITS**—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

**rtrv-attr-seculog****Display Security Log Characteristic**

Use this command to display security log attributes that were configured using the **chg-attr-seculog** command.

**Keyword:** **rtrv-attr-seculog**

**Related Commands:** **chg-attr-seculog**

**Command Class:** Security Administration

**Parameters**

This command has no parameters.

**Example**

```

```

**rtrv-bip****Retrieve Board Identification PROMs**

Use this command to show the board identification PROM (BIP) data for the main assembly at the specified card location.

The following information is displayed for the main assembly: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing date, and the software match ID.

For main assemblies, the port A ethernet address (if ENT01 record exists) and port B ethernet address (if ENT02 record exists) are also displayed.

**Keyword:** **rtrv-bip**

**Related Commands:** **chg-bip-fld, chg-bip-rec, disp-bip, tst-bip**

**Command Class:** System Maintenance

**Parameters**

**NOTE:** As of Release 42.0, the **dbdloc** parameter is obsolete.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**NOTE:** Locations **xy09** and **xy10** are valid only if they are equipped with a HIPR2 card.

**:type=** (optional)

The type of board at the specified location whose BIP information is to be displayed.

**Range:** **mbd**  
**mbd** — main assembly

**:dbdloc=** (obsolete)

Applique location. This parameter specifies the location of the applique.

This parameter can be specified only for cards that support multiple appliques.

This parameter is obsolete.

**Range:** 1-2

**Example**

The following example displays the BIP data for the main assembly.

**rtrv-bip: loc=1201**

**Dependencies**

The card location frame, shelf, and slot must be within the allowed range.

The card location must be valid for the command.

**Notes**

The **tst-bip** command verifies that the PROM is good by writing to and reading from the PROM. The **rtrv-bip** command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communication to the card has failed, and you might need to replace the card. Contact the Customer Care Center to find out if the card can be reprogrammed. See the "Customer Care Center" section in Chapter 1 of this manual.

**Output**

For main assemblies, the Max Power Rating is also displayed. If the Card Power value is not present in BIP data, then the Max Power Rating is displayed as **Undef**.

The following example displays the 7-digit serial number of a main assembly card manufactured on the eleventh week of 1993).

**rtrv-bip: loc=1201**

```
tekelecstp 10-03-14 23:32:51 IST EAGLE 42.0.0

END OF REPORT

```

;

**Legend**

- **LOCATION**—Card location for the BIP information
- **PART NUMBER**—Part number of the card in the specified card location
- **REVISION**—Hardware version of the card
- **SERIAL NUMBER**—Serial number of the card. Serial number formats are:
  - 7-digit serial number—ywwxxxx
  - 8-digit serial number—yywwxxxx
  - 11-digit serial number—nnnyywwxxxx
  - 12-digit serial number—nnnyyww\*xxxx
  - 14-digit serial number—nnnyyyww\*xxxx
  - y = year digit (0–9)
  - w = week digit (0–9)
  - n = product identifier digit (0–9) x = serial number digit (0–F hexadecimal)
  - \* = special character (0–9, a–z, or A–Z, alphanumeric characters)
- **SOFTWARE MATCH ID**—Used to check hardware and board type for the BIP information.
- **MAX POWER RATING**—Maximum power rating of the card.
- **WEEK/YEAR**—Week (1–52) and year (4 digits) of the card. The serial number formats are:
  - 7-digit: ywwxxxx
  - 8-digit: yywwxxxx
  - 11-digit: nnnyywwxxxx
  - 12-digit: nnnyyww\*xxxx
  - 14-digit: nnnyyyww\*xxxx
  - where y=year, w=week, n=product identifier, x=serial number (0–F, hexadecimal),  
\*=special character (0–9, a–z, or A–Z)

**rtrv-card****Retrieve Card**

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined by the **ent-card** command. If the **loc** parameter is specified, the command displays information for the specified card only.

**Keyword:** rtrv-card

**Related Commands:** dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card

**Command Class:** Database Administration

### Parameters

**:links=** (optional)

Links Provision Status. For the card in the location specified by the **loc** parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

**Range:** **all, equip, unequip, ips**

**all** — Display all possible links for the card.

**equip** — Display links that are equipped on the card.

**unequip** — Display links that are allowed but not equipped on the card.

**ips** — Display the SLKTPS and total card TPS used for a particular card or for all cards configured with the **ips** GPL.

**Default:** **equip**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115**

**Default:** Retrieve all

### Example

```
rtrv-card
```

```
rtrv-card:loc=1205
```

```
rtrv-card:links=ips
```

```
rtrv-card:loc=1111:links=ips
```

### Dependencies

The card location slot must be between **1** and **18** and not **9** or **10**.

The card location cannot be **1114, 1116, 1117, or 1118**.

The shelf location must be **11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx**.

The specified card location must be equipped in the database.

### Notes

None

## Output

**rtrv-card**

### Legend

**CARD**—The card location as stenciled on the shelf of the system.

**TYPE**—The type of card. (The DCM and SSED CM cards are card type DCM).

**APPL**—The application associated with each card in the display.

**LSET NAME**—The linkset name associated with the cards in the display.

### LINK

—The signaling link associated with the linkset. If the card is an MPL or MPL-T (TYPE is **limds0**

, APPL is **ss7ansi**) or an E1/T1 MIM (**TYPE** can be **lime1**, **limt1**, or **limch**; **APPL** can be **ss7ansi** or **ccs7itu**), the card can support 8 ports (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, and **b3**).

**SLC**—The signaling link code.

**UNEQUIPPED LINKS**—Signaling links that are unequipped on the provisioned card.

**SLKTPS**—Transactions Per Second configured for signaling links provisioned on the card.

## rtrv-clkopts

## Retrieve Clock Options

Use this command to retrieve the values of the clock parameters which are maintained in the STP's option table. All values are assigned initially to system defaults during STP installation, and can be updated using this command.

**Keyword:** **rtrv-clkopts**

**Related Commands:** **chg-clkopts**

**Command Class:** Database Administration

### Parameters

### Dependencies

No parameters can be specified with this command.

### Notes

None

### Output

#### rtrv-clkopts

## rtrv-cmd

## Retrieve Command Attributes

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

**Keyword:** rtrv-cmd

**Related Commands:** `chg-cmd`

**Command Class:** Basic

## Parameters

**:class=** (optional)

The command class whose attributes are to be retrieved.

**Range:** *ayyyyyy*

One alphabetic character followed by up to 5 additional alphanumeric characters.

**:cmd=** (optional)

The command whose attributes are to be retrieved.

**Range:** zzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz

One alphabetic character followed by up to 19 additional alphanumeric characters, enclosed in double quotes.

### Example

```
rtrv-cmd:cmd="ent-rte"
```

```
rtrv-cmd:class=dab
```

**rtrv-cmd**

## Dependencies

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before a command from the LNPBAS class can be specified in the **cmd** parameter or before the **class=lnpbas** parameter can be specified.

The value of the **cmd** parameter must be a valid system command.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

The Command Class Management feature must be enabled before CHG-CMD or CHG-CMDCLASS command can be entered.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following example shows the command classes to which the **rept-stat-slk** command is assigned (non-configurable class **sys** and user-configured classes **u01**, **u02**, **krb**, and **u11**):

**rtrv-cmd:cmd="rept-stat-slk"**

```

**rtrv-cmdclass****Retrieve Command Class**

Use this command to retrieve the name and description of one command class or all command classes.

**Keyword:** **rtrv-cmdclass**

**Related Commands:** **chg-cmdclass**

**Command Class:** Basic

**Parameters**

**:class=** (optional)

The command class whose name and description are to be retrieved.

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters

**Example**

```
rtrv-cmdclass: class=krb
```

```
rtrv-cmdclass
```

**Dependencies**

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **class=lnpbas** parameter can be specified.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

**Notes**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before class LNPBAS will appear in the command output.

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

## Output

In the following examples, the classes u01, u03, u05, and u32 are default configurable command class names. The classes krb and dab are user-assigned configurable command class names; the user changed default configurable command class name u02 to krb and changed default configurable command class name u04 to dab. The descriptions of classes krb and dab were entered with the **descr** parameter when the class names were changed with the **chg-cmdclass** command.

### **rtrv-cmdclass: class=krb**

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
class          descr
krb            my command class description
```

;

### **rtrv-cmdclass**

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
class          descr
link          link maintenance commands
sa            security administration commands
sys          system maintenance commands

.
.
u01          configurable command class 1
krb          my command class description
u03          configurable command class 3
dab          your command class description
u05          configurable command class 5
.
.
.
u32          configurable command class 32
```

;

## rtrv-csl

## Retrieve Common Screening List

Use this command to retrieve all Common Screening List (CSL) entries for a specified feature, a list of screening entries for the specified feature and screening list name, or a specific DS or PC value for a particular feature and screening list name. The Common Screening List commands are used to tailor certain types of general screening information to specific features.

**Keyword:** rtrv-csl

**Related Commands:** dlt-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**NOTE:** The scpgta parameter is used only by the Prepaid IDP Query Relay feature.

**:ds=** (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

**NOTE:** Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command.

**Range:** 1-15 digits  
Valid digits are **0-9, a-f, A-F**.

- 1-6 digits—Prepaid IDP Query Relay **ccnc** list
- 1-15 digits—Prepaid IDP Query Relay **gt** list
- 1-10 digits—Prepaid IDP Query Relay **skbcsn** list
- 4 digits—IDP Screening for Prepaid **skts** list
- 1-15 digits—IDP Screening for Prepaid **insl** list
- 1-15 digits—VFLEX **vmpfx** list
- 1-6 digits—Info Analyzed Relay Base **ccnc** list
- 1-15 digits—Info Analyzed Relay Base **gt** list
- 2 digits—Info Analyzed Relay Base **trig** list

Table 5-20 lists valid hexadecimal values for the IAR Base **trig** list **ds** entries.

**:feature=** (optional)

Feature name. This parameter specifies the name of the screening feature for which the command is entered.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:** *abcdefghijklmnopqrstuvwxyz*

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

- IDP Screening for Prepaid
- Info Analyzed Relay Base
- Prepaid IDP Query Relay
- IDP Service Key Routing
- VFLEX

**:list=** (optional)

The name of the Common Screening List that is associated with the feature.

The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

**Range:** **gt, skbcsn, ccnc, skts, insl, vmpfx, trig, delpfx**

**gt**—Global Title List

**skbcsn**—SK+BCSM List

**ccnc**—CC+NC List

**skts**—SK+TS List

**insl**—In Network Subscriber List

**vmpfx**—Voice Mail Prefix List

**trig**—Trigger List

**delpfx**—The **delpfx** list is not supported at this time. This list should only be used by Tekelec personnel.

The following screening lists are valid for the indicated features:

- **skts, insl**—IDP Screening for Prepaid

- **ccndc, gt**—Prepaid IDP Query Relay and Info Analyzed Relay Base
- **skbcsm**—Prepaid IDP Query Relay and IDP Service Key Routing
- **vmpfx**—VFLEX
- **trig**—Info Analyzed Relay Base

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code. Either the **ds** or a point code parameter must be specified.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*.

**Range:** **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

**:pcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned **on**(*nnn-gc, m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000–255

*ssa*—000–255

*sp*—000–255

**:pn=** (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example. Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:** 893000000-893999999

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- 893015501—IDP Screening for Prepaid
- 893034201—Info Analyzed Relay Base
- 893016001—Prepaid IDP Query Relay
- 893016701—VFLEX

**:scpgta=** (optional)

Signaling Control Point (SCP) Global Title Address (GTA).

**Range:** 1-21 digits, none

### Example

**rtrv-csl**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc**

**rtrv-csl:feature="IDP Screening for Prepaid":list=insl:ds=123456789abcdEF**

**rtrv-csl:scpgta=12345**

### Dependencies

The value specified for the **feature** parameter must be a valid feature name for a feature that uses a Common Screening List. The feature must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The specified feature name must be valid for a feature that uses a Common Screening List.

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccnc—ds** parameter
- **list=skbcm—ds** or **scpgta** parameters
- **list=skts—ds** parameter
- **list=insl—ds** parameter
- **list=vmpfx —ds** parameter
- **list=trig —ds** parameter

Only one of the **ds**, **pc**, and **scpgta** parameters can be specified in the command.

The **pn** or **feature** parameter must be specified before the **list** parameter can be specified.

**Notes**

MTT 4460 deleted for PR 194589 in rel 43.0

**Output**

Retrieve the specified screening entry for the specified feature and screening list.

**rtrv-cspc****Retrieve Concerned Signaling Point Code**

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

**Keyword:** **rtrv-cspc**

**Related Commands:** **dlt-cspc**, **ent-cspc**

**Command Class:** Database Administration

**Parameters**

**:grp=** (optional)

Group name

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** Retrieve all.

**Example**

**rtrv-cspc**

**rtrv-cspc:grp=grp01**

**Dependencies**

If specified, the group name must exist in the database.

**Notes**

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

**Output**

The following example displays output when the ANSI/ITU SCCP Conversion feature is enabled.

**rtrv-cspc**

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp02 ANSI, ITU, ITU-N24 3%
Grp03 ITU 2%
;
```

The following example displays output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is enabled.

**rtrv-cspc:grp=grp02**

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PC Type
GRP02 001-012-123 A
      001-012-124 A
      7-089-0 I
      s-2-021-4 I
      s-00789 N
;
```

The following example displays output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is not enabled.

**rtrv-cspc:grp=groupi**

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PCI
groupi 7-089-0
      s-2-021-4
;
```

**Legend**

**CSPC PC TABLE IS 15% FULL**—The relative size of the CSPC point code tables.

**CSPC GRP**—The name of the CSPC broadcast group.

**NETWORK**—The network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The **grp** parameter must be specified to list the point codes in the specified group.)

**PERCENT FULL**—The relative size of the CSPC broadcast group.

**PC**—The point codes that make up the CSPC broadcast group.

**TYPE**—The network type of the point code in the group. (The **grp** parameter is specified in the command to list the point codes in the specified group.)

**rtrv-ctrl-feat****Retrieve Controlled Feature**

Use this command to retrieve the status of feature access key controlled features that are purchased and enabled in the system.

**Keyword:** rtrv-ctrl-feat

**Related Commands:** chg-ctrl-feat, enable-ctrl-feat

**Command Class:** Database Administration

## Parameters

**:enable=** (optional)

Retrieve controlled features that are enabled with either temporary feature access keys or permanent feature access keys.

**Range:** **temp, perm**

**Default:** Retrieve controlled features for both temporary and permanent feature access keys

**:expired=** (optional)

Retrieve controlled features with expired temporary feature access keys.

**Range:** **yes, no**

**Default:** **no**

**:partnum=** (optional)

The Part Number to retrieve or the command.

**Range:** **893000000 - 893999999**

Do not include dashes in the 9-digit number.

**Default:** Retrieve all controlled features

**:status=** (optional)

Retrieve features with the specified status (On or Off).

**Range:** **on, off**

**Default:** Retrieve features with On and Off status

## Example

```
rtrv-ctrl-feat
```

```
rtrv-ctrl-feat:enable=perm
```

```
rtrv-ctrl-feat:partnum= 893005911
```

## Dependencies

None

## Notes

When the **enable=perm** parameter is specified, the **expired** parameter value is understood to be **no**.

The product right-to-use features (EAGLE5, EAGLE, and IP<sup>7</sup>) are not mutually exclusive. The hierarchy for product right-to-use features is EAGLE5, then EAGLE, then IP<sup>7</sup>. This means that if the EAGLE5 feature is on, the product is EAGLE5 regardless of the setting of the other product right-to-use features. Some EAGLE 5 ISS features require that a specific product right-to-use feature is enabled and turned on.

For systems being upgraded, the product right-to-use feature for the specific product is turned on. For example, upgrading from an EAGLE 5 ISS release in a system that uses no EAGLE 5 features to a release that uses at least one EAGLE 5 feature causes the EAGLE 5 product right-to-use feature to be enabled and turned on during the conversion.

For new installation, no product right-to-use features are on. The appropriate product right-to-use feature for the highest required product in the hierarchy must be enabled and turned on.

## Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. A feature must be purchased before you can enable the feature and turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

If a Part Number (**partnum** parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part Number is for a different quantity. The output will also include the temporary enabled information, if applicable.

**rtrv-data-rtdb****Retrieve Data RTDB**

This command retrieves data from the RTDB on an active Service Module card. If the **thdoc** parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card. If the **loc** parameter is not specified, the data is retrieved on the active Service Module card that has the lowest IMT address. The RTDB status on the active Service Module card can be coherent or incoherent.

For LNP database items (TN) all Service Module cards are queried for the existence of the specified item. Either the Service Module card specified by the **thdoc** parameter or the Service Module card with the lowest IMT address returns full item information. Any remaining Service Module cards return either COHERENT or INCOHERENT if the item is found in the RTDB on the card.

**Keyword:** **rtrv-data-rtdb**

**Related Commands:**

**Command Class:** Database Administration

**Parameters**

**:dn=** (optional)

Dialed Number.

**Range:** 5-15 digits

**:entity=** (optional)

Network Entity.

**Range:** 1-15 digits

**:entitytype=** (optional)

Entity Type.

**Range:** **sp, rn, vmsid, grn**

**sp** — Service Provider: Any 10-digit TN

**rn** — Routing Number: Any 10-digit TN

**vmsid** — Voice Mail Server ID: Any 1-15 digit hexadecimal number

**grn** — Generic Routing Number: Any 1-15 digit hexadecimal number

**:imei=** (optional)

International Mobile Equipment Identity.

**Range:** 14 digits

**:imsi=** (optional)

International Mobile Subscriber Identity.

**Range:** 5-15 digits

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:lrn=** (optional)

Location Routing Number.

**Range:** 10 digits

**:npanxx=** (optional)  
 Numbering Plan Area.  
**Range:** 6 digits

**:tn=** (optional)  
 Telephone Number.  
**Range:** 10 digits

### Example

**rtrv-data-rtdb:tn=9194663133**

**rtrv-data-rtdb:npanxx=919466**

**rtrv-data-lrn=9194460000**

**rtrv-data-rtdb:imsi=12345**

**rtrv-data-rtdb:dn=12345**

**rtrv-data-rtdb:entity=abcdefabcdefabc**

Retrieve DN information from a specific Service Module card.

**rtrv-data-rtdb:dn=19195554444:loc=1107**

Retrieve entity data from a specific Service Module card.

**rtrv-data-rtdb:entity=12345:loc=1107**

### Dependencies

The specified card location must be equipped in the database.

At least one of the following parameters must be specified: **imsi**, **dn**, **entity**, **imei**, **entitytype**, **npanxx**, **lrn**, **tn**.

Only one of the **tn**, **lrn**, or **npanxx** parameters can be specified in the command.

If the **npanxx**, **lrn**, or **tn** parameter is specified, the LNP ELAP Configuration feature must be on.

If the AINPQ, EIR, G-Flex, G-Port, INP, Prepaid IDP Relay Query, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the **imsi**, **dn**, **entity**, **imei**, or **entitytype** parameter must be specified.

If the **imsi** parameter is specified, then the G-Flex feature or the EIR feature must be turned on.

The G-Flex, G-Port, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **entity** parameter can be specified.

If the **entitytype** parameter is specified, the **entity** parameter must be specified.

If the **imei** parameter is specified, the EIR feature must be turned on.

The destination specified by the **loc** parameter must correspond to a Service Module card running the **vsccp** application.

The destination specified by the **loc** parameter must correspond to a Service Module card that is IS-NR.

A primary Service Module card must be provisioned.

The G-Flex, G-Port, INP, Prepaid SMS Intercept Ph1, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **dn** parameter can be specified.

The card location slot must be between **1** and **16** and not **9** or **10**. The frame location must be **1xxx**, **2xxx**, **3xxx**, **4xxx**, **5xxx**, **6xxx**. The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

An EPAP-related feature must be turned on before the **entity**, **entitytype**, or **dn** parameter can be specified.

**Notes**

For DN and DN Block entries, whichever entity is provisioned in the order of SP/RN, VMSID, GRN, will become EntIdx1.

## Output

**NOTE: A value of "---" in the TT column indicates that the service does not have a translation type defined in the EAGLE 5 ISS and that call processing will ignore the override data displayed.**

**Legend**

**CARD LOC**—Location of the card that contains the retrieved information.

**STATUS**—RTDB database status; Coherent or Incoherent.

**IMSI**—International Mobile Subscriber Identity.

**ENTIDX, ENTIDX1, ENTIDX2**—The hexadecimal index at which the Network Entity data is stored in the Entity Bucket on the Service Module card.

**IMEI INDEX**—The hexadecimal index at which the IMEI data is stored in the IMEI Bucket on the Service Module card.

**ENTITY ADDRESS**—Hexadecimal Network Entity address.

**Type**—Network Entity type; Service Provider (SP), Routing Number (RN), Voice Mail Server ID (VMSID) or Generic Routing Number (GRN).

**PC** (*type of PC*)—Point code and type of point code (ANSI; NATL - ITU National with or without group code (-gg)).

**RI**—Routing Indicator

**SSN**—Subsystem Number.

**TT**—Translation Type.

**NP**—Numbering Plan

**DA**—Digits action (Prefix, Suffix, or none)

**SRFIMSI**—Signaling Relay Function IMSI

**IMSI**—International Mobile Subscriber Identity.

**NSSN**—New Subsystem Number (yes or no)

**CCGT**—Cancel GT (yes or no)

**NTT**—New Translation Type

**NNP**—New Numbering Plan

**NNAI**—New Nature of Address Indicator.

**IMEI**—International Mobile Equipment Identity.

**VERSION**—IMEI data version.

**BLACK, WHITE, GRAY**—Equipment Identity Register search lists.

**DN**—Dialed Number.

**ASD ADDRESS**—Additional Subscriber Data address

**PORTABILITY TYPE** (*number*)—

- 36—Not Identified to be ported
- 255—No portability type

**NS ADDRESS**—Address of the associated DN, used for Number Substitution

**NS CATEGORY**—Category of the associated DN, used for Number Substitution

**NPA**—Number Planning Area (Area Code)

**NXX**—Exchange Code

## rtrv-dlk

## Retrieve Data Link

Use this command to show the parameters of a TCP/IP data link.

**Keyword:** rtrv-dlk

**Related Commands:** act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, tst-dlk

**Command Class:** Database Administration

## Parameters

**:ipaddr=** (optional)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

**Default:** Display all.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All TCP/IP data links are shown.

## Example

**rtrv-dlk**

**rtrv-dlk:loc=1201**

**rtrv-dlk:ipaddr=193.4.201.34**

## Dependencies

This command can be entered with no parameters or with one of the optional parameters **loc** or **ipaddr**; however, both **loc** and **ipaddr** cannot be specified in the same command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If the **ipaddr** parameter is specified, the IP address must be assigned to a TCP/IP data link.

## Notes

None

**Output**

In the following example, cards at location 1201 and 1203 are ENET cards running the **stplan** application. For these cards, the value of the auto parameter is defaulted to no, and the value of the duplex parameter is defaulted to half.

The cards at location 1101, 1103 and 1107 are DCM or E5-ENET cards running the **stplan** application. For these cards, if the **auto=yes** parameter is specified, then the values of **speed** and **duplex** parameters are not shown.

**rtrv-dlk**

```
tekelecstp 07-02-06 11:12:47 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit FULL    NO
1103 192.168.63.11    10Mbit  HALF    NO
1107 192.168.63.12    ----- ----    YES
1201 192.168.63.13    10Mbit  HALF    NO
1203 192.168.63.14    10Mbit  HALF    NO
```

;

**rtrv-dlk:loc=1101**

```
tekelecstp 07-02-01 14:09:13 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit FULL    NO
```

;

**rtrv-dlk:ipaddr=192.168.63.11**

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1103 192.168.63.11    10Mbit  HALF    NO
```

;

In the following example, the specified IP address is not assigned to a TCP/IP data link.

**rtrv-dlk:ipaddr=193.4.201.28**

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR not assigned to a TCP/IP Link.
```

;

In the following example, there are no TCP/IP data links in the database.

**rtrv-dlk**

```
tekelecstp 07-02-02 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
No TCP/IP Links are defined in the database.
```

;

In the following example, the specified IP address is assigned to a TCP/IP node instead of a TCP/IP data link.

**rtrv-dlk:ipaddr=193.4.201.63**

```
tekelecstp 07-02-01 12:12:10 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR assigned to a TCP/IP Node.
```

;

**Legend**

**IPADDR**—The IP address associated with the interface on the data link.

**LOC**—The card location containing the data link.

**LINK SPEED**—The bandwidth for the interface in megabits per second, **10** or **100**.

**AUTO**—Whether or not to automatically determine duplex and speed. If the value is **yes**, then duplex and speed are automatically determined. If the value is **no**, then duplex and speed are not automatically determined.

**DUPLEX**—The mode of operation of the interface. Possible values are **half** and **full**.

## rtrv-dstn

## Retrieve Destination

Use this command to show the destination point code entries in the Destination point code table.

**Keyword:** rtrv-dstn

**Related Commands:** chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-rte

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:aliasa=** (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:** 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:aliasa/aliasi/aliasn/aliasn24=** (optional)

Alias point code.

**:aliasi=** (optional)

ITU international alias point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*). If this parameter is specified with an ITU international destination (**dpci**) point code, the prefix subfields cannot be the same, i.e. both spare or both non-spare.

If an ITU international destination (**dpci**) point code is entered, then the **dpci** and **aliasi** *prefix* subfields cannot be the same, (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:aliasn=** (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). If this parameter is specified with an ITU national destination (**dpcn**) point code, the prefix subfields cannot be the same, i.e. both spare or both non-spare.

If an ITU national destination (**dpcn**) point code is entered, then the **dpcn** and **aliasn** *prefix* subfields cannot be the same, (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:aliasn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:clli=** (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:** **ayyyyyyyyy**

1 alphabetic character followed by 10 alphanumeric characters

**Default:** **none**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-*\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node *nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or **\*-\*-\*-\*** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:homescp=** (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SCP flag set to the specified value.

**Range:**     **yes, no**

**yes** — the DPC is considered a Home SCP for messages with no Global Title Address Digits

**no** — the DPC is not considered a Home SCP for messages with no Global Title Address Digits

**:homesmsc=** (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SMSC flag set to the specified value.

**Range:**     **yes, no**

**yes** — the DPC is considered a Home SMSC for messages with no Global Title Address Digits

**no** — the DPC is not considered a Home SMSC for messages with no Global Title Address Digits

**:msar=** (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The **summary** report or the **detail** report appears following the destination information that is requested by entering the command with or without other parameters. The **only** parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

**Range:**     **detail, only, summary**

**Default:**   **detail**—if **rtrv-dstn** is entered with no parameters

**summary**—if **rtrv-dstn** is entered with parameters

**:ncai=** (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes (**ncai=yes**), or clusters that do not allow nested cluster point codes (**ncai=no**) are displayed.

**Range:**     **yes, no**

**yes** — Display clusters with the **ncai** set to **yes**

**no** — Display clusters with the **ncai** set to **no**

**:nprst=** (optional)

NM bits reset. This parameter displays all entries with the specified value of the **nprst** option.

**Range:**     **off, on**

**off** — Display all entries with an **nprst** parameter value of **off**.

**on** — Display all entries with an **nprst** parameter value of **on**.

**:pest=** (optional)

Point code subtype. If selected, this parameter causes the command to display only point codes with no subtype prefix or only point codes of a specified subtype.

**Range:**     **none, p, ps, s**

**none** — Display only point codes without subtype prefixes

**p** — Display only private point codes (subtype prefix **p-**)

**ps** — Display only private and spare point codes (subtype prefix **ps-**)

**s** — Display only spare point codes (subtype prefix **s-**)

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:**       **ansi, itui, itun, itun24**

**ansi** — Display only ANSI point codes

**itui** — Display only ITU International point codes

**itun** — Display only ITU National point codes

**itun24** — Display only 24-bit ITU National point codes

**:ppc=** (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:ppc/ppca/ppci/ppcn/ppcn24=** (optional)

Proxy Point Code.

The proxy point code must be a full point code.

**:ppci=** (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**       **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:ppcn=** (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**:ppcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000-255*

*ssa—000-255*

*sp—000-255*

**:prx=** (optional)

Proxy point code indicator.

**Range:** **yes, no**

**yes** — Will be used as a proxy point code

**no** — Will not be used a proxy point code.

**:sccpmsgcnv=** (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. This parameter specifies the type of conversion performed on messages for the specified destination.

**Range:** **none, udt2xudt, xudt2udt, sxudt2udt**

**none** — conversion is not required on messages for the destination

**udt2xudt** — convert all UDT(S) messages for the destination to XUDT(S) messages

**xudt2udt** — convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

**sxudt2udt** — convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

**:spc=** (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **spca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps-*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:splitiam=** (optional)

IAM/SAM split. This parameter displays all entries with the specified **splitiam** parameter value.

**Range:** **15-31, none**

## Example

The following example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

**rtrv-dstn:dpca=20-2-\*\*\***

The following example displays the destination with an ANSI alias of 222-200-200:

**rtrv-dstn:aliasa=222-200-200**

The following example displays all encountered ANSI alias destination point codes that have a network indicator (ni) of 222 and a network cluster (nc) of 200:

**rtrv-dstn:aliasa=222-200-\*\***

The following example displays the destination with a CLLI of rlghncbb001:

**rtrv-dstn:clli=rlghncbb001**

The following example displays the secondary point code 6-6-6:

**rtrv-dstn:spc=6-6-6**

The following example displays a single cluster (the NRT feature must be turned on):

**rtrv-dstn:dpc=010- \*- \***

The following example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

**rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr**

The following example displays all ITU national group codes by duplicate point code:

**rtrv-dstn:dpcn=2050- \***

The following example displays all ITU national point codes within a group code:

**rtrv-dstn:dpcn=\*-fr**

The following example displays 24-bit ITU national point code 15-100-10:

**rtrv-dstn:dpcn24=15-100-10**

The following example displays 24-bit ITU national secondary point code 99-99-99:

**rtrv-dstn:spcn24=99-99-99**

The following example displays 24-bit ITU national alias point code 4-4-4:

**rtrv-dstn:aliasn24=4-4-4**

The following example displays a private point code:

**rtrv-dstn:dpca=p-12-12-12**

The following examples display a private and spare point code:

**rtrv-dstn:dpcn=ps-123**

**rtrv-dstn:dpci=ps-1-234-1**

The following example displays all ANSI private point codes:

**rtrv-dstn:pctype=ansi:pcst=p**

The following example displays all ITU international spare point codes:

**rtrv-dstn:pctype=itui:pcst=s**

The following example displays all ITU national private and spare point codes:

**rtrv-dstn:pctype=itun:pcst=ps**

The following example displays all 24-bit ITU national private point codes:

**rtrv-dstn:pctype=itun24:pcst=p**

The following example displays all ANSI point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=ansi**

The following example displays all ITU international point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itui**

The following example displays all ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun**

The following example displays all 24-bit ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun24**

The following example displays all point codes that do not have point code subtype prefixes:

**rtrv-dstn:pcst=none**

The following example displays all private point codes:

**rtrv-dstn:pcst=p**

The following example displays all spare point codes:

**rtrv-dstn:pcst=s**

The following example displays all private and spare point codes:

**rtrv-dstn:pcst=ps**

The following example displays all proxy destinations.

**rtrv-dstn:prx=yes**

The following example displays all destinations using a specified proxy point code.

**rtrv-dstn:ppc=1-1-1**

The following example displays full DPCs when the homescp=yes parameter is specified.

**rtrv-dstn:homescp=yes**

The following example displays all point codes where the sccpmsgcnv=udt2xudt parameter is specified.

**rtrv-dstn:sccpmsgcnv=udt2xudt**

## Dependencies

**NOTE:** A *full point code* contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLI parameter can be specified in the command; these parameters cannot be specified together in the command.

If the **dpcn** parameter or the **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

If specified (except when **spc=none**), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

When the **msar=only** parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

The **pcst** parameter value **s** or **ps** cannot be specified when the **pctype** value **ansi** or **itun24** is specified.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters.

The **clli** parameter value cannot be **none**.

The Proxy Point Code feature must be enabled before the **prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The **prx** parameter can be specified with only the **pctype**, **pcst**, or **msar** parameter.

The **ppc** parameter can be specified with only the **msar** parameter.

If the **prx** parameter is specified, then either **yes** or **no** value must be assigned.

The point code specified by the **ppc** parameter must be a full point code.

Proxy point codes, as specified by the **ppc** parameter, cannot be private.

PRX point codes cannot be private.

The XUDT UDT Conversion feature must be turned on before the **sccpmsgcnv** parameter can be specified.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- **rtrv-dstn:dpc=ni-nc-ncm**—Report for fully provisioned destination *ni-nc-ncm*
- **rtrv-dstn:dpc=ni-\*.\***—Report for provisioned network destination with the specified network indicator. If \* is specified in the *nc* field, \* must be specified in the *ncm* field.
- **rtrv-dstn:dpc=ni-\*\*-\***—Report for the full network cluster for the specified *ni*
- **rtrv-dstn:dpc=ni-\*\*\*-\***—Report for the full network cluster and the network cluster address (if any) for the specified *ni*
- **rtrv-dstn:dpc=ni-nc-\***—Report for provisioned cluster destination *ni-nc-\**
- **rept-stat-dstn:dpc=ni-nc-\*\*-\***—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address on *ni-nc-\** (if it exists) is not reported.
- **rtrv-dstn:dpc=ni-nc-\*\*\*-\***—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-\** (if it exists) is also reported.
- **rtrv-dstn:dpcn24=msa-ssa-sp**—Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

### Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example **20-2-\*\*-\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\*-\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

### Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-ab** is valid; **\*-15-\*-\*-ab** is not valid).

If the Proxy Point Code feature is enabled, then the values specified for the **ppc** and **dpc** parameters must be full point codes. Cluster point codes and private point codes are not supported.

## Output

### *Destination Table Memory Space Accounting Information*

Each output example for this command shows the display of destination table memory space accounting information. The **msar** parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

#### *Summary Report*

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the **msar** parameter values. The detail report cannot be displayed. The summary information appears at the end of the requested destination information, or appears without any other destination information when the **msar=only** parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The **msar=summary** parameter value is the default in this case.)
- When the command is entered with only the **msar=summary** parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The **chg-stpopts** command **mtpdpcq** parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the value x, the allowed maximum is the value y, and the table percent full is the value z shown in the following first line of the summary report:

Destination table is (x of y) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, 8000, or 10,000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The number currently provisioned is the x value, the allowed maximum is the y value, and the table percent full is the z value shown in the following second line of the summary report:

Alias table is (x of y) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.

- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.
- When the 7000 or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.
- When the 10000 Routesets quantity feature is enabled, a maximum of 10000 aliases can be provisioned.

#### *Detail Report*

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The **msar=detail** parameter value is the default in this case.)
- When the **msar=detail** parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.
- When the **msar=only** parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The **chg-stpopts mtpdpcq** parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the DESTINATION ENTRIES ALLOCATED value. The list of values under the allocated value includes the TOTAL DPCs currently provisioned and the Destination table CAPACITY (% FULL).

The allowed maximum number of aliases is the ALIASES ALLOCATED value. The list of values under the allocated value include the current number of ALIASES USED and the Aliases table CAPACITY (% FULL). The possible maximum numbers of aliases are described in the *Summary Report* section.

The output for the **rtrv-dstn** command does not change when the Proxy Point Code feature is on.

Abbreviated output is indicated by 3 vertical dots as shown:

.  
.  
.

The following example shows destination table memory space accounting information contained in a summary report. In the example, the **msar=only** parameter is specified and the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

#### **rtrv-dstn:msar=only**

```
rlghncxa03w 06-06-01 16:02:05 EST EAGLE 35.0.0
Destination table is (0 of 2000) 0% full
```

```
Alias table is (0 of 12000) 0% full
RTRV-DSTN: MASP A - COMPLTD
```

```
;
```

The following example shows the destination table memory space accounting information contained in a detail report. In the following example, the **msar=only** parameter is specified and one or more of the NCR, NRT, CRMD or Origin-based MTP Routing features are on. The Detail Report information appears without any other destination information.

#### **rtrv-dstn:msar=only**

```
eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0
DESTINATION ENTRIES ALLOCATED: 2000

## rtrv-e1

## Retrieve E1 Information

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the **ent-e1** command for an E1/T1 MIM MIM card, or an HC-MIM or E5-E1T1 card used as an E1 or SE-HSL card.

**NOTE: The following information can be retrieved: card location, E1 port number, CRC4, CAS/CCS, encoding/decoding, channel bridging, timing source, international NFAS data, national NFAS data, and link class with minimum signal unit rate for unchannelized links.**

**Keyword:** **rtrv-e1**

**Related Commands:** **chg-e1, dlt-e1, ent-e1, tst-e1**

**Command Class:** Database Administration

### Parameters

**:e1port=** (optional)

E1 port number

The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card (**loc** parameter).

**Range:** **1-8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**Default:** If not specified, all E1 ports are listed.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** If not specified, all E1 card locations are listed.

### Example

**rtrv-e1**

**rtrv-e1:loc=1307:e1port=2**

**rtrv-e1:loc=1311:e1port=1**

### Dependencies

The **loc** and **e1port** parameters must be specified together in the command.

The E1 interface of the E1 card specified by the **loc** parameter must already be defined (see the **ent-e1** command) before this command can be entered.

The card specified by the **loc** parameter must be a **lime1** card type (see the **ent-card** command).

An E1 interface must already be defined on the port specified by the **e1port** parameter before this command can be entered.

### Notes

None.

**Output**

The following example shows HC-MIM cards used as E1 cards. Cards with CHANBRDG=MASTER or CHANBRDG=SLAVE have 2 ports configured in channel bridging mode to allow non-signaling data pass-through.

**rtrv-e1**

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 33.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  CLASS  RATE
1307  7      ON    OFF  HDB3    LINE      0  0  -----  CHAN    ----
1307  8      ON    OFF  HDB3    LINE      0  0  -----  CHAN    ----

LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MINSU
1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
```

;

The following example shows HC-MIM cards used as E1 cards. Cards with LINKCLASS=UNCHAN have SE-HSL links.

**rtrv-e1**

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 34.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MINSU
1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
1307  8      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 2000
1311  1      OFF  ON   AMI     LINE    1  1  -----  CHAN   ----
```

;

**Legend**

**LOC**—E1 card location in an EAGLE 5 ISS shelf.

**E1PORT**—E1 port number on an E1 card.

**CRC4**—CRC4 indicator.

**CAS**—CAS/CRC indicator (**on** = CAS is used; **off** = CRC is used).

**ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding.

**E1TSEL**—E1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair.)

**SI**—Value of two Spare International bits of NFAS data.

**SN**—Value of five Spare National bits of NFAS data.

**CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

**LINKCLASS**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN).

**MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.

**TSx**—Timeslot.

**rtrv-eisopts****Retrieve EAGLE Support for Integrated Sentinel Options**

Use this command to retrieve the status of the copy functions for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** rtrv-eisopts  
**Related Commands:** chg-eisopts  
**Command Class:** Security Administration

### Parameters

This command has no parameters.

### Example

**rtrv-eisopts**

### Dependencies

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

### Notes

None

### Output

## rtrv-feat

## Retrieve Feature

Use this command to show the status of optional features in the system that are controlled with the **chg-feat** command.

**Keyword:** rtrv-feat  
**Related Commands:** chg-feat  
**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-feat**

### Dependencies

None

### Notes

This command is not allowed in upgrade mode.

## Output

CAUTION

**CAUTION:** The following output example may differ from the output shown at your terminal and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative. After you turn on a feature with thechg-feat command, you cannot turn it off.

## rtrv-frm-pwr

## Retrieve Frame Power Threshold

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

**Keyword:** **rtrv-frm-pwr**

**Related Commands:** **chg-frm-pwr**, **dlt-frm-pwr**, **ent-frm-pwr**, **rtrv-stp**

**Command Class:** Database Administration

### Parameters

**:frm=** (optional)

Frame ID. The command displays the FPT table entry for the specified provisioned frame.

**Range:** **cf00**, **ef00**, **ef01**, **ef02**, **ef03**, **ef04**

**cf00**— Control frame

**ef00**— First extension frame

**ef01**— Second extension frame

**ef02**— Third extension frame

**ef03**— Fourth extension frame

**ef04**— Fifth extension frame

### Example

Retrieve all provisioned Frame Power Threshold table entries.

**rtrv-frm-pwr**

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00)..

**rtrv-frm-pwr : frm=cf00**

### Dependencies

The **frm** parameter value must specify a provisioned frame.

The **frm** parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

### Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

**Output**

Retrieve all Frame Power Threshold table entries.

**rtrv-frm-pwr**

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |

| ef00  | 36                     |
| ef01  | 40                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

Retrieve the Frame Power Threshold table entry for the control shelf only.

**rtrv-frm-pwr:frm=cf00**

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |
|-------|------------------------|
| cf00  | 56                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

**rtrv-ftp-serv****Retrieve FTP Server Entry**

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

**Keyword:** rtrv-ftp-serv

**Related Commands:** chg-ftp-serv, dlt-ftp-serv, ent-ftp-serv

**Command Class:** Database Administration

**Parameters**

**:app=** (optional)

Application. This parameter specifies the FTP Client application that interfaces with the FTP Server.

**Range:** meas, user, db, dist

**meas** — Measurements Platform application

**user** — FTP-based Table Retrieve Application (FTRA)

**db** — Database Backup/Restore application

**dist** — EAGLE 5 ISS Software Release Distribution application

**:ipaddr=** (optional)

IP Address of the FTP Server.

**Range:** 4 numbers separated by dots, with each number in the range of 0-255.

**:mode=** (optional)

Full or brief report indicator.

**Range:** full, brief

**Default:** brief

**Example**

```
rtrv-ftp-serv
```

```
rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100
```

```
rtrv-ftp-serv:mode=brief  
rtrv-ftp-serv:app-meas  
rtrv-ftp-serv:ipaddr=1.255.0.100  
rtrv-ftp-serv:mode=full
```

**Dependencies**

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **mode** parameter allows you to display either the full 100 characters of the path string for each entry (**mode=full**), or the first 29 characters of the path string for each entry (**mode=brief**). The default is **brief**.

**Notes**

The LOGIN and PATH are displayed in mixed case.

**Output**

The following examples show output when the EAGLE OA&M IP Security feature is not enabled:

**rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100**

**rtrv-gpl****Retrieve Generic Program Load**

Use this command to show the version numbers of the GPLs stored on each fixed disk or removable cartridge or drive and the system release table stored on each fixed disk

**Keyword:** rtrv-gpl

**Related Commands:** act-gpl, chg-gpl, copy-gpl, rept-stat-gpl

**Command Class:** Program Update

**Parameters**

**NOTE:** As of Release 43.0, the BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1 GPLs are replaced with the BLIXP GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

**:gpl=** (optional)

Generic program load. This parameter specifies the GPL for which to retrieve information.

**Range:** xxxxxxxx

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

**atmansi**—Used by the LIM cards to support the high-speed ATM signaling link feature

**atmh**—Supports functionality for the E5-ATM card. The E5-ATM card runs either the ATMANSI or ATMITU application. The GPL allows the card to support up to 2 signaling links.

**atmitu**—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

**blbepm**—Flash GPL containing the BIOS ROM image on E5-E1T1 and E5-ENET cards

**blbios**—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

**blbsmg**—Flash GPL containing the BIOS ROM image on E5-SM4G cards

**blcpld**—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, and E5-ENET cards that are used for E1 or T1 signaling links.

**bldiag6**—Flash GPL containing the diagnostic code on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blixp**—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ENET, and E5-SM4G cards

**blmcap**—Flash GPL containing a tar image with all code required on E5-MCAP cards

**blvxw6**—Flash GPL containing the VxWorks operating system on E5-E1T1 cards, HC-MIM cards, and E5-ENET cards

**blrom1**—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

**bpdc**—Used to support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design

**bpdc2**—Used to support the flash memory Board PROM for DCM and GPSM boards, revised design

**bphcap**—Used to support Board PROM for HCAP flash memory

**bphcapT**—Supports Board PROM for HCAP-T flash memory

**bphmux**—Supports Board PROM for HMUX flash memory

**bpmp**—Supports Board PROM for MPL flash memory

**bpmpT**—Supports Board PROM for E1/T1 flash memory

**cdu**—Used in the card manufacturing process.

**eoam**—Used by the GPSM-II card for enhanced OAM functions

**eroute**—Used by the STC card for EAGLE 5 Integrated Monitoring Support functions

**erthc**—Used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

**gls**—Used by TSM cards to download gateway screening to LIM cards

**glshe**—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

**hipr**—Communication software used on the High Speed IMT Packet Router (HIPR) card

**hipr2**—Communication software used on the High Speed IMT Packet Router (HIPR2) card

**imt**—Communication processor on the logical processing element (LPE)

**imtpci**—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, and E5-ENET cards

**ipghe**—Used by E5-ENET cards to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes

**ipgwi**—Used by SSEDCCM cards for TCP/IP point-to-point connectivity for ITU point codes

**iplhe**—Used by E5-ENET cards for TCP/IP point-to-point connectivity for both ANSI and ITU point codes

**iplim**—Used by SSEDCCM cards for TCP/IP point-to-point connectivity for ANSI point codes

**iplimi**—Used by SSEDCCM cards for TCP/IP point-to-point connectivity for ITU point codes

**ips**—Used by IPSM cards for the IP User Interface feature

**ipsg**—Used by E5-ENET cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

**ipshe**—Used by E5-IPSM cards to support the IPS application

**mcp**—Used by MCPM cards for the Measurements Platform feature

**oamhe**—Used by E5-MCAP cards for enhanced OAM functions

**pldpme1**—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

**sccphe**—Used by E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

**slanhe**—Used by E5-ENET cards to support the STPLAN application

**ss7he**—Supports the functionality for HC-MIM or E5-E1T1 cards. The HC-MIM and E5-E1T1 cards run the SS7ANSI or CCS7ITU application; the GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

**ss7ipgw**—Used by SSEDCCM cards to support TCP/IP point-to-multipoint connectivity

**ss7ml**—Support functionality for MPL and the E1/T1 MIM cards. MPL cards run the SS7ANSI application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. MPL cards support only the DS0 interface. E1/T1 MIM card runs either the SS7ANSI or CCS7ITU application; the GPL allows the card to support 8 signaling links for E1 and T1 functions.

**utility**—Used by the factory for testing, and when directed by the Customer Care Center

**vcdu**—Used in the card manufacturing process

**vsccp**—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a Service Module card is present, then the GPL processes normal GTT traffic.

**vxwslan**—Used by SSED CM cards to support the STP LAN application

**Default:** Display all

### Example

```
rtrv-gpl
rtrv-gpl:gpl=ipshc
rtrv-gpl:gpl=hpr2
rtrv-gpl:gpl=ipsg
```

### Dependencies

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

The value specified for the **gpl** parameter must be supported. See the **gpl** definition for a list of supported GPLs.

### Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

If no application is specified, the approved and trial versions for all GPLs are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge or drive, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the utility and OAM GPL trial versions on the fixed disk and for all GPLs on the removable when the removable cartridge or drive is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the **rept-stat-gpl** command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

## Output

The following example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

**rtrv-gpl**

e1080402 10-10-10 15:16:33 EST EAGLE 43.0.0

**Legend****GPL**—The type of GPL associated with each card in the display**APPROVED**—The GPL version that is the approved GPL.**CARD**—The card location.**RELEASE**—version number of each GPL that is required to be installed and approved for a specific release of software for the system.**REMOVE TRIAL**—The GPL version that is on the removable cartridge or drive.**TRIAL**—The GPL version that is the trial GPL.

-----GPL is not present at the specified location.

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.**CORRUPTED**—Data audit has determined that the GPL is corrupted.**rtrv-gserv-data****Retrieve G-Port Query for Prepaid Service Data**

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

**Keyword:** rtrv-gserv-data**Related Commands:** dlt-gserv-data, ent-gserv-data**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:display=** (optional)

Use this parameter to display a specified category of entries in the GSERV table.

**Range:** **all, gta, opc, tt**

**all**— Display all entries in the GSERV table.

**gta**— Display all calling party (CgPA) global title addresses in the GSERV table.

**opc**— Display all message transfer part (MTP) originating point codes in the GSERV table.

**tt**— Display all called party (CdPA) translation types in the GSERV table.

**:gta=** (optional)

Global title address. Use this parameter to specify a CgPA global title address.

**Range:** 1-21 digits

**:opc=** (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

**Synonym:** **opca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/open24=** (optional)

Originating point code. Use these parameters to specify MTP originating point codes.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*.

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opcn24=** (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:**     **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:tt=** (optional)

Translation type. Use this parameter to specify a CdPA translation type.

**Range:**     **0-255**

### Example

**rtrv-gserv-data:display=all**

**rtrv-gserv-data:tt=26**

**rtrv-gserv-data:display=opc**

### Dependencies

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The **gta**, **opc/opca/opci/opcn/opcn24**, **tt**, or **display** parameter must be specified.

The **display**, **tt**, **opc**, and **gta** parameters cannot be specified together in the command.

**Output****rtrv-gserv-data:display=all**

```

## rtrv-gsmmap-scrn

## Retrieve GSM MAP Screening Entry

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

**Keyword:** rtrv-gsmmap-scrn

**Related Commands:** chg-gsmmap-scrn, dlt-gsmmap-scrn, ent-gsmmap-scrn

**Command Class:** Database Administration

### Parameters

**:opname=** (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command.

**Range:** ayyyyyy  
Up to 8 alphanumeric characters

**:action=** (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

**Range:** pass, discard, atierr, route, forward, duplicate, dupdisc

**pass**— Route the message as normal to the destination.

**discard**— The MSU is to be discarded.

**atierr**— An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

**route**— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

**forward**— Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

**duplicate**— Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

**dupdisc**— Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

**Default:** Display all screening actions

**:cdsr=** (optional)

CdPA Screening Reference.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

**:cgsr=** (optional)

CgPA Screening Reference.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

**:eaddr=** (optional)

The ending origination address, in association with **npv** and **naiv** for the CGPA address to be screened.

**Range:** 1-15 digits

1-15 hexadecimal digits. Valid digits are **0-9**, **a-f**, **A-F**

**:forbid=** (optional)

The forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter.

**Range:** **all**, **location**, **none**, **state**

**all**—All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.

**location**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **location** as the forbidden parameter value for the entered address/operation code combination. Note: The **location** value is valid only for GSM ATI messages.

**none**—None of the parameters are forbidden. Route the message to its destination.

**state**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **state** as the forbidden parameter value for the entered address/operation code combination. Note: The **state** value is valid only for GSM ATI messages.

**Default:** Display all forbidden parameter values

**:mapset=** (optional)

The MAP set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**:naiv=** (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. When this parameter is specified, the **npv** parameter must be specified.

**Range:** **0-127**, \*

**:npv=** (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

When this parameter is specified, the **naiv** parameter must be specified.

**Range:** **0-15**, \*

**:ri=** (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:** **gt**, **ssn**

**:saddr=** (optional)

The starting origination address. in association with **npv** and **naiv** for the single entry or range of entries of the CGPA address to be screened.

**Range:** 1-15 digits, \*

1-15 hexadecimal digits. Valid digits are **0-9, a-f, and A-F**

**Default:** \*

**:tt=** (optional)

Translation type. This parameter specifies the value that the CdPA translation type is set to as the result of Enhanced GSM Map Screening.

**Range:** **0-255 none**

**Default:** Display all translation types

**Example**

The following example retrieves all CgPA entries for the specified opname:

**rtrv-gsmmap-scrn:opname=e**

The following example retrieves the specified CgPA range entry for the specified opname:

**rtrv-gsmmap-scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000**

The following example retrieves all CdPA entries for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela**

The following example retrieves the specified cdsr entry for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4**

The following examples retrieves the specified RI for the specified opname:

**rtrv-gsmmap-scrn:opname=e:ri=ssn**

**rtrv-gsmmap-scrn:opname=e:ri=gt**

**rtrv-gsmmap-scrn:opname=e:mapset=df1t:ri=gt**

**rtrv-gsmmap-scrn:opname=rr:cgsr=au:cdsr=aj**

**rtrv-gsmmap-scrn:opname=dd:cgsr=ak**

**rtrv-gsmmap-scrn:opname=test4:tt=12**

**Dependencies**

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The **cgsr** parameter can be specified.
- The **cdsr** parameter can be specified.
- The **saddr=\*** parameter can be specified.
- The **saddr** and **eaddr** parameters can contain hexadecimal digits.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

If the **eaddr** parameter is specified, its value must contain the same number of digits as the **saddr** parameter value.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **saddr=\*** parameter is specified, then the **eaddr** parameter cannot be specified.

If the **saddr** parameter is specified, the **cgsr** and **cdsr** parameters cannot be specified.

The **saddr**, **npv**, and **naiv** parameters must be specified together in the command.

If any of the **saddr/eaddr/npv/naiv** and **cdsr** parameters are specified, then the **forbid** and **action** parameters cannot be specified.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code referenced by the **opname** parameter is **71**. The **forbid** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The **action=atierr** parameter cannot be specified unless the operation code referenced by the **opname** parameter is **71**. The **atierr** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If the **cdsr** parameter is specified, then the **cgsr** parameter must be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

## Notes

None

## Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

GSM MAP Screening Table (26 of 4000) is 1% full

;

### Legend

**SINGLE ENTRIES/RANGE ENTRIES**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.

**CgPA**—Calling Party Address entry

**CdPA**—Called Party Address entry

**OPNAME**—User-defined MAP operation code name.

**SADDR**—Start origination address.

**EADDR**—End origination address. This column is displayed for range entries only.

**NPV**—Numbering plan value.

**NAIV**—Nature of address indicator value.

**FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter. (Some values are abbreviated; for example, locat means **location**.)

**ACTION** or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atterr, route, forward, duplicate (dupl), and dupdisc.

**PC** or **PCA**—ANSI Point Code

**PCI**—ITU International Point Code

**PCN**—ITU National Point Code

**PCN24**—24-bit ITU National Point Code

**SSN**—Subsystem Number

**CGSR**—CgPA Screening Reference

**CDSR**—CdPA Screening Reference

**MAPSET**—MAP set

**RI**—Routing Indicator

**TT**—Translation Type

**rtrv-gsms-opcode****Retrieve GSM MAP Screening Operation Code**

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

**Keyword:** rtrv-gsms-opcode

**Related Commands:** chg-gsms-opcode, dlt-gsms-opcode, ent-gsms-opcode

**Command Class:** Database Administration

## Parameters

**:mapset=** (optional)

The MAP set ID.

**Range:** 1-36000 dflt  
dflt—Default MAP set

**:opcode=** (optional)

MAP operation code.

**Range:** 0-255 \*  
**Default:** Display all MAP operation codes

**:opname=** (optional)

The user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

**Range:** ayyyyyy  
Up to 8 alphanumeric characters  
**Default:** Display all operation code names

**:ri=** (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:** gt, ssn

**:tt=** (optional)

Translation type. This parameter specifies the value the CdPA TT is set to as the result of Enhanced GSM Map Screening.

**Range:** 0-255 none  
**Default:** Display all translation types

## Example

```
rtrv-gsms-opcode
rtrv-gsms-opcode:opname=ati
rtrv-gsms-opcode:ri=gt
rtrv-gsms-opcode:ri=ssn
rtrv-gsms-opcode:tt=11
```

## Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The **opcode=\*** can be specified.
- An **opname** parameter can be specified that refers to an **opcode=\*** parameter.

The **opcode** parameter and the **opname** parameter cannot be specified together in the same command.

The specified **opname** parameter must exist in the GSM MAP Op-Code table.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

**Commands****rtrv-gsms-opcode**

The specified MAP set must exist.

**Notes**

None

## Output

**rtrv-gsms-opcode**

## rtrv-gsmssn-scrn

## Retrieve GSM Subsystem Number Screening Entry

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

**Keyword:** rtrv-gsmssn-scrn

**Related Commands:** dlt-gsmssn-scrn, ent-gsmssn-scrn

**Command Class:** Database Administration

**Parameters****:ssn=** (optional)

Subsystem number.

**Range:**     **000-255****Default:**    Display all**:type=** (optional)

Subsystem type.

**Range:**     **orig, dest****orig**—The origination SSN**dest**—The destination SSN**Default:**    Display all**Example****rtrv-gsmssn-scrn****rtrv-gsmssn-scrn:ssn=0:type=dest****Dependencies**

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

If specified, the **ssn/type** parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

SSN ORIG DEST

No matching entries with the specified criteria found.

**Output****rtrv-gsmssn-scrn:ssn=10:type=orig**

```
rlghncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0
SSN  ORIG  DEST
010  Yes   Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

**rtrv-gsmssn-scrn**

```
rlghncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0
SSN  ORIG  DEST
002  Yes   No
010  Yes   Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

**Legend****SSN**—Subsystem number.**ORIG**—Specifies whether the subsystem type is origination (yes) or not (no).**DEST**—Specifies whether the subsystem type is destination (yes) or not (no).

**rtrv-gta****Retrieve Global Title Address Information**

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

**NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.**

**Keyword:** rtrv-gta

**Related Commands:** chg-gta, dlt-gta, ent-gta

**Command Class:** Database Administration

**Parameters**

**NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.**

**:gttsn=** (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:acn=** (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

**Range:** 0-255 \*, none

The *acn* field supports up to 7 subfields separated by a dash (e.g., 1-202-33-104-54-26-007).

\*—any valid value in the ITU TCAP *acn* field in the incoming MSU

none—there is no ITU TCAP *acn* field in the incoming MSU

**:actsn=** (optional)

GTT Action Set Name.

**Range:** ayyyyyyyy, none

1 leading alphabetic character and up to 8 following alphanumeric characters

**:cdssn=** (optional)

Starting CdPA subsystem number.

**Range:** 0-255

**:cggtmod=** (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

**Range:** yes, no

**:cgpc=** (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **cgpc**

**Range:** **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-*\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:cgpci=** (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:cgpcn=** (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:cgpcn24=** (optional)

24-bit ITU national CgPA point code with subfields main signaling *area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:cgssn=** (optional)

Starting CgPA subsystem number.

**Range:**       **0-255**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **dpca**

**Range:**       **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni-\*-\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Point Code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**       **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU destination point code in the format of a 5-digit number(*nnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:ecdssn=** (optional)

Ending CdPA subsystem number.

**Range: 0-255****:ecgssn=** (optional)

Ending CgPA subsystem number.

**Range: 0-255****:egta=** (optional)

End global title address. This parameter specifies the end of a range of global title digits.

**Range: 1-21 digits**

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** The first **gta** entry for the given GTT selector

**:family=** (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

**Range: 0-255 \*, none**

\*—any valid value in the ANSI TCAP *family* field in the incoming MSU

**none**—there is no value in the ANSI TCAP *family* field in the incoming MSU

**:force=** (optional)

Display more than 1000 entries.

**Range: yes, no**

**Default: no**

**:gta=** (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

**Range: 1-21 digits**

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** The first **gta** entry for the given GTT selector

**:gtmodid=** (optional)

Global title modification identifier.

**Range: ayyyyyyyy, none**

1 leading alphabetic character followed by up to 8 alphanumeric characters

**Default:** displays all GT Modification Indicators for the GTA

**:loopset=** (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

**Range:** *ayyyyyyy*, **none**  
 1 alphabetic character followed by up to 7 alphanumeric characters.  
**none**—Translation entries with no association to any loopset.

**:mapset=** (optional)

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

**Range:** **1-36,000 dflt**  
**dflt**—Default MAP set

**Default:** Retrieves GTA information for the default MAP set.

**:mrnset=** (optional)

MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.

**Range:** **1-3000 none, dflt**  
**dflt**—Default MRN set  
**none**—The GTA translation does not participate in any loadsharing.

**:num=** (optional)

Number of entries to display.

**Range:** **1-1000000**  
**Default:** **1**—if **gta** is specified  
**20**—if **gta** is not specified

**:opc=** (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **opca**

**Range:** **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned **on**(*nnn-*

*gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:opcn24=** (optional)

24-bit ITU originating point code with subfields main signaling *area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:opcode=** (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

**Range:** **0-255 \*, none**

\*—any valid value in the TCAP *opcode* field in the incoming MSU

**none**—there is no value in the TCAP *opcode* field in the incoming MSU

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*).

**Synonym:** **pca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pci=** (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:pctype=** (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24, ituis, ituns**

**Default:** Display all point code types

**:pkgtype=** (optional)

Package type. This parameter specifies the ANSI TCAP and ITU TCAP package type.

**Range:** **ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any, bgn, end, cnt, ituabort, ituuni**

**ansiuni**—ANSI unidirectional

**qwp**—Query with Permission

**qwop**—Query with out Permission

**resp**—Response

**cwp**—Conversation with Permission

**cwop**—Conversation with out Permission

**ansiabort**—ANSI abort

**any**—Wildcard value

**bgn**—Begin

**end**—End

**cnt**—Continue

**ituabort**—ITU abort

**ituuni**—ITU unidirectional

ANSI TCAP PKGTYPE—**ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any**

ITU TCAP PKGTYPE—**bgn, ituabort, ituuni, any, end, cnt**

**:ppmeasreqd=** (optional)  
 Per Path Measurement required.  
**Range:**     **yes, no**

**:refgttsn=** (optional)  
 Referred GTT set name. This parameter specifies the GTT Set Name referred in the GT Translation Entry by the **optsn**, **opcsn**, and **cgcnvs** parameters.  
**Range:**     ayyyyyyy  
               1 leading alphabetic and up to 8 following alphanumeric characters.

**:ssn=** (optional)  
 Subsystem number.  
**Range:**     **002-255**  
**Default:**   Display all

**:testmode=** (optional)  
 Test mode. This parameter displays all translation entries that have a specified value of the **testmode** parameter.  
**Range:**     **on, off**  
**Default:**   **off**

**:xlat=** (optional)  
 Translate indicator. This parameter specifies translation actions and routing actions.  
**Range:**     **dpc, dpcngt, dpcssn, none**

### Example

```

rtrv-gta:gttsn=setcdgta:ppmeasreqd=yes
rtrv-gta:gttsn=setcdgta:xlat=none:mrnset=1:mapset=6

```

## Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, and **dpc/dpca/dpci/dpcn/dpcn24** parameters must have valid values within the range for each subfield.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code that is of a different domain than the GTT set specified by the **gttsn** parameter can be specified.

If the **egta** parameter is specified, the **gta** parameter must be specified. The **gta** and **egta** parameters must be the same length, and the value for the **egta** parameter must be greater than the value for the **gta** parameter.

If the specified **num** parameter value is greater than **1000**, the **force=yes** parameter must be specified.

The number of digits in the specified **dgt** parameter must be at least the number of digits provisioned for the GTT set specified by the **gttsn** parameter. If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the **ecgssn/ecdssn** parameter is specified, the **cgssn/cdssn** parameter must be specified, and the **ecgssn/ecdssn** parameter must be greater than the **cgssn/cdssn** parameter.

The OBSR feature must be enabled before the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **cgssn**, or **ecgssn** parameter can be specified.

The range specified by the **cgssn/ecgssn** or the **cdssn/ecdssn** parameters must exist for the specified GTT set.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggtmod** parameter can be specified.

The **xlat=none** parameter must be specified before the **mapset** and **mrnset** parameters can be specified together in the command.

A TOBR quantity feature must be turned on before the **opcode**, **pkgtype**, **acn**, or **family** parameter can be specified.

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

The **acn** and **family** parameters cannot be specified together in the command.

If the **family** parameter is specified, then a value of **ansiuni**, **qwp**, **qwop**, **resp**, **cwp**, **cwop**, **ansiabort**, or **any** must be specified for the **pkgtype** parameter.

If the **acn** parameter is specified, then a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **cnt** must be specified for the **pkgtype** parameter.

If the **pkgtype=ituabort** is specified, then a value of **none** must be specified for the **acn** and **opcode** parameters can. If the **pkgtype=ansiabort** parameter is specified, then a value of **none** must be specified for the **family** and **opcode** parameters.

The **cgpc**, **cgssn**, **gta**, **opc**, **cdssn**, and **opcode** parameters cannot be specified together in the command. If the **cgssn** and **cdssn** parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The value specified by the **actsn** parameter must already exist in the database.

The FLOBR feature must be turned on before the **dp**, **cdssn**, or **ecdssn** parameters can be specified.

The specified point code must be a full point code.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

A value of **none** cannot be specified for the **gttsn** and **refgttsn** parameters.

If the **xlat=none** parameter is specified, then the **pc/pca/pci/pcn/pcn24**, **force**, **ssn**, and **cgt** parameters cannot be specified.

The specified GTT set must have a set type of **opcode** (see the **ent-gttset** command) before the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters can be specified. The specified GTT set must have a set type of **cdssn**, **cgssn**, **cdgta/cgta**, **opc**, or **cgpc** before the **cdssn**, **cgssn**, **gta**, **opc**, or **cgpc** parameter, respectively, can be specified.

If the **cgssn** parameter is specified, then the **ecdssn** parameter cannot be specified. If the **cdssn** parameter is specified, then the **ecgssn** parameter cannot be specified.

If the **opc** or **dpc** parameter is specified, then the **(e)gta**, **(e)cgssn**, **(e)cdssn**, and **opcode** parameters cannot be specified.

## Notes

The percentage full and number of cells used report that is provided with **rtrv-gta** command reflects the total entries in the GTA table without regard to the selector specified.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the **rtrv-gta** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if **gta=8005556666** is specified, the six-digit GTT set **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

## Output

**NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.**

Retrieve all GTAs for the specified GTT Set:

**rtrv-gta:gttsn=t800:num=65535:force=yes**

### **Legend**

**GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**NETDOM**—The network domain.

**NDGT**—The number of digits required for GTAs associated with this set.

**START GTA**—The start global title address.

**END GTA**—The end global title address.

**XLAT**—The translate indicator.

**RI**—The routing indicator.

**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Translated point code.

**SSN**—The translated subsystem number.

**CCGT**—The cancel called global title indicator.

**MRN**—Mated Relay Node

**MRNSET**—MRN set ID

**MAPSET**—MAP set ID

**CGGTMOD**—Calling Party Global Title Modification Indicator

**ACTSN**—GTT Action Set Name

**GTMODID**—Global Title Modification Identifier

**PPMEASREQD**—Per Path Measurement Required

**OPCODE**—TCAP opcode field

**ACN**—Application context name. ITU TCAP *acn* field.

**PKGTYPE**—TCAP package type

**FAMILY**—ANSI TCAP *family* field

**TESTMODE**—Invokes a Test Tool to debug the FLOBR/TOBR rules

**DPC**—Destination point code

**CGPC**—CgPa point code

**OPC**—Originating point code

## **rtrv-gtcnv**

## **Retrieve Global Title Conversion**

Use this command to display entries in the Default Global Title Conversion table.

**Keyword:** **rtrv-gtcnv**

**Related Commands:** **chg-gtcnv, dlt-gtcnv, ent-gtcnv**

**Command Class:** Database Administration

### **Parameters**

**:dir=** (optional)

Direction of conversion.

**Range:** **atoi, itoa, both**

**atoi**—ANSI to ITU conversion

**itoa**—ITU to ANSI conversion

**both**—Conversion in both directions

**:gtixlat=** (optional)

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

**Range:**     **22, 24**

**22**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

**24**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

**:nai=** (optional)

Nature of address indicator.

**Range:**     **0-63 \***

**:np=** (optional)

Numbering plan.

**Range:**     **0-15 \***

**:tta=** (optional)

ANSI translation type.

**Range:**     **0-255 \***

**:tti=** (optional)

ITU translation type.

**Range:**     **0-255 \***

### Example

**rtrv-gtcnv**

### Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the command can be entered.

### Notes

None

**Output**

The following example displays output containing decimal global title digits.

**rtrv-gtcnv**

```
tekelecstp 06-11-07 13:44:12 EST EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi   22    10   5   --- ---  10  pfx  123

GTCNV      table is (1 of 1000) 1% full.
```

;

The following example shows output containing hexadecimal global title digits.

**rtrv-gtcnv**

```
tekelecstp 06-11-07 11:52:58 EST EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi   22    1   3   --- ---  ---  pfx  abcdef0123456789abcdf
ittoa   24    5   6   2   1   ---  sfx  abcdef0123456789abcef

GTCNV      table is (2 of 1000) 1% full.
```

;

**Legend**

**DIR**—The direction of the translation: ANSI to ITU or ITU to ANSI.

**GTIXLAT**—The GTI translation.

**TTA**—The ANSI translation type

**TTI**—The ITU translation type

**NP**—The numbering plan

**NAI**—The nature of address indicator

**DEL**—The deletion status, listing the number of incoming MSUs that will be deleted prior to translation.

**POS**—The prefix or suffix.

**ADD**—The global title address

**rtrv-gtmod****Retrieve GT Modification Data**

Use this command to display entries from the GTMOD table. A GTMOD entry consists of a GTMOD ID and GTMOD specific data.

**Keyword:** rtrv-gtmod

**Related Commands:** chg-gtmod, dlt-gtmod, ent-gtmod

**Command Class:** Database Administration

**Parameters**

**NOTE:** Definitions for the feature options specified by the on and off parameters are located in the Notes section.

**:cgpassn=** (optional)

Calling Party Subsystem number. This parameter specifies the calling party subsystem address that receives the message.

**Range:** 002-255 none

**:gtmodid=** (optional)

GT Modification Identifier.

**Range:**        *ayyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**:ngti=** (optional)

New Global Title Indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

**Range:**        **2, 4, none**

**:nnai=** (optional)

New nature of address indicator. This parameter specifies the value that is used to replace the received NNAI.

**Range:**        **0-127, none**

**:nnp=** (optional)

New numbering plan. This parameter specifies the value that is used to replace the received numbering plan.

**Range:**        **0-15, none**

**:npdd=** (optional)

Number of prefix digits to be deleted. This parameter specifies the number of digits to be deleted from the prefix of the received GT address.

**Range:**        **1-21, none**

**:npds=** (optional)

New prefix digits string. This parameter specifies the digits to be prefixed to the received GT address.

**Range:**        1-21 digits, **none**

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:**      Display all

**:nsdd=** (optional)

Number of suffix digits to be deleted. This parameter specifies the number of digits to be deleted from the suffix of the received GT address.

**Range:**        **1-21, none**

**:nsds=** (optional)

New suffix digits string. This parameter specifies the digits to be suffixed to the received GT address.

**Range:**        1-21 digits, **none**

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**:ntt=** (optional)

New Translation Type. This parameter specifies the value that is used to replace the received Translation Type.

**Range:**        **0-255, none**

**:off=** (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:**     **gt0fill**

**:on=** (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:**     **gt0fill, refcnt**

**:precd=** (optional)

Precedence. This parameter specifies whether the prefix or suffix takes precedence when modifying the received GT address

**Range:**     **pfx, sfx**

### Example

```
rtrv-gtmod:gtmodid=id2
rtrv-gtmod:npdd=5:on=refcnt
rtrv-gtmod:nsdd=10:precd=sfx:nnai=2:nnp=5
rtrv-gtmod:ngti=4:on=gt0fill:cgpasn=12
```

### Dependencies

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **npds** and **nsds** parameters.

The **gtmodid=none** parameter cannot be specified.

If the **gtmodid** parameter is specified, then the **on=refcnt** parameter is the only other parameter that can be specified.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

The same value cannot be specified for the **on** and **off** parameters.

### Notes

#### *on/off options*

- **gt0fill**—GT zero fill. Specifies whether the last 0 of the GTA is treated as a valid digit (OFF) or as filler (ON) during GT Modification for the gti(x)=2 to gti(x)=4 scenario.
- **refcnt**—Reference count. Specifies the number of entries in the GTT Table that references the GTMOD entry. This option is ON only.

**Output****rtrv-gtmod**

**Legend**

**AMGTT**—Advanced GT Modification

**GT0FILL**—Indicates whether a trailing 0 in the GTA is considered as a valid digit or a filler

**NGTI**—New Global Title Indicator

**NNP**—New Numbering Plan

**NNAI**—New Nature of Address Indicator

**NPDD**—New Prefix Digits to be Deleted

**NPDS**—New Prefix Digits String

**NSDD**—New Suffix Digits to be Deleted

**NSDS**—New Suffix Digits String

**PC**—Point Code

**rtrv-gtt****Retrieve Global Title Translation**

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the **type** parameter specified.

**NOTE:** If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

**Keyword:** rtrv-gtt

**Related Commands:** chg-gtt, dlt-gtt, ent-gtt

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cggtmod=** (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

**Range:** yes, no

**:egta=** (optional)

End global title address. This parameter specifies the end of a range of global title digits.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** If the **gta** parameter is specified, the **egta** parameter default value is the specified **gta** parameter value.

**:force=** (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

**Range:** yes, no

**Default:** no

**:gta=** (optional)

Global title start address. This parameter specifies the beginning of a range of global title digits.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** The first GTT entry for the given translation type.

**:gtmodid=** (optional)

Global Title Modification Identifier.

**Range:** ayyyyyyyy, none

1 leading alphabetic character followed by up to 8 alphanumeric characters

**:loopset=** (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

**Range:** ayyyyyyy, none

1 alphabetic character followed by up to 7 alphanumeric characters.

**none**—Translation entries with no association to any loopset.

**:mapset=** (optional)

MAP set ID.

**Range:**     **1-36000 dflt**  
                  **dflt**—Default MAP set

**:mrnset=** (optional)

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

**Range:**     **1-3000 none, dflt**  
                  **dflt**—Default MRN set  
                  **none**—The GTA translation does not participate in any loadsharing.

**:num=** (optional)

This parameter specifies the number of entries to be shown.

**Range:**     **1-1000000**  
                  **1-1000**—If **force=yes** is not specified  
                  **1-1000000**—If **force=yes** is specified  
**Default:**   **1** (if **gta** is specified),  
                  **20** (if **gta** is not specified).

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **pca**

**Range:**     **p-, 000-255**  
                  Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).  
                  *prefix*—**p-**  
                  When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.  
                  When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.  
                  When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.  
                  The point code **000-000-000** is not a valid point code.

**Default:**   Display all

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**     **s-, p-, ps-, 0-255**  
                  Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).  
                  *prefix*—**s-, p-, ps-**  
                  *zone*—**0-7**  
                  *area*—**000-255**  
                  *id*—**0-7**  
                  The point code **0-000-0** is not a valid point code.  
**Default:**   Display all

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**Default:** Display all

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*) (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** Display all

**:pctype=** (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24, ituis, ituns**

**Default:** Display all

**:ssn=** (optional)

Subsystem number. This parameter specifies the subsystem address that is to receive the message.

**Range:** **002-255**

**Default:** Display all

**:ttn=** (optional)

Translation name.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

**Default:** None given

**:type/typea/typei/typen/typen24/typeis/typens=** (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

**Range:** 0-255

**Default:** None given

### Example

```
rtrv-gtt:type=5:ttn=lidb1:gta=919555
rtrv-gtt:type=5:gta=919555
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
rtrv-gtt:typen24=0
rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui
rtrv-gtt:type=55:pctype=itun
rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:ttn=tbla
rtrv-gtt:ttn=tbla:mapset=1
rtrv-gtt:type=4:cggmod=yes
rtrv-gtt:ttn=ituset:gtmodid=set1
rtrv-gtt:typens=5:gta=123456
rtrv-gtt:typeis=5:gta=123456
```

### Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The value of the **tt** parameter must exist in the Translation Type table.

The value specified for the **tt** parameter must correspond to a value of the **type/typea/typei/typen/typen24/typeis/typens** parameter (see the **ent/chg-gtt** command).

If the value of the **num** parameter exceeds **1000**, then the **force=yes** parameter must be specified.

Either the **type** parameter or the **ttn** parameter must be specified.

The value of the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

If the **egta** parameter is specified, the **gta** parameter must be specified.

If the system is defined as an ANSI system, the **pc/pca** parameter must be specified as a valid ANSI point code.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the **tt** parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The value of the **num** parameter must not exceed the maximum table size.

The length of the **egta** parameter must equal the length of the **gta** parameter.

The value of the **egta** parameter must be greater than the value of the **gta** parameter.

If the **tt** parameter is not specified, then the value of the **ttn** parameter must match the value of a **tt** parameter in the STP database.

The value of the **gta** parameter must exist.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

The **mapset** parameter and the **mrnset** parameter cannot be specified together in the command.

The GTT set associated with the translation type specified by the **ttn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The value specified for the **gtmodid** parameter must already exist in the GTMOD table

The **tt=none** parameter cannot be specified.

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command).

## Notes

If the **rtrv-gtt** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if **gta=8005556666** is specified, the six-digit translation type **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If you do not know either the translation type or the translation type name, use the **rtrv-tt** command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The number of entries to be shown (the **num** parameter) can be specified for any valid combination of parameters.

If the **gta** parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the **num** and **gta** parameters are not specified, then up to 20 entries are shown.

If the **gta** parameter is specified, but the **num** parameter is not specified, then only one entry is shown.

If the **num** parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the **num** parameter.

If the **gta** and **egta** parameters are specified, then the entry that matches the **gta** parameter, or is the nearest entry below the **gta** parameter, is the first entry shown for the specified range.

The **rtrv-gtt** command can retrieve only CdGTA entries that were provisioned through GTA commands when the OBSR or FLOBR feature is turned on.

## Output

**rtrv-gtt:type=10:num=65535:force=yes**

**Legend**

**TYPE/TYPEA/TYPEI/TYPEN/TYPEN24/TYPEIS/TYPENS**—Translation type

**TTN**—Translation name

**NDGT**—Number of digits

**GTT TABLE IS 10% FULL**—Relative size of the GTT table

**X OF Y**—Number of entries in the table (x) and the maximum number of entries configured for the table (y)

**START GTA**—Global title start address

**END GTA**—Global title end address

**XLAT**—Translate indicator

**RI**—Route indicator

**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Point code

**SSN**—Subsystem number

**MRN**—Mated Relay Node

**MRNSET**—MRN set ID

**MAPSET**—MAP set ID

**CGGTMOD**—Calling Party GT Modification Indicator

**GTMODID**—Global Title Modification Identifier

## rtrv-gttact

## Retrieve a GTT Action Entry

Use this command to display entries from the Global Title Translations (GTT) Action table.

**Keyword:** rtrv-gttact

**Related Commands:** chg-gttact, dlt-gttact, ent-gttact

**Command Class:** Database Administration

### Parameters

**NOTE:** Definitions for the feature options specified by the on and off parameters are located in the Notes section.

**:act=** (optional)

Action. This parameter specifies the action applied to the message.

**Range:** disc, dup, tcaperr, udts, fwd

**disc**—discard message with no return error

**dup**—route a copy of the message to a specified duplicate node

**tcaperr**—discard message that has a specified TCAP error

**udts**—discard message and send udts/xudts

**fwd**—route the original message to a specified forward node instead of the destination indicated by the GTT/DB data

**:actid=** (optional)

GTT Action Id.

**Range:** ayyyyyyyy

1 leading alphabetic followed by up to 8 alphanumeric characters

**:atcaperr=** (optional)

ANSI TCAP Error Cause. This parameter specifies the reason for discarding the message containing the ANSI TCAP portion that is associated with the TCAPERR GTT Action.

**Range:** 0-255

**:cdgtmodid=** (optional)

Called party global title modification identifier.

**Range:** ayyyyyyyy, none

1 leading alphabetic character followed by up to 8 alphanumeric characters

**:cggmtmodid=** (optional)

Calling party global title modification identifier.

**Range:** ayyyyyyyy, none

1 leading alphabetic character followed by up to 8 alphanumeric characters

**:cgpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** cgpc

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:cgpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:cgpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:cgpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:cgpcogmsg=** (optional)

This parameter specifies the data that is used as the Calling Party Point Code in the outgoing message.

**Range:** **dflt, cgpcicmsg, opcicmsg, provegpc**

**dflt**—Default. The standard Global Title Translation process provides the CgPA PC.

**cgpcicmsg**—CgPA PC data from the incoming MSU

**opcicmsg**—OPC data from the incoming MSU

**provegpc**— provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24 data in the GTT Action

**:defactid=** (optional)

Default Action ID. This parameter specifies the Action Id that is associated with the Forward action.

**Range:** **disc, udts, tcaperr, fallback**

**disc**— GTT Action ID of type **disc**

**udts**— GTT Action ID of type **udts**

**tcaperr**— GTT Action ID of type **tcaperr**

**fallback**— The MSU is routed using routing data in the incoming MSU.

**:itcaperr=** (optional)

ITU TCAP Error Cause. This parameter specifies the reason for discarding the message containing the ITU TCAP portion that is associated with the TCAPERR GTT Action.

**Range:** **0-255**

**:loopset=** (optional)

SCCP loopset name. This parameter retrieves action entries that are associated with the specified loopset.

**Range:** **ayyyyyyy, none**

One alphabetic character followed by up to 7 alphanumeric characters.

**none**—Action entries with no association to any loopset.

**:mapset=** (optional)

MAP Set ID. This parameter specifies the Mated Application Set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**:mrnset=** (optional)

MRN Set ID. This parameter specifies the Mated Relay Node Set ID.

**Range:** **1-3000 none, dflt**

**dflt**—Default MRN Set ID

**none**—The GTT Action table entry with no association to any mrnset.

**:off=** (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:** **uimreqd, useicmsg**

**:on=** (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:** **uimreqd, useicmsg, refcnt**

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The value "none" indicates that the Origin Point Code (OPC) field in the message will be used in place of CGPC.

**Synonym:** **pca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ri=** (optional)

Routing indicator.

**Range:** **gt, ssn**

**:ssn=** (optional)

Subsystem number.

**Range:** **2-255, none**

**:udtserr=** (optional)

UDTS error cause. This parameter specifies the reason for discarding the message that is associated with UDTS GTT Action.

**Range:** 0-255

### Example

```
rtrv-gttact:actid=disc1
rtrv-gttact:cggtmodid=idda1
rtrv-gttact:cggtmodid=cggt1:cdgtmodid=cdgt2
rtrv-gttact:defactid=fallback
```

### Dependencies

The specified GTT Action entry must already exist in the database.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified.

The value specified for the **pc/pci/pcn/pcn24** and **cgpc/cgpci/cgpcn/cgpcn24** parameters must be a full point code and must have valid value within the range for each subfield.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

The **mapset** and **mrnset** parameters cannot be specified together in the command.

A value of **none** or **fallback** cannot be specified for the **actid** parameter.

The **act=tcaperr** parameter must be specified before the **atcaperr** or **itcaperr** parameter can be specified. The **act=udts** parameter must be specified before the **udtserr** parameter can be specified.

A value of **disc**, **udts**, or **tcaperr** must be specified for the **act** parameter before a value of **uimreqd** can be specified for the **on** or **off** parameter.

A value of **dup** or **fwd** must be specified for the **act** parameter before the **pc**, **ssn**, **ri**, **mrnset**, **mapset**, **loopset**, **cgpc**, **cgpcogmsg**, **cggtmodid** or **cdgtmodid** parameters can be specified and before a value of **useicmsg** can be specified for the **on** or **off** parameter. The **act=fwd** parameter must be specified before the **defactid** parameter can be specified. The **pc**, **ssn**, **ri**, **mrnset**, **mapset**, **loopset**, **cgpc**, **cgpcogmsg**, and **defactid** parameters cannot be specified in the same command as the **atcaperr**, **itcaperr**, or **udtserr** parameters. Values of **useicmsg** and **uimreqd** cannot be specified for the **on** or **off** parameters in the same command. If the **actid** parameter is specified, then the **ri**, **pc**, **ssn**, **mrnset**, **mapset**, **loopset**, **on**, **off**, **atcaperr**, **itcaperr**, **udtserr**, **act**, **cgpc**, **cgpcogmsg**, **defactid**, **cggtmodid**, and **cdgtmodid** parameters cannot be specified. The **act=tcaperr** parameter must be specified before the **atcaperr** or **itcaperr** parameter can be specified. The **act=udts** parameter must be specified before the **udtserr** parameter can be specified. The **udtserr** parameter and the **atcaperr** or **itcaperr** parameters cannot be specified in the same command. The **pc**, **ri**, **ssn**, **mrnset**, **mapset**, **loopset**, **on/off=useicmsg**, **cdgtmodid**, **defactid**, **cgpc**, **cgpcogmsg**, and **cggtmodid** parameters cannot be specified in the same command with the **on/off=uimreqd**, **atcaperr**, **itcaperr**, and **udtserr** parameters.

The point code specified for the **pc/pci/pcn/pcn24** and **cgpc/cgpci/cgpcn/cgpcn24** parameters must be a full point code.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value specified for the **loopset** parameter must already exist in the database.

The value specified for the **cdgtmodid** or **cggtmodid** parameter must already exist in the GTMOD table.

The **defactid=none** parameter cannot be specified.

The value specified for the **pc/pca/pci/pcn/pcn24** and **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameters must have the same domain.

The same value cannot be specified for the **on** and **off** parameters.

The specified MAP set must already exist in the MAP table.

The specified MRN set must already exist in the MRN table.

## Notes

### *on/off options*

- **uimreqd**—UIM required. Specifies whether a UIM should be generated.
- **useicmsg**—Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).

## Output

**rtrv-gttact:on=refcnt**

;

**rtrv-gttapath****Retrieve GTT Action Path Entry**

Use this command to retrieve a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

**Keyword:** rtrv-gttapath

**Related Commands:** chg-gttapath, dlt-gttapath, ent-gttapath

**Command Class:** Database Administration

## Parameters

**:acn=** (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

**Range:** 0-255 \*, none

none—there is no ITU TCAP *acn* field in the incoming MSU

**:cdgta=** (optional)

Called Party Global Title Address.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**:cdgttsn=** (optional)

GTT set name (CDPA type).

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:cggtta=** (optional)

Calling Party Global Title Address.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**:cggttsn=** (optional)

GTT set name (CGPA type).

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:family=** (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

**Range:** 0-255 \*, none

none—there is no value in the ANSI TCAP *family* field in the incoming MSU

**:gttpn=** (optional)

GTT Path name.

**Range:** ayyyy

1 leading alphabetic character and up to 4 following alphanumeric characters.

**:opcode=** (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

**Range:** 0-255 \*, none

none—there is no value in the TCAP *opcode* field in the incoming MSU

**:opgttsn=** (optional)

GTT set name (Opcode type).

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:pkgtype=** (optional)

This parameter specifies the ANSI and ITU TCAP package type.

**Range:**     **ituuni, qwp, qwop, resp, cwp, cwop, any, bgn, end, cnt, ituabort, ansiabort, ansiuni**

**ituuni** — ITU unidirectional

**qwp** — Query with Permission

**qwop** — Query without Permission

**resp** — Response

**cwp** — Conversation with Permission

**cwop** — Conversation without Permission

**any** — Wildcard value

**bgn** — Begin

**end** — End

**cnt** — Continue

**ituabort** — ITU abort

**ansiabort** — ANSI abort

**ansiuni** — ANSI unidirectional

ANSI TCAP Package Types—**ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any**

ITU TCAP Package Types—**bgn, ituabort, ituuni, any, end, cnt**

### Example

**rtrv-**

**gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2:cggtsn**  
**n=cgsn3:cggta=987654:cdgttsn=cdsn1:cdgta=123456**

**rtrv-gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2**

**rtrv-gttapath**

### Dependencies

The **acn** and **family** parameters cannot be specified together in the command.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

A value of **none** cannot be specified for the **opgttsn**, **cggtsn**, and **cdgttsn** parameter(s).

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

If the **family** parameter is specified, then a value of **ansiuni**, **qwp**, **qwop**, **resp**, **cwp**, **cwop**, **ansiabort**, or **any** must be specified for the **pkgtype** parameter.

If the **acn** parameter is specified, then a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **cnt** must be specified for the **pkgtype** parameter.

If the **pkgtype=ituabort**, then a value of **none** must be specified for the **acn** and **opcode** parameters. If the **pkgtype=ansiabort** is specified then a value of **none** must be specified for the **family** and **opcode** parameters.

If the **family** and **opcode** parameters are specified in the command, then either both parameters must have a value of **none** or neither parameter can have a value of **none**.

At least one GTT set-value combination must be specified.

The value specified for the **gttpn** parameter must already exist in the database.

Both Path name and set-value combination(s) cannot be specified together.

The value specified for the **gttpn** parameter cannot be a reserved word.

## Output

GTT Action Path table is (3 of 10000) 1% full

Command Completed.

;

**rtrv-gttaset****Retrieve a GTT Action Set**

Use this command to display entries from the Global Title Translations (GTT) Action Set table.

**Keyword:** rtrv-gttaset

**Related Commands:** chg-gttaset, dlt-gttaset, ent-gttaset

**Command Class:** Database Administration

### Parameters

**NOTE: Definitions for the feature options specified by th~~on~~ and off parameters are located in the Notes section.**

**:actid1=** (optional)

GTT Action ID 1. This parameter specifies the first action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actid2=** (optional)

GTT Action ID 2. This parameter specifies the second action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actid3=** (optional)

GTT Action ID 3. This parameter specifies the third action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actid4=** (optional)

GTT Action ID 4. This parameter specifies the fourth action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actid5=** (optional)

GTT Action ID 5. This parameter specifies the fifth action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actid6=** (optional)

GTT Action ID 6. This parameter specifies the sixth action ID associated with the GTT action set.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:actsn=** (optional)

GTT Action Set Name.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

**:off=** (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:** testmode

**:on=** (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:** testmode, refcnt

**Example**

```
rtrv-gttaset:actid1=disc1  
rtrv-gttaset:actsn=asetdisc1:on=refcnt  
rtrv-gttaset:on=testmode
```

**Dependencies**

The specified GTT Action Set must already exist in the database.

The **actsn=none** parameter cannot be specified.

If the **actsn** parameter is specified, then the **on=refcnt** parameter is the only other parameter that can be specified.

A value of **fallback** or **none** cannot be specified for the **actid1/actid2/actid3/actid4/actid5/actid6** parameters.

The EGTT feature must be on before this command can be entered.

The action ID specified by the **actid1/actid2/actid3/actid4/actid5/actid6** parameter(s) must already exist in the GTT Action table.

The **actid1/actid2/actid3/actid4/actid5/actid6** parameters must each specify a unique GTT Action ID in the command.

Only one Action ID with an action of **disc**, **udts**, or **tcaperr** can be specified. If an Action ID with an act of **fw** is specified, then no other Action ID in the Action Set with an act of **disc**, **udts**, **tcaperr**, or **fw** can be specified. If 5 Action IDs with an act of **dup** are specified then the remaining Action ID with an act of **dup** cannot be specified.

The same value cannot be specified for the **on** and **off** parameters.

**Notes*****on/off options***

- **testmode**—Invokes a field-safe Test Tool in order to debug the GTT Action Set rules.
- **refcnt**—Reference Count. Displays the number of GTTs that reference the GTT Action Set. This feature option is ON only.

**Output****rtrv-gttset**

GTT Action Set table is (5 of 20000) 1% full

;

**rtrv-gttset****Retrieve GTT Selectors**

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

**NOTE:** If the EGGT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGGT feature is on.

**Keyword:** rtrv-gttset

**Related Commands:** chg-gttset, dlt-gttset, ent-gttset

**Command Class:** Database Administration

**Parameters**

**NOTE:** The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and the nai parameter values.

**NOTE:** The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-8 shows the mapping between the npv and the np parameter values.

**:cdgtasn=** (optional)

CdPA GTA GTT set name.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cdgttsn=** (optional)

CdPA GTT set.

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:cggtasn=** (optional)

CgPA GTA GTT set name.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cggttsn=** (optional)

CgPA GTT set.

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**:cgpcsn=** (optional)

CgPA PC GTT set name.

**Range:** ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cgssn=** (optional)

CgPA subsystem number.

**Range:** 0-255

**:eaglegen=** (optional)

This parameter specifies whether the selector is used by EAGLE 5 ISS generated messages.

**Range:** yes

yes— The selector is used by EAGLE 5 ISS generated messages

**:gti/gtia/gtii/gtin/gtin24/gtiis/gtins=** (optional)

Global title indicator.

For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), **gtin24** (24-bit ITU national), **gtiis** (ITU international spare), and **gtins** (ITU national spare).

For the selector commands, **gti** and **gtia** are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry with **gtin=2** and **tt=4** can be specified.

**Range:** 0, 2, 4

Supported value for ANSI: **gti=0, 2** and **gtia=0, 2**

Supported values for ITU: **gtii/gtin/gtin24/gtiis/gtins=0, 2, 4**

**Default:** display all **gti(x)** parameter values

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:** ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

**Default:** Display all

**:lsn=** (optional)

Linkset name.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:nai=** (optional)  
 Nature of Address indicator.  
**Range:**     **sub, rsvd, natl, intl, dflt**  
**Default:**    Display all

**:naiv=** (optional)  
 Nature of Address indicator value.  
**Range:**     **0-127**  
**Default:**    Display all

**:np=** (optional)  
 Numbering Plan.  
**Range:**     **e164, generic, x121, f69, e210, e212, e214, private, dflt**  
**Default:**    Display all

**:npv=** (optional)  
 Numbering Plan value.  
**Range:**     **0-15**  
**Default:**    Display all

**:ovrlapd=** (optional)  
 Overlapped GTT Selectors. This parameter displays the overlapped GTT selectors.  
**Range:**     **yes**  
**Default:**    **no**

**:selid=** (optional)  
 Selector ID.  
**Range:**     **0-65534 none**

**:tt=** (optional)  
 Translation type.  
**Range:**     **0-255**  
**Default:**    Display all

### Example

```

rtrv-gtttsel
rtrv-gtttsel:gtii=2
rtrv-gtttsel:tt=0:np=e164
rtrv-gtttsel:gti=2:tt=10
rtrv-gtttsel:gttsn=setint000
rtrv-
gttsel:gtia=2:tt=21:cggttsn=setcgpc:cdgttsn=setcdgta:cgssn=20:sel
id=1:lsn=ls10
rtrv-gtttsel:gtia=2:tt=2:lsn=ls1010
rtrv-gtttsel:gtia=2:eaglegen=yes
rtrv-gtttsel:cdgttsn=setdpc
rtrv-gtttsel:ovrlapd=yes

```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

Only entries that exactly match all specified parameters will be displayed. If no match is found, the following message is displayed in the Scroll Area of the terminal:

No GTT Selectors matching the specified criteria were found.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The **gti/gtia=4**, **gti(x)=1**, and **gti(x)=3** parameters cannot be specified.

If the **gti/gtia/gtii/gtin/gtin24/gtiis/gtins=2** parameter is specified, then the **np/npv** and **nai/naiv** parameters cannot be specified.

If a full GTT selector key is specified by the **gti(x)**, **tt**, **np/npv**, **nai/naiv**, **cgssn**, **selid**, and **lsn** parameters, then the GTT set specified by the **cgpcsn**, **cggtasn**, or **cggttsn** parameters cannot be specified.

The OBSR feature must be enabled before the **cggtasn**, **cgpcsn**, **cgssn**, or **cdgtasn** parameters can be specified.

The GTT set specified by the **cggtasn** or **cgpcsn** parameter must exist in the database before it is assigned to a GTT selector.

The set type of the **cggtasn** parameter or the **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggtas**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The FLOBR feature must be turned on before the **lsn**, **eaglelegn**, **cdgttsn**, or **cggttsn** parameter can be specified.

If the **eaglelegn=yes** parameter is specified, then the **lsn**, **selid**, **gttsn**, **cgssn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

The value specified for the **cdgtasn** or **gttsn** parameter must match the name of an existing GTT set.

The GTT set specified by the **cdgtasn** or **gttsn** parameter must have a set type of **cdgtas** (see the **ent-gttset** command).

If the OBSR feature is enabled or the FLOBR feature is turned on, then the **gttsn** parameter cannot be specified.

The linkset specified by the **lsn** parameter must already exist in the Linkset table.

The CdPA GTT Set specified by the **gttsn**, **cdgtasn**, or **cdgttsn** parameter must already exist in the GTT Set table.

A value of **dflt** must be specified for the **np** and **nai** parameters, or neither value can be **dflt**.

If a full GTT selector key is specified by the **gti(x)**, **tt**, **np/npv**, **nai/naiv**, **selid**, and **lsn** parameters, then the GTT set specified by the **gttsn**, **cdgtasn**, or **cdgttsn** parameters cannot be specified.

If the **lsn** parameter is specified, then the **cdgttsn** or **cggttsn** parameter must be specified.

The **cggtasn**, **cgpcsn**, and **cggttsn** parameters cannot be specified together in the command.

The **gttsn**, **cdgtasn**, and **cdgttsn** parameters cannot be specified together in the command.

If the **gttsn**, **cdgttsn**, or **cdgtasn** parameter is specified, then the **cgssn** parameter cannot be specified.

If the **eaglelegn=yes** parameter is specified, then the **lsn**, **selid**, **gttsn**, **cdgtasn**, **cgssn**, **cggttsn**, **cggtasn**, or **cgpcsn** parameters cannot be specified.

If the FLOBR feature is turned on, then the **cdgtasn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

If a value of **dflt** is specified for the **np** and **nai** parameters, then the **cggtasn**, **cgpcsn**, **cgssn**, **selid**, **lsn**, **cggttsn**, and **eaglelegn** parameters cannot be specified.

A value of **none** cannot be specified for the **gttsn**, **cdgtasn**, **cdgttsn**, **cggttsn**, **cggtasn**, and **cgpcsn** parameters.

If the **gti(x)=0** parameter is specified, then the **eaglegen**, **tt**, **np/npv**, and **nai/naiv** parameters cannot be specified.

## Notes

## Output

Retrieve all GTT selectors when EGTT is ON:

**rtrv-gttset**

**Legend**

**GTI/GTIA/GTII/GTIN/GTIN24**—Global title indicator

**TT**—Translation type

**NP**—Number plan

**NAI**—Nature of address indicator

**GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**rtrv-gttset**

**Retrieve GTT Set**

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

**NOTE:** If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

**Keyword:** rtrv-gttset

**Related Commands:** chg-gttset, dlt-gttset, ent-gttset

**Command Class:** Database Administration

**Parameters**

**:actsn=** (optional)

GTT Action Set Name.

**Range:** ayyyyyyyy, none

1 leading alphabetic and up to 8 following alphanumeric characters.

**:gtmodid=** (optional)

Global title modification identifier.

**Range:** *aaaaaaaa*, **none**

**Default:** Display all

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:** *aaaaaaaa*

1 leading alphabetic and up to 8 following alphanumeric characters.

**:netdom=** (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

**Range:** **ansi**, **itu**, **cross**

**Default:** Display all

**:refcnt=** (optional)

GTT set reference count. This parameter gives the count of GTT set being referred in GTT Selectors, GTA Translations, BPARTYGTTSN and IS41SMSCGTTSN options in GSMSMSOPTS table and BPARTYGTTSN option in IS41SMSOPTS table.

**Range:** **yes**

**:setidx=** (optional)

GTT set index. This parameter allows GTT set information to be retrieved based on the GTT index number.

**Range:** **0-1999**

**:settype=** (optional)

GTT set type.

**Range:** **cdgta**, **cggta**, **cgpc**, **cgssn**, **opc**, **cdssn**, **opcode**, **dpc**

**Default:** Display all

### Example

```
rtrv-gttset
rtrv-gttset:netdom=ansi
rtrv-gttset:gttsn=t800
rtrv-gttset:netdom=ansi:settype=cdssn
rtrv-gttset:settype=opcode
rtrv-gttset:setidx=1
rtrv-gttset:actsn=actdisc1
rtrv-gttset:refcnt=yes
rtrv-gttset:gtmodid=set1
```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

If the **gttsn** parameter is specified, it cannot have a value of **none**, and must match an existing **gttsn**.

If the **netdom** parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

No GTT Sets matching the specified criteria were found.

The **netdom=cross** parameter is valid only if the **settype=cdgta** parameter is specified.

If the **gttsn** parameter is specified then the **settype**, **netdom**, **actsn**, and **gtmodid** parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the **settype** parameter is **cggta**, **cgssn**, **opc**, or **cgpc**.

The ANSI/ITU SCCP Conversion feature must be enabled before the **netdom=cross** parameter can be specified.

The TOBR feature must be turned on before the **opcode=settype** parameter can be specified.

If the **setidx** parameter is specified, then no other parameter can be specified in the command.

The FLOBR feature must be turned on before the value of **cdssn** or **dpc** can be specified for the **settype** parameter.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

### Notes

When the Origin-based SCCP Routing feature is turned on, the **settype** parameter is displayed regardless of feature key status. If the feature key is not enabled, the **settype=cdgta** parameter (default value) is displayed.

**Output**

Retrieve all GTT sets:

**rtrv-gttset**

```
tekelecstp 10-05-04 12:57:51 EST EAGLE 42.0.0

## **rtrv-gtw-stp**

### **Retrieve Gateway STP Parameters**

Use this command to display the level 3 ANSI transfer control status (TFCSTAT) parameter. This value is the level 3 control status used on a TFC message received from an ITU node destined for an ANSI node.

**Keyword:** **rtrv-gtw-stp**

**Related Commands:** **chg-gtw-stp**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gtw-stp**

**Dependencies**

None

**Notes**

None

**Output**

**rtrv-gtw-stp**

```
rlghncxa03w 03-03-11 11:34:04 EST EAGLE 31.3.0
TFCSTAT
1
;
```

**rtrv-gtwy-acthresh****Retrieve the Gateway Screening Activity  
Threshold**

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

**Keyword:** **rtrv-gtwy-acthresh**

**Related Commands:** **set-gtwy-acthresh**

**Command Class:** Database Administration

**Parameters**

**:lsn=** (optional)

Linkset name.

**Range:** *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

**Example**

**rtrv-gtwy-acthresh:lsn=wy644368**

**rtrv-gtwy-acthresh**

**Dependencies**

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

**Notes**

None

**Output**

The following example shows the display of the thresholds of all linksets:

**rtrv-gtwy-acthresh**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN          REJ      RECV      INTRVL
WY644368     10       1000     10
WY234456     25       2000     20
LN123445     -         -         -
LN123556     25       2500     30
OP239900     -         5         5
;
```

The following example shows the display of the linkset **wy644368** rejection thresholds:

**rtrv-gtwy-acthresh: lsn=wy644368**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN          REJ      RECV      INTRVL
wy644368     10       1000     10
:
```

**Legend**

**LSN**—Linkset name.

**REJ**—Reject threshold.

**RECV**—Received message threshold.

**INTRVL**—Monitor interval.

**rtrv-gtwy-prmtrs****Retrieve Gateway Parameters**

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the **set-scrrej-prmtrs** command are displayed.

**Keyword:** **rtrv-gtwy-prmtrs**

**Related Commands:** **set-scrrej-prmtrs**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-gtwy-prmtrs
```

**Dependencies**

None

**Notes**

None

**Output****rtrv-gtwy-prmtrs**

```

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LIMIT INTRVL
1000 15
;

```

**Legend**

**LIMIT**—The threshold not to be exceeded.

**INTRVL**—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**rtrv-gws-actset****Retrieve Gateway Screening Stop Action Sets**

Use this command to display the values defined for gateway screening stop actions.

**Keyword:** **rtrv-gws-actset**

**Related Commands:** **chg-gws-actset**

**Command Class:** Database Administration

**Parameters**

**:actid=** (optional)

The identification number of the gateway screening stop action.

**Range:** **4-16**

**Default:** Display all

**:actname=** (optional)

The name of the gateway screening stop action set.

**Range:** *ayyyyy*

One alphabetic character followed by up to five alphanumeric characters.

**Default:** Display all

**Example**

```
rtrv-gws-actset
```

```
rtrv-gws-actset:actname=cr
```

```
rtrv-gws-actset:actid=6
```

**Dependencies**

Either **actname** or **actid** can be specified, but not both.

**Notes**

If neither **actname** nor **actid** are specified with the **rtrv-gws-actset** command, all gateway screening stop actions are displayed.

**Output****rtrv-gws-actset:actname=cr**

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
ACT ACT ACT ACT ACT ACT ACT ACT ACT ACT ACT ACT

```

;

**rtrv-gws-redirect****Retrieve Gateway Screening Redirect**

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

**Keyword:** rtrv-gws-redirect

**Related Commands:** chg-gws-redirect, dlt-gws-redirect, ent-gws-redirect

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gws-redirect**

**Dependencies**

None

**Notes**

None

**Output**

The second column in the output displays the type of point code used:

- ANSI—DPCA
- International—DPCI
- ITU National—DPCN
- ITU National 24—DPCN24

**rtrv-gws-redirect**

```
rlghncxa03w 09-04-10 11:43:04 EST EAGLE 41.0.0
ENABLED      DPCA          RI   SSN  TT   GTA
off          003-033-003   GT   0    0    1
```

;

In the following example, the gateway screening redirect function is not enabled.

**rtrv-gws-redirect**

```
rlghncxa03w 09-04-10 11:43:04 EST EAGLE 41.0.0
ENABLED      DPCA          RI   SSN  TT   GTA
Redirect function data is not provisioned.
```

;

**Legend**

**ENABLED**—Indicates whether the gateway screening redirect function is on or off

**DPCA/DPCI/DPCN/DPCN24**—The destination point code that the message is being redirected to.

**RI**—The routing indicator for the redirected message

**SSN**—The subsystem to which the redirected message is bound for.

**TT**—The translation type of the global title translation

**GTA**—The global title translation address

**rtrv-home-smsc****Retrieve HOME SMSC Address**

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

**Keyword:** rtrv-home-smsc

**Related Commands:** dlt-home-smsc, ent-home-smsc

**Command Class:** Database Administration

**Parameters**

**:force=** (optional)

Display more than 50 entries.

**Range:** yes, no

**Default:** no

**:num=** (optional)

Number of entries to display. The **force** parameter must also be specified to display more than 50 entries.

**Range:** 1-500

**Default:** 50

**:smc=** (optional)  
 Short Message Service Center address.  
**Range:** 1-21 digits  
 1-21 hexadecimal digits

### Example

```
rtrv-home-smsc
rtrv-home-smsc:smc=552611646
rtrv-home-smsc:num=100:force=yes
```

### Dependencies

One of the following features must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP
- Portability Check for Mobile Originated SMS

When the specified **num** parameter value is greater than 50, the **force=yes** parameter must also be specified.

### Notes

None

### Output

```
rtrv-home-smc

rlghncxa03w 03-03-28 08:50:12 EST EAGLE 31.3.0
SMSC ADDRESS

13214564894498
55231465465434
5465455655656456

HOME SMSC ADDRESS TABLE IS 1 % FULL (3 of 500)

;
```

## rtrv-homern

### Retrieve Home Routing Number Prefix List

Use this command to retrieve a list of routing number prefixes that belong to the operating network.

**Keyword:** **rtrv-homern**

**Related Commands:** **dlt-homern**, **ent-homern**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-homern**

**Dependencies**

None.

**Notes**

None

**Output**

**rtrv-homern**

```
rlghncxa03w 03-03-28 08:50:12 EST EAGLE 31.3.0
RN
-----
216780909087654

abc1234
c10234567
cabade
```

HOMERN table is (6 of 100) 6% full

;

**Legend**

**RN**—Routing Number

**rtrv-inpopts****Retrieve INP Options**

Use this command to retrieve INP-specific options.

**Keyword:** **rtrv-inpopts**

**Related Commands:** **chg-inpopts**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-inpopts**

**Dependencies****Notes**

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

If no NEC value has been provisioned, a value of **none** is displayed.

If a RELCAUSE value was not provisioned, then the default value of **31** is displayed.

**Output**

The following example shows output with default INP options.

**rtrv-inpopts**

```
rlghncxa03w 10-03-17 15:35:05 EST EAGLE 42.0.0
INP OPTIONS
-----

CUTNPASTE    = ON

CDPNPFX      DLTPFX
-----
CDPNNAI      SNAI
---
127          unknown
```

;

**Legend**

- **ASD**—Additional Subscriber Data
- **CDPNNAI**—Called Party Number Nature of Address Indicator
- **CDPNPFX**—Called Party Number Prefix
- **DLTPFX**—Delete Prefix
- **DRA**—Destination Routing Address.
- **DRANAI**—Nature of Address Indicator for the Destination Routing Address
- **DRANPV**—Numbering Plan Value for the Destination Routing Address
- **GRN**—Generic Routing Number.

- **NEC**—National Escape Code
- **SNAI**—Service Nature of Address Indicator
- **SPRESTYPE**—INP option to send a "Connect" message or a "Continue" message when IDP messages are received for INP services, the DN digits match, and the HLR ID is present
- **SPORTTYPE**—Service Portability Type
- **DEFRN**—Default Routing Number
- **RELCAUSE**—INP CRP option, specifying the reason for releasing the call when an INP Circular Route is detected
- **CUTNPASTE**—Specifies whether the CutAndPaste parameter is included in an INP CONNECT response message

## rtrv-ip-card

## Retrieve Internet Protocol Card

Use this command to retrieve IP networking parameters for a given card.

**Keyword:** rtrv-ip-card

**Related Commands:** chg-ip-card

**Command Class:** Database Administration

### Parameters

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

### Example

```
rtrv-ip-card:loc=1211
```

```
rtrv-ip-card
```

### Dependencies

The value specified for the **loc** parameter must correspond to the location of a card that can run an IP application (other than the EROUTE application, which is not supported by this command).

### Notes

None

## Output

**rtrv-ip-card: loc=1211**

```

rlghncxa03w 08-02-22 15:35:05 EST EAGLE 38.0.0

### Legend

**LOC**—The card location.

**SRCHORDR**—The Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVROnly indicates that only the Domain server is searched.

**DNSA**—The IP address of Domain Server A.

**DNSB**—The IP address of Domain Server B.

**DEFROUTER**—The IP address for the default router.

**DOMAIN**—The Domain name of the Domain server.

**SCTPCSUM**—The SCTP checksum algorithm type.

**BPADDR**—The bonded port IP address.

**BPSUBMASK**—The bonded port IP submask.

## rtrv-ip-host

## Retrieve Internet Protocol Hostname

Use this command to retrieve the IP Host table. The IP Host table defines local host names for IP addresses.

**Keyword:** rtrv-ip-host

**Related Commands:** `dlt-ip-host`, `ent-ip-host`

**Command Class:** Database Administration

## Parameters

**:display=** (optional)

This parameter is specified to display all the provisioned local or remote IP Host entries.

Range: all

**:host=** (optional)

Host name. The logical name of the device associated with the indicated IP address.

[illegible]

Any string of characters beginning with a letter and comprising up to 60 characters in length. Valid characters are a-z, A-Z, 0-9, - (dash), . (period)

**:ipaddr=** (optional)

The IP address associated with the hostname. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 4 numbers separated by dots, with each number in the range of **0-255**.

**:num=** (optional)

This parameter specifies the number of IP Host entries that are displayed in the command output.

**Range:** 1-2048

**System****Default:** 50**:type=** (optional)

This parameter specifies whether to retrieve entries for local or remote IPs.

**Range:** local, remote**local**— The host name and address of the IP card for the local EAGLE 5 ISS**remote**— The host name and address of the IP card for a remote EAGLE 5 ISS**Example****rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1****rtrv-ip-host:host=gw100.nc.tekelec.com****rtrv-ip-host:ipaddr=150.1.1.1****rtrv-ip-host****rtrv-ip-host:display=all****rtrv-ip-host:num=10****rtrv-ip-host:type=local:num=3****Dependencies**

The value specified for the **host** parameter must begin with an alphabetic character and can contain **a..z, A..Z, 0..9, -** (hyphen), or **.** (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

**Notes**

If optional parameters are specified, only the entries that match the entered parameters are retrieved.

## Output

If the **rtrv-ip-host** command is entered without any parameter, then the command displays up to a maximum of 50 entries. The **display=all** parameter must be specified to display all entries in the IP Host table.

This example displays the output when no other parameter is specified.

;

## rtrv-ip-lnk

## Retrieve Internet Protocol Link

Use this command to retrieve the IP link table.

**Keyword:** rtrv-ip-lnk

**Related Commands:** chg-ip-lnk

**Command Class:** Database Administration

### Parameters

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

**Default:** All card location link data are displayed.

**:port=** (optional)

Ethernet interface port ID.

**Range:** a, b

**Default:** All IP link port data associated with all ports on the card are displayed.

### Example

```
rtrv-ip-lnk:loc=1211:port=a
```

```
rtrv-ip-lnk:loc=1211
```

```
rtrv-ip-lnk
```

### Dependencies

The value specified for the **loc** parameter must correspond to the location of a card that can run an IP application (other than the EROUTE application, which is not supported by this command).

The card in the location specified by the **loc** parameter must support the port specified by the **port** parameter.

## Notes

None

## Output

### rtrv-ip-lnk

;

## Legend

**LOC**—The card location.

**PORT**—The Ethernet interface port ID, **A** or **B**.

**IPADDR**—The IP address for the specified port.

**SUBMASK**—The subnet mask of the IP interface.

**DUPLEX**—The mode of operation of the interface, **HALF** or **FULL**.

**SPEED**—The bandwidth for the interface in megabits per second, **10** or **100**.

**MACTYPE**—The Media Access Control Type of the interface, **802.3** or **DIX**. **802.3** indicates the IEEE standard number 802.3 for Ethernet 1, and **DIX** indicates the Digital/Inter/Xerox *de facto* standard for Ethernet 2.

**AUTO**—Whether or not to automatically determine duplex and speed. If **YES**, duplex and speed are automatically determined. If **NO**, duplex and speed are not automatically determined.

**MCAST**—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the Service Module card to the MPS system.

## rtrv-ip-node

## Retrieve IP Node

Use this command to display one or more nodes that are directly connected to a TCP/IP data link. A particular connection can be displayed, a particular application on a node can be displayed, or an

entire node can be displayed. If an entire node is displayed, no parameters are required to perform this action. A particular application can be specified by giving either the application's name or its IP port on the node.

**Keyword:** **rtrv-ip-node**

**Related Commands:** **dlt-ip-node**, **ent-ip-node**

**Command Class:** Database Administration

## Parameters

**:ipaddr=** (optional)

The remote host's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** **1-223, 0-255**

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:ipappl=** (optional)

The IP application supported by the node.

**Range:** **stplan**

**:ipport=** (optional)

The logical IP port that addresses the application on the node.

**Range:** **1024-5000**

**Default:** Display all

**:iprte=** (optional)

The default router's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** **1-223, 0-255**

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** Display all

## Example

**rtrv-ip-node**

**rtrv-ip-node:ipappl=stplan**

**rtrv-ip-node:ipaddr=193.4.201.50**

**rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024**

**rtrv-ip-node:loc=1201**

### Dependencies

If the **ipappl**, **ipport**, or **loc** parameter is specified, the others cannot be specified.

The **ipport** parameter can be specified only if the **ipaddr** parameter is specified.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

If the **loc** parameter is specified, the card location must be equipped with a TCP/IP data link.

If the **ipaddr** parameter is specified, that IP address must be in the TCP/IP data link table.

If the **ipappl** parameter is specified, that IP application must be in the TCP/IP data link table.

If the **iprte** parameter is not specified, then all TCP/IP nodes meeting the display criteria are displayed. If the TCP/IP node has no TCP/IP router assigned to it, dashes are displayed in the IPRTE field.

### Notes

**Legend****IPADDR**—The remote host's IP address.**IPPORT**—The logical IP port to address the application on the node.**IPAPPL**—The IP application supported by the node.

**LOC**—The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**CAP**—The maximum percentage of ethernet capacity for this node connection.

**IPRTE**—The default router's IP address.

## rtrv-ip-rte

### Retrieve IP Route

Use this command to display all static IP route entries in the Static IP Route table, or the entries for a specific card (destination IP addresses, subnet masks, and gateway IP addresses), or the entries for a specific destination IP address, or the entries for a specific gateway IP address.

**Keyword:** **rtrv-ip-rte**

**Related Commands:** **, ent-ip-rte**

**Command Class:** Database Administration

### Parameters

**:dest=** (optional)

Destination IP Address. The IP Address of a remote destination host or network.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.  
The IP address **0.0.0.0** is not valid.

**:gtwy=** (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.  
The IP address **0.0.0.0** is not valid.

**:loc=** (optional)

Card location. The unique identifier of a specific IP card in the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

### Example

```
rtrv-ip-rte
rtrv-ip-rte:loc=1301
rtrv-ip-rte:dest=128.252.10.5
rtrv-ip-rte:gtwy=140.190.15.3
```

### Dependencies

Only one optional parameter can be specified in a single command.

The **loc** parameter value must correspond to a SSEDCCM card in the card table that is running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application. The B network is used only on SSEDCCM cards.

The specified destination IP address (**dest** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

Use this command to display the values of the SS7 MTP Level 2 timers.

**NOTE:** The timers are organized in 35 timer sets of 9 timer values each. The timer sets are grouped and system default values are initialized by specification (ANSI, ITU, High Speed for China, High Speed for Q.703 Annex A, and High Speed for Unchannelized T1).

**NOTE:** Each timer set is administered individually by the **chg-l2t** command. The **ent-slk** command is used to assign an SS7 signaling link to any of the timer sets. Each assigned link is associated with a timer set.

**Keyword:** **rtrv-l2t****Related Commands:** **chg-l2t**, **ent-slk**, **rtrv-slk****Command Class:** Database Administration**Parameters****:l2tset=** (optional)

Level 2 timer set identifier, or timer set number. Up to 35 different SS7 MTP Level 2 timer sets can be defined.

**Range:** 1-35  
**Default:** Displays all timer sets

**Example**

```
rtrv-l2t
```

```
rtrv-l2t:l2tset=3
```

**Dependencies**

None.

**Notes**

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the **chg-l2t** command.

**Output**

The timer values are shown in the output for the **rtrv-l2t** command in seconds.

**rtrv-l2t**

**T6**—Remote congestion

**T7**—Excessive delay of acknowledgment

**NODATA**—Amount of time with no data

## rtrv-l3t

### Retrieve Level 3 Timers

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

**Keyword:** rtrv-l3t

**Related Commands:** chg-l2t, chg-l3t, ent-ls, rtrv-l2t, rtrv-ls

**Command Class:** Database Administration

#### Parameters

**:l3tset=** (optional)

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the **ent-ls** or **chg-l3t** command.

**Range:** 1

**Default:** Display table

#### Example

```
rtrv-l3t:l3tset=1
```

#### Dependencies

Only one timer set is supported in this release.

#### Notes

The timer output for this command is in seconds, even though it could have been entered in milliseconds on the **chg-l3t** command.

**Output****rtrv-l3t:l3tset=1**

**Legend****L3TSET**—The level 3 timer set table.**T1**—The delay, in seconds, to avoid message missequencing on changeover. Also used as the ITU MTP restart isolation timer.**T2**—The amount of time, in seconds, to wait for changeover acknowledgment.**T3**—Time controlled diversion – the delay, in seconds, to avoid missequencing on changeback.**T4**—The amount of time, in seconds, to wait for changeback acknowledgment, first attempt.**T5**—The amount of time, in seconds, to wait for changeback acknowledgment, second attempt.**T6**—The delay, in seconds, to avoid message missequencing on controlled rerouting.**T7**—The amount of time, in seconds, to wait for signaling data link connection acknowledgment.**T8**—The transfer-prohibited inhibited timer (transient solution).**T10**—The amount of time, in seconds, to wait before repeating the signaling-route-set-test message.**T11**—The transfer-restricted timer.**T12**—The amount of time, in seconds, to wait for uninhibit acknowledgment.**T13**—The amount of time, in seconds, to wait for force uninhibit.**T14**—The amount of time, in seconds, to wait for inhibition acknowledgment.**T15**—The amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test.**T16**—The amount of time, in seconds, to wait for route-set-congestion status update.**T17**—The delay, in seconds, to avoid oscillation of initial alignment failure and link restart.**T18**—The repeat TFR once by response method timers.**IT18**—The timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.**T19**—The failed link craft referral timer.

**IT19**—The amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages.

**T20/IT22**—The amount of time, in seconds, to wait before repeating the local inhibit test.

**IT20**—The amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts.

**T21/IT23**—The amount of time, in seconds, to wait before repeating the remote inhibit test.

**IT21**—The overall MTP restart timer at a signaling point adjacent to one whose MTP restarts.

**T22**—The timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available.

**T23**—The timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.

**T24**—The timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.

**T25**—The timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).

**T26**—The timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.

**T28**—The timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.

**T29**—The timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.

**T30**—The timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message.

**T31**—The false link congestion detection timer.

**T32**—The link oscillation timer—Procedure A.

## rtrv-lbp

## Retrieve Loopback Point Attributes

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

**Keyword:** rtrv-lbp

**Related Commands:** act-lbp, chg-lbp, dact-lbp, dlt-lbp, ent-lbp

**Command Class:** Database Administration

### Parameters

**:lbp=** (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

**Range:** 1-32

**Default:** Display all

**:link=** (optional)

SS7 signaling link. The SS7 signaling link that is to be tested.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**Default:** Display all

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card locations.

### Example

**rtrv-lbp**

**rtrv-lbp:loc=1202**

**rtrv-lbp:loc=1202:link=a**

**rtrv-lbp:loc=1202:link=a:lbp=3**

### Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the **loc** parameter cannot be reserved by the system.

If the **link** parameter is specified, the **loc** parameter must be specified. If the **lbp** parameter is specified, both the **loc** parameter and the **link** parameter must be specified.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following example displays the attributes for all the loopback points for SS7 links assigned to the STP:

**rtrv-lbp**

```

rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0

## rtrv-lnpopts

## Retrieve LNP System Options

Use this command to display all the LNP-specific system options from the database.

**Keyword:** rtrv-lnpopts

**Related Commands:** chg-lnpopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

```
rtrv-lnpopts
```

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

### Notes

None

**Output**

The JIPPROV and JIPDIGITS fields appear in the output only when the Triggerless LNP feature is turned on.

**rtrv-lnpopts**

```

AMASLPID      = 123456789
INCSLP        = yes
AMATYPE       = 003
AMAFEATID     = 010
CIC           = 1369
AUD           = on
SP            = a123
FRCSMPLX     = no
ADMHIPRI      = yes
GTWYSTP       = yes
JIPPROV       = yes
JIPDIGITS     = 919460
CCP           = no
SERVPORT      = no
WQREDRCT      = off
WSMSC10DIG    = yes

```

;

**Legend**

**AMASLPID**—AMA slip ID

**INCSLP**—Whether the AMA slip ID included in the response

**AMATYPE**—AMA call type

**AMAFEATID**—AMA feature ID

**CIC**—Carrier identification code

**AUD**—Audit indicator

**SP**—Service provider ID

**FRCSMPLX**—Allow simplex database updates indicator

**ADMHIPRI**—Indicator that LNP database administration has the highest priority of all administration

**GTWYSTP**—Indicator that LNP system is also configured as a Gateway STP

**JIPPROV**—Indicator of whether a Jurisdictional Information Parameter (JIP) value is to be added to the IAM

**JIPDIGITS**—The Jurisdictional Information Parameter value

**CCP**—Copy Charge Parameters

**SERVPORT**—Service Portability

**WQREDRCT**—Wireless queries directed to default GTT

**WSMS10DIG**—SCCP GTA length indicator for 10 or 11 digits

**rtrv-log****Display Records from the Log**

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

**Keyword:** rtrv-log

**Related Commands:**

**Command Class:** System Maintenance

## Parameters

**:dir=** (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

**Range:** **fwd, bkwd**

**fwd**—Display entries from nearer the beginning of the log toward entries at the end of the log

**bkwd**—Display entries from nearer the end of the log toward entries at the beginning of the log

**Default:** **fwd**

**:edate=** (optional)

End date. Report only log entries that were created on or *before* the specified date (when **dir=fwd**), or only log entries that were created on or *after* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:** **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:** Report log entries regardless of their creation date

**:enum=** (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

**Range:** **1-1499**

**1-999**—Alarms (UAMs)

**1000-1499**—UIMs

**Default:** If **enum** is not specified and:

If **snum** is specified, the default **enum** value is the same as the specified **snum** value.

If **snum** is not specified and **type** is **alarm** or not specified, **enum= 999**.

If **snum** is not specified and **type** is **all** or **uim**, **enum= 1499**.

**:etime=** (optional)

End time. Report only log entries that were created on or *before* the specified time (when **dir=fwd**), or only log entries that were created on or *after* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:** **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:** Report log entries regardless of their creation time

**:mode=** (optional)

Log display mode; display all information or just summary information from each log entry.

**NOTE: If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.**

**Range:** **brief, full**

**brief**—Display only the first “Summary” line of the log entry

**full**—Display all information available in the log entry

**Default:** **full**

**:next=** (optional)

Number of additional records to display using the same direction (**dir**) and filtering criteria of **outgrp**, **type**, **slog**, and **mode** that were used for the previous successful **rtrv-log** command at the same terminal. This parameter cannot be specified with any other parameters in the command. See the Dependencies and Notes sections for usage information.

**Range:** 1-65500

**:num=** (optional)

Number of records that can be displayed before the report is stopped.

**Range:** 1-65500

**Default:** 15

**:outgrp=** (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on. This parameter cannot be specified when the **snum** parameter is specified.

**Range:** **all**, **appserv**, **appss**, **card**, **clk**, **db**, **dbg**, **gtt**, **gws**, **link**, **meas**, **mon**, **mps**, **pu**, **sa**, **seas**, **slan**, **sys**, **traf**

**all**— Retrieve information for all Output Groups

**appserv**— Application Server

**appss**— Application Subsystem

**card**— Card

**clk**— Clock

**db**— Database

**dbg**— Debug

**gtt**— GTT Maintenance

**gws**— GWS Maintenance

**link**— Link Maintenance

**meas**— Measurements Maintenance

**mon**— Monitoring (Sentinel or IMF) Maintenance

**mps**— MPS Maintenance

**pu**— Program Update

**sa**— System Administration

**seas**— SEAS (Sentinel or IMF)

**slan**— SLAN Maintenance

**sys**— System Maintenance

**traf**— Traffic

**Default:** If the **next** parameter is not specified, the default is **all**.

If the **next** parameter is specified, the output is the same as the immediately previous successful **rtrv-log** command that was entered at the same terminal (and no **rtrv-log** command was entered at another terminal).

**:sdate=** (optional)

Start date. Report only log entries that were created on or *after* the specified date (when **dir=fwd**), or only log entries that were created on or *before* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:** 000101-991231

(in the form *yy**mm**dd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:** Report log entries regardless of their creation date

**:slog=** (optional)

Source of log. Which OAM's Maintenance log to access: active or standby.

**Range:** **act**, **stb**

**act**—Active OAM

**stb**—Standby OAM

**Default:** act

**:snum=** (optional)

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the **outgrp** parameter is specified.

**Range:** 1-1499

1-999—Alarms (UAMs)

1000-1499—UIMs

**Default:** All entries for the specified **type** are displayed.

If **type** is **all**, **alarm**, or not specified, **snum=1**.

If **type** is **uim**, **snum=1000**.

**:stime=** (optional)

Start time. Report only log entries that were created on or *after* the specified time (when **dir=fwd**), or only log entries that were created on *before* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:** 000000-235959

hhmmss—hh=hours (00-23), mm=minutes (00-59), ss=seconds (00-59)

**Default:** Report log entries regardless of their creation time

**:type=** (optional)

Type of Maintenance log to access for the report: alarms (UAMs), UIMs, or both logs (**all**).

**Range:** all, alarm, uim

**Default:** alarm

### Example

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

### Dependencies

No other **rtrv-log** command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the **rtrv-log** command can be entered.

If both the **sdate** and **edate** parameters are specified,

- In the forward direction, the **sdate** value must be less than or equal to the **edate** value.
- In the backward direction, the **sdate** value must be greater than or equal to the **edate** value.

The month component of the **sdate** and **edate** parameters must be in the range 1–12.

The day component of the **sdate** and **edate** parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the **stime** and **etime** parameters must be in the range 00–59.

The minutes component of the **stime** and **etime** parameters must be in the range 00–59.

If the **sdate** parameter value is equal to the **edate** parameter value,

- In the forward direction, the **stime** value must be less than or equal to the **etime** value.
- In the backward direction, the **stime** value must be greater than or equal to the **etime** value.

The **sdate** parameter value plus the **stime** parameter value must be less than the current time and date combination.

If **dir=bkwd** is specified with a date and time range, **sdate/stime** must be greater than **edate/etime**.

When the **enum** parameter is specified, the **snum** parameter must be specified with a value less than or equal to the specified **enum** value.

The specified **enum** parameter value and the specified **snum** value must be within the same range: **1-999** for Alarms (UAMs) and **1000-1499** for UIMs.

The **type** parameter and the **snum/enum** parameters cannot be specified together in the command.

The **rtrv-log:next=** command must be entered on the same terminal where the previous successful **rtrv-log** command was entered in the system. No other parameters can be entered with the **next** parameter in the command.

The **rtrv-log:next=** command cannot be entered following a **rtrv-log** command that contained the **type=all** parameter. A **rtrv-log** command without the **type=all** parameter must be entered before the **rtrv-log::next=** command can be entered.

Because entries can be overwritten between the entry of a **rtrv-log** command without the **next** parameter and the entry of a **rtrv-log:next=** command, the **rtrv-log:next:** command might not execute successfully. Another **rtrv-log** command without the **next** parameter must be entered before the **rtrv-log:next:** command can be entered again,

The values specified for the **edate** with the **stime** parameter combination is not valid.

The values specified for the **edate** with **stime** and **etime** parameter combination is not valid.

When an **enum** parameter is specified, it requires an **snum** as its mated parameter.

No other parameters can be entered with the **next** parameter in the command.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999  
years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any **sdate/edate** value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of two other parameters: **num** and **dir**. The **num** parameter determines the maximum number of entries to display, and the **dir** parameter determines whether entries are displayed from the oldest end (**dir=fwd** or not specified) or the newest end (**dir=bkwd**).

When **sdate** is specified and **edate** is not specified in the forward direction, **edate** is defaulted to be the end of the log.

When **edate** is specified and **sdate** is not specified in the forward direction, **sdate** is defaulted to be the beginning of the log.

When **sdate** is specified and **edate** is not specified in the backward direction, **edate** is defaulted to be the beginning of the log.

When **edate** is specified and **sdate** is not specified in the backward direction, **sdate** is defaulted to be the end of the log.

When **stime** is specified and **etime** is not specified in the forward direction, **etime** is defaulted to **235959**.

When **etime** is specified and **stime** is not specified in the forward direction, **stime** is defaulted to **000000**.

When **stime** is specified and **etime** is not specified in the backward direction, **etime** is defaulted to **000000**.

When **etime** is specified and **stime** is not specified in the backward direction, **stime** is defaulted to **235959**.

When **stime** or **etime** is specified but neither the **sdate** or **edate** parameters are specified, **sdate** and **edate** are each defaulted to the value **today**.

The **num** parameter is used to control the maximum number of entries to be displayed by one command.

The **dir** parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the **dir** parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (**outgrp**) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group (**outgrp**) is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When **outgrp=all** is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The **next** parameter is used to display a specified number of additional log records after the previous **rtrv-log** entry at the terminal. New records that are logged after the previous **rtrv-log** command was entered will not be displayed when the **rtrv-log:next=** command is entered. The **next** parameter is valid only under the following conditions:

- The **rtrv-log:next=** command is entered at the same terminal from which the previous **rtrv-log** command was entered. The previous **rtrv-log** command must not include the **type=all** parameter.
- No other terminal has issued a **rtrv-log** command after the **rtrv-log** command entered at the terminal from which the **rtrv-log:next=** command is entered.
- The **next** parameter is the only parameter specified in the **rtrv-log** command.
- There are still logs present that match the conditions (except **time/date/num**) specified in the previous **rtrv-log** command.

When either a single **snum** or range of **snum/enum** is specified, only those Alarms or UIMs within the specified range are displayed.

When **snum** is specified and **enum** is not specified, the **enum** value defaults to the specified **snum** value.

When **enum** is specified, an **snum** value must be specified that is less than or equal to the specified **enum** value.

If an **snum** is specified within the range **1-999**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1-999**.

If an **snum** is specified within the range **1000-1499**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1000-1499**.

When **enum** is not specified and the specified **snum** Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the **snum** value is out of range.

If **snum** and **enum** are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

## Output

In the following example, the sequence numbers that are replaced by the dashes ( - - - ) represent the UIMs that were discarded due to the UIM thresholding feature.

**rtrv-log:type=uim:sdate=960715:stime=220000:num=50**

## rtrv-loopset

## Retrieve Loop Set Command

Use this command to retrieve loopset data from the database.

**Keyword:** rtrv-loopset

**Related Commands:** chg-loopset, dlt-loopset, ent-loopset

**Command Class:** Database Administration

### Parameters

**:disp=** (optional)

Display method. This parameter specifies the manner in which the retrieved data is displayed.

**Range:** detail, list

**detail** — Provides detailed information for a loopset entry.

**list** — Provides a list of loopset entries.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

**Default:** detail

**:force=** (optional)

The **force=yes** parameter must be specified if the value of the **num** parameter is greater than **50**.

**Range:** yes

**:mode=** (optional)

Mode of operation. This parameter retrieves loopset entries that have been assigned the specified mode.

**Range:** notify, discard

**notify** — Generates a UIM without discarding the message.

**discard** — Generates a UIM and discards the message.

**:name=** (optional)

Loopset name. This parameter retrieves a specified loopset.

The **name=none** parameter cannot be specified.

**Range:** ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters.

**:num=** (optional)

Number. This parameter specifies the number of entries to be retrieved.

If the value of the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

**Range:** 1-1000

**Default:** 50

### Example

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

**rtrv-loopset**

This example provides detailed information for the loopset entry rtp1.

**rtrv-loopset:name=rtp1**

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

**rtrv-loopset:num=100:force=yes**

This example provides a list of the first 100 valid loopset entries in the loopset table.

**rtrv-loopset:force=yes:num=100:disp=list**

This example provides detailed information for the first 100 valid loopset entries set to discard mode in the loopset table.

**rtrv-loopset:force=yes:num=100:mode=discard**

This example provides a list of the first 100 valid loopset entries set to notify mode in the loopset table.

**rtrv-loopset:force=yes:num=100:mode=notify:disp=list****Dependencies**

If the value of the **num** parameter is greater than **50**, then the **force=yes** parameter must be specified.

The value of the **name** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The **name=none** parameter cannot be specified.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

**Output**

The following example displays the loopset entry details for loopset **rtp1**.

**rtrv-loopset:name=rtp1**

```

**rtrv-ls****Retrieve Linkset**

Use this command to show the linkset information.

**Keyword:** **rtrv-ls**

**Related Commands:** **chg-ls**, **chg-lsopts**, **dlt-ls**, **ent-ls**, **rept-stat-ls**

**Command Class:** Database Administration

**Parameters**

**:apc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:apc/apca/apci/apcn/apcn24=** (optional)

Adjacent point code.

**:apci=** (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code **0-000-0** is not a valid point code.

**:apcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible

point code option. A group code must be specified when the ITUDUPPC feature is turned **on** (*nnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:apcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The prefix indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:cggtnmod=** (optional)

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

**Range:** **yes, no**

**:islsrsb=** (optional)

Incoming rotated signaling link selection (SLS) bit. This parameter displays the linksets with the specified rotated bit.

**Range:** **1-8**

ITU linksets—**1-4**

ANSI linksets—**1-8**

**Default:** Display all link sets

**:itutfr=** (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the **itutfr** parameter.

This parameter is valid for ITU national linksets only.

**Range:** **on, off**

**Default:** Display all link sets

**:lsn=** (optional)

Linkset name

**Range:** *aaaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all link sets

**:lst=** (optional)

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

**Range:** **prx**

**prx** — Display proxy links.

**:mtprse=** (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

**Range:**     **yes, no**  
               **yes** — equipped  
               **no** — not equipped  
**Default:**   Display all link sets

**:pct=** (optional)

This parameter displays the linksets where the Point Code and CIC Translation has the specified status.

**Range:**     **on, off**

**:ppc=** (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

**Synonym:** **ppca**

**Range:**     **000-255**  
               Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).  
               When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.  
               When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.  
               When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.  
               The point code **000-000-000** is not a valid point code.

**:ppc/ppca/ppci/ppcn/ppcn24=** (optional)

Proxy Point Code.

The proxy point code must be a full point code.

**:ppci=** (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**     **s-, 0-255**  
               Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).  
               *prefix*—**s-**  
               *zone*—**0-7**  
               *area*—**000-255**  
               *id*—**0-7**  
               The point code **0-000-0** is not a valid point code.

**:ppcn=** (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned **on** (*nnn-gc, m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:**     **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:ppcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:randsls=** (optional)

Random SLS (signaling link selection). This parameter is used to display linksets that have the specified value of the **randsls** parameter.

**Range:** off, class0, all

**off**—Displays all linksets where random SLS is disabled.

**class0**—Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

**all**—Displays ITU linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled and ANSI linksets where random SLS generation for Class0 and ISUP traffic is enabled.

**Default:** off

**:slsobit=** (optional)

Other CIC (Circuit Identification Code) Bit. This parameter displays all the linksets that have the **slsobit** parameter set to a value from 5 to 16.

**Range:** \*

\*—Specifies all possible values ( 5-16 )

**Default:** Display all link sets

**:slrsb=** (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

**Range:** 1-4

**Default:** Display all link sets

**:spc=** (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

### Example

Display all linksets having the parameter **pct=on**.

**rtrv-ls:pct=on**

Display the attributes of all link sets:

**rtrv-ls**

Retrieve link set **ls1**:

**rtrv-ls:lsn=ls1**

Retrieve all link sets with the **mtprse** parameter set to yes:

**rtrv-ls:mtprse=yes**

Retrieve all link sets that use the slsocbit parameter with a value from 5 to 16:

**rtrv-ls:slsocbit=\***

Display a specified ITU linkset to view the settings for the slrsb or slsocbit parameters:

**rtrv-ls:lsn=lsitu**

Retrieve all ITU national linksets that have the itutfr parameter set to on:

**rtrv-ls:itutfr=on**

Retrieve the specified ITU national linkset and display its setting for the itutfr parameter:

**rtrv-ls:lsn=lsitun**

Retrieve all linksets where random SLS generation is enabled for SCCP ITU traffic and Class0 ANSI traffic.

**rtrv-ls:randsls=class0**

Display all proxy linksets.

**rtrv-ls:lst=prx**

Display all linksets using a specified proxy point code.

**rtrv-ls:ppc=11-11-11**

Display all linksets using a specified secondary point code.

**rtrv-ls:spc=2-2-2**

Display all linksets using a specified adjacent point code.

**rtrv-ls:apc=1-1-2**

Retrieves all linksets where calling party global title modification is requested:

**rtrv-ls:cgtmod=yes**

Retrieves all link sets with the ISLSRSB value 6.

**rtrv-ls:islsrsb=6****Dependencies**

A PCT quantity feature must be enabled before the **pct** parameter can be specified.

The specified linkset must be in the database.

All optional parameters, except for the combination of the **slsocbit** and **slrsb** parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the **apcn** parameter is specified as the Adjacent Point Code, then the format of the **apcn** parameter must match the format dictated by the **chg-stpopts:npcfmti** parameter.

The SLSOCB feature must be enabled before the **slsocbit** parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the **apc** and **spc** parameters can be specified.

At least one linkset must be associated with the value of the **apc** parameter.

The Proxy Point Code feature must be enabled before the **lst=prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The value specified for the **ppc** parameter must be a full point code.

The value specified for the **ppc** parameter must already exist in the Destination table, and the **prx=yes** parameter must have been specified.

The value specified for the **apc** parameter must be a full point code.

The value specified for the **spc** parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **eggtmod** parameter can be specified.

The ISLSRSB feature must be enabled before the **islsbr** parameter can be specified.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The CLLI, TFATCABMLQ, MTPRSE, and ASL8 fields are displayed only when a specific linkset is specified. The SLSOCBIT and SLSRSB fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the **tfatcabmlq** parameter database value is **0** for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or **1** if there are 2 or fewer links in the linkset).

If the **tfatcabmlq** parameter database value is **0**, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be a minimum of **1** for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the **rtrv-ls** command output.

If the **tfatcabmlq** parameter value is set to a specific value greater than **0**, then the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the **rtrv-ls** command output.

The EAGLE 5 ISS **ent-ls** command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE 5 ISS command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS **vfy-ls** command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS **vfy-ls** output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The value specified for the **ppc** parameter must be a full point code. Cluster point codes and private point codes are not supported.

The ICNIMAP and OGNIMAP fields are displayed only if the linkset name is specified in the command, the ITU Spare Point Code feature is enabled, and an ITUN or ITUI point code is associated with the linkset.

IPSG linksets have SLKTPS configured rather than IPTPS. SLKTPS configures the transactions per second for each link assigned to the IPSG linkset as opposed to IPTPS which configures the combined transactions per second for the entire IPGW linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSG-M2PA links, then the command does not report any data below the TPS header or raise alarms.

## Output

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

In Release 37.5.0, if information is requested for a linkset, then the secondary point code field is displayed in the output. If the MLS feature is not enabled, or if the linkset was not created with a secondary point code, the field contains dashes.

In Release 38.0, headings for unequipped cards are not displayed.

The following example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic for ITU linksets and Class0 and ISUP traffic for ANSI linksets:

### rtrv-ls:randsls=all

```
tekelecstp 10-03-06 19:36:00 EST EAGLE 42.0.0

Link set table is (4 of 1024) 1% full.

;

### Legend

**LSN**—Name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the **apctype=itunchina** parameter specified.

**APC/APCI/APCN/APCN24**—Adjacent DPC of the linkset

**SPC/SPCI/SPCN/SPCN24**—Secondary PC of the linkset

**SCRN**—Screen set assigned to the linkset

**L3TSET**—Level 3 timer set value assigned to the linkset

**SLTSET**—SLTM record associated with the linkset

**BEI**—Broadcast exception indicator. Indicates whether TFP (transfer prohibited) messages can be broadcast on the linkset.

**LST**—Type of links in the linkset (access links, bridge links, etc.)

**LNKS**—Number of links in the linkset

**GWSA**—Shows whether gateway screening is used on the specified linkset

**GWSM**—Shows whether the display of messages generated for each screened message is turned on or off

**GWSD**—Shows whether the gateway screening message discard function is turned on or off

**SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset

**NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset

**CLLI**—The far end Common Language Location Identifier (CLLI)

**TFATCABMLQ**—the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted

**MTPRSE**—Shows whether the adjacent node is equipped with MTP restart

**ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs

**MULTGC**—Shows whether multiple group codes are allowed

**IPGWAPC**—Shows whether the adjacent point code is an IP Gateway adjacent point code

**MATELSN**—The name of the mate IP Gateway linkset

**IPTPS**—Provisioned or default TPS for the specific IPGWx linkset. This value is a user-defined or default portion of the total enabled system IP Signaling TPS.

**LSUSEALM**—Percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset

**SLKUSEALM**—Percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

**LOC**—Location of the card containing the signaling links that make up the linkset

**PORT**—Port on the card containing the signaling link

**SLSOCBIT**—Setting of the Other CIC (Circuit Identification Code) Bit

**SLRSRB**—Setting of the Rotated SLS (Signaling Link Selection) Bit

**ISLSRSB**—setting of the Incoming Rotated SLS (Signaling Link Selection) Bit

**GSMSCRN**—Shows whether the GSM MAP screening indicator is turned on or off

**ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off

**L2TSET**—Level 2 timer set value associated with the signaling link

**SLC**—Signaling link code of the signaling link

**TYPE**—Type of card

**BPS**—Transmission rate for the link in bits per second

**E1PORT**—E1 port with the E1 interface that services the link

**E1LOC**—Card location of the E1 card with the E1 interface that services the link

**T1PORT**—T1 port with the T1 interface that services the link

**T1LOC**—Card location of the T1 card with the T1 interface that services the link

**TS**—Timeslot assigned to the link that is serviced by the E1 or T1 interface

**E1ATMCRC4**—Indicator of whether CRC4 multi-frame structure is enabled or disabled

**E1ATMSI**—Value of two Spare International bits of NFAS data

**E1ATMSN**—Value of five Spare National bits of NFAS data

**RANDSLS**—The setting of linkset for Random SLS generation

**ADAPTER**—Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset

**RSVDSLKTPS**—Guaranteed SLKTPS for an IPSP linkset

**MAXSLKTPS**—Maximum SLKTPS for an IPSP linkset

**RCONTEXT**—Routing context ID of IPSP M3UA linkset

**ASNOTIF**—Shows whether AS notifications will be generated for IPSP M3UA linkset

**ANAME**—Association name configured for signaling link of IPSP linkset

**SLKTPS**—Provisioned TPS for concerned signaling link of the specified IPSP linkset

**CGGTMOD**—Shows whether calling party global title modification indicator is yes or no for the linkset

**PPC/PPCI/PPCN/PPCN24**—The proxy point code of the linkset

**NUMSLKALW**—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state

**NUMSLKRSTR**—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state

**NUMSLKPROH**—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state

**ICNIMAP**—Incoming NI Map

**OGNIMAP**—Outgoing NI Map

**RSLS8**—Shows whether the incoming SLS is rotated by 8 bits

**PCT**—Shows whether the Point Code & CIC Translation (PCT) feature is applied to messages coming in or going out on links of a particular link set

## rtrv-m2pa-tset

## Retrieve M2PA Timer Set

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

**Keyword:** rtrv-m2pa-tset

**Related Commands:** chg-m2pa-tset

**Command Class:** Database Administration

### Parameters

**:tset=** (optional)  
The name of the M2PA timer set to be retrieved.  
**Range:** 1-20

**:ver=** (optional)  
The M2PA version supported by the association.  
**Range:** d6, rfc

### Example

```
rtrv-m2pa-tset
rtrv-m2pa-tset:tset=1
```

**Dependencies**

None

**Notes**

If a timer set is not specified in the command, all timer sets are retrieved.

## Output

**rtrv-m2pa-tset:tset=1:ver=d6**

**rtrv-map****Retrieve Mate Applications**

Use this command to show the mated application relationship information and Alternate RI Mate information maintained by the system. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to view Alternate RI Mate information. This information is used to support the routing of SCCP management SSP/SSA messages.

**Keyword:** **rtrv-map**

**Related Commands:** **chg-map, dlt-map, ent-map**

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mapset=** (optional)

The MAP set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**Default:** **dflt** - The default value of the **mapset** parameter is **dflt** only when the Flexible GTT Load Sharing feature is not enabled.

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code in the form of *zone-area-id*.

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:ssn=** (optional)

Subsystem number

**Range:** **2-255**

**Default:** All subsystem numbers and their mates are shown for the given point code.

### Example

**rtrv-map**

**rtrv-map:pc=2-2-2**

**rtrv-map:pca=1-1-4:ssn=15**

**rtrv-map:mapset=2**

**rtrv-map:mapset=dflt:pcn=s-10155-ab**

### Dependencies

The value of the **pc/pca/pci/pcn/pcn24** parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See the **canc-cmd** command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

If the Flexible GTT Load Sharing feature is enabled, then the retrieved MAP examples contain the MAPSET ID for each MAP set. MAP sets that were configured before the Flexible GTT Load Sharing feature was enabled are shown as MAPSET ID=DFLT after the Flexible GTT Load Sharing feature is enabled.

The **pc/pca/pci/pcn/pcn24**, **ssn**, and **mapset** parameters can be used to screen the output of all MAP sets. These parameters allow retrieval of only those MAP sets that contain the desired parameters. A MAP set can contain one primary entry and up to 31 mated entries.

If no parameters are entered, all defined mated point codes (up to 36,000) are shown.

If the Flexible Final GTT Loadsharing feature is not enabled, then the number of entries in the MAP table is based on unique point codes. Point codes that are duplicated in MRN sets using different SSNs are counted only once in the number of entries.

If the Flexible Final GTT Loadsharing feature is enabled, then the number of entries in the MAP table is based on unique point code and SSN combinations. Point codes that are duplicated in MRN sets are counted in the number of entries).

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MRNSET and MRNPC fields, is displayed for all MAP Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

## Output

All subsystem numbers for the specified point code and its mates are shown.

The NET column is shown only when a MAP set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

If an MRC value is preceded with an "\*", then the MRC value is not applicable for the current multiplicity mode (MULT field). The MRC value is only valid when MULT is *DOM*.

If an SRM value is preceded with an "\*", then the SRM value is not applicable for the current multiplicity mode (MULT field). The SRM value is only valid when MULT is *DOM* or *COM*.

The following example retrieves an ANSI MAP set for a specified point code.

### rtrv-map:pc=2-2-2

```
flexgtttoff 09-08-09 12:05:28 EST EAGLE 41.1.0
PCA          Mate PCA      SSN RC MULT SRM MRC GRP NAME SSO
002-002-002          10 10 SHR *Y *Y ----- OFF
                   002-002-003 20 10 SHR *Y *Y ----- OFF
```

MAP table is (8 of 1024) 1% full.

The following example includes MAP sets with a Concerned Signaling Point Code group name and spare point codes, (prefix s-). The ITUDUPPC (ITU National Duplicate Point Code) feature is on, and the Flexible ITU National Point Code STP option is set to **4-4-3-3**.

;

**Legend**

**MAPSET ID**—This field specifies the MAP set number or DFLT when numbered MAP sets are allowed.

**PCA/PCI/PCN/PCN24**—This field identifies the point code of the SCP where the primary application resides.

**NET**—This field identifies the mate network type of the point code when an ITU MAP set contains both ITU-I and ITU-N point codes. The field can show I if the MATE PC is an ITU-I point code or N if the MATE PC is an ITU-N point code.

**MATE PC/PCA/PCI/PCN/PCN24**—This field identifies the point code of the SCP where the mate application resides.

**SSN**—This field identifies the applications subsystem number.

**RC**—This field identifies the relative cost of the point code/subsystem.

**MULT**—Multiplicity mode SOL (Solitary), DOM (Dominant), SHR (Shared), or COM (Combined - Shared and Dominant) Load sharing. See the "Notes" section in the **ent-map** command description for an explanation of multiplicity modes.

**SRM**—This field specifies whether subsystem routing messages are transmitted is on (YES), off (NO), not applicable (\*Y) but would be YES if applicable, or not applicable (\*N) but would be NO if applicable. See the "Notes" section in the rtrv-map command description for SRM non applicable Load sharing modes.

**MRC**—This field specifies whether message routing under congestion is on (YES), off (NO), not applicable (\*Y) but would be YES if applicable, or not applicable (\*N) but would be NO if applicable. See the "Notes" section in the rtrv-map command for **MRC** non applicable Load sharing modes.

**GRP NAME**—This field identifies the name of a group of point codes (the broadcast list group name) that should be notified of the subsystem status.

**SSO**—Subsystem Status Option. Indicates the subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.

**WT**—This field specifies the weight assigned to the PC.

**%WT**—This field specifies the relative percentage, according to weight, of an in-service PC within an RC group.

**THR**—This field specifies the service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.

**MRNSET** —This field specifies the Alternate RI Mate MRN Set ID.

**MRNPC** —This field specifies the Alternate RI Mate point code.

**rtrv-meas-sched****Retrieve Measurements Schedule**

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for OAM based measurements.

**NOTE: This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see rtrv-measopts).**

**NOTE: Refer to the *Measurements Manual* for specific details on measurement reports.**

**Keyword:** rtrv-meas-sched

**Related Commands:** chg-meas, rept-meas, rtrv-measopts

**Command Class:** Link Maintenance

**Parameters**

This command has no parameters.

**Example**

**rtrv-meas-sched**

**Dependencies**

None

**Notes**

None

**Output**

Output with measurement collection on.

**rtrv-meas-sched**

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = on
GTWYLSFLTR   = both
-----
SYSTOT-STP   = on
SYSTOT-TT    = off
SYSTOT-STPLAN = off
COMP-LNKSET  = on
COMP-LINK    = on
GTWY-STP     = on
GTWY-LNKSET  = on
MTCD-STP     = on
MTCD-LINK    = on
MTCD-STPLAN  = on
MTCD-LNKSET  = on
;
```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

**rtrv-meas-sched**

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = off
GTWYLSFLTR   = (both)
-----
SYSTOT-STP   = (off)
SYSTOT-TT    = (off)
SYSTOT-STPLAN = (off)
COMP-LNKSET  = (off)
COMP-LINK    = (off)
GTWY-STP     = (off)
GTWY-LNKSET  = (off)
MTCD-STP     = (on)
MTCD-LINK    = (on)
MTCD-STPLAN  = (on)
MTCD-LNKSET  = (on)
;
```

**Legend**

**COLLECT**—Shows whether measurement collection is on or off.

**GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:

**both**—Only gateway linksets are included in the report to the terminal and SEAS.

**stp**—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.

**seas**—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.

**none**—All defined linksets are included in the report to the terminal and SEAS.

**SYSTOT-STP**—System total–STP measurement collection is on or off.

**SYSTOT-TT**—System total–translation type measurement collection is on or off.

**SYSTOT-STPLAN**—System total–STP LAN measurement collection is on or off.

**COMP-LNKSET**—Component-linkset measurement collection is on or off.

**COMP-LINK**—Component-link measurement collection is on or off.

**GTWY-STP**—Gateway administration-STP measurement report is on or off.

**GTWY-LNKSET**—Gateway administration-LNKSET measurement report is on or off.

**MTCD-STP**—Maintenance daily-STP measurement collection is on or off.

**MTCD-LINK**—Maintenance daily-link measurement collection is on or off.

**MTCD-STPLAN**—Maintenance daily-STP LAN measurement collection is on or off.

**MTCD-LNKSET**—Maintenance daily-LNKSET measurement report is on or off.

## rtrv-measopts

## Retrieve Measurement Options

Use this command show the status of:

- All FTP scheduled measurements reports
- the Measurements Platform collection function (PLATFORMENABLE setting)
- the 15 Minute Measurements collection function (COLLECT15MIN setting)
- the CLI-based report file name option (CLLIBASEDNAME setting)
- the Integrated Measurements collection function (OAMHCMEAS setting)

**Keyword:** rtrv-measopts

**Legend**

**PLATFORMENABLE**—status of the Measurements Collection function

**COLLECT15MIN**—status of the 15 Minute Measurements collection function

**OAMHCMEAS**—Indicates the status of the Integrated Measurements collection function on an E5-OAM card

**CLLIBASEDNAME**—indicates whether the CLI-based file name option is turned on or off

**SYSTOTSTP**—System Total measurements report for the entire STP

**SYSTOTTT**—System Total report for Translation Type measurements

**SYSTOTSTPLAN**—System Total report STP LAN measurements

**SYSTOTIDPR**—System Total measurements report for the entire IDPR Measurements

**COMPLINK**—Component measurements report for links

**COMPLNKSET**—Component measurements report for link sets

**COMPSCTPASOC**—Component measurements report for SCTP associations

**COMPSCTPCARD**—Component measurements report for SCTP cards

**COMPUA**—Component measurements report for M3UA and SUA application server/association pairs

**GTWYORIGNI**—Gateway Administration measurements report per originating network (large network uniquely identified by NI only)

**GTWYORIGNINC**—Gateway Administration measurements report per originating network (small network identified by NI-NC)

**GTWYLSORIGNI**—Gateway Administration measurements report per link set and originating network

**GTWYLSDESTNI**—Gateway Administration measurements report per link set and destination network

**GTWYLSONISMT**—Gateway Administration measurements report per link set, per originating network, per ISUP message type

**NMLINK**—Network Management measurements report for links

**NMLNKSET**—Network Management measurements report for link sets

**NMSTP**—Network Management measurements report for the entire STP

**AVLINK**—Hourly Availability report for links

**AVLSTPLAN**—Hourly Availability report for STP LAN

**AVLDLINK**—Daily Availability report for links

## rtrv-mrn

## Retrieve Mated Relay Node

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE 5 ISS. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing feature is on and the Flexible GTT Load-Sharing feature is enabled, then use this command to retrieve MRN set information.

If the GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature is enabled, then use this command to display Alternate RI Mate information.

**Keyword:** rtrv-mrn

**Related Commands:** chg-mrn, dlt-mrn, ent-mrn

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mrnset=** (optional)

The MRN set ID.

**Range:** 1-3000 dflt

dflt—Default MRN set

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** pca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)  
Post-GTT-translated point code.

**:pci=** (optional)  
ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

### Example

**rtrv-mrn**

**rtrv-mrn:pc=1-1-2**

**rtrv-mrn:pci=s-2-2-1**

**rtrv-mrn:pcn=s-1-1-1-123-aa**

**rtrv-mrn:pci=1-55-1:mrnset=2**

### Dependencies

A point code that is specified in the command must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled. If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together. The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

If any entries are provisioned in the SCCP-SERV table, then the maximum number of entries shown for the MRN table are reduced by that amount.

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MAPSET, MAPPC, and MAPSSN fields, is displayed for all MRN Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

**Output**

The NET column is shown only when an MRN set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

### Legend

- **MRNSET**—MRN set ID
- **NET**—This field identifies the mated network type of the point code when an ITU MRN set contains both ITU-I and ITU-N point codes. The field can show I if the PC is an ITU-I point code or N if the PC is an ITU-N point code.
- **PC/PCI/PCN**—Point Code
- **RC**—Relative Cost
- **WT**—PC Weight
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group.
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within a RC group falls below the in-service threshold, that RC group is considered out-of-service, and traffic is routed to the next lowest RC group.
- **MAPSET**—This field specifies the secondary mate MAP Set.
- **MAPPEN**—This field specifies the Alternate RI Mate point code.
- **MAPSSN**—This field specifies the Alternate RI Mate subsystem number.

## rtrv-mtc-measopts

## Retrieve Maintenance Measurement Options

Use this command to show the enabled/disabled status of all hourly and daily scheduled maintenance measurements reports.

**Keyword:** rtrv-mtc-measopts

**Related Commands:** chg-measopts, chg-mtc-measopts, chg-netopts, rtrv-measopts, rtrv-netopts

**Command Class:** Link Maintenance

**Parameters**

This command has no parameters.

**Example**

**rtrv-mtc-measopts**

**Dependencies**

This command cannot be entered while in upgrade mode.

## rtrv-na

## Retrieve Network Appearance

Use this command to display the configured network appearances.

**Keyword:** rtrv-na

**Related Commands:** dlt-na, ent-na

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-na**

### Dependencies

None

### Notes

None

### Output

**rtrv-na**

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE 31.12.0

;
```

## rtrv-netopts

## Retrieve Network Options

Use this command to retrieve the user-specified options for the IP and Fast Copy (FC) networks used by the EAGLE 5 ISS. This command displays the PVN IP address, PVN subnet mask, and FC Network parameters.

**Keyword:** rtrv-netopts

**Related Commands:** chg-netopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-netopts**

**Dependencies**

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

**Notes**

None

**Output****rtrv-netopts**

```
rlghncxa03w 08-12-11 16:35:57 IST  EAGLE 40.1.0

**rtrv-npp-as****Retrieve NPP Action Set(s)**

Use this command to display a Numbering Plan Processor (NPP) Action Set (AS) entry.

**Keyword:** rtrv-npp-as

**Command Class:** Database Administration

**Parameters**

**:asn=** (optional)

Action set name. This parameter specifies the name of the AS.

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**Dependencies**

None

**Output**

The following example displays all AS entries.

**rtrv-npp-as**

```
tekelecstp 09-03-05 15:37:41 EMS EAGLE 41.0.0
```

| ASN  | CA                | SA                                       | FA             | OFNAI | REFS |

**FA**—Formatting Action

**OFNAI**—Outgoing Filter Nature of Address Indicator

**REFS**—NPP Rule References

**rtrv-npp-serv****Retrieve a NPP Service Data**

Use this command to display a Numbering Plan Processor (NPP) Service Data entry.

**Keyword:** rtrv-npp-serv

**Related Commands:** chg-npp-serv, chg-npp-srs, dlt-npp-srs, ent-npp-srs

**Command Class:** Database Administration

### Parameters

**:mode=** (optional)

This parameter allows the command to display NAI and delimiter values.

**Range:** full

**:srvn=** (optional)

Service name. This parameter specifies the name of the NPP Service.

**Range:** nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4  
nppt — NPP Test Service  
idprcdpn — IDPRCDPN Service  
idprcgpn — IDPRCGPN Service  
tif — TIF Service  
tif2 — TIF2 Service  
tif3 — TIF3 Service  
mosmsicgpn — MOSMSICGPN service  
mosmsicdpn — MOSMSICDPN Service  
mosmsgcgpn — MOSMSGCGPN Service  
mosmsgcdpn — MOSMSGCDPN Service  
iarcdpn — IARCDPN Service  
iarcgpn — IARCGN Service  
idprcdpn2 — IDPRCDPN2 Service  
idprcdpn3 — IDPRCDPN3 Service  
idprcdpn4 — IDPRCDPN4 Service

### Example

rtrv-npp-serv:srvn=tif:mode=full

rtrv-npp-serv:srvn=tif

### Dependencies

None

**Output**

The following example displays all NPP Service table entries.

**rtrv-npp-serv**

## rtrv-npp-srs

## Retrieve a NPP Service Rule Set

Use this command to display a Numbering Plan Processor (NPP) Service Rule Set entry.

**Keyword:** rtrv-npp-srs

**Related Commands:** chg-npp-serv, chg-npp-srs, dlt-npp-srs, ent-npp-srs

**Command Class:** Database Administration

### Parameters

**:asn=** (optional)

Action set name. This parameter displays the rules associated with the specified action set.

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:fdl=** (optional)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

**Range:** 1-32 \*

\*—multiple lengths of digit strings can be filtered

**:fnai=** (optional)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

**Range:** intl, natl, nai1, nai2, nai3, unkn

**intl**— filter messages with NAI=INTL

**natl**— filter messages with NAI=NATL

**nai1**— filter messages with NAI=NAI1

**nai2**— filter messages with NAI=NAI2

**nai3**— filter messages with NAI=NAI3

**unkn**— filter messages with NAI=UNKN

The **chg-npp-serv** command is used to assign values to the various FNAI classes.

**:fpfx=** (optional)

Filter prefix. This parameter specifies the prefix used to filter incoming digit strings.

**Range:** 1-16 digits, \*, ?

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (\*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

**:srvn=** (optional)

Service name. This parameter displays the rules associated with the specified service.

**Range:** nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4

**nppt**— NPP Test Service

**idprcdpn**— IDPRCDPN Service

**idprcgpn**— IDPRCGPN Service

**tif**— TIF Service

**tif2**— TIF2 Service

**tif3**— TIF3 Service

**mosmsicgpn**— MOSMSICGPN Service

**mosmsicdpn**— MOSMSICDPN Service

**mosmsgcgpn**— MOSMSGCGPN Service

**mosmsgcdpn**— MOSMSGCDPN Service

**iarcdpn**— IARCDPN Service

**iarcgpn**— IARCGPN Service

**idprcdpn2**— IDPRCDPN2 Service

**idprcdpn3**— IDPRCDPN3 Service

**idprcdpn4**— IDPRCDPN4 Service

**Example**

Display all NPP Service Rule Set table entries for a given service.

**rtrv-npp-srs**

Display NPP Service Rule Set table entries for a specified digit length.

**rtrv-npp-srs:fdl=\***

Display NPP Service Rule Set table entries for a specified filter prefix and filter digit length.

**rtrv-npp-srs:fpfx=91:fdl=16**

**Dependencies**

The value specified for the **fpx** parameter cannot have a **?** as the final character.

**Output**

Display all NPP Service Rule Set table entries for a given service.

**rtrv-npp-srs**

```
tekelecstp 10-10-28 16:41:44 EST EAGLE 43.0.0

**rtrv-oap-config****Retrieve OAP Configuration**

Use this command to display the OAP configuration information in the EAGLE 5 ISS database configured with the **chg-oap-config** command.

**NOTE:** As of Release 42.0, this command is obsolete.

**Keyword:** rtrv-oap-config

**Related Commands:** chg-oap-config

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-oap-config
```

**Dependencies**

The SEAS feature must be on (**seas=on** in the **rtrv-feat** command output) before this command can be entered.

**Notes**

None

**Output**

In the following example, the SEAS feature is on.

**rtrv-oap-config**

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
OAP CONFIGURATION REPORT
DATA                OAP A                OAP B
Hostname            tekelec-8            tekelec-9
IP Address           128.132.064.015       128.132.064.016
IP Netmask           255.255.255.000       255.255.255.000
Default Router       128.132.064.001       128.132.064.001
Config               dual                 dual
SEAC CLLI            SEASNJPYRRC           SEASNJPYRRC
X25 Packet Size      7                     7
X25 Mode             DTE                  DTE
;
```

**Legend**

**HOSTNAME**—Host name of OAP A or OAP B.

**IP ADDRESS**—IP address of OAP A or OAP B.

**IP NETMASK**—The netmask for OAP A or OAP B.

**DEFAULT ROUTER**—The IP address of the default router assigned to OAP A or OAP B.

**CONFIG**—The number of OAPs configured (single or dual).

**SEAC CLLI**—The common language location identifier (CLLI) of the SEAC to which the OAP connects.

**X25 PACKET SIZE**—The X.25 package size for the link to the SEAC (7 or 8).

**X25 MODE**—The mode of the X.25 link to the SEAC (DTE or DTC).

**rtrv-obit****Retrieve Obituary Report**

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

**Keyword:** rtrv-obit

**Related Commands:** act-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-trbl

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

**Range:** 1113,1115

**:mode=** (optional)

Display mode

**Range:**     **c, m**  
              **c**—Continuous mode; shows obituaries already logged and new obituaries as they occur.  
              **m**—Manual mode; shows obituaries on demand only, when thsi command is entered.  
**Default:**   **c**

**:num=** (optional)

This parameter specifies the number of obituaries to display.

**Range:**     **1-150**

**Default:**   **150**

### Example

**rtrv-obit:loc=1115:num=2**

### Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

Only one **rtrv-obit** or **rtrv-trbl** command at a time can be in progress throughout the entire system.

The card location specified by the **loc** parameter must be either **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

The **num** parameter value must be between **1** and **150**.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command when the command is entered for the active OAM. See **canc-cmd** for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the **mode=m** parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which includes HIPR, HIPR2 and HC MIM cards) contains significantly more information than an obituary from an X86-based processor card. The data in an IXP obituary is spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

## Output

The following example shows output for two obituaries from an x86-based card.

**rtrv-obit:loc=1115:num=2**

```

## rtrv-pct

## Display Point Code and CIC Translation entries

Use this command to display Point Code and CIC Translations.

**Keyword:** rtrv-pct

**Related Commands:** dlt-pct, ent-pct

**Command Class:** Database Administration

### Parameters

**:ecice=** (optional)

This parameter specifies the end of the Emulated Circuit Identification Code range.

**Range:** 0-16383,, \* 0-4095,, \* 0-4294967295 \*

- 0-4095—ITU TUP/ISUP
- 0-16383—ANSI ISUP
- 0-4294967295—ANSI Q.BICC

**Default:** \*

**:ecics=** (optional)

This parameter specifies the start of the Emulated Circuit Identification Code range.

**Range:** 0-16383,, \* 0-4095,, \* 0-4294967295 \*

- 0-4095—ITU TUP/ISUP
- 0-16383—ANSI ISUP
- 0-4294967295—ANSI Q.BICC

**Default:** \*

**:epc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** epca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:epci=** (optional)

ITU international destination point code with subfields *zone-area-id*.

**Range:** 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

**:epcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:** **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:filtpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **filtpca**

**Range:** **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.
