This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle America, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, products, or services.

CAUTION: Use only the Upgrade Procedure included in the Upgrade Kit.

Prior to upgrading any system, log on to <u>My Oracle Support</u> and review any Technical Service Bulletins (TSBs) that relate to this procedure. Then inform Oracle Support of your upgrade.

To contact Oracle Support by phone, refer to the <u>Oracle Support Contacts Global Directory</u>. to retrieve your countryspecific phone number.

IPv6 Migration Guide

1 Introduction

The migration of deployed platforms from an IPv4 address space to IPv6 will occur over time. Customers need a path for reconfiguring applications, on their own schedule. Therefore IPv6 migration will be offered as a procedure independent of software upgrade procedures.

1.1 Purpose and Scope

This document describes the procedures to reconfigure platform components managed with PM&C to enable dual stack IPv4 and IPv6 networking, and add IPv6 addresses to existing platform switches and interfaces. In addition, procedures are provided to remove the IPv4 addressing and services on some interfaces.

This procedure documents how to transition in service platform components to IPv6 addresses. It is not intended for initial deployments. The platform should be fully configured using IPv4 addressing.

The audience for this document includes those responsible for managing and administering the platform. The reader is assumed to be familiar with HP c7000 enclosures, RMSs, and the PM&C application.

1.2 Product Summary

This procedure targets platform components hosted on c7000 enclosures and RMS servers and managed with the PM&C application. Application requirements are not addressed. This includes application specific servers, VM guests, and network devices in c7000 enclosures or RMS servers.

The primary focus of this procedure is networking. The PM&C application requires the Platform "management" and "control" networks, and optionally a dedicated "netBackup" network. Application networks must be migrated separately. The platform management network is a routed network that is used to access system components. The control network is a private non-routed network that is used for managing target RMS and c7000 blades servers. Since this control network is private, it will *not* be migrated to IPv6. Furthermore, the PM&C OS Install feature requires IPv4 for PXE boot functionality on the control network.

1.3 References

1.3.1 External

The following references capture the source material used to create this document.

[1] Oracle Communications Tekelec Platform 7.0.x Configuration Guide, E53486, Current revision

1.4 Glossary

This section lists terms and acronyms specific to this document.

Table 1. Glossary

Acronym/Term	Definition			
Activity	Subset of events that support a task.			
Backout	The process to take a system back to a state prior to the beginning of the procedure			
Control Network	An address space that is used by PM&C to manage devices. No global IPv6 addresses are required on this network			

Software Upgrade Procedure

Table 1. Glossary

Acronym/Term	Definition					
EBIPA	Enclosure Bay IP Addressing					
External documentation	Documentation delivered to a customer, also called "customer documentation."					
Go-No-Go Step	A step that is defined as a decision point to continue or not continue the MOP execution. At this step, both customer and Oracle representative review the current MOP progress and decide whether there is enough time left in the Maintenance Window to complete the MOP and/or, if required, run the Back-Out Procedure.					
iLO	Integrated Lights Out remote management port					
Internal documentation	Documentation created and used internally to Oracle, often as source material for external documentation.					
Management Network	An address space used by Platform utilities and PM&C to discover and manage devices. This is not to be confused with any Application Management (OAM) networks.					
Method of Procedure	Set of specific customer and site instructions that define and describe the work to be completed along with the specific procedures (tasks + activities + steps) by which the work is to be performed. A MOP contains both non-technical as well as technical information. Some information is confidential between Oracle and the identified customer.					
netBackup Network	The netBackup application often uses a dedicated network, and may require host or network routes.					
OA	HP Onboard Administrator					
OS	Operating System (e.g. TPD)					
OTN	Oracle Technology Network Location of released customer documentation					
PM&C	Platform Management & Configuration application					
Procedure	Tasks + activities + steps					
Procedure table	Table that provides numbered steps with checkboxes					
RMS	Rack Mount Server A standalone compute server, not a bladed server in a c7000 enclosure.					
Rollback	The process to take a system from a Target Release back to a Source Release including preservation of databases and system configuration.					
SLAAC	Stateless Address Auto-configuration					
SNMP Simple Network Management Protocol						
Step	Specific work instruction that supports the completion of an activity.					
Task	Broad description of activities that need to occur.					
TVOE	Tekelec Virtual Operating Environment					

Software Upgrade Procedure

1.5 Conventions

T

2

3

Refer to the following example for procedural conventions used in this document. Multiple servers are involved in procedures in this manual. Some steps in the procedures begin with the name or type of server to which the step applies.

Each step has a checkbox for every command within the step that the technician should check to keep track of the progress of the procedure.

	The title box describes the operations to be performed during that step.						
Each command that the technician is to enter is in 9 point Lucida Console font							
	¥	¥	\downarrow				
	1	ServerX: Login	\$ ssh user@somehost				
	Ш						

Run command that displays output

myName

For commands containing site specific variables, the command will use syntax of <i><variable></variable></i> within the command. The						
italicized string in angle brackets should	l be replaced appropriately. The output, shown in unshaded steps, may show site					
specific configuration information. The	refore the output step often does not contain the same command responses as you					

\$ sudo netConfig --device=<variable> getHostname

will see. GUI screen captures are always shown with example inputs without additional formatting. In general, text input on a GUI view should be replaced appropriately. GUI controls will be identified using bolded 9 point **Lucida Console** font of the

button name or label.

1.6 Component Descriptions

display switch hostname

Verify output

The components addressed include the Management Server, HP c7000 enclosures, TVOE host, PM&C guest, and network devices. Network devices include c7000 enclosure and aggregations switches.

1.7 Software Release Numbering

This procedure is only applicable to Platform 7.0 or newer. The PM&C application must be on a current 6.0 release or newer.

IPv6 Migration Guide

1.8 Recommendations

The migration may be performed in phases over time, rather than in a single maintenance window. Configuring the dual IP stack on the network equipment may be done before reconfiguring the PM&C application. Application migration may be a subsequent procedure.

1.9 Supported Browsers and Versions

This procedure requires accessing services using IPv6, so the installer's host to execute the procedure must have IPv6 access to the platform.

Table 2. Supported Internet Browsers and Versions

Product Release	Supported Browsers	Versions
PM&C 6.0	Microsoft Internet Explorer	8,9 or 10
HP OA/iLO	Microsoft Internet Explorer	8 or above
HP OA/iLO	Firefox	3.6 or above

IPv6 Migration Guide

2 General Description

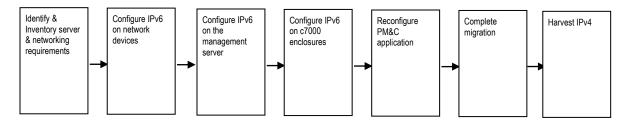

The IPv6 migration is a software reconfiguration procedure involving several components. It also involves procedures that may be executed over extended timeframes.

2.1 Process Summary

Figure 1 shows the major parts of this procedure, from inventory to a final health check.

My Oracle Support (MOS) https://support.oracle.com is your initial point of contact for all product support needs. A representative at Customer Access Support (CAS) can assist you with MOS registration. Call the CAS main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at http://www.oracle.com/us/support/contact/index.html.

Figure 1. Migration Process

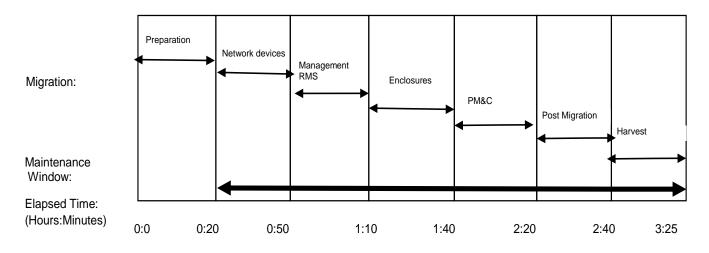

2.2 Supported Upgrade Paths

This migration procedure does not involve a software upgrade. The PM&C server must be at version 6.0 or above, and all components satisfy Platform 7.0 or above requirements.

2.3 Migration Timeline

The following shows an example timeline that assumed a single c7000 enclosure and one RMS.

Figure 2. Migration Time Line

IPv6 Migration Guide

3 Migration Overview

The basic process and approximate time required to migrate a platform to IPv6 address spaces, and to optionally backout in case of error, are show in the tables in this section.

Migration of applications shall be coordinated with or executed in parallel with the platform migration to ensure that all work is performed within the maintenance window. Note that several variables affect the times shown in the tables – the timing values shown are estimates only. The time estimates here assume a single c7000 enclosure. Scale these times if you are migrating multiple enclosures.

These procedures introduces IPv6 addresses and transition services from IPv4 to IPv6, to setup a dual IP stack and leave IPv4 services. Transition of customer services such as DNS, NTP, SNMP must be coordinated prior to this procedure. Removal of the IPv4 addresses is executed in the Harvesting procedures. In most cases, IPv4 addresses and services are left configured, and harvested at a future time.

3.1 Required Materials

There are no additional materials required for this process.

3.2 Pre-Migration Overview

The pre-migration procedures shown in this table may be executed outside of the maintenance window.

Table 3. Pre-Migration Overview

Phase/Procedure #			Downtin (Hrs:Min		Activity	Impact
	This Step	Cum.	This Step	Cum.	Activity	Impact
Software preparation	20	20	0	0	Collect information	None

3.3 Migration Execution Overview

The procedures shown in this table must be executed in the maintenance window.

Table 4. Migration Execution Overview

Phase/Procedure #	Elapsed Time (Hrs:Min)		Downtime (Hrs:Min)		Activity	Impact
	This Step	Cum.	This Step	Cum.	Activity	Impact
Procedure 1	30	50	0	0	Configure network devices	Add IPv6 stack
Procedure 2	20	1:10	0	0	Configure management server	Add IPv6
Procedure 3	30	1:40	0	0	Configure enclosures	Add IPv6, OA reset
Procedure 4	40	2:20	5	5	Configure PM&C	Application restart

3.4 Post Migration Overview

The post-migration procedures shown in this table must be executed in the maintenance window.

IPv6 Migration Guide

Table 5. Post Migration Overview

Phase/Procedure #			Downtin (Hrs:Min		Activity	Impact
Filase/Fiocedule #	This Step	Cum.	This Step	Cum.	Activity	inipact
Procedure 5	20	2:40	0	5	Cleanup and verification	None

3.5 Backout Procedure Overview

If necessary, the backout procedures shown in this table must be executed in the maintenance window. This procedure is only applicable before IPv4 harvesting.

Table 6. Backout Procedure Overview

Phase/Procedure #		lapsed Time Downtime Irs:Min) (Hrs:Min)		Activity	Import	
	This Step	Cum.	This Step	Cum.	Activity	Impact
Procedure 12	15	2:55	5	10	Recover PM&C	Application restart
Procedure 13	20	3:15	0	10	Recover OA and servers	Reset OAs
Procedure 14	20	3:35	0	10	Recover network	Network reloads

3.6 Harvest IPv4 Overview

Harvesting IPv4 addresses must be executed in the maintenance window. It is assumed this will be done in a separate window after an extended acceptance period. Therefore this is shown as a discrete procedure.

Table 7. Harvest IPv4 Overview

Phase/Procedure #			Downtii (Hrs:Mi		Activity	Impost
	This Step	Cum.	This Step	Cum.	Activity	Impact
Procedure 6	15	15	5	5	Configure PMC&C	Application restart
Procedure 7	20	35	0	5	Configure enclosures	
Procedure 9	20	55	0	5	Configure management server	
Procedure 10	15	1:05	0	5	Configure network devices	
Procedure 11	5	1:10	0	5	Verify	

3.7 Log Files

Commands executed during the migration are *not* logged automatically. Session logging requirements are left to the discretion of the application procedure. The **script** command or client side logging may be used for shell sessions. GUI interactions must be implied from various log and audit files. Log files may be subject to rotation, thus deletion. Procedures

Software Upgrade Procedure

do not preserve these on external hosts. In addition to session logging, logs in the following directories contain information that may be necessary to resolve issues:

- TVOE: /var/TKLC/log/netAdm/
- PM&C: /var/TKLC/log/netAdm/
- PM&C: /var/TKLC/smac/logs/

IPv6 Migration Guide

4 Migration Preparation

- Perform inventory and environment discovery to identify components and networking requirements.
- Perform pre-migration system health checks to establish that the system is fit to migrate.

4.1 Hardware Preparation

No hardware or firmware upgrade is required. Hardware limitations exits, such as HP G6 ILO2, or Cisco 3020 switches, All platforms must be on a supported software and firmware release, and be IPv6 capable. If older equipment not qualified for IPv6 exists, contact Oracle Support.

Software Upgrade Procedure

4.2 Software Migration Preparations

All platform components must be compatible for platform 7.0 or later releases. The components include c7000 enclosure OAs, enclosure devices, RMS hardware, RMS iLOs, and network devices.

The PM&C application is a necessary component, and must be on a supported 6.0 or later release.

The **appRev** utility may be used on TPD based hosts to determine the version. Consult release notes to identify additional requirements:

\$ sudo appRev

4.2.1 Network

Record the network information here. Only the new IPv6 platform management network is required. Other platform networks, e.g. for **NetBackup**, are necessary only if they are currently defined. The control network is not migrated. Application networks are not covered by this procedure.

Additional routing information may also be required, e.g., Virtual Routing information if it is provided by customer devices, or host or network routes. The customer should provide the following information.

SLAAC for IPv6 auto configuration is not used by default. All IPv6 addresses and routes should be collected and explicitly provisioned as static.

Network	Server Credentials					
Network	VLAN ID	IPv6 Network	IPv6 Prefix	IPv6 gateway		
Management						
NetBackup (optional)						

Routing information on the TVOE management host and PM&C guest may be displayed with:

\$ ip -4 r

Current routing on switches is displayed with:

```
$ netConfig --device=<deviceName> listRoutes
```

Host & type or function	IPv6 destination	IPv6 gateway

4.2.2 Management Servers

The management RMS that hosts the PM&C application as a guest must be migrated. If a layer 3 aggregation switch is managed, it must be migrated also. Switch access credentials should be available, but only for unforeseen issues. The following information is required:

Somer Tupo	Server Credentials					
Server Type	Login	Password	IPv4 Address	IPv6 Address		
Management Server iLO						
Management Server TVOE OS	admusr					

Software Upgrade Procedure

Somer Tuno	Server Credentials					
Server Type	Login	Password	IPv4 Address	IPv6 Address		
PM&C guest OS	admusr					
Aggregation switch "A"						
Aggregation switch "B"						
Application Server(s) iLO						

Application RMS servers will not be reconfigured, but the iLO interfaces on the Platform Management networks should be migrated with this procedure. The RMS iLO is used by PM&C to manage the service, thus should be performed with this procedure. RMS host interfaces must be configured with application specific procedures.

The management RMS OS is configured with two or three platform network bridges that need identified. Typically, they use descriptive names, e.g. "management" or "control". Applications typically add additional bridges. From this TVOE host, the following command will display the bridge names that can be used to help identify devices:

\$ sudo netAdm show --type=Bridge

TVOE Bridge	Bridge Name
Management	
NetBackup (optional)	

4.2.3 C7000 Enclosures

The system may include multiple c7000 enclosures. For each c7000 enclosure, the below information is required. The enclosures may be displayed from the PM&C GUI or with the command:

\$ sudo pmaccli getProvEnclosures

The Enclosure may have multiple interconnect devices, but only the primary "A" and "B" switches in bays 1 and 2 are migrated within this platform procedure. Additional interconnect devices are dedicated for application use, so they should be migrated with application specific procedures. EBIPA addresses should be allocated for each device bay, but EBIPA interconnect addresses may be applied only to populated bays. Switch access credentials should be recorded, but are only required for unforeseen issues.

Server Type	Server Credentials					
Server Type	Login	Password	IPv4 Address	IPv6 Address		
c7000 Enclosure OA "A"						
c7000 Enclosure OA "B"						
EBIPA for device iLOs						
EBIPA for interconnects						
Enclosure switch "A"						
Enclosure switch "B"						
Other interconnect devices						

IPv6 Migration Guide

4.2.4 Services

The following services may be used by the platform. If IP addresses are used rather than hostnames resolved by a name service, document the IPv6 addresses below. Name service resolution for services supporting IPv4 and IPv6 is outside the scope of this procedure and is assumed to resolve as desired by the customer.

Service	Service Credentials						
Service	Login	Password	IPv4 Address	IPv6 Address			
DNS primary							
DNS secondary							
NTP 1							
NTP 2							
NTP 3							
LDAP							
SNMP notification target							

5 Software Migration Procedures

To contact Oracle Support by phone, refer to the Oracle Support Contacts Global Directory.

Before beginning the migration, users must perform a system health check. Refer to section 8. This check only ensures that the system does not have any know issues. Performing the system health check determines alarms present in the system, however the procedure may proceed with alarms raised; Contact Oracle support.

Please read the following notes on procedures:

- Procedure completion times shown here are estimates. Times may vary due to differences in user experience, and user preparation.
- Command steps that require user entry are indicated with shaded step numbers.
- Shaded area within response steps must be verified to successfully complete that step.
- Where possible, EXACT command response outputs are shown. EXCEPTIONS are as follows:
 - When explicitly documented as an example.
 - System-specific configuration information such as *addresses*, *hostnames*, and *system features*.
- After completing each step and at each point where data is recorded from the screen, the technician performing the upgrade must initial each step. A check box should be provided.
- Captured data is required for future support reference if no Oracle service technician is present during the procedure.

**** WARNING ****

Some of the procedural steps must be executed on multiple devices. In particular, the network configuration typically must be performed on pairs of switches, or over a variable number of enclosures. Other steps may require multiple commands for duplicated services, e.g. NTP or SNMP.

Software Upgrade Procedure

5.1 Configure Switches

This procedure will add IPv6 addresses on the Aggregation and Enclosure switches, using the **netConfig** utility. This procedure requires that the **netConfig** has been properly setup on the PMAC (or Management server) during system installation and subsequent upgrade activities. For information about **netConfig** setup, see Reference [1].

Note that this procedure has optional steps to handle either Layer 2 or Layer 3 Aggregation switch configurations, as well as deployments without Oracle provided/managed aggregation switches.

S T E	Use this procedure to configure IPv6 on network devices. Estimated time of completion: 30 minutes Check off (\sqrt{y} each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.		
Р	Task	Description	
1	PM&C: Login	Login to the PM&C host on the management server	
		\$ ssh admusr@ <i><pm&c_ipv4_address></pm&c_ipv4_address></i>	
2	Backup netConfig data	Backup the pre-migration netConfig repository	
		<pre>\$ sudo cp -p /usr/TKLC/plat/etc/TKLCnetwork-config/model.xml /var/TKLC/smac/backup/model.xml-premigrate</pre>	
3	List backup services	Display the SSH services defined to netConfig for backup.	
		<pre>\$ sudo netConfigrepo listServices grep -C 1 ssh</pre>	
4	Identify service name	Note the name of the service on the PM&C server by the Host address (in the example below, "pmacSCP"): Service Name: pmacSCP Type: ssh	
		Type: ssh Host: 10.240.72.40	
		Typically, a single SSH service is defined, however other services such as TFTP may be used. After the service name is identified, use the same command to list all properties, including the userid:	
		<pre>\$ sudo netConfigrepo showService name=<service></service></pre>	

IPv6 Migration Guide

5		Service Name: pmacSCP Type: ssh Host: 10.240.72.40 Options: password: FC076474A8F1ECB8 user: pmacuser Record the service and user name here.
		netConfig backup service:
6	List aggregation switches	If aggregations switches are managed, find their names in netConfig. Otherwise, skip to step 8. (Supported aggregation switches are Cisco 4948E or 4948E-F): \$ sudo netConfigrepo listDevices grep -B3 4948E
7	Identify aggregation switches	Note the names of the devices found (in the example below, "aggA" and "aggB"). Record in step 10: Device: aggB Vendor: Cisco Model: 4948E-F Device: aggA Vendor: Cisco Model: 4948E-F The following command may be useful to help resolve devices: \$ sudo netConfigrepo showDevice name= <device></device>
8	List enclosure switches	<pre>Find all enclosure switch names in netConfig. (Supported enclosure switches are HP 6120 or 6125) : \$ sudo netConfigrepo listDevices grep -B3 -e 6120 -e 6125</pre>
9	Identify enclosure switches	Note the names of the devices found (in the example below, "en1swA" and "en1swB"). Record in step 10: Device: en1swA Vendor: HP Model: 6120 Device: en1swB Vendor: HP Model: 6120

10	Identify all switches	<pre>in the previous steps will be configured be used to gather more information: \$ sudo netConfigrepo listD \$ sudo netConfigrepo showD</pre>	pevice name=< <i>device></i> g. "Cisco 4948 agg switch A" => "aggA").
		Backup Device □ □	netConfig name
11	Backup the devices	 Perform a backup of <i>all</i> aggregation an using the service name found in step 5 unique name for each of the backups¹ \$ sudo netConfigdevice=<na service="<service"> filenam</na> 	:
	Add IPv6 address	Add the IPv6 management address to 4.2.3. For aggregation devices, use the follow VLAN ID: \$ sudo netConfigdevice= <na interface=VLAN<id> ip=<a For enclosure devices use: \$ sudo netConfigdevice=<na interface=management ip=</na </a </id></na 	ving command with the management ame> setInterface device_IPv6_address> ame> setInterface

¹ Backup files depend upon the service. SSH backup files are stored in the home directory of the "user" specified in the netConfig service. TFTP backup services should have a "dir" option in the netConfig service definition.

13	Verify	For aggregation devices:
		<pre>\$ sudo netConfigdevice=<name> getInterface interface=VLAN<id></id></name></pre>
		For enclosure devices:
		<pre>\$ sudo netConfigdevice=<name> getInterface interface=management</name></pre>
14	Determine virtual L3 routing	Layer 3 aggregation switches typically use Virtual Routing when configured as Layer 3 devices. If an IPv4 virtual route exists, an IPv6 one must also be defined.
		Display the non-application VLANs from Section 4.2.1 with this command:
		<pre>\$ sudo netConfigdevice=<name> getVR interface=VLAN<id></id></name></pre>
15	Identify VR Goup and Track ID	The lack of any output means no virtual routing is necessary; skip to step 27. Otherwise continue. Use the Group and Track indexes in the output for <groupid></groupid> and <trackid></trackid> respectively:
		Group: 1 Hellotime: = (1.000 1.000
) Preemption: enabled State: Backup VIP: 10.240.72.38
16	Determine tracking objects	Each Virtual Router in an L3 deployment should track an uplink using a tracking object. Identify the existing tracking objects:
		<pre>\$ sudo netConfigdevice=<name> listTrackingObject Group: = (<trackid> <trackid>)</trackid></trackid></name></pre>
17	Record the VR group that tracks each object	For each of the tracking objects identified in the previous step, execute the following command and record which virtual routers are tracking the object. Record the vlan <id>and <groupid></groupid></id> for the given <trackid></trackid> :
		<pre>\$ sudo netConfigdevice=<name> getTrackingObject id=<trackid></trackid></name></pre>
		Interface: GE47
		Tracked by: VRRP Vlan <id> <groupid></groupid></id>
		Status: Down
		Note: More than one virtual router may track a single tracking object. It is important to record all virtual routers (vlan id and group id) that track each tracking object.

18	Add the virtual router	Run the same command ² on both mated aggregations switches for all required VLANs (active or standby states do not need to be examined; execute in either order): \$ sudo netConfigdevice= <name> addVR interface=VLAN<id> id=<groupid> track=<trackid> addrType=autoconfig priority=100 preempt=yes</trackid></groupid></id></name>
19	Verify new virtual router	On both aggregations switches, the following command should report the same virtual IPs: \$ sudo netConfigdevice=<name> getVR interface=VLAN<id></id></name>
20	Record IPv6 virtual IPs	<pre>Within the output will be the State, and VIP addresses for both IPv4 and IPv6: Standby: local Group: = (1 1) Hellotime: = (1.000 1.000) Preemption: = (enabled enabled) Priority: 100 State: = (Active Active /) VIP: = (FE80:15:73FF:FEA0:1 10.240.72.38) If the states are not Active or Standby, wait 10 seconds and try again. Record the link local addresses³: management IPv6 VIP: If netBackup is used, VIP:</pre>

² The "Type=autoconfig" is an option of the HSRP configuration, and does not imply that SSLAC is enabled.

³ The IPv6 virtual routing may use a link-local IPv6 VIP. This value is selected by the switch. In this step, we determine the value assigned by the switch, so it can be used later for configuring default routes on the hosts using this network.

IPv6 Migration Guide

21	Verify the virtual router(s) are tracking the appropriate objects.	For each tracking object identified in the previous step, verify the correct virtual routers are tracking the object: \$ sudo netConfigdevice= < <i>name></i> getTrackingObject id= <trackid> Interface: GE47 Tracked by: = (VRRP Vlan<id> <groupid> HSRP Vlan<id> <groupid>) Status: Up</groupid></id></groupid></id></trackid>
22	Identify IPv4 Routes	Identify all of the IPv4 routes that are configured. \$ sudo netConfigdevice= < <i>name</i> >listRoutes Netmask: = (255.255.255.0 255.255.255.255) Network: = (192.168.0.0 0.0.0) Next Hop: = (192.168.1.1 192.168.2.1)
23	Configure matching IPv6 Routes	Configure IPv6 routes where needed. Run the following command for each network requiring an IPv6 route: \$ sudo netConfigdevice= <name> addRoute network=<ipv6 network>/<prefix length=""> nexthop=<ipv6 address=""> Example, for the default route: \$ sudo netConfigdevice=<name> addRoutes network=::/0 nexthop=fd1d::1 Note: If the nexthop is a linklocal address (fe80::/64) an interface is required. The interface used should be the vlan interface of the network where the linklocal address exists and should use the following format: \$ sudo netConfigdevice=<name> addRoutes network=fd1d::/1%VLAN2 nexthop=fe80::1</name></name></ipv6></prefix></ipv6 </name>

Verify the routes	Verify the routes have been configured: \$ sudo netConfigdevice= < <i>name></i> listRoutes Interface: VLAN2 Netmask: = (255.255.255.0 255.255.255.0 255.255.255.255) Network: = (192.168.00 0.0.0 2001:DB8::/32 ::/0) Next Hop: = (192.168.1.1 192.168.2.1 FD0D:DEBA:D97C:FF1:5054:FF:FE3A:FC2B FE80::1 FD0D::DEBA:D97C:FF1:5054:FF:FE3A:FC2B FE80::1 FD0D::1) Note: In the example above, Interface: VLAN2 corresponds to the route with the linklocal nexthop.
25 Verify Network	 The preceding step is executed on <i>both</i> aggregation switches. After both switches are configured, the Active or Standby State should be associated with a single switch. i.e. if for a given VLAN, all 4 states are State = Active, or none are Active stop and contact Oracle support. As an optional test, ping the newly assigned addresses on the Aggregation switche. This may be done from the installer's laptop, another switch, or external hosts, depending upon IPv6 support and the current configuration. The follows assumes a Linux client: For each switch: Verify the management interface: \$ ping6 -c 5 <i><ipv6_address></ipv6_address></i> Verify any IPv6 Virtual Route interfaces on management VLANs using VIPs recorded in step 16 (Link local addresses often must be scoped to a specific interface): \$ ping6 -I <i><interface> -c 5 <ipv6_virtual_addresss></ipv6_virtual_addresss></interface></i>
26 □	IPv6 networking is now configured on the network devices. The rest of this procedure is optional, and may depend upon the customer's support. SNMP alarming requirements for IPv6 and/or IPv6 should be understood.

27	IPv4 service disposition	The host based IPv4 services may be deleted, or left in service. The customer determines when services will be migrated; therefore the rest of this procedure is optional. If all IPv4 services will be left configured, continue to the next procedure.
		Note: If Layer 3 VRs were defined, IPv4 VIPs are always left configured. Host based services may be removed, but host networking is left in a dual stack mode.
28	Show NTP	For each switch, show current NTP servers.
		<pre>\$ sudo netConfigdevice=<name> listNTP</name></pre>
29	Add IPv6 NTP	If NTP is not used, skip to step 32; otherwise, for each switch, add the NTP servers documented in Section 4.2.4. There may be multiple NTP servers.
		Aggregation switches do not support NTP over IPv6.
		<pre>For HP 6210 switches, use: \$ sudo netConfigdevice=<name> addNTP server=<ipv6_server> priority=3</ipv6_server></name></pre>
		For HP 6215 switches switches, use: \$ sudo netConfigdevice=< <i>name></i> addNTP server= <ipv6_<i>server></ipv6_<i>
30	Remove IPv4 NTP	For each switch, remove the old IPv4 service:
		Note: Leave Aggregation IPv4 NTP services if defined.
		<pre>\$ sudo netConfigdevice=<name> deleteNTP server=<ipv4_server></ipv4_server></name></pre>
31	Verify NTP	For each switch, verify NTP servers.
		<pre>\$ sudo netConfigdevice=<name> listNTP</name></pre>
32	Show current SNMP	<pre>\$ sudo netConfigdevice=<name> listSNMPNotify</name></pre>
33	Note IPv4 addresses and community strings	If no output is displayed, skip to step 36; otherwise continue to replace the IPv4 addresses with IPv6. Since there is no editSNMP, you must delete the old and add the new, using the Auth and options here.
		Host: = (10.240.72.40
) Auth: =(Public)
34	Add IPv6 SNMP targets	For each device with an SNMP IPv4 SNMP destination, add the IPv6 target documented in Section 4.2.4:
		<pre>\$ sudo netConfigdevice=<name> addSNMPNotify host=<ipv6_target> auth=<community></community></ipv6_target></name></pre>

35	Remove IPv4 SNMP targets	Optionally remove the SNMP IPv4 SNMP destinations shown in step 32:
		<pre>\$ sudo netConfigdevice=<name> deleteSNMPNotify host=<ipv4_target> auth=<community></community></ipv4_target></name></pre>
36	Show syslog	<pre>\$ sudo netConfigdevice=<name> listRemoteLogging</name></pre>
37	Note IPv4 addresses	If no output is displayed, skip to step 40; otherwise continue to replace the IPv4 addresses with IPv6. You must delete the old and add the new remote host.
		Server: 10.240.72.40
38	Add IPv6	For each device with an IPv4 syslog destination, add the IPv6 target documented in Section 4.2.4: HP 6120 switches do not support IPv6 syslog.
		<pre>\$ sudo netConfigdevice=<name> addRemoteLogging server=<ipv6_address></ipv6_address></name></pre>
39	Remove IPv4	Optionally remove the IPv4 syslog destinations shown in step 36: Note: Leave HP 6120 IPv4 syslog services if defined. \$ sudo netConfigdevice= <name> deleteRemoteLogging server=<ipv4_address></ipv4_address></name>
40	Logout	\$ exit
End of Procedure		

Software Upgrade Procedure

5.2 Configure Management Server Dual IP Stack

This section must be performed on the management server that hosts the PM&C guest. This procedure may be reused for Application RMS servers to configure the iLO. Since the iLO management is not directly used by, or impacted by, applications, this task may be done with this platform procedure. Only the iLO interface is updated. Application servers are reconfigured here because of the PM&C use of the iLO for managing servers.

Procedure 2 Configure Management Server

S T E	Use this procedure to configure an IPv6 stack on the management server. Estimated time of completion: 15 minutes <i>Check off</i> ($$) <i>each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>	
Р	Task	Description
1	Management Server iLO: Login	Login to the iLO on the management server using a supported browser https:// <ilo_ipv4_address></ilo_ipv4_address>
2	View current configuration	Navigate to the network configuration: Network -> iLO Dedicated Network Port Expand All + Information + iLO Federation + Remote Console + Virtual Media + Power Management - Network iLO Dedicated Network Port Shared Network Port

Software Upgrade Procedure

3	Enable IPv6 services	Select the IPv6 tab and update the IPv6 settings. Check the use IPv6 first checkbox. Unless applications procedures specify otherwise, disable SLAAC, DHCPv6, and DNS. Scroll down and continue with the next step.
		iLO Dedicated Network Port - IPv6 Settings
		Summary General IPv4 IPv6 SNTP
		Changes to IPv6 configuration may require an iLO reset in order to take effect.
		✓ iLO Client Applications use IPv6 first
		Enable Stateless Address Auto Configuration (SLAAC)
		Enable DHCPv6 in Stateful Mode (Address)
		Use DHCPv6 Rapid Commit
		Enable DHCPv6 in Stateless Mode (Other)
		Use DHCPv6 Supplied DNS Servers
		Use DHCPv6 Supplied NTP Servers
		Primary DNS Server
		Secondary DNS Server
		Tertiary DNS Server
		Enable DDNS Server Registration

4	Configure static IPv6 addresses	Update the Static IPv6 Address and Default gateway. Refer to Section 4.2.3. Then press the Submit button. Note: The gateway may be the customer provided gateway from Section 4.2.1 or the Layer 3 VR optionally created in Procedure 1.
		iLO Dedicated Network Port - IPv6 Settings
		Summary General IPv4 IPv6 SNTP
		Address Prefix Length Status
		Static IPv6 Address 1 FD0D:DEBA:D97C:EE3::9 64 Active
		Static IPv6 Address 2 Unknown
		Static IPv6 Address 3 Unknown
		Static IPv6 Address 4 Unknown
		Static Default Gateway fe80::669e:f3ff:feeb:6f7f
		Static Route # 1 (Destination) Unknown
		(Gateway)
		Static Route # 2 (Destination) Unknown
		(Gateway)
		Static Route # 3 (Destination) Unknown
		(Gateway)
		Submit Reset
5	Reset the iLO	Press the Reset button that is enabled after the settings from the previous step are verified. A pop-up will ask to authorize a reset.
		iLO Dedicated Network Port - IPv6 Settings
		Summary General IPv4 IPv6 SNTP
		(Gateway)
		Static Route # 3 (Destination) Unknown
		(Gateway)
		Submit Reset
] 9	Login with IPv6 address	Wait 30 seconds for the iLO to reset, then login with the new IPv6 address to verify.
		https://[<i><il0_ipv6_address></il0_ipv6_address></i>]

7	Change NTP if necessary	Optionally, NTP may be configured with IPv6 addresses. If desired, update the primary and optionally secondary server, then press the Submit and Reset buttons.
		ILO Dedicated Network Port - SNTP Settings Summary General Pv4 Pv6 SNTP Note: DHCPv4 is currently disabled. To use DHCPv4 Supplied Time Settings, enable DHCPv4 in the IPv4 tab first. Note: Stateless DHCPv6 is currently disabled. To use DHCPv6 Supplied Time Settings, enable Stateless DHCPv6 in the IPv6 tab first. Changes to SNTP configuration may require an ILO reset in order to take effect. Primary Time Server, Secondary Time Server, Time zone, and Time Propagation settings are shared between all ILO Network Ports. Use DHCPv4 Supplied Time Settings Use DHCPv6 Supplied Time Settings Propagate NTP Time to Host Primary Time Server Secondary Time Server Time Zone Europe/London (GMT)
8	Logout	Press the Sign Out button when compete.
9	Application RMSs	If Application RMS servers exist, the iLOs may be updated. Unless directed otherwise, the preceding steps may be used to configure IPv6 addresses on application RMS iLOs.
10	Management server: Login	Login to the TVOE host on the management server \$ ssh admusr@ <tvoe_ipv4_address></tvoe_ipv4_address>
11	Add IPv6 address	Add the IPv6 address of the Management Server to the management bridge as recorded in Section 4.2.2. \$ sudo netAdm settype=Bridgename= <management> address=<ipv6_address>netmask=<ipv6_prefix></ipv6_prefix></ipv6_address></management>
12	Verify dual IP stack	Both the old IPv4 and new IPv6 address should be displayed \$ sudo netAdm querytype=Bridgename= <management></management>

13	NetBackup requirements	If the NetBackup feature is implemented, a dedicated bridge may exist and require an IPv6 address as well.		
		List the bridges. Devices other than the management and control likely need an IPv6 address added using commands in the previous steps.		
		<pre>\$ sudo netAdm showtype=Bridge</pre>		
14	Determine routing requirements	If static routes are not required, skip to step 16. Otherwise add routes to the management host from Section 4.2.1.		
		Typically, IPv4 static routes require a similar IPv6 route, but consult network engineers. If netBackup is used, it may require a route.		
15	Add routes as required	Use netAdm to add routes. An example to add a default route may look like:		
		<pre>\$ sudo netAdm add routeroute=defaultdevice=management</pre>		
		An example to add a network route is:		
		<pre>\$ sudo netAdm add routeroute=netdevice=netbackup address=2001:1::netmask=96gateway=fe80::99</pre>		
16	Verify IPv6 routes	To verify the routes, the ip command, or preferably ping6 may be used.		
		\$ ip -6 route		
		<pre>\$ ping6 -c 3 <ipv6_gateway></ipv6_gateway></pre>		
17	Check for IPv4 rules	If IPv4 rules for the conserver service exist, they must be added for IPv6.		
		<pre>\$ sudo iptablesAdm showtype=ruleprotocol=ipv4</pre>		
18	Verify if IPv6 rules required	If rules were found:		
		Persist Domain Table Chain Match		
		yes 10platnet filter INPUT -s yes 10platnet filter INPUT -s		
		Continue with the next step to add the IPv6 rules. Otherwise skip the step.		
19	Verify they do not exist	If IPv6 rules for the conserver service already exist, skip the next step.		
		<pre>\$ sudo iptablesAdm showtype=ruleprotocol=ipv6</pre>		
		Output from the proceeding command implies the rules exist and the next step is skipped.		

20	Add IPv6 firewall rules	Add the two rules show in the previous step to the IPv6 firewall. Replace <i>"<pmacipv6>"</pmacipv6></i> with the PM&C IPv6 management address.		
		<pre>\$ \$ sudo iptablesAdm appendtype=ruleprotocol=ipv6 domain=10platnettable=filterchain=INPUT match="-s <pmacipv6>/128 -p tcpdport 782 -j ACCEPT" persist=yes </pmacipv6></pre>		
		<pre>\$ sudo iptablesAdm appendtype=ruleprotocol=ipv6 domain=10platnettable=filterchain=INPUT match="-s <pmacipv6>/128 -p tcpdport 1024:65535 -j ACCEPT" persist=yes</pmacipv6></pre>		
21	Verify the new rules exist	<pre>\$ sudo iptablesAdm showtype=ruleprotocol=ipv6</pre>		
22	Verify management server requirements	The management server may provide or require IPv6 services. If client services, such as NTP services or SNMP targets, are defined by IPv4 addresses rather than names, they must be updated.		
		Refer to Reference [1].		
23	Logout	\$ exit		
24 □	Application RMS servers	Application RMS servers are managed by PM&C over the iLO interface. Those RMS server iLOs may be migrated to IPv6 at this time – baring Application requirements. Steps 1 through 8 may be executed on each Application RMS server.		
		Note: If this is executed, you will update the target RMSes in procedure 4 also.		
	End of Procedure			

IPv6 Migration Guide

5.3 Configure Enclosure Dual IP Stack

Procedure 3 Configure Enclosures

S T E	Use this procedure to configure an IPv6 stack on c7000 enclosures Estimated time of completion: 30 minutes <i>Check off</i> ($$) <i>each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>	
Р	Task	Description
	Identify all c7000 enclosures	Each enclosure must be individually configured. The following steps are repeated for each enclosure in Section 4.2.3.
2	OA: Login	Login to the active OA using a supported browser. https:// <oa_ipv4_address> If the OA is in Standby mode, login with the other IPv4 address: Standby Onboard Administrator Firmware Version 4.21 This Onboard Administrator is in Standby mode. Also ensure the system Status is OK. Status Connection OK Primary</oa_ipv4_address>

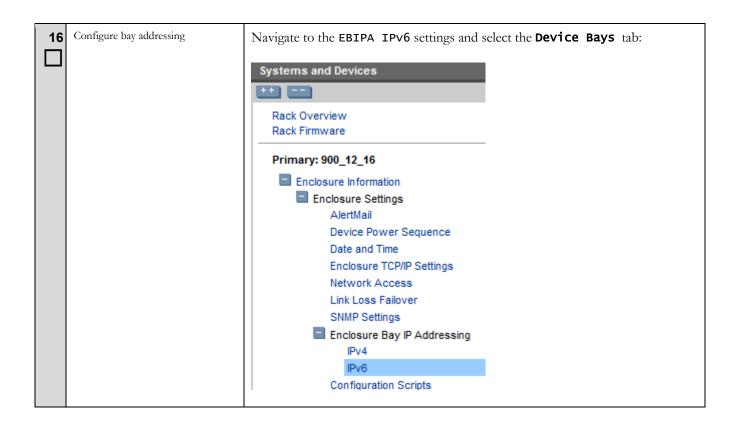

3	Backup OA configuration	Navigate to the Configuration Scripts:		
Ш		Enclosure Information -> Enclosure Settings -> Configuration Scripts		
		Systems and Devices		
		Rack Overview Rack Firmware		
		Primary: 900_12_16		
		Enclosure Information		
		Enclosure Settings		
		Device Power Sequence		
		Date and Time		
		Enclosure TCP/IP Settings Network Access		
		Link Loss Failover		
		SNMP Settings		
		Enclosure Bay IP Addressing Configuration Scripts		
4	Display config as a script	View the configuration script. Click on the SHOW CONFIG link. This will open a new tab or window.		
Ш		a new tab or window.		
		Enclosure Settings - 900_12_16		
		Configuration Scripts		
		A configuration script may be used to automate the setup process for this enclosure. If you have a script file on a local drive you may upload it. If the script is located on a web server you may provide the URL to the script.		
		Note: Do not directly apply a configuration script from another enclosure without removing or changing possibly unique settings such as the enclosure Asset Tag, enclosure name, static IP addresses and EBIPA settings.		
		SHOW CONFIG: Click to view a configuration script containing the current settings for this enclosure.		
		SHOW ALL: Click to view a script containing a list of the enclosure's current inventory.		
5	Save the script	Save the text in the window to a file, as applicable for the browser (e.g. File->Save or <control>-s). A copy should also be placed on the PM&C server using scp in the following directory:</control>		
		/var/TKLC/smac/backup		

6	View the IP settings	Navigate to the TCP/IP configuration:
Ш		Enclosure Information -> Enclosure Settings -> Enclosure TCP/IP Settings
		Systems and Devices
		Rack Overview

5.4 Migrate PM&C IP addressing

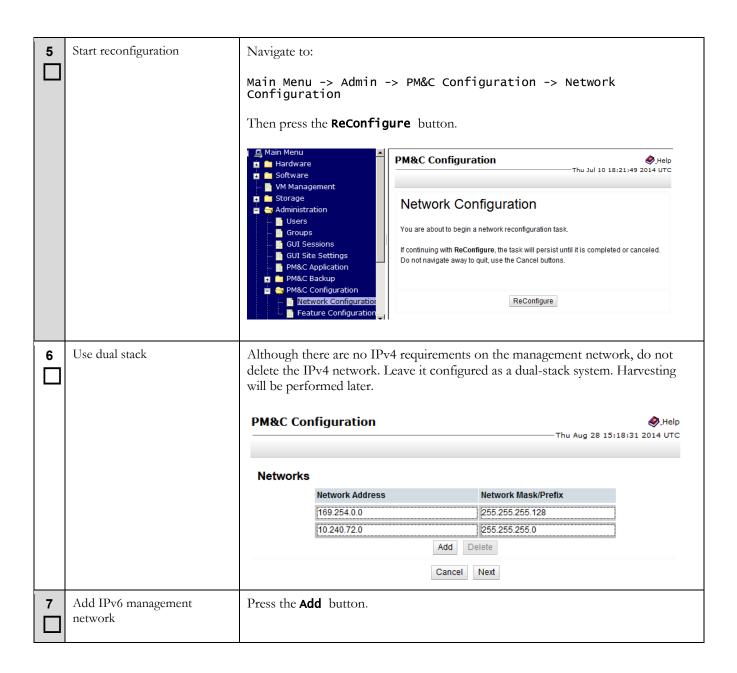

**** WARNING ****

The PM&C application reconfiguration is presented as a wizard. There is no "back" button, and you should not use the browser's back button; cancel and restart if you make an error. If you navigate away from the wizard, the process is left in progress. Returning to the wizard will ask you to finish or cancel the in-progress task. The safe response is to cancel and restart the reconfiguration. Use the **cancel** button to quit the wizard.

Procedure 4. Reconfigure PM&C

STEP	Use this procedure to migrate the PM&C application to IPv6 addressing. Estimated time of completion: 15 minutes Check off ($$) each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.					
•	Task	Description				
1	PM&C: Login to GUI	Login to the PM&C from a s	Login to the PM&C from a supported browser

5.5 Migration Completion

Procedure 5 Finish Migration

S T E P	Use this procedure to complete the migration procedure. Estimated time of completion: 20 minutes Check off ($\sqrt{2}$ each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.				
-	Task	Description			
	Health check	Execute the health check procedure in Procedure 15.			
2	Update netConfig repository	All devices identified in Procedure 1 Step 10 must replace the IPv4 management address with the new IPv6 addresses in the netConfig repository. Devices shown in the following command should have IPv6 address listed in Section 4.3.2 \$ netConfigrepo listDevices grep Device: Run the following command for each device:			
		<pre>\$ sudo netConfigrepo editDevice name=<name></name></pre>			

3	Update addresses	<pre>In the example interactive session below, press enter for any data that does not need to be changed, but enter new IPv6 addresses with appropriate. The prompting is device specific, and subject to change: Access network address [10.240.72.27]: fd0d:deba::1:1/64 Firmware service [pmacSCP]: Firmware filename [Z_14_37.swi]: Initialization Management Options What is the IPv4 (CIDR notation) or IPv6 (address/prefix notation) address for management? [10.240.72.27/24]: fd0d:deba::1:1/64 Live Network Credentials Platform access username [tklc]: Platform user password [***]: Device privileged mode password [***]: Device named en9001216bay1R successfully edited.</pre>
4	List netConfig services	Services with IPv4 management addresses must be replaced with the new IPv6 addresses in the netConfig repository. Display the services with: \$ sudo netConfigrepo listServices grep "Service Name:"
5	Update netConfig repository	Run the following command for each service: \$ sudo netConfigrepo editService name =< <i>name</i> > Note: this is changing the services used by netConfig ; it does not remove the actual service.
6	Update addresses	<pre>In the example interactive session below, press enter for any data that does not need to be changed, but enter new IPv6 addresses with appropriate: Note: Edit may only modify existing options. To add or delete options, delete the service. Service Host? [10.240.72.40]: fd0d:deba::1/64 Enter a new password [***]: Enter the value for user [pmacuser]: Service named pmacSCP successfully edited.</pre>
7	Sanity test	As a final netConfig validation, run the validate command to login to each device in the repository. <pre>\$ sudo netConfigrepo validate</pre>
8	Backup network	Perform a backup of <i>all</i> aggregation and enclosure switches recorded in Procedure 1 step 10 using the service name found in step 5. The filename option should specify a unique name for each of the backups: \$ sudo netConfigdevice= <name> backupConfiguration service=<service> filename=<device>-postmigrate</device></service></name>

9 10	Save backups Backup the PM&C	<pre>Move netConfig backup files to the backup directory to preserve files with PM&C backups. Replace <user> with the userid noted in Procedure 1 Step 4: \$ sudo mv ~<user>/*migrate* /usr/TKLC/smac/etc/switch/backup Note: If the backup directory does not exist, create it with: \$ sudo mkdir /usr/TKLC/smac/etc/switch/backup In the PM&C GUI, navigate to the Backup: Main Menu -> Administration -> PM&C Backup -> Perform Backup Select the appropriate Media for the site, enter a Comment, and then press the</user></user></pre>
		Backup button.
11	Verify PM&C discovery	In the PM&C GUI, navigate to the Software Inventory, and verify c7000 and RMS systems are discovered. The IP Addresses will show the control network IPv4 address by default. Main Menu -> Software -> Software Inventory Main Menu Hardware Software Inventory Manage Software Inventory Manage Software Inventory Manage Software Inventory Manage Software Inventory Manage Software Inventory Status and Manage

12	Verify c7000 remote management	Test iLO access for a sample of c7000 blades using IPv6. At least one per c7000 enclosure. Login to the OA GUI and navigate to Enclosure Info -> Device Bays -> [bay] -> iLO Systems and Devices +++ Rack Overview Rack Firmware Primary: 900_12_16 Enclosure Information
		 Enclosure Settings Active Onboard Administrator Standby Onboard Administrator Device Bays 1. hostname1346777089 3. hostnamee45afa59aba9 4. hostname750a9ccbd0e4 5. G8bay5 iLO
13	Open iLO session	Select the global IPv6 address from the iLO Remote Management radio button then click on a link to open the iLO session. Once the console window displays, it may be closed; the test passed. Logout of the OA GUI when complete. Management Processor IPv6 Information Link Local Address fe80::6e3b:e5ff:fea1:4a4e/64 DHCPv6 Address fd0d:deba:d97c:ee3::2:5/7 iLO Remote Management Select the address that will be used for the links in the section below. C 10.240.72.15 fe80::6e3b:e5ff:fea1:4a4e (Link Local Address) Test:fiftea1:4a4e (Link Local Address) Clicking the links in this section will open the requested iLO sessions in new windows using single sign-on (SSO), which does not require an iLO username or password to be entered. If your browser settings prevent new popup windows from opening, the links will not function properly.
		If your browser settings prevent new popup windows from opening, the links will not function properly. Web Administration Access the iLO web user interface. Integrated Remote Console

14	netBackup?	If netBackup is used, verify netBackup is using IPv6 for the backup. Since this is a customer provided service, this must be performed by the customer.			
	End of Procedure				

6 Harvest IPv4

To contact Oracle Support by phone, refer to the Oracle Support Contacts Global Directory.

Before beginning the address harvesting, users must perform a system health check. Refer to section 8. This check only ensures that the system does not have any know issues. Performing the system health check determines alarms present in the system, however the procedure may proceed with alarms raised; Contact Oracle support.

**** WARNING ****

Some of the procedural steps must be executed on multiple devices. In particular, the network configuration typically must be performed on pairs of switches, or over a variable number of enclosures.

6.1 Harvest PM&C addresses

**** WARNING ****

The PM&C application reconfiguration is presented as a wizard. There is no "back" button, and you should not use the browser's back button; cancel and restart if you make an error. If you navigate away from the wizard, the process is left in progress. Returning to the wizard will ask you to finish or cancel the in-progress task. The safe response is to cancel and restart the reconfiguration. Use the **cancel** button to quit the wizard.

Procedure 6 Harvest PM&C IPv4 addresses

S T E P	Use this procedure to reconfigure PM&C to remove unused IPv4 addresses. Procedure 4 is a prerequisite. Estimated time of completion: 15 minutes Check off ($\sqrt{2}$ each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.

Г

Software Upgrade Procedure

6.3 Harvest Management Server addresses

This section must be performed on the management server that hosts the PM&C guest. This procedure may be reused for Application RMS servers. Since the iLO management is not directly used by, or impacted by, applications, this task may be done with this platform procedure. Only the iLO interface is updated; Application TVOE host addresses should be configured with the application migration.

Procedure 8 Harvest iLO IPv4 addresses

S T E P	Estimated time of completion: 20 minutes Check off (\mathbf{v} each step as it is completed. Shaded steps indicate: eray = input, white = output, black = Go-No-Go.		
	Task	Description	
	Management Server iLO: Login	Login to the iLO on the management server	
		https://[<i><ilo_ipv6_address></ilo_ipv6_address></i>]	
2	View current configuration	Navigate to the network configuration: Network -> iLO Dedicated Network Port Expand All + Information + iLO Federation + Remote Console + Virtual Media + Power Management - Network LO Dedicated Network Port Shared Network Port	

C	Delete IPv4 addresses	Select the IPv4 tab and update the IPv4 Addres, Mask and Gateway is use 0.0.0.0.
3	Delete IFV4 addresses	Scroll down and press the Submit button. The pending changes notice shown below will be displayed.
		iLO Dedicated Network Port - IPv4 Settings
		Summary General IPv4 IPv6 SNTP
		There are pending changes that may not take effect until iLO is reset.
		Enable DHCPv4
		Use DHCPv4 Supplied Gateway
		Use DHCPv4 Supplied Static Routes
		Use DHCPv4 Supplied Domain Name
		Use DHCPv4 Supplied DNS Servers
		Use DHCPv4 Supplied Time Settings
		Use DHCPv4 Supplied WINS Servers
		IPv4 Address 0.0.0.0 Subnet Mask 0.0.0.0 Gateway IPv4 Address 0.0.0.0
4	Reset the iLO	Press the Reset button that is enabled after the settings from the previous step
Π		are verified. A pop-up will ask to authorize a reset, press OK .
		iLO Dedicated Network Port - IPv4 Settings
		Summary General IPv4 IPv6 SNTP Message from webpage
		Primary WINS Server 0.0.0.0
		Secondary WINS Server 0.0.0.0 Applying new settings requires an iLO reset. Would apply the new settings and reset iLO now?
		Enable WINS Server Registra
		✓ Ping Gateway on Startup Submit Reset ✓

5	Verify	Wait 30 seconds for the iLO to reset, then login to verify.	
		https://[<i><il0_ipv6_address></il0_ipv6_address></i>]	
		Press the Sign Out button when compete.	
6 □	Application RMSs	If Application RMS servers exist, the iLOs may be updated. Unless directed otherwise, the preceding steps may be used to remove IPv4 addresses on application RMS iLOs.	
	End of Procedure		

Procedure 9 Harvest Management Server IPv4 addresses

S T P	Use this procedure to reconfigure the TVOE management server host to remove unused IPv4 addresses. Procedure 2 is a prerequisite. Estimated time of completion: 20 minutes <i>Check off ($\sqrt{2}$ each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>	
	Task	Description
	Management Server iLO: Login	Login to the iLO on the management server <pre>https://[<ilo_ipv6_address>]</ilo_ipv6_address></pre>
2	View current configuration	Navigate to the network configuration: Network -> iLO Dedicated Network Port Expand All + Information + iLO Federation + Remote Console + Virtual Media + Power Management - Network LO Dedicated Network Port Shared Network Port

Software Upgrade Procedure

2	Delete IPv4 addresses	Select the TDVA tab and update the IDvA Address Mask and Cateway is use 0.0.0.
3	Delete IPv4 addresses	Select the IPv4 tab and update the IPv4 Addres, Mask and Gateway is use 0.0.0.0. Scroll down and press the Submit button. The pending changes notice shown below will be displayed.
		iLO Dedicated Network Port - IPv4 Settings
		Summary General IPv4 IPv6 SNTP
		There are pending changes that may not take effect until iLO is reset.
		Enable DHCPv4
		Use DHCPv4 Supplied Gateway
		Use DHCPv4 Supplied Static Routes

		Subnet Mask 0.0.0.0
		Gateway IPv4 Address 0.0.0.0
		.
4	Reset the iLO	Press the Reset button that is enabled after the settings from the previous step are verified. A pop-up will ask to authorize a reset, press OK .
		il O Dedicated Naturalk Bast, JPv4 Settings
		iLO Dedicated Network Port - IPv4 Settings
		Summary General IPv4 IPv6 SNTP Message from webpage
		Primary WINS Server 0.0.0.0
		Secondary WINS Server 0.0.0.0 Applying new settings requires an iLO reset. Would apply the new settings and reset iLO now?
		Enable WINS Server Registra
		Submit Reset

5	Verify	Wait 30 seconds for the iLO to reset, then login to verify.
		https://[<i><ilo_ipv6_address></ilo_ipv6_address></i>]
		Press the Sign Out button when compete.
6 □	Application RMSs	If Application RMS servers exist, the iLOs may be updated. Unless directed otherwise, the preceding steps may be used to remove IPv4 addresses on application RMS iLOs.
7	Management server: Login	Login to the TVOE host on the management server
		<pre>\$ ssh admusr@<tvoe_ipv6_address></tvoe_ipv6_address></pre>
8	Determine devices	Display the bridges. The management and optional netBackup bridges should be updated. Application bridges may be updated using these steps only when directed by application procedures.
		<pre>\$ sudo netAdm showtype=Bridge</pre>
9 □	Determine IPv4 routing	Display the routes for each non-control bridge, noting the NETWORK or HOST and GATEWAY values to use in the next step. There may be multiple routes per device.
		<pre>\$ sudo netAdm queryroutedevice=<bridge></bridge></pre>
10	Delete IPv4 routes	For each IPv4 route, delete the route using the type of "default", "network", or "host", and the gateway noted in the previous step.
		<pre>\$ sudo netAdm deleteroute=<type>device=<bridge> gateway=<ipv4_address></ipv4_address></bridge></type></pre>
11	Determine IPv4 addresses	Display the IP addressing for each non-control bridge, noting the IP Address and Netmask to use in the next step.
		<pre>\$ sudo netAdm querytype=Bridgename=<bridge></bridge></pre>
12	Delete IPv4 addresses	Remove the IPv4 address of the Management Server on the management bridge and the optional netBackup bridge if it exists.
		<pre>\$ sudo netAdm settype=Bridgename=<bridge> address=<ipv4_address>netmask=<ipv4_mask> deleteAddr</ipv4_mask></ipv4_address></bridge></pre>
13	Backup the TVOE	Backup the TVOE configuration from platcfg using appropriate media.
		\$ sudo su – platcfg
14	Logout	\$ exit
		End of Procedure

6.4 Harvest Switch addresses

This procedure will remove IPv4 addresses on the Aggregation and Enclosure switches, using the netConfig utility.

Procedure 10 Harvest Network IPv4 addresses

S T E	Use this procedure to reconfigure network switches to remove IPv4 addresses. Procedure 1 is a prerequisite. Estimated time of completion: 15 minutes <i>Check off ($$ each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>		
Р	Task	Description	
1	PM&C server: Login	Login to the PM&C server	
		<pre>\$ ssh admusr@<pm&c_ipv6_address></pm&c_ipv6_address></pre>	
2 □	Identify all aggregation switches	Each aggregation switch must be individually configured. The following steps are repeated for each device in Section 4.2.3	
		If there are no aggregation switches, skip to step 17.	
3	List interfaces	For aggregation device, display all the interfaces:	
		<pre>\$ sudo netConfigdevice=<name> listInterfaces</name></pre>	
4	Identify interfaces	Each interface is the IPv4 Interfaces section of output: IPv4 Interfaces: = (vLAN20 <interface>) IPv6 Interfaces: = (vLAN20)</interface>	
5	Display interface addresses	Display the IPv4 addresses <pre>\$ sudo netConfigdevice=<name> getInterface interface=<if></if></name></pre>	
6	Identify address	<pre>IP Address: = (<ipv4_address> FD0D:DEBA:D97C:FFF::10/64) Netmask: <ipv4_netmask> Router Advertisements: On</ipv4_netmask></ipv4_address></pre>	
7	Calculate CIDR	Determine the network prefix to use for the IPv4 address in CIDR format for the next step.	
		<pre>\$ ipcalc -p <ipv4_address> <ipv4_netmask></ipv4_netmask></ipv4_address></pre>	

8	Delete IPv4 addresses	Delete the IPv4 addresses.
Г		
		<pre>\$ sudo netConfigdevice=<name> deleteInterface interface=<interface> ip=<ipv4_address>/<prefix></prefix></ipv4_address></interface></name></pre>
9	Verify IPv4 address removed	Verify the address was deleted
		<pre>\$ sudo netConfigdevice=<name> getInterface interface=<if></if></name></pre>
10	Identify IPv4 routes	Use the following command to identify all IPv4 routes:
		<pre>sudo netConfigdevice=<name> listRoutes Interface: VLAN2 Netmask: = (<ipv4_netmask> 255.255.255.255) Network: = (<ipv4_network> 0.0.0 2001:DB8::/32 ::/0) Next Hop: = (<nexthop> 192.168.2.1 FD0D:DEBA:D97C:FF1:5054:FF:FE3A:FC2B FE80::1 FD0D::1)</nexthop></ipv4_network></ipv4_netmask></name></pre>
11	Delete IPv4 Routes	Use the following command to identify the CIDR netmask to use when deleting the routes identified in the previous step: \$ ipcalc -p <ipv4_network> <ipv4_netmask> PREFIX=<prefix> Delete all IPv4 routes: sudo netConfigdevice=<name> deleteRoute network=<ipv4_network>/<prefix> nexthop=<nexthop></nexthop></prefix></ipv4_network></name></prefix></ipv4_netmask></ipv4_network>
12	Verify all IPv4 addresses and routes are removed	Repeat steps 3 through 11 above for each device. Then, verify no IPv4 addresses still exist: \$ sudo netConfigdevice= < <i>name></i> listInterfaces Verify no IPv4 routes still exist: sudo netConfigdevice= < <i>name></i> listRoutes

13	Display virtual interfaces	For aggregation device, display any IPv4 virtual interfaces:
		<pre>\$ sudo netConfigdevice=<name> listVR protocol=v4</name></pre>
14	Identify interfaces	Each virtual interface is defined by the ID and Interface. If there is more than one virtual interface, they should be paired in the order shown in the output, e.g. ID=3 and VLAN3 as shown below.
		<pre>ID: = (3 <id>) Interface: = (VLAN3 <interface>) Preempt: =(</interface></id></pre>
15	Delete the interfaces	<pre>Delete the interface. \$ sudo netConfigdevice=<name> deleteVR id=<id> interface=<interface> protocol=v4</interface></id></name></pre>
16	Verify interfaces are removed	Verify the address was deleted <pre>\$ sudo netConfigdevice=<name> listVR protocol=v4</name></pre>
17	Identify all enclosure switches	Enclosure switches must be individually configured. Enclosure switches dedicated to applications should be configured with application procedures. The following steps are repeated for each device from Section 4.2.3
18	Delete IPv4 addresses	<pre>\$ sudo netConfigdevice=<name> deleteInterface interface=management addrType=dhcp</name></pre>
19 □	Verify IPv4 addresses are removed	<pre>Verify no IPv4 addresses are shown: \$ sudo netConfigdevice=<name> getInterfaces interface=management</name></pre>
20	Repeat for each enclosure switch	Repeat steps 18 through 19 for each enclosure switch.
21 □	Backup switch configurations	Perform a backup of the aggregation and enclosure switches recorded in step 10 of procedure in section 5.1. The filename option should specify a unique name for each.
		<pre>\$ sudo netConfigdevice=<name> backupConfiguration service=<service> filename=<device>-harvested</device></service></name></pre>

22	Move netConfig backup files to the backup directory to preserve files with PM&C backups. Replace <user> with the userid noted in Procedure 1 Step 4: \$ sudo mv ~<user>/*harvested /usr/TKLC/smac/etc/switch/backup</user></user>	
End of Procedure		

6.5 Harvest Completion

Procedure 11 Finish Harvest

S T E	Use this procedure to verify the health of the system Estimated time of completion: 5 minutes Check off ($$) each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.		
Р	Task	Description	
	Health check	Execute the health check procedure in Procedure 15.	
	End of Procedure		

Software Upgrade Procedure

7 Recovery Procedures

**** WARNING ****

Execute this section only if there is a problem and it is desired to undo changes introduced with this migration procedure. Do not attempt to perform these backout procedures without first contacting Oracle Support:

Log on to <u>My Oracle Support</u>. To contact Oracle Support by phone, refer to the <u>Oracle Support Contacts Global</u> <u>Directory</u>.

NOTE: These recovery procedures are provided for the reconfiguration of the PM&C application. IPv6 addressing is left intact.

**** WARNING ****

Prior to executing this procedure, log on to <u>My Oracle Support</u> to ensure that proper recovery planning is performed:. To contact Oracle Support by phone, refer to the <u>Oracle Support Contacts Global Directory</u>.

Before disaster recovery, users must properly evaluate the outage scenario. This check ensures that the correct procedures are executed for the recovery.

NOTE: Disaster Recovery is an exercise that requires collaboration of multiple groups and is expected to be coordinated by the TAC prime. Based on TAC's assessment of Disaster, it may be necessary to deviate from the documented process.

7.1 Backout Setup

The decision to execute a backout may be determined at multiple points in the procedure. Since the reason and failure point cannot be known ahead of time, no definitive procedure is provided.

Oracle Support personnel may have to have login access to the affected system, probe for the root cause of the problem, and set up or clean up what is necessary to prepare the recovery.

The migration procedure involved configuration a dual IP stack on all components, and configuring the IPv6 resources. If only PM&C is impacted, recovery may leave the IPv6 stack configured. The OA and management platform may require a backout. For networking issues, recovery may require backout of migration modifications.

7.2 Backout Execution

Once the necessity of a backout has been determined and the scope of the backup, the following procedures can be executed. Refer to section 3.5 for the Backout process overview.

Procedure 12 PM&C Recovery Preparation

S T E	Use this procedure backout the PM&C migration. Estimated time of completion: 15 minutes Check off ($\sqrt{2}$ each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.		
Р	Task	Description	
1	Verify recovery scope	With Oracle Support assistance, determine if the PM&C configuration must be undone.	
2	PM&C: Login	Login to the PM&C host on the management server	
		<pre>\$ ssh admusr@<pm&c_ipv4_address></pm&c_ipv4_address></pre>	
		SSH access via IPv4 should still be functional, but the TVOE virsh console access may be used.	
3	Identify and test backup	Find the backup file from the pre-migration.	
		<pre>\$ ls -lrt /var/TKLC/smac/backup/</pre>	
		Verify the file and check the Description matches from your pre-migrate task comment used in step 3 of Procedure 4:	
		<pre>\$ sudo pmacadm checkBackupfileName=<backupfile.pef></backupfile.pef></pre>	
4	Verify backup is valid	PM&C checkBackup was successful Backup Description: Pre IPv6 migration	
		Otherwise, contact Oracle Support for assistance	
5	Prepare to restore	Reset the configuration.	
		<pre>\$ sudo pmacadm resetProfileConfig</pre>	
6 □	Verify reset succeeded	Platform has been successfully reset	
7	Restore	Begin the restore task	
		<pre>\$ sudo pmacadm restorefileName=<backupfile.pef></backupfile.pef></pre>	
8	Note the task ID	PM&C Restore been successfully initiated as task ID <i><taskid< i="">></taskid<></i>	

9	Verify restore completes	<pre>Wait for the task state to reach the COMPLETE state: It will take a few minutes, and network interruptions and an application restart may be noticed. \$ sudo pmaccli getBgTaskStateid=<taskid> IN_PROGRESS \$ sudo pmaccli getBgTaskStateid=<taskid> Error communcating with the PM&C server. Is the application running? \$ sudo pmaccli getBgTaskStateid=<taskid> COMPLETE \$ exit</taskid></taskid></taskid></pre>	
11	PM&C: Login to PM&C GUI	Navigate to the current network configuration: Main Menu -> Administration -> PM&C Configuration Main Menu Main Menu Main Menu Main Menu Main Menu Main Menu Main Menu Main Menu Maradement Software MM Management Storage Administration Groups GUI Sters GUI Stessions GUI Site Settings PM&C Application M&C Backup M&C Configuration Metwork Configuration Metwork Configuration Metwork Configuration	
12	Verify	The Configuration Summary should show the pre-migration state.	
13	Logout	Press the Logout button.	
14	Continue?	If the Management server or IPv6 network changes must be backed out, continue.	
	End of Procedure		

Software Upgrade Procedure

Procedure 13 Management recovery

P Task Description 1 Verify scope With Oracle Support assistance, determine if the OA and management must be restored to their original configurations. 2 RMS iLO: Login Login to the iLO on the management server 1 https:// <ilo_ipv4_address> 3 Navigate to configuration Navigate to the network configuration: Network -> iLO Dedicated Network Port Expand All</ilo_ipv4_address>	Use this procedure to restore the management server and OA components. Estimated time of completion: 20 minutes <i>Check off</i> ($\sqrt{2}$ <i>each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>

14	Logout	Press the Sign Out button when compete.		
15	Additional OAs?	Restore the OA configuration for each enclosure.		
16	Management server: Login	Login to the TVOE host on the management server		
		<pre>\$ ssh admusr@<tvoe_ipv4_address></tvoe_ipv4_address></pre>		
17	List routes	Check for IPv6 routes on the management and other bridges listed in section		
		4.2.2.		
		<pre>\$ sudo netAdm queryroutedevice=management</pre>		
18	Remove IPv6 routes	Remove the IPv6 routes, for example:		
		<pre>\$ sudo netAdm delete routeroute=default device=managementgateway=<ipv6_address></ipv6_address></pre>		
19	List bridges	Display the the management and other bridges:		
		<pre>\$ sudo netAdm querytype=Bridgename=management</pre>		

IPv6 Migration Guide

20	Remove IPv6 address	Remove the IPv6 address from the management bridge and other bridges.	
		<pre>\$ sudo netAdm deletetype=Bridgename=<management></management></pre>	
21	Continue?	If the IPv6 network changes must be backed out, continue.	
	End of Procedure		

Procedure 14 Network Recovery

S T E	Use this procedure to restore the network devices to the original state. Estimated time of completion: 20 minutes <i>Check off</i> ($$ <i>each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.</i>			
Р	Task	Description		
1	Verify scope	With Oracle Support assistance, determine if the network devices must be restored to their original configurations.		
2 □	PM&C: Login	Login to the PM&C host on the management server using IPv4 addresses. \$ ssh admusr@ <pm&c_ipv4_address></pm&c_ipv4_address>		
3	Restore repository	<pre>Restore the pre-migration netConfig repository \$ sudo cp -fp /usr/TKLC/plat/etc/TKLCnetwork-config/model.xml-premigrate /var/TKLC/smac/backup/model.xml</pre>		
4	List service used to backup	List the service used to backup. This will be used to list all the backup files: \$ sudo netConfig -repo showService name=< <i>service</i> >		
5	Find backup location	The output include the user: field, to identify the location of backup files: Service Name: pmacSCP Type: ssh Host: 10.240.72.40 Options: password: FC076474A8F1ECB8 user: pmacuser		
6	List configuration files	List the backup files that need to be used in the next step (e.g. 1s ~pmacuser/*premigrate): \$ sudo 1s ~ <user>/*premigrate</user>		

7	Restore configurations	Perform a restore of <i>all</i> aggregation and enclosure switches using the filename and service from the backup. Switches will reboot during this step: \$ sudo netConfigdevice= <name> restoreConfiguration service=<service> filename=<device>-premigrate</device></service></name>	
8	Verify netConfig	The following command will attempt to login to each switch using the management address. It is only to verify access from netConfig, not the switch configuration. \$ sudo netConfigrepo validate	
9	Logout	\$ exit	
10	Health checks	The health check procedure should be executed, but additional verification may be required.	
	End of Procedure		

8 Health Check Procedures

Depending upon the calling procedure, either IPv4 or IPv6 addresses may be used here.

Procedure 15 Health Check

s	Use this procedure to verify the system health of platform components.			
T E	Estimated time of completion: 5 minutes Check off ($$) each step as it is completed. Shaded steps indicate: gray = input, white = output, black = Go-No-Go.			
Р	Task	Description		
11	PM&C: Login	Login to the PM&C on the management server		
		\$ ssh admusr@ <i><pm&c_ip_address></pm&c_ip_address></i>		
12 □	Check for alarms	\$ sudo alarmMgralarmStatus		
13	Verify	No (new) alarms should be reported.		
		Otherwise, stop and contact Oracle Support.		
14	List OAs	List provisioned enclosures to be used in OA health checks		
		\$ sudo pmaccli getProvEnclosures		
15	TVOE: Login	Login to the TVOE host on the management server		
Ш		<pre>\$ ssh admusr@<tvoe_ip_address></tvoe_ip_address></pre>		
16 □	Check for alarms	\$ sudo alarmMgralarmStatus		
17	Verify	No alarms should be reported.		
		Otherwise, stop and contact Oracle Support.		
18	OA: Display Login GUI	For each enclosure (from step 4), display the OA login window		
		https:// <i><oa_ip_address></oa_ip_address></i>		
		If the login window does not show OK, continue to login. Otherwise this procedure is complete.		
		All Enclosures Status Image: Market status <t< th=""></t<>		

19	Verify details	Click on the System Status link to display the alerts. If any alerts are displayed, contact Oracle Support.

Appendix C. Locate Product Documentation on the Oracle Technology Network Site

Oracle customer documentation is available on the web at the Oracle Technology Network (OTN) site, <u>http://docs/oracle/com</u>. You do not have to register to access these documents. Viewing these files requires Adobe Acrobat Reader, which can be downloaded at <u>www.adobe.com</u>.

- 1. Log into the Oracle Technology Network site at <u>http://docs.oracle.com</u>.
- Select the Applications tile. The Applications Documentation page appears.
- 3. Select Apps A-Z.
- 4. After the page refreshes, select the Communications link to advance to the Oracle Communications Documentation page.
- 5. Navigate to your Product and then Release Number, and click the View link (note that the Download link will retrieve the entire documentation set).
- 6. To download a file to your location, right-click the PDF link and select Save Target As.
