ent-gttset:gttsn=setdpc:netdom=ansi:settype=dpc
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The GTT Set table cannot contain more than 2000 entries.

The gttsn=none parameter cannot be specified.

If the VGTT (Variable Length GTT) feature is turned on, the ndgt parameter cannot be specified.

The `gttsn` parameter must be specified and must not match an existing `gttsn`.

If the `settype` parameter has a value of `cgssn`, `opc`, `cgpc`, `cdssn`, `opcode`, or `dpc`, then the `ndgt` parameter cannot be specified.

The `netdom=cross` parameter can be specified only if the `settype=cdgta` parameter is specified.

The Origin-based SCCP Routing feature must be turned on if the value of the `settype` parameter is `cggta`, `cgssn`, `opc`, or `cgpc`.

If the OBSR feature is enabled or the FLOBR feature is turned on, then the `settype` parameter must be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the `netdom=cross` parameter can be specified.

The TOBR feature must be turned on before the `settype=opcode` parameter can be specified.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the `settype` parameter can be specified and before more than 950 GTT set entries can be provisioned.

The FLOBR feature must be turned on before a value of `cdssn` or `dpc` can be specified for the `settype` parameter.

Notes

When the Origin-based SCCP Routing feature is turned on, VGTT is supported only for CdPA GTA and CgPA GTA. The `cross` network domain is supported only for CdPA GTA.

Output

```
ent-gttset:gttsn=setcdssn:netdom=ansi:settype=cdssn
```

```

ent-gws-redirect

Enter Gateway Screening Redirect Command

Use this command to provision the gateway screening redirect function. The Redirect table must be provisioned before configuring gateway screening to redirect received MSUs. The values that are specified with this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the `ri=gt` parameter is specified, the value `gt` is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (mandatory)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The ANSI point code has subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

dpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)

Destination point code.

dpci (mandatory)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (mandatory)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the *chg-stpopts:npcfmti* flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnmmn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point(msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (mandatory)

Specifies the value used to set the 16-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *unit number-sub number area-main number area(un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

gta (mandatory)

Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.

Range:

1 - 21 digits

ri (mandatory)

Specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected. Use the *gt* value to route by global title digits or use the *ssn* value to route by subsystem number.

Range:

gt

*ssn***ssn (mandatory)**

Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.

Range: 000 - 255

tt (mandatory)

Identifies the type of the global title translation (GTT). This value is the decimal representation of the 1-byte field used in SS7 and is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.

Range: 000 - 255

enabled (optional)

Specifies whether MSUs that have passed gateway screening are to be redirected (*enabled=on*) or routed as normal (*enabled=off*).

Range:

*on**off*

Default:

on

Example

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
ent-gws-redirect:dpc=1-40-1:ri=ssn:ssn=10:tt=1:gta=1800833:enabled=off
ent-gws-redirect:dpcn16=1-14-0:ri=gt:ssn=10:tt=10:gta=1:enabled=on
```

Dependencies

The dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must be defined in the Destination table or defined as the STP site point code.

If the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter is defined as a destination, it must have at least one route defined.

The redirect function data can be entered only once.

Notes

The SCCP screening functions (CGPA, TT, CDPA, and AFTPC) cannot select an MSU to be redirected.

Do not apply a Redirect Stop Action on the Adjacent Node point code for the BLKOPC and OPC screening functions.

Do not apply a Redirect Stop Action for an allowed DPC screen rule if the rule contains the self-identity point code of EAGLE 5 ISS where the screening rule is applied. This is because the redirection of SLTAs and SLTMs (Signal Link Test Messages and Acknowledgements) will not return to the originating EAGLE 5 ISS and will cause the link to fail.

If gwsa=off and gwsm=off are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

Output

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

ent-home-smsc

Enter HOME SMSC Address

Use this command to enter HOME SMSC specific addresses, currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Parameters

smsc (mandatory)

Identifies the type of the Short Message Service Center address.

Range:

1-21 hexadecimal digits. Valid digits are 0-9, a-f, A-F .

Example

```
ent-home-smsc:smsc=256489
```

```
ent-home-smsc:smsc=256489a98bccee56ad237
```

Dependencies

The Portability Check for Mobile Originated SMS (MNPSMS) feature must be turned on or one of the following features must be enabled before this command can be entered.

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP

- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP

The specified HOME SMSC address cannot already exist in the HOME SMSCADDR table.

The HOME SMSCADDR table can contain a maximum of 500 entries.

The HOME SMSCADDR table must be accessible.

The GSM DBMM table must be accessible.

Notes

None

Output

```
ent-home-smsc:smc=256489

ent-homern

Enter Home Routing Number Prefix

Use this command to enter up to 100 routing number prefixes for the operating network into the HOMERN table.

Parameters

rn (mandatory)

The home routing number prefix.

Range:

1-15 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

Example

```
ent-homern:rn=C441234
```

Dependencies

The HOMERN table cannot be full.

The routing number must not already exist in the HOMERN table.

The rn=none parameter cannot be specified.

The A-Port, AINPQ, G-Port, INP, or V-Flex feature must be turned on before this command can be entered.

The HOMERN table must be accessible.

Notes

None

Output

```
ent-homern:rn=C441234

ent-ip-conn

Enter IP Connection

Use this command to enter SIP connection information. The IPCONN table supports the provisioning information related to the SIP connections.

Parameters

cname (mandatory)

Connection name. This parameter specifies the unique logical name assigned to each SIP connection.

Range:

```
zzzzzzzzzzzzzzzzzz
```

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

lhost (mandatory)

Local host name. This parameter specifies the local host name as defined in the IP Host table.

Special characters, such as hyphens, can be used in the host name if the host name is enclosed in double quotes (" ").

Range:

SIPNP Feature must be enabled before entering any SIP connection information.

IPCONN table should be accessible.

A unique CNAME must be specified for a new connection.

The value specified for the HOST parameter must begin with an alphabetic character and can contain a..z, A..Z, 0..9, - (hyphen), or . (period).

New connection cannot be made if the Number of CNAMEs has reached the maximum limit.

Duplicate LHOST, RHOST, LPORT and RPORT entry combination is not allowed.

Connections can only be made with a LHOST that is configured on a SIP card.

Remote IP address (RHOST) must not exist in the IPLINK table.

Notes

ent-ip-host command should be used to define local host names and remote host names for IP addresses. This is an existing command and will be used to configure the local host and remote host for an IP address prior to adding any SIP connection.

Maximum of 16 connections can be provisioned against a local host.

If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Output

```
ent-ip-conn:prot=tcp:lhost=lss1:lport=2020:rhost=rss1:rport=2020:cname=connection5
```

```

ent-ip-host

Enter Internet Protocol Hostname

Use this command to configure the IP Host table. The IP Host table defines local and remote host names for IP addresses.

Parameters

host (mandatory)

Host name. This parameter specifies the logical name of the device associated with the specified IP address.

Special characters, such as hyphens, can be used in the host name if the host name is enclosed in double quotes (" ").

Range:

XX

A string of characters, beginning with a letter and comprising up to 60 characters in length. Valid values are *a..z*, *A..Z*, *0..9*, or *.* (*period*)

ipaddr (mandatory)

The IP address associated with the host name. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the system's network number and 5 is the machine's host number.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

realm (optional)

Realm. Specifies the domain of a host from which the message can be sent or received.

Range:

XX

A string of characters, beginning with a letter and comprising up to 60 characters in length. Valid values are *a..z*, *A..Z*, *0..9*, *-* (*dash*), *.* (*period*)

type (optional)

The residency attribute of the host entry.

Range:

local

The IP host name and IP address resides on the IP card in this EAGLE 5 ISS.

remote

The IP host name and IP address resides on equipment not in this EAGLE 5 ISS.

Default:

local

Example

```
ent-ip-host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001
ent-ip-host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001:type=local
ent-ip-host:host="gw100.nc-tekelec.com":ipaddr=150.001.001.001
ent-ip-host:host=abc:ipaddr=250.001.001.001:type=remote:realm=xyz.com
```

Dependencies

The value specified for the `ipaddr` parameter cannot already exist in the IP Host table.

A valid value must be specified for the `host` parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

The `ipaddr=0.0.0.0` parameter cannot be specified.

The value specified for the `host` parameter cannot already exist in the IP Host table.

The IP Host table can have a maximum of 4096 host entries.

If a remote host is used (the `type=remote` parameter is specified), then the value specified for the `ipaddr` parameter cannot already exist in the IP Link table.

If a local host is used (the `type=local` parameter is specified), then the value specified for the `ipaddr` parameter must already exist in the IP Link table.

A valid value must be specified for the `realm` parameter. If the realm contains a hyphen, then the realm must be enclosed within quotation marks.

HOST and REALM must be specified together for the host associated with diameter connection.

Notes

If the realm contains a hyphen, then the realm must be enclosed within quotation marks.

Realm is mandatory for all the IP hosts associated with diameter connections.

Output

```
ent-ip-host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001:type=local
```

```

ENT-IP-HOST: MASP A - COMPLTD
```

Related Commands

dlt-ip-host, *rtrv-ip-host*

ent-ip-node

Enter IP Node

Use this command to define the IP address of a node that will be receiving messages from the STPLAN application.

Parameters

cap (mandatory)

The maximum percentage of ethernet capacity for the node connection. This capacity is added to other connections to this node for the total capacity of the node.

Note: The value specified for this parameter can be used to calculate throughput for DCM, E5-ENET, and E5-ENET-B cards. Refer to the *Notes* section for more information.

Range:

1 - 100

ipaddr (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is *192.126.100.5*, where *192.126.100* is the network number and *5* is the machine's host number.

Range:

4 numbers separated by dots

1-233-first number

0-255-the other three numbers

ipappl (mandatory)

The IP application supported by the node.

Range:

stplan

ipport (mandatory)

The logical IP port that addresses the application on the node.

Range:

1024 - 5000

loc (mandatory)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

iprte (optional)

The default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's

unique host number. An example IP address is 192.126.100.5 , where 192.126.100 is the network number and 5 is the machine's host number.

Range:

4 numbers separated by dots

1-233-first number

0-255-the other three numbers

Example

```
ent-ip-node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=15:iprte=193.4.201.84
```

Dependencies

The shelf and card must be equipped.

The node IP address cannot be *127.x.x.x*, where *x* is a number from 1 to 254.

The specified card location must be equipped with a TCP/IP data link.

The IP address must be unique to the TCP/IP link table and to the TCP/IP nodes.

Only one node can be connected for each data link and each application. The IP address, IP application, and card location combination must be unique in the database.

The IP port on each node cannot already be assigned to another application.

The class of the IP address (ipaddr) must match the class of the assigned TCP/IP data link's IP address. The system supports three classes of IP addresses, Class A, Class B, and Class C. Class A IP addresses can contain only the values 1 - 126 in the first field of the IP address. Class B IP addresses can contain only the values 128 - 191 in the first field of the IP address. Class C IP addresses can contain only the values 192 - 223 in the first field of the IP address.

The network portion of the IP address (ipaddr) must match the network portion of the IP address assigned to the TCP/IP data link. The network portion of the IP address is based on the class of the IP address. If the IP address is a Class A IP address, the first field is the network portion of the IP address. If the IP address is a Class B IP address, the first two fields are the network portion of the IP address. If the IP address is a Class C IP address, the first three fields are the network portion of the IP address.

If the network portion and class of the IP address of the TCP/IP node matches the class of the assigned TCP/IP data link's IP address, the iprte parameter cannot be specified. The iprte parameter can be specified only with the ent-ip-node command when the network portion and class of the TCP/IP node does not match the class of the assigned TCP/IP data link's IP address. The values of the ipaddr parameter, the IP address of the TCP/IP node, and the iprte parameter cannot be the same.

The capacity of all connections to the given node cannot be greater than 100%.

The router's IP address must not be assigned to a local TCP/IP data link.

The router's IP address must be in the same network as the node's IP address.

Notes

If the IP address is a Class A IP address, do not use the IP addresses *127.x.x.x*, where *x* is a number from 1 - 254. These addresses are reserved for loopback.

Determining the correct CAP value for ECAP

The STPLAN uses a TVG (grant) rate value, while the ECAP uses an MSUs per second value. These values do not have a 1-to-1 correlation. Therefore, the average number of MSUs per TVG can vary depending on the average MSU size. When calculating the cap parameter value, the average number of MSUs per TVG must be factored. The formula for determining the cap value is as follows:

cap value = (Host capacity / (175 [or 17.5] * MSU/TVG)).

CAUTION

Caution: The 175 multiplier is used only when the link negotiates to 100 Mbits/second full duplex. If the link is a different value than 100 Mbits/second full duplex, then a multiplier of 17.5 is used.

Note: The cap value is rounded down.

- **Host capacity**—capacity of the ECAP server
- **MSU/TVG**—average number of MSUs a single system buffer can transfer to Remote Host

If the MSU/TVG value is not known, then 2 should be used as the MSU/TVG value. If a value of 2 is used, then the network must be monitored to determine if the *cap* value requires adjustment.

Using the CAP Value to Calculate Throughput for DCM and E5-ENET/E5-ENET-B Cards

The value specified for the cap parameter can be used to calculate the throughput in transactions per second (TPS) for DCM, E5-ENET, and E5-ENET-B cards. The TPS value is the smaller of the following values:

- GPL_CARD_CAPACITY
 - E5-ENET/E5-ENET-B card—15000
 - DCM card—2870
- 175 [or 17.5] * cap parameter value

CAUTION

Caution: The 175 multiplier is used only when the link negotiates to 100 Mbits/second full duplex. If the link is a different value than 100 Mbits/second full duplex, then a multiplier of 17.5 is used.

Output

```
ent-ip-node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=15:iprte=193.4.201.84
```

```

Related Commands

dlt-ip-node, *rtrv-ip-node*

Use this command to configure the destination IP address, subnet mask, and the gateway IP address for the specified card in the Static IP Route table.

Parameters

dest (mandatory)

Destination IP Address. The IP Address of a remote destination host or network to be reached.

Range:

4 numbers separated by dots, with each number in the range of 0–255.

The IP address 0.0.0.0 is not valid.

gtwy (mandatory)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

Range:

4 numbers separated by dots, with each number in the range of 0–255.

The IP address 0.0.0.0 is not valid.

loc (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

submask (mandatory)

The subnet mask of the destination IP address, in the form of an IP address with a restricted range of values. This parameter is required if the ipaddr parameter is entered.

Range:

The value must be valid for the class of the entered IP address.

Valid for Class A Networks

- 255.0.0
- 255.192.0
- 255.224.0
- 255.240.0
- 255.248.0
- 255.252.0
- 255.254.0
- 255.255.128.0

Valid for Class A or B Networks

- 255.255.0.0
- 255.255.192.0
- 255.255.224.0
- 255.255.240.0
- 255.255.248.0
- 255.255.252.0
- 255.255.254.0
- 255.255.255.128

Valid for Class A, B, or C Networks

- 255.255.255.0
- 255.255.255.192
- 255.255.255.224
- 255.255.255.240
- 255.255.255.248
- 255.255.255.252

Note: The value `255.255.255.255` must be specified if the destination IP address represents a host address. If the destination IP address represents a network address, a value must be specified that identifies the network ID and host ID portions of the address.

Example

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:  
gtwy=140.188.13.33
```

Dependencies

The specified destination IP address (`dest` parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must be unique per card
- Must not reside on this card's A or B local network

The specified gateway IP address (`gtwy` parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must correspond to a host IP address that resides on this card's A or B local network

The IP address must be defined for the A or B network, or both, for the card before this command can be entered. (See the [chg-ip-lnk](#) command.)

Each destination IP address entered into the Static IP Route table must be unique for the card.

A maximum of 64 static IP routes can be defined for a card.

A maximum of 2048 static IP routes can be defined in the IP Route table.

The network address specified by the dest and submask parameters must be different from the network address specified by the pvn and pvnmask, fcna and fcnamask, and fcnb and fcnbmask parameters of the NETOPTS table.

Notes

The Static IP Route table is used to store static IP route entries. Static routes are maintained across card initialization, failures, and reloads. These types of routes are used when the IP Layer cannot determine routes dynamically. Static IP route entries can be added or deleted dynamically.

Output

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

```
rlghncxa03w 12-07-24 15:35:05 EST EAGLE 45.0.0
IP Route table is (1 of 2048) 1% full

ent-j1

Enter J1 Interface

Use this command to enter a J1 interface on a T1 card.

Any of the 8 ports on an E5-E1T1 card can be specified as a J1 port when the card used is a standard E5-E1T1 or E5-E1T1-B card.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

j1port (mandatory)

J1 port number.

The value must be a J1 port for which an interface has not been configured on the specified J1 card.

Range:*1-8*

Any 1 of the 8 ports on an E5-E1T1 card can be specified as a J1 port.

encode (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range:*b8zs**ami***Default:***b8zs***j1tsel (optional)**

Timing source

Range:*line**slave timing source**external**master timing source***Default:***line***l1 (optional)**

T1 cable length in feet between the EAGLE and the connecting node.

Range:*0-655***Default:***133*

Example

```
ent-j1:loc=1101:j1port=1:encode=ami:j1tsel=external
```

```
ent-j1:loc=1102:j1port=1:j1tsel=line
```

```
ent-j1:loc=1103:j1port=2
```

Dependencies

The specified card location (loc parameter) must be equipped.

The J1 table must be accessible.

The Card (IMT) table must be accessible.

The port specified by the j1port parameter must not be already equipped with a J1 interface.

Card locations 1113 - 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the loc parameter.

The specified card location must be provisioned with type as limt1 and appl as ccs7itu.

The card must not be provisioned with any E1/T1 ports.

The j1port parameter must be in the range from 1 to 8.

IMT card location cannot be specified.

The J7 support feature must be enabled before the J1 port can be provisioned.

Notes

There is not a new card type for J1. The J1 interface will be provisioned on a T1.

Once the J1 interface is provisioned on it, no T1 interface will be allowed on the T1 card.

This card will be treated as a J1 card.

Output

```
ent-j1:loc=1101:j1port=1:encode=ami:j1tsel=external
```

```
tekelecstp 13-12-20 12:12:36 EST 46.0.0-65.3.0
ent-j1:loc=1101:j1port=1:encode=ami:j1tsel=external
ENT-J1: MASP A - COMPLTD
;

ent-lbp

Enter Loopback Point

Use this command to assign a far-end loopback point for testing data signaling link elements in a SS7 transmission path.

Parameters

lbp (mandatory)

Loopback point ID. A far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range:

1 - 32

lfst (mandatory)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range:

llt
latching loopback test

nlt
nonlatching loopback test

link (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym:

port

Range:**loc (mandatory)**

Card location. The unique identifier of a specific application subsystem located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

rle (mandatory)

Remote link element. The link element to be looped back for testing.

Range:

ds0

ocu

csu

dsu

nei

cli (optional)

The Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by up to 10 alphanumeric characters

rep (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range:

0 - 31

Default:

0—If the link element to be looped back for testing is NEI (*rle=nei* is specified)

0—If the LFS test is NLT (non-latched); *lfst=nl* is specified

0—If no other LBP for this link has the same *rle* value

1–30—Next sequential number for subsequent loopback points of the link to be tested (*rle* is specified as anything but *nei*)

Example

```
ent-lbp:loc=1101:link=a:lbp=1:rle=ds0:lfst=llt:rep=0:clli=rlghncxa05w
ent-lbp:loc=1101:port=a:lbp=2:rle=nei:lfst=llt
ent-lbp:loc=1205:port=a1:lbp=1:rle=ds0:lfst=llt:clli=rlghncxa05w:rep=1
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location (*loc* parameter) must be equipped.

The *rle=ds0* parameter and the *rle=nei* parameter cannot be specified when the *lfst=nl* parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If the *rle=nei* parameter is specified, the *rep=0* parameter must be specified.

The *rep* parameter can be specified only if the *lfst=llt* parameter is specified.

Each specified *rep* parameter value must be greater than any previously specified *rep* value and less than any subsequent specified *rep* value.

The specified *clli* cannot be a reserved word.

The loopback point (LBP) cannot have been previously defined.

The value specified for the *lbp* parameter cannot exceed the *lbp* parameter value previously defined for a loopback point with *rle=nei* specified.

For each SS7 signaling link, only one loopback point with *rle=nei* specified can be defined.

The *rep* parameter must be specified if taking the default value results in duplicate *rep* values for loopback points.

The loopback point with *rle=nei* specified must be the terminating SS7 signaling link element.

The card location must contain a provisioned LIMDS0, LIMT1, or LIMCH (associated to a LIMT1) card that is running an SS7ANSI or CCS7ITU application.

The card location (*loc* parameter) must not be reserved by the system.

The values specified for the loc and link parameters must already exist in the database.

Notes

None

Output

```
ent-lbp:loc=1101:link=a:lbp=2:rle=nei:lfst=llt
```

```

ent-lnp-serv

Enter LNP Service

Use this command to reserve an LNP translation type for a unique LNP service. The available services include up to six query services (*ain*, *in*, *pcs*, *lnpqs*, *wnp*, and *lrnqt*) and any combination of six message relay or user-defined services. Translation type names can also be defined and are defaulted to the corresponding reserved service type names.

Note: LNP Translation Type name referenced in the ENT-LNP-SERV command is different from the Translation Type name referenced in ENT-TT command.

A maximum of 10 LNP services can be assigned in systems with up to 12 million numbers, and a maximum of 15 LNP services can be assigned in systems with more than 12 million numbers (using ELAP). Two of these assigned services will always be reserved for administration of AIN and IN Translation Types. Administration of Message Relay user defined services will also be allowed.

Parameters

serv (mandatory)

Reserved service type name.

Range:

ain

in

pcs

wnp

class

lidb

cnam

*isvm**lnpqs**wsmc**udf1**udf2**udf3**udf4**lrnqt***alias (optional)**

Alias translation type.

Range:

000 - 255

dfltact (optional)

This parameter specifies the default action associated with the LNP TT Service entry.

Range:*ayyyyyyy*

1 leading alphabetic followed by up to 8 alphanumeric characters. This parameter can have one of the following values:

- a valid GTT Action ID of type *disc/udts/tcaperr* that already exists in the GTT Action table
- *fallback* —Fallback to the relay data for MSUs relayed by LNP using relay data from the LNP database provided by the LNP Message Relay service. For an LNP Query message, the MSU is sent to the LNP local subsystem.
- *falltogg* —Fallback to GTT. The GTT selector search is performed again, using *gttselid=none*.

Default:*fallback***dv (optional)**

Digits valid.

Range:*sccp**tcap***Default:***sccp* —If serv has a value of *class, lidb, cnam, isvm, wsmc, udf1, udf2, udf3, udf4**tcap* —If serv has a value of *ain, in, pcs, wnp, lnpqs, lrnqt*

gttselid (optional)

GTT Selector ID. This parameter specifies the ID used to perform GTT on the MSU processed by the LNP Message Relay or LNP Query Service.

Range:

0 - 65534

Default:

none

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range:

gttrqd

on (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range:

gttrqd

rqdtblnop (optional)

The action performed with a message that arrives at an SCCP card that does not have the necessary LNP table, and the current message routing is subsystem.

Range:

udts

generate UDTS for the processed MSU

disc

discard the processed MSU

Default:

No change to the current value

tt (optional)

Translation type.

Range:

000 - 255

ttn (optional)

User defined LNP Translation Type name.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters, the value *none* is not allowed.

Default:

Reserved service type name (*serv* parameter)

Example

```
ent-lnp-serv:serv=class:tt=10:ttn=class1:dfltact=disc1:on=gttrqd:gttselid=100
ent-lnp-serv:serv=lidb:tt=16:dv=tcap:ttn=mrlidb
ent-lnp-serv:serv=lrnqt:tt=239:dv=tcap
```

Dependencies

The same value cannot be specified for the on and off parameters.

The dfltact=none parameter cannot be specified.

The EGTT feature must be turned on before the gttselid, dfltact, or on/off=gttrqd parameter can be specified.

If a GTT Action ID is specified as the value for the dfltact parameter, then the Action ID must already exist in the GTT Action table.

If a GTT Action ID is specified as a value for the dfltact parameter, then the GTT Action ID must be associated with an action of *disc/udts/tcaperr* .

The LNP feature must be turned on before this command can be entered.

The PLNP feature must be turned on before the serv=pcs parameter can be specified.

The WNP feature must be turned on before the serv=wnp parameter can be specified.

The LNP SMS feature must be turned on before the serv=wsmc parameter can be specified.

If a value of *udf1*, *udf2*, *udf3*, or *udf4* is specified for the serv parameter, then the dfltact, gttselid and on/off=gttrqd parameters cannot be specified.

The tt parameter must be specified if the alias parameter is not specified.

The ttn=none parameter cannot be specified.

If a value of *udf1*, *udf2*, *udf3*, *udf4*, or *wsmc* is specified for the serv parameter, then the dv=sccp parameter must be specified.

If the *lnpqs*, *ain*, *in*, *pcs*, *wnp*, or *lrnqt* value is specified for the serv parameter, then the dv=tcap parameter must be specified.

A reserved service type name can be specified for the ttn parameter only if it matches the serv parameter value.

The value of the tt parameter cannot already exist in the LNP database.

If the tt parameter is specified, then the value of the serv parameter cannot exist in the LNP database.

A maximum of 6 Message Relay services are allowed.

If the alias parameter is specified, then the serv parameter must already have an assigned translation type.

When the alias parameter is specified, its value cannot already exist in the LNP database as a true translation type for this service.

If the alias parameter is specified, then the specified alias cannot be in use.

If the tt parameter is specified, then its value cannot already exist in the LNP database as an alias for this service.

The value of the ttn parameter cannot exist in the LNP database.

The LRNQQT feature must be turned on before the serv=lrnqt parameter can be specified.

If the alias parameter is specified, then the tt, ttn, and dv parameters cannot be specified.

The nrqdtblnop parameter requires that the Dual ExAP Config feature is enabled.

Notes

on/off options

gttrqd—GTT required. Specifies whether GTT is performed after the successful completion of an LNP Message Relay service and before initiation of an LNP Query service. This option has a default of OFF.

Translation type names must be unique for LNP services.

A translation type name can be a reserved service type name only if it matches the specified service.

TTN

LNP Translation type name referenced in the ENT-LNP-SERV command is different from the Translation type name referenced in ENT-TT command.

Output

```
ent-lnp-serv:tt=1:serv=lidb:on=gttrqd:dfltact=falltogtt
```

```
rlghncxa03w 10-11-08 08:50:12 EST EAGLE 43.0.0
ENT-LNP-SERV: MASP A - COMPLTD
```

Related Commands

chg-lnp-serv, dlt-lnp-serv, rtrv-lnp-serv

ent-loopset

Enter Loop Set Command

Use this command to enter the loopset information into the database. This command updates the Loopset table.

Parameters

name (mandatory)

Loopset name. This parameter specifies an entry in the Loopset table.

The *name=none* parameter cannot be specified.

Range:

ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters

pcl (mandatory)

ANSI point code list with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym:

pcla

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pcli (mandatory)

ITU international point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcln (mandatory)

ITU national point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcln24 (mandatory)

24-bit ITU national point code list with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

pcln16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

p---, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

mode (optional)

Mode of operation. This parameter specifies whether the message is discarded when an SCCP loop is detected.

Range:

notify

Generates a UIM without discarding the message.

discard

Generates a UIM and discards the message.

Default:

notify

Example

This example creates a new loopset using the default mode of *notify*.

```
ent-loopset:name=rtp1:pcl=3-3-3,5-5-5,7-7-7,3-4-3
```

This example creates a new loopset and sets the mode to *discard*.

```
ent-loopset:name=rtp2:mode=discard:pcl=3-3-3,5-5-5,7-7-7,3-4-3
```

This example creates a new loopset with four 16-bit ITU-N point codes.

```
ent-loopset:name=rtp1:pcln16=3-3-3,5-5-5,7-7-7,3-4-3
```

Dependencies

The value of the name parameter cannot already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The Loopset table can hold a maximum of 1,000 loopset entries, with each entry containing up to 12 point codes. Additional loopset entries and point codes cannot be added when the table is full.

The values for the `pcl` parameter must be unique.

The `name=none` parameter cannot be specified.

At least one valid point code must be specified as a value for the `pcl` parameter.

The values for the `pcl` parameter cannot consist of any invalid point codes. The valid point codes must be consecutively specified and separated by commas.

Notes

There is no J7 FAK dependency on the `apcln16/rpcln16/pc1n16/npc1n16/pc2n16/npc2n16` parameters. The command can be entered successfully when the J7 FAK is not enabled.

There is no J7 FAK dependency on the `apcln24/rpcln24/pc1n24/npc1n24/pc2n24/npc2n24` parameters. The command can be entered successfully when the J7 FAK is enabled.

There is no J7 FAK dependency on the apcl/ apcla/rpcla/pc1a/npc1a/pc2a/npc2a parameters. The command can be entered successfully when the J7 FAK is enabled.

Output

The following example creates a new loopset and sets the mode to *discard*.

```
ent-loopset:name=rtp2:mode=discard:pcl=3-3-3,5-5-5,7-7-7,3-4-3
```

```

rlghncxa03w 07-02-10 08:31:28 EST  EAGLE Rel 35.6.0

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--s-- , p-- , ps

zone--0-7

area--000--255

id--0--7

The point code *0--000--0* is not a valid point code.

apcn (mandatory)

ITU national adjacent destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn,prefix-nnnnn-gc,prefix-m1-m2-m3-m4,prefix-m1-m2-m3-m4-gc*).

Range:

s-- , p-- , ps-- , 0--16383 , aa--zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--s-- , p-- , ps

nnnnn--0--16383

gc--aa--zz

m1--m2--m3--m4--0--14 for each member; values must sum to 14

apcn24 (mandatory)

24-bit ITU national adjacent destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p--- , 000---255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--p

msa---000---225

ssa---000---225

sp---000---225

apcn16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--,000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000--127

sna---000--15

mna---000--31

lsn (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

lst (mandatory)

Linkset type. The linkset type of the specified linkset as defined in Telcordia GR-246-CORE, T1.111.5.

Range:

a

Access links

b

Bridge links

c

Cross links

d

Diagonal links

e

Extended links

prx

Proxy links

adapter (optional)

The adapter layer for links provisioned in an IPSP linkset.

Range:

m3ua

m2pa

Default:

m2pa

apcntype (optional)

ITU-N Adjacent Point Code Type. The format used for changeover and changeover acknowledgement messages.

Range:

itun

ITU National Adjacent Point Code Type

itunchina

ITU National China Adjacent Point Code Type

Default:

itun

asl8 (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSs.

Range:

yes

no

Default:

no

asnotif (optional)

AS notification. This parameter specifies whether AS notifications should be sent for IPSP-M3UA linkset.

Range:

yes

no

Default:

yes

bei (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range:

yes

TFPs are not broadcast

no

TFPs are broadcast

Default:

no

cggtmod (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required for the specified linkset.

Range:

yes

no

Default:

no

clli (optional)

Far-end Common Language Location Identifier (CLLI). The CLLI assigned to the linkset.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by up to 10 alphanumeric characters

Default:

CLLI of the adjacent point code

gsmscrn (optional)

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range:

on

off

Default:

off

gttmode (optional)

Global title translation mode. The GTT Mode hierarchy for each link set.

Range:

cd

CdPA GTT only

cg

CgPA GTT only

acdcd

Advanced CdPA GTT, CdPA GTT

acdcgcd
Advanced CdPA GTT, CgPA GTT, CdPA GTT

acdcdcg
Advanced CdPA GTT, CdPA GTT, CgPA GTT

cgacdcd
CgPA GTT, Advanced CdPA GTT, CdPA GTT

cgcd
CgPA GTT, CdPA GTT

sysdflt
System wide default value

fgd
FLOBR CdPA only

fcg
FLOBR CgPA only

fcgfgd
FLOBR CgPA, FLOBR CdPA

fgdfcg
FLOBR CdPA, FLOBR CgPA

cdcg
CdPA GTT, CgPA GTT

Default:*sysdflt***gwsa (optional)**

Gateway screening action. This parameter specifies whether gateway screening is on or off for the specified linkset.

Range:*on**off***Default:***on* —if scrn is specified*off* —if scrn is not specified**gwsd (optional)**

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if gwsd=on is specified.

Range:

on

off

Default:

off

gwsm (optional)

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range:

on, off

Default:

off

ipgwapc (optional)

IP gateway adjacent point code. Specifying ipgwapc=yes indicates that the linkset is entered for a card of application type SS7IPGW or IPGWI and the adjacent point code specified is an IP gateway adjacent point code.

Range:

yes

no

Default:

no

ipsg (optional)

IP signaling gateway adjacent point code. This parameter specifies whether a linkset is entered for an IP SG card. The specified adjacent point code is an IPLIM or IP gateway adjacent point code.

Range:

yes

no

Default:

no

iptps (optional)

IPGWx Linkset TPS.

This parameter is a user-defined portion of the total system IP Signaling TPS. This parameter is allowed and required only for IPGWx linksets (the ipgwapc=yes parameter is specified).

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all

linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

Range:

100 - 32000

The specified value must be divisible by 10.

islsrsb (optional)

Incoming rotated signaling link selection (SLS) bit. The bit (1–4 for ITU and 1 – 8 for ANSI linksets) to rotate as the new SLS LSB (Least Significant Bit) of the incoming linkset. The SLS is not modified in the outgoing message.

Table 29: Incoming SLS Bit Rotation for ITU shows how the rotation affects the four bits of the ITU SLS during linkset selection:

Table 29: Incoming SLS Bit Rotation for ITU

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

Table 30: Incoming SLS Bit Rotation for ANSI shows how the rotation affects the eight bits of the ANSI SLS during linkset selection:

Table 30: Incoming SLS Bit Rotation for ANSI

If This Bit is Selected...	Then Bit Locations 8 7 6 5 4 3 2 1 Are Rotated To...	
Bit 8	7 6 5 4 3 2 1 8	SLS = 10010110 becomes Rotated SLS = 00101101

If This Bit is Selected...	Then Bit Locations 8 7 6 5 4 3 2 1 Are Rotated To...	
		SLS = 11001011 becomes Rotated SLS = 10010111
Bit 7	6 5 4 3 2 1 8 7	SLS = 10010110 becomes Rotated SLS = 01011010 SLS = 11001011 becomes Rotated SLS = 00101111
Bit 6	5 4 3 2 1 8 7 6	SLS = 10010110 becomes Rotated SLS = 10110100 SLS = 11001011 becomes Rotated SLS = 01011110
Bit 5	4 3 2 1 8 7 6 5	SLS = 10010110 becomes Rotated SLS = 01101001 SLS = 11001011 becomes Rotated SLS = 10111100
Bit 4	3 2 1 8 7 6 5 4	SLS = 10010110 becomes Rotated SLS = 11010010 SLS = 11001011 becomes Rotated SLS = 01111001
Bit 3	2 1 8 7 6 5 4 3	SLS = 10010110 becomes Rotated SLS = 10100101 SLS = 11001011 becomes Rotated SLS = 11110010
Bit 2	1 8 7 6 5 4 3 2	SLS = 10010110 becomes Rotated SLS = 01001011 SLS = 11001011 becomes Rotated SLS = 11100101
Bit 1	No rotation is performed because bit 1 is the existing LSB.	

This parameter is used for ITU or ANSI messages on a per-linkset basis.

Range:

1 - 8

ITU linksets— 1 - 4

ANSI linksets— 1 - 8

The rsls8=yes parameter must be specified (see the `chg-lsopts` command) before a value greater than 5 can be specified for the `islsrsb` parameter.

Default:*1***itutfr (optional)**

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range:*on**off***Default:***off***l3tset (optional)**

Link timer set. This parameter value is the value that is defined with the `chg-l3t` command.

Range:*1***Default:***1***lsusealm (optional)**

IPTPS linkset alarm threshold percent. The percent of the linkset TPS (IPTPS) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured IPTPS value for the linkset.

Range:*10 - 100***Default:***100***maxslktps (optional)**

Maximum per signaling link TPS. The maximum capacity a link is permitted when sufficient unused capacity is present on the host card.

Note: This parameter can only be specified for links in IPSP linksets.

Note: If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

Range:*100 - 9500*

Note: The maximum value that can be specified for this parameter depends on the type of IPSP card that is used and whether the E5-ENET-B IPSP High Throughput feature is turned on:

- E5-ENET card-5000 TPS
- E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned off-6500 TPS
- E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned on-9500 TPS

System Default:

value of slktps/rsvdslktps parameter

mtprese (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range:

yes

equipped

no

not equipped

Default:

no

multgc (optional)

Multiple group codes. This parameter specifies whether multiple group codes can be specified.

Range:

yes

no

Default:

no

nis (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range:

on

off

Default:

off

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

The proxy point code must be a full point code.

Synonym:

ppca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code.

Range:

s-, 0-255, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

Enter *none* to delete the point code.

The point code *0-000-0* is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ppcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point*(*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

ppcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

randsls (optional)

Random SLS (signaling link selection). This parameter is used to apply random SLS generation for the specified linkset.

The `randsls=perls` parameter must be specified in the `chg-stpopts` command before specifying the `randsls` parameter in the `ent-ls` command enables random SLS generation on a per linkset basis.

Range:

off

Disables random SLS generation on a specified linkset.

class0

Enables random SLS generation for Class0 SCCP traffic on a specified linkset.

all

Enables random SLS generation for Class0 and Class1 SCCP traffic on a specified ITU linkset and for Class0 and ISUP traffic on a specified ANSI linkset.

Default:

off

rcontext (optional)

Routing context. The new routing context for an IPSP-M3UA linkset.

Range:

0 - 4294967295

System Default:

none

scrn (optional)

Gateway screening screen set. The gateway screening screen set assigned to this linkset.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

none —Deletes screen set association with the linkset

slktps (optional)

Reserved per signaling link TPS for IPSP Linkset. The capacity guaranteed to each link in the linkset.

Note: This parameter is required for each link in an IPSP linkset. The parameter cannot be specified for links in non-IPSP linksets. The guaranteed capacity for the links hosted by an IPSP card cannot exceed the IPSP card capacity.

Note: If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

Synonym:

rsvdsllktps

Range:

0 - 9500

Note: The maximum value that can be specified for this parameter depends on the type of IPSP card that is used and whether the E5-ENET-B IPSP High Throughput feature is turned on:

- E5-ENET card-5000 TPS
- E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned off-6500 TPS
- E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned on-9500 TPS

slkusealm (optional)

IPTPS signaling link alarm threshold percent. The percent of the link TPS at which an alarm is generated to indicate that the actual link TPS is approaching the alarmed IPTPS (slktps/rsvslktps or maxslktps) configured for the link.

System Default:

80

slsci (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range:

yes

enabled

no

disabled

Default:

no

slsocbit (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5– 16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (slsocbit=9). The new SLS is 0100.

Table 31: SLSOCBIT example (ent-ls)

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS							0					1	0	0	

Range:

5 - 16, none

Default:

none

slrsb (optional)

Rotated signaling link selection (SLS) bit. The bit (1–4) to rotate as the new SLS Least Significant Bit (LSB). The SLS is not modified in the outgoing message. [Table 32: SLS Bit Rotation](#) shows how the rotation affects the four bits of the SLS during linkset selection:

Table 32: SLS Bit Rotation

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

This parameter is used for ITU messages on a per-linkset basis.

Range:

1 - 4

Default:

1

sltset (optional)

SLTM record. The SLTM record to be associated with the linkset.

Range:

0 - 20

0 –sets the linkset to SLT reflect mode

Default:

- 1 - ANSI
- 2 - ITU

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point*(*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—*000-255*

ssa—*000-255*

sp—*000-255*

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000-127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---*000---127

*sna---*000---15

*mna---*000---31

tpsalmttype (optional)

IPSG IPTPS threshold alarm type. The IPTPS threshold that can be alarmed.

Range:

slktps

the SLKTPS/RSVDSLKTPS threshold is alarmed

maxslktps

the MAXSLKTPS threshold is alarmed

System Default:

slktps

Example

Adds linkset WY64438 with APC 144-201-1 AND LIST C:

```
ent-ls:lsn=wy644368:apc=144-201-001:lst=c
```

Adds linkset LSITUA1 with APCN 5 and LST C. The APCN uses a four-part format where the maximum number of bits in each position is defined by the `chg-stpopts:npcfmti` parameter:

```
ent-ls:lsn=lsitua1:apcn=5-5-5-1:lst=c
```

Adds linkset EXP123 with APCN 2-3-4-5-aa, which has a duplicate point code group of *aa* and linkset type *a*. The ITU national duplicate point code (ITUDUPPC) feature is turned on, so the ITU national point code contains a group code.:

```
ent-ls:lsn=exp123:apcn=2-3-4-5-aa:lst=a
```

Add a linkset in which all applicable MSUs arriving on the linkset are screened using the GSM MAP screening feature:

```
ent-ls:lsn=lsitul:apcn=5000:lst=a:gsmscrn=on
```

Adds linkset LSN24 with 24-bit ITU-N APCN24 10-100-10 and linkset type *a*:

```
ent-ls:lsn=lsn24:apcn24=10-100-10:lst=a
```

Adds linkset LSA2 with private APC p-1-2-4

```
ent-ls:lst=a:lsn=lsa2:apc=p-1-2-4
```

Adds linkset LSN410234 with private and spare APCN ps-1-1-1-2047-aa:

```
ent-ls:lst=b:lsn=lsn410234:apcn=ps-1-1-1-2047-aa
```

Adds linkset LSI00001 with spare APCI s-1-1-209-7:

```
ent-ls:lst=b:lsn=lsi00001:apci=s-1-1-209-7
```

Adds linkset LSN24 with APCN24 10-100-10 with an APCNTYPE of *itunchina* and linkset type *a*:

```
ent-ls:lsn=lsn24:apcn24=10-100-10:lst=a:apcntype=itunchina
```

Adds linkset LSA using the global title translation mode CGACDCD.

```
ent-ls:lsn=lsa:lst=a:apca=1-1-1:gttmode=cgacdcd
```

Enables random SLS generation for Class0 and Class1 SCCP traffic on ITU linkset LSA:

```
ent-ls:lsn=lsa:lst=a:apci=1-1-2:randsls=all
```

Adds a linkset in which calling party global title modification is required for all GT routed MSUs arriving on the linkset:

```
ent-ls:lsn=ls2:apc=2-2-2:lst=a:cggtmod=yes
```

Adds an IPSPG-M3UA linkset:

```
ent-ls:lsn=ls1201:apc=10-10-10:lst=a:adapter=m3ua:ipsg=yes:slktps=100
```

Adds an IPSPG-M2PA linkset:

```
ent-ls:lsn=lsm2pa:apc=5-6-7:lst=c:ipsg=yes:slktps=300
```

Adds a linkset and sets the Incoming SLS Bit Rotation on the 2nd Bit:

```
ent-ls:lsn=lsa:lst=a:apci=1-1-2:islsrsb=2
```

Adds linkset LSA using GTT mode FCDFCG when the Flexible Option Based Routing (FLOBR) feature is turned on:

```
ent-ls:lsn=lsa:lst=a:apca=1-1-1:gttmode=fcdfcg
```

Adds ANSI linkset LSA and sets the Incoming SLS Bit Rotation to the 6th bit (the 6th bit in the SLS is used as the LSB)

```
ent-ls:lsn=lsa:lst=a:apca=1-1-1:islsrsb=6
```

Converts the linkset to SLT reflect mode

```
ent-ls:lsn=ls1:lst=a:apca=1-1-1:sltset=0
```

Add linkset LS1 with 16-bit ITU-N APCN16 120-11-12 and sets linkset to SLT reflect mode:

```
ent-ls:lsn=ls1:lst=a:apcn16=120-11-12:sltset=0
```

Dependencies

The value specified for the apc parameter must be a full point code.

The specified adjacent point code cannot exist as an alias point code.

If the gwsa=on, gwsn=on, and gwsd=on parameters are specified, the scrn parameter must be specified.

The specified adjacent point code cannot be the same as the self-ID destination point code of the STP.

The specified adjacent point code cannot be the same as any self-ID capability point codes of the STP.

If the system is configured for ANSI point codes, and the nc=0 parameter is specified, then the value of the ni parameter must be 6 or greater.

The specified linkset name cannot already exist in the database.

The specified adjacent point code cannot be assigned to any other linkset.

Private (p-) and private and spare (ps-) point codes can be assigned only to IPGW linksets (the ipgwapc=yes parameter is specified).

The maximum number of linksets that can be defined in the system is 1024.

The specified screen set (scrn parameter) must exist in the database.

If the gwsd=on parameter is specified, the gwsa=on parameter must be specified.

If a destination point code matching the specified far-end point code exists, the far-end CLLI for the given linkset must match the destination identifier (DI) of that matching destination.

The mtrse parameter can be specified only if the MTP Restart feature MTPRS (for ANSI) is turned on. The rtrv-feat command can be used to verify whether the feature is turned on (mtrps=yes in the output).

If the ipgwapc=yes parameter is specified or the ipsg=yes and the adapter=m3ua parameters are specified, then the mtrse=yes parameter cannot be specified.

The asl8=yes parameter can be assigned only to an ANSI linkset (a linkset containing an adjacent point code in the SS7 domain).

The apcntype parameter can be specified only for ITU-N and ITU-N24 linksets.

The Other CIC (Circuit Identification Code) Bit Used feature (SLSOCB) feature must be turned on before the `slsobit` parameter can be specified.

The `slsobit` parameter is valid only for ITU linksets.

The `slrsb` parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on (see the `enable/chg-ctrl-feat` commands) before the `gmscrn` parameter can be specified.

The `itutfr` parameter is valid only for ITU linksets.

The ITU National Duplicate Point Code (ITUDUPPC) feature must be turned on before the `multgc=yes` parameter can be specified.

The `multgc=yes` parameter is valid only for ITU-N or ITU-I point codes.

The `iptps` parameter must be specified for IPGWx linksets

The `iptps` parameter cannot be specified for linksets that are not IPGWx.

The specified `iptps` parameter value must be divisible by 10.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

The `ipgwapc=yes` or the `ipsg=yes` parameter must be specified before the `lsusealm` parameter can be specified.

The `ipgwapc=yes` or the `ipsg=yes` parameter must be specified before the `slkusealm` parameter can be specified.

The Enhanced GSM Map Screening feature must be turned on before the `gmscrn=on` parameter can be specified for an ANSI linkset.

The `mtrprse` parameter can be specified only if the MTP Restart feature ITUMTPRS (for ITU), is turned on. The `rtrv-feat` command can be used to verify whether the feature is turned on (`itumtprs=yes` in the output).

A point code cannot be assigned to a linkset as an APC if the point code has been provisioned with exception routes.

An APC cannot be assigned to an IPGWx linkset that is already assigned to a route involving another linkset.

The Origin-based SCCP Routing feature must be turned on before the `gttmode` parameter can have a value of `acdc`, `cgacdc`, `acdcgc`, `acdcgcg`, `cgcd`, `cdcg`, or `cg`.

A new IPGW link set cannot be entered if it contains an APC that is already configured in a routing key. An SAPC cannot be added to an existing IPGW link set if the new SAPC is already configured in a routing key.

If APCN is specified for the Adjacent Point Code then the format of APCN must match the format dictated by the NPCFMTI parameter via the CHG-STPOPTS command.

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must exist in the Destination Point Code table.

The `gmscrn` parameter can be specified only for ITU linksets.

The value specified for the `spc` parameter must be a full point code.

If the Multiple Linksets to a Single Adjacent Point Code (MLS) feature is enabled and turned on, then a maximum of 6 non-IPGW linksets can be created using the same adjacent point code.

The values specified by the `spc` and `apc` parameters must have the same network type.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the `spc` parameter can be specified.

The value specified by the `spc` parameter must already exist in the SPC table.

The SPC table must be accessible.

The specified combination of the `apc` and `spc` parameters must be unique for each linkset.

The value specified for the `spc` parameter cannot already be specified as a secondary point code for an adjacent destination point code.

The Proxy Point Code feature must be enabled before the `lst=prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The value specified for the `ppc` parameter must be a full point code.

The `lst=prx` parameter must be specified before the `ppc` parameter can be specified. If the `lst=prx` parameter is specified, then the `ppc` parameter must be specified.

The values specified for the `apc` and `ppc` parameters must have the same network type.

The values specified for the `apc` and `ppc` parameters must have the same group code.

The `spc` and `ppc` parameters cannot be specified together in the command.

The `ppc` parameter cannot be specified for more than 10 linksets.

Two adjacent point codes cannot reference each other as proxy point codes.

Only one IPGWx linkset can be created for an adjacent destination point code.

The `apc` parameter and the `prx=yes` parameter must be specified before the `ppc` parameter can be specified.

If the `ipgwapc=yes` parameter is specified, then the `ppc` parameter cannot be specified.

If an IPGW linkset is used, then the `lst=prx` parameter cannot be specified.

If the `ipgwapc=yes` parameter is specified, then the `spc` parameter cannot be specified.

The `spc` and `ppc` parameters cannot be specified together in the command.

All of the linksets for an adjacent destination point code must be of the same type.

The specified combination of the `apc` and `ppc` parameters must be unique for each linkset.

The value specified for the proxy point code must be defined in the Destination table before the `lst=prx` parameter can be specified.

If multiple linksets are defined for the `apc` parameter, and if a proxy point code is defined for the `apc` parameter, then the first linkset defined in the `ent-ls` command must use the proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggtmod` parameter can be specified.

The `ipgwapc=yes` and `ipsg=yes` parameters cannot be specified together in the command.

The `ipsg=yes` parameter must be specified before the `adapter` parameter can be specified.

The `ipsg=yes` and `adapter=m3ua` parameters must be specified before the `asnotif` parameter can be specified.

The `ipsg=yes` and the `adapter=m3ua` parameters must be specified before the `rcontext` parameter can be specified.

The `ipgwpc=yes` parameter must be specified before an invalid point code (ANSI network = 0) can be specified as an APC.

If the `ipsg=yes` parameter is specified, then the `slktps/rsvdslktps` or `maxslktps` parameter must be specified.

The `ipsg=yes` parameter must be specified before the `slktps/rsvdslktps` or `maxslktps` parameter can be specified.

The `ipsg=yes` and `adapter=m3ua` parameters must be specified before the `lst=a` parameter can be specified.

A maximum of one IPGW linkset or a maximum of 6 of any other linksets are allowed between any APC and the EAGLE.

If the `ipsg=yes` and `adapter=m3ua` parameters are specified, then the `multgc=yes` parameter cannot be specified.

The ISLSBR feature must be enabled before the `islsrsb` parameter can be specified.

The FLOBR feature must be turned on before a value of `fcd`, `fcg`, `fcgfcg`, or `fcdfcg` can be specified for the `gttmode` parameter.

The `rsls8=yes` parameter (see the `chg-lsopts` command) must be specified for an ANSI linkset before a value greater than 5 can be specified for the `islsrsb` parameter.

If an ITU linkset is used, then a value of 1 – 4 must be specified for the `islsrsb` parameter.

The value specified for the `slktps/rsvdslktps` parameter must be less than or equal to the value specified for the `maxslktps` parameter.

The value specified for the `ppc` parameter must already exist in the DSTN table and the `prx=yes` parameter must be assigned (see the `ent-dstn` command).

The `sltset=0` parameter can be specified only for a type A linkset (`lst=a`).

The value specified for the `slktps/rsvdslktps` and `maxslktps` parameters must be within the allowed range.

The ITUTFR cannot be specified for a linkset to be configured for APCN16.

The NIS cannot be specified for a linkset to be configured for APCN16.

The PPC specified must not be a private point code.

The MTP Restart Equipped (MTPRSE) parameter is only valid for adjacent ANSI nodes in the SS7 domain.

The `adapter` type specified must be either `m3ua` or `m2pa`.

Notes

Of the 1024 maximum linksets supported, up to 255 of the linksets can be gateway linksets.

The system supports a maximum of 700 links. If more than 700 linksets are defined, a maximum of 700 of the defined linksets can be in use at any one time.

The links that directly connect the system with an adjacent node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standards) signaling links, depending on how the system was configured when the network was created.

Each linkset must be assigned the same physical links at both ends of the link (local and adjacent signaling points) and each link must be assigned the same link number.

Signaling link acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

If the `gwsa=off` and `gwsm=off` parameters are specified, all MSUs are passed.

If the `gwsa=off` and `gwsm=off` parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the `gwsa=off` and `gwsm=on` parameters are specified, all MSUs pass, but MRNs are generated if an MSU matches a screening condition.

If the `gwsa=on` and `gwsm=off` parameters are specified, MSUs are screened but messages are not generated.

If the `gwsa=on` and `gwsm=on` parameters are specified, MSUs are screened and MRNs are generated at the rate of one MRN every 20 seconds per link.

If the `asl8=yes` parameter is specified with the `lst=a` parameter (a linkset containing access signaling links), this indicates that the originator of the MSUs is generating 8-bit SLSs. For other linkset types, the `asl8=yes` parameter indicates that the adjacent STP is converting 5-bit SLSs to 8-bit SLSs. The SLS in MSUs received by the system on a linkset that has the `asl8=yes` parameter assigned to it will not be converted. These MSUs are assumed to contain 8-bit SLSs.

The Network Indicator Spare (`nis`) parameter can be specified only for ANSI and ITU-N links.

The `mtrprse` parameter value can be specified independently of the value specified on the `mtrprsi` parameter of the `chg-stpopts` command.

The MTP restart option (`mtrprse`) is not a valid option on point-to-multipoint IP links (DCM cards equipped as SS7IPGW links).

When two linksets are used as a combined linkset, each linkset must have the same `slsci` and `asl8` values and the same `slsocbit` and `islsrsb/slsrsb` values.

Caution: This is not enforced in the system and there is no warning mechanism if the values of these parameters are not the same for each linkset.

CAUTION

MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent as shown:

- up to 64 LIMs—62 seconds (Link Alignment Delay)
- 64 - 127 LIMs—97 seconds
- 128 - 191 LIMs—132 seconds
- more than 191 LIMs—167 seconds

The `slrsb` parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route

messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field are still not realized. The `slsocbit` parameter must also be specified to provide an even distribution across all links within the linkset. If both parameters are specified for a given linkset, the SLS field is processed in the following order.

- The SLS is modified using the Other CIC Bit option.
- The modified SLS is modified again using the Rotated SLS Bit option.
- The modified SLS is used by the existing linkset and link selection algorithms to select a link
- The ISUP message is sent out the link containing the original, unmodified SLS field.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is turned on, for each group that is defined, a separate ITU national C linkset must be provisioned. The C linkset is used as the alternate route for point codes in the group.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All point code types support the private (internal) point code subtype prefix (p-).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The `randsls` parameter value applies to SCCP ITU-T messages and Class0 and ISUP ANSI messages when random SLS generation is set to occur on a per linkset basis (the `randsls=perls` parameter is specified in the `chg-stpopts` command).

If the `randsls=perls` parameter is specified in the `chg-stpopts` command, it is recommended that the linksets in a combined linkset be provisioned with the same `randsls` value to avoid undesired SLS distribution.

The value specified for the `ppc` parameter must be a full point code. Cluster point codes and private point codes are not supported.

Invalid point codes (ANSI network = 0) can be used for the adjacent point code of an IPGWx linkset. Private point codes (p-) can be used for IPGWx linksets, as adjacent point codes (`ent-ls:apc=xxx`) or internal point codes (`ent-rmt-appl:ipc=xxx`). Ordinary point codes can be used in all cases as APCs or IPCs.

If the ISLSBR feature is turned on, and Incoming SLS Bit Rotation is applied to an MSU, then the outgoing SLS bit rotation is not applied for that MSU. If the ISLSBR feature is turned off, or Incoming SLS Bit Rotation is not applied to an MSU, then the outgoing SLS bit rotation is applied for that MSU.

The valid ISLSRSB values for ITU link sets are 1 – 4 and for ANSI link sets 1 – 8.

The `randsls` parameter is applied on an incoming linkset for ANSI messages and on an outgoing linkset for ITU messages.

Output

```

ent-map

Enter Mate Applications

Use this command to create new entries in the MAP table, which allow the assignment of mated applications and Alternate RI Mate searches for use with SCCP network management. A mated application is used if the local application becomes unavailable. An Alternate RI Mate is used if all mated applications within a MAP Set become unavailable or congested.

Note: A MAP set is a logical grouping of a set of PC/SSNs that already exist in the EAGLE MAP table. The Flexible GTT Load Sharing (FGTTLS) feature allows a PC/SSN combination to be part of more than one load-sharing group, with each PC/SSN combination defined by a different MAP set.

Note: If the FGTTLS feature is enabled, then all existing entries in the MAP table and all existing GTA translations in the GTT table with ri=ssn are stored in default MAP sets. Additional MAP sets can be provisioned, and GTT entries can be associated to the MAP sets.

Note: The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

pc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (mandatory)

Primary remote point code.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

pcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area(un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

un---000---127

sna---000---15

mna---000---31

ssn (mandatory)

Subsystem number. The application's subsystem number. This attribute is composed of the decimal representation of the 1-byte field used in the SS7 protocol.

Range:

2 - 255

grp (optional)

Concerned point code broadcast list (CSPC) group name. The name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA. This parameter must be provisioned for a node if the node is to receive SSP or SSA broadcasts, even if the node is a mated application.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default:

No broadcast list for this mated application.

mapset (optional)

MAP Set ID.

Range:

dflt

new

Default:

dflt if the FGTTLS feature is not enabled

materc (optional)

Mate relative cost. The RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE determines the multiplicity mode based on the relative costs (the rc and materc parameters) of the subsystem.

Range:

0 - 99

Default:

50

mpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

Synonym:*mpca***Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

Default:

000

mpc/mpca/mpci/mpcn/mpcn24/mpcn16 (optional)

Mate remote point code.

mpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

Default:

0-000-0

mpcn (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

00000

mpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default:

000

mpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

un---000---127

sna---000---15

mna---000---31

Default:

000

mrc (optional)

Message routing under congestion. This parameter indicates whether Class 0 messages to the specified PC/SSN can be routed to the next preferred node/subsystem when that PC/SSN is congested.

Range:*yes**no***Default:***yes* —if ANSI*no* —if ITU**mrnpc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

Synonym:*mrnpca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

Default:*000***mrnpc/mrnpca/mrnpnci/mrnpncn/mrnpncn24/mrnpncn16 (optional)**

Alternate RI Mate point code.

mrnpnci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255*

id—0-7

The point code 0-000-0 is not a valid point code.

Default:

0-000-0

mrnpcn (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

00000

mrnpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default:

000

mrnpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000--127

Specify a valid value for each subfield of the point, and separate the subfields with a dash (-).

*un---*000---127

sna---000---15

mna---000--31

Default:

000

mrnset (optional)

Alternate RI Mate MRN Set ID. The MRN Set where the Alternate RI Mate search is performed.

Range:

1 - 3000, dflt

dflt —default MRN Set

If the *mrnpc* parameter is specified, and the *mrnset* parameter is not specified, then the value for the *mrnset* parameter is automatically set to *dflt*

mssn (optional)

Mate subsystem number. The mate application's subsystem number. This attribute is the decimal representation of the one-byte field used in the SS7 protocol.

Range:

2 - 255

Default:

Parameter is not used

mwt (optional)

Mate point code weight. The weight assigned to the mate PC/SSN that is being added to a weighted entity set.

Range:

1 - 99

rc (optional)

Relative cost. The EAGLE determines the multiplicity mode based on the relative costs (the *rc* and *materc* parameters) of the subsystem. (See *Notes* for additional information on multiplicity modes.)

Range:

0 - 99

Default:

10

srm (optional)

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

Note: This value can be provisioned in any of the multiplicity modes, but its value only affects traffic if the multiplicity mode is *DOM* or *COM*. See the *Notes* section for more information on multiplicity modes.

Range:

yes

no

Default:

yes —if ANSI

no —if ITU

sso (optional)

Subsystem status option. This parameter specifies whether or not the PC/SSN is to initiate a subsystem test when a RESUME is received for the PC.

Range:

on

off

Default:

off

thr (optional)

Threshold. The in-service threshold assigned to each PC/SSN in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Note: If this parameter is not specified, a value of 1% is assigned to each weighted PC/SSN.

Range:

1 - 100

wt (optional)

Weight. The weight assigned to the primary PC/SSN that is being added to the weighted entity set.

Range:

1 - 99

Example

In this example, the rc parameter is not required for a solitary PC/SSN pair. If the rc parameter is not specified, the relative cost defaults to 10.

```
ent-map:pc=1-1-1:ssn=10:grp=xyz
```

This example enters 1 and 1 into the MAP table. The rc and materc parameters are required for this command, which defines a map group.

```
ent-map:pc=1-1-0:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:grp=xyz:srm=on
```

These examples enter a solitary point code in the MAP table with the Subsystem Status Option set to ON:

```
ent-map:pc=1-1-3:ssn=20:grp=abc:sso=on
```

```
ent-map:pc=2-2-3:ssn=20:grp=abc
```

Thus example sets the Subsystem Status Option to ON for the primary and mate:

```
ent-map:pc=1-1-4:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:sso=on
```

This example enters a solitary point code in the MAP table with the Subsystem Status Option set to OFF (the default):

```
ent-map:pc=1-1-6:ssn=10:rc=10:mpc=1-1-7:mssn=10:materc=20
```

This example creates a new MAP Set with Alternate RI Mate 1-1-3/1.

```
ent-map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=new:mrnset=1:mrmpc=1-1-3
```

The following example creates a new MAP set, and enters 1 and 1 into the newly created MAP set.

```
ent-map:pc=1-1-1:ssn=10:rc=10:mpc=1-1-2:mssn=20:materc=20:mapset=new
```

The following example enters 1 and 1 into the default MAP set.

```
ent-map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=df1t
```

The following example creates a new MAP set and enters a solitary PC/SSN value of 1.

```
ent-map:pc=1-1-1:ssn=10:mapset=new
```

This example enters a solitary PC/SSN of 1 into the default MAP set.

```
ent-map:pc=1-1-2:ssn=15:mapset=df1t
```

This example creates a new MAP set and enters a solitary PC/SSN 1 with the subsystem option ON. It specifies the sso=on parameter for all instances of PC/SSN 1.

```
ent-map:pc=1-1-1:ssn=10:sso=on:mapset=new
```

This example enters a solitary PC/SSN of 1 into the default MAP set with the subsystem option ON. The sso=on parameter is specified for all instances of PC/SSN 1.

```
ent-map:pc=1-1-3:ssn=15:sso=on:mapset=df1t
```

These examples create a weighted shared PC/SSN pair.

```
ent-map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=20
```

```
ent-map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=20:thr=40
```

This example creates a new MAP Set with a different ITU network type point code for the Alternate RI Mate PC.

```
ent-map:pci=1-001-1:ssn=15:rc=10:mpci=1-001-2:mssn=25:materc=20:mapset=new:mrmpcn=00126:mrnset=2
```

Example for 16 bit PC.

```
ent-map:pcn16=1-2-3:ssn=10:rc=20:wt=30:mpcn16=1-1-1:mssn=10:materc=20:mwt=20:thr=40
```

Dependencies

The PC/SSN pair cannot already exist in the MAP table.

The specified MPC/MSSN pair cannot already exist in the MAP table.

The apca and pcn24/pcn16 parameters cannot be specified for the same MAP set. The pci and pcn parameters cannot be specified for the same MAP set if the MAP set contains a true point code.

If a subsystem is configured for a subsystem number (SSN) value in the SS-APPL table, then the specified MAP table entry for that subsystem must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I point code.
- For the AIQ, ATINPQ, VFLEX, and EIR subsystems, the True Point code can not be an ITU-N24 point code.

The ANSI/ITU SCCP Conversion feature must be enabled before the network type of the CPC broadcast group can be different from the network type of the point code.

If the pci, pcn, or pcn24/pcn16 parameter is specified, then the srm=yes parameter cannot be specified.

The primary remote point code must already exist in the Route table, as a destination in the ordered route entity set, or in a cluster destination for which ordered routes are specified.

If a CSPC broadcast list group name is specified, it must already exist.

A maximum of 1024 unique remote point codes are allowed.

A maximum of 12 SSNs per remote point code can be entered.

The primary subsystem DPCs must be full point codes.

The mate subsystem DPCs must be full point codes.

The LNP, V-Flex, EIR, or INP feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the pca/mpca parameter.

The AINPQ, EIR, INP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the pcn/mpcn parameter.

The EIR or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the pci/mpci parameter.

If the mpc/mpca/mpci/mpcn/mpcn24/mpcn16 parameter is specified, then the value must exist in the Routing table.

If the mssn or materc parameter is specified, then the mpc parameter must be specified.

If the pc parameter value is an EAGLE true point code, the subsystem must have a lower relative cost than all other mated subsystems in the group.

The sso parameter cannot be specified with a point code value that is the system true point code.

A true point code cannot be routed to itself.

The mpc and mssn parameters cannot have the same values as the pc and ssn parameters.

The point code must already exist in the Concerned Point Code (CSPC) group.

The number of MPC Subsystem entries must not exceed the table capacity.

If the Flexible GTT Load Sharing feature is not enabled, then the mapset parameter cannot be specified.
If the Flexible GTT Load Sharing feature is enabled, then the mapset parameter must be specified.

The EAGLE True PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the wt , mwt , or thr parameters can be specified.

If the thr parameter is specified, the wt and mwt parameters must be specified.

If the mpc parameter is specified, the rc parameter must be specified.

The wt and mwt parameters must be specified together in the same command.

If the materc parameter value equals the rc parameter value, a Loadshared Group is indicated, and the rc, mpc, materc , and mwt parameters must be specified.

If the chg-sid:pctype=ansi command is entered, a value of *fni=000* cannot be specified.

If the chg-sid:pctype=ansi command is entered, and a value of *fni=001 – 005* is specified, a value of *fnc=000* cannot be specified

If the mpc parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the entity set.

The maximum number of entries in the MAP table cannot be exceeded.

The maximum number of possible entries in the MAP table for the specified True Point Code cannot be exceeded. Maximum entries for the ANSI, ITU-I, and ITU-N point codes are:

- ANSI—2 (ANS41 AIQ and LNP), 4 (ANSI41 AIQ, ATINPQ, INP, and V-FLEX)
- ITU-I—4 (ANSI41 AIQ, ATINPQ, EIR, V-FLEX)
- ITU-N—5 (for ANSI41 AIQ, ATINPQ, EIR, INP, and V-FLEX)

Note: LNP is mutually exclusive with ATINPQ and V-FLEX, unless the Dual ExAP Config feature is enabled.

If the mwt parameter is specified, the mpc parameter must be specified.

If the mpc parameter is specified, the mssn and materc parameters must be specified.

The entity set being created must be either solitary or dominant to use the true point code as a point code.

If the thr parameter is specified, the rc1, rc2, rc3 , and rc4 parameters must be of equal value.

If the mpc parameter is specified, then the mssn parameter must be specified.

SRM=YES cannot be entered with ITU point codes.

If the mpc or mssn parameter is specified, then the materc parameter must be specified.

If the pc/ssn parameters and the mpc/mssn parameters are specified, then the rc parameter must be specified.

If the pcn or mpcn parameter is specified, then the format of the parameter must match the format dictated by the chg-stpopts:npcfmti command.

True PC cannot be routed to itself.

The Spare Point Code support feature must be enabled to allow provisioning of an ITU-I or ITU-N spare point code.

The True Point Code can be provisioned only in default MAPSET.

The values specified for the pc and mpc parameters cannot be associated with proxy point codes.

If the mrnset parameter is specified, then the mrnpc parameter must be specified.

The GTT LS ARI feature must be enabled before the mrnset or mrnpc parameters can be specified.

The value specified for the mrnpc/mrnpca/mrnpca/mrnpca/mrnpca24/mrnpca16 parameter must be a full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24
- ITUN-16 ---ITUN-16

The value specified for the mrnset parameter must already exist in the MRN table.

The value specified for the mrnpc parameter must already exist in the specified MRN Set.

The mrnset parameter cannot be specified if the MAP Set specified by the mapset parameter contains a True Point Code.

The ent-map command will reject provisioning of local subsystem for ITUN16 SID, so that ITUN16 MSUs won't be forwarded to Local Subsystems.

Notes

Up to 32 PC/SSN pairs can be entered into a mated PC/SSN group.

Multiplicity Modes

For the -map commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In *loadsharingmode*, an entity set contains 1 RC group. In *combined loadsharing / dominantmode*, an entity set can contain multiple loadsharing groups.

Note: For *dominant* and *combined loadsharing / dominant* modes, the PC/SSN in the MAP table where traffic distribution initializes is determined by the result of GTT translation and is referred to as the preferred PC/SSN. The preferred PC/SSN may not be the lowest cost entry.

The EAGLE supports the following multiplicity modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is *insolitary*(SOL) mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns "Subsystem Unavailable" messages to the originator.
- A group of replicated PC/SSN pairs are *indominant*(DOM) mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup.
- A group of replicated PC/SSN pairs are *inload sharing*(SHR) mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. If failure occurs, the non-affected subsystem assumes the load of its failed mate.
- The *combined load sharing / dominant*(COM) mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in COM mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC.

If the XMAP feature is enabled, the MAP table can have up to either 2000 or 3000 entries, depending on the controlled feature Part Number that is enabled. If XMAP is not enabled, the MAP table can contain up to 1024 user entries.

The sso parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE previously marked the subsystem status “allowed” for each PC/SSN entry. The sso parameter marks the subsystem status “prohibited” for each new entry that has sso=on. This causes the EAGLE to generate an SST to the remote point-code when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each set is identified by the mapset parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

When the GTT Load Sharing with Alternate Routing Indicator feature is enabled, an Alternate RI Mate can be provisioned.

Related Commands

chg-map, dlt-map, rtrv-map

ent-mrn

Enter Mated Relay Node

Use this command to assign point codes and Alternate RI Mates in the Mated Relay Node (MRN) table. The Intermediate GTT Loadsharing feature must be on before this command can be entered. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

If the Flexible GTT Loadsharing feature is enabled, use this command to create a new MRN set, or to add entries to an existing MRN set in the MRN table. If the Flexible GTT Loadsharing feature is turned on, then MRN sets are used.

Note: If only the Intermediate GTT Loadsharing feature is turned on, the MRN table can contain a maximum of 3000 entries. If the Intermediate GTT Loadsharing feature is on and the Flexible GTT Loadsharing feature is enabled, the MRN table can contain a maximum of 6000 entries.

CAUTION

Caution: If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Check the `rtrv-sccp-serv` command output to see if entries exist in the SCCP-SERV table.

Note: An MRN set is a logical grouping of PCs that already exist in the EAGLE 5 ISS MRN table. The Intermediate GTT Loadsharing feature allows PCs to be part of more than one load-sharing group, with each PC defined by a different MRN set. If the Intermediate GTT Loadsharing feature is enabled, then all existing entries in the MRN table and all existing GTA translations in the GTT table with `ri=gtare` stored in default MRN sets. Additional MRN sets can be provisioned, and GTT entries can be associated to the MRN sets.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

If a point code is being added to an existing weighted entity set, and the `dflwt` parameter is not specified, the `wt1/wt2/wt3/wt4` parameter must be specified. The `wt1/wt2/wt3/wt4` parameter can only be specified if at least two of the `rc/rc1/rc2/rc3/rc4` parameters are equal, creating a weighted entity set.

pc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (mandatory)

Post-GTT-translated point code.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

dflwt (optional)

Default weight. The weight to be assigned to a specified PC that is not assigned a weight with the *wt/wt1/wt2/wt3/wt4* parameter.

Note: If a PC weight is specified with the *wt/wt1/wt2/wt3/wt4* parameter and the *dflwt* parameter is specified, the default weight is ignored, and the PC is assigned the weight specified by its respective weight parameter.

Range:

1 - 99

mappc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

mappca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

Default:

000

mappc/mappca/mappci/mappcn/mappcn24/mappcn16 (optional)

Alternate RI Mate point code.

mappci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

Default:

0-000-0

mappcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

00000

mappcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

Default:

000

mappcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Default:

000

mapset (optional)

Alternate RI Mate MAP Set ID. The MAP Set where the Alternate RI Mate search is performed.

Range:

1 - 36000, dflt

dflt—default MAP Set

Note: If the mappc and mapssn parameters are specified, and the mapset parameter is not specified, then the mapset parameter is automatically set to a value of *dflt*.

mapssn (optional)

Alternate RI Mate subsystem number.

Range:

*2 - 255, *, none*

Default:

none

mrnset (optional)

MRN set ID.

Range:

1 - 3000, *dflt*, *new*
dflt—default MRN set
new—create a new MRN set

pc1 (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca1

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc1/pca1/pci1/pcn1/pcn241/pcn161 (optional)

Alternate post-GTT-translated point code.

pc2 (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca2

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc2/pca2/pci2/pcn2/pcn242/pcn162 (optional)

Alternate post-GTT-translated point code.

pc3 (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca3

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc3/pca3/pci3/pcn3/pcn243/pcn163 (optional)

Alternate post-GTT-translated point code.

pc4 (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca4

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc4/pca4/pci4/pcn4/pcn244/pcn164 (optional)

Alternate post-GTT-translated point code.

pci1 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

pci2 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

pci3 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

pci4 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn1 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn2 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn241 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn242 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn243 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn244 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn3 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn4 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn161 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn162 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn163 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn164 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

rc (optional)

Relative cost. The relative cost of the route for the primary PC.

Range:

0 - 99

rc1 (optional)

Relative cost 1. The relative cost of the route for mate PC 1.

Range:

0 - 99

rc2 (optional)

Relative cost 2. The relative cost of the route for mate PC 2.

Range:

0 - 99

rc3 (optional)

Relative cost 3. The relative cost of the route for mate PC 3.

Range:

0 - 99

rc4 (optional)

Relative cost 4. The relative cost of the route for mate PC 4.

Range:

0 - 99

thr (optional)

Threshold. The in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Note: If a threshold value is not specified when creating a new RC group in an existing entity set, the new RC group is assigned a threshold value of 1%.

Range:

1 - 100

wt (optional)

Weight. The weight assigned to the primary PC.

Note: If PCs are being added to an existing entity set, the wt parameter cannot be specified. If a new entity set is being created, the wt parameter can only be specified if at least two of the specified RC values are equal, which creates a weighted entity set.

Range:

1 - 99

wt1 (optional)

Weight 1. The weight assigned to the mate PC 1 that is being added to the weighted entity set.

Range:

1 - 99

wt2 (optional)

Weight 2. The weight assigned to the mate PC 2 that is being added to the weighted entity set.

Range:

1 - 99

wt3 (optional)

Weight 3. The weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range:

1 - 99

wt4 (optional)

Weight 4. The weight assigned to the mate PC 4 that is being added to the weighted entity set.

Range:

1 - 99

Example

This example enters point code 1 into the MRN table with a relative cost of 10 and associates point code 1 with it as a point code with a relative cost of 20.

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20
```

This example updates the group containing point code 1 in the MRN table, to add point code 1 with relative cost of 20 and point code 1 with relative cost of 30 to the group.

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30
```

These examples include spare point codes:

```
ent-mrn:pci=s-2-2-1:rc=10:pci1=s-2-2-2:rc1=11:pci2=2-100-1:rc2=12
```

```
ent-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3
```

```
ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=10:mrnset=df1t
```

```
ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=20:pc2=1-1-3:rc2=30:apc3=1-1-4:rc3=40:apc4=1-1-5:rc4=50:mrnset=new
```

```
ent-mrn:pc=1-1-3:pc1=1-1-6:rc1=60:pc2=1-1-7:rc2=70:mrnset=111
```

These examples create a new weighted entity set:

```
ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10
```

```
ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10:thr=50
```

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:pc2=1-3-2:rc2=20:wt2=30:pc3=1-10-2:rc3=20:df1twt=20
```

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:wt1=30:pc2=1-3-2:rc2=10:df1twt=20:thr=60
```

```
ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:pc2=1-1-10:rc2=30:pc3=1-3-2:rc3=10:wt3=20:df1twt=30
```

```
ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=20:wt2=40:thr=30
```

```
ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=40:pc2=1-1-10:rc2=20:pc3=1-3-2:rc3=20:df1twt=25:thr=30
```

```

ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=30:wt2=40
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30:mapset=1:
mappc=2-1-1:mapssn=*
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30:mappc=2-1-1:mapssn=*
ent-mrn:pci=1-001-0:rc=10:pci1=1-001-1:rc1=20:pci2=1-001-10:rc2=30:mapset=1:
mappcn=00126:mapssn=12
ent-mrn:pcn16=1-14-0:rc=10:wt=30:pcn161=40-2-3:rc1=10:wt1=10:mrnset=dflt

```

Dependencies

The Intermediate Global Title Translation Loadsharing feature must be turned on before this command can be entered.

The apca and pcn24/pcn16 parameters cannot be specified for the same MRN set.

When a point code parameter is specified, its relative cost parameter must be specified.

Point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

ITU-N point codes must be in the format set by the npcfmti parameter of the chg-stpopts command. (Use the rtrv-stpopts command to display the STP option settings.)

Remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

One or more point codes in the command will exceed the maximum number of point codes that can be entered into the MRN table (3000 if the IGTTLS feature is turned on and 6000 if the IGTTLS and FGTTLS features are turned on)..

The Flexible GTT Load-Sharing feature must be enabled before the mrnset parameter can be specified.

If the Flexible GTT Loadsharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

When creating a new weighted entity set, the mrnset=new or mrnset=dflt parameter must be specified.

Each point code group can contain a maximum of 32 point codes.

The Weighted GTT Loadsharing feature must be turned on before the wt/wt1/wt2/wt3/wt4, thr, and dfltw parameters can be specified.

If the wt/wt1/wt2/wt3/wt4 parameter is specified, the corresponding pc/pc1/pc2/pc3pc4 parameter must be specified.

When creating or modifying a weighted entity set, the dfltw parameter must be specified, or an individual weight must be specified for each PC.

Entity sets in a solitary or dominant loadsharing mode cannot have weights assigned to the PCs. When creating an entity set, if all of the RC values are unique, the wt/wt1/wt2/wt3/wt4 and thr parameters cannot be specified.

If the thr parameter is specified, the rc1, rc2, rc3, and rc4 parameters must be of equal value.

If the `thr` parameter is specified, the associated `wt/wt1/wt2/wt3/wt4` parameter or the `dflwt` parameter must be specified.

At least one additional point code must be specified.

Any specified point code must be a full point code.

If the `chg-sid:pctype=ansi` command is entered, a value of `ni=000` cannot be specified.

If the `chg-sid:pctype=ansi` command is entered, and a value of `ni=001 – 005` is specified, a value of `nc=000` cannot be specified.

If a new point code is being added to the MRN table, the `pc` and `rc` parameters must be specified together in the command.

If the Flexible GTT Loadsharing feature is enabled, and the `mrnset=new` parameter is specified, the `pc` and `rc` parameters must be specified together in the command.

If the `pc1/pc2/pc3/pc4` parameter is specified, the `pc` parameter value must already exist in the MRN table.

A new point code that is specified in the command must not already exist in the MRN table.

If the `rc` parameter is not specified, the `wt` parameter cannot be specified.

If PCs are being added to a weighted entity set, the `wt/wt1/wt2/wt3/wt4` parameter or the `dflwt` parameter must be specified.

If PCs are being added to a non-weighted entity set, the `wt/wt1/wt2/wt3/wt4` and the `dflwt` parameters cannot be specified.

At least one optional parameter must be specified.

If the `wt/wt1/wt2/wt3/wt4` parameters are specified, the `dflwt` parameter cannot be specified.

The value specified for the `pc/pc1/pc2/pc3/pc4` parameter cannot be associated with a proxy point code.

The GTT LS ARI feature must be enabled before the `mapset`, `mappc`, or `mapssn` parameter can be specified.

The value specified for the `mappc/mappca/mappci/mappcn/mappcn24/mappcn16` parameter must be a full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24
- ITUN-16---ITUN-16

The specified MAPSET must already exist in the MAP table.

If the `mapset` parameter is specified, then the `mappc` and `mapssn` parameters must be specified.

The `mappc` and `mapssn` parameters must be specified together in the command.

The MAP table is corrupt or cannot be found.

The values specified for the `mappc` and `mapssn` parameters must already exist in the specified MAP Set.

The values specified for the `mapset` and `mappc` parameters must already exist in the MAP table.

The value specified for the `mappc` parameter cannot match an STP point code.

The `ent-mrn` command cannot be used to change an Alternate RI Mate that has already been specified for an MRN Set. Use the `chg-mrn` command to modify the Alternate RI Mate.

Notes

For the `-mrn` commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes and subsystems:

- A group of replicated PCs are *indominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are *inload sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The `ent-mrn` command cannot be used to change the relative cost value for a point code; the `chg-mrn` command must be used.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If the `ent-mrn` command is used to add PCs to an existing weighted entity set, and the threshold is specified, all RC group values specified with `rc/rc1/rc2/rc3/rc4` parameters for the alternate post-GTT-translated point codes must be equal.

The following rules apply when the `ent-mrn` command is used to add PCs to RC groups:

- If a threshold value is specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold is changed to the specified threshold value and both pre-existing and new PCs in the RC group assume the new threshold value.
- If a threshold value is specified and the PCs are creating a new RC group in the existing entity set, the new RC group assumes the specified threshold value.
- If a threshold value is not specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold does not change and the PC assumes the threshold value of the existing RC group.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Entries cannot be provisioned in the MRN table unless routes are also provisioned for corresponding point codes. However, an entry without a configured route may result from upgrading to a new EAGLE 5 ISS release. If such an entry occurs, then traffic will not be routed to the corresponding point code. The entry can be deleted, or a route for the entry can be configured.

When a node is marked congested in the MRN or MAP table, traffic continues to be routed to that node. When the congested node becomes prohibited, traffic is diverted to another node.

Related Commands

[chg-mrn](#), [dlt-mrn](#), [rtro-mrn](#)

ent-na

Enter Network Appearance

Use this command to enter a new network appearance in the Network Appearance table.

Parameters

na (mandatory)

Network appearance.

Range:

0 - 4294967295

type (mandatory)

Type of the network appearance.

Range:

ansi

itui

ituis

itun

ituns

itun24

itun16

gc (optional)

Group Code of the network appearance.

Range:

yy

Example

```
ent-na:type=ansi:na=10
```

```
ent-na:type=itun:na=11:gc=fr
```

Dependencies

The value specified for the na parameter cannot already exist in the Network Appearance table.

The Network Appearance table can contain a maximum of 45 entries.

The value specified for the gc or na parameter cannot already be equipped.

A value of *itun* or *ituns* must be specified for the type parameter before the gc parameter can be specified.

If the ITUDUPPC feature is turned on, and a value of *itun* or *ituns* is specified for the type parameter, then the gc parameter must be specified.

If the ITUDUPPC feature is turned off, then the gc parameter cannot be specified.

The value specified for the gc parameter must already exist in the SID or SPC table.

The Spare Point Code Support feature must be enabled before the *ituis* or *ituns* network type can be specified.

The J7 support feature must be enabled before the type=*itun16* parameter is specified.

If the J7 support feature is enabled then the type=(*ansi* or *itun24*) parameter can not be specified.

Notes

Network Appearance identifies the SS7 network context of the message, for the purposes of logically separating signaling traffic between the SGP and ASP over a common SCTP association. A unique network appearance value can be associated with ANSI, ITUI, 14-bit ITU-N or 24-bit ITU-N networks.

When the ITUDUPPC (ITU National Duplicate Point Code) feature is turned on, network appearance can be associated with a specific 14-bit ITU-N group code.

Output

```
ent-na:type=ansi:na=10

ent-npp-as

Enter an NPP Action Set

Use this command to enter a Numbering Plan Processor (NPP) Action Set (AS). An AS is a collection of Conditioning Actions (CAs), Service Actions (SAs), and Formatting Actions (FAs).

Parameters

Note: As of Release 45.0, the individual CA, SA, and FA parameters are obsolete. CAs, FAs, and SAs must be specified using the comma-separated list (ca, fa, and sa parameters). The ca1, fa1, and sa1 parameters are shown at the end of the parameter list in their obsolete status. For readability purposes, the remaining CA, SA, and FA parameters are not shown.

Note: CAs and FAs are processed in the order that they are specified in the comma-separated list.

Note: CAs and FAs are processed in consecutive order.

Note: SAs are processed in order of high-to-low precedence and must be specified in high-to-low precedence order in the comma-separated list. The SAs cannot be duplicated in the list. If multiple SAs in the list have the same precedence, then those SAs are processed in the order in which they appear in the list.

Note: The ac*,dn*,sn*, andcc* values refer to all CAs that begin with *ac*, *dn*, *sn*, or *cc*, respectively.

Note: Refer to the *Numbering Plan Processor (NPP) Overview* and to the Feature Manual for the feature of interest for more information on provisioning Action Sets and for definitions for the CA, FA, and SA values.

Note: The sa(X)dgts parameters are currently not supported by any feature.

Note: The sa(X)val parameters are used by the TIF Range CgPN Blacklist, TIF Subscriber CgPN Blacklist, and TIF Selective Screening features. Up to 2 numerical values can be specified in each list.

Note: Support of a numerical values list (sa(X)val parameter) is specific to the Service and Service Action.

asn (mandatory)

Action set name. The name of the AS.

Range:

ayyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

ca (optional)

Conditioning Action list. A comma-separated CA list that can be applied to an incoming digit string. Up to 12 CAs can be specified in the list. The CAs are processed in the order in which they are specified in the list.

Range:

ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, accgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8, acdef, aclac, cc1, cc2, cc3, ccdef, cccgpn, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn11, dn12, dn13, dn14, dn15, dnx, fpx, ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, znx

fa (optional)

Formatting Action list. A comma-separated FA list that can be applied to the outgoing digit string. Up to 12 FAs can be specified in the list. The FAs are processed in the order they are specified in the list and cannot be duplicated.

Range:

ac, asd, asdothor, cc, dlma, dlmb, dlmc, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, dn, fpx, grn, grnothor, orig, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, rn, rnospodn, rnosposn, rnospozsn, sn, sp, sfrimsi, vmid, zn

Default:

orig

ofnai (optional)

Outgoing filter nature of address indicator. This parameter specifies the filter nature of address indicator (FNAI) class of the outgoing digit string.

Range:

intl

intl value provisioned in the `chg-npp-serv` command

natl

natl value provisioned in the `chg-npp-serv` command

nai1

nai1 value provisioned in the `chg-npp-serv` command

nai2

nai2 value provisioned in the `chg-npp-serv` command

nai3

nai3 value provisioned in the `chg-npp-serv` command

unkn

unkn value provisioned in the `chg-npp-serv` command

inc

NAI of the incoming digit string

Default:

inc

sa (optional)

Service Action list. A comma-separated SA list that can be applied to an incoming digit string. Up to 8 SAs can be specified in the list. The SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list.

Note: SAs are service-specific.

Range:

asdlkup, blkstqry, blkstrly, blnfdrls, blrls, cdial, ccncchk, cdpnnp, cgpnasdrqd, cgpngrnrqd, cgpnnp, cgpnrtd, cgpnsvcrqd, crp, fpxrls, fraudchk, fwdscs, grnlkup, inprtq, lacck, migrate, nocgpnrls, npnrls, nprelay, nprls, nscgpn, nscdpn, pprelay, rtdbtrn, rtdbtsp, rtdbtrnsp, skgtartg, snsccgpn, selscr

sa1dgts (optional)

Service Action 1 digit string. This parameter specifies a digit string that can be used with the first SA.

Range:

1 - 8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa1val (optional)

Service Action 1 numerical values list. A comma-separated numerical values list that can be used with the first SA.

Range:

0 - 65534

sa2dgts (optional)

Service Action 2 digit string. A digit string that can be used with the second SA.

Range:

1 - 8 hexadecimal digits Valid digits are *0-9, a-f, A-F*.

sa2val (optional)

Service Action 2 numerical values list. A comma-separated numerical values list that can be used with the second SA.

Range:

0 - 65534

sa3dgts (optional)

Service Action 3 digit string. A digit string that can be used with the third SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa3val (optional)

Service Action 3 numerical values list. A comma-separated numerical values list that can be used with the third SA.

Range:

0 - 65534

sa4dgts (optional)

Service Action 4 digit string. A digit string that can be used with the fourth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa4val (optional)

Service Action 4 numerical values list. A comma-separated numerical values list that can be used with the fourth SA.

Range:

0 - 65534

sa5dgts (optional)

Service Action 5 digit string. A digit string that can be used with the fifth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa5val (optional)

Service Action 5 numerical values list. A comma-separated numerical values list that can be used with the fifth SA.

Range:

0 - 65534

sa6dgts (optional)

Service Action 6 digit string. A digit string that can be used with the sixth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa6val (optional)

Service Action 6 numerical values list. A comma-separated numerical values list that can be used with the sixth SA.

Range:

0 - 65534

sa7dgts (optional)

Service Action 7 digit string. a digit string that can be used with the seventh SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa7val (optional)

Service Action 7 numerical values list. A comma-separated numerical values list that can be used with the seventh SA.

Range:

0 - 65534

sa8dgts (optional)

Service Action 8 digit string. A digit string that can be used with the eighth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa8val (optional)

Service action 8 numerical values list. A comma-separated numerical values list that can be used with the eighth SA.

Range:

0 - 65534

ca1 (obsolete)

Conditioning action 1. The first CA that can be applied to an incoming digit string.

Range:

ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, accgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8, acdef, aclac, cc1, cc2, cc3, ccdef, cccgpn, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn11, dn12, dn13, dn14, dn15, dnx, fpx, ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, znx

fa1 (obsolete)

Formatting action 1. The first FA that can be applied to the outgoing digit string.

Range:

ac, asd, asdoth, cc, dlma, dlmb, dlmc, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, dn, fpx, grn, grnoth, orig, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, rn, rnospodn, rnosposn, rnospoz, sn, sp, sfrimsi, vmid, zn

System Default:

orig

sa1 (obsolete)

Service action 1. The first SA that can be applied to an incoming digit string.

Range:

asdlkup, blkstqry, blklstly, blnfndrls, blrls, cdial, ccncchk, cdpnnp, cgpnasdrqd, cgpngrnrqd, cgpnpnp, cgpnrty, cgpnsvcrqd, crp, fpxrls, fraudchk, fwdscs, grnlkup, inprtg, lacck, migrate, nocgpnrsl, npnrsl, nprelay, nprsl, nscgpn, nscdpn, pprelay, rtdbtrn, rtdbtsp, rtdbtrnsp, skgtartg, snscgpn

Example

```
ent-npp-as:asn=asn1:ca=ign1,ign2,ign4,znx:fa=zn
ent-npp-as:asn=asn4:ca=fpx,cc2,ign3,dn4:fa=dn,cc
ent-npp-as:asn=asn5:ca=ac8,sn8,cc3:fa=sn,ac,cc:

ent-npp-as:asn=asn7:ca=cc2,ac3,sn5:sa=inprtg,skgtartg
ent-npp-as:asn=set32:ca=cc2,accgpn5,snx
ent-npp-as:asn=tifcd7:ca=znx:sa=selscr,cgpnpnp:salval=12,none:fa=zn
```

Dependencies

The value specified for the asn parameter cannot already exist in the NPP AS table.

One of the following combinations of Conditioning Actions must be specified for the AS:

- znx
- cc*, dn*
- cc*, ac*, sn*

The Formatting Actions specified for the AS must contain the corresponding Formatting Action that a Conditioning Action will populate or load.

The AS must contain a CA that can load or populate the specified FA.

The CAs within an AS cannot condition more than 32 digits.

The AS cannot contain CAs that load or populate the same FA.

Conditioning Actions must be specified for inclusion in an individual Action Set using valid number conditioning rules:

- If the ZNX Conditioning Action is specified, then the CC*, AC*, SN*, DN*, and DNX Conditioning Actions cannot be specified.
- If the CC* AND DN* or DNX Conditioning Actions are specified, then the AC*, SN*, SNX, and ZNX Conditioning Actions cannot be specified.

- If the CC*, AC*, AND SN* or SNX Conditioning Actions are specified, then the DN*, DNX, and ZNX Conditioning Actions cannot be specified.

The AS cannot contain the following combinations of FAs:

- If the DN FA is specified, then the AC, SN, and ZN FAs cannot be specified.
- If the ZN FA is specified, then the AC, CC, SN, and DN FAs cannot be specified.
- If the SN FA is specified, then the ZN and DN FAs cannot be specified.
- If the RNOSPODN, RNOSPOSN, or RNOSPOZN FA is specified, then the RN, SP, SN, DN, and ZN FAs cannot be specified.
- The RNOSPODN, RNOSPOSN, and RNOSPOZN FAs cannot be specified together in the command.

If specified, the PPFX CA must be the first value (*ppfx*) in the ca list.

If specified, the ZNX, SNX, or DNX CA must be the final value (*znx*, *snx*, or *dnx*) in the ca list.

A maximum of 1024 (1K) AS entries can be specified in the NPP system.

If no Service Actions are provisioned, then the sa1val parameter cannot be specified.

If less than 2 Service Actions are provisioned, then the sa2val parameter cannot be specified.

If less than 3 Service Actions are provisioned, then the sa3val parameter cannot be specified.

If less than 4 Service Actions are provisioned, then the sa4val parameter cannot be specified.

If less than 5 Service Actions are provisioned, then the sa5val parameter cannot be specified.

If less than 6 Service Actions are provisioned, then the sa6val parameter cannot be specified.

If less than 7 Service Actions are provisioned, then the sa7val parameter cannot be specified.

If less than 8 Service Actions are provisioned, then the sa8val parameter cannot be specified.

If no Service Actions are provisioned, then the sa1dgts parameter cannot be specified.

If less than 2 Service Actions are provisioned, then the sa2dgts parameter cannot be specified.

If less than 3 Service Actions are provisioned, then the sa3dgts parameter cannot be specified.

If less than 4 Service Actions are provisioned, then the sa4dgts parameter cannot be specified.

If less than 5 Service Actions are provisioned, then the sa5dgts parameter cannot be specified.

If less than 6 Service Actions are provisioned, then the sa6dgts parameter cannot be specified.

If less than 7 Service Actions are provisioned, then the sa7dgts parameter cannot be specified.

If less than 8 Service Actions are provisioned, then the sa8dgts parameter cannot be specified.

Notes

Note: When a new Action Set is entered using the `ent-npp-as` command, the FANF, FASP, FARN, FANE, FASCRCRCD, and FASCRCRGC FA lists are unpopulated. These lists are populated using the `chg-npp-as` command.

Output

```
ent-npp-as:asn=asn6:ca=znx:sa=nscdpn,nscgpn:fa=zn:ofnai=intl
```

```
tekelecstp 09-08-18 11:25:31 EAGLE 41.1.0
NPP-AS table is (5 of 1024) 1% full.

ENT-NPP-AS: MASP A - COMPLTD

ent-npp-srs

Create a NPP Service Rule Set

Use this command to enter a Numbering Plan Processor (NPP) Service Rule Set entry. A Service Rule Set (SRS) is a collection of NPP Rules that are associated with a NPP Service. A NPP Rule is an association between a single NPP filter and a single NPP Action Set.

Parameters

asn (mandatory)

Action set name. The name of the AS.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

fdl (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

Range:

*1 - 32, **

* —multiple lengths of digit strings can be filtered

fnai (mandatory)

Filter nature of address indicator. The filter Nature of Address Indicator (NAI) class.

Range:

intl

filter messages with NAI=INTL

natl

filter messages with NAI=NATL

nai1

filter messages with NAI=NAI1

nai2

filter messages with NAI=NAI2

nai3

filter messages with NAI=NAI3

unkn

filter messages when NAI=UNKN

The `chg-npp-serv` command is used to assign values to the various FNAI classes.

fpfx (mandatory)

Filter prefix. The prefix used to filter incoming digit strings.

Range:

1-16 digits *, ?

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

srvn (mandatory)

Service name. The name of the NPP service.

Range:

nppt

NPP Test Service

idprcdpn

IDPRCDPN Service

idprcgpn

IDPRCGPN Service

tif

TIF Service

tif2

TIF2 Service

tif3

TIF3 Service

```

Dependencies

The value specified for the *asn* parameter must exist in the NPP AS table.

The AS specified by the *asn* parameter cannot contain Conditioning Actions that are not supported by the service specified by the *svrn* parameter.

The AS specified by the `asn` parameter cannot contain Service Actions that are not supported by the service specified by the `srvn` parameter.

The AS specified by the `asn` parameter cannot contain Formatting Actions that are not supported by the service specified by the `srvn` parameter.

The AS specified by the `asn` parameter cannot contain Service Actions that do not conform to the precedence order supported by the service specified by the `srvn` parameter.

The Conditioning Actions in the AS specified by the `asn` parameter cannot condition more digits than allowed by the `fdl` parameter.

If the `fdl=*` parameter is specified, then the AS specified by the `asn` parameter must contain Conditioning Actions that support variable digit string conditioning.

A maximum of 8192 (8K) rules can be specified in the NPP system.

A maximum of 4096 (4K) service rules can be specified in the NPP system.

The NPP Rule cannot already exist within the NPP Rule table.

If a values other than `*` is specified for the `fpfx` and `fdl` parameters, then the value specified for the `fpfx` parameter cannot be greater than the value specified for the `fdl` parameter.

All of the features that are associated with the Service Actions in the AS specified by the `asn` parameter must be turned on before the AS can be used.

The Service Actions in the AS specified by the `asn` parameter cannot violate mutual exclusivity rules defined by the service specified by the `srvn` parameter.

The AS specified by the `asn` parameter cannot contain an OFNAI class with a value of *none*.

At least one TIF feature must be turned on before an AS containing the CDIAL Service Action can be specified as a value for the `asn` parameter.

The TIF SCS Forwarding feature must be turned on before an AS containing the FWDSCS Service Action can be specified.

The TIF Simple Number Substitution feature must be turned on before an AS containing the SNSCGPN Service Action can be specified as a value for the `asn` parameter.

The TIF Number Portability feature must be turned on before an AS containing the CRP, NPNRLS, CGPNNPRQD, NPVELA, or NPRLS Service Action can be specified as a value for the `asn` parameter.

The IDPR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the `asn` parameter with the IDPRCDPN(X) or IDPRCGPN service.

The IDPR GRN feature must be enabled before an AS containing the GRNLKUP or GPNGRNRQD Service Action can be specified as a value for the `asn` parameter with the IDPRCDPN(X) or IDPRCGPN service.

An AS containing the ASDLKUP and CGPNASDRQD and SAs cannot be specified as a value for the `asn` parameter.

An AS containing the GRNLKUP and CGPNGRNRQD Service Actions cannot be specified as a value for the `asn` parameter.

The TIF GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD SAs can be specified as a value for the `asn` parameter with the TIF services.

The TIF ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD SA can be specified as a value for the asn parameter with the TIF services.

If a value of *mosmsgcdpn*, *mosmsgcgpn*, *mosmsicdpn*, or *mosmsicgpn* is specified for the srvn parameter, then the MO SMS ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the asn parameter.

If a value of *mosmsgcdpn*, *mosmsgcgpn*, *mosmsicdpn*, or *mosmsicgpn* is specified for the srvn parameter, then the MO SMS GRN feature must be enabled before an AS containing the CGPNGRNRQD or GRNLKUP Service Action can be specified as a value for the asn parameter.

If the *fpfx=** parameter is specified, then an AS containing the PPFX Conditioning Action cannot be specified as value for the asn parameter.

The value specified for the *fpfx* parameter cannot have a ? as the final character.

The TIF Number Substitution feature must be enabled before an AS containing the NSCGPN or NSCDPN Service Action can be specified.

The AS specified by the asn parameter cannot contain both the NSCGPN and SNSCGPN Service Actions.

If a value of *mosmsgcdpn* or *mosmsgcgpn* is specified for the srvn parameter, then the Prepaid SMS Intercept Ph1 feature must be enabled before an AS containing the PPRELAY Service Action can be specified as a value for the asn parameter.

If the *srvn=mosmsgcgpn* parameter is specified, then the Portability Check for MO SMS feature must be enabled before an AS containing the FRAUDCHK Service Action can be specified as a value for the asn parameter.

If the *srvn=mosmsicdpn* parameter is specified, then the MO SMS IS41-to-GSM Migration feature must be enabled before an AS containing the MIGRATE Service Action can be specified as a value for the asn parameter.

If the *srvn=mosmsicdpn* parameter is specified, then the MO-based IS41 SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the asn parameter.

If the *srvn=mosmsgcdpn* parameter is specified, then the MO-based GSM SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the asn parameter.

The IDP A-Party Routing feature must be enabled before the AS specified by the asn parameter can contain the CGPNRTG Service Action.

The IDP A-Party Blacklist feature must be enabled before the AS specified for the asn parameter can contain the BLKLSTQRY or BLKLSTRLY Service Action.

If the AS specified by the asn parameter contains the BLKLSTQRY Service Action, then the AS cannot contain any other Service Actions.

The NPP Unlimited SDWC Characters feature must be turned on before a single digit wildcard (?) can be specified as a value for the *fpfx* parameter more than 25 times across all of the rules for an NPP service.

If the *srvn=idprcdpn(X)* parameter is specified, then the Action Set specified by the asn parameter cannot contain both the ACCGPN* and the CCCGPN Conditioning Actions.

If a value of *iarcdpn* or *iargcpn* is specified for the *srvn* parameter, then the IAR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the *asn* parameter.

If a value of *iarcdpn* or *iargcpn* is specified for the *srvn* parameter, then the IAR GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Action can be specified as a value for the *asn* parameter.

If a value of *iarcdpn* or *iargcpn* is specified for the *srvn* parameter, then the IAR Base feature must be enabled before an AS containing the CCNCCHK, CDIAL, or CGPNSRVRQD Service Action can be specified as a value for the *asn* parameter.

If a value of *iarcdpn* or *iargcpn* is specified for the *srvn* parameter, then the IAR NP feature must be enabled before an AS containing the CDNNP or CGNNP Service Action can be specified as a value for the *asn* parameter.

If the NPP Service specified by the *srvn* parameter does not support invoking another NPP Service, then only a value of *none* can be specified for the *invkserv* parameter.

If the NPP Service specified by the *srvn* parameter can invoke the TIFCGPN NPP Service, then only a value of *tifcgpn* or *none* can be specified for the *invkserv* parameter.

If the NPP Service specified by the *srvn* parameter can invoke the TIFCGPN2 NPP Service, then only a value of *tifcgpn2* or *none* can be specified for the *invkserv* parameter.

If the NPP Service specified by the *srvn* parameter can invoke the TIFCGPN3 NPP Service, then only a value of *tifcgpn3* or *none* can be specified for the *invkserv* parameter.

If the AS specified by the *asn* parameter contains the ASDOTHER or GRNOTHER Formatting Action, then the *invkserv=none* parameter cannot be specified.

If the AS specified by the *asn* parameter contains the CGPNASDRQD, CGPNGRNRQD, CGPNSVCRQD, NSCGPN, or SNSCGPN Service Action, then only a value of *none* can be specified for the *invkserv* parameter.

The TIF Range CgPN Blacklist feature must be enabled before:

- an AS containing the NOCGPNRLS Service Action can be specified as a value for the *asn* parameter and a value of *tif*, *tif2*, or *tif3* can be specified for the *srvn* parameter
- an AS containing the FPFXRLS Service Action can be specified as a value for the *sn* parameter and a value of *tifcgpn*, *tifcgpnp2*, or *tifcgpnp3* can be specified for the *srvn* parameter.

If the AS specified by the *asn* parameter contains the FPFXRLS Service Action, then no other Service Action can be specified in the AS.

If the AS specified by the *asn* parameter contains the FPFXRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the *asn* parameter contains the FPFXRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127 .

If the AS specified by the *asn* parameter contains the NOCGPNRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the *asn* parameter contains the NOCGPNRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127 .

The TIF Subscr CgPN Blacklist feature must be enabled before an AS containing the BLRLS or BLNFNDRLS Service Action can be specified as a value for the *asn* parameter, and a value of *tifcgpn*, *tifcgpnp2*, or *tifcgpnp3* can be specified as a value for the *srvn* parameter.

If the AS specified by the `asn` parameter contains the BLRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the BLRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127 .

If the AS specified by the `asn` parameter contains the BLNFNDRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the BLNFNDRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127 .

If the Service specified by the `srvn` parameter does not support a numerical value list for the first Service Action in the AS specified by the `asn` parameter, then the `sa1val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the second Service Action in the AS specified by the `asn` parameter, then the `sa2val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the third Service Action in the AS specified by the `asn` parameter, then the `sa3val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the fourth Service Action in the AS specified by the `asn` parameter, then the `sa4val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the fifth Service Action in the AS specified by the `asn` parameter, then the `sa5val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the sixth Service Action in the AS specified by the `asn` parameter, then the `sa6val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the seventh Service Action in the AS specified by the `asn` parameter, then the `sa7val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the eighth Service Action in the AS specified by the `asn` parameter, then the `sa8val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the first Service Action in the AS specified by the `asn` parameter, then the `sa1dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the second Service Action in the AS specified by the `asn` parameter, then the `sa2dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the third Service Action in the AS specified by the `asn` parameter, then the `sa3dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the fourth Service Action in the AS specified by the `asn` parameter, then the `sa4dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the fifth Service Action in the AS specified by the `asn` parameter, then the `sa5dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the sixth Service Action in the AS specified by the `asn` parameter, then the `sa6dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the seventh Service Action in the AS specified by the `asn` parameter, then the `sa7dgts` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the eighth Service Action in the AS specified by the `asn` parameter, then the `sa8dgts` parameter in the AS can only have a value of *none*.

If the NPP Unlimited SDWC Characters feature is turned on, then the value specified for the `fpfx` parameter cannot contain more than three single digit wildcards (?).

If the NPP Unlimited SDWC Characters feature is turned on, then the value specified for the `fpfx` parameter can contain single digit wildcards (?) within only the first six digits.

The TIF Selective Screening feature must be enabled before an AS containing the SELSCR, FPFXRLS, BLRRLS, or BLNFNDRLS Service Action can be specified as a value for the `asn` parameter, and a value of *tif*, *tif2*, or *tif3* can be specified as a value for the `srvn` parameter.

If the AS specified by the `asn` parameter contains the SELSCR Service Action, then no TIF Number Substitution (NSCGPN or NSCDPN) Service Action can be specified in the AS.

If the AS specified by the `asn` parameter contains the SELSCR Service Action, then the 2 numerical values specified by the numerical values list must be none or between 0-127.

Only one call type can be specified for the SELSCR SA. If the AS specified by the `asn` parameter contains the SELSCR SA, the corresponding SA Digit String specified must be none or between 1-FF.

The CGPNSVCRQD and NPNRLS Service Actions cannot exist within the same Action Set.

Notes

None.

Enter a Point Code and CIC Translation entry

Use this command to enter Point Code and CIC Translations.

Parameters

epc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

epca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

epci (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

epcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmi* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

realpc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

realpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

realpci (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

realpcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnmmn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ecice (optional)

The end of the Emulated Circuit Identification Code range.

Range:

0-4095

ITU TUP/ISUP

0-16383

ANSI ISUP

0-4294967295

ANSI Q.BICC

*

Default:

0-4294967295

ANSI Q.BICC

*

Default:

*

filtpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

filtpca

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-**-** is valid if *ni =006-255*.

The point code *000-000-000* is not a valid point code.

filtpci (optional)

ITU international destination point code with subfields *zone-area-id*.

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

filtpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

rcice (optional)

The end of the Real Circuit Identification Code range.

Range:

0-4095

ITU TUP/ISUP

0-16383

ANSI ISUP
 0-4294967295
 ANSI Q.BICC
 *

Default:

*

rcics (optional)

The start of the Real Circuit Identification Code range.

Range:

0-4095
 ITU TUP/ISUP
 0-16383
 ANSI ISUP
 0-4294967295
 ANSI Q.BICC
 *

Default:

*

relcause (optional)

Release Cause

Range:

0 - 127

Default:

0

si (optional)

Service Indicator

Range:

0
 NM
 3
 SCCP
 5
 ISUP
 4
 TUP

13

ANSI Q. BICC

*

Default:

*

ssn (optional)

SCCP Subsystem number

Range:

Default:

*

Example

```
ent-pct:epc=1-1-1:realpc=2-2-2:si=5:ecics=100:ecice=200
```

```
ent-pct:epc=1-1-2:realpc=2-2-3:si=3:ssn=10:filtpc=5-5-5
```

Dependencies

If the ecice or rcice parameter is specified, then the ecics or rcics parameter must be specified, respectively.

The value specified for the ecice/rcice parameter must be equal to or greater than the value specified for the ecics/rcics parameter, respectively.

Full point codes must be specified as the values for the realpc/realpca/realpci/realpcn and epc/epca/epci/epcn parameters.

The PCT table cannot contain more entries than the amount specified by the FAK for the PCT quantity feature.

The si=3 parameter must be specified before the ssn parameter can be specified.

The values specified for the realpc/realpca/realpci/realpcn and filtpc/filtpca/filtpci/filtpcn parameters must already exist in the Route table.

The values specified for the epc/epca/epci/epcn, filtpc/filtpca/filtpci/filtpcn, and realpc/realpca/realpci/realpcn parameters must have the same domain.

A PCT quantity feature must be enabled before this command can be specified.

If the ssn or ecics parameter is specified, then the si parameter must be specified.

Duplicate values for the following Key combinations are not allowed:

- epc/epca/epci/epcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(ecics/ecice)
- realpc/realpca/realpci/realpcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(rcics/rcice)

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must have at least one route for each value defined in the Route table.

If the ITUDUPPC feature is turned on, and ITU-N Point codes are specified, then the values specified for the `epcn`, `realpcn`, and `filtpcn` parameters must have the same group code.

A total of 250 unique `epc` and `rpc` values are supported in the PCT table.

A total of 100 PCT Translations with a single `epc` and `realpc` value are supported in the PCT table.

A spare point code cannot be specified as a value for the `epci/epcn`, `filtpci/filtpcn`, and `realpci/realpcn` parameters.

The `ecics` parameter must be specified before the `relcause` parameter can be specified.

A value of 4, 5, or 13 must be specified for the `si` parameter before the `ecice/ecics` and `rcice/rcics` parameters can be specified.

If the `rcics` parameter is specified, then the `ecics` parameter must be specified.

If the `ecics`, `ecice`, and `rcics` parameters are specified, then the `rcice` parameter must be specified.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be the same as the STP point code.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be the same as the STP capability point code.

The value specified for the `ecics/ecice` and `rcics/rcice` parameters must be within the range specified by the parameter definition.

The difference between the values specified for the `ecice` and `ecics` parameters must be equal to the difference between the values specified for the `rcice` and `rcics` parameters.

A value of 5 or 13 must be specified for the `si` parameter before the `relcause` parameters can be specified.

The `ssn` and `cic` parameters cannot be specified together in the command.

If the `ecics`, `rcics`, and `rcice` parameters are specified, then the `ecice` parameter must be specified.

If the same value is specified for the `epc` and `realpc` parameters, then the values specified for the `ecics/ecice` and `rcics/rcice` parameters cannot indicate the same range.

Only one of the `filtpc/filtpca/filtpci/filtpcn` parameters can be specified in the command.

The value specified for the `epc/epci/epcn` parameter cannot be the same as a secondary point code.

Output

```
ent-pct:epc=1-1-1:realpc=5-5-5:si=13:ecics=10:ecice=20:relcause=15
```

```

Enter Remote Application

Use this command to assign user parts to an internal point code that, in turn, assigns user parts to an End Office node.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

ipc (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym:

ipca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ipc/ipca/ipci/ipcn/ipcn24/ipcn16 (mandatory)

End Node's internal point code.

ipci (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

ipcn (mandatory)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-, p-, ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ipcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

ipcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* indicates a private point code (*prefix- un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

*un---*000---127

*sna---*000---15

mna---000---31

si (mandatory)

Service indicator value that designates which user part is assigned to the IPC.

Range:

3 - 15

ssn (optional)

SCCP subsystem number. Valid only if si=3. Use ssn as the starting value of the range if ssne is specified.

Range:

0 - 255

ssne (optional)

The end of the range of subsystem numbers.

Range:

1 - 255

Example

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5:ssne=100
ent-rmt-appl:ipc=0-0-1:si=5
ent-rmt-appl:ipcn24=1-100-1:si=5
ent-rmt-appl:ipc=p-1-1-1:si=3:ssn=5:ssne=102
ent-rmt-appl:ipci=ps-2-2-2:si=5
ent-rmt-appl:ipcn16=1-2-1:si=5
```

Dependencies

Partial point codes are not allowed.

The ssn parameter is required if si=3.

The ssn and ssne parameters are not allowed unless si=3.

The ssne parameter value must be greater than the ssn parameter value.

The specified IPC must be previously defined in the destination table.

The new entry cannot conflict with an existing entry.

Notes

To specify a range of subsystem numbers, specify the `ssn` parameter value as the start of the range and the `ssne` parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
```

```

ent-rte

Enter Route

Use this command to add a route to the system.

Caution: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

lsn (mandatory)

The linkset name associated with this route.

Range:

ayyyyyyyyyy

1 alphabetic character followed by 9 alphanumeric characters

rc (mandatory)

The relative cost of the route

Range:

0 - 99

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*dpca***Range:***p-*, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:*s-*, *p-*, *ps-*, 0-255

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

force (optional)

This parameter allows a route to be added to the database even if the linkset to be assigned to the route does not have any signaling links in it.

Range:

yes

Example

Adds route for DPC 1 to linkset WE123642:

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
```

Adds route for DPC 21-**-* to linkset WE123642:

```
ent-rte:dpc=21-**-*:lsn=we123642:rc=25
```

Adds route for DPCN24 10-100-14 to linkset WE123624:

```
ent-rte:dpcn24=10-100-14:lsn=we123624:rc=10
```

Adds route for private DPC p-1-1-1 to linkset WE123642:

```
ent-rte:dpc=p-1-1-1:lsn=we123642:rc=25
```

Adds route for private and spare DPCN ps-4082-ge to linkset E1NITUN:

```
ent-rte:dpc=ps-4082-ge:lsn=e1ntitun:rc=10
```

Adds route for private DPCN24 p-10-100-14 to linkset WE123642:

```
ent-rte:dpcn24=p-10-100-1:lsn=we123642:rc=10
```

Adds route for private and spare DPCI s-1-100-1 to linkset UE123642:

```
ent-rte:dpci=s-1-100-1:lsn=ue123642:rc=10
```

Adds route for DPCN16 121-10-15 to linkset WE123642:

```
ent-rte:dpcn16=121-10-15:lsn=we123642:rc=10
```

Dependencies

The value of the lsn parameter must exist in the STP database.

The DPC must be in the Destination Point Code table.

The destination point code of a route must be a full point code (*ni-nc-ncm*), a cluster point code (*ni-nc-**), or a network point code (*ni-*-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether ordered routes can be assigned is determined by the destination address's NCAI (nested cluster allowed indicator). The ncai=yes/no parameter is set with the ncai parameter of the ent / chg-dstn commands.

- If the ncai=no parameter is specified, destinations comprising a cluster inherit their ordered routes from the cluster.
- If the ncai=yes parameter is specified, then the destination address is a member of a provisioned nested cluster where ordered routes can be assigned to a provisioned member.

If the specified destination address is a network cluster address (*ni-nc-**), the assignment of the specified ordered route attributes is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The ncai=yes/no parameter is set with the ncai parameter of the ent / chg-dstn commands.

- If the ncai=no parameter is specified, the collection of signaling point codes having the same network identifier (the ni parameter) and network cluster (the nc parameter) code are assigned the specified ordered route.
- If the ncai=yes parameter is specified, then the specified destination is a network cluster address where provisioned members's signaling point codes can be assigned the same or different ordered routes from the cluster.

If the `dpcn` parameter is specified, the format of the point code(s) must match the format that was assigned with `chg-stpopts:npcfmti`.

The `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot be specified with a private point code (-p) unless the route is an IPGW route.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

If the `ipgwapc=yes` parameter is specified for the linkset, then the associated `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot have a cluster route assigned.

The linkset must be defined with at least one link. To override this requirement, specify `force=yes`.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost.

A linkset can be entered only once as a route for each destination or for a routeset.

If the specified destination address is a network address (*ni-*-**), or network cluster address (*ni-nc-**), the linkset type (see the `chg-ls` command) used in the route must be *b*, *c*, or *d*.

All routes with ANSI DPCs must use ANSI linkset APCs. A route with an ITU-I DPC can go over an ITU-N APC and an ITU-N DPC can go over an ITU-I APC.

If the link set name (the `lsn` parameter) references a link set that has the `ipgwapc=yes` parameter specified, the DPC must not be a cluster route.

The NRT feature must be turned on before the `dpc/dpca` parameter can be specified using the asterisk (*) in the `nc` or `ncm` subfields.

When using network routing, if the DPC has a value of * in the `nc` field, the `ncm` field must also be * (for example, `dpc=21-*-*`).

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot be the same as the EAGLE point code.

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot be the same as the EAGLE capability point code.

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot have already been assigned to an APC or SAPC for an IPGWx linkset. The entered route must include the APC or SAPC's linkset with the destination equal to the APC or SAPC.

If `dpcn` is specified then the format of `dpcn` must match the format dictated by the `chg-stpopts:npcfmti` command

The STP shall ensure that the ITU-N ordered route destination's group code must match the route's Link Set Adjacent PC's group code for all linksets other than IPGWI and IPLIMI.

The group code must match for all linksets because the ITU Duplicate Point Code feature is on.

All linksets in a routeset must have the same network type. The network type of the routeset must be the same as the network type of the destination point code.

If multiple routes are defined for the destination point code, and if a proxy point code is assigned to the destination point code, then the first route defined in the `ent-rte` command must use the proxy linkset.

If the `dpc` parameter has a network cluster address (*ni-nc-**) or network address (*ni-*-**), then the `lst=prx` parameter cannot be specified.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
```

```

ent-rtx

Enter Exception Route

Use this command to enter an exception route entry. An exception route is associated with an entry in the Routing table. When the Origin-Based MTP Routing feature is enabled and turned on, the least cost route available for an MSU to be routed to a Destination Point Code over a specified linkset is used.

Up to 6 routes can be defined to a single entry in the Routing table. Up to 8000 routesets can be defined for an STP. This total must include at least one normal route (not an exception route). The remaining 7999 routesets can include any combination of normal and exception routes.

Note: A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.

Parameters

dpc (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)

Destination point code.

dpci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

dpcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmiti` flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:*p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p**msa—000–255**ssa—000–255**sp—000–255***dpcn16 (mandatory)**

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:*p--, 000--127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p**un---000---127**sna---000---15**mna---000---31***lsn (mandatory)**

Linkset Name. The name of the linkset that is associated with the specified exception route.

Range:*ayyyyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

rc (mandatory)

Relative Cost. The relative cost associated with the specified exception route.

Range:*0 - 99***cic (optional)**

Starting Circuit Identification Code. This parameter is used alone or together with the *ecic* parameter as exception routing criteria for the specified exception route.

Range:*0 - 16383***ecic (optional)**

Ending Circuit Identification Code. This parameter, together with the `cic` parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

force (optional)

The `force=yes` parameter must be specified when the `ilsn` parameter value is the same as the `lsn` parameter value.

Range:

yes

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

Range:

ayyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

opc (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Originating Point Code

opci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

opcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmit` flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

opcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

prefix---*p*

un--000---127

sna--000--15

mna--000--31

si (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range:

3 - 15

Example

```
ent-rtx:dpc=1-1-1:opca=2-3-3:lsn=1set1:rc=30
```

```
ent-rtx:dpc=1-3-1:ilsn=1set2:lsn=1set3:rc=20
```

```
ent-rtx:dpc=2-100-1:si=5:lsn=1set5:rc=50
```

Dependencies

Only one of the opc, ils, cic, or si parameters can be specified for a exception route entry.

For an ANSI origination point code that is defined using asterisks (*nnn-*-**), the value of the *network identifier* subfield (*nnn*) must be greater than 5.

If the ecic parameter is specified, the cic parameter must also be specified.

The ecic parameter value cannot be less than the cic parameter value.

The opc/opca/opci/opcn/opcn24/opcn16 parameter value cannot be the same as the dpc parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The point code specified by the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must already exist in the Route table.

The value specified for the dpc parameter cannot already be used as an adjacent point code (APC).

The linkset name, as defined by the ils or lsn parameter, must exist.

An exception route entry cannot already exist with the same input parameter values, other than the relative cost.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost for a given exception route criteria.

A maximum of 6 exception routes can be associated with the specified DPC and criteria.

A maximum total of 8000 exception routes and normal routes can be defined for the EAGLE 5 ISS. At least one route must be a normal (not exception) route. The remaining routes (up to 7999) can be all normal routes, all exception routes, or any combination of normal and exception routes.

The network domain of the adjacent point code in the linkset or of the routes in the specified routeset must be the same as the network domain of the specified destination point code or its alias.

The adjacent or secondary point code type and group code of the linkset or linksets in the specified routeset must match the point code type and group code of the destination point code.

The specified CIC/ECIC range must not overlap an existing range.

If the `ilsn` and `lsn` parameters have the same value, or if the value specified for the `opc/opca/opci/opcn/opcn24/opcn16` parameter is the same as the APC of the linkset specified by the `lsn` parameter, then the `force=yes` parameter must be specified.

The `opcn` parameter must be in the same ITU-N group as the `dpcn` parameter.

The Group Code of the APCN in the `ilsn` parameter must be the same as the Group Code of the `dpcn` parameter.

ANSI network routing and cluster point codes as OPC exception route criteria are not allowed for ITU destinations.

ITU point codes as OPC exception route criteria are not allowed for ANSI Network and Cluster destination.

If the `lsn` parameter is specified, then the `rc` parameter must be specified.

If a proxy destination is used, then this command cannot be entered.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

The destination point code specified by the `dpc` parameter must have routes provisioned.

The Nested Cluster Routing feature must be turned on before an exception route can be assigned to cluster members.

The value specified for the `opc/opca/opci/opcn/opcn24/opcn16` parameter cannot be the same as the adjacent point code of the linkset specified by the `lsn` parameter.

The J7 Support feature must be enabled before the `dpcn16/opcn16` parameter can be specified.

Output

```
ent-rtx:dpci=2-100-1:si=5:lsn=1set5:rc=50
```

```
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
ENT-RTX: MASP A - COMPLTD
```

ent-scr-aftpc

Enter Allowed Affected Point Code

Use this command to add a specific allowed affected point code (AFTPC) screening reference in the AFTPC entity set.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

nsfi (mandatory)

The next screening category that is used in the gateway screening process.

Range:*stop*

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number.

Range:*0 - 255, **

*—the full range of values from 0–255

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:*ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:*0 - 255, ****id (optional)**

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:*0 - 7, **

*—the full range of values from 0–255

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:*0---31, **

*---the full range of values from 0--31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No change to the current value

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0--15, **

**---the full range of values from 0--15*

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

**---the full range of values from 0--255*

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

**---the full range of values from 0--255*

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)ITU international zone. The *zone* in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

*—the full range of values from 0–255

Example

ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop

ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop:actname=copy

ent-scr-aftpc:nsfi=stop:sr=af01:ssn=1:msa=255:ssa=255:sp=255

ent-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s

ent-scr-aftpc:nsfi=stop:sr=af02:ssn=1:un=10:sna=2:mna=5

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna`, or `npc`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

The character *c* is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If specified, the `nsfi` parameter value must be *stop*.

If the nsfi=stop parameter is specified, the nsr parameter cannot be specified.

If the screening reference exists, the new affected point code and subsystem number to be added cannot already exist in the AFTPC entity set.

The Spare Point Code Support feature must be enabled before the pcst parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters ni, nc, ncm) or for 24-bit ITU national point codes (parameters msa, ssa, sp) or for 16-bit ITU national point codes (parameters un, sna, mna). The pcst and npcst parameters cannot be specified for ANSI, ITU-N24 and ITU-N16 point codes.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

If the nc parameter is specified as a range, the ncm parameter must be specified as an asterisk or as the full range.

If the nc parameter is specified as a single value or a range, a single value must be specified for the ni parameter.

If the nc parameter is specified as an asterisk, the ncm parameter must be specified as an asterisk or as the full range.

If the ncm parameter is specified as a single value, or a range other than the full range of 0–255, the ni and nc parameters must be specified with a single value.

If the ni parameter is specified as an asterisk or as a range, the nc and ncm parameters must be specified as an asterisk or as the full range.

The J7 support feature must be enabled before the un, sna, or mna parameters can be specified.

The J7 support feature must not be enabled before the msa, ssa, or sp parameters can be specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100.

If the screening reference is valid, but does not exist, a new AFTPC screen is created.

If the screening reference exists, a new rule is added to the AFTPC screening table.

If asterisks or ranges are specified for the allowed AFTPCs, nothing that matches the specified range of AFTPCs can already exist in the AFTPC screen for the screening reference.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original ent-scr-aftpc command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix to has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```

ent-scr-blkdpc

Enter Blocked DPC

Use this command to add a specific blocked destination point code (BLKDPC) screening reference, and associated attributes, to the BLKDPC's table. The associated attributes are: destination point code, next screening function identifier, and next screening reference. The destination point codes listed on this screen are prohibited from sending SS7 messages to the network.

Parameters

nsfi (mandatory)

The next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

cgpa

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

fail

Discard the received message.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

*0 - 7, *, C*

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

*0--31, *, C*

*--the full range of values from 0–31

C -- continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more nc values for the network indicator and network cluster member values specified in the ni and ncm parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more ncm values for the network indicator and network cluster values identified in the ni and nc parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more ni values for the network cluster and network cluster member values identified in the nc and ncm parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–16383

C—continue

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the screening category (nsfi) is to be used in the screening process.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:*none**s***Default:***none***sna (optional)**16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.**Range:***0--15, *, C***--the full range of values from 0--15**C -- continue***sp (optional)**24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.**Range:***0 - 255, *, C***—the full range of values from 0–255**C—continue***ssa (optional)**24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.**Range:***0 - 255, *, C***—the full range of values from 0–255**C—continue***un (optional)**16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *, C

*---the full range of values from 0--127

C --continue

zone (optional)ITU international zone. The *zone* in the point code represented by *zone-area-id*.**Range:**

0 - 7, *, C

*—the full range of values from 0–7

C—continue

Dependencies

**CAUTION**

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc` combination unless a value of `c` is specified.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

At least one optional parameter must be specified.

When a blocked screening reference is created, the first entry for the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, or `un-sna-mna` must be `c-c-c` or `npc=c` must be specified. Subsequent entries can be specific point codes.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `msa=c` parameter is specified, then the `ssa` and the `sp` parameters must have a value of `c` or cannot be specified. If the `msa=c` parameter is specified, and the `ssa` and the `sp` parameters are not specified, then the `ssa` and `sp` parameters default to a value of `c`.

If the `un=c` parameter is specified, then the `sna` and the `mna` parameters must have a value of `c` or cannot be specified. If the `un=c` parameter is specified, and the `sna` and the `mna` parameters are not specified, then the `sna` and `mna` parameters default to a value of `c`.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `ni=c` parameter is specified, then the `nc` and `ncm` parameters must have a value of `c` or cannot be specified. If the `ni=c` parameter is specified, and the `nc` and the `ncm` parameters are not specified, then the `nc` and `ncm` parameters default to a value of `c`.

If the specified `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is not equal to `c-c-c`, or if the `npc=c` parameter is not specified, then the `nsfi=fail` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi` parameter has a value other than `stop` or `fail`, the `nsr` parameter must be specified and must exist.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `sr` does not exist, then the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` parameters must equal `c-c-c`, or the `npc=c` parameter must be specified, and the `nsfi=fail` parameter cannot be specified.

If the specified screening reference exists:

- The `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` must equal `c-c-c` or `npc` cannot equal `c`.
- The `nsfi` parameter must have a value of `fail`.
- The `nsr` parameter cannot be specified.
- The blocked DPC, given by `ni-nc-ncm`, `zone-area-id`, or `npc`, to be added to the BLKDPC screening table for the blocked DPC screening reference cannot exist as defined or within an existing range of DPCs.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The `pcst` parameter cannot be specified with `c` for a blocked screen reference (`sr`).

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 and ITU-N24 point codes.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

If the `zone=c` parameter is specified, then the `area` and `id` parameters must have a value of `c` or cannot be specified. If the `zone=c` parameter is specified, and the `area` and `id` parameters are not specified, then the `area` and `id` parameters default to a value of `c` .

The value of the `nsfi` parameter must be valid for the BLKDPC entity type.

If a blocked screening reference exists, then the `ni`, `zone`, `msa`, `un`, and `npc` parameters cannot have a value of `c` .

The J7 support feature must be enabled before the `un/sna/mna` parameters are specified.

The J7 support feature must not be enabled before the `msa,ssa,sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be `c-c-c`, or `c` for the `npc` parameter. Subsequent entries must be specific point codes.

The character `c` is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code is in the form of `npc=c`, or of subfields equal to `c-c-c`. When the character `c` is specified, the `nsfi` and `nsr` parameters must be specified.

If the character `c` is specified for the parameters `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp`, the character `c` is the only value that can be specified for all three parameters. No other values can be used. For example, a point code `c-c-255` is not allowed. The point code must be `c-c-c`. The asterisk value cannot be used with the character `c` (for example, a point code `c-c-*` is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code `c-c-c` or `npc=c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

If the current `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is equal to `c-c-c` or `npc=c`, only the `nsfi` and `nsr` parameters can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100 .

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-blkdpc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

ent-scr-blkopc

Enter Blocked OPC

Use this command to add a specific blocked originating point code (BLKOPC) screening reference and associated attributes `OPC`, `nsfi`, and `nsr` to the BLKOPC entity set. Any messages received on the link assigned to this screening reference that match the attributes in this table are blocked from entering the network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

dpc

Allowed DPC is the next screening category.

fail

Discard the received message.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* of the point code represented by *zone-area-id*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. This parameter specifies the *ID* of the point code represented by *zone-area-id*.

Range:

*0 - 7, *, C*

*—the full range of values from 0–255

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C ---continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–255

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *, C

*---the full range of values from 0--15

C ---continue

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *, C

*---the full range of values from 0--127

C ---continue

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*—the full range of values from 0–255

C—continue

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsm=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc` combination unless a value of *c* is specified.

The ANSI point code value 000-000-000 and the ITU-International point code value 0-000-0 cannot be specified.

At least one optional parameter must be specified.

When a blocked screening reference is created, the first entry for the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp` or `un-sna-mna` must be `c-c-c` or `npc=c` must be specified. Subsequent entries can be specific point codes.

If asterisks or ranges are specified for the blocked OPCs, nothing that matches the specified range of blocked OPCs can already exist in the BLKOPC screening table for the screening reference.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must exist in the Gateway Screening Stop Action table.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If the `msa=c` parameter is specified, then the `ssa` and `sp` parameters must have a value of *c* or cannot be specified. If the `msa=c` parameter is specified, and the `ssa` and the `sp` parameters are not specified, then the `ssa` and `sp` parameters default to a value of *c*.

If the `un=c` parameter is specified, then the `sna` and `mna` parameters must have a value of *c* or cannot be specified. If the `un=c` parameter is specified, and the `sna` and the `mna` parameters are not specified, then the `sna` and `mna` parameters default to a value of *c*.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `ni=c` parameter is specified, then the `nc` and the `ncm` parameters must have a value of *c* or cannot be specified. If the `ni=c` parameter is specified, and the `nc` and the `ncm` parameters are not specified, then the `nc` and `ncm` parameters default to a value of *c*.

If the specified `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is not equal to `c-c-c`, or if the `npc=c` parameter is not specified, then the `nsfi=fail` parameter must be specified, and the `nsr` parameter cannot be specified.

If the value of the `nsfi` parameter is not `stop` or `fail`, then the `nsr` parameter must be specified.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `sr` does not exist, then the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` parameters must equal `c-c-c`, or the `npc=c` parameter must be specified, and the `nsfi=fail` parameter cannot be specified.

If the specified screening reference exists:

- The `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` must equal `c-c-c` or `npc=c` cannot be specified.
- The `nsfi` parameter must be `fail`.
- The `nsr` parameter cannot be specified.
- The blocked OPC, specified by `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc`, to be added to the BLKOPC screening table for the blocked OPC screening reference cannot exist as defined or within an existing range of OPCs.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The `pcst` parameter cannot be specified with `c` for a blocked screen reference (`sr`).

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `sna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 and ITU-N24 point codes.

If `ssa=*` is specified, `sp=*` must be specified.

If `sna=*` is specified, `mna =*` must be specified.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If the `zone=c` parameter is specified, then the `area` and `id` parameters must have a value of `c` or cannot be specified. If the `zone=c` parameter is specified, and the `area` and the `id` parameters are not specified, then the `area` and `id` parameters default to a value of `c`.

The specified `nsfi` parameter value must be valid for the BLKOPC entity type.

If a blocked screening reference exists, then the `ni`, `zone`, `msa`, `un` and `npc` parameters cannot have a value of `c`.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the `msa`, `ssa`, `sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be `c-c-c`, or the `npc=c` parameter must be specified. Subsequent entries must be specific point codes.

The character `c` is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When

screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, nsfi, and nsr. The point code is in the form of npc=c or subfields equal to c-c-c. When the character c is specified, the nsfi and nsr parameters must be specified.

If the character c is specified for the parameters ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp, the character c is the only value that can be specified for all three parameters. For example, a point code c-c-255 is not allowed. The point code must be c-c-c. The asterisk value cannot be used with the character c (for example, a point code c-c-* is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code c-c-c or npc=c. The nsfi and nsr in this entry are examined to determine the next step in the screening process.

If the current ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp is equal to c-c-c or npc=c, only the nsfi and nsr can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100 .

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original ent-scr-blkopc command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Related Commands

[chg-scr-blkopc](#), [dlt-scr-blkopc](#), [rtro-scr-blkopc](#)

Use this command to add a specific allowed called party address (CDPA) screening reference in the CDPA entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

aftpc

Allowed affected point code is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. This parameter specifies the screening reference name for the CdPA.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number

Range:

*0 - 255, **

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, **

*—the full range of values from 0–255

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *

*---the full range of values from 0–31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

*0 - 16383, **

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

scmgfid (optional)

SCMG Format ID. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

Range:

*1 - 255, **

*—the full range of values from 1–255

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *

*---the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*---the full range of values from 0--255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*---the full range of values from 0--255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*---the full range of values from 0--7

Example

```
ent-scr-cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds
```

```
ent-scr-cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:actname=copy
```

```
ent-scr-cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s
```

```
ent-scr-cdpa:sr=cdp2:un=1:sna=2:mna=1:ssn=1:nsfi=stop
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

At least one optional parameter must be specified.

The new CDPA entry to be added cannot match any specific, range, or asterisk entry already existing in the specified screening table.

The character `c` is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `una`, `sna`, `mna`, and `npc` parameters.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

When the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and the `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `nnc` parameter is specified as a range, the `nncm` parameter must be specified as an asterisk or as the full range.

When `nsfi=aftpc` is specified, the `ssn=1` parameter must be specified.

When `nsfi` is a value other than `stop`, the `nsr` parameter must be specified.

When `nsfi=stop` is specified, the `nsr` parameter cannot be specified.

When `ssn=1` is specified, the `scmgfid` parameter must be specified.

When `ssn` is not 1, the `scmgfid` parameter cannot be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The specified value for the `nsfi` parameter is not valid for `cdpa screen`.

The next screening function identifier (nsfi) and the next screening reference (nsr) must point to an existing screen, or the nsfi=stop parameter must be specified and the nsr parameter cannot be specified.

The J7 support feature must be enabled before the un/ sna/ mna parameters are specified.

The J7 support feature must not be enabled before the msa/ ssa/ sp parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

If the screening reference is valid, but does not exist, a new CDPA screen is created.

If the screening reference exists, a new rule is added to the CDPA screening table.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-cdpa` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds5
```

```

Related Commands

[chg-scr-cdpa](#), [dlt-scr-cdpa](#), [rtrv-scr-cdpa](#)

ent-scr-cgpa

Enter Allowed Calling Party Address

Use this command to add a specific allowed calling party address (CGPA) screening reference in the CGPA entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:*cdpa*

Allowed called party address is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

tt

Allowed translation type is the next screening category.

ri (mandatory)

Routing indicator. This parameter provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range:*dpc*

Allow a called party address with a routing indicator value of "DPC/SSN."

gt

Screening stops and gateway screening is bypassed as a forced pass.

*

A full range of values.

sr (mandatory)

Screening reference. The screening reference name for the CgPA.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number

Range:*1 - 255, ****actname (optional)**

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *

*—the full range of values from 0–255

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *

*---the full range of values from 0--31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more ni values for the network cluster and network cluster member values identified in the nc and ncm parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sccpmt (optional)

SCCP message type

Range:

9

UDT
10
 UDTS
17
 XUDT
18
 XUDTS
 *

Default:

*

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *

*---the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*---the full range of values from 0--255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*---the full range of values from 0--255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–255

Example

```
ent-scr-cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wr5:ri=dpc
ent-scr-cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:ri=dpc:actname=copy
ent-scr-cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=9:nsfi=sdpa:nsr=cdp1
ent-scr-cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
ent-scr-cgpa:sr=cgp1:un=1:sna=2:mna=1:ssn=1:sccpmt=9:nsfi=stop:ri=*
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one, and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The new CGPA point code, `ri`, `sccpmt`, and `ssn` to be added can not already exist in the CGPA entity set.

The character `c` is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

When the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The screen referenced by `nsfi` and `nsr` must already exist.

The `nsr` parameter must be specified, if `nsfi` is not equal to `stop`.

When `nsfi=stop` is specified, the `nsr` parameter cannot be specified.

The `nsfi=tt` parameter can be specified only if the `ri=gt` parameter or the `ri=*` parameter is specified.

The `nsfi=cdpa` parameter can be specified only if the `ri=dpc` parameter or the `ri=*` parameter is specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

The specified value for the `nsfi` parameter is not valid for `cgpa` screen.

Valid values must be specified for the `nscpmt` and `sccpmt` parameters.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the `msa/ ssa/ sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100 .

If the screening reference is valid, but does not exist, a new CGPA screening table is created.

If the screening reference exists, a new rule is added to the CGPA screening table. Only one rule may exist for a given `ni-nc-ncm/ssn/ri/sccpmt` (or `zone-area-id` or `npc`) combination. This implies that for a given combination, only one value of `ri` may be specified. The `ri` for a given combination can be `dpc`, `gt`, or `*`, but not `dpc` and `gt` independently.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-cgpa` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

Related Commands

[chg-scr-cgpa](#), [dlt-scr-cgpa](#), [rtrv-scr-cgpa](#)

ent-scr-destfld

Add an Allowed DESTFLD

Use this command to add an allowed affected destination field (DESTFLD) screening reference and associated attributes (destination point code, next screening function identifier, and next screening reference) to the allowed DESTFLD entity set. One or more point codes can be associated with the allowed DESTFLD screening reference. MTP Network Management messages regarding the DESTFLDs listed in this entity set are accepted from another network.

Parameters

nsfi (mandatory)

This parameter indicates that the gateway screening process should stop.

Range:

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters.

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, **

*—the full range of values from 0–255

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

*0---31, **

*---the full range of values from 0–31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm* .

Range:

*0 - 255, **

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *

*---the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*---the full range of values from 0--255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255

*---the full range of values from 0--255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7

*---the full range of values from 0--7

Example

```
ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop
ent-scr-destfld:sr=iec1:ni=1:nc=1:ncm=1:nsfi=stop:actname=copy
ent-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s
ent-scr-destfld:sr=iec:un=120:sna=10:mna=15:nsfi=stop
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsn=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or the `npc` parameter must not already exist in the screening reference or within an existing range of DPCs.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi=stop` parameter must be specified in the command.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` and `npcst` parameters cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nsfi=fail` parameter is specified, then the `nni`, `nc`, `nncm`, `narea`, `nzone`, `nid`, `nmsa`, `nssa`, `nsp`, `nun`, `nsna`, `nmna`, and `npc` parameters cannot have a value of `c`.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the *msa/ ssa/ sp* parameters are specified.
The *GWSOA* parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, *ni=025&&100* specifies all network indicators for ANSI point codes from 25-100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-destfld` command.

The spare point code subtype prefix (*s-*) is supported only for ITU international and ITU national point codes. The *pcst* parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., *ni, nc, ncm*. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop
```

```

ent-scr-dpc

Enter Allowed DPC

Use this command to add an allowed DPC screening reference and associated attributes (destination point code, next screening function identifier, next screening function reference) to the allowed DPC entity set. One or more DPCs may be associated with the allowed DPC screening reference. The DPCs listed in this entity set are allowed to receive SS7 messages from another network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Allowed DPC screening reference name. A set of one or more allowed destination point codes.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

*0 - 7, *, C*

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C ---continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

000 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–16383

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *, C

*---the full range of values from 0--15

C ---continue

sp (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *, C

*---the full range of values from 0--127

C ---continue

zone (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*—the full range of values from 0–7

C—continue

Example

```
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=blkdpc:nsr=bdp1
ent-scr-dpc:sr=dpc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
ent-scr-dpc:sr=dpc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
ent-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s
ent-scr-dpc:sr=dpc2:un=1:sna=2:mna=1:nsfi=stop
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by `thegwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna`, or the `npc` parameter must not already exist in the screening reference or within an existing range of DPCs.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The value of the `nsfi` parameter must be valid for the BLKDPC entity type.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the msa/ ssa/ sp parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a DPC screening reference is created, the first entry for a point code must be *c-c-c*, or *c* for the npc parameter. Subsequent entries must be specific point codes.

The character *c* is used in the DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the DPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, nsfi, and nsr . The point code is in the form of npc=*c* or subfields equal to *c-c-c*. When the character *c* is specified, the nsfi and nsr parameters must be specified.

If the character *c* is specified for the parameters ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp, the character *c* is the only value that can be specified for all three parameters. For example, a point code *c-c-255* is not allowed. The asterisk (*) value cannot be used with the character *c* (for example, a point code *c-c-** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code *c-c-c* or npc=*c*. The nsfi and nsr in this entry are examined to determine the next step in the screening process.

If the current ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp is equal to *c-c-c* or npc=*c*, only the nsfi and nsr can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100 .

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-dpc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf
```

Related Commands

chg-scr-dpc, dlt-scr-dpc, rtrv-scr-dpc

ent-scr-isup

Enter Allowed ISUP Screening Reference

Use this command to add an allowed ISUP or TUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Parameters

isupmt/tupmt (mandatory)

ISUP or TUP message type.

Range:

*0 - 255, **

*—the full range of values from 0–255

sr (mandatory)

Individual ISUP screening reference to which this rule will be added. If the specified sr does not exist, it will be created.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process.

Range:

stop

The gateway screening process ends and the message proceeds through normal routing.

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop
ent-scr-isup:sr=iall:isupmt=*:nsfi=stop
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
```

Dependencies

If the actname parameter is specified, the nsfi=stop parameter must be specified.

The value of the actname parameter must already be defined in the Gateway Screening Stop Action table with the chg-gws-actset command.

The specified isupmt parameter or tupmt parameter value must not already exist in the specified sr.

If the nsfi parameter is specified, the value must be stop.

The nsr parameter cannot be specified if the nsfi=stop parameter is specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values can be specified for the isupmt or tupmt parameter by separating the values that define the range by two ampersands (&&); for example, isupmt=025&&100 specifies all ISUP message types from 25-100. The value to the left of the&&must be less than the value to the right of the && in the range.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original ent-scr-isup command.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with si=04 (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (nsr) value.

To use ISUP message type screening, an SIO screening reference with si=05 (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (nsr) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with si=4 and the SIO screening reference with si=5 must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference

parameter (nsr) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (nsr) value.

Output

When a screen reference is specified that is not yet associated with a screen set, the following output appears:

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
```

```
tekelecstp 04-09-02 09:39:13 EST EAGLE 31.3.0
ENT-SCR-ISUP: MASP A - COMPLTD

ent-scr-opc

Enter Allowed OPC

Use this command to add an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference) to the allowed OPC entity set. One or more OPCs may be associated with the allowed OPC screening reference. Each OPC listed in this entity set is allowed to send SS7 messages to the customer's network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

blkopc

Blocked OPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

dpc

Allowed DPC is the next screening category.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. A set of one or more allowed OPCs.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*. A

Range:

*0 - 7, *, C*

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0--31, *, C

*--the full range of values from 0--31

C—continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—full range of values from 0-255

C—continue

npc (optional)

ITU national point code.

Note: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—full range of values from 0-255

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *, C

*---the full range of values from 0--15

C—continue

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—full range of values from 0-255

C—continue

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—full range of values from 0-255

C—continue

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *, C

*---the full range of values from 0--127

C—continue

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*—full range of values from 7

C—continue

Example

```
ent-scr-opc:sr=iec:nsfi=stop
```

```
ent-scr-opc:sr=iec:ni=240:nsfi=sio:nsr=iec
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=copy
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=dpc:nsr=iec
```

```
ent-scr-opc:sr=opc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
```

```
ent-scr-opc:sr=opc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

```
ent-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
```

```
ent-scr-opc:sr=opc2:un=1:sna=2:mna=1:nsfi=stop
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna` or `npc` combination unless a value of `c` is specified.

The OPC specified by `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna` or the `npc` parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

The `nsr` parameter must be specified if `nsfi` is not equal to `stop`.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point

codes (parameters un, sna, mna). The pcst parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the nsfi=fail parameter is specified, then the nni, nc, nncm, narea, nzone, nid, nmsa, nssa, nsp, nun, nsna, nmna, and npc parameters cannot have a value of c.

The value of the nsfi parameter must be valid for the OPC entity type.

The J7 support feature must be enabled before the un/ sna/ mna parameters are specified.

The J7 support feature must not be enabled before the msa/ ssa/ sp parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When an OPC screening reference is created, the first entry for a point code must be *c-c-c* or *c* for the npc parameter. Subsequent entries must be specific point codes.

The character *c* is used in the OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the OPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, nsfi, and nsr. The point code is in the form of npc=*c* or subfields equal to *c-c-c*. When the character *c* is specified, the nsfi and nsr parameters must be specified.

If the character *c* is specified for the parameters ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp, the character *c* is the only value that can be specified for all three parameters. For example, a point code *c-c-255* is not allowed. The point code must be *c-c-c*. The asterisk value cannot be used with the character *c* (for example, a point code *c-c-** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code *c* or npc=*c*. The nsfi and nsr in this entry are examined to determine the next step in the screening process.

If the current ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp is equal to *c-c-c* or npc=*c*, only the nsfi and nsr can be changed. Otherwise, only the OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-opc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```

[chg-scr-opc](#), [dlt-scr-opc](#), [rtro-scr-opc](#)

ent-scr-sio

Enter Allowed SIO

Use this command to add an allowed SIO screening reference and associated attributes (network indicator, service indicator, message priority, H0 heading code, H1 heading code, next screening function identifier, next screening function reference) to the allowed SIO entity set.

Note: To use TUP message type screening, an SIO screening reference with si=04 (TUP) must be defined in the SIO table. This SIO screening reference is specified in the `ent-scr-isup` command as the next screening reference (nsr) value in a screening reference for TUP message types

Parameters

nic (mandatory)

Network indicator code. NIC for the SIO screening reference specified in the `sr` parameter. The NIC is the last 2 bits of the subservice field of an SIO.

Range:

0 - 3, *

*—full range of values from 0-3

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

cdpa

cgpa

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

dpc

Allowed DPC is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

pri (mandatory)

Message priority. A single priority, or the beginning of a range of priorities for the SIO screening reference specified by the sr parameter .

Range:

*0 - 3, **

*—full range of values from 0-3

si (mandatory)

Service indicator. SI for the SIO screening reference specified in the sr parameter. The SI is the first 4 bits of an SIO. The SS7 code directs the message to the MTP-user at the destination code.

Range:

00 - 15

sr (mandatory)

The allowed SIO screening reference name. This parameter specifies a set of one or more si/nic/pri combinations.

Range:

ayyy

1 alphabetic character followed by up to 5 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

h0 (optional)

H0 heading code. New H0 heading code for the screening reference specified in the sr parameter.

Range:

*0 - 15, **

*—full range of values from 0-15

Default:

Value given if si value is 00, 01, 02

h1 (optional)

H1 Heading Code. H1 heading code for the screening reference specified in the sr parameter.

Range:

0 - 15, *

*—full range of values from 0-15

Default:

Value given if si value is 00, 01, 02

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
ent-scr-sio:sr=iec:nic=1:si=1:h0=01&&03:h1=*:pri=*:nsfi=dpc:nsr=abc
```

```
ent-scr-sio:sr=iec:nic=1:si=3:pri=2:nsfi=stop
```

```
ent-scr-sio:sr=iec:nic=1:si=4:pri=3:nsfi=stop:actname=cncf
```

Dependencies

CAUTION

Caution: Even though gateway screening is in the screen test mode, as defined by the gwsa=off and gwsm=on parameters, the gateway screening action in the stop action set specified by the actname parameter of the screen set will be performed at the end of the screening process.

If the actname parameter is specified, then the nsfi=stop parameter must be specified.

The value of the actname parameter must already be defined in the Gateway Screening Stop Action table with the chg-gws-actset command.

If the si parameter is equal to 00, 01, or 02, the h0 and h1 parameters must be specified. Otherwise, the h0 parameter cannot be specified.

Valid combinations for the h0/h1 and nh0/nh1 parameters are:

- h0 is a single value—h1 can be a single value, range, or an asterisk
- h0 is a range—h1 can be an asterisk

- h0 is an asterisk— h1 can be an asterisk

If the screening reference exists, the nic, si, h0/h1, and priorities to be added to the allowed SIO entity set for the SIO screening reference cannot exist in that allowed SIO entity set.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of nic, si, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

If the screening reference does not exist, a new screening reference for the allowed SIO entity set is created.

The nsfi and nsr parameters must point to an existing screen, or the nsfi=stop parameter must be specified, and the nsr parameter cannot be specified.

The values specified for the nsfi and si parameters must meet the mapping requirements as shown:

- nsfi=destfld — si=00
- nsfi=cdpa — si=03
- nsfi=cgpa — si=03
- nsfi=isup — si=05

Use [Table 33: Additional Valid ent-scr-sio Parameter Combinations](#) to determine the acceptable combination of the specified parameter values:

Table 33: Additional Valid ent-scr-sio Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
00	s, *	s, *, r	s	s, *, r
00	s, *	s, *, r	*, r	*
01, 02	s, *	s, *, r	s	s, *, r
01, 02	s, *	s, *, r	*, r	*
03-15	s, *	s, *, r	u	u
Legend				
<ul style="list-style-type: none"> • s = single value • r = range • * = asterisk • u = unspecified 				

If the nsfi parameter has a value other than *stop* or *fail*, the nsr parameter must be specified and must exist.

If the nsfi=stop parameter is specified, then the nsr parameter must be specified.

If the si parameter is greater than 2, the h0 and h1 parameters must not be specified.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The GWSOA parameter combination should be known and valid.

For SEAS commands, the pri parameter specified must be in the range 0-3, *.

For SEAS commands, the h0 parameter specified must be in the range 0-15, *.

For SEAS commands, the h1 parameter specified must be in the range 0-15, *.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, pri=0&&2 specifies all message priorities for the range 0 - 2.

If the screen set reaches 100% capacity (indicated by the **100% Full** message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with si=04 (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with si=05 (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with si=4 and the SIO screening reference with si=5 must be two different screening references.

The h0 and h1 parameters cannot be specified if si is not equal to 00, 01, or 02.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-sio` command.

Output

```
ent-scr-sio:sr=iec:nic=1:si=1:h0=01&&03:h1=*:pri=*:nsfi=dpc:nsr=abc
```

```

[chg-scr-sio](#), [dlt-scr-sio](#), [rtrv-scr-sio](#)

ent-scr-tt

Enter Allowed Translation Type

Use this command to add a specific allowed translation type (TT) screening reference in the TT entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

cdpa

Allowed CDPA is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

type (mandatory)

Translation type. The GTT type value in the CdPA. This value is the decimal representation of the 1-byte field used in SS7.

Range:

*000 - 255, **

*—full range of values from 0-255

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

Example

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wr5
```

```
ent-scr-tt:sr=iec:type=012:nsfi=stop:actname=copy
```

Dependencies

Caution: Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsn=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

If the screening reference is valid, but does not exist, a new TT screen is created.

If the screening reference exists, a new rule is added to the TT screening table.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-tt` command.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `nsfi=stop` parameter is specified, the `nsr` parameter cannot be specified.

If the `nsfi` parameter has a value other than `stop`, the `nsr` parameter must be specified.

If the `nsr` parameter is specified, the specified screening reference must exist.

If the screening reference (`sr`) exists, the single value or range specified for the allowed type to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

If an asterisk is specified for the allowed type, nothing can already exist in the TT screen for the screening reference.

The specified value for the `nsfi` parameter is not valid for TT screen.

The screen referenced by `sfi` and `nsr` must already exist.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The value specified for the `type` parameter must be within the allowed range.

The GWSOA parameter combination should be known and valid.

Notes

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wrds
```

ent-scrset

Enter Screen Set

Use this command to create a new screen set and point it to its first screen. A screen set is a set of screens (filters) that can be assigned to a linkset. SS7 messages transmitted on a linkset assigned to a screen set require screening by the system, if screening is enabled.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

blkopc

Blocked OPC is the next screening category.

dpc

Allowed DPC is the next screening category.

opc

Allowed OPC is the next screening category.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

scrn (mandatory)

Screenset name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the *actname* parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy 1 alphabetic character followed by up to 5 alphanumeric characters.

destfld (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is ON, the automatic screening is applied at the end of the provisioned screen set.

Range:*yes**no***Default:***yes***nsr (optional)**

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsfi) is to be used in the screening process.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

Example

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
ent-scrset:scrn=ss02:nsfi=stop
ent-scrset:scrn=empt:nsfi=stop:destfld=yes
ent-scrset:scrn=scr1:nsfi=stop:actname=copy
```

Dependencies

Even though gateway screening is in the screen test mode, as defined by the parameters gwsa=off and gwsm=on, the gateway screening action in the stop action set specified by the actname parameter of the screen set will be performed at the end of the screening process.

The nsfi=stop parameter must be specified before the actname parameter can be specified.

The value of the actname parameter must already be defined in the Gateway Screening Stop Action table with the chg-gws-actset command. These values are shown in the *ACT NAME* field of the rtrv-gws-actset command output.

If the nsfi=stop parameter is specified, then the nsr parameter cannot be specified.

The specified screen set name cannot be in use by another screen set.

A maximum of 63 user-defined screen sets can be defined in the database.

The nsfi and nsr parameters must point to one or more existing entities in another entity set, or the nsfi=stop parameter must be specified, and the nsr parameter cannot be specified.

If the nsfi=stop parameter is not specified, then the nsr parameter must be specified.

The nsfi parameter must be valid for the SCRSET entity.

The Gateway Screening (GWS)/Global Title Translation (GTT) shared database resource (DBMM.TBL) cannot be full.

The GWSOA parameter combination should be known and valid.

Notes

Entering a new screen set may take a few minutes of processor time. The following message appears in the scroll area:

```
Extended processing time required-please wait
```

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
```

```

ent-serial-num

Enter Serial Number

Use this command to enter and lock the NT serial number into the database for an EAGLE 5 ISS STP.

You must enter the serial number at least once without specifying the *lock* parameter. As long as you enter the command without the *lock* parameter, you can enter the system serial number as many times as needed. After the correct serial number is entered, you must use the *lock=yes* parameter to lock the serial number table. You cannot change the serial number with administration commands after the table is locked.

Parameters

serial (mandatory)

The system NT Serial Number.

Range:*aaayyyyyyy*

Up to 10 alphanumeric characters; mixed case is allowed.

The first two characters (the prefix) must be letters. The remaining characters must be numbers. The serial number cannot contain spaces or special characters.

lock (optional)

This parameter is used to lock the Serial Number table when the serial number is entered for the system.

Caution: After the serial number is locked, you cannot enter it again or change it in the database. You can use the command without the lock parameter to enter the serial number as many times as needed; then enter the command with the lock parameter and the correct serial number to lock the serial number table.

Range:*yes***Default:**

Not locked

Example

```
ent-serial-num:serial=nt00000123
ent-serial-num:serial=nt00000123:lock=yes
```

Dependencies

The serial number must be entered at least once without specifying the lock parameter.

The system serial number that is entered when the lock parameter is specified must match the serial number that was previously entered in the Serial Number table by using the command without the lock parameter.

The system serial number cannot be entered again after the Serial Number table is locked.

Notes

None

Output

```
ent-serial-num:serial=nt00000123
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0

Related Commands

[rtrv-serial-num](#)

ent-shlf

Enter Shelf

Use this command to add an equipment shelf to the database.

Parameters

loc (mandatory)

The location of the shelf.

Range:

1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300,
6100, 6200, 6300

type (mandatory)

The type of equipment shelf to be configured.

Range

ext, fpb

fan (optional)

This parameter turns ON/OFF the FAN option. If it is turned ON, the FAN power for this shelf will be added to the Frame Power Budget.

Range

off,
on

Example

```
ent-shlf:type=ext:loc=1200
ent-shlf:type=fpb:loc=6200:fan=on
```

Dependencies

The frame and shelf values of the shelf location parameter (loc) must be within the valid range (*xyzz*, where *x*=frame and *y*=shelf; *zz* is always 00 for this command).

The specified shelf location must not have been configured previously.

A shelf cannot be provisioned at location 1100. This location is reserved for the control shelf.

The shelf locations 6200 and 6300 are reserved for shelf type FPB only. However, shelf with type=fpb can be provisioned in any shelf location from 1200 to 6300.

ent-sid

Enter Self Identification

Use this command to define additional true point codes for an STP. This command allows newly defined true point codes to be distributed to the cards without requiring system initialization.

Parameters

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

STP true point code.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfnti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Example

To create a site identification STP PC for ITU-N and ITU-I:

```
ent-sid:pcn=123:pci=1-1-1
```

To create a site identification STP PC for ITU-N Spare and ITU-I Spare:

```
ent-sid:pcn=s-123:pci=s-1-1-1
```

To create a site identification STP PC for ITU-N16:

```
ent-sid:pcn16=125-1-6
```

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the pc parameter must be 6 or greater when the specified cluster value is 0 (*nc*).

The pcn and pcn24 parameters cannot be specified together in the command.

The specified STP point code must not have been previously defined as a capability point code.

An STP point code cannot exist that is the same type (ANSI, ITU-I, ITU-N, ITU-N24, ITU-N16, ITU-ISpare, or ITU-NSpare) as the specified STP point code or must not have been previously defined as a capability point code.

The value of the pc/pca/pci/pcn/pcn24/pcn16 parameter must be a full point code.

ITU-N STP destination point codes can be specified only as full point codes.

Invalid parameter was specified.

A string of 1 to 64 characters. Valid values are (0-9, A-Z), +, *, #, .(period), @ or DFLT (default).

npdd (optional)

Number of prefix digits to be deleted from the incoming digit string. If NPDD is zero then no digits are deleted.

Range:

zzzzzzzzzzzzzzzz

An integer in the range of 0 to 15.

Default:

No change to the current value.

System Default:

0

npds (optional)

New prefix digits to be substituted to digit string after deleting the NPDD. If NPDS is NONE then no digits are prepended.

Range:

zzzzzzzzzzzzzzzz

A string of 1 to 15 characters. Valid values are hex digits (0-9, A-F) and NONE.

Default:

No change to the current value

System Default:

none

px (optional)

Prefix

Range:

zzzzzzzzzzzzzzzz

A string of 1 to 15 characters. Valid values are hex digits (0-9, A-F), +, *, -, #.

Example

```
ent-sip-npp:phcxt=abc.com:px=101
```

```
ent-sip-npp:phcxt=abc.com:px=121:npdd=5:npds=2f
```

```
ent-sip-npp:phcxt=a*bc.com:px=91*:npdd=5:npds=af1
```

```
ent-sip-npp:phcxt=dflt:px=*121#
```

Dependencies

SIPNP Feature must be enabled before entering any number normalization rules.

SIP Phone Context table (SIPPHCXT) should be accessible.

SIP Prefix table (SIPNNPFX) should be accessible.

SIP DBMM 2 table should be accessible.

A maximum of 101 entries can be added in the SIP Phone Context table (SIPPHCXT).

A maximum of 50 prefixes for each phone context can be added in the SIP Prefix table (SIPNNPFX).

Prefixes must be unique. Duplicate Prefix entries are not allowed.

Phone Contexts must be unique. Duplicate Phone Context entries are not allowed.

At least one NPDD or NPDS must be specified with non-default (other than 0, NONE) value.

SIPPHCXT table can have a maximum of 101 Phone Contexts which includes 100 Unique and 1 DFLT.

A valid Phone Context/Prefix value should be given.

The PHCTXT parameter value must contain no more than 64 characters and the PFX parameter value must contain no more than 15 characters.

Notes

None.

Output

This example displays the output when all the parameters are specified:

```
ent-sip-npp:phctxt=a*bc.com:px=91:npdd=5:npds=af1
```

```
tekelecstp 12-07-16 10:05:45 EST EAGLE 45.0.0
ent-sip-npp:phctxt=a*bc.com:px=91:npdd=5:npds=af1
Command entered at terminal #4.
PHCTXTID table is (2 of 101) 2% full.
ENT-SIP-NPP: MASP A - COMPLTD
;
```

This example displays the output when just the phctxt and px parameters are specified:

```
ent-sip-npp:phctxt=linea.com:px=*121#
```

```
tekelecstp 12-07-09 18:59:31 EST 45.0.0-64.35.0
ent-sip-npp:phctxt=linea.com:px=*121#
Command entered at terminal #4.
PHCTXTID table is (1 of 101) 1% full.
ENT-SIP-NPP: MASP A - COMPLTD
;
```

ent-slk

Enter Signaling Link

Use this command to add a low-speed or high-speed (ATM or IP) signaling link to a linkset in the database.

Signaling links are the only elements in the database directly supported by a hardware device. When a link is added to a linkset, the link remains in the state OOS-MT-DSBLD (out of service maintenance disabled) until it is activated.

For HC-MIM, E5-E1T1 or E5-E1T1-B cards, use this command to associate a signaling link and a timeslot with the E1, T1 or J1 interface that will service the timeslot.

For HC-MIM or E5-E1T1-B cards used for SE-HSL links, use this command to assign links A and B on any 2 of the 8 HC-MIM/E5-E1T1-B card ports. For E5-E1T1 cards used for SE-HSL links, use this command to assign link A on any 1 of the 8 card ports.

Up to 64 signaling links can be assigned to one HC-MIM/E5-E1T1-B card, allowing links A, A1 - A31, B, and B1 - B31 to be provisioned. Up to 32 signaling links can be assigned to one E5-E1T1 card, allowing links A, A1 - A15, B, and B1 - B15 to be provisioned.

One signaling link can be assigned to a LIMATM or E1-ATM card, allowing link A to be provisioned. Up to 3 signaling links can be assigned to an E5-ATM or E5-ATM-B card, allowing links A, A1, and B to be provisioned.

Note: The link parameter has been added as a synonym for the port parameter. Either port or link can be used for a few more EAGLE releases; then the port parameter will be removed.

Parameters

link (mandatory)

The signaling link on the card specified in the loc parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table 54: Summary of Ranges for link Parameter](#) for valid link parameter range values for each type of card that can have a location specified in the loc parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lsn (mandatory)

Linkset name. The linkset name must be unique.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

slc (mandatory)

Signaling link code. The SLC must be unique within the linkset. It must be the same at both the system location and the distant node.

Range:

0 - 15

aname (optional)

Association name. The association assigned to the signaling link added in an IPSP linkset.

Range:

ayyyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

atmtsel (optional)

ATM timing selector. The timing source for the ATM signaling link—internal, line, or external. Internal timing is derived from an internal clock source operating at 1.544 MHz \pm 200 Hz for ANSI links and 2.048 MHz \pm 103 Hz for ITU links. External timing is derived from the High-Speed Master Clock (T1 or E1). Line timing is derived from its received data stream, if present.

**CAUTION**

Caution: The internal timing source is used for debug purposes only, and is not to be used for production operation.

If you are using the 2.048 MHz reference clock as the timing source for E1 signaling links, the `atmtsel=external` parameter must be specified for high-speed ATM signaling links. The `atmtsel` parameter is not valid in the command when the `e1loc` or `e1port` parameter is specified for an E1 signaling link. For information on the E1 interface, see the *Database Administration - SS7 User's Guide*.

Range:

external

internal

line

Default:*line***bps (optional)**

Transmission rate for the link in bits per second.

Note: Links with different speeds can be mixed within a linkset. Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Range:

1536000, 1544000, 1984000, 2048000, 56000, 64000

The value specified for the bps parameter must be supported for the associated card application:

- SS7ANSI—56000 or 64000
- CCS7ITU—56000 or 64000
- ATMANSI—1544000
- SS7ANSI, CCS7ITU (E1 SE-HSL cards)—1984000
- SS7ANSI, CCS7ITU, (T1 SE-HSL-A cards)—1536000
- ATMITU—2048000
- CCS7ITU, (J1 cards) --- 64000

Default:*56000***Default: (For J1 links)***64000***e1atmcr4 (optional)**

CRC4 multi-frame structure enable/disable indicator.

Range:*on**off***Default:***on***e1atmsi (optional)**

Value of two Spare International bits of NFAS data.

Range:*0 - 3***Default:***3***e1atmsn (optional)**

Value of five Spare National bits of NFAS data.

Range:*0 - 31***Default:***0***e1loc (optional)**

Card location of an E1 card with an E1 interface that will service the link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

e1port (optional)

Port for the E1 interface on the E1 card where a signaling link and timeslot or an SE-HSL link is being assigned.

Range:*1 - 8*

Any 2, but no more than 2, of the 8 ports on an HC-MIM/E5-E1T1-B card can be specified when the card is used as an SE-HSL card. Any 1, but no more than 1, of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

Default:*1***ecm (optional)**

Error correction method.

Range:*basic**pcr***Default:***basic***ipliml2 (optional)**

IPLIM level 2 stack.

Range:*m2pa***Default:***m2pa*

j1port (optional)

Port for the J1 interface on the J1 card where a signaling link and timeslot is being assigned.

Range:

1-8

Ports 1 through 8 can be specified for E5-E1T1 or E5-E1T1B cards.

Default:

1

l2tset (optional)

Level 2 timer set

A signaling link can be assigned to any of the thirty-five timer sets.

Range:

1 - 40

1-10 —ANSI low speed links

11-20 —ITU low speed links

21-25 —ITUN China high speed links

26-30 —ITUN Q703.A high speed links

31-35 —Unchannelized T1 high speed links

36 --40---- ITUN16 Japan low speed links

Default:

1 — ANSI low speed links

11 — ITU low speed links

21 — ITUN China high speed links (SE-HSL link in a linkset defined with the apctype=ituchina parameter)

26 — ITUN Q703.A high speed links (SE-HSL link in a linkset defined with the apctype=itun parameter)

31 — Unchannelized T1 high speed links

*36----*ITUN16 Japan low speed links

ll (optional)

ATM line length in feet.

Range:

0 - 7

0 —0-110 feet

1 —110-220 feet

2 —220-330 feet

3 —330-440 feet

- 4 —440-550 feet
- 5 —550-660 feet
- 6 —More than 660 feet
- 7 —Allows use of external line buildout networks

Default:

0

lpset (optional)

Link parameter set identifier

Range:

1 - 30

Default:

1 — ANSI

21 — ITU

pcrn1 (optional)

Threshold of the number of MSUs available for retransmission. If the error correction method being used is PCR and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range:

1 - 1023

low speed E1/T1 links: 1 - 127

unchannelized T1 links: 1 - 1023

Default:

76 — low speed E1/T1 links.

608 — unchannelized T1 links.

pcrn2 (optional)

Threshold of the number of MSU octets available for retransmission. If the error correction method being used is PCR, and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range:

300 - 287744

low speed E1/T1 links: 300 -35500

unchanelized T1 links: 7200 -287744

Default:

3800 — low speed E1/T1 links.

32224 — unchannelized T1 links.

t1loc (optional)

Card location of a T1 card with a T1 interface that will service the signaling link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

t1port (optional)

Port for the T1 interface on the T1 card where a signaling link and timeslot or an ST-HSL-A link is being assigned.

Range:

1 - 8

Any 2, but no more than 2, of the 8 ports on an HC-MIM/E5-E1T1-B card can be specified when the card is used as an ST-HSL-A card.

Any 1, but no more than 1, of the 8 ports on an E5-E1T1 card can be specified when the card is used as an ST-HSL-A card.

Default:

1

ts (optional)

E1 or T1 timeslot for the assigned signaling link.

Range:

1 - 31

E1 range:

1-31

T1 range:

1 - 24

J1 range:

1-24

vci (optional)

Virtual channel identifier.

Range:

5, 32 - 65535

0-4 and 6-31 are reserved values; they cannot be specified in the command.

Default:

5

vpi (optional)

Virtual path identifier.

Range:

0 - 4095

Default:

0

Example

```
ent-slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:bps=64000:ecm=basic
```

```
ent-slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:ecm=pcr:pcrn1=50:pcrn2=4000
```

This example adds signaling link A to linkset LSHCAP:

```
ent-slk:loc=1304:link=a:slc=0:lsn=lshcap:lpset=3:vci=5:vpi=15
```

```
ent-slk:loc=1302:link=a:slc=5:lsn=atm1302a:lpset=3:vci=10:vpi=15:ll=0:atmtsel=external
```

This example adds a link to linkset LS1 at 56 KB:

```
ent-slk:loc=1205:link=a1:slc=0:lsn=ls1
```

This example assigns a timeslot for the signaling link on an E1 card that uses E1 port 1:

```
ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=1
```

This example assigns a timeslot for a signaling link on an E1 card that uses E1 port 2:

```
ent-slk:loc=1205:link=b:slc=0:lsn=e1typ:ts=1:elport=2
```

This example adds a timeslot for a signaling link using E1 port 2 and signaling link B2:

```
ent-slk:loc=1205:link=b2:slc=0:lsn=e1typ:ts=1:elport=2
```

This example adds a timeslot for a signaling link using signaling link A2. The T1 interface defaults to the interface defined for T1 port 1 (t1port parameter not specified)

```
ent-slk:loc=1207:link=a2:slc=0:lsn=t1jwk:bps=64000:ts=1
```

This example adds a timeslot for a signaling link using T1 port 2 and signaling link B2:

```
ent-slk:loc=1207:link=b2:slc=0:lsn=t1typ:ts=1:t1port=2
```

This example adds a signaling link to linkset LS1 at 2048000 bps for an ATM card that will use the CRC4 multi-frame structure:

```
ent-slk:loc=1205:link=a:slc=0:lsn=ls1:bps=2048000:atmsel=line:elatmcr4=on
```

This example adds a link to linkset LS1 at 56 Kbps for a card that is provisioned as an E1 card:

```
ent-slk:loc=1205:link=a31:slc=0:lsn=ls1:elport=4:ts=4
```

This example adds a link to linkset LS2 at 64 Kbps for a card provisioned as a T1 card:

```
ent-slk:loc=1207:link=b27:slc=3:lsn=ls2:t1port=8:ts=6:bps=64000
```

This example adds signaling link B to linkset LSE5ATM on an E5-ATM or E5-ATM-B card:

```
ent-slk:loc=1305:link=b:slc=1:lsn=1se5atm:lpset=3:vci=5:vpi=15
```

This example adds a signaling link to an IPSG linkset for an E5-ENET card running the IPSG application and hosting an association:

```
ent-slk:loc=1204:port=b:lsn=1sipsg:slc=3:aname=assocsg1204
```

This example adds signaling link A1 to linkset L2E5ATM on an E5-ATM or E5-ATM-B card:

```
ent-slk:loc=1303:link=a1:slc=1:lsn=12e5atm:lpset=3:vci=5:vpi=15
```

This example assigns a timeslot for the signaling link on a J1 card that uses the J1 port:

```
ent-slk:lsn=1s2:j1port=2:slc=9:port=a3:loc=1102:ts=5:bps=64000:ecm=basic
```

Dependencies

Card locations 1113 - 1118 cannot be specified.

The ecm=pcr parameter must be specified before the pcrn1 and pcrn2 parameters can be specified for the SS7ANSI and CCS7ITU applications.

The value specified for the bps parameter must be supported for the associated card application.

If the card application is SS7ANSI or CCS7ITU, then a value of 56000 or 64000, respectively, must be specified for the bps parameter. If SE-HSL or ST-HSL-A cards are used, then a value of 1984000 or 1536000, respectively, must be specified for the bps parameter.

The value of the bps parameter must be 56000 if the card type is LIMDS0.

A value of 1544000 must be specified for the bps parameter if the card application is ATMANSI.

A value of 56000 must be specified for the bps parameter if the card is a multi-port LIM.

A value 2048000 must be specified for the bps parameter if the card type is LIME1ATM.

The card application must be ATMANSI before the bps=1544000 parameter can be specified. The card application must be ATMITU before the bps=2048000 parameter can be specified.

A value of 1984000 or 1536000 must be specified for the bps parameter if the card is an HC-MIM, E5-E1T1, E5-E1T1-B card used for SE-HSL or ST-HSL-A links (the linkclass=unchan parameter is specified in the ent-e1 or ent-t1 command) respectively.

The values 0 - 4 and 6 - 31 cannot be specified for the vci parameter; these values are reserved system values.

The linkset type must be valid for the card:

- The linkset adjacent point code (APC) type must be the same as the card application type (ANSI or ITU).
- IPSG-M2PA linksets cannot contain IPGWx and IPSG-M3UA link types. During migration to an IPSG-M2PA linkset, link types other than IPGWx or IPSG-M3UA can be added to the linkset. After the linkset is transitioned to IPSG-M2PA, only IPSG-M2PA and IPLIMx links can be added.
- IPSG-M3UA linksets cannot contain SS7IPGW, IPGWI, and IPGHC link types. After the linkset is transitioned to IPSG-M3UA, only IPSG-M3UA links can be added to the linkset.

The specified linkset name must exist in the database.

The value of the slc parameter cannot be used by more than one link in the linkset.

A card must be equipped in the specified card location.

The card in the specified card location must be a LIM or MIM and must exist.

A link cannot be already assigned to the specified port.

The parameters that are specified for the command must be valid for the type of card in the specified card location.

If a low-speed link is assigned to a card (card application is not ATMANSI or ATMITU), then the ATM high-speed link and E1 ATM parameters (atmtsel, e1atmcr4, etatmsi, e1atmsn, ll, lpset, vci, and vpi) cannot be specified.

If an ATM high-speed link is assigned to a card (card application is ATMANSI), then the low-speed link parameters (ecm, l2tset, pcrn1, and pcrn2) cannot be specified.

If an IP link is assigned to a card (card application is SS7IPGW, IPGWI, IPLIM, or IPLIMI), then the following low-speed link parameters, ATM high-speed link parameters, and E1 ATM high-speed link parameters cannot be specified: lpset, vci, vpi, ll, atmtsel, e1atmcr4, e1atmsi, e1atmsn, ecm, l2tset, pcrn1, and pcrn2.

The value specified for the link parameter must be valid for the specified card type and application:

- A4 - A15 and B4 - B15—card type is LIME1 or LIMT1 for an E5-E1T1/E5-E1T1-B card or for an HC-MIM card used as an E1 or T1 card, and the card application is SS7ANSI or CCS7ITU
- A16 - A31 and B16 - B31 --- card type is LIME1 or LIMT1 for an HC-MIM/E5-E1T1-B card used as an E1 or T1 card, and the card application is SS7ANSI or CCS7ITU. HC-MIM cards cannot be specified for even-numbered card locations. HC-MIM cards are dual-slot cards. For HC-MIM, these links are assigned only to cards in odd-numbered locations.
- A4 - A31 and B4 - B31—cannot be specified for an SE-HSL or an ST-HSL-A card.
- A - A7 and B - B7—E5-ENET, or E5-ENET-B cards running the IPLIM or IPLIMI application
- A - A15 and B - B15—E5-ENET or E5-ENET-B cards running the IPSG application

HIPR2 cards must be in card locations *xy09* and *xy10* on any shelf that contains one or more HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, or E5-ENET-B cards. When links A4 - A31 or B4 - B31 are specified, the system verifies that HIPR2 cards are in card locations *xy09* and *xy10* on the same shelf with the specified HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, or E5-ENET-B card.

If the card application is SS7IPGW or IPGWI, then the link=*a* parameter must be specified.

If an HC-MIM/E5-E1T1-B card is used for SE-HSL or ST-HSL-A links, then only the link=*a* parameter or link=*b* parameter can be specified.

If an E5-E1T1 card is used for SE-HSL or ST-HSL-A links, then only the link=*a* parameter can be specified.

If the specified linkset has a mate linkset, only 1 SS7IPGW or IPGWI signaling link can be assigned to the specified linkset. The assigned link must be an SS7IPGW or IPGWI link.

Up to 8 IPGW \times signaling links can be assigned to one linkset if the linkset is not mated.

The associated location must be empty, or an E5-ATM or E5-ATM-B card must be provisioned in the location before the link=*b* parameter can be specified. Upon initialization, the card is in *boot phase-0* for up to 30 seconds. During this period, the hardware is not detected, which may result in a lack of support for signaling link B.

If an IP link is assigned to a card running the SS7IPGW application, then the lsn parameter must reference a linkset that specifies an IP gateway adjacent point code.

If an IP link is assigned to a card running the IPGWI application, then the `lsn` parameter must reference a linkset that specifies an IP gateway adjacent point code.

If the `multgc=yes` parameter is specified, then all links assigned to the linkset must be of the same type.

If `multgc=yes` parameter is specified, then the card in the specified location must be running the IPGWI, IPLIMI, or IPSP application.

The `ipliml2` parameter can be specified only for IPLIM cards.

Linksets with 14-bit ITU-N and 24-bit ITU-N APCs or SAPCs can contain only IPGWI or IPLIMI M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously.

Linksets containing 24-bit ITU-N APCs or SAPCs cannot contain E1 ATM links. These links do not support 24-bit ITU-N traffic.

A maximum of 1200, 1500, 2000, or 2800 links is allowed in the system. The maximum depends on the enabled Large System # Links quantity (see the `rtrv-ctrl-feat` command output). A FAK is required to enable support for more than 1200 links. A mixture of T1 ATM high-speed, E1 ATM high-speed, SE-HSL, IP, and low-speed signaling links is supported.

HC-MIM, E5-E1T1, or E5-E1T1-B cards cannot be used as or with Channel cards. The `e1loc` and `t1loc` parameters cannot be specified for HC-MIM, E5-E1T1, or E5-E1T1-B cards.

If a card location is specified for a Channel card (card type LIMCH) assigned to an E1 or T1 interface, then the `e1loc` or `t1loc` parameter, respectively, must be specified.

If a card location is specified for an E1, T1, or Channel card (card type LIME1, LIMT1, or LIMCH), then the `ts` parameter must be specified.

A specific timeslot can be assigned in the `ts` parameter to only one E1 signaling link for the E1 interface that services that timeslot.

A specific timeslot can be assigned in the `ts` parameter to only one T1 signaling link for the T1 interface that services that timeslot.

The `ts` parameter value for a T1 link must be in the range 1-24.

The `ts` parameter cannot be specified for HC-MIM, E5-E1T1, or E5-E1T1-B cards that are used for SE-HSL or ST-HSL-A links (the `linkclass=unchan` parameter is specified in the `ent-e1` or `ent-t1` command).

If the E1 interface has CAS multi-framing enabled for an E1 card or a Channel card, timeslot 16 cannot be specified.

If the card is an IPSP card, then the `ipsg=yes` parameter must be specified (see the `ent-ls` command).

If an IPSP linkset and card are used, then the `aname` parameter must be specified.

If the `aname=m3ua` parameter is specified, then a maximum of 16 signaling links can be assigned.

If the `aname=m2pa` parameter is specified, then only one signaling link can be assigned.

The total TPS of all signaling links configured for an IPSP card cannot exceed 5000 TPS for an E5-ENET card. The total TPS of all signaling links configured for an IPSP card cannot exceed 6500 TPS for an E5-ENET-B card when the `type=enetb` parameter is specified (see the `ent-card` command).

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is

turned on, then the sum of the TPS values must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000. The total provisioned system TPS is equal to SIGTRAN TPS + ATM TPS.

The value specified for the `aname` parameter must already exist in the database.

The adapter assigned to the association must be the same as the adapter assigned to the linkset.

The value specified for the `aname` parameter must be associated with the value specified for the `loc` parameter.

Linksets must have same routing context to share an association.

The `aname` parameter can be specified only for IPSPG links.

The `e1loc/t1loc` or the `e1port/t1port/j1port` parameters cannot be specified together in the command.

The specified parameter must be valid for the card type and use:

- `e1port` —HC-MIM, E5-E1T1, or E5-E1T1-B cards used as E1 cards
- `t1port` — HC-MIM, E5-E1T1, or E5-E1T1-B cards used as T1 cards
- `j1port`—E5-E1T1 or E5-E1T1-B cards used as J1 cards
- `e1loc` and `t1loc` —E1/T1 MIM cards used as E1/T1 channel cards
- `ts` —HC-MIM, E5-E1T1, or E5-E1T1-B cards used as E1/T1 cards
- `lsn`, `slc`, `loc`, `port`, `bps`, `lpset`, `atmsel`, `vci`, `vpi`, `e1atmcr4`, `e1atmsi`, and `e1atmsn` —LIM E1 ATM cards. Low-speed link parameters (`ecm`, `l2tset`, `pcrn1`, and `pcrn2`) cannot be specified.
- `e1port` and `l2tset` —HC-MIM, E5-E1T1, or E5-E1T1-B cards used as SE-HSL cards
- `t1port` and `l2tset`—HC-MIM, E5-E1T1, or E5-E1T1-B cards used as ST-HSL-A cards

The E1 interface for the card at the location specified by the `loc` parameter must be defined (see the `ent-e1` command) before a signaling link can be assigned to the port.

If an E1/T1 MIM card is used as an E1 channel card, then the `e1port=1` parameter must be specified.

If an E1/T1 MIM card is used as a T1 channel card, then the `t1port=1` parameter must be specified.

The same value must be specified for the `e1loc` or `t1loc` parameter for all provisioned links on an E1 or T1 channel card, respectively.

The card location specified by the `e1loc` parameter must contain an HC-MIM, E5-E1T1, or E5-E1T1-B card that is used as an E1 card.

The specified card slot must be equipped with the valid card type.

If the value specified for the `loc` parameter indicates a Channel card, then the Channel card must be installed on the same shelf as the E1 card that is specified by the `e1loc` parameter

The E1 interface for the E1 port specified by `e1loc` parameter must already be defined (see the `ent-e1` command) before a signaling link can be assigned to the card.

A channel bridged slave port (see the `chg-e1` or `chg-t1` command) cannot be specified as a value for the `e1port` or `t1port` parameter.

The value specified for the `ts` parameter cannot already be in use by the E1 card.

The T1 interface of the T1 card specified by the `t1loc` parameter must already be defined (see the `ent-t1` command) before a signaling link can be assigned to the card.

If the value specified for the `loc` parameter indicates a Channel card, then the card must be installed on the same shelf as the T1 card that is indicated by the `t1loc` parameter.

The T1 interface for the T1 port specified by `t1loc` parameter must already be defined (see the `ent-t1` command) before a signaling link can be assigned to the card.

All available links on the specified IPLIM card have already been provisioned.

If a multi-port LIM card is used, then the `bps=56000` parameter must be specified.

If the `loc` parameter indicates an ST-HSL-A card, then the `t1port` parameter must be specified.

For provisioning links A16 - A31 and B16 - B31 on HC-MIM card, shelf FAN bit must be turned on for the shelf on which HC-MIM card is provisioned and present.

If the `loc` parameter indicates an SE-HSL card, then the `e1port` parameter must be specified.

If the link is In-Service, then this command cannot be entered.

Links must be available in the linkset that is specified by the `lsn` parameter.

The domain of the linkset specified by the `lsn` parameter must match the domain of the link specified by the `link` parameter.

The link capacity cannot exceed the maximum allowed by the SE-HSL or ST-HSL-A FAK.

The L2 timer range must be valid for the type of signaling link being provisioned as shown:

- ANSI LSL—1 - 10
- ITU LSL—11 - 20
- E1-HSL (China)—21 - 25
- E1-HSL (ITUN)—26 - 30
- T1-HSL-A—31 - 35
- J1 LSL ---- 36-40

The same value cannot be specified for the `aname` parameter for multiple links in the same linkset.

The same value must be specified for the `ecm` parameter for all links in a linkset.

The T1 interface on the card at the location specified by the `loc` parameter must be defined (see the `ent-t1` command) before a signaling link can be assigned to the port.

The N1/N2 thresholds for PCR Error Correction Mode (ECM) specified by the `pcrn1` and `pcrn2` parameters must be within the range specified for the link type. Only low speed E1/T1 (LSL) and Unchannelized T1 links support PCR ECM.

E5-ATM and E5-ATM-B cards must be inhibited before the card can support an A1 link.

If a 3 Links per E5-ATM Card feature quantity is enabled, and an E5-ATM or E5-ATM-B card is used, then the value specified for the `vci` parameter must be less than or equal to 16383.

A 3 Links per E5-ATM Card feature quantity must be enabled before the `link=a1` parameter can be specified for an E5-ATM or E5-ATM-B card.

The maximum number of E5-ATM or E5-ATM-B cards with 3 links cannot exceed the value that is set by the 3 Links per E5-ATM Card quantity feature.

The value specified for the `link` parameter when an ATM card is used must be valid:

- `a`—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- `a-a1, b`—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

The BPS parameter value must be 64000 for J1 links. By default, BPS is 64000 for J1 links.

The Time Slot parameter value must not be greater than 24 for J1 links. The range for the Time Slot is 1 - 24.

The ECM parameter value must be BASIC for J1 links. By default, ECM is BASIC for J1 links.

The J1 table must be accessible.

A specific timeslot can be assigned in the ts parameter to only one J1 signaling link for the J1 interface that services that timeslot.

The value specified for the SLC parameter must be in the range of 0 to 15.

The value specified for TS parameter must be in the range of 0 to 15.

Notes

The ll parameter is not available in the SEAS database.

If a signaling link is assigned to a card that is running the ATMANSI or ATMITU application, and the bps, vci, vpi, e1atmcr4, e1atmsi, e1atmsn, ll, atmset, and lpset parameters are not specified, then the ATM default values are assigned for these parameters.

The MTP Level 2 timers (l2tset parameter) are not valid for IP links or for ATM links.

A link is equipped when it is physically operational, that is, when the hardware is in place that is needed to support the link.

Signaling Links for HC-MIM Cards

An HC-MIM card can be used for E1 card functions or T1 card functions but not both at the same time. E1 cards or T1 cards can coexist in the same EAGLE.

Each signaling link for an E1 card or T1 card must be associated with a timeslot assigned using the ent-slk command. Each signaling link and timeslot assigned for an E1 card or T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the HC-MIM card (see the ent-e1 command or ent-t1 command).

Timeslots and signaling links are defined in this command by a combination of card location (loc parameter), the signaling link that uses the timeslot (A, A1-A31, B, B1-B31), the timeslot number (ts), and the port for the servicing E1 or T1 interface on the E1 or T1 card (e1port or t1port parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each HC-MIM used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on an HC-MIM card can service 1-31 timeslots.

Each HC-MIM used as a T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on an HC-MIM card can service 1-24 timeslots.

Signaling Links for E5-E1T1 Cards

An E5-E1T1 card can be used for E1, T1, or J1 card functions, but only one function per card. E1 cards, T1 cards, and J1 cards can coexist in the same EAGLE.

Each signaling link for an E1, T1, or J1 card must be associated with a timeslot assigned using this command. Each signaling link and timeslot assigned for an E1, T1, or J1 card must be associated with an E1, T1, or J1 interface that has been defined for one of the ports on the card (see the ent-e1 or ent-t1, respectively).

Timeslots and signaling links are defined in the ent-slk command by a combination of card location (loc parameter), the signaling link that uses the timeslot (A, A1-A15, B, B1-B15), the timeslot number (ts), and the port for the servicing E1, T1 or J1 interface on the E1, T1, or J1 card (e1port, t1port, or j1port parameter). Timeslot numbers must be unique to the E1, T1 or J1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1, T1, or J1 interface for more than one signaling link.

Each E5-E1T1 card used as an E1 card can have up to 32 signaling links assigned to the card. Each E1 interface on the card can service 1-31 timeslots.

Each E5-E1T1 card used as a T1 card can have up to 32 signaling links assigned to the card. Each T1 interface on the card can service 1-24 timeslots.

Each E5-E1T1 card used as a J1 card can have up to 32 signaling links assigned to the card. Each J1 interface on the card can service 1-24 timeslots.

Signaling Links for E5-E1T1-B Cards

An E5-E1T1-B card can be used for E1, T1, or J1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE.

Each signaling link for an E1, T1, or J1 card must be associated with a timeslot assigned in this command. Each signaling link and timeslot assigned for an E1, T1, or J1 card must be associated with an E1, T1, or J1 interface that has been defined for one of the ports on the card (see the ent-e1 or ent-t1 command, respectively).

Timeslots and signaling links are defined in the ent-slk command by a combination of card location (loc parameter), the signaling link that uses the timeslot (A, A1-A31, B, B1-B31), the timeslot number (ts), and the port for the servicing E1, T1, or J1 interface on the E1, T1, or J1 card (e1port or t1port parameter). Timeslot numbers must be unique to the E1, T1, or J1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1, T1, or J1 interface for more than one signaling link.

Each E5-E1T1-B card used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on the card can service 1-31 timeslots.

Each E5-E1T1-B card used as a T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on the card can service 1-24 timeslots.

Each E5-E1T1-B card used as a J1 card can have up to 64 signaling links assigned to the card. Each J1 interface on the card can service 1-24 timeslots.

Signaling Links for E5-ATM/E5-ATM-B Cards

An E5-ATM or E5-ATM-B card can support E1 or T1 card functions: however, the card cannot support both functions at the same time. Cards running E1 and T1 functions can coexist in the same EAGLE.

Each E5-ATM or E5-ATM-B card can have up to 3 signaling links assigned to the card. Only the A, A1, or B link can be used. The card must be inhibited, a 3 Links per E5-ATM Card feature quantity must be enabled, and the value specified for the vci parameter must be less than or equal to 16383 before the A1 link can be provisioned.

The A, A1, and B links can be provisioned for a location if a card is not seated in that location. However, if a card other than an E5-ATM or E5-ATM-B card is inserted in this location, then the card is auto-inhibited.

Signaling Links for IPSC Cards

An IPSP card supports both M2PA and M3UA signaling links.

The card supports up to 32 signaling links per card, 16 M3UA links per association, and 32 associations per card.

Multiple M3UA signaling links with routing context (different linksets/AS, up to 16) can use a single association.

Each M3UA AS-ASP instance maps to a signaling link. Signaling link state depends upon AS-ASP state, as well as administrative action.

The IPSP card can share M2PA linksets with IPLIM, IPLIMI, and IPLHC cards, but the card cannot share M3UA linksets with SS7IPGW, IPGWI, and IPGHC cards.

The IPSP card supports ANSI and ITU and ITUN/ITUN24 signaling links simultaneously on one card and on one association. Each signaling link resides in a set of networks determined by the APC and SAPCs of the assigned linkset.

The slktps parameter specified for the IPSP linkset (see the `ent /chg-ls` command) specifies the TPS for each link provisioned for that linkset.

HSL and LSL in same linkset

Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Signaling links and scheduled UI measurement reports

If the Integrated Measurements feature is turned on, then the measurements subsystem automatically disables the scheduled UI measurements reports, including the daily scheduled reports, if the entered link causes the provisioned link count to exceed 700.

ent-spc

Enter Secondary Point Code

Use this command to enter an SPC (secondary point code) into the database.

Parameters

spc (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym:

spca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (mandatory)

Secondary point code.

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

spci (mandatory)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

spcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcf fmt` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000–255

spcn16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna--000---15

mna---000---31

Example

This example adds a secondary point code:

```
ent-spc:spc=10-20-30
```

This example adds a 24-bit ITU-N secondary point code:

```
ent-spc:spcn24=99-99-99
```

This example adds a spare ITU-N secondary point code:

```
ent-spc:spcn=s-12345
```

This example adds a 16-bit ITU-N secondary point code:

```
ent-spc:spcn16=121-5-10
```

Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix s-) can be specified in the command.

The value specified for the spc parameter must be a full point code.

The ANSI point code range requirements have been violated for an ANSISID. For the ANSI secondary point code with subfields *ni-nc-ncm*, the *ni* component cannot equal 000, the *nc* component cannot equal 000 if the *ni* component is 001 - 005

The specified secondary point code to be added must not already exist as a secondary point code.

A maximum of 40 secondary point codes may be defined.

The MPC feature must be turned on before a secondary point code can be added using this command.

The value specified for the spc parameter cannot already exist in the Destination table as a destination point code, true point code, or concerned point code.

The specified secondary point code cannot match an existing true point code or capability point code in the Site Identification table.

The value specified for the spc/spca/spci/spcn/spcn24/spcn16 parameter cannot be the same as any Emulated Point Code value in the PCT table.

The J7 support feature must be enabled before the spcn16 parameter can be specified.

The SPC/SPCA/SPCN24 parameters are not allowed if the J7 support feature is enabled.

Notes

If the spcn parameter is specified, its format must match the format that was assigned with the `chg-stpopts:npcfmti` parameter.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-spc:spc=10-20-30
```

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full

ent-srvsel

Enter Service Selector

Use this command to assign the applicable service selectors required to specify a service entry for DSM services.

Parameters

Note: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

Note: The nature of address indicator parameters (naivornai) and the numbering plan parameters (npvornp) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. [Table 60: NAIV/NAI Mapping](#) shows the mapping between the naiv and naivalues. [Table 61: NPV/NP Mapping](#) shows the mapping between the npv and npvalues.

gti/gtia/gtii/gtin/gtin24 (mandatory)

Global title indicator. For all service selector commands, the domain is defined as GTI and GTIA (ANSI), GTI (ITU international), and GTIN (ITU national). For the service selector commands, GTI and GTIA are equivalent.

Range:

Supported value for ANSI: gti=2 and gtia=2

Supported values for ITU: gtii= 2, 4; gtin=2, 4; gtin24= 2, 4

serv (mandatory)

DSM service.

Note: Thegportservice cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) or the Portability Check for Mobile Originated SMS feature; use thesmsmrservice. Themnpservice includes the G-Port, A-Port, and IS41 GSM Migration services.

Range:

eir

Equipment Identity Register

gflex

GSM flexible numbering

gport

GSM number portability

inpq

INP query

inpmr

INP message relay

smsmr

MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO-based GSM SMS NP, MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migration, Portability Check for MO SMS, Prepaid SMS Intercept Phase 1

idps

IDP Screening for Prepaid

idpr

Prepaid IDP Query Relay

mnp

Mobile Number Portability

vflex

Voice Mail Router

atinp

ATI Number Portability Query (ATINP)

ttr

Triggerless TCAP Relay

aiq

ANSI41 AnalyzedInformation Query

ssn (mandatory)

Subsystem number.

Range:*0 - 255***tt (mandatory)**

Translation type.

Range:*0 - 255***dfltact (optional)**

This parameter specifies the default Action ID associated with the service selector entry.

Range:*ayyyyyyyyy*

1 leading alphabetic followed by up to 8 alphanumeric characters

The dfltact parameter can have one of the following values:

- a GTT Action ID that exists in the GTT Action table and has an associated GTT Action of *disc/udts/tcaperr*
- *fallback* —Fallback to the Relay data. The relayed MSU is routed as per routing data provided by the service.
- *falltogtt* —Fallback to GTT. If the gttselid parameter has a value other than *none* , and the GTT selector search fails, then the GTT selector search is performed again using gttselid=*none* .

Default:*fallback***gttselid (optional)**

The GTT Selector ID used for performing GTT on messages relayed by the service.

Range:*0 - 65534***nai (optional)**

Nature of Address indicator.

Range:*sub**rsvd**natl*

intl

naiv (optional)

Nature of Address indicator value.

Range:

0 - 127

np (optional)

Numbering Plan.

Range:

e164

generic

x121

f69

e210

e212

e214

private

npv (optional)

Numbering Plan value.

Range:

0 - 15

off (optional)

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range:

gttrqd

on (optional)

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range:

gttrqd

rqdtblnop (optional)

The action performed if a message arrives at an SCCP card that does not have the necessary RTDB table, and the current message routing is GT.

Range:*udts*

generate UDTS for the processed MSU

gft

fall through to GFT for the processed MSU

disc

discard the processed MSU

snai (optional)

Service nature of address indicator.

Range:*natl*

National significant number

intl

International number

rnidn

Routing number prefix and international dialed/directory number

rnndn

Routing number prefix and national dialed/directory number

rnsdn

Routing number prefix and subscriber dialed/directory number

ccrndn

Country code, routing number, and national directory number

sub

Subscriber number

snp (optional)

Service numbering plan.

Range:*e164**e212**e214***Example**

ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*

dfltact=act2
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=:rqdtblnop=disc
```

Dependencies

The Service Selector table cannot contain more than 1024 entries.

The G-Flex feature must be turned on before the `serv=gflex` parameter can be specified.

The INP feature must be turned on before the `serv=inpqr` or `serv=inpq` parameter can be specified.

The G-Port feature must be turned on before the `serv=gport` parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the `serv=eir` parameter can be specified.

The `np` and `npv` parameters cannot be specified together in the command.

The `nai` and `naiv` parameters cannot be specified together in the command.

The `gtia=4` parameter cannot be specified.

The values 1 and 3 are not valid for the `gti/gtia/gtii/gtin/gtin24` parameters.

If the `gti/gtia/gtii/gtin/gtin24=2` parameter is specified, then the `np(v)` and `nai(v)` parameter combinations cannot be specified.

If the `gtii/gtin/gtin24=4` parameter is specified, then an `np(v)` and `nai(v)` parameter combination must be specified. The parameters can be specified in the following combinations: `np/naiv`, `npv/nai`, `np/nai`, or `npv/naiv`.

If the `serv` parameter has a value of `inpqr`, `gport` or `eir`, then the `gtia` and `gti` parameters cannot be specified.

If the `serv=inpqr` parameter is specified, then the `snp=e164` parameter must be specified.

If the `serv=inpq` parameter is specified, then the `gtii` parameter cannot be specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the value specified for the `serv` parameter must be `inpqr`, `gport`, or `smsmr`.

If the value specified for the `serv` parameter is `gflex`, `gport`, `inpqr`, or `smsmr`, then the `snai` and `snp` parameters must be specified.

If the value specified for the `serv` parameter is `aiq`, `atinp`, `eir`, `idpr`, `inpq`, `ttr`, or `vflex` then the `snai` and `snp` parameters cannot be specified.

If the `snai=ccrndn` parameter is specified, then the value specified for the `serv` parameter must be `gport` or `smsmr`.

If the value specified for the `serv` parameter is `gport` or `smsmr`, then the `snp=e164` parameter must be specified.

An entry cannot already exist that matches the new `gti/gtii/gtin/gtin24`, `tt`, `ssn`, `np(v)`, and `nai(v)` combination of parameters.

For the specified *gti/gtia/gtii/gtin*, *tt*, *np(v)*, *nai(v)*, and *ssn=** parameters, an entry matching a specific *ssn* cannot already exist.

For the specified *gti/gtia/gtii/gtin*, *tt*, *np(v)*, *nai(v)*, and *ssn* parameters, an entry matching the *ssn=** parameter cannot already exist.

If the *ansigflex STP* option is enabled (see the *chg-stpotps* command), then an ITU service selector cannot be entered.

The IDP Screening for Prepaid feature must be on before the *serv=idps* parameter can be specified.

If the *serv=idps* parameter is specified, then the supported mandatory parameters are *tt*, *serv*, *ssn*, *gtin*, and *gtii*. Supported optional parameters are *np* and *nai*.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the *serv=ttr* parameter can be specified.

If a value of *idpr* or *ttr* is specified for the *serv* parameter, then the only valid mandatory service parameters are *tt*, *serv*, *ssn*, *gtii*, and *gtin*, and the only valid optional parameters are *np* and *nai*.

If the A-Port or IGM feature is enabled, then the *serv=gport* parameter cannot be specified.

An entry cannot already exist that matches the new *gti/gtii/gtin/gtin24*, *tt*, *ssn*, *np(v)*, and *nai(v)* combination of parameters.

An entry cannot already exist that matches the new *gti/gtii/gtin/gtin24*, *tt*, *ssn*, *np(v)*, and *nai(v)* combination of parameters.

An entry cannot already exist that matches the new *gti/gtii/gtin/gtin24*, *tt*, *ssn*, *np(v)*, and *nai(v)* combination of parameters.

The V-Flex feature must be turned on before the *serv=vflex* parameter can be specified.

The ATINP feature must be enabled before the *serv=atinp* parameter can be specified.

The PPSMS or Portability Check for Mobile Originated SMS feature must be turned on, or the MO SMS ASD, MO SMS GRN, MO SMS B-Party Routing, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the *serv=smsmr* parameter can be specified.

If a value of *aiq* or *atinp* or *eir* is specified for the *serv* parameter, then the *gtin24* parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the *serv=idpr* parameter can be specified.

The ANSI41 AIQ feature must be enabled before the *serv=aiq* parameter can be specified.

The A-Port or IGM feature must be turned on, or the A-Port or IGM feature must be enabled and the G-Port feature must be turned on before the *serv=mnp* parameter can be specified.

If a DSM4G card is active in the system, then the *on=gtrqd* parameter cannot be specified.

The *dfltact*, *gttselid*, and *on/off=gtrqd* parameters are supported for only the IDPR, TTR, MNP, GPORT, SMSMR, GFLEX, and INPMR services.

If a GTT Action ID is specified as the value for the *dfltact* parameter, then the Action ID must already exist in the GTT Action table.

A valid value must be specified for the *dfltact* parameter.

The EGTT feature must be turned on before the *gttselid* or *dfltact* parameter can be specified.

The same value cannot be specified for the on and off parameters.

The `dfltact=none` parameter cannot be specified.

The EPAP Data Split feature OR Dual ExAP Config feature must be on before the `rqdtblnop` parameter can be specified.

If a value of `inpq`, `vflex`, `atinp`, or `eir` is specified for the `serv` parameter, then the `rqdtblnop=gtt` parameter cannot be specified.

If a value of `aiq` or `idps` is specified for the `serv` parameter, then the `rqdtblnop` parameter cannot be specified.

The requested service selector entry must exist in the database.

The GSM DBMM table must be accessible.

Notes

on/off options

- `gttrqd` —GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.

Output

```
ent-srvsel:gtia=4:tt=10:ssn=25:snai=natl:serv=aiq
```

```

ent-ss-appl

Enter Subsystem Application

Use this command to reserve a subsystem number for an application and set the application status to be online or offline. One subsystem can be defined per application. The application must be unique.

Parameters

appl (mandatory)

Application type.

Range:

lnp

inp

eir

vflex

atinq

aiq

ssn (mandatory)

Primary subsystem number.

Range:

2 - 255

rqdtblnop (optional)

The action performed if a message arrives at an SCCP card that does not have the necessary RTDB table, and the current message routing is subsystem.

Range:

udts

generate UDTS for the processed MSU

disc

discard the processed MSU

stat (optional)

Status.

Range:

offline

online

Default:

offline

Example

```
ent-ss-appl:appl=lnp:ssn=16:stat=online
```

```
ent-ss-appl:appl=inp:ssn=15:stat=offline:rqdtblnop=disc
```

Dependencies

The LNP feature must be turned on before the appl=lnp parameter can be specified.

The INP feature must be turned on before the appl=inp parameter can be specified.

The EIR feature must be turned on before the appl=eir parameter can be specified.

The value specified for the appl parameter cannot already be assigned.

The maximum number of applications must not already be assigned.

For LNP, the STP true point code and LNP subsystem must exist in the MAP table.

For INP, the STP true point code and INP subsystem must exist in the MAP table.

For EIR, the STP true point code and EIR subsystem must exist in the MAP table.

STP True Point Code must exist in MAP table

If the V-Flex feature is turned on, then the STP true point code and V-Flex subsystem must exist in the MAP table.

The V-Flex feature must be turned on before the appl=vflex parameter can be specified.

The ATINP feature must be enabled before the appl=atinpq parameter can be specified.

For ATINP, the STP true point code and ATINPQ subsystem must exist in the MAP table.

The value specified for the ssn parameter cannot already exist in the SS-APPL table.

The specified MAP table entry for a subsystem number (SSN) value in the SS-APPL table, must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I point code.
- For the EIR subsystem, the True Point code cannot be an ANSI point code.
- For the AIQ, ATINPQ, or VFLEX subsystem, the True Point code can not be an ITU-N24 point code.

The ANSI41 AIQ feature must be enabled before the appl=aiq parameter can be specified.

The STP true point code and a MAP entry for the AIQ subsystem must be provisioned in the MAP table before the appl=aiq parameter can be specified.

The EPAP Data Split feature OR Dual ExAP Config feature must be on before the rqdtblnop parameter can be specified.

If the appl=aiq parameter is specified, then the rqdtblnop parameter cannot be specified.

Notes

If not specified, the application subsystem status defaults to OFFLINE. When the application is OFFLINE, the application subsystem is down.

The LNP application status applies to both message relay and LNP query.

Output

```
ent-ss-appl:appl=aiq:ssn=18:stat=online
```

```
tekelecstp 09-12-03 16:40:40 EST EAGLE 42.0.0
ENT-SS-APPL: MASP A - COMPLTD
```

```
;
```

Related Commands

ent-subnetid

Enter Subnet ID

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (subnetidlen parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

Parameters

subnetid (optional)

Vendor Subnet ID

Range:

1 - 15 digits

Valid digits are 0-9, a-f, A-F.

Note: The number must contain the number of digits defined by the subnetidlen parameter.

subnetidlen (optional)

Subnet ID Length.

Range:

1 - 15

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

subnetnum (optional)

Subnet Number. A reference to the prefix number for the ISUP NP with EPAP feature (see the `chg-prefix` command).

Range:

1

Corresponds to the prefix defined with prefix number 1

2

Corresponds to the prefix defined with prefix number 2

- 3 Corresponds to the prefix defined with prefix number 3
- 4 Corresponds to the prefix defined with prefix number 4
- 5 Corresponds to the prefix defined with prefix number 5

Example

```
ent-subnetid:subnetidlen=6
ent-subnetid:subnetid=886933:subnetnum=1
```

Dependencies

The value *none* cannot be specified for the subnetid parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

All SUBNETID table entries must have the number of digits defined by the subnetidlen parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The subnetidlen parameter cannot be specified in the same command with the subnetid and subnetnum parameters.

Notes

None.

Output

The Subnet ID length must be entered first.

```
ent-subnetid:subnetidlen=6
```

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-SUBNETID: MASP A - COMPLTD
;
```

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

```
ent-subnetid:subnetid=886933:subnetnum=1
```

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 50) 11% full
ENT-SUBNETID: MASP A - COMPLTD
;

dlt-subnetid, *rtrv-subnetid*

ent-t1

Enter T1 Interface

Use this command to enter an interface for an HC-MIM, E5-E1T1, or E5-E1T1-B card used as a T1 or ST-HSL-A card.

T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through.

Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified when the card is used as a standard HC-MIM or E5-E1T1 card, respectively.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

t1port (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

Range:

1 - 8

Any 2 of the 8 ports on an HC-MIM or E5-E1T1-B card can be specified when the card is used as an ST-HSL-A card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an ST-HSL-A card.

chanbrdg (optional)

Port bridging status. This parameter specifies whether an odd-numbered T1 port is channel bridged with its adjacent even-numbered T1 port for non-signaling data pass through.

Range:

on

off

Default:

off

encode (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range:

b8zs

ami

Default:

b8zs

force (optional)

This parameter specifies to provision an odd-numbered T1 port to channel bridging mode if the adjacent next higher even-numbered port is already provisioned with a T1 interface.

Range:

yes

no

framing (optional)

Indicator for framing format. *esfperf* is the framing format with performance monitoring.

Range:

sf, esf, esfperf

Default:

sf

linkclass (optional)

Link class for links assigned to T1 cards (channelized links) or ST-HSL-A cards (unchannelized links).

Range:

chan

unchan

Default:

chan

ll (optional)

T1 cable length in feet between the EAGLE and the connecting node.

Range:

0 - 655

Default:

133

minsurate (optional)

Minimum signal unit rate. The minimum number of SUs present on a link uniformly distributed.

Note: The linkclass=unchan parameter must be specified for an ST-HSL-A card before this parameter can be specified.

Range:

400 - 1600

Default:

1000

t1tsel (optional)

Timing source

Range:

line

slave timing source

external

master timing source

recovered

timing source recovered from the paired master port for channel bridged slave ports

Default:

line

Example

```
ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
```

```
ent-t1:loc=1203:t1port=1:chanbrdg=on:t1tsel=recovered
```

```
ent-t1:loc=1203:t1port=2:linkclass=unchan:minsurate=1200
```

Dependencies

The specified card location (loc parameter) must be equipped.

The card specified by the loc parameter must be a LIMT1 card type.

The port specified by the `t1port` parameter must not be already equipped with a T1 interface.

The `chanbrdg=on` parameter can be specified only for cards that are used as T1 cards. The parameter cannot be specified if the cards are used as ST-HSL-A cards.

The `chanbrdg=on` parameter cannot be specified for even-numbered T1 ports.

The timing source parameter `t1tsel` must be specified if the `chanbrdg=on` parameter is specified.

The `t1tsel=line` parameter cannot be specified if the `chanbrdg=on` parameter is specified.

The `chanbrdg=on` parameter must be specified before the `t1tsel=recovered` parameter can be specified.

When provisioning an odd-numbered T1 port to channel bridging mode using the `chanbrdg=on` parameter, the `force=yes` parameter must be specified if the adjacent even-numbered port is already provisioned with a T1 interface.

Before the `chanbrdg=on` parameter can be specified for an odd-numbered T1 port, all signaling links assigned to the adjacent even-numbered T1 port must be deleted.

The shelf FAN bit must be turned ON for the shelf on which an HC-MIM card is being used as a T1 or ST-HSL-A card.

HIPR2 cards must be equipped in card locations $xy09$ and $xy10$ (x is the frame, y is the shelf) on each EAGLE shelf that contains one or more HC-MIM or E5-E1T1/E5-E1T1-B cards that are used as T1 cards or ST-HSL-A cards.

T1 ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

Card locations 1113 - 1118 (E5-MASP and E5-MDAL cards) cannot be specified as values for the `loc` parameter.

If the `linkclass=unchan` parameter is specified, then the `chanbrdg=on` parameter cannot be specified.

The `linkclass=unchan` parameter must be specified before the `minsurate` parameter can be specified.

An ST-HSL-A feature quantity must be enabled before the `linkclass=unchan` parameter can be specified for an ST-HSL-A card.

The `linkclass=unchan` parameter can be specified only for HC-MIM and E5-E1T1 cards.

Channelized and unchannelized T1 ports (mixed mode) cannot be specified on a single card (the card cannot be used as a T1 card and an ST-HSL-A card at the same time).

Only 2 of the 8 ports can be used for T1 interfaces on an HC-MIM or E5-E1T1-B card that is used as an ST-HSL-A card.

Only 1 of the 8 ports can be used for T1 interfaces on an E5-E1T1 card that is used as an ST-HSL-A card.

The ST-HSL-A feature must be turned on before the `framing=esfperf` parameter can be specified.

Notes

One or two T1 interfaces must be defined on a T1 card after the T1 card type (LIMT1) is defined in the database, and before the signaling links and associated timeslots are defined for the T1 card.

External timing is derived from the EAGLE High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1): therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an HC-MIM or E5-E1T1/E5-E1T1-B card used as a T1 card after the T1 card type (LIMT1) is defined in the database, and before the signaling links and associated timeslots are defined for the T1 card.

On an HC-MIM or E5-E1T1/E5-E1T1-B card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The `chanbrdg=on` parameter must be specified for the odd-numbered T1 port.

For an ST-HSL-A card, the `minsurate` parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is the `minsurate` parameter value (without link traffic) and the `minsurate` parameter value minus the number of MSUs (with link traffic).

Output

```
ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
```

```

;
```

Related Commands

[chg-t1](#), [dlt-t1](#), [rtrv-t1](#), [tst-t1](#)

ent-tt

Enter Translation Type

Use this command to add a translation type to the system database.

Note: If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrv-gttsel`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrv-gta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

type/typea/typeei/typen/typen24/typeis/typens (mandatory)

The translation type and network type. This value is the decimal representation of the 1-byte field used in SS7.

The `type` and `typea` parameters specify an ANSI network.

The `typeei` parameter specifies an ITU-international network.

The `typen` parameter specifies an ITU-national network.

The `typen24` parameter specifies a 24-bit ITU-national network.

The `typeis` parameter specifies an ITU-international spare network.

The `typens` parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (`type/typea`) and as an ITU type (`typeei/typen/typen24/typeis/typens`). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

000 - 255

Default:

No translation type is specified

alias (optional)

The alias of the global title translation type

Range:

000 - 255

Default:

No alias assignment is made.

ndgt (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

Range:

1 - 21

Default:

6 (not applicable if the VGTT feature is on)

ttn (optional)

Translation type name.

Range:

ayyyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

"set" + "ans"|"int"|"nat"|"24n"|"ins"|"nas" + 3-digit TT value

Example

```
ent-tt:type=230:ttn=lidb:ndgt=5
```

```
ent-tt:type=230:ttn=lidb:alias=007
```

```
ent-tt:type=2:ndgt=5
```

```
ent-tt:type=3
```

```
ent-tt:typens=2
```

```
ent-tt:typeis=1:ttn=setitu001
```

Dependencies

The translation type specified by `type/typea/typei/typen/typen24/typeis/typens` cannot already exist in the database containing the ANSI and ITU types.

The `alias` and `ndgt` parameters cannot be specified together in the command.

The translation type name must be unique.

The `ndgt` parameter is not valid if the VGTT (variable length GTT) feature is turned on.

The value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter cannot be an alias value.

The value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter must already exist in the database for the network type.

The value specified for the `ttn` parameter must already exist in the database.

The values specified for the `type/typea/typei/typen/typen24/typeis/typens` and `ttn` parameters must refer to the same entity.

The value specified for the `alias` parameter must be associated with the specified translation type and cannot be the value of an existing translation type.

The value specified for the `alias` parameter cannot be an existing alias value for the specified network type.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command) when entering an alias entry for that `ttn`.

The `ttn=none` parameter cannot be specified.

Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The `ttn` parameter always refers to a translation type. Aliases do not have translation type names.

If the OBSR or FLOBR feature is turned on, then the `ent-tt` command can be used to provision only CdGTA GTT sets and GTT selectors. NP and NAI values cannot be specified for GTT selectors using the `ent-tt` command as `gtii=4` entries cannot be provisioned with this command.

If the EGTT feature is on, then the following occurs for this command:

- For ANSI, if the GTT selector of a true entry is deleted using the `dlt-gttset` command, a new entry using the same TTN cannot be created. If the true selector is deleted for an entry using the `dlt-gttset` command, then its aliases cannot be entered.
- For ITU, if a true GTT selector entry (GTI=2 or GTI=4) is deleted using the `dlt-gttset` command, or if the GTT set name of an entry is changed using the `chg-gttset` command, then a new entry for the same TTN cannot be created. If a true GTT selector entry is deleted using the `dlt-gttset` command, or if the GTT set name of an entry is changed using the `chg-gttset` command, then its aliases cannot be created.

Output

```
ent-tt:typeeis=1:ttn=setitu001
```

```
tekelecstp 10-04-28 16:45:34 EST Eagle 42.0.0
ENT-TT: MASP A - COMPLTD
;
```

Related Commands

ent-ttmap

Enter Translation Type Mapping

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

Parameters

ett (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range:

000 - 255

io (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range:

i

incoming

o

outgoing

lsn (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range:

ayyyyyyyyy

1 alphabetic character followed by 9 alphanumeric characters

mtt (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message after translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range:

000 - 255

Example

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

Dependencies

The linkset must be defined.

The Translation Type Mapping table must not be full for the linkset specified in the lsn parameter.

Notes

None

Output

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

```
rlghncxa03w 04-02-21 13:09:27 EST EAGLE 31.3.0

ent-user**Enter User**

Use this command to add a user to the database. When you first enter the command, the system prompts you for the user's password, which must follow the administered password guidelines. For security reasons, the password is not displayed. After successfully entering a user password, you are prompted to verify it by entering it again.

Parameters

Note: All *cc(X)* parameters consist of a configurable command class name (*ayy*), and indicator (*-yes* or *-no*) to specify whether the command class is allowed. A value of *ayy-yes* indicates that the value is allowed. A value of *ayy-no* indicates that the value is not allowed.

uid (mandatory)

User ID

Range:

azzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters (including asterisks, single quotes, and commas)

all (optional)

This parameter specifies whether the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP).

Range:

yes

no

Default:

no

cc1 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is not allowed

cc2 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is not allowed

cc3 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is allowed

cc4 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is allowed

cc5 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is allowed

cc6 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is allowed

cc7 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is allowed

cc8 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed.

yes —the command class is allowed

db (optional)

Access to all commands in command class Database Administration.

Range:

yes

no

Default:

no

dbg (optional)

Access to all commands in command class Debug.

Range:

yes

no

Default:

no

link (optional)

Access to all commands in command class Link Maintenance.

Range:

yes

no

Default:

no

page (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for this parameter.

Range:

0-999

Default:

The value specified for the page parameter in the `chg-secu-dflt` command

pu (optional)

Access to all commands in command class Program Update.

Range:

yes

no

Default:

no

revoke (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range:

yes

no

Default:

no

sa (optional)

Access to all commands in command class Security Administration.

Range:

yes

no

Default:

no

sys (optional)

Access to all commands in command class System Maintenance.

Range:*yes**no***Default:***no***uout (optional)**

User ID aging interval. The number of successive days a user ID can go unused (no successful login) before the system denies login of that user ID.

Range:*0 - 999***Default:**

The value specified for the uout parameter in the `chg-secu-dflt` command

Example

```
ent-user:uid=john:db=yes
```

```
ent-user:uid=john*mayer:db=yes
```

```
ent-user:uid=user123:cc5=u21=yes:cc8=u32=yes
```

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

The specified user ID cannot already exist.

The user IDs *seas* or *none* cannot be entered because they are reserved for system use. Up to 100 users can be entered.

The `revoke=yes` parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the `cc1-cc8` parameters.

The `cc1-cc8` parameter values must have valid default or provisioned configurable command class names. Default names are *u01-u32*.

Notes

To disable user ID aging, specify the `uout=0` parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all

32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the `minlen` parameter of the `chg-secu-dflt` command.
- A new password must contain at least the number of alphabetic (`alpha` parameter), numeric (`num` parameter), and punctuation (`punc` parameter) characters that is specified in the `chg-secu-dflt` command.
- A new password cannot contain the associated user ID.

As a default, the command class Basic is assigned to all users. If no other command class is assigned, the user still has access to commands in the Basic class.

Output

```
ent-user:uid=john*mayer:db=yes
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0

ent-vendid

Enter Vendor ID

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (`vendidlen` parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

Parameters

vendid (optional)

Vendor ID

Range:

1 - 15 digits

vendidlen (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

Range:

1 - 15

vendnum (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

Note: The prefix values in the range are defined in the `chg-prefix` command.

Range:

1 - 32

1

Corresponds to the prefix defined with prefix number 1

2

Corresponds to the prefix defined with prefix number 2

..

..

32

Corresponds to the prefix defined with prefix number 32

vendtype (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

Range:

1 - 32

Example

```
ent-vendidvend:len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

```
ent-vendid:vendid=886939:vendnum=5:vendtype=9
```

Dependencies

The `vendid=none` parameter cannot be specified.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 500 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the vendidlen parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The vendidlen parameter cannot be specified in the same command with the vendid, vendidlen, and vendtype parameters. Either the vendidlen parameter, or the vendid, vendidlen, and vendtype parameters can be specified in the command.

Notes

None.

Output

```
ent-vendid:vendidlen=6

Enter VFLEX Call Decision Entry

Use this command to provision the call decision criteria that is used to create a voice mail routing number. This command creates a new entry in the V-Flex Call Decision Table. The V-Flex feature must be enabled before this command can be entered.

Parameters

bcap (mandatory)

The INAP/CAP bearer capabilities for the call.

The INAP/CAP bearer capabilities are used to determine the type of mail that is used by the call, such as voice, video, multimedia, etc.

Range:

0 - 31, none

none —BCAP is not present in the incoming MSU.

cdn (mandatory)

Call decision name. This parameter specifies an entry in the call decision table.

Range:

ayyy

1 alphabetic character followed by 3 alphanumeric characters

dnstat (mandatory)

Dialed number status. This parameter specifies whether the MSISDN is found in the EPAP RTDB.

Range:

fnd

DN found in RTDB

nfd

DN not found in RTDB

It does not matter whether the DN is found in RTDB

rnidx (mandatory)

Routing number index. The index associated with the generated voice mail routing number.

Range:

0 - 9

vmdig (mandatory)

Voice mail number or voice mail prefix digits. A voice mail number or voice mail digits for the call decision entry.

Note: If the call is redirected (the *rdi=redir* parameter is specified), then the value specified for the *vmdig* parameter represents a voice mail number. If the call is not redirected (the *rdi=dir* parameter is specified), then the value specified for the *vmdig* parameter represents a set of voice mail digits.

Range:

1 - 15

Valid digits are 0-9, A-F, a-f

rdi (optional)

Redirection indicator. This parameter specifies whether the call is redirected.

Range:

dir

call is not redirected

redir

call is redirected

Default:

dir

Example

```
ent-vflx-cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the *cdn* parameter cannot be a reserved word, such as *none*.

The value specified for the *cdn* parameter cannot already exist in the Call Decision table.

An entry with the specified *dnstat*, *rdi*, *bcap*, and *vmdig* parameters cannot already exist in the Call Decision table.

The value specified for the *vmdig* parameter cannot differ from a value that already exists in the Call Decision table by only the value of the *dnstat* parameter. The values specified for the *rdi* and *bcap* parameters must differ as well.

The maximum number of 25 entries cannot already be provisioned for a given *rdi*, *dnstat*, and *bcap*.

Output

```
ent-vflx-cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1

Enter VFLEX Routing Number

Use this command to associate a routing number name to a set of voice mail routing numbers. This command creates an entry in the Routing Number table. The V-Flex feature must be enabled before this command can be entered.

Parameters

rn (mandatory)

Routing number. The voice mail routing number.

Range:

1 - 15 digits. Valid digits are 0-9, A-F, a-f.

rname (mandatory)

Routing number name. The name associated with the voice mail routing number.

Range:

ayyyyyyy

1 alphabetic character followed by 7 alphanumeric characters

Example

```
ent-vflx-rn:rname=rn01:rn=123ABCDF012
```

Dependencies

The V-Flex feature must be enabled before this command can be specified.

The Routing Number table cannot contain more than 10,000 entries.

The value specified for the rname parameter cannot already exist in the database.

The value specified for the rn parameter cannot already exist in the database.

The value specified for the rname parameter cannot be a reserved word, such as *none*.

Output

```
ent-vflx-rn:rname=rn01:rn=1234ABCDF56
```

ent-vflx-vmsid

Enter VFLEX VMS ID Entry

Use this command to provision a voice mail server ID and associate up to 10 routing number names with the ID. This command creates an entry in the VMSID table. The V-Flex feature must be enabled before this command can be entered.

Parameters

id (mandatory)

The ID of the voice mail server.

Range:

1 - 15 digits, *dflt*

Valid digits are 0-9, A-F, a-f

dflt—a set of routing numbers used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB

idx0 (optional)

Index 0. The routing number name for index 0.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx1 (optional)

Index 1. The routing number name for index 1.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx2 (optional)

Index 2. The routing number name for index 2.

Range:

ayyyyyyy

1 alphabetic character followed by upto 7 alphanumeric characters

idx3 (optional)

Index 3. The routing number name for index 3.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx4 (optional)

Index 4. The routing number name for index 4.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx5 (optional)

Index 5. The routing number name for index 5.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx6 (optional)

Index 6. The routing number name for index 6.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx7 (optional)

Index 7. The routing number name for index 7.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx8 (optional)

Index 8. The routing number name for index 8.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx9 (optional)

Index 9. The routing number name for index 9.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Example

This example provisions a VMS ID and associates a routing number name with index 0:

```
ent-vflx-vmsid:id=123456abcdef123:idx0=RN45
```

This example provisions a VMS ID and associates routing number names with index 0 and index 5:

```
ent-vflx-vmsid:id=DADBEEFEED:idx0=rn15:idx5=rn30
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The values specified for the `idx*` parameters must already exist in the Routing Number table.

The value specified for the `id` parameter cannot already exist in the VMSID table.

The `idx*=none` parameter cannot be specified.

The VMSID table contains a maximum of 1000 entries.

The value specified for the `rname` parameter must already exist in the Routing Number table.

Output

```
ent-vflx-vmsid:id=123456abcdef123:idx0=rn45
```

```

flash-card

Flash-Card

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the `init-flash` and the `act-flash` commands.

Parameters

code (mandatory)

The GPL type to be loaded.

Range:

appr

Approved GPL

trial

Trial GPL

loc (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 -
3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108,
4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 -
5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

force (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

Range:

yes

no

Default:

no

Example

```
flash-card:loc=1105:code=trial
```

```
flash-card:loc=1105:code=appr:force=yes
```

Dependencies

Cards do not have to be provisioned to use the `flash-card` command. However, if the specified card is provisioned and not inhibited, use of the `force` parameter is required.

The specified card locations must be running a flashable software image.

This command cannot be used to load flash images for MUX cards. Use the `init-flash` command.

If the even-numbered E5-TDM (1114,1116) is specified, the flash occurs on the odd-numbered E5-MCAP running OAM (1113,1115).

The specified card location cannot be the active E5-MASP (either the active E5-MCAP or the active E5-TDM).

No other action command can be in progress when this command is entered.

The card specified in the location parameter must be present and able to communicate over the IMT. The card does not have to be provisioned in the database.

If the card is already running the specified code load, it cannot be loaded by this command.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the force parameter. The act-flash and init-flash commands must then be used to reload the same code level.

Output

```
flash-card:loc=1105:code=appr:force=yes
```

```

Related Commands

act-flash, *init-flash*

format-disk

Format Disk

Use this command to format and initialize a removable cartridge, removable drive, or standby Terminal Disk Module (TDM).

Note: The `format-disk` command leaves the disk unusable until the `chg-dbandcopy-gpl` commands are entered.

Parameters

type (mandatory)

The type of drive to format.

Range:

fixed

The standby fixed disk on the standby TDM

meas

The measurement cartridge

system

The removable system cartridge or drive

usb

Argument to be used by Tekelec personnel only.

force (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

Range:

yes

no

Default:

no

loc (optional)

The location of the disk that is being formatted.

Range:

1114

The TDM

1116

The TDM

1117

The removable cartridge drive

1113

The latched USB port

1115

The latched USB port

low (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying `low=no` can be used to decrease formatting time.

Range:

yes

no

Default:

yes

prtngrp (optional)

Partition group. The disk partition group to be formatted. Specifying the inactive group is relevant only when `type=fixed` is specified.

Caution: Do not enter `theformat-disk:prtngrp=inactive` unless directed to by the Customer Care Center to avoid possible loss of a previously archived software release.

Range:

active

inactive

Default:

active

Example

```
format-disk:type=system
```

```
format-disk:type=meas:force=yes
```

Dependencies

The `type=fixed` parameter must be specified before the `prtnggrp` parameter can be specified.

If the `prtnggrp` parameter is specified, then the `low=no` parameter must be specified.

Measurements collection must be inhibited during execution of this command. If measurements are not inhibited, this command cannot be executed.

- Do not enter the `chg-measopts : collect=on` command while the `format-disk` command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter the `format-disk` command until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

If a removable USB drive that is inserted into the flush-mount USB port contains Eagle data, then the `force=yes` parameter is required.

If a removable USB that is inserted into the faceplate-mounted USB port contains Eagle data, then the `force=yes` parameter is required.

If the medium that is being formatted contains system data, then the `force=yes` parameter is required.

The `force=yes` parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have `adms.cfg` file are recognized as system removable cartridges.

A removable cartridge must be inserted and made ready before the `type=meas` or `type=system` parameter can be specified in the command.

If the `force=yes` parameter is specified, the disk should not require low-level formatting, and the `format=no` parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

OAM Measurements collection cannot be in progress when this command is entered.

If the `type=usb` parameter is specified, then a credit card drive must be present in the active MASP.

A value of 1114 or 1116 must be specified for the `loc` parameter before the `type=fixed` parameter can be specified.

An E5-MCAP card must be installed before the `type=usb` parameter can be specified.

The OAM card must be able to read the media being formatted.

Notes

The `low=no` parameter should be specified when upgrading a spare TDM. The `low=yes` parameter should be specified when there is a suspected hardware problem.

When the `type=meas` parameter is specified, a measurements removable cartridge or removable drive is built.

When the `type=system` parameter is specified, a system removable cartridge, removable drive, or credit card drive is built.

A system removable cartridge or drive can contain only GPLs and the database, not measurement data. After formatting, the cartridge or drive does not contain any data, but can be used as the destination disk of the `copy-gpl` and `chg-db:action=backup:dest=remove` commands. The `copy-gpl` command copies all approved GPLs from the fixed disk on the active TDM to the system removable cartridge or drive, providing a backup copy of the approved GPLs. The `chg-db:action=backup:dest=remove` command copies the database from the current partition of the fixed disk on the active TDM to a system removable cartridge or drive, providing a backup copy of the database.

A measurements removable cartridge or drive can contain only measurement data, not database information and GPLs. After formatting, the cartridge or drive does not contain any data, but can be used as the destination disk of the `copy-meas` command. The `copy-meas` command copies all measurement data from the fixed disk on the active TDM to a measurements removable cartridge or drive for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the `format-disk` command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous `format-disk` or `copy-disk` failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
```

```
Standby MASP initialization timed out - continuing...
```

The `dms.cfg` file on either the active TDM or a system formatted removable cartridge is used by the `format-disk` command when formatting the target disk. The location of the `dms.cfg` file cannot be specified by the `format-disk` command. The value of the type parameter is used to determine the target disk to format and the location of the `dms.cfg` file on which to base the format. [Table 34: DMS.CFG File Location for format-disk Command](#) shows the location of the `dms.cfg` file based on the value of the type parameter for the `format-disk` command.

Table 34: DMS.CFG File Location for format-disk Command

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
<i>fixed</i>	Standby TDM (1114 or 1116)	Removable Cartridge Drive (1117) Latched USB Port (1113 or 1115)

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
<i>system</i>	Removable Cartridge Drive (1117) Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)
<i>meas</i>	Removable Cartridge Drive (1117)Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)

The `format-disk` command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

[Table 35: Disk Format Capacity](#) shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

Table 35: Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of Partition
Latched USB Port	1113 or 1115	2 Gigabytes	1	1.9 GB
TDM	1114 or 1116	540 Mbytes	1	507 Mbytes
TDM	1114 or 1116	2 Gigabytes	1	2014 Mbytes
TDM	1114 or 1116	4 Gigabytes	2	2047 Mbytes

Output

```
format-disk:type=system
```

```

inh-alm

Inhibit Alarm Reporting

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All `rept-stat-xxx` commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dev (mandatory)

Device. The device where the reporting of alarms is to be inhibited.

Range:

applsock

IP gateway application socket

as

IP gateway application Application Server

tps

TPS subsystem

asname (optional)

Gateway Application Server name. Used with the dev=as parameter to inhibit alarms for the named Application Server.

Range:*ayyyyyyyyyyyyyyy*

up to 15 alphanumeric characters; the first character must be a letter

cic (optional)

Starting Circuit Identification Code. Used with the ecic parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

Range:*0 - 16383*

dpc (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24 /dpcn16 (optional)

Destination Point Code

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p*-, *ps*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code.

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

dur (optional)

Duration. The period for which the alarms are inhibited.

Range:

perm

permanent inhibition of an alarm

temp

temporary inhibition of an alarm

timed

inhibition of an alarm for a specified duration

Note: If the *dur=temp* parameter is specified, then an alarm inhibit lasts as long as the alarm is present. If the system boots or switches over, then the alarm inhibit is removed. If the *dur=perm* parameter is specified, then the alarm inhibit remains after the alarm is cleared or is no longer present, and after a boot/switchover. The *dur=timed* parameter behaves the same as the *dur=perm* parameter, but for a set time period.

Default:

perm

e1port (optional)

Port ID. The E1 port on the specified E1 card.

This parameter is mandatory if the *dev=e1port* parameter is specified.

Range:

1 - 8

ecic (optional)

Ending Circuit Identification Code. Used with the *cic* parameter to define the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

edate (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the *etime* parameter value.

Note: This parameter is valid and required when the *dur=timed* parameter is specified.

Range:

101 - 991231

Specify the date in the format of *year*, followed by *month*, followed by *day(yymmdd)*.

etime (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the *edate* parameter value.

This parameter is valid and required when the *dur=timed* parameter is specified.

Range:

0 - 2359

Specify the time in the format of *hour* followed by *minute(hhmm)*.

force (optional)

Allows critical alarms to be inhibited on a device.

This parameter is mandatory if the `lvl=crit` parameter is specified.

The `criticalminh STP` option must be turned on before this parameter can be specified.

Range:

yes

no

Default:

no

id (optional)

Identification number of the customer-defined trouble. Customer-defined troubles 1 - 4 are generated critical alarms and cannot be specified as values for this parameter.

Range:

5 - 16

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

link (optional)

Signaling link on the card specified in the `loc` parameter.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

a, b — `dev=dlk, dev=slk` for a two-port LIM

a1, a2, b1, b2 — `dev=lsmconn`

a, b, a1, b1, a2, b2, a3, b3 — `dev=slk` for a multi-port LIM

a, b, a1-a31, b1-b31 — `dev=slk` for an HC-MIM, E5-E1T1, or E5-E1T1-B

a1, b1 — `dev=dlk` for an FC-capable card

a, b — `dev=enet`

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318,
3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101
- 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

lvl (optional)

The alarm severity level (critical, major, or minor).

Range:

crit

majr

minr

Default:

majr

opc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Origination point code.

opci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

opcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

opcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p-- , 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

si (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range:

0 - 15

sname (optional)

Gateway application socket. Used with the `dev=applsock` parameter to inhibit alarms for the named application socket.

Range:

aaaaaaaaaaaaaaaa

1 to 15 alphanumeric characters

t1port (optional)

Port ID. This parameter is mandatory if the `dev=t1port` parameter is specified.

Range:

1 - 8

trm (optional)

Terminal ID. The ID number of the terminal whose characteristics are to be retrieved and displayed.

Range:

1 - 40

Example

```
inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes
```

```
inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4
```

```
inh-alm:dev=route:dpc=1-1-1:dur=timed:lvl=crit:edate=050515:etime=2300:force=yes
```

```
inh-alm:dev=enet:loc=1201:port=a
```

```
inh-alm:dev=enet:loc=1101:port=a:dur=temp:lvl=minr
inh-alm:loc=1102:dev=dlk:port=a1
inh-alm:dev=rtx:dpcn16=121-10-15:opcn16=121-10-16
```

Dependencies

This command is not allowed in upgrade mode.

The parameters that can be specified with the dev parameter vary, depending on the value specified for the dev parameter as shown:

- dev=(any value) — dur or lvl
- dev=asname — as
- dev=dpc/dpca/dpci/dpcn/dpcn24/dpcn16 — route
- dev=id — cdt
- dev=loc — card, dlk, e1port, slk, t1port, enet
- dev=lsn — ls
- dev=e1port — e1port
- dev=link (link=a, b)— dlk, slk, enet
- dev=link (link=a1, b1)— dlk (For FC-capable cards)
- dev=link (link=a, b, a1, a2, b1, b2, a3, b3)— slk
- dev=link (link=a1, a2, b1, b2)— lsmsconn
- dev=sname — applsock
- dev=t1port — t1port
- dev=trm — trm

No other action command can be in progress when this command is entered.

The linkset specified by the lsn parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option critalminh must be enabled. The `chg-stpopts:critalminh=yes` command enables this option.

Alarms already inhibited for the specified device.

If the lvl=crit parameter is specified, the force=yes parameter must be specified.

When the dev=card parameter is specified, the loc parameter must be specified.

When the dev=dlk parameter is specified, the loc parameter must be specified.

When the dev=slk parameter is specified, the loc parameter and the link parameter must be specified.

When the dev=e1port parameter is specified, the loc and e1port parameters must be specified.

When the dev=t1port parameter is specified, the loc and t1port parameter must be specified.

When the dev=ls parameter is specified, the lsn parameter must be specified.

When the dev=trm parameter is specified, the trm parameter must be specified.

When the dev=cdt parameter is specified, the id parameter must be specified.

When the dev=lsmsconn parameter is specified, the link parameter must be specified.

When the dev=route parameter is specified, the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must be specified.

When the dev=applsock parameter is specified, the sname parameter must be specified.

If the dev=as parameter is specified, the asname parameter must be specified.

If the sname parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the dev=slk or dev=dlk parameter is specified, the specified link must exist in the database.

The card location that is specified in the loc parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the dev=rtx parameter can be specified.

Permanent alarm inhibit is not allowed on the cluster PC because either the cluster or a member PC of the cluster is already alarm inhibited.

When the dur=timed parameter is specified, the edate and etime parameters must be specified.

If the dur parameter has a value other than *timed*, the edate and etime parameters cannot be specified.

The edate parameter value must be a date equal to or later than the current system date. If the current system date is specified, then the etime parameter value must be a time later than the current system time. If a date later than the current system date is specified, then the etime parameter value can be any valid time in the format *hhmm*.

This command cannot be used to change the level of inhibition on a device.

If the dev=enet parameter is specified, then the loc and port parameters must be specified.

The card specified by the loc parameter must be provisioned with an IPS, MCP, STPLAN, EROUTE, VSCCP, IPSP, IPLIM, IPLIMI, SS7IPGW, or IPGWI application.

The value specified for the port parameter is out of range.

The link parameter must be valid for the selected device type.

The J7 support feature must be enabled before the opcn16 / dpcn16 parameters can be specified.

Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The dur parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

[rept-stat-alm](#), [rept-stat-card](#), [rept-stat-cdt](#), [rept-stat-dlk](#), [rept-stat-dstn](#), [rept-stat-ls](#), [rept-stat-rte](#), [rept-stat-rtx](#), [rept-stat-seas](#), [rept-stat-slk](#), [rept-stat-sys](#), [rept-stat-trbl](#), [rept-stat-trm](#), [rtrv-log](#), [unhb-alm](#)

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the card or physically remove it from the shelf.

Parameters

loc (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

force (optional)

Force indicator. This parameter is required if:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-DSM connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified HC-MIM or E5-E1T1 card is in channel bridging mode
- The specified card has the last in-service SEAS terminal configured.

Range:

yes

no

Default:

no

Example

```
inh-card:loc=1101
```

```
inh-card:loc=1201:force=yes
```

Dependencies

No other action commands can be in progress when this command is entered.

TDM and MDAL cards cannot be inhibited. E5APPB cards and Telco Switches cannot be inhibited. Card locations 1114, 1116, 1117, xx09, and xx10 cannot be specified as values for the loc parameter.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type LIME1, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless `force=yes` is specified.

If the card is type LIMT1, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless `force=yes` is specified.

The shelf and card must be equipped.

If the specified card is the only in-service MPS-DSM, the `force=yes` parameter must be specified.

The `force=yes` parameter must be specified if:

- the specified card is the only in-service E5-TSM, LIM, or MCPM card
- the specified HC-MIM or E5-E1T1 card is in channel bridging mode
- the card is the only linkset, SCCP or Service Module card remaining

If inhibiting the Service Module card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the `force=yes` parameter must be specified.

If the Integrated GLS feature is turned OFF and the specified card is only GLS card remaining, then the `force=yes` parameter is required.

The card that is specified cannot be running the active OAM.

If the specified card has the last in-service SEAS Terminal configured, then the `force=yes` parameter must be specified to inhibit the card.

The card location (`loc`) must be within the allowed range.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

Notes

The function of this command is the same as the `rmv-card` command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

Caution: This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the `chg-measopts:platformenable=on` command. To disable collection, ALL MCPM cards in the system must be inhibited. THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS. Use the `alw-card` command to enable measurements collection after the MCPM cards have been inhibited.

When an IPSM card is inhibited, the active SEAS terminals are set to the state OOS-MT/FLT.

Output

```
inh-card:loc=1101
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been inhibited.
```

```
;
```

inh-imt

Inhibit IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

Caution: Use this command only when directed by the Customer Care Center.

CAUTION

Parameters

bus (mandatory)

IMT bus to be inhibited

Range:

a, b

force (optional)

This parameter forces inhibition of a specified bus where an IMT Rate change sequence is in progress.

Range:

yes

no

Default:

no

Example

```
inh-imt:bus=a
```

```
inh-imt:bus=a:force=yes
```

Dependencies

Valid IMT bus entries are "A" or "B".

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

The force=yes parameter must be specified to inhibit a bus where an IMT Rate Change sequence is in progress.

If an IMT Rate Change sequence is in progress on the alternate bus, then this command cannot be entered.

Notes

Cards not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the alternate IMT bus.

The function of this command is the same as the `rmv-imt` command.

Output

```
inh-imt:bus=a
```

```

rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Inhibit IMT Bus A command issued

inh-map-ss

Inhibit Mated Application Subsystem

Use this command to shut down (inhibit) a mated application subsystem. Currently, the AIQ, ATINPQ, EIR, INP, INPQS, LNP, and V-Flex and subsystems can be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the force parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

Parameters

ssn (mandatory)

The AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem number.

Range:

2 - 255

force (optional)

This parameter forces the shutdown of the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

Range:

yes

*no***Default:***no***Example**

inh-map-ss:ssn=10

inh-map-ss:ssn=10:force=yes

Dependencies

The EIR, INP, LNP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before this command can be entered.

No other action command can be in progress when this command is entered.

The specified ssn parameter value must represent the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

The EAGLE 5 ISS must be configured with at least one card running the SCCP application.

Notes

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE 5 ISS to generate a TFP for the EAGLE 5 ISS CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

Table 36: Route Set Test When LNP is Offline

Network Management	Concerned PC	Network Management
RSP	CPC	TFA concerning CPC
RSP	LNP CPC	None
RSP	TPC	TFA concerning TPC
RSR	CPC	TFA concerning CPC
RSR	LNP CPC	TFP concerning LNP CPC
RSR	TPC	TFA concerning TPC

Table 37: Receiving Messages when LNP is Offline shows what actions the system takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

Table 37: Receiving Messages when LNP is Offline

Routing Indicator in Incoming Message	DPC	Result of GTT	Message Handling	Network Management
rt-on-gt	Capability PC	rt-on-ssn, LNP subsystem	Reroute to mate	TFP concerning CPC
rt-on-gt	True PC	rt-on-ssn, LNP subsystem	Reroute to mate	None
rt-on-gt	Capability PC	Message Relay required	Generate UDTS	TFP concerning CPC
rt-on-gt	True PC	Message Relay required	Generate UDTS	None
rt-on-ssn	Capability PC	Not applicable	Generate UDTS	None
rt-on-ssn	True PC	Not applicable	Generate UDTS	SSP concerning True PC

inh-slk

Inhibit Signaling Link

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

Note: The signaling link's inhibited status is not preserved across a LIM reboot.

Parameters

link (mandatory)

The signaling link on the card that is specified in the loc parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table 54: Summary of Ranges for link Parameter](#) for valid link parameter range values for each type of card that can have a location specified in the loc parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
inh-slk:loc=1307:link=b
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- E5-E1T1, E5-E1T1-B, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPLIM, IPLIMI, or IPSP application

The card must contain signaling links.

The signaling link must be equipped in the database.

If an IPSP-M3UA signaling link is used, then this command cannot be entered.

This command is not valid for E5-ENET or E5-ENET-B cards with IPGWI links.

If an ATM card is used, then a valid value must be specified for the link parameter:

- a-a1, b—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

This command is not valid for IPSPG-M3UA signaling links.

Notes

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, then the SS7 changeover procedure cannot occur, the inhibit request is denied, and UIM 1150 is issued. The UIM can be retrieved from the logs or from a terminal with the appropriate TRM settings.

If the `inh-slk` command is followed by the `init-card` command, the inhibition of the signaling link is not preserved after the `init-card` command completes.

The `inh-slk` command might time out if a far-end remote does not respond to the inhibit message.

Output

```
inh-slk:loc=1301:link=a
```

```
rlghncxa03w 05-01-07 11:11:28 EST EAGLE5 33.0.0
Inhibit Link message sent to card
;

inh-trm

Inhibit Terminal

Use this command to set the primary state of a serial port to OOS-MT-DSBLD . It sets the secondary state to MANUAL . The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

Parameters

trm (mandatory)

The ID of serial port to be inhibited

Range:

1 - 40

force (optional)

This parameter forces the removal of a specified terminal, even if it is last in-service SEAS terminal available.

Range:*yes**no***Default:***no*

Example

```
inh-trm:trm=5
```

```
inh-trm:trm=1:force=yes
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified for the trm parameter.

The terminal specified by the trm parameter must be equipped.

This command cannot be used to inhibit the terminal from which the command is entered.

The force=yes parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

Output

```
inh-trm:trm=5
```

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Inhibit message sent to terminal
;
```

```

init-card

Initialize Card

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued to the E5-OAM software, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

Caution: When a LIME1 or LIMT1 card has associated channel cards (LIMCH) with provisioned links, the `init-card` command entered for the LIME1 or LIMT1 card causes all links on the associated channel cards to go out of service.

Caution: Resetting more than 8 Service Module cards at once may result in an extended reload time for the Service Module cards.

Parameters

`appl` (optional)

Application. The type of application residing on the card.

Caution: Because the `appl` parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.

Range:

xyyyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

atmansi—Used by E5-ATM and E5-ATM-B cards to support high-speed ATM signaling links and T1 functions.

atmitu—Used by E5-ATM and E5-ATM-B cards to support E1 high-speed signaling links and E1 functions.

ccs7itu—Used by HC-MIM and E5-E1T1 cards for ITU-TSS MTP functions.

deirhc—Used by E5-SM8G-B Cards to support the S13/S13' EIR feature.

eroute—Used by STC cards and E5-STC cards for EAGLE 5 Integrated Monitoring Support functions.

gls—Used by E5-TSM cards for downloading gateway screening to LIM cards and Service Module cards.

ipgwi—Used by E5-ENET and E5-ENET-B cards for point-to-multipoint IP connectivity for ITU point codes. The system allows a maximum of 125 cards to be assigned the IPGWI application.

iplim—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI point codes.

iplimi—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes.

ips—Used by IPSM cards for the IP User Interface feature.

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—Used by MCPM cards for the Measurements Platform feature

siphc—Used by E5-SM8G-B Cards to support SIP application

ss7ansi—Used by HC-MIM and E5-E1T1 cards for the MTP functions

ss7ipgw—Application software for point-to-multipoint IP connectivity. The system allows a maximum of 125 cards to be assigned the SS7IPGW application.

stplan—Used by E5-ENET and E5-ENET-B cards to support STP LAN functions

vsccp—Used by Service Module cards to support EPAP-based features and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the *vsccp* GPL processes normal GTT traffic.

Default:

The application assigned to the card

data (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card.

Note: The LNP feature or an EPAP-based feature must be turned on or the ATINP feature must be enabled before this parameter can be specified. This parameter applies only to Service Module cards that (1) run the SCCPHC application and contain an RTDB or (2) run the DEIRHC application.

Range:

refresh

Causes data to be reloaded to the specified card.

persist

Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place. The force parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

Default:

refresh

force (optional)

Force indicator. Enables the command to be processed under the following conditions:

- If serial=yes and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If initclk=yes and the TDM card specified in the loc parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If initclk=yes and appl=oam is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

Range:

yes

no

Default:

no

initclk (optional)

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the initclk parameter cannot be specified unless force=yes is also specified.

CAUTION

Caution: The resulting clock outage will probably cause loss of traffic on all links.

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

Range:

yes, no

If initclk=yes is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If initclk=yes is specified with appl=oam and force=yes, the bitfile reloads on both TDMs.

loc (optional)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1116, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2301 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

When the initclk parameter is not specified, the listed card locations are valid.

When the `initclk` parameter is specified, card locations 1113, 1114, 1115, and 1116 are valid.

Entering locations 1114 and 1116 results in the same action as entering 1113 and 1115.

Default:

All valid card locations are initialized.

prtnggrp (optional)

Partition group. The disk partition group that is used as the source for downloading the appropriate GPL.

A value of 1113 or 1115 must be specified for the `loc` parameter before this parameter can be specified.

Range:

active

the active partition group

inactive

the inactive partition group

Default:

active

serial (optional)

Controls the manner in which cards are initialized.

Range:

yes

cards of the specified APPL type are initialized one at a time

no

cards of the specified APPL type are initialized simultaneously

Default:

no

type (optional)

SM Type. The type of RTDB data that can be loaded on an E5-SM4G or an E5-SM8G-B card.

Range:

dn

initialize SM cards running the SIPHC or SCCPHC gpl, with SM type DN or EPAP.

elap

initialize SM cards running the SIPHC or SCCPHC gpl, with SM type ELAP.

epap

initialize SCCPHC cards running the SIPHC, DEIRHC, or SCCPHC gpl, with SM type DN, IMSI, or EPAP.

gtt

initialize SM cards running the SCCPHC gpl, with SM type GTT.

imsi

initialize SM cards running the DEIRHC or SCCPHC gpl, with SM type IMSI or EPAP.

Default:

none

Example

```
init-card:Loc=1113:prtnggrp=inactive
init-card:loc=1101:data=persist
init-card:loc=1113:initclk=yes
init-card:appl=oam:initclk=yes:force=yes
init-card:appl=ipsg
init-card:type=epap
init-card:appl=deirhc
init-card:appl=deirhc:data=persist
```

Dependencies

The shelf and card must be equipped.

The loc or appl or type parameter must be specified in the command. The parameters cannot be specified together in the command.

The following card locations (loc parameter) are not allowed for this command: 1117, 1118, and all *xy09* and *xy10* card locations (where *x* is the frame and *y* is the shelf).

If the loc and initclk parameters are specified, the loc parameter value must be card location 1113 or 1115. If the appl and initclk parameters are specified, the appl parameter value must be *oam*.

If TDM reload would cause system clocks to fail that are required to keep links active or TSCSYNC available, the initclk parameter cannot be specified unless force=yes is also specified.

**CAUTION**

Caution: The resulting clock outage will probably cause loss of traffic on all links.

Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.

- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A&B) are required.

The initclk parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

The force parameter must be specified for the cards that are not in the In-service Normal state.

The serial parameter is valid only when used with the appl parameter.

The appl=all parameter can be specified only when the serial=yes parameter is also specified.

A valid value must be specified for the appl parameter.

The initclk, appl, and data parameters must be specified before the force parameter can be specified.

The data parameter is valid only for SCCP card locations or GPLs/MPS database (VSCCP) card locations or GPLs/DEIR card locations or GPLs.

The data parameter is not allowed when DUAL ExAP or EPAP Split feature is ON and type=GTT is specified.

The card location (loc) must be within the allowed range.

The specified card does not exist or is not a logical processing element.

An EPAP-based feature or an LNP feature that is warm-restart-capable must be enabled before this command can be entered with the data=persist parameter.

If the serial=yes parameter is specified, the appl parameter must specify a network type application value or must be equal to *all*.

A primary DSM card must be provisioned.

The link interface module service cannot be loaded due to non availability of the system resources.

The command cannot be executed as the system maintenance is in progress.

The A-Port, EIR, G-Flex, G-Port, INP, IS41 GSM Migration (IGM), LNP ELAP Configuration, PPSMS, Prepaid IDP Relay Query (IDP Relay), or V-Flex feature must be turned on, or the ATINP feature must be enabled before the data parameter can be specified.

If a removable cartridge is inserted in the system, then the prtnggrp=inactive parameter cannot be specified.

The loc parameter must be specified with a value of 1113 or 1115 before the prtnggrp parameter can be specified.

If an Extended BERT is running, the appl parameter cannot be specified in this command to initialize multiple cards.

If type specified is *epap*, *elap* or *gtt* then the Dual ExAP Config, SIPNP or DEIR feature must be enabled.

If type specified is *imsi* or *dn*, then the EPAP Data Split feature must be ON.

If type specified is *epap*, then the Dual ExAP feature must be ON and EPAP Data Split feature must be OFF.

Notes

The TDM card has a processor but no application.

init-ext-stats

Initialize Extended Statistics

Use this command to cause the HIPR2 cards to collect Extended Statistics for later retrieval.

Parameters

bus (optional)

The IMT bus that contains the HIPR2 card where extended statistics are collected.

Range:

a

collect statistics for HIPR2 cards on the A bus

b

collect statistics for HIPR2 cards on the B bus

both

collect statistics for HIPR2 cards on both buses

Default:

both

delay (optional)

The number of milliseconds to wait before collecting HIPR2 Extended Statistics.

Range:

0 - 10000

Note: The specified value is automatically rounded to a 10 ms boundary.

Default:

0

eloc (optional)

The ending card location for a range of HIPR2 cards where extended statistics are collected.

Note: Statistics are collected from only valid In-Service Normal HIPR2 cards within the range.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

6110

loc (optional)

The location of a single HIPR2 card where statistics are collected.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

all HIPR2 cards within the range specified by the `sloc` and `eloc` parameters

sloc (optional)

The starting card location for a range of HIPR2 cards where extended statistics are collected.

Note: Statistics are collected from only valid In-Service Normal HIPR2 cards within the location range.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

1109

Example

```
init-ext-stats
init-ext-stats:bus=a
init-ext-stats:sloc=1109:eloc=1110
init-ext-stats:loc=1109
```

Dependencies

The value specified for the `loc` or `sloc` and `eloc` parameters must indicate a valid card location. See the description of the desired parameter for a list of valid values.

The range specified by the `sloc` and `eloc` parameters must include an MUX card location.

The value specified for the `loc` parameter must be a valid MUX card location or the range specified by the `sloc` and `eloc` parameters must include an MUX card location.

The value specified for the `delay` parameter must be between 0 - 10000.

A value of *a*, *b*, or *both* must be specified for the `bus` parameter.

The `loc` parameter cannot be specified in the same command with the `sloc` and `eloc` or `bus` parameters.

An `init-ext-stats` or `copy-ext-stats` command cannot already be in progress when this command is entered.

Output

```
init-ext-stats
```

```
e5oam 10-02-06 00:56:54 EST EAGLE 42.0.0

Related Commands

[copy-ext-stats](#)

init-flash

Initialize Flash

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

Parameters

Note: As of Release 43.0, the BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1 GPLs are replaced with the BLIXP GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

code (optional)

The version of the GPL being loaded onto the card.

Range:

appr

The approved GPL version

trial

The trial GPL version

The code parameter must be specified if the mode parameter is not specified as mode=imgselct ; the code parameter must not be specified if the mode parameter is specified as mode=imgselct .

boot (optional)

This parameter specifies whether the HC-MIM or E5-class card should boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the HC-MIM or E5-class card , this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card. This option does not apply to MUX cards .

Range:

yes

Reboot the card after the command completes successfully

no

Do not reboot the card after the command completes successfully.

Default:

yes

For HC-MIM and E5-class cards, if the mode parameter is not specified or if mode=foregrnd, mode=imgselct or mode=pvjoy, then default value of boot parameter is yes. If the mode parameter is specified for E5-class card(s) as mode=backgrnd, then default value of boot parameter is no.

eloc (optional)

End location. The location of the last card of a range of cards to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

force (optional)

This parameter is required to force the TDM-GTI bitfile reload if a clock outage will occur when initclk=yes is specified.

Range:

yes

no

Default:

no

gpl (optional)

Generic program load. The flash GPL type that is running on the cards in the specified range of cards.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters.

Valid GPLs: *blbios, blbepm, blbsmg, blcpld, bldiag6, blixp, blmcap, blrom1, blxw6, hipr, hipr2, imtpci, pldpmc1, multiple*.

Use " gpl=multiple " to simultaneously flash multiple E5-class cards running different GPLs, such as BLIXP, BLMCAP, etc. The command will then flash all E5-class cards in the specified range.

initclk (optional)

If this parameter is specified for an EOAM card location (1113 or 1115), it determines whether or not the TDM-GTI bitfile should be reloaded, causing a clock initialization.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the force=yes parameter is used.

Range:

yes

no

Default:

no

loc (optional)

The location of a single card to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

mode (optional)

If this parameter is specified for the E5-class cards, it indicates that the flashing of the E5-class card or range of cards will be performed in the specified mode. This parameter can be specified only for E5-class cards.

Range:

foregrnd

In this mode, the flash image will be copied into an inactive FLASH memory area of an E5-class card or range of cards. After the E5-class card initializes, it runs this version of the GPL in the card's inactive FLASH memory. If the E5-class card in the specified location is provisioned, the E5-class card must be inhibited before it can be flashed in this mode.

backgrnd

In this mode, the flash image will be copied into an inactive FLASH memory area of an E5-class card or range of cards. If the E5-class card in the specified location is provisioned, the E5-class card can be flashed without inhibiting it. The image uploaded with mode=backgrnd will run after the card boots upon receiving the command init-flash:mode=imgselct.

imgselct

This mode will initialize the card(s), and load & run the image previously copied to the local FLASH memory with mode=backgrnd. Do not use this mode unless directed by Oracle's Customer Service.

pvjoy

In this mode, the flash image will be copied into inactive FLASH memory of an E5-class card or range of cards and the card(s) will initialize. After the E5-class card initializes, it will run the version of the GPL in the card's inactive FLASH memory. If the E5-class card in the specified location is provisioned, then the

E5-class card can be flashed without inhibiting the E5-class card in the specified location. Do not use this mode unless directed by Oracle's Customer Service.

Default:

foregrnd

sloc (optional)

Start location. Location of the first card of a range of cards to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Example

```
init-flash:loc=1105:code=trial
init-flash:sloc=1101:eloc=1112:gpl=blixp:code=appr
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
init-flash:sloc=1105:eloc=1306:appr:gpl=blmcap:mode=foregrnd
init-flash:sloc=1203:eloc=1402:code=trial:gpl=blixp:mode=foregrnd:boot=no
init-flash:loc=1205:code=appr:mode=backgrnd
init-flash:sloc=1201:eloc=1311:code=trial:gpl=blmcap:mode=backgrnd
init-flash:sloc=1201:eloc=1311:code=trial:mode=imgselct
```

Dependencies

The specified card must be an HC-MIM, E5-class card, or Service Module card. A MUX card can be specified for locations *xy09* and *xy10* (*x* is the frame and *y* is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, then the card must be inhibited before this command is entered (unless the card is a MUX card or E5-class card with mode set to *backgrnd*, *imgselct* or *pvjoy*).

If the target card is a MUX card, then both card locations specified in the *sloc* and *eloc* parameters must contain MUX cards on the same IMT bus. For these cards, the bus is implicit based on the specified location. Location *xy09* specifies the MUX A Bus, and location *xy10* specifies the MUX B Bus (*x* is the frame and *y* is the shelf). For example, *sloc=1109:eloc=6109* specifies all MUX cards on the A Bus only; *sloc=1110:eloc=6110* specifies all MUX cards on the B Bus only. MUX cards from both the A bus and B bus cannot be flash downloaded simultaneously.

The boot parameter can be specified only if the target is an HC-MIM or E5-class card .

The boot parameter cannot be specified for an HC-MIM card running the BLCPLD GPL.

A card location that contains the active MASP cannot be specified for the loc parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The loc parameter cannot be specified with the eloc and sloc parameters.

The loc parameter or the eloc and sloc parameters must be specified.

If the eloc and sloc parameters are specified, the gpl parameter must be specified. MUX cards in the locations specified in the sloc and eloc parameters must be running the specified general program load (gpl). If the GPL specified is not multiple, then other cards in the range of card locations can be running other GPLs, but will not be initialized and only the cards within the range that are running the specified GPL will be initialized.

The sloc parameter value must be less than the eloc parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed. If the sloc and eloc parameters are specified, cards within the range running an inactive flash GPL will be skipped.

If the initclk parameter is specified, the card location parameter value must be 1113 or 1115.

If TDM reload would cause a system clock outage, the initclk parameter cannot be specified unless force=yes is also specified.

Caution: The resulting clock outage will probably cause loss of traffic on all links.

CAUTION

The initclk parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

E5-class cards cannot support a valid trial version of the BLBEPM GPL and BLCPLD GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

The HC-MIM card cannot support a valid trial version of the BLBIOS GPL and BLCPLD GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

No other related command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The eloc and sloc parameters must be specified together in the command.

MUX cards specified in the sloc and eloc location parameters must be running the specified GPL. For other GPLs including multiple, all cards within the range running the specified GPL will be flashed.

If the loc and initclk parameters are specified, the loc parameter value must be card location 1113 or 1115. If the appl parameter and initclk parameters are specified, the appl parameter value must be eoam .

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the force=yes parameter is used.

The boot parameter cannot be specified with the mode=backgrnd, mode=imgselct or mode=pvjoy for the E5-class card.

A card location that contains the MASP cannot be specified for the sloc or eloc parameter.

The mode parameter cannot be specified with the non E5-class card.

The gpl=multiple parameter can be specified only if the sloc and eloc parameters are specified.

The gpl=multiple parameter can be specified only if the card locations in the sloc and eloc parameters are E5-class cards.

The code parameter cannot be specified with mode=imgselct parameter for the E5-class card(s). If the mode=imgselct parameter is not specified, then the code parameter must be specified.

Notes

Card locations 1114, 1116, and 1117 are not valid and cannot be specified.

For the HC-MIM or E5-class cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the boot=no parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the `init-flash` command with the boot=yes parameter or by entering the `init-card` command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

If E5-OAMs are being used, then the `init-flash` command can be accepted even when the cards specified in the sloc and eloc parameter range contains 1113 and/or 1115 locations in it. But the cards in 1113 and 1115 are never included in the list to flash the cards.

For example, if "sloc=1111:eloc=1215:gpl=blmcap", neither 1113 nor 1115 would be included in the list to flash the cards and the command will be accepted. The only way to flash an E5-OAM card is to specify loc=1113/1115 but the card location specified cannot be the active E5-MASP.

For mode=backgrnd or mode=imgselct to be accepted, the E5-class target card must already be running a 45.0.0=64.XX.YY release version or higher.

Output

init-imt-gpl

Initialize IMT GPL

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

Parameters

code (mandatory)

The IMT GPL to load to the card.

Range:

appr

The approved GPL version

refresh

Reload approvedl GPL version without card reset

trial

The trial GPL version

loc (optional)

The location of the card to be initialized.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All locations

Example

```
init-imt-gpl:loc=1201:code=trial
```

```
init-imt-gpl:code=refresh
```

```
init-imt-gpl:code=appr
```

Dependencies

The card location shelf must be within the allowed ranges as specified on the `loc` parameter. The shelf is the first two digits of the `loc` parameter.

The card location slot must be within the allowed ranges as specified on the `loc` parameter. The slot is the second two digits of the `loc` parameter.

The card location cannot contain a card with flash memory (HC-MIM or MUX).

When this command is entered, no other action command can be in progress.

If the `code=appr` or `code=trial` parameter is specified, the `loc` parameter must be specified.

If the `code=trial` parameter is specified, the `loc` parameter must be specified, and the specified card location must be equipped and in service.

If the `code=appr` or `code=refresh` parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

This command cannot be entered if the `clr-imt-stats`, `rept-imt-info`, `rept-imt-lvl1`, `rept-imt-lvl2`, or `tst-imt` command is running.

This command must not be entered during IMT statistics collection following an hourly boundary.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

None

Output

```
init-imt-gpl:loc=1201:code=trial
```

```

init-mux

Initialize High-Speed Multiplexer

This command is used to reset an individual MUX card, or a given IMT Bus A or B (which includes all MUX cards for that bus).

The command boots the MUX card processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the MUX card(s) come back into service.

Note: When a card is disconnected from the IMT Bus, it may take several seconds for the card IMT Status to be updated. If an `init-mux` or `disc-imt` command is entered for the alternate IMT Bus before the card IMT Status is updated, then the card may reboot. After disconnecting the card from the IMT bus, use the `rept-stat-imt` or `rept-stat-card` command to determine whether the card IMT status is updated. Do not issue the `disc-imt` or `init-mux` command for the alternate IMT bus until the card status is updated.

Parameters

bus (optional)

The MUX bus to be reset. All MUX cards on the specified bus are reset.

Range:

a

b

Default:

a

force (optional)

This parameter is specified to override normal safeguards. The `force=yes` parameter can be used to reset an entire MUX bus when the alternate bus is non-functional or to reset one MUX card during a fault isolation test (see the `tst-imt` command).

Caution: If the `force=yes` parameter is specified, and the alternate IMT bus is OOS, then all of the cards on the IMT that are running a GPL will initialize. If one or more cards are not aligned on the alternate bus, placing the alternate IMT in IS-ANR, only the non-aligned cards will initialize. Either occurrence could result in nodal isolation.

Range:

yes

no

Default:

no

loc (optional)

The location of a single MUX card to be reset.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Example

```
init-mux:bus=a
init-mux:loc=1109
init-mux:loc=6202
```

Dependencies

An `act/init-flash` command cannot be in progress when this command is entered.

The `bus` or `loc` parameter must be specified in the command. Both parameters cannot be specified in the command.

The `force=yes` parameter must be specified before this command can be entered during an IMT Fault Isolation test.

This command cannot be entered during an Extended Bit Error Rate Test (BERT) even if the `force=yes` parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

This command cannot be entered if an IMT Rate Change sequence is in progress.

Notes

None

Output

```
init-mux:loc=1109
```

```
rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0
Command Completed.
;
```

Related Commands

act-flash, *init-flash*

init-network

Initialize the Network

Use this command to reset all the network cards. The network cards are E5- TSMs and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

CAUTION

Caution: Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

Parameters

force (optional)

Force the resetting of all the network cards.

Range:

yes

no

Default:

no

Example

```
init-network
```

Dependencies

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with the SS7ANSI or CCS7ITU application installed must exist with an in-service active signaling link.

The force=yes parameter must be specified to override the required four-card SS7ANSI or CCS7ITU configuration. The system then selects the best available of the remaining SS7ANSI or CCS7ITU cards.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

Upgrade Phase 3

Upgrade Phase 3 mode means that the MASP's are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

Full Function

Full Function mode means that all MASP's are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

Output

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

init-sys

Initialize System

Use this command to reset all cards in the system (except MUX cards). When this command is entered, a caution message is displayed in the scroll area requesting to re-enter the command to confirm the operation. The command must be re-entered within 30 seconds. The only valid commands that can be entered after entering this command the second time are the `login` and `act-user` commands.

Caution: This command causes a complete system reload, and should be used only during periods of low traffic. Use this command only when directed by the Customer Care Center.

Caution: When this command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. Each device must be put back into its previous state after the system is back on line. It is advisable to print or electronically capture the output of the `rept-stat-slk`, `rept-stat-card`, and `rept-stat-trm` commands for reference prior to issuing the `init-sys` command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above `rept-stat` commands.

Parameters

data (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the G-Flex, G-Port, INP, or LNP feature is on, or the ATINP feature is enabled. This parameter is applicable only to network cards containing the MPS database (VSCCP or S13 card running DEIRHC gpl).

Range:

refresh

Causes data to be reloaded to the specified card.

persist

Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE perform a warm restart of the requested cards. The EAGLE performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

Default:

refresh

Example

```
init-sys
init-sys:data=persist
```

Dependencies

When this command is entered, another `init-sys` command cannot be in progress on another port.

The G-Flex, G-Port, INP, LNP, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the `data` parameter can be specified.

The value specified for the `data` parameter for the confirmation command must be the same value that was specified the first time.

Notes

When this command is entered the first time, 30 seconds are allowed to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the `init-sys` command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicate that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the `init-sys` command, the MASP that was active before the `init-sys` command was entered will be the active MASP when the system has finished reinitializing. E5-TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require E5-TSM cards to be reloaded.

When the OA&M IP Security feature and the parameter SSH in SECUDFLT table are turned ON, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature and the parameter SSH in SECUDFLT table are turned ON, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The

UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

Output

This example shows the output when the `init-sys` command is entered once, then entered again within 30 seconds, causing the system to start resetting all of its cards:

`init-sys`

```
rlghncxa03w 04-01-07 07:05:00 EST EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:01 EST EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

lock

Lock Keyboard

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the `unlock` command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

Parameters

This command has no parameters.

Example

```
lock
```

Dependencies

The terminal cannot be an MGMT terminal used for Network Surveillance.

The terminal cannot be a TELNET terminal (terminal IDs 17-40).

Notes

A locked terminal can also be unlocked by entering the `inh-trm` command, followed by the `alw-trm` command.

Output

```
lock
```

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

Related Commands

[unlock](#)

login

Login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

Parameters

uid (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

Range:

```
aZZZZZZZZZZZZZZZZ
```

1 alphabetic character followed by up to 15 alphanumeric characters

Example

```
login:uid=john
```

Dependencies

The user cannot be logged onto any terminal while changing the password.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the `uout` parameter of the `ent-user` command.

The OA&M IP Security Enhancements feature must be turned on before the password can be changed from a Telnet terminal (IDs 17-40) if the user is logging in with the assigned ID and password for the first time, or the password has expired.

The password can contain up to 12 characters.

The password must contain at least the number of characters specified by the `minlen` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of alphabetic characters specified by the `alpha` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of numeric characters specified by the `num` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of punctuation characters specified by the `punc` parameter in the `chg-secu-dflt` command.

The password cannot contain the associated User ID.

The number of days specified by the `minintrvl` parameter in the `chg-secu-dflt` command must pass between password changes.

The password must contain fewer duplicate characters from the existing password than the number specified by the `pchreuse` parameter in the `chg-secu-dflt` command.

The password cannot be the same as a previous password if the limit in the password history, specified by the `preuse` parameter of the `chg-secu-dflt` command, has been reached.

The current password cannot be entered as the new password.

The values specified for the `uid` parameter and for the password must already exist.

Notes

The `act-user` command can be used in place of `login`. The `act-user` command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

Output

When the `login` command is entered, a password prompt occurs. If the password and User ID are valid, then the login is processed. When a password change is required, password rules are displayed, and a new password is requested. The login is granted if the change is successful, then or if no password change is necessary.

After login is granted, a banner is displayed. This banner consists of the warning text provided on the `chg-secu-dflt` command, indications about the last login, and any unsuccessful login attempts.

This example shows the output for a normal login path with no request for new password:

```
login:uid=eagle
```

```
eagle5 10-02-19 19:37:16 EST  EAGLE5 42.0.0
User logged in on terminal 3.
;

eagle5 10-02-19 19:37:16 EST  EAGLE5 42.0.0
NOTICE: This is a private computer system.
Unauthorized access or use may lead to prosecution.
0 LOGIN failures since last successful LOGIN
Last successful LOGIN was on port 3 on 10-02-18 @ 20:38:26
;
```

This example shows the output for a login where a password change is required:

```
login:uid=user1
```

```
Enter Password :
Enter new password (password has expired and must be changed) :
Verify Password :
Command Accepted - Processing
e5oam 10-02-19 23:30:57 EST  EAGLE 42.0.0
login:uid=user1
Command entered at terminal #3.
;

e5oam 10-02-19 23:30:59 EST  EAGLE 42.0.0
New password must contain:
- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. $%#@)
New password must:
- be unique from the old password
- be unique from the last 2 historical password(s)
- not reuse more than 4 character(s) from the old password
;
```

logout

Logout

Use this command to end a user session. The `logout` command has the same affect as the `canc/dact-user` commands.

Parameters

This command has no parameters.

Example

```
logout
```

Dependencies

None

Notes

The `canc/dact-user` commands can be used in place of `logout`.

Output

```
logout
```

```
rlghncxa03w 06-06-05 07:05:31 EST EAGLE 35.0.0
Command Completed.
```

Use this command to pass a command string to an individual card for processing. This command reduces the reliance on the OAM build for card and on application-specific information.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

cmd (optional)

Command string including quotes (" "). The command represented in the quoted string is sent to the specified card. Maximum command string length including quotes is 132 characters.

Range:

////////////////////////////////////

Any string of characters that represent a pass-through command. The string must be enclosed in double quotation marks.

Valid pass-through commands are *arp*, *aslog*, *asplog*, *assocrtt*, *conmmgr*, *drklog*, *ftptest*, *help*, *linkinfo*, *msucount*, *msuroute*, *msutrace*, *netstat*, *nslookup*, *pct*, *ping*, *sctp*, *sockrtt*, *sockstate*, *traceroute*, *ualog*, *soipdata*, *soiplog* .

Note: Pass-through commands shown in online help that are not documented in Chapter 6 are not supported at this time.

proc (optional)

Processor type.

Range:

appl

Application processor

com

Communication processor

Default:

appl

Example

```
pass:loc=1201:cmd="ping 198.89.1.2"
```

```
pass:loc=1111:cmd="soipdata -f"
```

```
pass:loc=6312:cmd="help"
```

Dependencies

The value specified for the loc parameter must be valid for the card type and application:

- E5-ENET or E5-ENET-B card running the IPGWI, IPLIM, IPLIMI, IPSG, SS7IPGW, or STPLAN application
- SSEDCM card running the STPLAN application
- STC or E5-STC card running the EROUTE application
- IPSM card running the IPS application
- Service Module card running the VSCCP application
- E5-TSM card running the GLS application

The pass command must include either the cmd or shellcmd parameter.

Notes

None

Output

Output is shown in the individual Pass commands.

Related Commands

rept-ftp-meas

Report Measurements to FTP

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM or Integrated Measurements enabled E5-OAM to an FTP server.

Parameters

enttype (mandatory)

Entity type to report on in the measurements report.

Range:

aiq

Measurements for ANSI41 AIQ

atinpq

Measurements for ATINP

deir

Measurements for S13/S13' EIR

eir

Measurements for Equipment Identity Register

gttath

Measurements for GTT Actions Per-Path

idpr

Measurements for IDPR

link

Measurements for signaling links

lnkset

Measurements for linksets

lnp

Measurements for local number portability

ldestni

Measurements for linkset destination network identifiers

lsonismt

Measurements for ISUP message type screening

lorigni

Measurements for linkset originating network identifiers

mapscrn

Measurements for GSM MAP message screening

np

Measurements for INP, INP CRP, G-Port, A-Port, MO-based GSM SMS NP, MO-based IS41 SMS NP, IGM, MT-Based GSM SMS NP, and MT-Based IS41 SMS NP

origni

Measurements for originating network identifiers greater than 5

origininc

Measurements for originating network identifiers (less than 5, small networks) for network clusters

sctpasoc

Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)

sctpcard

Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)

sip

Measurements for SIP

stp

Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP

stplan

Measurements for STP Local Area Network data links

tt

Measurements for translation types

ua

Measurements per application server/association for the M3UA and SUA protocols

vflex

Measurements for V-Flex

type (mandatory)

Type of measurement report.

Range:

avl

Availability measurements

avld

Daily availability measurements

avldth

Day to hour availability measurements.

comp

Component measurements

gtwy

Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd

Daily maintenance measurements

mtcdth

Day-to-hour maintenance measurements

mtch

Hourly maintenance measurements

mtcs

Link/linkset maintenance status

nm

Network management, on-demand

rbase

Schedule-report type record base measurements

systot

STP system totals

day (optional)

Day of the week for the specified daily measurement report.

Range:

mon

tue

wed

thu

fri

*sat**sun***Default:**

If not specified, the previous single day is reported.

hh (optional)

Half-hour for the specified report. The end time for the collection interval. For example, hh=0300 generates a report for the interval 2:30-3:00.

Range:

0000 - 2400

hhmm where hh=00 -24 (hour) and mm=00 or 30 (minute)

period (optional)

The relative period for the report.

Range:*active**last**specific***qh (optional)**

Quarter-hour for the specified report. The end time for the collection interval. For example, qh=0315 generates a report for the interval 3:00-3:15.

Range:

0000 - 2400

hhmm where hh = 00-24 (hour) and mm = 00, 15, 30 or 45

Example

```
rept-ftp-meas:type=systot:enttype=stp
```

```
rept-ftp-meas:type=mtch:enttype=deir
```

Dependencies

This command cannot be used to specify a report type if that report type is currently printing.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (chg-measopts:collect15min=on command) must be on before the qh parameter can be specified.

The LNP feature must be turned on before the `mtchlnp=on`, `mtcdlnp=on`, or `enttype=lnp` parameter can be specified.

The GSM Map Screening feature must be turned on before the `mtcdmap=on` and `enttype=mapscrn` parameters can be specified

The EIR feature must be turned on before the `enttype=eir` parameter can be specified,.

If a value of `avl`, `avld`, `comp`, `gtwy`, `mtcd`, or `systot` is specified for the `type` parameter, then the value specified for the `hh` parameter must indicate a half-hour boundary (the end of the requested half-hour for the report). If the `type=mtch` parameter is specified, then the value specified for the `hh` parameter must indicate an hourly boundary (half hours ending in 00, such as 0100, etc).

The `qh` parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (`avld(th)`, `mtcd(th)`, `mtch`, `nm`, `rbase`, and `mtcs`) cannot be specified.

Hourly collection and report processing cannot be in progress when report type `mtch` is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type `mtcd` is specified
- When report type `mtcdth` is specified

Daily collection and report processing cannot be in progress when report type `mtcd` is specified.

Half-hourly collection and report processing cannot be in progress when report type `comp`, `systot`, `avl`, or `gtwy` is specified.

Quarter-hourly collection and report processing cannot be in progress when report type `comp`, `systot`, `avl`, or `gtwy` is specified.

5-minute collection and report processing cannot be in progress when report type `nm` is specified.

The `mtcdth` report type is unavailable between midnight and 1:00 AM (0100).

The `day` parameter can be specified only for report type `mtcd` and entity types `aiq`, `eir`, `lnp`, `np`, `vflex`, `mapscrn`, `atinpq`, and `gttath`.

The `hh` and `qh` parameters cannot be specified together in the command.

When the `period=last` parameter is specified, the `hh`, `qh`, and `day` parameter cannot be specified.

When the `period=active` parameter is specified, the `hh`, `qh`, and `day` parameters cannot be specified.

When the `period=specific` parameter is specified, the `hh`, `qh`, or `day` parameters must be specified.

[Table 38: rept-ftp-meas Valid Parameter Combinations](#) indicates valid parameter combinations for measurements reports; invalid combinations will generate an error message.

Table 38: rept-ftp-meas Valid Parameter Combinations

Param. Value	:type Values											
	avl	avld	avldth	comp	gtwy	mtcd	mtcdth	mtch	mtcs	nm	systot	rbase
entity												
aiq						X		X				
atinpq						X		X				

Param. Value	:type Values

gttpath						X		X				
idpr											X	
link	X	X	X	X		X	X		X	X		X
linkset				X	X	X	X		X	X		X
lnp						X		X				
lsdestni					X							
lsonismt					X							
lsorigni					X							
mapscn						X		X				
np						X		X				
origni					X							
originc					X							
sctpasoc				X		X	X					
sctpcard				X		X	X					
SIP						X					X	
stp					X	X	X			X	X	X
stplan	X					X	X				X	
tt											X	
ua				X		X	X					
:period												
active									X			X
last	X	X	X	X	X	X	X	X		X	X	
specific	X			X	X	X		X			X	

An hourly boundary must be specified for report type mtch .

The oamhcmcas=on or platformenable=on parameter must be specified (see the chg-measopts command) before this command can be entered.

The V-Flex feature must be turned on before the enttype=vflex parameter can be specified.

The A-Port, G-Port, IS41 GSM Migration, Prepaid SMS Intercept Ph1, TIF ASD, TIF GRN, TIF Number Portability, or TIF Simple Number Substitution feature must be enabled, or the INP, MO SMS

IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the `mtchnp=on` or `mtcdnp=on` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `enttype=aiq` parameter can be specified.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The GTT Action - DUPLICATE, GTT Action - DISCARD, or GTT Action - FORWARD feature must be enabled before the `enttype=gttapath` parameter can be specified.

SIPNP Feature must be enabled before the `enttype=sip` and `type=mtcd/systot` parameters can be specified.

Period/type parameter combinations:

- If the `period=specific` parameter is specified, then a value of *avl*, *mtcd*, *comp*, *systot*, *gtwy*, or *mtch* must be specified for the type parameter.
- If the `type=mtcd` and `period=specific` parameters are specified, then a value of *lnp*, *mapscrn*, *np*, *eir*, *vflex*, *atinpq*, *aiq*, or *gttapath* must be specified for the enttype parameter.
- If the `period=active` parameter is specified, then a value of *mtcs* or *rbase* must be specified for the type parameter.
- If the `period=last` parameter is specified, then a value of *mtcs* or *rbase* cannot be specified for the type parameter.

S13 EIR Feature must be activated before the `enttype=deir` and `type=mtch/mtcd` parameters can be specified.

An entity type (ENTTYPE) of DEIR, EIR, LNP, MAPSCRN, NP, or VFLX requires the DAY parameter to be specified.

rept-imt-info

Display IMT Error and Use Statistics

Use this command to display the following statistics:

- IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- Current IMT bus use statistics. Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.
- MUX card error statistics

Parameters

report (mandatory)

The type of report that is generated.

Range:

err

IMT bus error statistics

hmuxerr

HMUX card error statistics

hiprerr

HIPR card error statistics

hipr2err

HIPR2 card error statistics

ebucket (optional)

End bucket. The last one-hour time period (*bucket*) for which error statistics are reported.

Range:

0 - 15

Default:

If sbucket is specified—current sbucket value; information for only that time period is displayed.

If sbucket is not specified—15, the report includes statistics for all 16 time periods

eloc (optional)

End location. Specifies the card location of the last card in the range for the report.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Default:

If sloc is specified—current sloc value; displays information for one card

If sloc is not specified—1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

erronly (optional)

This parameter filters the output to display only non-zero counts in the error report.

Range:

yes

no

Default:

yes

eshelf (optional)

The end shelf location for MUX statistics. This shelf location is the last shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

sshelf is specified—the report starts with the sshelf value

sshelf and eshelf are not specified—the report is generated for all shelves equipped with the specified MUX type

eslot (optional)

The end slot location for MUX statistics for the cards in the MUX shelf.

Range:

1 - 18

Default:

sslot is specified—current sslot value

sslot is not specified—no default

mode (optional)

The display mode used in the error report.

Range:

full

Displays information for each card along with a summary report

stats

Displays only individual card statistics

summary

Displays the summary portion of the report

Default:

summary

sbucket (optional)

Start bucket. The first one-hour time period (bucket) for which error statistics are reported.

Range:

0 - 15

Default:

0

sloc (optional)

Start location. The card location of the first card in the range for the report.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Default:

eloc is specified—current eloc value

eloc and sloc are not specified—displays information for entire range of card locations

sshelf (optional)

The starting shelf location for MUX statistics. This location is the first shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

eshelf is specified—current eshelf value

eshelf and sshelf are not specified—report is generated for all shelves equipped with the specified MUX type

sslot (optional)

The starting slot location for MUX statistics for the cards in the MUX shelf.

Range:

1 - 18

Default:

eslot is specified—current eslot value

eslot is not specified—no default

trm (optional)

The serial port (printer location) where the report is sent.

Range:

1 - 16

Default:

Report displays on the terminal where the command is issued

Example

```
rept-imt-info:report=err
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no
rept-imt-info:report=hiprerr:sbucket=0
rept-imt-info: report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0
```

Dependencies

No related IMT command can be in progress when this command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

This command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The ending hourly time period cannot be less than the starting hourly time period.

If the sslot and eslot parameters are specified, then the sshelf parameter must be specified and the eshelf parameter cannot be specified (slot information is reported for a single shelf).

A value of *hmutexerr*, *hiprerr*, or *hipr2err* must be specified for the report parameter before the sshelf and eshelf parameters can be specified.

The MUX card slots (09 and 10) cannot be specified for the sslot and eslot parameter values.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The shelf locations specified by the `sshelf` and `eshelf` parameters must be provisioned in the frame.

The `report=err` parameter must be specified before the `erronly` and `mode` parameters can be specified.

The `sshelf` parameter must be specified, and a value of `hiprerr` or `hipr2err` must be specified for the `report` parameter before the `sslot` and `eslot` parameters can be specified.

A value of `hiprerr`, `hipr2err`, or `hmutexerr` must be specified for the `report` parameter before the `sshelf` or `eshelf` parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Hourly Bucket Statistics

Hourly Bucket Statistics apply to cards on the IMT bus and to MUX cards. Each hourly time period (*bucket*) contains the statistics for a single hour. A total of 16 hourly time periods, numbered 0 - 15, exist. Hourly time period 0 is the most-recent (current), and hourly time period 15 is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period 0 are now reported in the hourly time period 1, and so on. The statistics reported in the hourly time period 15 are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period 0 and changes to hourly time period 1 at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

MUX Statistics

A MUX card stores the statistics separately for each card on its shelf. If the `sloc` and `eloc` parameters are specified, then the card sends the statistics for each card to the OAM application for display. If the `sloc` and `eloc` parameters are not specified, then the card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

Low Speed Summary

Table 39: rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Packet CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
		card, MUX card, FC cable or backplane.	the Customer Care Center.
IMT Rx Packet Format Error	Receive Format error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware/software.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact the Customer Care Center.
IMT Rx Violation Error	Violation Error: Received an illegal character from the physical IMT transport (TAXI Interface). Detected by hardware	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Command Error	Reserved.	Reserved.	Reserved.
IMT Rx FIFO Full	Receive FIFO Full: Watermark indication that this interface receiving data off the TAXI line is receiving traffic in excess of what it can handle. Some traffic will have been discarded. May cause retransmissions, CRC errors and Format errors.	Relatively heavy traffic on this interface can cause these counts to increment. If these counts occur in the field, a software problem may exist.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that the interface receiving data off the TAXI line has received substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication; no action is required.
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost.	Relatively heavy traffic on this interface can cause these counts to increment. This	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
	This stat is only meaningful for MUX card columns.	condition should never occur. These events may indicate a software problem	perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.
CPU Rx FIFO Empty Before SOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO from the low speed link.	None. This error will automatically empty the FIFO so it is ready to continue receiving data. If the error continues, contact the Customer Care Center.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO and the end (EOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the low speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the error continues, contact the Customer Care Center.
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the IMT bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None. If the problem persists, contact the Customer Care Center.
CPU Rx Packet CRC Error	Occurs when valid packet data is read from the CPU Rx FIFO and transferred to the processor memory and calculated CRC does NOT match the CRC word at the end of the packet.	The data was corrupted while being written into the CPU Rx FIFO or data coming from the low speed link is corrupted.	None. If the problem persists, contact the Customer Care Center.

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
DMA Terminal Count	Received IMT packet length is longer than the max allowed. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Clear the stats and if the problem persists, contact the Customer Care Center.
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Full	Transmit Buffer Full : The Tx Buffer unexpectedly filled up.	Either the COM software attempted to transmit too much data at once or the Tx logic was unable to transmit the data.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Half Full	Transmit Buffer Half Full : Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy outbound traffic on this interface can cause these counts to increment.	None. Buffer Half Full is just an indication, no action is required.
CPU Rx FIFO Full	Receive FIFO Full : The Rx FIFO unexpectedly filled up.	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	Receive FIFO Half Full : Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.
IMT Bypass FIFO Full	IMT Bypass FIFO Full : The bypass FIFO unexpectedly filled up.	Relatively heavy traffic on this interface can cause these counts to increment. If these counts occur in the field, a software problem may exist.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Bypass FIFO Half Full	IMT Bypass FIFO Half Full : Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.

High Speed Summary

Table 40: rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Disparity Error	Fibre Channel Receive Packet with Disparity Errors: Parity error in received packet. Usually caused by corrupted data.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Sync Lost Error (This error count is not used in MUX card.)	Fibre Channel Receive Lost Synchronization Errors: The receiver on this interface lost synchronization.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Code Word Error	Fibre Channel Receive code Word Errors: Error in received packet. Caused by corrupted data.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Packet SOM Before EOM	Fibre Channel Receive Packet with Start of Message without a previous End of Message Errors: The software detected the start of a new packet	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
	before the end of the previous packet was detected.		may exist. Contact Customer Care Center.
IMT Bypass FIFO Full	Fibre Channel Bypass FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Should not occur in a properly functioning system, and may indicate a software or hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Bypass FIFO Half Full	Fibre Channel Bypass FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is just an indication: no action is required.
IMT Rx FIFO Full	Fibre Channel Receive FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Should not occur in a properly functioning system. Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx FIFO Half Full	Fibre Channel Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full in this case is just an indication; no action is required.
IMT Tx FIFO Full	Fibre Channel Transmit FIFO Full: Watermark indication that this interface has transmitted substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full in this case is just an indication; no action is required.

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Tx FIFO Half Full	Fibre Channel Transmit FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is just an indication; no action is required.
IXP Rx FIFO Full	Fibre Channel IXP Receive FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Should not occur in a properly functioning system. Indicates a software or hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
CPU Rx Fifo Full	Receive FIFO Full : The Rx FIFO unexpectedly filled up.	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	Receive FIFO Half Full : Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.
CPU Rx FIFO Empty Before SOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO from the high speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, contact the Customer Care Center.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the high speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, contact the Customer Care Center.

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the Fibre Channel bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None. If the problem persists, contact the Customer Care Center.
CPU Rx Packet CRC Error	Occurs when valid packet data is read from the CPU Rx FIFO and transferred to the processor memory and calculated CRC does NOT match the CRC word at the end of the packet.	The data was corrupted while being written into the CPU Rx FIFO or data coming from the high speed link is corrupted.	None. If the problem persists, contact the Customer Care Center.
DMA Terminal Count	Received IMT packet length (on Fibre Channel) is longer than the max allowed. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Clear the stats and if the problem persists, contact the Customer Care Center.
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, contact Customer Care Center.
CPU Tx Buffer Full	Transmit Buffer Full : The Tx Buffer unexpectedly filled up.	Either the COM software attempted to transmit too much data at once or the Tx logic was unable to transmit the data.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Half Full	Transmit Buffer Half Full : Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy outbound traffic on this interface can cause these counts to increment.	None. Buffer Half Full is an indication, no action is required.

IMT Rx DSU Byte Per Second AVG	Average bytes per second received on the line card interface within best effort delivery packets.	Normal behavior	None. Information only.
IMT Rx MSU Byte Count	Number of bytes received on the line card interface within reliable delivery packets.	Normal behavior	None. Information Only
IMT Rx ASU Byte Count	Number of bytes received on the line card interface within acknowledgment packets.	Normal behavior	None. Information only.

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx DSU Byte Count	Number of bytes received on the line card interface within best effort delivery packets.	Normal behavior	None. Information only.
IMT RX HSU Byte Count	Number of bytes received on the line card interface within mux specific packets.	Normal behavior	None. Information only.
IMT Rx LSSU Byte Count	Number of bytes received on the line card interface within virtual circuit alignment packets.	Normal behavior	None. Information only.
IMT Rx TSU Byte Count	Number of bytes received on the line card interface within test data packets.	Normal behavior	None. Information only
IMT Rx SSU Byte Count	Number of bytes received on the line card interface within safety packets.	Normal behavior.	None. Information only.
IMT Rx BSU Byte Count	Number of bytes received on the line card interface within broadcast packets.	Normal behavior	None. Information only.
IMT Rx Byte Other	Number of bytes received on the line card interface within data packets other than the above.	Normal behavior	None. Information only.
IMT Rx Total Byte Count	Number of bytes received on the line card interface within all types of packets.	Normal behavior	None. Information only.
IMT Rx MSU Packet Count	Number of reliable delivery packets received on the IMT.	Normal behavior	None. Information only.

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx ASU Packet Count	Number of acknowledgment packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx DSU Packet Count	Number of best effort delivery message data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx HSU Packet Count	Number of mux card data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx LSSU Packet Count	Number of virtual circuit alignment packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx TSU Packet Count	Number of test data packets received on the IMT.	Normal behavior.	None. Information only.
IMT Rx SSU Packet Count	Number of safety packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx BSU Packet Count	Number of broadcast data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx Packet Other	Number of all packets types not counted by one of the above.	Normal behavior	None. Information only.
IMT Rx Total Packet Count	Number of packets received on the IMT, all types.	Normal behavior	None. Information only.
IMT Rx MSU Packet Safety Count	Number of reliable delivery message data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx ASU Packet Safety Count	Number of acknowledgment packets that did not	Normal behavior	None. Information only.

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
	arrive to the intended recipient on the IMT.		
IMT Rx DSU Packet Safety Count	Number of best effort delivery packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx HSU Packet Safety Count	Number of mux card packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx LSSU Packet Safety Count	Number of virtual circuit alignment packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx TSU Packet Safety Count	Number of test data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx SSU Packet Safety Count	Number of safety packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx BSU Packet Safety Count	Number of broadcast data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Other Packet Safety Count	Number of other packets types not included above that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Total Packet Safety Count	Number of all packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Packet Violation Error	Number of packets received that contained an illegal character.	Card insertion, removal, boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear,

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
			there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
IMT Rx Packet CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
IMT Rx Packet Format Error	Receive Format error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware/software.	Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
IMT Rx Packet Discard Error	Number of packets received that were discarded by this interface.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear then there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
IMT Tx Packet Format Error	Number of packets transmitted that were detected to contain a data format error.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear then there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
IMT Tx Packet Discard Error	Number of packets that were discarded by the transmit interface.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. if stats are clear then there is no action to perform. If errors continue a problem

			may exist. Contact Customer Care Center.

Miscellaneous Summary

Table 41: rept-imt-info Statistics, Miscellaneous Summary

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
Shelf ID UART Framing Error	The Mux card at this location detected a framing error within the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
Shelf ID UART Overrun Error	The Mux card at this location detected a overrun error in the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.

Output

An asterisk (*) is appended to each statistic in the output when one or more MUX cards are unable to report statistics during the collection of IMT statistics.

IMT statistics are displayed as '-' instead of zero for counts when the IMT bus is down or inhibited in the output for `rept-imt-info` reports for MUX cards.

This example output displays the output when IMT Bus A and Bus B are normal and all HMUX cards are reporting the statistics:

```
rept-imt-info:report=hmuxerr:sbucket=0
```

```

rlghncxa03w 10-01-17 00:10:20 PST EAGLE 42.0.0
HMUX Summary Report: Summed across all requested cards for each bucket
Collecting HMUX stats: Extended processing time required.

Legend

IMT Statistics:

- **Bucket**—The hourly time periods (*buckets*) for which a report was requested.
- **Statistic**—The error statistic type for the IMT buses A and B.
- **Bus A Value**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus A.
- **Bus B Value**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus B.
- **Low Speed Statistic**—The error statistic type for the low speed 125 Mbps secondary rings with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **High Speed Statistic**—The error statistic type for the high-speed 1 Gbps primary ring with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Misc Speed Statistics**—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Bucket Summary**—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the `rept-imt-info` command.)
- **Cumulative**—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MUX Statistics:

- **Bucket**—The hourly time periods (*buckets*) for which a report was requested.
- **Loc**—The card location (shelf and slot) for which information is displayed.
- **Low Speed Statistic**—The error statistic type for the low speed 125 Mbps secondary rings with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **High Speed Statistic**—The error statistic type for the high-speed 1 Gbps primary ring with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Misc Speed Statistic**—The miscellaneous error statistic type.
- **Bus A**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus A.
- **Bus B**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus B.

Related Commands

[clr-imt-stats](#), [init-imt-gpl](#), [rept-imt-lvl1](#), [rept-imt-lvl2](#), [tst-imt](#)

rept-imt-lvl1

Report IMT Level 1

Use this command to display IMT level 1 statistics for a card or a range of cards. A summary report of totals for all cards is also generated.

Parameters

e (optional)

End address. The IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 42: Hexadecimal/Decimal Values for s and e Parameters](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0-251 or hexadecimal (*h'00 – h'fe*)

Default:

If the s parameter is specified, the default value is the s parameter value.

If the s parameter is not specified, the e parameter cannot be specified and the sloc parameter must be specified.

eloc (optional)

End location. The card location of the last card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 -
3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108,
4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 -
5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If sloc is specified—current sloc value; displays information for one card

If sloc is not specified— 1115 , which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

eshelf (optional)

End Shelf location. The shelf location of the last shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200,
5300, 6100

Default:

if the sshelf parameter is specified—current sshelf value

if the sshelf parameter is not specified— 6100 , which displays information for entire range of shelves

filter (optional)

The filter that determines the information that is displayed in the report.

Range:

error

display all error counts

perf

display performance counts

erroronly

display non-zero error counts

full

display zero and non-zero error counts and performance counts

Default:

full

hs (optional)

This parameter specifies whether to include High Speed interface counts in the report.

Range:

no

do not include High Speed interface counts

yes

include High Speed interface counts

Default:

no

r (optional)

Report type value

Range:

full

Displays information for each card along with a summary report.

stats

Displays only individual card statistics.

summary

Displays the summary portion of the report.

Default:

full

s (optional)

Start address. The IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 42: Hexadecimal/Decimal Values for s and e Parameters](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0-251) or hexadecimal (h'00 – h'fb)

sloc (optional)

Start location. The card location of the first card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If eloc is specified—current eloc value

If eloc is not specified— *1201* , which corresponds to IMT address 0 (*s=0*).

sshelf (optional)

Start Shelf location. The shelf location of the first shelf in the range.

Note: This parameter specified alone is the equivalent to specifying the IMT address range. For example, “*sshelf=1200*” is equivalent to specifying the IMT address range as “*s=h'00:e=h'0f*”.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

if the eshelf parameter is specified—the current eshelf value

Default:

if the eshelf parameter is not specified— *1100* , which displays information for the entire range of shelves

trm (optional)

This parameter specifies the terminal port where the report is sent.

Range:

1 - 40

Default:

Report displays on the terminal where the command was issued

Example

This example requests low speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00
```

This example requests a summary report of low speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00:r=summary
```

This example requests low speed interface counts.

```
rept-imt-lvl1:sshelf=1200
```

This example requests low speed interface counts for individual cards.

```
rept-imt-lvl1:sshelf=1200:r=stats
```

This example requests low speed and high speed interface counts.

```
rept-imt-lvl1:sshelf=1200:hs=yes
```

This example requests low speed and high speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00:hs=yes
```

This example requests an error report for non-zero error counts.

```
rept-imt-lvl1:s=h'00:e=h'00:filter=error-only
```

This example requests an error report for zero and non-zero error counts.

```
rept-imt-lvl1:s=h'00:e=h'00:filter=error
```

Dependencies

Only one report status command can be in progress at a time.

The `s`, `sloc`, or `sshelf` parameter must be specified in the command.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The command cannot be entered if the `clr-imt-stats`, `rept-imt-info`, `rept-imt-lvl2`, or `tst-imt` command is running.

Only one of the `sloc/eloc`, `s/e`, and `sshelf/eshelf` parameter combinations can be specified in the command.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Low speed ring counts and performance counts

If an HMUX card is not present in the shelf, then HMUX low speed ring counts are not displayed. If HIPR or HIPR2 cards are not present in the shelf, then performance counts are not displayed.

Table 43: Level 1 IMT Statistics describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

These statistics are displayed when the `rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full` command is entered.

Table 43: Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Rx CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system. Indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
Rx Format Error	Receive Format Error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware.	Service/Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system. Indicates a hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
		failure: defective LIM card, MUX card, FC cable or backplane.	issue is present. Contact Customer Care Center.
Rx Inv Len	Receive Packet with Invalid Length: Card received an IMT packet where the actual length of the packet did not match the length indicated in the length field. Detected by software	Software defect. Does not occur in a normal system.	Contact Customer Care Center.
Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that this interface receiving data off the TAXI line has received substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication; no action required.
Rx FIFO Full	Receive FIFO Full: Watermark indication that this interface receiving data off the TAXI line is receiving traffic in excess of what it can handle. Some traffic will have been discarded. May cause retransmissions, CRC errors and Format errors. Detected by hardware	Relatively heavy traffic on this interface can cause these counts to increment. Seeing these counts in the field may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	CPU Receive FIFO Half Full: Communication CPU on the card is becoming congested. Detected by hardware. This stat is only meaningful for cards that contain a BPxxxx GPL.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	None: FIFO Half Full is an indication; no action required.
CPU Rx FIFO Full	CPU Receive FIFO Full: Communication CPU on the card is becoming	Relatively heavy traffic on this interface can cause these counts to	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to

	<p>congested. Data has been dropped. May cause retransmissions, format and large packet errors. Detected by hardware.</p> <p>This stat is only meaningful for cards that contain a BPxxxx GPL.</p>	<p>increment. May indicate a SW problem.</p>	<p>perform. If errors continue, a hardware issue is present. Contact Customer Care Center.</p>
CPU Rx MSU FIFO Full	<p>CPU Receive MSU FIFO Full: Watermark indication that the MSU traffic is in excess of what the card can handle. Traffic will have been discarded. Expect retransmissions and possibly other errors.</p> <p>This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a MSU with no CRC error.</p>	<p>Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.</p>	<p>Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.</p>
CPU Rx LSSU FIFO Full	<p>CPU Receive LSSU FIFO Full: Watermark indication that the LSSU traffic is in excess of what the card can handle.</p> <p>This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a LSSU with no CRC error.</p>	<p>May indicate a hardware failure (i.e.: a defective board), although a software issue is also possible.</p>	<p>Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.</p>
CPU Rx XSU FIFO Full	<p>CPU Receive XSU FIFO Full: Watermark indication that the XSU traffic is in excess of what the card can handle.</p>	<p>Relatively heavy traffic on this interface can cause these counts to increment.</p>	<p>Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware</p>

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	<p>This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined not to be a MSU, LSSU or ASU, and no CRC error. Data internal to this card has been lost.</p>		<p>issue exists. Contact Customer Care Center.</p>
ASU Rx FIFO Half Full	<p>CPU Receive ASU FIFO Half Full: Watermark indication that this interface has received substantial ASU traffic.</p> <p>This stat is only meaningful for cards that contain a BPxxxx GPL; the FIFO stores data determined to be an ASU with no CRC error.</p>	<p>Relatively heavy traffic on this interface can cause these counts to increment.</p>	<p>None. FIFO Half Full is an indication. No action required.</p>
ASU Rx FIFO Full	<p>CPU Receive ASU FIFO Full: Watermark indication that the ASU traffic is in excess of what the card can handle. ASUs will have been lost resulting in retransmission and other possible LVL1 errors.</p> <p>This stat is only meaningful for cards that contain a BPxxxx or IMTPCI GPL; the FIFO stores data determined to be an ASU with no CRC error.</p>	<p>Relatively heavy traffic on this interface can cause these counts to increment. Seeing these counts in the field may indicate a software problem.</p>	<p>Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.</p>
SSU Packet Rx	<p>Safety Packets Received: This message type detects the loss of a card in the system if virtual connections between cards are lost.</p>	<p>Card insertion, removal, or boot, heavy traffic, abnormal conditions and/or software/hardware problems can result in these packets being generated.</p>	<p>None. These counts are an indication. No action required.</p>

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
ASU Safety Pkt	ASU Safety Packets: ASU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
TSU Safety Pkt	TSU Safety Packets: TSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
BSU Safety Pkt	BSU Safety Packets: BSU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
SSU Safety Pkt	SSU Safety Packets: SSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Other Safety Pkt	Other Safety Packets Received: Possible message types are MSU, DSU, ISU, and/or HSU.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Pri Ctrl Rx Error	Primary control receive error: Corrupted packet received. Detected by hardware	Card insertion, removal, or boot	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Pri Ctrl Sanity Err	Primary Control Sanity Error: Internal hardware monitoring self check failed. Detected by hardware	Indicates that the hardware receive logic was unable to successfully process the incoming packet. May indicate a hardware problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
RX HW flow control event	Indicates the number of times the HW RX FIFO's backed up to a point to request the other end to HOLD until room is made available in the RX FIFO. Counts in the MUX column indicate the receiver was backed up on the MUX.	Does not indicate a problem just an indication of low level congestion. Should excessive counts be seen it could indicate a problem.	None. RX HW flow control event is an indication. No action is required.

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	Counts in the COM side indicate the LIM receiver was backed up.		
Pri Ctrl No SOM	Primary Control No Start of Message Error: Incoming data was detected without a start of message (SOM.) This stat is only meaningful for cards that contain a BPxxxx GPL.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Pri Ctrl Tx Err	Primary Control Transmit Error: Transmit logic encountered a problem sending a packet. Detected by hardware. This stat is only meaningful for application cards.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.
Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a software problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Future Field	Reserved	Reserved	Reserved
Future Field	Reserved	Reserved	Reserved

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	May indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO 3/4 Full	Reserved	Reserved	Reserved
IMT By-pass FIFO Half Full	Watermark indication that this interface has backed to fill half on the FIFO. This stat is only meaningful for cards that contain a BLMCAP GPL.	May indicate that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.
IMT By-pass FIFO Full	By-pass FIFO overflowed data has been lost. This stat is only meaningful for cards that contain a BLMCAP GPL.	Very little if any data flows through this FIFO. May indicate a hardware problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced.
Pass thru CRC Error	Reserved	Reserved	Reserved
Lost Multicast Pkt	Lost Multicast Packets: This counter increments when the interface detects that one of these packets has not been	Card insertion, removal, or boot. These events may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	<p>delivered to a card in the list.</p> <p>This stat is only meaningful for application card columns.</p>		continue, a problem may exist. Contact Customer Care Center.
Invalid Interrupt	<p>The interface generated a spurious interrupt.</p> <p>This stat is only meaningful for cards that contain an IMTPCI GPL.</p>	May indicate a software or hardware defect.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced.
Error Int Overflow	Deprecated	Deprecated	Deprecated
Large Pkt Error	<p>Large Packet Error: The interface has detected packets larger than allowed in the data stream.</p> <p>This stat is meaningful for all cards except those containing the IMTPCI GPL.</p>	Card insertion, removal, boot, or a hardware error. May indicate a hardware problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
MSU Retran / MUX LVL1 Cong	<p>COM - Retransmissions occur when a transmitted MSU does not receive an acknowledgment (ASU) within an engineered timeout value. Detected by software.</p> <p>This stat is only meaningful for application cards.</p> <p>MUX - Count of occurrences that the MUX has reached level 1 congestion on the transmit path to the LIM (works in conjunction with MFC)</p>	<p>COM - Card insertion, removal, or boot. May indicate hardware, software or configuration problems.</p> <p>MUX - Nothing specific to do except for monitor for excessive counts</p>	<p>COM - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.</p> <p>MUX - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.</p>

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
MSU ROE / MUX LVL2 Cong	<p>COM - MSU Returned On Error: Number of MSUs returned to the application as undeliverable. Each application is responsible for indicating their need for MSUs to be returned if undeliverable. This count is for messages that the application has deemed important and requested that they be returned if undeliverable. Detected by software.</p> <p>MUX - Count of occurrences that the MUX has reached level 2 congestion on the transmit path to the LIM (works in conjunction with MFC)</p>	<p>COM - Destination card is not available to receive packets.</p> <p>MUX - Nothing specific to do except monitor for excessive counts</p>	<p>COM - None. MSU Returned on Error is an indication. No action is required.</p> <p>MUX - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.</p>
VC OS Cnt / MUX Cong Disc	<p>COM - Virtual Circuit Out of Service Count: Count of times a Virtual Circuit (VC) on this card has gone Out of Service.</p> <p>Note: The A and B bus counts will be the same. For the VC to drop, communications on both busses must be lost.</p> <p>This stat is only meaningful for application cards.</p> <p>MUX - Count of occurrences that the MUX has reached congestion discard on the transmit path to the LIM. More data is being delivered to the transmit queue than can</p>	<p>COM - Destination card is not available to receive packets, or software/hardware errors that cause the virtual connection(s) to be dropped. Could occur during normal maintenance (card replacement/upgrades, or booting).</p> <p>MUX - Packets are being dropped or retransmitted internally. This should not occur.</p>	<p>COM - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.</p> <p>MUX - Contact Customer Care Center.</p>

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	be transmitted to the slot/LIM.		
Bus Disconnect Count	<p>Bus Disconnect Count:</p> <p>Counts the times that the card has been disconnected from the bus.</p> <p>Note: The A and B bus counts can be different.</p> <p>This stat is only meaningful for application cards.</p>	Any event that disconnects the card from the bus can cause this counter to increment (e.g. connectivity problems to the IMT bus, or issuing the <code>disc-imt</code> or <code>inh-imt</code> command)	If commands that disconnect the card from the bus have not been issued, clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Violation Error	<p>Received an illegal character from the physical IMT transport (TAXI Interface).</p> <p>Detected by hardware</p>	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Info: MSU Dropped no Rept	<p>MSU Dropped With No Report: Number of undeliverable MSUs that are not being returned to the application.</p> <p>Note: This statistic may be non-zero after executing the <code>rept-imt-lvl1</code> or <code>clr-imt-stats</code> command. During execution of these commands, the active MASP generates MSUs to unpopulated card slots. These MSUs result in an "MSU Dropped With No Report" count. To determine the number of unexpected "MSU Dropped With No Report" occurrences, the active MASP must</p>	Destination card is not available to receive packets.	None. MSU Dropped is an indication. No action is required.

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
	be excluded from the rept-imt-lvl1 card range.		

Level 1 IMT Statistics, Low Speed Performance Counts

The probable cause for all Level 1 IMT Statistics, Low Speed Performance Counts is normal behavior. These counts are information only, and no action is required.

These statistics are displayed when the `rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full` command is entered.

- All Packets—Number of packets transmitted on the IMT, all types
- All bytes—Number of bytes transmitted on the IMT, all types
- MSU Packets—Number of reliable delivery message data packets transmitted on the IMT
- MSU Bytes—Number of reliable delivery message data bytes transmitted on the IMT
- ASU Packets—Number of acknowledgment packets transmitted on the IMT
- ASU Bytes—Number of acknowledgment bytes transmitted on the IMT
- DSU Bytes—Number of best effort delivery message data bytes transmitted on the IMT
- HSU Packets—Number of mux card data packets transmitted on the IMT
- HSU Bytes—Number of mux card data bytes transmitted on the IMT
- TSU Bytes—Number of test bytes transmitted on the IMT
- TSU Packets—Number of test packets transmitted on the IMT
- LSSU Packets—Number of virtual circuit alignment packets transmitted on the IMT
- LSSU Bytes—Number of virtual circuit alignment bytes transmitted on the IMT
- BSU Packets—Number of broadcast data packets transmitted on the IMT
- BSU Bytes—Number of broadcast data bytes transmitted on the IMT
- SSU Packets—Number of Safety packets transmitted on the IMT
- SSU Bytes—Number of safety bytes transmitted on the IMT
- Othr Packets—Number of all packets types not counted by one of the above
- Othr Bytes—Number of all data bytes not counted by one of the above
- TAXI Util—Approximate percentage utilization of Low Speed data bus

High Speed Error Summary for Level 1 IMT Statistics

[Table 44: Level 1 IMT Statistics, High Speed Error Summary](#) displays the High Speed Error Summary for Level 1 IMT Statistics.

These statistics are displayed when the `rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full` command is entered.

Table 44: Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Rx Packet CRC Error	Fibre Channel Receive Packet with CRC Errors: Checksum error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
			continue a problem may exist. Contact Customer Care Center.
HS Rx Packet Format Error	Fibre Channel Receive Packet with Format Errors: Format error in received packet. Usually caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Disparity Error	Fibre Channel Receive Packet with Disparity Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Sync Lost Error	Fibre Channel Receive Lost Synchronization Errors: The interface lost sync on the received stream.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Code Word Error	Fibre Channel Receive code Word Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx Packet SOM Before EOM	Fibre Channel Receive Packet with Start of Message without a previous End of Message Errors: The software received detected the start of a new packet before the end of the previous packet was detected.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Bypass FIFO Half Full	Fibre Channel Bypass FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Bypass FIFO Full	Fibre Channel Bypass FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Rx FIFO Half Full	Fibre Channel Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Rx FIFO Full	Fibre Channel Receive FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS Tx FIFO Half Full	Fibre Channel Transmit FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Tx FIFO Full	Fibre Channel Transmit FIFO Full: Watermark indication that this interface has transmitted substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full is an indication. No action is required.

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
IXP RX FIFO Half Full	Fibre Channel IXP Receive FIFO Half full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
IXP Rx FIFO Full	Fibre Channel IXP Receive FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.
HS RX Large PKT Discard	A packet larger than allowed was processed on the receive path of the Fibre Channel. May result in significant downstream errors.	Indicates a software or hardware failure, unless the BUS is being brought up or being taken down.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.

Note: In the top portion of this sample output "Error Counts" there are three types of possible output for each field:

- 1) A decimal number (indicates a count)
- 2) "--" (indicates NO DATA)
- 3) "N/A" (indicates this field is not supported)

Legend

- **Card**—IMT address of the card in hexadecimal
- **Elapsed Time (day - h:m:s)**— Amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the `clr-imt-stats` command. This is shown in the format *day - h:m:s*, where *day* is the number of days that have elapsed, and *h:m:s* is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).
- "--" in the statistics column signifies that the statistics count is not applicable for the corresponding Card type.
- **Error Count**—IMT level 1 error statistics displayed in this report.
- **Perf Count**—IMT level 1 performance statistics displayed in this report.
- **A Bus value** and **B Bus value**—Values of the IMT level 1 statistics on IMT bus A and IMT bus B. Refer to the Notes section for descriptions of the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions. Contact the Customer Care Center if the count is excessive in relation to other cards.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Packets are included in the counts:

- **Safety Packet**—When an IMT packet goes around the IMT, a pre determined value in the packet is decremented by each card. When this value reaches zero, the card that receives the value equal to zero logs this as a safety packet and removes the IMT packet from the IMT.
- **Message Signaling Unit (MSU)**—IMT packet containing data
- **Acknowledgement Signaling Unit (ASU)**—ACK for an MSU that is sent from the destination card back to the originating card.
- **Test Signaling Unit (TSU)**—Typically used to keep the card on the bus. There are many types of TSUs one of which performs a heartbeat function.
- **Broadcast Signaling Unit (BSU)**—Function is the same as an MSU except that each card will process the BSU and then copy it to the next card for processing. Used for IMT maintenance functions.
- **Safety Signaling Unit (SSU)**—Anytime a packet times out (Safety Packet), the card that logged a safety packet sends an SSU to make sure the original destination card is still on the IMT bus.
- **Isolation Signaling Unit (ISU)**—These are only used by the Fault Isolation test (`tst-imt`), in an attempt to isolate a hard failure on an IMT bus.
- **Other Packets and Other Bytes**—These include the ISUs when Fault Isolation test (`tst-imt`) is run (IMT bus is inhibited) and TVG packets when the IMT bus is allowed.

rept-imt-lvl2

Report IMT Level 2

Use this command to display IMT level 2 statistics for a card. This report displays IMT traffic statistics for one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the loc or l parameters), whose statistics pool is queried for report information, and another card (specified with the sloc or s parameter).
- Report statistics between the source card and a range of cards (specified with the sloc/eloc or s/e parameter combinations).

Parameters

b (optional)

IMT bus identification.

Range:

a

Displays statistics for IMT bus A.

b

Displays statistics for IMT bus B.

both

Displays statistics for both IMT busses, A and B.

Default:

both

e (optional)

End address. The IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 42: Hexadecimal/Decimal Values for s and e Parameters](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0 – 251) or hexadecimal (*h'00 – h'fe*).

Default:

If the s parameter is specified, the default is the s parameter value.

If the s parameter is not specified, the default is 251 .

eloc (optional)

End location. Specifies the card location of the last card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If sloc is specified—current sloc value; displays information for one card

If sloc is not specified— 1115 , which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

l (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for report information.

Range:

0 - 251

loc (optional)

Source card location. The location of the card whose "statistics pool" is to be queried for report information.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

s (optional)

Start address. The IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 42: Hexadecimal/Decimal Values for s and e Parameters](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0 – 251) or hexadecimal (h'00 – h'fe)

Default:

If e is specified—current l parameter value.

If e is not specified— 0 .

sloc (optional)

Start location. The card location of the first card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If eloc is specified—current sloc value.

If eloc is not specified—IMT address 0 (s=0).

trm (optional)

Serial port (printer location) where the report is to be sent.

Range:

1 - 40

Default:

The report displays on the terminal where the command was issued.

Example

```
rept-imt-lvl2:l=00:s=00:e=02:b=a
```

Dependencies

The s/e parameters and sloc/eloc parameters cannot be specified together in the command.

This command cannot be entered if the `clr-imt-stats`, `rept-imt-info`, `rept-imt-lvl1`, or `tst-imt` command is running.

The l or loc parameter must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The l parameter or the loc parameter must be specified. Both parameters cannot be specified.

A card location must be specified that is valid and defined in the database.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

[Table 42: Hexadecimal/Decimal Values for s and e Parameters](#) maps each card location to the decimal and hexadecimal values that can be specified for the s and e parameters.

Output

If the source card location falls within the range of cards specified with the sloc/eloc or s/e parameters, then the output report for the source card shows zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports the values or pegs received, transmitted, or re-transmitted across the IMT bus.

Legend

- **Card**—IMT address of the card location specified by the *l* parameter in this command in hexadecimal
- **Bus**—IMT bus for which the IMT level 2 statistics are being reported
- **Field**—IMT level 2 statistics displayed in this report
- **00 - ef**—IMT address of the cards on the IMT bus in hexadecimal
- **Link Status**—Status of the link: ALGN (aligned) or OS (out of service)
- **OS Count**—Number of times the link has cycled between being aligned and being out of service
- **Transmit BSN**—Number of BSNs transmitted.
- **Transmit FSN**—Number of FSNs transmitted
- **Receive BSN**—Number of BSNs received
- **Receive FSN**—Sequence number for the next FSN that the source card location expects to receive
- **Unack Messages**—Number of unacknowledged messages received
- **Invalid Length**—Number of messages received with invalid length indicators
- **Invalid rx BSN**—Number of invalid BSNs received
- **Invalid rx FSN**—Number of invalid FSNs received
- **Invalid LSSU**—Number of invalid LSSUs received
- **Invalid ASU**—Number of invalid ASUs received
- **RTB Address**—Address of the retransmission buffer, in hexadecimal
- **Retx count**—Number of re-transmitted MSUs
- **Minimum ack time**—Minimum amount of time for an acknowledgment, in milliseconds
- **Maximum ack time**—Maximum amount of time for an acknowledgment, in milliseconds

rept-meas

Report Measurements

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

Parameters

enttype (mandatory)

Entity type to report on.

Range:

idpr

	Measurements for IDPR
<i>link</i>	Measurements for signaling links
<i>lnkset</i>	Measurements for linksets
<i>lnp</i>	Measurements for local number portability
<i>lsdestni</i>	Measurements for linkset destination network identifiers
<i>lsonismt</i>	Measurements for ISUP message type screening
<i>lsorigni</i>	Measurements for linkset originating network identifiers
<i>mapscrn</i>	Measurements for GSM MAP message screening
<i>np</i>	Measurements for INP, INP CRP, G-Port, A-Port, MO-based GSM SMS NP, MO-based IS41 SMS NP, IGM, MT-Based GSM SMS NP, and MT-Based IS41 SMS NP
<i>origni</i>	Measurements for originating network identifiers greater than 5
<i>origininc</i>	Measurements for originating network identifiers (less than 5, small networks) for network clusters
<i>sctpasoc</i>	Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, SUA and DIAM traffic)
<i>sctpcard</i>	Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, SUA and DIAM traffic)
<i>sip</i>	Measurements for SIP
<i>stp</i>	Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP
<i>stplan</i>	Measurements for STP Local Area Network data links
<i>tt</i>	Measurements for translation types

ua

Measurements per application server/association for the M3UA and SUA protocols

type (mandatory)

Type of measurement report.

Range:***avl***

Availability measurements

avld

Daily availability measurements

avldth

Day to hour availability measurements.

comp

Component measurements

gtwy

Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd

Daily maintenance measurements

mtcdth

Day-to-hour maintenance measurements

mtch

Hourly maintenance measurements

mtcs

Link/linkset maintenance status

nm

Network management, on-demand

rbase

Schedule-report type record base measurements

systot

STP system totals

aname (optional)

Association name. This parameter specifies the name assigned to the association in the IPAPSOCK table.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

appl (optional)

GPL to report measurements on.

This parameter can be used only with the *stplan-avl* (*enttype=stplan:type=avl*) measurement report.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc —Used by E5-ATM or E5-ATM-B cards to allow the card to support up to 3 signaling links

ipghc —Used by E5-ENET or E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

iplhc —Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

sccphc —Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM4G or E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

ss7ml —Used by MPL and E1/T1 MIM cards. The GPL allows the MPL card to support 8 signaling links. MPL cards support only the DS0 interface. The GPL allows the E1/T1 MIM card to support 8 signaling links for E1 and T1 functions.

vxwslan —Used by SSEDCCM cards to support the STPLAN application

asname (optional)

Application server name. The name of the application server.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

day (optional)

Day of the week for daily measurement reports.

Range:

mon

tue

wed

thu

fri

sat

sun

Default:

The previous single day report is generated.

hh (optional)

Half-hour interval. The ending time for the collection interval; for example, *hh=0300* generates a report for 2:30-3:00.

Range:

0000 - 2400

hhmm where *hh*= 00-24 (hour) and *mm*= 00 or 30 (minute)

Default:

The hh parameter value is not given.

link (optional)

The link on the card specified in the loc parameter

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table 54: Summary of Ranges for link Parameter](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

Default:

none

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

none

lsn (optional)

Linkset name for the linkset where link or linkset measurements are reported.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

none

nc (optional)

Network cluster for the specified GTWY measurement report.

Range:

0 - 255

Default:

none

ni (optional)

Network indicator for the specified GTWY measurement report.

Range:

0 - 255

Default:

none

nzo (optional)

Print non-zero measurements only.

Range:

yes

no

Default:

yes for types *avl*, *avld*, and *avldth*.

This parameter is not used with the other report types.

period (optional)

Relative time period to report.

Range:

last

The previous collection interval

specific

A specific half-hourly interval (specified with the *hh* parameter)

active

The current collection interval

all

All collection intervals.

Default:

none

qh (optional)

Quarter-hour interval. This parameter implies the ending time for the collection interval; for example, *qh=0315* generates a report for 3:00-3:15.

Range:

0000 - 2400

hhmm where *hh*= 00-24 (hour) and *mm*= 00, 15, 30, or 45 (minute)

Default:

none

trm (optional)

Serial port (printer location) where the report is to be sent.

Range:

1 - 16

Default:

none

tt (optional)

Translation type to be reported.

Range:

0 - 255

Default:

none

Example

```

Dependencies

This command cannot be used to specify a report type if that report type is currently printing.

Valid parameter combinations depend on the report type specified. These combinations are shown in [Table 45: Valid Parameter Combinations for the type Parameter](#) . An X in a cell indicates that the parameter is valid for the report type shown.

Table 45: Valid Parameter Combinations for the type Parameter

Parameter Value	Report Types (type parameter)											
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase
enttype:												
link		X	X	X		X	X	X	X	X		X
Parameter Value	Report Types (type parameter)											
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase
linkset		X	X	X		X	X				X	X
lnp			X		X							
lsdestni											X	
lsonismt											X	
lsorigni											X	
mapscm			X		X							
np			X		X							
origni											X	
origninc											X	
sctpasoc		X	X	X								
sctpcard		X	X	X								
sip	X		X									
stp	X		X	X		X					X	X
stplan	X		X	X				X				
tt	X											
ua		X	X	X								
period:												
last	X	X	X	X	X		X	X	X	X	X	
specific	X	X			X			X			X	
active		X				X	X	X				X
all			X					X				
nzo								X	X	X		

When the Enhanced GSM MAP Screening (EGMS) feature is turned on, this command cannot be used to generate EGMS measurements reports.

The entity specified by the `loc` parameter must be equipped in the database.

When `enttype=link` is specified, the card in the location specified by the `loc` parameter must be a LIM.

Hourly collection and report processing cannot be in progress when report type `mtch` is specified.

Quarter-hourly collection and report processing cannot be in progress when report type `comp`, `systot`, `avl`, or `gtwy` is specified.

The `mtcdth` report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress when report type `mtcd` or `mtcdth` is specified.

Daily collection and report processing cannot be in progress when report type `mtcd` is specified.

Half-hourly collection and report processing cannot be in progress when report type `comp`, `systot`, `avl`, or `gtwy` is specified.

5-minute collection and report processing cannot be in progress when report type `nm` is specified.

If the `nc` parameter is specified for origininc reports, then the `ni` parameter must be specified.

If the `ni` parameter is specified for origin reports, then measurements data must be available at the time the command is entered.

The `day` parameter can be specified only for report type `mtcd` and entity types `lnp` and `mapscrn`.

The LNP feature must be turned on before the `enttype=lnp` parameter can be specified.

The GSM Map Screening feature must be turned on before the `enttype=mapscrn` parameter can be specified.

A primary MCPM card must be available when the Measurements Platform collection option is enabled and this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the `qh` parameter can be specified.

The `hh` parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (`mtcd` and `nm` are excluded with message "E2307: QH or HH is not valid for this TYPE"). An hourly boundary must be specified for report type `mtch` (that is, only half hours ending in 00, such as 0100, 0200 or 0300).

The `hh` and `qh` parameters cannot be specified together in the command.

When the `period=last` parameter is specified, the `hh`, `qh`, and `day` parameters cannot be specified.

If the `period=active` parameter is specified, then the `hh` and `qh` parameters cannot be specified.

When the `period=specific` parameter is specified, the `hh`, `qh`, or `day` parameter must be specified. The `hh`, `qh`, and `day` parameters can be specified only if the `period=specific` parameter is specified.

A quarter-hour boundary must be specified for the `qh` parameter, except for report type `mtch`. An hourly boundary must be specified for report type `mtch` (only quarter hours ending in 00, such as 0100, 0200, or 0300).

The `hh` and `qh` parameters cannot be specified if a value of `avld`, `mtcd`, `nm`, `rbase`, or `mtcs` is specified for the `type` parameter.

If the `link` parameter is specified, the `loc` parameter must be specified.

The `lsn` and `loc` parameters cannot be specified together in the command.

If the `enttype=link` parameter is specified, then the `loc` and `port` parameters or the `lsn` parameter must be specified.

The `enttype=stplan` and the `type=avl` parameters must be specified before the `appl` parameter can be specified.

The `period=active` parameter cannot be specified when the `enttype=stp` parameter or the `enttype=tt` parameter is specified.

If a value of `idpr`, `lnp`, `mapscrn`, `np`, `origni`, `origininc`, `stp`, `stplan`, or `tt` is specified for the `enttype` parameter, or if the `type=systot` parameter is specified, then the `lsn` parameter cannot be specified.

For entity type `avl`, if `period=all` is specified, the `loc` and `port` parameters must be specified.

A value of `avl`, `avld`, or `avldth` must be specified for the `type` parameter before the `nzo=yes` parameter can be specified.

The `appl` and `loc` parameters cannot be specified in the same command line.

When the `enttype=lnp` parameter is specified, the `trm` parameter cannot be specified because LNP measurements can be written only to the FTA. To retrieve this data, use the procedure described with the `act-file-trns` command information.

The `type=systot` and `loc` parameters cannot be specified in the same command line.

If the `type=gtwy` parameter is specified, and the value of the `enttype` parameter is `lsorigni`, `lsdestni`, or `lsonismt`, then the `ni` parameter cannot be specified for ITU linksets. The `ni` parameter is allowed only for ANSI linksets.

If the `type=gtwy` parameter is specified, and a value of `lsdestni`, `lsonismt`, or `lsorigni` is specified for the `enttype` parameter for an ITU linkset, then only the `lsn` parameter can be specified.

If the `enttype=sctpcard` parameter is specified, then the `card` in the location specified by the `loc` parameter must be an IPLIMx, IPGWx, or IPST card.

The `enttype=sctpasoc` or `enttype=ua` parameter must be specified before the `aname` parameter can be specified.

The `enttype=ua` parameter must be specified before the `asname` parameter can be specified.

The G-Port, INP, or AINPQ feature must be turned on before the `enttype=np` parameter can be specified.

If the `enttype=sctpcard` parameter is specified, then the `loc` parameter must be specified.

If the `enttype=sctpcard` parameter is specified, then a card must be installed in the location specified by the `loc` parameter.

The `enttype=link` parameter must be specified before the `link` parameter can be specified.

The `type=gtwy` parameter and the `enttype=origininc` parameter must be specified before the `nc` parameter can be specified. If the `enttype=lnp` parameter is specified, then the `nc` parameter cannot be specified.

The `type=gtwy` parameter must be specified, and a value of `lsdestni`, `lsonismt`, `lsorigni`, `origni`, or `origininc` must be specified for the `enttype` parameter before the `ni` parameter can be specified. If the `enttype=lnp` parameter is specified, then the `ni` parameter cannot be specified.

The `enttype=tt` parameter must be specified before the `tt` parameter can be specified. If the `enttype=tt` parameter is specified, then the `tt` parameter must be specified.

If a value of `sctpasoc` or `ua` is specified for the `enttype` parameter, then the `aname` parameter must be specified.

The association specified by the `aname` parameter must be provisioned in the system.

If the `enttype=ua` parameter is specified, then the `asname` parameter must be specified.

The application server specified by the `asname` parameter must be provisioned in the system.

The association specified by the `aname` parameter must be assigned to the application server specified by the `asname` parameter.

The `lsn` and `link` parameters cannot be specified together in the command.

If the `period=all` parameter is specified, then the `hh` and `qh` parameters cannot be specified.

Either the specified Linkset does not exist or no link is configured for it.

The A-Port, G-Port, IS41 GSM Migration, or Prepaid SMS Intercept Ph1 feature must be enabled, or the INP, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the `mtchnp=on` parameter or the `mtcdnp=on` parameter can be specified.

The value specified for the `appl` parameter must be a supported GPL.

If the Integrated Measurements feature is turned on, then a value of `lnp`, `np`, or `mapscrn` cannot be specified for the `enttype` parameter.

If the `loc` parameter is specified, then a value of `stplan`, `link`, or `sctpcard` must be specified for the `enttype` parameter. If the `enttype=lnkset` parameter is specified, then the `loc` parameter cannot be specified.

If the `enttype=link` parameter is specified, then the values specified for the `loc` and `link` parameters must already exist in the database.

Period/type combinations:

- If a value of `rbase` or `mtcs` is specified for the `type` parameter, then a value of `active` must be specified for the `period` parameter.
- If a value of `avld`, `avldth`, `mtcdth`, or `nm` is specified for the `type` parameter, then the `period=specific` parameter cannot be specified.
- If the `period=active` parameter is specified, then a value of `avld`, `avldth`, `mtcd`, `mtch`, `mtcdth`, or `systot` cannot be specified for the `type` parameter.
- The `type=avl` parameter or the `enttype=lnp` and `type=mtcd` parameters must be specified before the `period=all` parameter can be specified.
- If the `type=mtcd` and `period=specific` parameters are specified, then a value of `lnp`, `mapscrn`, or `np` must be specified for the `enttype` parameter.

SIPNP Feature must be enabled before the `enttype=sip` and `type=mtcd/systot` parameters can be specified.

The location specified must be in the range from 1101 to 6118, except for MUX cards.

If the `enttype=tt` parameter is specified, then the `tt` parameter must be specified.

The `type` parameter must be one of the AVL, AVLD, AVLDTH, COMP, GTWY, MTCD, MTCPTH, MTCH, MTCS, NM, RBASE, or SYSTOT range values.

An entity type (ENTTYPE) of DEIR, EIR, LNP, MAPSCRN, NP, or VFLX requires the DAY parameter to be specified.

Notes

INP, GSM MAP screening, LNP, G-Port, A-Port, and IGM measurements are sent to the FTA (file transfer area) rather than to the EAGLE terminal.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The `rept-meas` command must be entered again.

If this command is executed, and one or more cards did not respond to the request for measurements because the card was Out-Of-Service, then the following warning message may appear:

```
Measurement data represents an incomplete interval
```

This message does not indicate that data was lost.

If this command is executed, and measurements data does not exist for the specified time, then the following message may appear:

```
LINK-COMP MEASUREMENT:  LOC: 1201, LINK: A, LSN: (MTP2)
Measurement data are not current.
```

Default values are shown for LOC, LINK, and LSN. These values always appear in the message, no matter what values were specified in command.

Output

Note: Refer to *Measurements Reference* for `rept-meas` output examples.

Related Commands

[chg-meas](#), [copy-meas](#), [rept-ftp-meas](#), [rtro-meas-sched](#)

rept-stat-alm

Report Status Alarm

Use this command to provide status of all alarms.

Parameters

cli (optional)

CLLI string. Displays only alarms that pertain to a particular CLLI.

Range:

```
ayyyyyyyyyyy
```

dev (optional)

Device. The type of device for which alarms are displayed.

Range:

applsock
as
card
cdt
clock
dlk
ls
lsmconn
route
slk
trm
rtx
e1port
t1port
tps
enet

display (optional)

Type of alarms to be displayed. When the `disply=inhb` parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The `dev` parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

Range:

inhb

dur (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the `display=inhb` parameter is specified.

Range:

perm

temp

timed

edate (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

Range:

101 - 991231

Specify the date in the format *year*, followed by *month*, followed by *day*.

Example

```
rept-stat-alm
rept-stat-alm:display=inhb:dev=card
rept-stat-alm:display=inhb:clli=slkset1:dev=ls
rept-stat-alm:display=inhb
rept-stat-alm:display=inhb:dur=timed
rept-stat-alm:display=inhb:dur=timed:edate=040520
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `dur` parameter can be specified only if the `display=inhb` parameter is specified.

The `dur`, `dev`, or `clli` parameter can be specified only if the `display=inhb` parameter is specified.

The `edate` parameter can be specified only if the `dur=timed` parameter is specified.

The `dev` parameter can have only the values *slk*, *ls*, or *route* if the `clli` parameter is specified.

The `dur` parameter must be compatible with the specified device.

The value specified for the `clli` parameter must already exist in the DSTN table.

The value specified for the `edate` parameter must be greater than the system date.

Notes

None

Output

This example shows the output when the system is clean and before a maintenance baseline has been established:

```
rept-stat-alm
```

```

This example includes the Alarm Inhibit report for multiple device types. It includes point codes with point code subtype prefixes, and exception routes that require a second line of display to uniquely identify the exception class/criteria of the routes. A plus sign (+) following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

Legend

- **ALARM TRANSFER**—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.
- **ALARM MODE**—Displays whether the critical, major, and minor alarms are silent or audible
- **ALARM FRAME 1**—Number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1)
- **ALARM FRAME 2**—Number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2)
- **ALARM FRAME 3**—Number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3)
- **ALARM FRAME 4**—Number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4)
- **ALARM FRAME 5**—Number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5)
- **ALARM FRAME 6**—Number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6)
- **ALARM FRAME GPF**—Number of critical, major, and minor alarms detected at the MPS (multi-purpose server). If the LNP feature is turned on, the number includes alarms for any applications running on the MPS. If the G-Flex, G-Port, INP, or AINP Q feature is turned on, the number includes alarms for any applications running on the GSM subsystem and the DSM/EPAP links.
- **PERM. INH. ALARMS**—Number of alarms that are permanently inhibited per alarm level
- **TEMP. INH. ALARMS**—Number of alarms that are temporarily inhibited per alarm level
- **TIMED. INH. ALARMS**—Number of alarms that are timed inhibited per alarm level
- **ACTIVE ALARMS**—Number of alarms still active per alarm level.

Range:

Default:

Current value

rhost (optional)

Remote host name. The logical name assigned to the remote host device.

Range:

abcdefghijklmnopqrstuvwxyzabcdefghijklmnopqrstuvwxyzabcdefghijklmnopqrstuvwxyz

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are *a-z, A-Z, 0-9, - (dash), . (period)*

Default:

Current value

sname (optional)

Socket name. The name of the IP application socket to be reported.

Range:

abcdefghijklmnop

Up to 15 alphanumeric characters; the first character must be a letter

Default:

All IP application sockets are reported

Example

```
rept-stat-applsock
rept-stat-applsock:port=b
```

Dependencies

The name parameter value, if specified, must exist in the Socket table.

A valid value must be specified for the host parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

This command displays the primary states (PST) and the secondary state (SST). Primary states are:

- IS-NR—In-service normal
- IS-ANR—In-service abnormal (congested)
- OOS-MT—Out of service

- OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Secondary states are:

- ALMINH—Alarm inhibited
- OOS—Out-of-service
- NEA—Near-end allowed
- FEA—Far-end allowed
- NEP—Near-end prohibited
- FEP—Far-end prohibited

Output

rept-stat-as

Report Status AS Association

Use this command to generate a report of the Application Server (AS) association status.

Parameters

aname (optional)

Association name to report on. This parameter causes the ASP states for a given association and all of the AS's that it is assigned to be displayed.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

asname (optional)

Application Server name; the AS name to report on. This parameter causes the the PST, SST, ASP state, and ASP-ID for each association in the AS to be displayed.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
rept-stat-as
```

Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

Output

```
rept-stat-as
```

```
rlghncxa03w 04-02-04 12:57:21 EST EAGLE 34.0.0

rept-stat-card

Report Status Card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

Parameters

appl (optional)

Application. The status of cards running the specified application.

Range:

xyyyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

atmansi —Used by E5-ATM and E5-ATM-B cards to support ATM high-speed signaling links and T1 functions.

atmitu —Used by E5-ATM and E5-ATM-B cards to support E1 high-speed signaling links and E1 functions.

ccs7itu —Used by HC-MIM, E5-E1T1, and E5-E1T1-B cards for ITU MTP functions.

deirhc— Used by E5-SM8G-B cards to support the S13/S13' EIR feature.

elap —Used by E5-APP-B cards to support the ELAP application.

epap —Used by E5-APP-B cards to support the EPAP application.

eroute —Used by STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support functions

gls —Used by E5-TSM cards for downloading gateway screening to LIM and Service Module cards

imf —Used by the E5-APP-B card to support IMF functionality.

ipgwi —Used by E5-ENET and E5-ENET-B cards for point-to-multipoint IP connectivity for ITU point codes. A maximum of 125 cards can be assigned the IPGWI application.

iplim —Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI point codes

iplimi —Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

ips —Used by E5-IPSM and E5-ENET-B cards for the IP User Interface feature.

ipsg —Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

lsms - Used by E5-APP-B cards to support LSMS application.

mcp —Used by E5-MCPM-B cards for the Measurements Platform feature.

nas - Used by E5-APP-B cards to support the NAS application.

siphc — Used by E5-SM8G-B cards to support the SIP application.

ss7ansi —Used by HC-MIM, E5-E1T1, and E5-E1T1-B cards for ANSI MTP functions

ss7ipgw —Used by E5-ENET and E5-ENET-B cards for point-to-multipoint IP connectivity. The system allows a maximum of 125 cards to be assigned the SS7IPGW application.

stplan —Used by E5-ENET and E5-ENET-B cards to support STP LAN functions.

switch - Used by Telco switch to add power consumed by Telco Switch to Frame Power Budget. This is not an application gpl.

vsccp —Used by Service Module cards to support EPAP-based features and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and a Service Module card is present, then normal GTT traffic is processed.

links (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (*loc*).

Range:

all

Reports the maximum number of links available on the card in the specified *loc*

equip

Reports only links that are equipped

unequip

Reports only links that are unequipped

Default:

equip

loc (optional)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1117, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118, 6201 - 6218, 6301 - 6318

Default:

A status of all cards is displayed.

mode (optional)

Mode. The type of report to display (full or summary).

Range:

full

Default:

A summary report is displayed.

stat (optional)

Primary state filter. This parameter cannot be used with the loc or mode parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbl

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-card
rept-stat-card:loc=1201
rept-stat-card:loc=1201:mode=full
rept-stat-card:stat=alminh
rept-stat-card:appl=ss7ansi
rept-stat-card:appl=siphc
rept-stat-card:loc=1205:links=equip:mode=full
rept-stat-card:appl=epap
rept-stat-card:appl=switch
rept-stat-card:appl=elap
```

```
rept-stat-card:appl=lsms  
rept-stat-card:appl=nas  
rept-stat-card:appl=deirhc
```

Dependencies

No other command can be in progress when this command is entered.

The mode parameter can be specified only when the loc parameter is specified.

Only one of the loc or stat parameters can be specified in the command.

No other parameter can be specified with the appl parameter.

The shelf and card must be equipped.

The card location (loc) must be within the allowed range.

A valid value must be specified for the appl parameter.

The card location specified by the loc parameter must be equipped.

Notes

If Message Flow Control (MFC) is OFF, then LIM cards show TVG results for SNM, SLAN, SCCP, EROUTE and INM. SCCP cards show TVG results for SNM and INM.

If MFC is ON, then LIM cards show MFC results for SNM, SLAN, SCCP, EROUTE, INM and MTP3. SCCP cards show MFC results for SNM, INM and MTP3 when the mode=full and loc parameters are specified.

The status displayed is for the previous 5 minutes and the previous 24 hours.

TVG status and MFC status both use G to indicate service request GRANTED, D to indicate service request DENIED, and N to indicate NO OPERATIONAL SERVERS AVAILABLE. In addition, TVG status only uses H for HARDWARE TIMEOUT, S for SOFTWARE TIMEOUT, and I to indicate INVALID RESULTS FROM HARDWARE.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The mode=full parameter gives more information than the summary report.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the `act/init-flash` command for a list of flash GPLs.

E1 alarms are displayed in the alarm status field. When the mode=full parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the mode=full parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist,

the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the links=all parameter is specified, then the maximum number of supported SS7 links on the card is displayed as shown. If the links=unequip parameter is specified, then the number of links displayed is equal to the maximum supported links minus the provisioned links. If the links=equip parameter is specified, then only the provisioned links are displayed.

Multiple cards of the same card type but different capacity can be installed into a slot configured with the ent-card command. The number of links supported cannot be determined until the card is physically installed into the configured slot.

Table 46: Maximum Supported Links based on Card Type and GPL

GPL with Card Type	Maximum Supported Links	
	Card Hardware Verified	Card Hardware Unknown
ATMHC on E5-ATM/E5-ATM-B	3	3
SS7HC on E5-E1T1	32	64
SS7HC on E5-E1T1-B	64	64
SS7HC on HC-MIM	64	64
IPLHC on E5-ENET/E5-ENET-B	16	16
IPGHC on E5-ENET/E5-ENET-B	1	1
IPSG on E5-ENET/E5-ENET-B	32	32

The CARD WARNING field in the command output indicates a specific condition that can hinder the normal functioning of a card. For HC-MIM, E5-E1T1 and E5-E1T1-B cards, the "Obsolete Framer" warning indicates that a port configured on the card may get stuck in a Loss of Frame (LOF) state. If an HC-MIM, E5-E1T1 or E5-E1T1-B card displaying this warning is reloaded, and one of the ports on the card is reporting LOF, then the OAM reboots the card up to 5 times to attempt to clear the LOF condition when the card changes state from IS-ANR to IS-NR.

Fast Copy Cards

E5-ENET or E5-ENET-B cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

If the 3 Links per E5-ATM feature is turned on, then E5-ATM and E5-ATM-B cards can support 3 links.

Output

The clock status fields are reported when the mode=full report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are *Idle*, *Active*, and *Fault*. The meanings of these values are:

- *Idle* —Clock is available but is not being used by the card

- *Active* —Clock is available and is being used by the card
- *Fault* —Clock is unavailable

Idle and *Active* are shown when the CLK or HS CLK distribution to the card is good. The *Active* value does not denote that the card is actually using the clock source for link alignment. Use the `rtrv-sl`, `rtrv-el`, and `rtrv-tl` commands to determine what clock source each card is using for link alignment.

If the `mode=full` parameter is specified for an FC-enabled card, and Fast Copy functionality has been provisioned for the GPL (see the `chg-eisopts` command), then Fast Copy status and FC Link status is shown. For an E5-ENET or E5-ENET-B card running the IPGHC GPL, Fast Copy and Fast Copy link status is shown only when the card is in IS-NR state.

Abbreviated output is indicated by 3 vertical dots as shown:

.
.
.

MCPM cards consist of EDSM-2G and E5-MCPM-B cards. If either MCPM card is used, then the *Type* field displays MCPM.

Card TYPE "ENET" appears if an E5-ENET card is not installed for an IPSG application. If an E5-ENET card (IPSG card) is installed, card TYPE "E5ENET" appears.

Legend

- **CARD**—Location of the card
- **VERSION**—Version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—Card type entered in the database.
- **APPL**—Application loaded on the card
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#) .
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#) .
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#) .

If Message Flow Control (MFC) is OFF, then Group Ticket Voucher status is displayed in these fields: SNM REQ STATUS (SNM messages), SLAN REQ STATUS (STPLAN messages), SCCP REQ STATUS (for SCCP messages), EROUTE REQ STATUS (EROUTE messages) and INM REQ STATUS (INM messages).

If MFC is ON, then Message Flow Control status is displayed in these fields: SNM REQ STATUS (SNM messages), SLAN REQ STATUS (STPLAN messages), SCCP REQ STATUS (SCCP messages), EROUTE REQ STATUS (EROUTE messages), INM REQ STATUS (INM messages) and MTP3 REQ STATUS (MTP3 messages).

For card type STC (EROUTE application), the TVG and MFC status are not displayed.

Group ticket voucher status output is displayed as a series of these letters:

- **G**—Service Granted. Indicates normal system behavior.
- **D**—Service Denied. Indicates an overload, but the group ticket voucher hardware and software are working correctly.
- **N**—No granter in the system. For GTT, STPLAN or EROUTE traffic, there can be no Service Module cards, STPLAN or EROUTE in the system. If there are Service Module cards, STPLAN or EROUTE in the system, then a serious failure is indicated (hardware or software bug or hardware failure).
- **H**—Hardware time-out. Indicates the hardware timed out waiting for a group ticket voucher packet to return. Group ticket voucher packets can be lost when a card is plugged in or booted. This is a serious condition if cards have not been connecting or disconnecting from the IMT. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in *Maintenance Guide*) or the card must be replaced..
- **S**—Software time-out. No result was ever returned from hardware, indicating a probable hardware failure.
- **I**—Invalid result from hardware. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in *Maintenance Guide*) or the card must be replaced.

Message Flow Control status output is displayed as a series of these letters:

- **G**—MFC found a service with available capacity. Indicates normal system behavior.
- **D**—Servers were present in the system, but no server had available capacity. Indicates an overload, but MFC is working correctly.
- **N**—No operational server cards were available in the system for use by this card over the corresponding interval.

The HW VERIFICATION CODE field is shown only in the mode=full report. ---- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

Table 47: Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
059	VSCCP	MPS database has been detected to exceed capacity of Service Module extended memory (only for GPORT, GFLEX, INP, EIR features). UAMs 281, 283, and 285 are used for LNP and LNP ELAP Configuration features.	422
099	E5-TSM	E5-TSM card equipped has one or more daughterboard.	99

HW Verification Code	Card or Application Code	Description	Associated UAM Code
101	SS7IPGW, IPGWI, IPLIM, IPLIMI	E5-ENET only supports SLK link A-7 and B-7.	276
102*	SS7IPGW, IPGWI	Non-DCM detected in slot.	99
103	SS7IPGW, IPGWI, IPLIM, IPLIMI	E5-ENET or E5-ENET-B does not support >16 associations (IPLIMx). E5-ENET or E5-ENET-B does not support >50 associations (IPGWx).	276
104	SS7IPGW, IPGWI, IPLIM, IPLIMI	E5-ENET or E5-ENET-B does not support >0 sockets (IPLIMx). E5-ENET or E5-ENET-B does not support >0 sockets (IPGWx).	276
106	SS7IPGW, IPGWI, IPLIM, IPLIMI	E5-ENET or E5-ENET-B does not support >3200Kb SCTP buffers (IPLIMx). E5-ENET or E5-ENET-B does not support >3200Kb SCTP buffers (IPGWx).	276
124	HC-MIM	Card is not an HC-MIM and is provisioned as a T1 card.	99
129	HC-MIM, E5-E1T1	Card does not support CAS framing.	297
131	HC-MIM, E5-E1T1	Card has channel bridging mode active but is not running supported high capacity GPL.	297
134	E5-E1T1	E5-E1T1 card with SLK provisioned on link greater than 15.	99
135	E5-E1T1	E5-E1T1 card supports only 1 SE-HSL link.	276

HW Verification Code	Card or Application Code	Description	Associated UAM Code
141	IPS	E5-IPSM card not running with D2G memory.	422
142	MCP	E5-MCPM-B card not running with D4G memory.	422
150	various	Card is obsolete.	47
165	VSCCP	Hardware configuration does not support configured feature set.	99
170	EROUTE	Non-DCM/Non-E5-ENET card detected in slot provisioned for <i>eroute with card type DCM</i> .	99
171	STPLAN	Non-E5-ENET/E5-ENET-B card detected in slot provisioned for STPLAN with card type DCM.	99
179	E5-ATM-B, E5-ENET-B, E5-E1T1-B	EPM-B based card detected and MFC is OFF.	99
180	SCCP, SS7ANSI	SCCP card equipped with DCM with MOBR on.	441

rept-stat-cdl

Report Command Driven Loopback Status

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the `tst-slk:loopback=lxvr` command, which loops the transmitted data back to the receive.

Parameters

link (optional)

SS7 signaling links. The signaling links that is being tested.

Synonym:

port

Range:**Default:**

All signaling links that are in CDL testing are displayed.

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108 , 6111 - 6118

Default:

All cards containing signaling links that are in CDL testing are displayed.

loopback (optional)

Loopback test type.

Range:

line

payload

Note: The payload value is valid only on LIM-ATM and E1-ATM cards.

Default:

All loopback tests are displayed.

Example

```
rept-stat-cdl
rept-stat-cdl:loc=1201
rept-stat-cdl:loc=1203:link=a
rept-stat-cdl:loopback=payload
```

Dependencies

If the `link` parameter is specified, the `loc` parameter must be specified.

The card location specified in the `loc` parameter must be equipped.

The signaling link specified in the `link` parameter must be equipped.

This command is not available during upgrade.

The card location specified in the `loc` parameter cannot be reserved by the system.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information

Output

rept-stat-cdl

```
tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK      CDL      CDL-TIME
1102,A1  LINE     00:04:01
1201,A   PAYLOAD  01:04:11
1203,A   LINE     00:22:21
1203,B   LINE     20:04:01
1208,A   LINE     01:05:22
1211,A   PAYLOAD  00:14:01
```

;

Legend

- **SLK**—The card and assigned signaling link that is in CDL testing
- **CDL**—Command Driven Loopback test type (LINE or PAYLOAD)
- **CDL-TIME**—Time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

rept-stat-cdt

Report Status Customer Defined Troubles

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

Parameters

This command has no parameters.

Example

rept-stat-cdt

Dependencies

No other status command can be in progress when this command is entered.

Notes

These troubles are customer-defined and configured by the factory.

Output

rept-stat-cdt

```

rlghncxa03w 04-01-07 20:20:43 EST  EAGLE 31.3.0
ID          ALARM STATUS
1      *C 0058  Critical Customer Trouble detected

rept-stat-clk

Report Status Clock

Use this command to display the clock status summary for cards in the system.

Parameters

mode (optional)

Display mode. When mode=full is specified, the "Cards with bad clock source" section of the report is displayed

Range:

full

Example

```
rept-stat-clk
```

```
rept-stat-clk:mode=full
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

The clock status report includes the status of all the clocks in the system (Clock A, Clock B, Clock I, High Speed (HS) Clock A, HS Clock B, etc).

The Time Slot Counter Synchronization (TSC) clock appears only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the `chg-feat` command.

The Composite clock sections of the report are the *Primary Comp Clock (CLK)* and *Secondary Comp CLK* fields in the COMPOSITE SYSTEM CLOCK section: the summary of the number of cards having bad status or using COMP CLKs: and the *CLK* columns in the "Cards with bad clock source" section that appears when the mode=full parameter is specified.

The HS clock sections of the report are the *Primary HS Clock (CLK)*, *Secondary HS CLK*, *HS CLK TYPE*, and *HS CLK LINELEN* fields in the HIGH SPEED SYSTEM CLOCK section: the summary of the number of cards having bad status or using HS CLKs: and the *HS CLK* columns in the "Cards with bad clock source" section that appears when the mode=full parameter is specified.

HS clock capable cards can support a link that is provisioned to use HS Master Timing. These cards include all cards with type LIME1 or LIMIT1 and all cards that run the ATMANSI or ATMITU applications. The clock status values are the same as those listed in the `rept-stat-card:mode=full:loc=xxx` report.

If HS clock A and B status is included in the "Cards with bad clock source" section, then cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status.

The PST/SST for the Primary Composite Clock (Comp Clk) 1114, Primary Comp Clk 1116, Secondary Comp Clk 1114, Secondary Comp Clk 1116, Primary HS Clk 1114, Primary HS Clk 1116, Secondary HS Clk 1114, and Secondary HS Clk 1116 can be one of the following values:

- IS-NR/active—clock source is valid, clock chosen as source
- IS-NR/idle—clock source is valid, clock not chosen as source
- OOS-MT/fault—clock source is invalid

The PST/ SST for the Composite System Clock and High Speed System Clock can be one of the following values:

- IS-NR/Idle—all cards showing good clock, clock not required
- IS-ANR/Idle—some cards showing bad clock, clock not required
- OOS-MT/Idle—all cards showing bad clock, clock not required
- IS-NR/Active—all cards “requiring clocks” showing good clock, clocks required
- IS-ANR/Fault—some cards “requiring clocks” showing bad clock, clocks required
- OOS-MT/Fault—all cards “requiring clocks” showing bad clock, clocks required

Note: An asterisk (*) indicates that the card requires the indicated clock.

Output

Note: A TDM card can use a local clock that is generated independently on each TDM as a clock source for the corresponding internal system clock. The system does not report the “cards bad” status for these internal clocks.

Note: The use of HS CLK I is not automatic when both the high-speed primary and secondary clocks are invalid. A LIM-ATM card must be provisioned (using the `ent-slk:atmtsel=internal` command) to use the high-speed internal clock.

Note: The *Using* field in the Composite Clock section describes all of the cards that are using the Composite Clock, not just LIM-DS0, MPL, or HS clock capable cards.

The following example shows output when two GPSM-II cards are configured, and LIM-DS0 cards, MPL cards, and HS clock capable cards are not configured. The TSCSYNC feature is not turned on.

Legend

- **COMPOSITE SYSTEM CLOCK**—Composite System clock status
- **ALARM STATUS**—System clock alarms; "No alarms" is shown when there are no alarms.
- **PRIMARY COMP CLK**—The status of the primary Composite clock input for a particular TDM
- **SECONDARY COMP CLK**—The status of the secondary Composite clock input for a particular TDM
- **CLK A** – Internal Eagle Clock sourced by the 1114 TDM from the selected clock source.
- **CLK B** – Internal Eagle Clock sourced by the 1116 TDM from the selected clock source.
- **CLK I** – Local clock generated independently on each LIM card.
- **Prefer CLOCK x for TSC CLOCK**—The preferred clock source of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.
- **HIGH SPEED SYSTEM CLOCK**—HS system clock status
- **ALARM STATUS**—HS System clock alarms; "No alarms" is shown when there are no alarms.
- **PRIMARY HS CLK**—The status of the high-speed primary clock input for a particular TDM
- **SECONDARY HS CLK**—The status of the high-speed secondary clock input for a particular TDM
- **HS CLK TYPE**—HS clock source (see the `chg-stpopts` command) for a particular TDM

- **HS CLK LINELEN**—HS clock line length (see the `chg-stpopts` command) for a particular TDM
- **HS CLK A** – Internal Eagle High Speed Clock sourced by the 1114 TDM from the selected clock source.
- **HS CLK B** – Internal Eagle High Speed Clock sourced by the 1116 TDM from the selected clock source.
- **HS CLK I** – Local clock generated independently on each LIM card. The value for the internal high-speed clock (Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by the Xilinx on the LIM main board when the LIM card does not have a valid system clock source (eg. both A system clock and B system clock are bad at the LIM card).

rept-stat-cluster

Report Status Cluster-Related DPC

Use this command to report summary status and statistical information for all provisioned clusters. Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

Note: This command does not support 24-bit ITU national point codes.

Parameters

dpc (optional)

ANSI destination point code of the cluster whose status is to be reported ,with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym:

dpca

Range:

p-, *000-255*, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

Default:

Display summary for all provisioned clusters

mode (optional)

The type of display. Specify mode=full to display additional information for the specified DPC.

Range:

full

Default:

Display summary report

stat (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-cluster
rept-stat-cluster:stat=alminh
rept-stat-cluster:stat=MT
rept-stat-cluster:dpc=20-2-*
rept-stat-cluster:dpc=20-2-*:mode=full
rept-stat-cluster:dpc=20-2-5
```

Dependencies

If the `mode=full` parameter is specified, the `dpc/dpca` parameter must be specified.

The `stat` parameter cannot be specified with the `dpc/dpca` parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as `ni-nc-*`. A DPC with `ni-nc-*` or `ni-nc-***` cannot be specified.

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the `dpc/dpca` parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the `mode=full` parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format hh:mm is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "----" are displayed.

Output

This example shows the output when no parameters are specified. Summary information for all of the defined cluster DPCs is shown. The report shows the number of provisioned and x-list members of each cluster.

```

If a circular routing alarm is raised for a cluster DPC, then specifying the `dpc` and `mode=full` parameters displays information pertinent to the cluster member experiencing the circular routing condition. The value for the `MEMBER` field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

Note: The circular routing member information shown in this output report displays as `***-***-***` if the specified DPC is not a cluster DPC or the information is not known by maintenance at the time the report is generated.

```
rept-stat-cluster:dpc=20-2-*:mode=full

Legend

- **ORIG**—Origination of the destination point code being reported. Possible values that can appear in the column are:
- **CLUST**—Entry is a provisioned cluster (*ni-nc-**) DPC
- **PROV**—Entry is a provisioned cluster member (*ni-nc-ncm*)
- **X-LIST**—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member
- **X-REASON**—Reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:
- **RT**—X-LIST entry created due to routing
- **CG**—X-LIST entry created due to congestion
- **CR**—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the mode=full detailed output report displays as "-----" if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

Related Commands

[chg-feat](#), [chg-stpopts](#), [rept-stat-cluster](#), [rtro-stpopts](#)

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

If the AINPQ, G-Flex, G-Port, INP, LNP ELAP Configuration, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the status of the MPS databases and Service Module cards is displayed.

Parameters

db (optional)

Report section or sections to display in the output. The content of each section depends on the specified or default value of the display parameter, MPS output appears only if a feature that uses the MPS is turned on in the system (G-Flex, G-Port, INP, PPSMS, or the LNP ELAP Configuration controlled feature) or the ATINP feature is enabled.

Range:

all

displays database and card output for the STP and MPS report sections

mps

displays database and card output for the MPS report section

stp

displays database and card output for the STP report section

Default:

all

display (optional)

Output type.

Range:

all

Displays operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

brief

Displays operational status of databases in the active and standby MASP and of MPS databases if a feature that uses the MPS is turned on

except

Displays operational status information contained in the display=brief output along with the cards whose database level does not match the active fixed disk current partition or active MPS database

version

Displays the same information that is displayed with the display=all parameter except that the individual database status column is replaced with the database format version and status. Details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the `rept-stat-mps` command.

Default:*brief***loc (optional)**

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

Example

```
rept-stat-db
rept-stat-db:display=all
rept-stat-db:loc=1207
rept-stat-db:db=stp
```

Dependencies

The db and loc parameters cannot be specified at the same time.

For EOAM cards, values of 1113, 1115, and 1118 cannot be specified for the loc parameter. For E5-OAM cards, values of 1117 and 1118 cannot be specified for the loc parameter.

One of the following features must be turned on, or the ATINP feature must be enabled before the db=mps parameter can be specified:

- A-Port
- AINPQ
- Diameter S13/S13' Interface for EIR
- EIR
- G-Flex
- G-Port
- INP
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- SIP NP
- V-Flex

The shelf and card must be equipped.

The card location slot must be between 1 and 18, but not 9 or 10.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

The frame value of the shelf location parameter (*loc*) must be within the valid range.

Notes

If the *display*, *db*, or *loc* parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the `rept-stat-db` command with no parameters specified or with the *display=brief* parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable cartridge or drive (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the EIR, G-Flex, G-Port, INP, PPSMS, or V-Flex feature is turned on, or the ATINP feature is enabled, EPAP A and EPAP B database status followed by Service Module card database status
- If the LNP ELAP Configuration controlled feature is turned on, ELAP A and ELAP B database status followed by Service Module card database status

The output when the *display=except* parameter is specified shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output when the *display=all* parameter is specified shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output when the *display=version* parameter is specified shows the coherency and the number of updates for the active and standby databases, along with the database version and the operational status of each of these databases. If the LNP feature is turned on, the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the `rept-stat-mps` command to display version information for these databases.

The output when the *loc* parameter specifies an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The *db* parameter is used to limit the output of the command to the EAGLE STP information or the MPS information. The information is displayed as indicated by the *display* parameter value (*display=version* is not valid for *db=mps*; the command does not display the MPS database versions). The default *db* parameter value is *all*, which displays the information for the STP and MPS databases and cards as indicated by the *display* parameter value.

Output

Note: Credit card USB database information is shown only for the Active OAM slot, whether or not a credit card drive is inserted into the standby OAM.

Note: A status of 'OK' indicates that the database has no errors.

This example shows the output for a specified card. The disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

```

This example shows the output when the LNP ELAP Configuration feature is turned on, and ELAP is used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

```
rept-stat-db:display=all:db=mps
```

```

Legend

- **DATABASE STATUS**—Indicates any database alarms on the MASPs. Not used with *loc* parameter output.
 - >> OK<<—No database alarms
 - >>NOT OK (DMS)<<—Database DMS alarms are present
 - >>NOT OK (DRMS)<<—Database DRMS alarms are present
 - >>NOT OK (DMS,DRMS)<<—Database DMS and DRMS alarms are present
- **(ACTV MASP)**—The specified MASP is the active processor. Not used with *loc* parameter.
- **(STDBY MASP)**—The specified MASP is the standby processor. Not used with *loc* parameter.
- **(NOACCS)**—The specified processor is not accessible. Not used with *loc* parameter.
- **C**—Indicates whether the database is coherent
- **Y** —the database is coherent
- **N** —the database is not coherent
- Dash (-)—the database is not accessible
- **LEVEL**—Number of updates made to the database partitions

- **TIME LAST BACKUP**—Date and time the last change was performed on the removable cartridges or drives (if inserted) and the backup partition of the fixed disk. Not used with loc parameter.
- **TIME LAST UPDATE**—Date and time of the last update on the card database from OAM. Not used with loc parameter.
- **RD BKUP**—Removable cartridge or drive backup partition
- **FD BKUP**—Fixed disk backup partition
- **FD CRNT**—Fixed disk current partition. Not used with the loc parameter output.
- **DIFF CONTENTS**—The specified database's contents are different compared to the other database in that partition.
- **DIFF LEVEL**—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).
- **DIFF TIME**—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.
- **CORRUPTED**—The specified database is corrupted.
- **INCOHERENT**—The specified database is incoherent.
- **EXCEPTION**—The following values can appear:
 - The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A "-" indicates that the database was not accessible. A blank entry indicates that the database has no problems. This field is used with the display=except, display=all, and loc parameter outputs.
 - A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.
- **IN-SRVC**—Length of time the card has been in service
- **CARD/APPL**—Card type or application assigned to the card specified in the **LOC** field. Not used with the display=brief (default) output.
 - **TDM-BKUP**—Backup partition on the fixed disk on the TDM
 - **TDM-CRNT**—Current partition on the fixed disk on the TDM
- **LOC**—Card location of the database. Not used with display=brief (default) output.
- **T**—Indicates whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM) or E5-TSM being loaded with the new screen set information after an update to the database, and the database has not reached the current reported database level. Not used with display=brief (default) output.
- **Y**—the database is in transition
- **N**—the database is not in transition.
- **TIME LAST BACKUP**—The date and time the last change was performed on the specified card and its associated database. A dash (-) in this field for the fixed drive (FD) or removable cartridge or drive (RD) indicates that no backup has been created on that drive. Not used with display=brief (default) output.
- **VERSION**—Version number of each database (including the LNP database if the LNP feature is on)
 - xxx-xxx-xxx—Version number of the database

- **UNKNOWN**—The `rept-stat-db` command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.
- A dash "-"—The database is not available. Used only with `display=version` output.
- **STATUS**—Operational status of the database version. Used only with `display=version` output.
 - **NORMAL**—The database version is fully operational.
 - Blank entry—Indicates the database is not available or is unknown. A numeric value indicates the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.
- **BIRTHDATE**—Date and time of creation for the database
- **EPAP A (ACTV)**—The active EAGLE Provisioning Application Processor. This section appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on or the ATINP feature is enabled.
 - **PDB**—Provisioning database status information
 - **RTDB**—Provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.
 - **RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.
- **EPAP B (STDBY)**—The standby EAGLE Provisioning Application Processor. This section appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on, or the ATINP feature is enabled.
 - **PDB**—Provisioning database status information
 - **RTDB**—The provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.
 - **RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.
- **ELAP A (ACTV)**—The active EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration feature is turned on.
 - **RTDB-EAGLE**—ELAP resident Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

- **TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS
- **ELAP B (STDBY)**—The standby EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration feature is turned on.
- **RTDB-EAGLE**—The ELAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.
- **TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS

Report Dynamic Database Status

Use this command to obtain the most recent dynamic database (DDB) audit report. The DDB audit report displays the checksums of the Route, Linkset, Link, CM Card, CM Cluster, Mated Application, and MTP globals. The report displays the exact status of active MTP card after audit and cause of that status.

Parameters

display (optional)

This parameter specifies the type of report to display.

Range:

brief

all

Default:

brief

filter (optional)

This parameter provides a full DDB audit report for cards that meet the specified criteria.

Range:

resp

Responding cards

nrsp

Non-responding cards

incn

Inconsistent cards

cons

Consistent cards

ncons

Not-consistent cards: includes cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO_DATA

ndat

Cards marked as "No Data" because the checksum of dynamic tables is not available

nddl

Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state

nddb

Cards marked as "No Data" because the checksum of dynamic tables is not available due to non-initialization of DDB

duip

Cards returning replies marked as "DDB update in progress"

duipt

Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task

duipc

Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation

nquiet

Cards returning replies having idle period less than the quiet period

list (optional)

This parameter displays a list of cards that meet the specified criteria.

Range:***resp***

Responding cards

nrsp

Non-responding cards

incn

Inconsistent cards

cons

Consistent cards

ncons

Not-consistent cards, including cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO_DATA

ndat

Cards marked as "No Data " because the checksum of dynamic tables is not available

nddl

Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state

nddb

Cards marked as "No Data " because the checksum of dynamic tables is not available due to non-initialization of the DDB

duip

Cards returning replies marked as "DDB update in progress"

duipt

Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task

duipc

Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation

nquiet

Cards returning replies marked as having the idle period less than the quiet period

Example

```
rept-stat-ddb
rept-stat-ddb:display=all
rept-stat-ddb:list=resp
rept-stat-ddb:filter=nddb
```

Dependencies

Audit data is available only if the execution of a periodic or manual DDB audit is complete (see the `aud-data` command).

If the system is in upgrade mode, then this command cannot be entered.

The `display`, `list`, and `filter` parameters cannot be specified together in the command.

Notes

A question mark (?) indicates that the corresponding card's status is not evaluated (Inconsistent/Consistent) when system status is marked as ABORTED.

Cards having an additional status of IGNORED responded with "DDB update in progress". These cards are not considered for calculating system status.

Output

The MATED APPL field is displayed only for Service Module cards.

rept-stat-ddb:display=all

Legend

- SYSTEM STATUS:

- **OK**—DDB is consistent on all active MTP cards or no active MTP card is present in system
 - **INCONSISTENT**—DDB is inconsistent
 - **UNKNOWN**—"All active MTP cards in the system responded without the checksum of DDB table" or "No active MTP card in the system responded to audit request"
 - **ABORTED**—"Checksums collected failed to meet the quiet period requirement" or "Number of cards responded with "DDB update in progress" greater than 25% number of cards responded with data"
-
- **ACTIVE MTP CARDS**—Number of active MTP cards
 - **NON RESPONDING CARDS**—Number of non-responding cards
 - **RESPONDING CARDS**—Number of responding cards
 - **CARDS WITH NO DATA**—Cards sending replies without the checksum of dynamic tables, due to incomplete DDL crossload or DDB initialization
 - **CARDS WITH DATA**—Cards sending replies with checksums
 - **CARDS FAILING QUIET PRD**—Cards failing quiet time requirement
 - **CARDS WITH DDB UPD IN PRG**—Cards sending replies marked as "DDB update in progress" due to DDB checksum not evaluated completely or TSRC task is incomplete
 - **CARDS CONSIDERED FOR CKSM**—Cards sending correct replies. Replies are not marked with "DDB update in progress" or "Reply with no data".
 - **INCONSISTENT CARDS**—Cards that are inconsistent
 - **CONSISTENT CARDS**—Cards that are consistent
 - **AUDIT START TIME**—Time that the audit started (*DD/MM/YYYY hh:ms:ss*format)
 - **QUIET PERIOD**—Minimum DDB idle time, in milliseconds, during which no DDB updates are applied
 - **RTE**—Checksum of RTE Table
 - **LINK SET**—Checksum of Link Set Table
 - **LINK**—Checksum of Link Table
 - **CM CARD**—Checksum of CM Card
 - **CM CLSTR**—Checksum of CM Cluster
 - **MATED APPL**—Checksum of Mated Application
 - **MTP GLOBS**—Checksum of MTP Globals Table
 - **IDLE (PERIOD)**—Time elapsed, in milliseconds, since the last DDB update was received by this card
 - **DDB UPD**—Total DDB updates received on the card
 - **ADDN'L STATUS**—Display more information for the card, including WWA updates or whether card is considered for audit calculations
 - **CAUSE**—Display the reason for sending replies of type "reply with no data " or "DDB update in progress". This value can be DDL (crossload not completed), DDB (dynamic database is not initialised) , (TSRC, DDB) (TSRC task is not completed) or DDB (checksums still needs to apply on tables).
 - **?**—Card status is not evaluated (inconsistent/consistent) if the system status is marked as "ABORTED"
 - **IGNORED**—Card responded with "DDB update in progress" and is not considered for calculating system status
 - **WWA UPD**—Number of entries that were updated by the WWA

rept-stat-deir

Report Diameter EIR Status

Use this command to display the overall status of the Diameter EIR service on the EAGLE.

Parameters

dcname (optional)

Diameter connection name. This parameter specifies the unique logical name assigned to each diameter connection. It shall display Status, TPS and Statistics of the Diameter connection specified.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

System Default:

null

loc (optional)

Diameter card location for which Card status, overall card TPS and total statistics of the card is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

mode (optional)

Display Diameter connection statistics.

Range:

perf

Displays per card TPS statistics, DEIR Service statistics, and per connection TPS statistics.

stat

Displays per card TPS statistics, DEIR Service statistics, and per connection service statistics.

peakreset (optional)

Reset peak values for a card or a specified diameter connection.

Range:

yes

Reset the peak value.

no

Do not reset the peak value.

Example

```
rept-stat-deir
rept-stat-deir:loc=1207
rept-stat-deir:dcname=dc1207a
rept-stat-deir:mode=perf
rept-stat-deir:peakreset=yes:loc=1207
rept-stat-deir:mode=perf:loc=1207
rept-stat-deir:mode=stat:loc=1207
rept-stat-deir:mode=stat
```

Dependencies

S13/S13' EIR Feature must be activated before retrieving the overall status of DEIR cards.

The (1) mode and loc parameters, (2) loc and peakreset parameters, or (3) dcname and peakreset parameters can be specified together. No other combination is allowed.

The location specified with this command should be of a DEIR card running DEIRHC gpl.

At least one Diameter EIR card running the DEIRHC gpl must be configured.

The Diameter connection name specified must be present in the DCONN table.

The card at the specified location must support this command.

Diameter card location or diameter connection name must be specified with peakrest parameter.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```
rept-stat-deir

This section defines the fields of the following `rept-stat-deir` reports:

- `rept-stat-deir`
- `rept-stat-deir:loc=1207`
- `rept-stat-deir:dname=dc1207a`
- `rept-stat-deir:mode=perf`
- `rept-stat-deir:peakreset=yes:loc=1207`
- `rept-stat-deir:peakreset=yes:dname=dc1217`
- `rept-stat-deir:mode=stat`
- `rept-stat-deir:mode=stat:loc=1101`

A dash (-) in an output field indicates that the statistic does not apply.

- **CARD IS-NR** -Number of DEIR cards running the DEIRHC GPL that can be used by the system (status is In-Service Normal, IS-NR).
- **CARD**-Card location of the DEIR card running the DEIRHC GPL
- **P**- The primary Service Module card. This card provides the MPS status to the EAGLE. This indicator is displayed between the card location and the GPL version.
- **VERSION** -Version number of the DEIRHC GPL running on the DEIR card.
- **PST** -Primary state of the card. See [Possible Values for PST/SST/AST](#)
- **SST**-Secondary state of the card. See [Possible Values for PST/SST/AST](#)
- **AST** -Associated state of the card. See [Possible Values for PST/SST/AST](#)
- **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
- **RSVD-TPS**- Reserved TPS is the guaranteed TPS for a diameter connection.
- **MAX-TPS** - This is the maximum TPS for a diameter connection
- **PTPS/PEAK-TPS ---**
 - PTPS indicates the maximum TPS occurred on the card when executed with loc parameter.
 - PTPS indicates the maximum TPS occurred on a diameter connection when executed with dname parameter.
- **PTIMESTAMP/PEAKTIMESTAMP** - The time when the PTPS occurred on the card or specified diameter connection.
- **DCNAME** -Diameter connection name.
- **STATUS** - UP or DOWN status of the diameter connection.
- **DEIR ALARM STATUS** - Displays DEIR system related alarms. If there are no system alarms present, this field displays No Alarms.

- **CARD ALARM STATUS** - Displays DEIR card specific alarms. If there are no card alarms present, this field displays No Alarms.
- **DCONN ALARM STATUS** - Displays diameter connection specific alarms. If there are no connection related alarms present, this field displays No Alarms.
- **TOTAL DEIR SERVICE STATISTICS**-System-wide view of per-service statistics. The report tracks the following information:
 - **SERVICE** --- Service running on the DEIR card. Currently only the EIR service is supported for the DEIR card.
 - **SUCCESS** -Total number of messages successfully processed by the DEIR card for the EIR service.
 - **ERROR** -Total number of messages with errors which are received by the DEIR cards for the EIR service.
 - **WARNINGS** -Total number of messages received for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for the EIR service.
 - **OVERFLOW** - Number of messages discarded due to congestion on a DEIR card.
 - **TOTAL** - Total number of messages received. It should be the sum of (Success + Error + Warnings) messages.
- **TPS STATISTICS**- Section of the report that provides TPS statistics on each Service Module card or diameter connection.
 - **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
 - **PTPS** - PTPS indicates the maximum TPS that occurred on the card or specified diameter connection.
 - **PTIMESTAMP** - The time when the PTPS occurred on the card or specified diameter connection.
- **PER CONNECTION SERVICE STATISTICS** - Service statistics corresponds to each diameter connection
 - **DCNAME**-Diameter connection name.
 - **STATUS**- UP or DOWN status of the diameter connection.
 - **SUCCESS**-Total number of messages successfully processed on this particular Diameter connection by the DEIR card for the Diameter EIR service.
 - **WARNING**-Total number of messages received on this particular Diameter connection for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for Diameter EIR service.
 - **ERRORS**-Total number of messages with errors which are received on this particular Diameter connection by the DEIR cards for the Diameter EIR service.
 - **OVERFLOW**-Number of messages received on this particular Diameter connection and discarded due to congestion.
 - **TOTAL**- Total number of messages received on this particular diameter connection. It should be the sum of (Success + Warning + Errors) messages.
- **DCONN STATISTICS** -Statistics of diameter connection are displayed when DCNAME parameter is specified in `rept-stat-deir` command.
 - **SUCCESS**-Total number of messages successfully processed on this particular Diameter connection by the DEIR card for the Diameter EIR service.
 - **ERROR**-Total number of messages with errors which are received on this particular Diameter connection by DEIR cards for the Diameter EIR service.

- **WARNING**-Total number of messages received on this particular Diameter connection for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for the Diameter EIR service.
- **OVERFLOW**-Number of messages received on this particular Diameter connection and discarded due to congestion.
- **TOTAL**- Total number of messages received. It should be the sum of (Success + Error + Warning) messages.
- **PER CONNECTION TPS STATISTICS** - TPS statistics corresponds to each diameter connection.
 - **DCNAME** -Diameter connection name.
 - **STATUS** -- UP or DOWN status of the diameter connection.
 - **RSVD-TPS** - Reserved TPS is the guaranteed TPS for a diameter connection.
 - **MAX-TPS** - This is the maximum TPS for a diameter connection.
 - **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
 - **Peak-TPS** - Peak-TPS indicates the maximum TPS that occurred on the card or specified diameter connection.
 - **PEAKTIMESTAMP** - The time when the Peak-TPS occurred on the card or specified diameter connection.

[rtro-dconn](#)

rept-stat-dlk

Report Status Data Link

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All data links are shown.

Example

```
rept-stat-dlk
```

```
rept-stat-dlk:loc=1104
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

The card location, frame, shelf, or slot must be within the allowed range.

The data link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

Notes

None

Output

```
rept-stat-dlk

Related Commands

[act-dlk](#), [canc-dlk](#), [dlt-dlk](#), [ent-dlk](#), [rtrv-dlk](#), [tst-dlk](#)

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-**) or a network destination (*ni-*-**).

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, *000-255*, ***, ****, *****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values ***, ****, and ***** are not valid for the *ni* subfield.

If **** or ***** is specified for the *nc* subfield, either ***, ****, or ***** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, *0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

mode (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

Range:

full

Comprehensive display of point code status, including *rtx*. If entered with a point code, status for that point code is displayed. If specified without a point code, the status of all routesets is displayed.

rtx

Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default:

A summary report is displayed.

stat (optional)

The primary state filter. The state of the destination for which to generate a report. To generate a report for all destinations whose state is DSBLD, specify *stat=dsbld*.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-dstn
```

```
rept-stat-dstn:dpci=2-004-1:mode=full
```

```

rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc:9-4-***:stat=alminh
rept-stat-dstn:dpc=9-3-*:mode=rtx
rept-stat-dstn:mode=full
rept-stat-dstn:mode=rtx
rept-stat-dstn:dpc=1-1-1
rept-stat-dstn:dpcn16=1-1-1

```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

If a `dpc` parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

The `stat` parameter can be specified with the `dpc` parameter only if the `dpc` parameter specifies one of the *ni-nc-** formats.

An x-list DPC cannot be specified in the `dpc` parameter.

The `mode=rtx` parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

The `mode` parameter cannot be specified with the `dpc` parameter if the `dpc` parameter specifies one of the *ni-nc-** formats.

When the `mode=full` parameter is specified, the `dpc/dpca/dpcn/dpci/dpcn24` parameter must be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

This command does not report the x-list point codes. Use the `rept-stat-cluster` command for a report of x-list point codes.

If the `mode=rtx` parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix p-).

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- `rept-stat-dstn:dpc=ni-nc-ncm`—Report for fully provisioned destination *ni-nc-ncm*
- `rept-stat-dstn:dpc=ni-*-*`—Report for provisioned network destination with the specified network indicator. If * is specified in the *nc* field, * must be specified in the *ncm* field.
- `rept-stat-dstn:dpc=ni-**-*`—Report for the full network cluster for the specified *ni*
- `rept-stat-dstn:dpc=ni-***-*`—Report for the full network cluster and the network cluster address (if any) for the specified *ni*
- `rept-stat-dstn:dpc=ni-nc-*`—Report for provisioned cluster destination *ni-nc-**
- `rept-stat-dstn:dpc=ni-nc-**-*`—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address on *ni-nc-** (if it exists) is not reported.
- `rept-stat-dstn:dpc=ni-nc-***-*`—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is also reported.
- `rept-stat-dstn:dpcn24=msa-ssa-sp`—Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

If the `mode=rtx` parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the `mode=full` parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the `mode=full` parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

Output

If the `dpc` parameter is not specified:

- If the `mode` parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the `mode=rtx` parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the `mode=full` parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the `dpc` parameter is specified:

- If the `mode` parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the `mode=rtx` parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.

- If the mode=full parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

This example shows the output when no parameters are specified:

This example shows the circular routing alarm for a cluster destination. The alarm indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as "OOS-MT Prohibit INACCESS" as it does for an FPC destination.

```
rept-stat-dstn:dpc=9-3-*
```

```

```

This example shows the output if an FPC is specified for which no subsystems are defined. Also, because aliases cannot be defined for cluster destinations, this report shows only an empty header. The circular routing information portion of this report displays "-----" for the linkset names when no circular routing condition exists for the DPC.

rept-stat-e1

Report Status E1

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

Parameters

e1port (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

Range:

1 - 8

Ports 3 through 8 can be specified only for HC-MIM cards.

loc (optional)

The unique identifier of a specific LIME1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIME1 cards is reported.

Example

```
rept-stat-e1
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `loc` parameter must be specified when the `e1port` parameter is specified.

The active TDM location cannot be specified in the `loc` parameter.

Card locations 1117 and 1118 and the MUX card locations ($xy09$ and $xy10$ where x is the frame and y is the shelf) cannot be specified in the `loc` parameter.

Notes

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the `loc` parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the `loc` and `e1port` parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

Output

This example shows the output when no parameters are specified:

```
rept-stat-e1
```

```

rlghncxa03w 05-01-04 07:01:08 EST  EAGLE5 33.0.0

Legend

- **LOC**—Card location
- **E1PORT**—Number of the E1 port provisioned on the card in the specified location.
- **ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **UNAVAIL REASON**—Reason for the E1 port being unavailable
- **SLK**—Signaling link assigned to the E1 port
- **TS**—Timeslot assigned to the signaling link

Related Commands

None.

rept-stat-enet

Report Status Ethernet

Use this command to display a summary report of Ethernet status for all cards in the system that have configured Ethernet Interfaces.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

Default:

All ENET data for the card location is displayed.

port (optional)

Ethernet interface port ID.

Range:

a, b

Default:

All port data for ENET is displayed.

Example

```
rept-stat-enet
rept-stat-enet:loc=1101:port=b
```

Dependencies

Another command is already in progress.

The loc and port parameters must be specified together in the command.

The shelf and card must be equipped, and the card specified by the loc parameter must have an application of IPS, MCP, STPLAN, EROUTE, VSCCP, IPSP, IPLIM, IPLIMI, SS7IPGW, or IPGWI.

The card in the location specified by the loc parameter must support the port specified by the port parameter.

Notes

None.

Output

This example shows the status of all configured Ethernet interfaces in the system:

rept-stat-enet

```

eagle10110 07-02-10 14:50:23 EST EAGLE 35.6.0
LOC  PORT IPADDR          PST          SST          AST

      ALARM STATUS           = No Alarms.

Command Completed.
;

```

Legend

- CARD—Location of the card
- VERSION—Version number of the application loaded on the card. Dashes (-----) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- TYPE—Card type entered in the database
- APPL—Application loaded on the card

Related Commands

None.

rept-stat-gpl

Report Status Generic Program Load

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

Parameters

display (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

Range:

all

gpl (optional)

Generic program load. The GPL for which to retrieve information.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc—Used by E5-ATM and E5-ATM-B cards to allow the card to support up to 3 signaling links

blbepm—Flash GPL containing the BIOS ROM image on E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards

blbios—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

blbsmg—Flash GPL containing the BIOS ROM image on E5-SM4G and E5-SM8G-B cards

blcpld—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards that are used for E1 or T1 signaling links

bldiag6—Flash GPL containing the diagnostic code on E5-E1T1, E5-E1T1-B, HC-MIM, E5-ENET, and E5-ENET-B cards

blixp—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ATM, E5-IPSM, E5-TSM, E5-ENET, and E5-SM4G cards

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

blrom1—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

blvxw6—Flash GPL containing the VxWorks operating system on HC-MIM, E5-ATM/E5-ATM-B, E5-E1T1/E5-E1T1-B, E5-ENET/E5-ENET-B, E5-IPSM, E5-MCPM-B, E5-SM4G/E5-SM8G-B, and E5-TSM cards.

cdu—Used in the card manufacturing process.

deirhc— Used by E5-SM8G-B cards to support the S13/S13' EIR feature

erthc—Used by E5-ENET and E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

glshc—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

hipr—Communication software used on the High Speed IMT Packet Router (HIPR) card

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

imtpci—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards

ipghc—Used by E5-ENET and E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

iplhc—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

ipshc—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

mcpshc—Used by E5-MCPM-B cards for the Measurements Platform feature

oamhc—Used by E5-MCAP cards for enhanced OAM functions

pldpmc1—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

sccphc—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM4G or E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

siphc— Used by E5-SM8G-B Cards to support the SIP application

slanhc—Used by E5-ENET and E5-ENET-B cards to support the STPLAN application

ss7hc—Used by HC-MIM, E5-E1T1, and E5-E1T1-B cards. Allows the card to support up to 32 (E5-E1T1) or 64 (HC-MIM and E5-E1T1-B) signaling links for E1 and T1 functions.

utility—Used by the factory for testing, and when directed by My Oracle Support

vcdu—Used in the card manufacturing process

Default:

Display all

loc (optional)

Location. The target card address and versions of all GPLs running at the specified card location. For HC-MIM, E5-ENET, E5-ENET-B, or STC cards, this information includes all non-activated flash GPLs. For cards that are not HC-MIM, STC, E5-ENET, E5-ENET-B or E5-IPSM cards, there is no additional data: this parameter limits the report to the target card address.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=hipr2
rept-stat-gpl:gpl=siphc
rept-stat-gpl:gpl=deirhc
```

Dependencies

No other `rept-stat-xxxx` command can be in progress when this command is entered.

Only one of the `display=all`, `loc`, and `gpl` parameters can be specified in the command.

The value specified for the `gpl` parameter must be supported.

Notes

To check the version of the EPAP or ELAP application, use the `rept-stat-mps` command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the `chg-gpl` command to turn auditing on and off.

Use the `rtrv-gpl` command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the `act-gpl` command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge or drive, but not activated by the `act-gpl` command.

When the `act-gpl` command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, "ALM" is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and "ALM" is displayed for each APPROVED GPL (`rtrv-gpl`) and for each RUNNING GPL (`rept-stat-gpl`) that does not match the GPL in the RELEASE column of the `rtrv-gpl` command output. If GPL auditing is off, the minor alarm is not activated, but "ALM" is displayed for each GPL that does not match the GPL in the RELEASE column.

If no `gpl` parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of "-----" is displayed. This should happen only for utility and OAM GPLs when the cartridge is not inserted. A utility trial version is never displayed because it can never be run.

If the removable cartridge or drive is inserted, an "*" (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, "-----" is displayed for the running version.

When the `gpl` parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using the `init-flash` command) are not displayed.

When the `gpl=imt` parameter is specified, only the IMT GPLs for each configured card connected to the IMT are displayed.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the `act-flash` or `init-flash` command for a list of flash GPLs.

When a GPL is specified in the gpl parameter, the specified GPL for each card connected to the IMT is displayed.

Output

The output of the `rept-stat-gpl` command is site- and configuration-specific. The output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

This example shows the output when no parameters are defined. All GPLs for the card are listed:

```
rept-stat-gpl
```

```

Legend

- **GPL**—GPL associated with the cards in the display
- **CARD**—Card location
- **RUNNING**—GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.
- **APPROVED**—GPL version that is the approved GPL
- **TRIAL**—GPL version that is the trial GPL

- **ACTIVE**—GPL version downloaded using the `init-flash` command and activated using the `act-flash` command
- **INACTIVE**—GPL version downloaded using the `init-flash` command but not activated
- **-----**(dashes)—GPL is not present at the specified location
- *****—The trial version will run if the card boots (shown to the right of the TRIAL column)
- **ALM**—Alarm indicator showing the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.
- **+**—Currently running flash GPL has not been activated (shown between the RUNNING and APPROVED columns)

Related Commands

act-gpl, alw-card, chg-gpl, copy-gpl, init-card, init-sys, rtrv-gpl

rept-stat-imt

Report IMT Status

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

Parameters

mode (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

Range:

full

Default:

Do not display additional information.

Example

```
rept-stat-imt
```

```
rept-stat-imt:mode=full
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

Output

rept-stat-imt

```

Legend

- **IMT SYSTEM**—Logical entity representing the combination of both A and B IMT busses
- **IMT**—IMT bus A or IMT bus B
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the IMT System or specified IMT bus

- *—Minor Alarm
- **—Major Alarm
- *C—Critical Alarm

The states of the IMT bus are combined from the PST, SST and AST states as shown in [Table 48: IMT Bus States](#).

Table 48: IMT Bus States

PST	SST	AST	Definition
IS-NR	Active	----	The IMT bus is operating normally.
IS-ANR	Fault	----	The IMT bus has had a failure on at least one but not all cards.
IS-ANR	Manual	----	The IMT bus is inhibited, but some cards have been connected to it.
OOS-MT	Fault	----	The IMT bus has a failure on all cards.
OOS-MT-DSBLD	Manual	----	The IMT bus is inhibited and no cards are connected to it.
OOS-MT-DSBLD	Test	FLT CHK	The IMT Bus is inhibited and undergoing Fault Isolation test.
OOS-MT-DSBLD	Test	EXT BERT	The IMT Bus is inhibited and undergoing Extended BERT.

rept-stat-ipconn

Report Status IP Connection

Use this command to display the dynamic status of SIP transport.

Parameters

This command has no parameters.

Example

```
rept-stat-ipconn
```

Dependencies

SIPNP Feature must be enabled before retrieving the dynamic status of SIP transport.

A SIP card running the SIPHC application must be configured before this command can be entered.

Notes

None

Output

```
rept-stat-ipconn
```

```
tekelecstp 12-06-25 16:14:24 EST EAGLE 45.0.0

rept-stat-iptps

Report Status IPGWx TPS Utilization

Use this command to display current and peak IPTPS usage for each IPSPG / IPGWx linkset in the system or for each link in the IPSPG / IPGWx linkset.

Parameters

history

This parameter specifies whether to report the history of IP TPS usage data on IPSPG linksets for the last 60 seconds.

Range:

yes

no

Default:

no

link

The link on the card specified in the loc parameter.

Synonym:

port

Range:

loc

The IPSPG card location for which IP TPS usage data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

All linksets are displayed

peakreset (optional)

Reset peak values to the current TPS values.

Range:

yes

no

Default:

no

tpscost

This parameter specifies whether to report IP TPS usage data for IPSPG linksets relative to network conditions, including average MSU size, association RTT, number of links provisioned on the card, and the protocol used (M2PA or M3UA).

Range:

yes

no

Default:

no

Example

```
rept-stat-iptps
rept-stat-iptps:lsn=lsqw1101
rept-stat-iptps:peakreset=yes
rept-stat-iptps:lsn=lsm2pa1:tpscost=yes
rept-stat-iptps:loc=1305:tpscost=yes
rept-stat-iptps:loc=1305:history=yes
rept-stat-iptps:loc=1305:link=a3:history=yes
```

Dependencies

If the linksets are not IPGWx or IPSP, then this command cannot be entered.

The specified linkset name must exist in the database.

The history, link, loc, and tpscost parameters can be specified for only IPSP cards.

If the history parameter is specified, then the loc parameter must be specified.

If the tpscost parameter is specified, then the loc or lsn parameter must be specified.

If the loc parameter is specified, then the tpscost, history, or peakreset parameter must be specified.

Only one of the history, tpscost, and peakreset parameters can be specified in the command.

The loc and lsn parameters cannot be specified together in the command.

The specified linkset must be type IPSP.

Notes

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

IPSP linksets have SLKTPS linksets configured rather than IPTPS. SLKTPS configures the transactions per second for each link assigned to the IPSP linkset as opposed to IPTPS which configures the combined transactions per second for the entire IPGW linkset. For an IPSP linkset, the calculated IPTPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSP hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSP-M2PA links, then the command does not report any data below the TPS header or raise alarms.

For IPSP-M3UA and IPGWx-M3UA links, the `rept-stat-iptps` command also counts the received DAUD messages and transmitted SNMs in response to DAUD audits (along with the other transmitted SNMs).

The process of updating the IP TPS counts for DAUD and DAUD response SNMs is:

- Rcv IP TPS count is updated with the total number of valid DAUD messages that are successfully queued for response processing based on the combination of RCs (Routing Contexts) and APCs (Affected Point Codes) received in the M3UA DAUD message.
- In reply to DAUD, based on the response generated (DUNA or (DAVA/DRST + SCON)), Tx IP TPS counts are updated for each RC/APC combination (either the same as the Rcv counts or twice the Rcv counts respectively).
- If no RC is present, then the Tx/Rcv IP TPS is incremented for the associated link corresponding to the lowest PORT ID for IPSP-M3UA links for the same association.
- For IPGWx-M3UA links, Tx/Rcv IP TPS are always incremented on the default PORT Index (since only one link can be configured in IPGWx GPL).
- For IPGWx-M3UA links, Rcv IP TPS count are also updated with the number of valid and non discarded Deviated DAUD message received (since Deviated DAUD always contains single RC and APC combination).

All of the transmitted SNMs are pegged in IPTPS Tx counts and are considered in the TPS algorithms.

Output

The `rept-stat-iptps` command reports on IPSP and IPGWx linkset IP TPS. The report includes the following information for the system and for each IPSP or IPGWx linkset:

- Configured IP TPS alarm threshold
- Configured IP TPS
- Current IP TPS transmit and receive usage for 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

As of Release 44.0, the `rept-stat-iptps` command is enhanced to report derived IP TPS usage for IPSP linksets.

- Current derived IP TPS transmit and receive usage over a window of 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset
- 60 seconds history of the IP TPS transmit and receive usage

The derived IP TPS is calculated by adding the costs for factors such as average MSU size, association round trip time, number of provisioned links on card and protocol used (M2PA or M3UA). The derived TPS has valid values if:

- The specified card location indicates an E5-ENET-B IPSP card or the links in the specified linkset are hosted on E5-ENET-B card,
- the E5-ENET-B IPSP High Throughput feature is turned ON,
- the actual traffic rate running on the IPSP card > 6500 TPS and
- the network configuration or traffic characteristics exceeds optimal configuration limits as shown in [Table 49: Baseline Configuration Changes for the E5-ENET-B Card](#).

Table 49: Baseline Configuration Changes for the E5-ENET-B Card

E5-ENET-B Card Baseline Configuration	E5-ENET-B IPSP High Throughput feature OFF	E5-ENET-B IPSP High Throughput feature ON
TPS	6500	9500
Max RTT (ms)	120	50
Avg. MSU size (bytes)	0-272	0-120
Number of associations/links	16	4
Protocol	M2PA and M3UA	M2PA

For all other conditions, including the use of an E5-ENET card instead of an E5-ENET-B card, the derived IP TPS values is invalid and is denoted by dashes (---) in the *Derived TPS* and column.

If an E5-ENET card is used in an example that displays history information, the derived values are invalid and are denoted by dashes in the *Derived Tx* and *Derived RX* columns.

If the linkset is specified, then the command reports the same information for the individual links in the linkset.

If the peakreset=yes parameter is specified, then the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

If the linkset is specified with the peakreset=yes parameter, then the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

The peaks for transmit and receive, and for link, and linkset IP TPS may all occur at different times.

The IP TPS value shown in the command may contain one extra MSU if the linkset is specified. Because the alarm calculations are implemented using integer math, rounding may occur at each entity (link, linkset) if the IP TPS value for the entity is not evenly divisible by 15. This could occur when performing an IPTPS report for a linkset that has more than one link configured.

For mixed IPLIMx-M2PA and IPSP-M2PA linksets, the command does not report any data or raise alarms.

IPGW linksets display dashes in the *CONFIG/MAX* column.

Asterisk sign indicates that parameter (CONFIG/RSVD or CONFIG/MAX) is used to generate TPS alarm for IPSP links/linkset.

This example shows the output for an IPGW linkset:

```
rept-stat-iptps:lsn=ls1307a
```

```

Legend

- **LSN**—Linkset name
- **THRESH**—Threshold at which an alarm will be generated to indicate that the actual linkset TPS is approaching the configured linkset iptps value (lsusealm value as shown in `rtrv-ls` output).
- **CONFIG/RSVD**—Reserved TPS for the linkset
- **CONFIG/MAX**—Maximum TPS for the linkset
- **TPS**—Current transmit (TX) and receive (RCV) TPS for 15 seconds
- **PEAK**—Peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset

- **PEAKTIMESTAMP**—Date and time that the displayed transmit and receive TPS peaks occurred
- **LOC**—Location of the card that contains a displayed link in the linkset
- **PORT**—A signaling link in the linkset
- **THRESH**—The slkusealm value as shown in `rtrv-ls` output
- **CONFIG/RSVD**—Reserved TPS for each link in the linkset. (----). There is no configurable TPS for links.
- **CONFIG/MAX**—Maximum TPS for each link in the linkset. (----). There is no configurable TPS for links.
- **TPS**—Current transmit (TX) and receive (RCV) TPS for 15 seconds
- **PEAK**—Peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset
- **PEAKTIMESTAMP**—Date and time that the displayed transmit and receive TPS peaks occurred
- **Derived TPS**—Derived transmit (TX) and receive (RCV) TPS for 15 seconds
- **Derived Peak TPS**—Derived peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset
- **Actual Tx/Rx**—Actual transmit (TX) and receive (RCV) TPS for 60 seconds
- **Derived Tx/Rx**—Actual transmit (TX) and receive (RCV) TPS for 60 seconds
- **Avg TX MSU Size**—Average transmitted MSU size
- **Avg RTT**—Average round trip time
- **Avg RX MSU Size**—Average received MSU size

rept-stat-j1

Report Status J1

Use this command to display the J1 port status and signaling link status for cards with provisioned J1 ports.

Parameters

loc (optional)

Card address. The unique identifier of a specific LIMT1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIMT1 cards having J1 interfaces is reported.

j1port (optional)

J1 port number. This parameter displays information for a J1 port on the card in the specified card location.

Range:

1-8

Example

```
rept-stat-j1
rept-stat-j1:loc=1101
rept-stat-j1:loc=1101:j1port=1
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

The loc parameter must be specified when the j1port parameter is specified.

The OAM card location cannot be specified for the loc parameter.

MUX card locations (*xy09* and *xy10* where *x* is the frame and *y* is the shelf) cannot be specified for the loc parameter.

Card location 1118 cannot be specified.

Notes

Specifying the command without any parameters displays J1 port status for all cards with provisioned J1 ports.

If the loc parameter is specified, status is displayed for all J1 ports provisioned on the card in the specified location.

If the loc and j1port parameters are specified, the J1 port status summary is displayed for all J1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified J1 port on the card.

Output

This example shows the output when no parameters are specified:

```
rept-stat-j1
```

```

rept-stat-lfs

Report LFS Test Status

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

Parameters

link (optional)

The signaling link port on the card specified in the loc parameter.

Synonym:

port

Range:

loc (optional)

This parameter is mandatory when the link parameter is specified.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1212, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rept-stat-lfs
rept-stat-lfs:loc=1201
rept-stat-lfs:loc=1201:link=a1
```

Dependencies

The LFS feature must be turned on before this command can be entered.

The card location specified in the loc parameter must be equipped.

The signaling link that is specified in the link parameter must be assigned to the card in the loc parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all *xy09* and *xy10* locations (*x* is the frame and *y* is the shelf) cannot be specified in the loc parameter.

The card location (loc parameter) must be a LIMDS0, LIMIT1, or LIMCH (associated with a LIMIT1) card configured with either an SS7ANSI or CCS7ITU application.

If the link parameter is specified, the loc parameter must be specified.

This command cannot be entered during upgrade.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

If no parameters are specified, all links that are in LFS test are displayed.

```
rept-stat-lfs
```

```
rlghncxa03w 04-02-27 16:50:24 EST EAGLE 31.3.0

rept-stat-lnp

LNP Status Report

Use this command to generate a report of the local number portability (LNP) status information.

When this command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the `loc` parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS), Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), LRNQT (if the ITU TCAP LRN Query feature is turned on), and Automatic Call Gap (ACG).

When the `card=sccp-all` parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

Parameters

card (optional)

Specify `card=sccp-all` to display a report of the LNP status of all equipped SCCP cards.

Range:

sccp-all

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

A summary for all cards is displayed.

Example

```
rept-stat-lnp
rept-stat-lnp:card=sccp-all
rept-stat-lnp:loc=1106
```

Dependencies

The LNP feature must be turned on before this command can be entered.

The card and loc parameters cannot be specified together in the command.

The only valid value for the card parameter is *sccp-all*.

No other `rept-stat-xxx` command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The value specified for the loc parameter must identify a Service Module card.

Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When this command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The ALARM STATUS displays the current alarm on the LNP Subsystem.
- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The `rept-stat-lnp` command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPQR usage is expressed as the average percentage of LNPQR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average LRNQT usage is expressed as the average percentage of LRNQT usage per card. LRNQT information is displayed only if the LRNQT feature is turned on.

- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMPR, LNPQS, WNPQS (if turned on), TLNP (if turned on), PLNPQS (if turned on), and LRNQT (if turned on) errors for corresponding messages received across all cards.

When the `rept-stat-lnp` command is entered for a specific card (for example, `rept-stat-lnp:loc=xxxx`), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.
- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMPR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMPR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMPR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.
- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.
- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

Note: IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

Note: PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

Note: The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- LRNQT STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LRNQT USAGE, expressed as a percentage of the amount of CPU used to process LRNQT queries over the last 30-second period by the specific card.
- LRNQT ERRORS, the number of LRNQT query errors detected for the total number of LRNQT messages received by the specified card.

Note: The LRNQT STATUS, LRNQT USAGE, and LRNQT ERRORS fields are displayed only if the LRNQT feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the card=sccp-all parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the loc=xxxx parameter.

Output

This example shows the output when the WNP, PLNP, TLNP, and LRNQT features are off:

Report Status Linkset

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC). If the Multiple Linksets to Single Adjacent Point Code (MLS) feature is turned on, and an adjacent destination point code is requested, then the output displays a summary status, including the secondary point codes, of the linksets that use that adjacent point code.

Parameters

apc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

apc/apca/apci/apcn/apcn24/apcn16 (optional)

Adjacent point code.

apci (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

apcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

apcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The prefix indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000–255

apcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

All linksets are displayed

stat (optional)

The primary state filter. The state of the linksets for which a report will be displayed.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In-Service-Abnormal (IS-ANR)

dsbld

Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

mt

Out-of-Service-Maintenance (OOS-MT)

nr

In-Service-Normal (IS-NR)

Default:

all

Example

```
rept-stat-ls
rept-stat-ls:lsn=lsnstpa
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The linkset specified by the `lsn` parameter must be equipped in the database.

The `stat` and `lsn` parameters cannot be specified together in the command.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the `apc` parameter can be specified.

The `lsn`, `stat`, and `apc` parameters cannot be specified together in the command.

At least one linkset must be associated with the value of the `apc` parameter.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no link is equipped for the SLC, the output is “___,___ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

"ASP-STATE" is shown for only IPSG-M3UA linksets.

Output

If the Proxy Point Code feature is enabled, then proxy point code information is displayed.

Legend

- **LSN**—Name of the linkset
- **APCA/APCI/APCN/APCN24/APCN16**—Adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit, ITU-N 16-bit)
- **SPCA/SPCI/SPCN/SPCN24**—Secondary point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)
- **PST**—Primary state of the linkset. See [Possible Values for PST/SST/AST](#) .
- **SST**—Secondary state of the linkset. See [Possible Values for PST/SST/AST](#) .
- **AST**—Associated state of the linkset. See [Possible Values for PST/SST/AST](#) .
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the specified card
- **SCRN**—Name of the gateway screening screen set associated with the linkset
- **GWSA**—Shows whether gateway screening is used for the specified linkset
- **GWSM**—Shows whether gateway screening messaging is turned on for the specified linkset
- **GWSD**—Shows whether discarding of MSUs that bypass the gateway screening function due to loadshedding is turned on
- **SLC**—Signaling link codes associated with the links in the specified linkset

- **SLK**—Signaling links in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link
- **PPCA/PPCI/PPCN/PPCN24/PPCN16**—Proxy point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit, ITU-N 16-bit)
- **ASP STATE**—State of AS associated with each signaling link of the IPSPG-M3UA linkset. The states displayed are: ACTIVE, INACTIVE, or DOWN.

Related Commands

chg-ls, dlt-ls, ent-ls, rtrv-ls

rept-stat-meas

Report Measurement Status

Use this command to report the status of the Measurements Subsystem (Measurements Platform) or MASPs (Integrated Measurements), including card location and state, IP link status, alarm level, and subsystem state.

Note: If the Integrated Measurements collection function is turned on, then the status reflects the state of the E5-OAM card(s). If the Measurements Platform collection function is turned on, then the status reflects the state of the MCPM cards.

Parameters

This command has no parameters.

Example

```
rept-stat-meas
```

Dependencies

At least one MCPM card must be configured in the system if the Measurements Platform feature is turned on.

No other `rept-stat-xxx` commands can be in progress when this command is issued.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The `platformenable=on` or `oamhcmeas=on` parameter must be specified (see the `chg-measopts` command) before this command can be entered.

Notes

The card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the card is in the IS-NR or IS-ANR state. The `rept-stat-card` command does not show the GPL version if the card is IS-ANR.

Output

Note: MCPM cards consist of EDSM-2G and E5-MCPM-B cards. If either MCPM card is used, then the *Type* field displays MCPM.

Output example with an EDSM card isolated:

```
rept-stat-meas
```

```

MEAS SS          PST          SST          AST
IS-ANR          Active          -----
ALARM STATUS =  * 0516 Degraded Mode - 1 card failed

CARD  VERSION    TYPE    PST          SST          AST
1107 P 101-009-000  MCPM    IS-NR        Active        -----
IP Link A                IS-NR        Active        -----
1109 -----      MCPM    OOS-MT       Isolated      -----
IP Link A                OOS-MT       Unavail      -----

CARD 1107 ALARM STATUS = No Alarms
CARD 1109 ALARM STATUS = Card is isolated from the system
Command Completed.
;

```

Output example with both EDSM cards IS-NR:

```
rept-stat-meas
```

```

MEAS SS          PST          SST          AST
IS-NR          Active          -----

```

Legend

- **VERSION**—Version number of the GPL running on the specified card. The version is shown if the card is in the IS-NR or IS-ANR state.
- **TYPE**—Type of card running the Measurements Subsystem application
- **MEAS SS**—Measurements Subsystem application running on the card
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the card and the applications running on the card
- **CARD**—Location of the card. The card with the letter “P” to the right of its card location is the primary card. The primary card transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the card is IS-NR, the secondary state (SST) indicates whether the card is active or standby.
- **CARD XXXX ALARM STATUS**—List of trouble text alarm messages that have been generated for the card

Related Commands

[rept-stat-card](#)

rept-stat-mfc

rept-stat-mfc

Use this command to obtain the status of the Message Flow Control (MFC) services.

Parameters

mode (optional)

The amount and type of information displayed in the report.

Range:

full

display a full report for the specified MFC service

stats

display detailed statistics for the specified MFC service

act

display information about the status of MFC on individual Service cards

Default:

No change to the current value

reset (optional)

This parameter resets the statistics for all sample periods for the specified service.

Range:

yes

sample (optional)

The data sample to be used.

Range:

avg30s

30-second average value calculated over the previous 5 minutes

tot5m

total value summed over the previous 5 minutes

avg1h

1-hour average value calculated over the previous 24 hours

tot24h

total value summed over the previous 24 hours

service (optional)

The MFC service for which information is reported.

Range:

eroute

EROUTE MFC service

inm

INM MFC service

mtp3

MTP3 MFC service

scpdn

SCCP DN MFC service

scpelap
SCCP ELAP MFC service

scpepap
SCCP EPAP MFC service

scpimsi
SCCP IMSI MFC service

slan
SLAN MFC service

snm
SNM MFC service

vsccp
VSCCP MFC service

Example

```
rept-stat-mfc
rept-stat-mfc:service=vsccp:mode=act
rept-stat-mfc:service=eroute
rept-stat-mfc:service=eroute:reset=yes
rept-stat-mfc:service=slan:mode=full
rept-stat-mfc:mode=stats:service=vsccp:sample=avg30s
rept-stat-mfc:mode=stats:service=scpimsi:sample=avg30s
rept-stat-mfc:service=scpepap
rept-stat-mfc:service=scpelap
```

Dependencies

No other command can be in progress when this command is entered.

The mode=stats and sample parameters must be specified together in the command.

If the mode or reset parameter is specified, then the service parameter must be specified.

If a value of *mtp3*, *snm*, or *inm* is specified for the appl parameter, then the mode=act parameter cannot be specified.

The EPAP Data Split feature must be enabled before a value of *scpdn* or *scpimsi* can be specified for the service parameter.

The Dual ExAP Config feature must be enabled before a value of *scpepap* or *scpelap* can be specified for the service parameter.

If both Dual ExAP Config and EPAP Data Split features are enabled *scpepap* cannot be specified.

Output

Abbreviated output is indicated by 3 vertical dots as shown:

.
.
.

If the card does not support thermal monitoring, and if an MFC service is hosted on that card, then N/A is shown in the *THERMAL* column for that card location in `rept-stat-mfc:mode=act` output.

The *UNAVL* state in the output of `rept-stat-mfc:mode=full` indicates the cards that are not in the IS-NR state.

This example shows an MFC report for all the services when EPAP Data Split feature is enabled:

`rept-stat-mfc`

Legend

The MFC Engine provides Server card statistics that are computed every hour (based on a Server card's timer); therefore they are typically posted an hour later. Client card statistics update continuously; current values will be observed at every invocation of the command.

Related Commands

None.

rept-stat-mon

Report Status Monitoring System

Use this command to display the status of the Fast Copy subsystem on FC-capable cards and the EROUTE subsystem on STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Parameters

loc (optional)

Card location. The card location as stenciled on the shelf for an STC or E5-STC card or an FC-capable card in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Status for all STC and FC-capable cards is reported.

mode (optional)

This parameter provides extended performance information, including group ticket voucher (TVG) or message flow control (MFC) messaging rates.

If the mode=perf parameter is specified, then only subsystem performance information is displayed.

Range:

perf

type (optional)

Monitoring subsystem type. The type of the subsystem for which the monitoring statistics are displayed.

Range:

fcs

Display the statistics for the Fast Copy subsystem

eroute

Display the statistics for the EROUTE subsystem

Default:

Display the statistics for both the EROUTE and FC subsystems

Example

```
rept-stat-mon
rept-stat-mon:type=eroute
rept-stat-mon:type=fcs
rept-stat-mon:type=eroute:loc=1101
rept-stat-mon:type=fcs:loc=1104
rept-stat-mon:type=eroute:mode=perf
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

At least one STC card must be configured before this command can be entered.

At least one FC-capable card must be provisioned in the system before the `type=fcs` parameter can be specified.

The `loc` and `mode` parameters cannot be specified together in the command.

The `type=eroute` parameter must be specified before the `mode` parameter can be specified.

If the `loc` or `mode` parameter is specified, then the `type` parameter must be specified.

Either an STC card or an FC-capable card must be provisioned in the system.

An FC-capable card must be provisioned in the system before the `type=fcs` parameter can be specified.

An STC card must be provisioned in the system before the `type=eroute` parameter can be specified.

Notes**Fast Copy Cards**

E5-ENET or E5-ENET-B cards running the IPSP or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSP GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

For a card to be FC monitored, the following two conditions must be satisfied:

1. FCMODE = FCOPY for the GPL
2. The card must have at least one (1) link with an EMP session established.

When a card is not being FC-Monitored, no FC alarm will be present on the card/port. The card's FCS state remains OFFLINE and the state of FCS ports on the card is OOS-MA/UEQ irrespective of the Ethernet cable being connected on those ports or not.

Output

Note: For an E5-ENET card running the IPGHC GPL, Fast Copy card and link status are displayed in the command output only when the card is in the IS-NR state.

This example displays card- and system-level information for the Fast Copy and EROUTE subsystems:

```
rept-stat-mon

Legend

Information displayed in the EROUTE subsystem report:

- **STC Cards Configured**—Total number of STC cards and E5-STC cards configured in the system
- **Cards IS-NR**—Total number of STC cards and E5-STC cards in IS-NR state
- **EISCOPY BIT**—Indicates whether EIS copy function is turned On or Off
- **System Threshold**—% of system total capacity being used
- **System Peak EROUTE Load**—Current load in Buffers/Sec
- **System Total EROUTE Capacity**—Total capacity in Buffers/Sec
- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **VERSION**—Version number of the GPL loaded on the card. Dashes (----) in the version column indicate one of the following conditions about the card:
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is configured but is not physically present in the system.
 - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—Card type entered in the database
- **EROUTE Service Average Messaging Capacity \ AVERAGE MESSAGING CAPACITY**—Average TVG/MFC Capacity in percent
- **Average CPU Capacity \ Average CPU Usage**—Average CPU capacity in percent
- **Message usage**—% of system current TVG/MFC rate based on the Max TVG/MFC capacity of the E5-ENET card
- **TOTAL MESSAGING RATE**—Total TVG/MFC processing rate
- **CPU usage**—% of system current CPU usage
- **STC IP PORT**—Status of the STC IP ports A and B

Information displayed in the Fast Copy subsystem report:

- **FC Cards Configured**—Total number of FC-capable cards configured in the system
- **Cards IS-NR**—Total number of FC-capable cards in IS-NR state
- **FCMODE**—Monitoring mode
- **GPL**—Application loaded on the card
- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **CPU**—% of system current CPU usage
- **CARD FCS**—Fast Copy status for the card

- **REASON**—Deactivation alarm reason on Card FCS. Possible values are "CPU Thrshld Exceeded" or "Auto-Neg Fails".
- **FCS IP PORT**—status of the FCS IP ports A1 and B1
- **IPADDRESS**—IP addresses of the IMF
- **ASSOC NAME**—Association name
- **PKT CNT**—Snapshot of packets received/sent per association
- **SERVICE MODE**—Type of service granted by the DAS to FC-enabled card

Related Commands

None.

rept-stat-mps

Report the MPS Status

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is turned on, then the ELAP (EAGLE LNP Application Processor) subsystem status is displayed.
- If the INP/AINPQ feature is turned on, then the EPAP (EAGLE Provisioning Application Processor) subsystem status is displayed.
- If the G-Port (GSM mobile number portability), G-Flex (GSM flexible numbering), or PPSMS (Prepaid SMS Intercept Ph1) feature is turned on, then the GSM (Global System for Mobile Telecommunications) and EPAP status is displayed.
- If the EIR (Equipment Identity Register) feature is turned on, then the status of the EIR component on the card is displayed.
- If the V-Flex (Voice Mail Router) feature is turned on, then the status of the V-Flex component on the card is displayed.
- If the ATINP (ATI Number Portability Query) feature is enabled, then the status of the ATINPQ component on the card is displayed.

Parameters

loc (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE 5 ISS.

Range:

1101 - 1108, 1111 - 1117, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rept-stat-mps:loc=1106
```

Dependencies

One of the following features must be turned on, or the ATINP feature must be enabled before this command can be entered:

- A-Port
- AINPQ
- DEIR
- G-Flex
- G-Port
- INP
- EIR
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- SIP NP
- V-Flex

At least one Service Module card must be configured in the system before this command can be entered.

To specify the `rept-stat-mps` command, no other `rept-stat-xxxx` command can be in progress.

The card location specified in the `loc` parameter must contain either an SCCP card, a SIP card or a DEIR card running the DEIRHC gpl.

A Service Module card running the VSCCP/SIPHC/DEIRHC application must be configured before this command can be entered.

Notes

When the MPS does not have an alarm on it, the `rept-stat-mps` report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

Output

Note: The status for a particular feature is shown only if that feature is enabled or turned on.

This example shows the possible system response if the LNP ELAP Configuration feature is turned on:

Legend

- **CARD**—Location of the Service Module card. The Service Module card with the designator “P” to the right of its card location is the primary Service Module card as selected by the active ELAP/EPAP. The primary Service Module card provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.

- **VERSION**—Version number of the GPL that the specified ELAP/EPAP or card is running.
- **PST**—Primary state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **EPAP/ELAP A/B**—Application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, G-Port, or V-Flex is turned on, the output shows EPAP A/B.
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the *EPAP Administration Guide* or the *ELAP Administration and LNP Feature Activation Guide*. There are 6 categories of MPS alarms:
 - Critical platform alarm data
 - Major platform alarm data
 - Minor platform alarm data
 - Critical application alarm data
 - Major application alarm data
 - Minor application alarm data
- **GSM STAT**—Possible states are ACT (active) or SWDL (the GSM component on that card is inactive until the software download completes). GSM STAT information is not displayed if the G-Port, G-Flex and Prepaid SMS Intercept Ph1 features are turned off.
- **INP STAT**—Possible states include ACT (active), OFFL (offline) and SWDL (the INP component on that card is inactive until the software download completes). INP STAT information is not displayed if the INP feature is turned off.
- **LNP STAT**—Possible states include ACT (active), OFFL (offline) and SWDL (the LNP component on that card is inactive until the software download completes). LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.
- **EIR STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the EIR component on that card is inactive until software download completes). EIR STAT information is not displayed if the EIR feature is not enabled.
- **VFLEX STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the V-Flex component on that card is inactive until software download completes). V-Flex Status information is not displayed if the V-Flex feature is not on.
- **ATINPQ STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the ATINPQ component on that card is inactive until software download completes). ATINPQ STAT information is not displayed if the ATINP feature is not enabled.
- **DSM MEMORY USAGE**—Percentage of DSM memory used to store the ELAP/EPAP database. For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on a 2G DSM card means that 1G is used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the `rtrv-ctrl-feat` command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP

ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.

- **CARD XXXX ALARM STATUS**—List of trouble text alarm messages that have been generated for the card
- **DSM Port A/B**—List of trouble text alarm messages that have been generated for the port on the card.
- **IP Connection Unavailable**—The failed channels on those ports with IP Connection Unavailable alarms. Possible channels reported are:
 - Prov—RTDB Provisioning Channel
 - Dnld—RTDB Download Channel
 - TCP—Transmission Control Protocol Channel
 - UDP—User Datagram Protocol Channel

1310  HMUX   IS-NR      Active  -----  LOW   LOW  UNKNOWN

Command Completed.
;

```

Legend

- **CARD**—MUX card location
- **TYPE**—Type of card
- **BITRATE(OPER)**—Maximum operational bit rate that the Fibre-Channel ring is capable of. If the operational bit rate is HIGH, the Fibre-Channel ring can be switched between the HIGH rate and the LOW rate.
- **BITRATE(ACT)**—Bit rate currently used by the Fibre-Channel ring. This rate is determined by various parameters such as the operational bit rate of the other bus, availability of a High Rate Feature Access Key, etc.
- **BERT STATUS**—BERT (Bit Error Rate Test) status of the MUX card. BERT is a diagnostic test that is initiated by the MUX cards on the IMT Bus during Bus alignment. Possible values are:
 - **PASS**—BERT passed for the MUX card
 - **FAIL**—BERT failed for the MUX card
 - **UNKNOWN**— This value should not be seen. If it is observed, please contact My Oracle Support (MOS).

Related Commands

[rept-stat-card](#)

rept-stat-rtd

Report Status RTD

Use this command to report Run Time Diagnostics (RTD) for EAGLE cards, including the status of internal integrity checks and the RTD subsystem alarm. This display can help determine the cause when an RTD subsystem alarm occurs, or when associated issues are reported.

This command is also used to reset MSU validation statistics and clear the RTD subsystem alarm.

Parameters

force (optional)

This parameter is used with the `reset=yes` parameter to clear statistics for a card when the RTD subsystem alarm is present.

Range:

yes

loc (optional)

Location. The card location as stenciled on the shelf of the system.

Note: This parameter can be used to either retrieve or reset statistics for a card location. To reset the statistics, the `loc` and `reset` parameters must be specified together in the command.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

reset (optional)

This parameter clears the statistics by setting them to zero and resets the checksum card indicator error and RTD subsystem alarm.

Range: *yes*

Clears the statistics.

If this parameter is specified with the `loc` parameter, then statistics are cleared for the specified card. If this parameter is specified, and the `loc` parameter is not specified, then statistics are cleared for all cards in the system.

Example

```
rept-stat-rtd
rept-stat-rtd:loc=1107
rept-stat-rtd:reset=yes:force=yes
rept-stat-rtd:loc=1107:reset=yes
```

Dependencies

If the `reset=yes` parameter is specified, then the `force=yes` parameter must be specified to clear the statistics and checksum failure indicators.

The card specified by the `loc` parameter must be an IPLIMx, IPGWx, IPSTG, SCCP, Service Module, HC-MIM, E5-E1T1, E5-E1T1-B, E5-ATM, or E5-ATM-B card.

The card in the location specified by the `loc` parameter must be in service.

The `reset=yes` parameter must be specified to clear the statistics.

The `force=yes` parameter must be specified.

The loc parameter cannot have a non-numeric value.

The following card locations are not valid for this command: 1114, 1116, 1117, 1118 (E5-TDM and E5-MDAL cards), and all $xy09$ and $xy10$ locations where x is the frame and y is the shelf (MUX cards).

The card slot must be equipped and in service.

Notes

MSU Validation Statistics

The statistics from internal integrity checks are displayed for all in-service LIM and SCCP cards. The reported statistics are dynamic and are not maintained when a card is re-initialized.

The displayed reports contain message validation totals since the last time the diagnostic information for the cards was reset.

The individual statistics that are reported re-start at zero after the maximum values are reached and are cleared when reset by the `rept-stat-rtd` command.

Summary Report (rept-stat-rtd)

The report displayed shows the summary statistics or overall totals for MSU validation statistics for all LIM and SCCP cards in the system. It also includes the status for the RTD subsystem and the RTD subsystem alarm.

Card Summary Report (rept-stat-rtd:loc=)

When the loc parameter is specified in the `rept-stat-rtd` command, the report displayed shows the detailed MSU validation statistics report for the specified card. The report shows statistics from integrity checks performed by the specified card on MSUs transferred to and from LIM/SCCP cards and includes the timestamp when the card last detected an error during integrity checks. The statistics are only displayed for cards with non-zero totals.

The integrity checks are performed on a subset of the MSUs transferred between cards. When card(s) report errors during the integrity checks, the RTD subsystem alarm is activated. The error statistics reported should be used along with the UIMs or alarms to help identify the source of the problem.

RTD Subsystem Alarm

The RTD subsystem alarm is triggered when a card reports that a checksum error was detected during internal card integrity checks.

The RTD subsystem alarm remains active in the system until the statistics are reset using the `rept-stat-rtd` command, and no further indications of checksum errors are reported during internal card integrity checks.

Output

If the `rept-stat-rtd` command is entered with no parameters, then a summary status for the RTD subsystem and alarm and summary statistics for all of the LIM/SCCP cards in the system are displayed.

If the loc parameter is specified in the `rept-stat-rtd` command, then detailed statistics are displayed for the specified card location. Only cards with non-zero totals are reported in the location specific report.

This example displays a summary report on the status of the RTD subsystem and RTD subsystem alarm with MSU validation statistics for all LIM/SCCP cards in the system.

Legend

This section defines the fields of the `rept-stat-rtd` reports.

Total Rx Error (for a Summary Report)—Total MSUs received with checksum errors, including MSUs with checksum errors received from all cards in the system.

Total Rx Error (for a Location-Specified Report)—Total MSUs with checksum errors received at the card specified by the LOC parameter from SRC/DEST CARD.

Total Rx Validated (for a Summary Report)—Total MSUs with checksum received and validated from all cards in the system.

Total Rx Validated (for a Location-Specified Report)—Total MSUs with checksum received and validated at the card specified by the LOC parameter from SRC/DEST CARD.

Total Tx (for a Summary Report)—Total MSUs with checksum applied and transmitted to all cards in the system.

Total Tx (for a Location-Specified Report)—Total MSUs with checksums transmitted from the card specified in the LOC parameter to SRC/DEST CARD.

Last Alarm Timestamp—Timestamp for last reported checksum error for the card specified in the LOC parameter.

SRC/DEST CARD—Source card transmitting MSUs with checksums received by the card specified in the LOC parameter. Destination card receiving MSUs with checksums transmitted from card specified in LOC parameter.

RTD Subsystem—Indicates RTD Device Status (IS-NR, etc.).

RTD Alarm Status—Indicates whether an alarm is present for the RTD Device.

Related Commands

None.

rept-stat-rte

Report Status Route

Use this command to display the signaling route status for a particular destination.

Parameters

dpc (optional)

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

mode (optional)

This parameter specifies the type of display to produce.

Range:

full

Comprehensive display of point code status, including *rtx*. If specified with a point code, then the status for that point code is displayed. If specified without a point code, then the status of all routes is displayed.

rtx

Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default:

A summary report is displayed.

stat (optional)

The primary state filter.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:*all*

Example

```
rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25-**
rept-stat-rte:dpcn16=1-2-3
```

Dependencies

An x-list DPC cannot be specified in the dpc parameter.

If the mode=full parameter is specified, then the dpc/dpca/dpcn/dpci/dpcn24 parameter must be specified.

If the dpc parameter specifies an *ni-nc-** format, then the mode parameter cannot be specified.

The dpc parameter must specify *anni-nc-** format before the stat parameter can be specified with the dpc parameter.

No other `rept-stat-xxx` command can be in progress when this command is entered.

If a dpc parameter is specified, then the value must be the true destination point code (not an alias) and the value must be defined in the database.

The Origin-Based MTP Routing feature must be turned on before the mode=rtx parameter can be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

The pst and mode parameters cannot be specified together in the command.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

This command does not report the x-list point codes. Use the `rept-stat-cluster` command for a report of x-list point codes.

If the `mode=rtx` parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Summary of DPC parameter syntaxes

- `rept-stat-dstn:dpc=ni-nc-ncm` —Requests a report for fully provisioned destination *ni-nc-ncm*.
- `rept-stat-dstn:dpc= ni-*-*` —Requests a report for provisioned network destination with the specified network indicator. If * is specified in the *nc* field,* must be specified in the *ncm* field.
- `rept-stat-dstn:dpc= ni-**-*` —Requests a report for the full network cluster for the specified *ni*.
- `rept-stat-dstn:dpc= ni-***-` — Requests a report for the full network cluster and the network cluster address (if any) for the specified *ni*.
- `rept-stat-dstn:dpc= ni-nc-*` —Requests a report for provisioned cluster destination *ni-nc-**.
- `rept-stat-dstn:dpc= ni-nc-**` —Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. Note, however, that the network cluster address on *ni-nc-** (if it exists) is not reported.
- `rept-stat-dstn:dpc= ni-nc-***` —Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address (if it exists) is also reported.
- `rept-stat-dstn:dpcn24=msa-ssasp` —Requests a report for fully provisioned 24-bit destination point *main signaling area-sub signaling area signaling point*.

If the `mode=rtx` parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the `mode=full` parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the `mode=full` parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

Output

If the `dpc` parameter is not specified:

- If the `mode` parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the `mode=rtx` parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the `mode=full` parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the `dpc` parameter is specified:

- If the mode parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the mode=rtx parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the mode=full parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

This example shows how summary information for all provisioned cluster and noncluster DPCs is reported.

This example shows how the circular routing alarm for a cluster destination is displayed. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

rept-stat-rtkey

Report the Status of Routing Keys

Use this command to generate a summary report of the status of the system routing keys.

Parameters

This command has no parameters.

Example

```
rept-stat-rtkey
```

Dependencies

None

Notes

The report generated by this command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table
- The current number of static routing key entries in the routing key table
- The percentage of the static routing key table entries that is provisioned

Output

```
rept-stat-rtkey
```

```
rlghncxa03w 10-10-27 14:59:11 EST EAGLE 43.0.0
SRKQ = 250

Static Route Key table is (50 of 250) 20% full

Static Route Key Socket Association table is (80 of 4000) 2% full
;
```

rept-stat-rtx

Report Status Exception Route

Use this command to display the signaling route status for one or more exception routes to a particular destination.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cic (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the ecic parameter as exception routing criteria for the specified exception route.

Range:

0 - 16383

dpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national destination point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:*p-- , 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p**un---000---127**sna---000---15**mna---000---31***ecic (optional)**

Ending Circuit Identification Code. This parameter, together with the *cic* parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range:*0 - 16383***ilsn (optional)**

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

Range:*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

mode (optional)

The type of display to produce.

Range:*full*

Displays routes from the associated routeset and exception route table for the specified destination point code per criteria.

opc (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*opca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Origination point code.

opci (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

opcn (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

opcn16 (optional)

Origination Point Code. 16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---*000---127

*sna---*000---15

*mna---*000---31

si (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range:

0 - 15

Example

```
rept-stat-rtx
```

```
rept-stat-rtx:dpc=1-101-1
```

```
rept-stat-rtx:dpc=1-101-1:opc=1-2-1
```

```
rept-stat-rtx:dpc=100-100-1:opc=1-1-1:mode=full
```

```
rept-stat-rtx:dpcn16=001-1-2
```

Dependencies

If the `dpcn` parameter is specified, its format must match the format that was assigned with the `chg-stpopts:npcfmiti` parameter.

The dpc parameter and the class criteria parameters (opc/ilsn/cic/si) must be specified before the mode parameter can be specified.

The dpc parameter must be specified before the class criteria parameters (opc/ilsn/cic/si) can be specified.

Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

This command can be cancelled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This example provides the status of all exception route sets provisioned in the system, sorted by DPC:

rept-stat-rtx

```

stdcfg2b 09-05-24 01:54:32 EST  EAGLE 41.0.0

Related Commands

[chg-rtx](#), [dlt-rtx](#), [ent-rtx](#), [rtrv-rtx](#)

Use this command to display the following types of reports:

- `rept-stat-sccp` (with no parameters)—displays the status of the Service Module cards and the services executing on those cards:
 - A-Port (IS41 Mobile Number Portability)
 - AIQ (IS41 Analyzed Information Query)
 - ATINPQ (ATI Number Portability Query)
 - EIR (Equipment Identity Register)
 - G-Flex (GSM Flexible Numbering)
 - G-Port (GSM Mobile Number Portability)
 - GTT (Global Title Translation)
 - IAR (Info Analyzed Relay)
 - IDP Relay (Prepaid IDP Query Relay)
 - IGM (IS41 GSM Migration)
 - INP (INAP-based Number Portability)
 - INPMR (INP Message Relay)
 - LNP (Local Number Portability)
 - LNPMR (LNP Message Relay)
 - LRNQT (ITU TCAP LRN Query)
 - MNPSMS (Portability Check for Mobile Originated SMS)
 - MO SMS B-Party Routing
 - MO SMS IS41-to-GSM Migration

- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MTPRTD (MTP Routed messages serviced by the SCCP card)
- PPSMS (Prepaid SMS Intercept)
- TLNP (Triggerless LNP)
- TTR (Triggerless TCAP Relay)
- V-Flex (Voice Mail Router)

The command also displays any cards that are denied SCCP service.

- `rept-stat-sccp:mode=perf` —targets the general SCCP traffic performance for Service Module cards. The report supplies message rates for group ticket voucher (TVG) or message flow control (MFC) performance.
- `rept-stat-sccp:loc=nnnn` —provides a detailed view of the status of SCCP services provided by a specific Service Module card

Note: The `rept-stat-sccp` and `rept-stat-sccp:mode=perf` reports include the status of the Service Module cards (DSM, E5-SM4G, and E5-SM8G-B) cards but do not differentiate between the card types.

Note: To retrieve traffic statistics for the LNP feature, the `rept-stat-lnp` command can also be used.

Note: Statistics are displayed for the supported features as follows:

- AIQ—AIQ Subsystem Report and Service Statistics
- APORT, GPORT, and IGM—MNP Service Statistics
- ATINPQ—ATINPQ Subsystem Report and Service Statistics
- EIR—EIR Subsystem Report and Service Statistics
- G-Flex—GFLEX Service Statistics
- GTT—GTT Service Statistics
- IAR—IAR Service Statistics
- IDP Relay—IDPR Service Statistics
- INPQ—INP Subsystem Report and Service Statistics (includes INPQ and INPMR. AINPQ is combined with INPQ.)
- INPMR-INP Message Relay Service Statistics
- LNP—LNP Subsystem Report and Service Statistics (including LNPMR, LNPQS, WNPQS, TLNP, PLNPQS and LRNQT)
- LNPMR-LNP Message Relay Service Statistics
- LNPQS-LNP Query Service Statistics
- MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, MO-based IS41 SMS NP, PPSMS—SMSMR Service Statistics
- MTPRTD-MTP Routed (MTP routed messages serviced by the SCCP card) Statistics.
- TLNP-Triggerless LNP Service Statistics
- TTR-Triggerless TCAP Relay Service Statistics
- V-Flex—VFLEX Subsystem Report and Service Statistics
- WNPQS-Wireless LNP Query Service Statistics

Note: If traffic is being generated while DSM cards are loading, then superfluous counts may be displayed in Daily and Overall Peak SCCP Loads. To correct this occurrence, reset the Peak SCCP Loads using the `rept-stat-sccp:peakreset=yes` command.

Parameters

data (optional)

The subsystem data type used in the report.

Range:

- dn*
report on the SCCP DN subsystem
- imsi*
report on the SCCP IMSI subsystem
- epap*
report on SCCP EPAP subsystem
- elap*
report on SCCP ELAP subsystem
- gtt*
report on SCCP GTT subsystem

loc (optional)

The location of the Service Module card to be reported on.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Report a summary of all cards.

mode (optional)

Use this parameter to provide extended performance information, including output about group ticket voucher (TVG) or message flow control (MFC) performance and message rates for direct assignments.

Range:

perf

Default:

No extended performance information is displayed.

peakreset (optional)

Reset all Peak values to zero.

Range:

yes

Example

```
rept-stat-sccp
rept-stat-sccp:mode=perf
rept-stat-sccp:loc=1106
rept-stat-sccp:data=epap
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

A Service Module card running the VSCCP application must be configured before this command can be entered.

Only one optional parameter at a time can be specified in the command.

The value specified for the `loc` parameter must identify a configured Service Module card running the VSCCP application.

The EPAP Data Split feature must be enabled before the `data` parameter can be specified.

The Dual ExAP Config feature must be enabled before specifying parameter `DATA = ELAP/EPAP/GTT`.

If both Dual ExAP Config and EPAP Data Split features are Enabled, `DATA = EPAP` parameter cannot be specified.

The parameters `DATA` and `LOC` cannot be specified together. They are mutually exclusive.

Notes

None

Output

If the EIR, G-Port, INP, 1100 TPS/DSM for ITU NP, AINPQ, A-Port, IGM, E5-SM4G Throughput Capacity, IAR, or V-Flex features are enabled, then the **ansigflex** system option is disabled.

Note: Output for this command displays the status for services associated with features that are enabled and turned on. If a feature is not turned on, then the services for that feature are not displayed. The following examples display output when all possible features are turned on.

This example shows a summary report for all the features corresponding to EPAP-based services and subsystems:

Legend

This section defines the fields of the three `rept-stat-sccp` reports:

- `rept-stat-sccp` with no parameters
- `rept-stat-sccp:mode=perf`
- `rept-stat-sccp:loc=nnnn`

A dash (-) in an output field indicates that the statistic does not apply.

Note: The ERRORS and TOTAL ERRORS fields indicate that errors have occurred for Service Module cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the *Maintenance Manual* for error explanations and recovery procedures.

Report Type: `rept-stat-sccp` with no parameters

- **SCCP SUBSYSTEM REPORT, GFLEX/MNP SERVICE REPORT** and **LNP/INPQ/EIR/VFLEX/ATINPQ/AIQ SUBSYSTEM REPORT**—Summary of the SCCP subsystem status, GFLEX and MNP service status, LNP, INPQ (INP Query), EIR, VFLEX, ATINPQ and AIQ subsystem status
- **SCCP CARDS CONFIGURED**—Number of provisioned Service Module cards running the VSCCP application
- **CARD IS-NR**—Number of Service Module cards that can be used by the system (status is In-Service Normal, IS-NR)
- **SYSTEM PEAK SCCP LOAD**—Highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS
- **SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active SCCP cards
- **SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the `chg-th-alm` command.
- **CARD**—Card location of the cards running the VSCCP application
- **P**—When G-Flex, GPORT, INP, APORT, EIR, V-Flex, IAR, or IGM feature is turned on, a P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE 5 ISS. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the GPL running on the Service Module card
- **MSU USAGE**—Percentage of the maximum number of MSUs received by each card during the last 30 seconds
- **CPU USAGE**—Percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks
- **SCCP SERVICE AVERAGE MSU CAPACITY**—Average MSU capacity used over the last 30-second interval. This field includes all services provided by the Service Module cards.
- **AVERAGE CPU CAPACITY**—Average CPU capacity used over the last 30-second interval. This field includes all services provided by the Service Module cards.
- **AVERAGE CPU USAGE PER SERVICE**—System-wide view of the service traffic composition.
- **TOTAL SERVICE STATISTICS**—System-wide view of per-service statistics for the last 30-second interval. An "A" in the field indicates that the statistic does not apply. The report tracks the following information:
 - **SERVICE**
 - **SUCCESS**—Total number of successful messages processed by the specified card for each service. Applies to all services.
 - **ERRORS**—Total number of messages with errors for each service. Applies to all services.
 - **WARNINGS**—Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services
 - **FORWARD TO GTT**—Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR and INPMR services

Report Type: `rept-stat-sccp:mode=perf`

This report includes the status of DSM, E5-SM4G, and E5-SM8G-B cards, but does not differentiate between these card types.

- **SCCP SUBSYSTEM REPORT, LNP SUBSYSTEM REPORT and GFLEX/MNP SERVICE REPORT**—Summary status of the SCCP subsystem, GFLEX and MNP services, LNP subsystem along with their corresponding Alarm Status
- **SCCP CARDS CONFIGURED**—Number of Service Module cards provisioned
- **CARD IS-NR**—Number of Service Module cards that can be used by the system (status is in-service normal, IS-NR)
- **SYSTEM PEAK SCCP LOAD**—Highest SCCP TPS processed by the EAGLE 5 ISS
- **SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active Service Module cards
- **SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP TPS capacity. This value is set by the `chg-th-alm` command.
- **TPS STATISTICS**—Section of the report that provides TPS statistics on each Service Module card
 - **CARD**—Card location of the cards running the VSCCP application
 - **CPU USAGE**—Percentage of the amount of CPU used to process messages by each card during the last 30 seconds
 - **TOTAL MSU RATE**—Total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the Service Module card for the last 30-second period.
 - **CLASS 0 and CLASS 1 MESSAGING RATE**—Number of messages received per second.

The next section of the `rept-stat-sccp:mode=perf` report provides system-wide SCCP traffic statistics.

AVERAGE MSU USAGE

Total of the MSU usage fields from each Service Module card divided by the number of active Service Module cards

AVERAGE CPU USAGE

Total of the CPU usage fields from each Service Module card divided by the number of active Service Module cards

TOTAL MSU RATE

Sum of all MSU rates processed by all active Service Module cards

STATISTICS FOR PAST 30 SECONDS

Statistics that represent the last 30-second period

TOTAL MSUS

Sum of all transactions on all active Service Module cards

TOTAL ERRORS

Sum of all errors on all active Service Module cards

Report Type: `rept-stat-sccp:loc=nnnn`

- **CARD**—Card location of the card running the VSCCP application
- **VERSION**—Version number of the GPL the card is running
- **TYPE**—Type of the card

- **CARD ALARM STATUS**—If there are no card alarms present, this field displays No Alarms.

The next section of the `rept-stat-sccp:loc=nnnn` report supplies the status of the individual services provided by the card and the associated CPU usage for the service.

Possible values are ACTIVE, OFFLINE and SWDL (software loading)

TOTAL

Sum of the CPU usage for the services running over the previous 30-second period

CARD SERVICE STATISTICS

Card service statistics over the previous 30-second period for the specified card. The report tracks the following:

SERVICE SUCCESS

Total number of successful messages processed by the specified card for each service. Applies to all services.

ERRORS

Total number of messages with errors for each service. Applies to all services.

WARNINGS

Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services

FORWARD TO GTT

Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, and INPMR services

rept-stat-seas**Report Status SEAS Command**

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE. This command reports the status of the CCS MR connections if the SEAS Over IP feature is turned on. See the *Maintenance Guide* for information about the SEAS alarms.

Parameters

This command has no parameters.

Example

```
rept-stat-seas
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

None

Output

This example shows output when the SEAS Over IP feature is turned on.

`rept-stat-seas`

```

tekelecstp 07-01-11 16:47:51 EST  EAGLE 37.5.0

rept-stat-seculog

Display Security Log Status Information

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries
- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

Parameters

This command has no parameters.

Example

```
rept-stat-seculog
```

Dependencies

No other security log command can be in progress when this command is entered.

Notes

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are not necessarily displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format of *hh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

Output

This example shows the output in the normal security log state. All un-uploaded records appear in the log on the active OAM.

```
rept-stat-seculog
```

```

rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0

Legend

- **LOC**—Address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.
- **ROLE**—Current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: *active* or *standby*.
- **-- SINCE LAST UPLOAD**—Applies to the four columns directly below the heading on the output. It indicates that the fields below display information obtained since the last upload.
 - **ENTRIES**—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using `copy-seculog`.
 - **%FULL**—Shows, as a percentage, how much space in the log the ENTRIES field value occupies
 - **OFLO**—Overflow indicator. Overflow occurs if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. Displays *No* if no overflow has occurred and *Yes* if overflow has occurred

- **FAIL**—Failed indicator. Displays *No* if no logging failure has occurred. Displays *Yes* to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

Note: Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a `copy-disk` command is processing, the system sets the flag when the `copy-disk` command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

- **OLDEST RECORD/NEWEST RECORD**—Date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The **NEWEST RECORD** for the active log is the current date, because the log will have recorded the `rept-stat-seculog` command that was just entered to produce the report.
- **LAST UPLOAD**—Date and time when the log was last uploaded successfully. That is, the `copy-seculog` command successfully copied the log to the FTA.

Related Commands

rept-stat-sip

Report Status SIP

Use this command to display the overall status of the SIP service on the EAGLE.

Parameters

loc (optional)

The SIP card location for which SIP TPS usage data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

peakreset (optional)

Reset peak values to the current TPS values.

Range:

yes
no

Default:

no

mode (optional)

Performance data of SIP cards and their connections.

Range:*perf***Default:***perf*

Example

```
rept-stat-sip
rept-stat-sip:peakreset=yes:loc=1101
rept-stat-sip:loc=1101
rept-stat-sip:mode=perf
rept-stat-sip:mode=perf:loc=1101
```

Dependencies

The location specified with this command should be of a SIP card.

A SIP card running the SIPHC application must be configured before this command can be entered.

Parameter peakreset should be specified with loc parameter.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```
rept-stat-sip

rept-stat-slan

Report Status of the STPLAN

Use this command to generate a summary report of the status of the DCM, E5-ENET, and E5-ENET-B cards that make up the STPLAN subsystem.

Parameters

mode (optional)

Use this parameter to provide extended performance information, including group ticket voucher (TVG) and message flow control (MFC) message rates.

Range:

perf

Default:

No extended performance information is displayed

Example

```
rept-stat-slan
rept-stat-slan:mode=perf
```

Dependencies

No other `rept-stat-xxx` commands can be in progress when this command is entered.

At least one DCM, E5-ENET, or E5-ENET-B card that makes up the STPLAN must be configured.

Notes

The HOST Cap. field value is obtained by averaging usage percentages for data links from each DCM, E5-ENET, and E5-ENET-B card to the host.

The EAGLE Cap. field value is obtained by averaging usage percentages for DCM, E5-ENET, and E5-ENET-B traffic received from LIMs.

System level usage for host capacity (the AVERAGE USAGE per HOST CAPACITY field in the `rept-stat-slan` output) is obtained by averaging the usage percentages for the data links to the host from each DCM, E5-ENET, and E5-ENET-B card.

EAGLE 5 ISS level usage for DCM, E5-ENET, and E5-ENET-B card capacity (the AVERAGE USAGE per EAGLE CAPACITY field) is obtained by averaging usage percentages for DCM, E5-ENET, and E5-ENET-B traffic received from LIMs.

Output

The following example shows output with at least one card in an IS-NR state:

```
rept-stat-slan
```

Legend

- **SLAN Subsystem Report**—Status of the STPLAN subsystem
- **STPLAN Cards Configured**—Number of DCM, E5-ENET, and E5-ENET-B cards used by the STPLAN contained in the system.
- **Cards IS_NR**—Number of DCM, E5-ENET, and E5-ENET-B cards contained in the system whose status is in service normal (IS-NR)
- **CARD**—Locations of the DCM, E5-ENET, and E5-ENET-B cards
- **VERSION**—Version number of the GPL running on the STPLAN card
- **AST**—Associated state of the DCM, E5-ENET, and E5-ENET-B cards. The possible values are described in [\[missning link\]](#).
- **HOST CAP**—Amount of traffic being sent to the host from each DCM, E5-ENET, and E5-ENET-B card, expressed as a percentage of the total amount of traffic that can be sent to the host.
- **EAGLE CAP**—Amount of traffic being sent to each DCM, E5-ENET, and E5-ENET-B card, that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to the DCM, E5-ENET, and E5-ENET-B card.
- **AVERAGE USAGE per HOST CAPACITY**—Amount of traffic being sent to all hosts from all DCM, E5-ENET, and E5-ENET-B cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all DCM, E5-ENET, and E5-ENET-B cards.
- **AVERAGE USAGE per EAGLE CAPACITY**—Amount of traffic being sent to all DCM, E5-ENET, and E5-ENET-B cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all DCM, E5-ENET, and E5-ENET-B cards.
- **CARDS DENIED SLAN SERVICE**—Card locations that cannot use the STPLAN application.
- **CARDS DISABLED COPY SERVICE**—Card locations that cannot use the stop and copy action of the gateway screening feature.

The report displayed with the `rept-stat-slan:mode=perf` command shows these fields:

- **HOST CAP**—Average of usage percentages for the TCP/IP data links to the host from each DCM, E5-ENET, and E5-ENET-B card.

- **EAGLE CAP**—Average of usage percentages for the DCM, E5-ENET, and E5-ENET-B traffic that is received from the LIMs.
- **TVG RATE**—Number of messages per second received from all SS7 links and any other group ticket voucher paced message source. Obtained from statistics maintained by the DCM, E5-ENET, and E5-ENET-B cards for the last 30-second period.
- **AVERAGE USAGE per HOST CAPACITY**—Amount of traffic being sent to all hosts from all DCM, E5-ENET, and E5-ENET-B cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all DCM, E5-ENET, and E5-ENET-B cards.
- **AVERAGE USAGE per EAGLE CAPACITY**—Amount of traffic being sent to all DCM, E5-ENET, and E5-ENET-B cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all DCM, E5-ENET, and E5-ENET-B cards.

rept-stat-slk

Report Status Signaling Link

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the location of the E1 card and the UAM text. If the E1 association is not provisioned, "E1 association unknown" is displayed. If the card is not type LIME1, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the location of the T1 card and the UAM text. If the card is not type LIMT1, no T1 output is generated.

Parameters

l2stats (optional)

Report L2 status

Range:

align

Display alignment data only

both

Display alignment and service data

brief

Display up to 10 alignment events only

no

Do not display level 2 status information

service

Display service data only

Default:

no

link (optional)

The signaling link on the card specified in the *loc* parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table 54: Summary of Ranges for link Parameter](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

Default:

Display all

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All cards containing signaling links are displayed.

stat (optional)

A report on cards whose status is the same as the state indicated by the parameter

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In-Service-Abnormal (IS-ANR)

dsbl

Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

mt

Out-of-Service-Maintenance (OOS-MT)

nr

In-Service-Normal (IS-NR)

Default:

Display all

Example

```
rept-stat-slk
rept-stat-slk:loc=1201:link=a
rept-stat-slk:stat=alminh
rept-stat-slk:loc=1203:link=b:l2stats=both
rept-stat-slk:loc=1203:link=b:l2stats=brief
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

If the `loc` or `link` parameter is specified, then the `stat` parameter cannot be specified.

When the `loc` parameter is specified, the `link` parameter must be specified.

The card must be equipped and must be one of the following cards:

- E5-E1T1, E5-E1T1-B, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPLIM, IPLIMI, or IPSG application

The location specified by the `loc` parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (`l2stats`).

On point-to-multipoint IP links (E5-ENET /E5-ENET-B cards equipped as SS7IPGW or IPGWI links), `l2stats` output is not available.

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

The card in the location specified by the `loc` parameter must be in service.

The `link=b` parameter cannot be specified for SS7IPGW links.

Neither the `stat` or `loc` and `port` parameters can be specified with this command.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- *a-a1, b*—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

This command is not valid for IPSG-M3UA signaling links.

Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The *Installation Guide* provides an illustration of card locations.

Output

rept-stat-slk

  ALARM STATUS      = No Alarms
  UNAVAIL REASON    = --
  T1 STATUS         = 1201, REPT-ElF:FAC-T1 Port 1 LOS failure
Command Completed.
;

```

Legend

- **SLK**—Card location and the signaling link
- **LSN**—Name of the linkset that contains the signaling link
- **CLLI**—CLLI code of the destination STP of the signaling link
- **ALARM STATUS**—Trouble text alarm message generated for the specified signaling link.
- **UNAVAIL REASON**—Reason the signaling link is unavailable. More than one unavailable reason may be listed:
 - **BSNR**—The signaling link received 2 of 3 invalid BSNs.
 - **CNGT**—The signaling link has a remote congestion time-out.
 - **COO**—A changeover order was received.
 - **FC**—The signaling link is unavailable because of false congestion restart.
 - **FE**—The signaling link is in far end loopback mode.
 - **FIBR**—The signaling link received 2 of 3 invalid FIBs.
 - **INTR**—Too many link interrupts were received.
 - **LB**—The signaling link has been blocked locally.
 - **LD**—The signaling link received incomplete data.
 - **LI**—The signaling link has been inhibited locally.
 - **NA**—The signaling link is not aligned.
 - **PF**—The signaling link failed the proving period.
 - **RB**—The signaling link has been blocked remotely.
 - **RD(xx.xxx)**—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.
 - **RL**—The signaling link is in remote near end loopback mode.
 - **RMI**—The signaling link has been inhibited remotely.
 - **SIE**—An unexpected SIE was received.
 - **SIN**—An unexpected SIN was received.
 - **SIO**—An unexpected SIO was received.
 - **SIOS**—An unexpected SIOS was received.
 - **SLTF**—Link test failed.
 - **T1NR**—The level-2 T1 (not ready) timer expired.
 - **T1R**—The level-2 T1 (ready) timer expired.
 - **T2**—The level-2 T2 timer expired.
 - **T3**—The level-2 T3 timer expired.

- **XDA**—The signaling link did not receive an acknowledgment in time.
- **XER**—The SUERM threshold was exceeded.—
- **--**—The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

- **TNC**—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.
- **TNR**—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.
- **LPO**—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.
- **RPO**—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.
- **ROOS**—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.
- **RPE**—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.
- **RMIR**—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.
- **LCD**—Level 1 facility outage: Loss of Cell Delineation
- **LOF**—Level 1 facility outage: Loss of Frame
- **LOS**—Level 1 facility outage: Loss of Signal

EVENT TYPE

The type of event being logged:

RECEIVE

When a signal unit is received.

TRANSMIT

When a signal unit is transmitted.

STATE

When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail

EVENT

The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

SERVICE EVENT

The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

TIMESTAMP

The time event processed by the system as follows:

- **YY-MM-DD hh:mm:ss.ttt**, where

- **YY**—The last 2 digits of the year (range 00–99)
- **MM**—The month (range 01–12)
- **DD**—The day of month (range 00–31)
- **hh**—The hour of day (range 00–59)
- **mm**—The minute of the hour (range 00–59)
- **ss**—The seconds of the minute (range 00–59)
- **ttt**—Milliseconds of the second (range 000–995 in increments of 5)

E1 STATUS

The status of the E1 interface associated with the link; the status includes the card location and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type LIME1, no E1 output is displayed.

T1 STATUS

The status of the T1 interface associated with the link; the status includes the card location and the UAM text. If the card is not type LIMT1, no T1 output is displayed.

Related Commands

act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

rept-stat-sys

Report Status System

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

Parameters

This command has no parameters.

Example

```
rept-stat-sys
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

None

Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

```
rept-stat-sys
```

```

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.
- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.

- When the Measurements Platform collection function is enabled, the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.
- When the Origin-Based MTP Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.
- When the INAP Number Portability (INP) feature is turned on, the INP SS entry appears.
- When the ANSI41 AnalyzedInformation Query (ANSI41 AIQ) feature is enabled, the AIQ SS entry appears.
- When the FCMODE is FCOPY for an *FC-Capable* GPL, the FC IP LK and FCS entries appear. E5-ENET or E5-ENET-B cards running the IPSP or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This requirement does not apply to cards running the IPSP GPL.
- When the S13/S13' EIR feature is enabled and one or more DEIR cards have been provisioned and allowed, the DEIR CARD entry shows the number of DEIR cards that are in each state.
- When the SIP Number Portability feature is enabled and one or more SIP cards have been installed and allowed, the SIP CARD entry shows the number of SIP cards that are in each state.

rept-stat-t1

Report Status T1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

Parameters

loc (optional)

Card address. The unique identifier of a specific LIMT1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIMT1 cards is reported.

t1port (optional)

T1 port number. This parameter displays information for a T1 port on the card in the specified card location.

Range:

1 - 8

Ports 3 through 8 can be specified only for HC-MIM cards

Example

```
rept-stat-t1
rept-stat-t1:loc=1203
rept-stat-t1:loc=1203:t1port=1
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `loc` parameter must be specified when the `t1port` parameter is specified.

The active TDM location cannot be specified in the `loc` parameter.

Card locations 1117 and 1118 and the MUX card locations ($xy09$ and $xy10$ where x is the frame and y is the shelf) cannot be specified in the `loc` parameter.

Notes

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the `loc` parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the `loc` and `t1port` parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

Output

This example shows the output when no parameters are specified:

```
rept-stat-t1
```

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0
LOC  T1PORT  PST      SST      AST

;

```

Legend

- **LOC**—Card location
- **T1PORT**—Number of the T1 port provisioned on the card in the specified location.
- **ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **UNAVAIL REASON**—Reason for the T1 port being unavailable
- **SLK**—Signaling link assigned to the T1 port
- **TS**—Timeslot assigned to the signaling link

Related Commands

None.

rept-stat-trbl

Report Status Trouble

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

Parameters

display (optional)

Display type of alarms to be reported.

Range:

act

Display only active alarms

all

Display all alarms with no timestamps

inhb

Display only inhibited alarms

timestamp

Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the display=timestamp parameter is specified.

Default:

all

level (optional)

The alarm level of the alarms to be displayed

Range:

crit

majr

minr

Default:

All alarms are displayed

Example

```
rept-stat-trbl
```

```
rept-stat-trbl:level=majr
```

```
rept-stat-trbl:display=inhb
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

None

Output

This example lists all devices that could appear. This example is to be used as a sample only: all devices and alarms cannot coexist in the system.

```
rept-stat-trbl
```

```

rept-stat-trm

Report Status Terminal

Use this command to display the status of the terminal ports. The device primary, secondary, and associated state information is displayed along with the terminal identification number.

Parameters

trm (optional)

The ID of the terminal port that is to be reported.

Range:

1 - 40

Default:

Display status of all terminal ports

Example

```
rept-stat-trm
rept-stat-trm:trm=5
rept-stat-trm:trm=17
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

None

Output

This example shows output when the IP User Interface is not turned on:

```
rept-stat-trm
```

```

rept-stat-tstslk

Report Signaling Link Test Status

Use this command to generate a report of the status of the MTP signaling links currently under test.

Parameters

link (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

Synonym:

port

Range:

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

loopback (optional)

Loopback test type.

Range:

sltc

lxvr

oam

line

payload

Example

```
rept-stat-tstslk
rept-stat-tstslk:loc=1201
rept-stat-tstslk:loc=1203:link=a
rept-stat-tstslk:loopback=lxvr
```

Dependencies

The card location specified in the `loc` parameter must be equipped.

The signaling link specified in the `link` parameter must be equipped.

If the `link` parameter is specified, the `loc` parameter must be specified.

The signaling link specified in the `link` parameter must be an SS7 signaling link.

This command cannot be entered for E5-ENET or E5-ENET-B cards that are running the SS7IPGW, IPGWI, or IPKG application, or that have SS7IPGW, IPGWI, or IPKG-M3UA links.

This command cannot be entered for cards with IPGWI signaling links.

The card location specified in the `loc` parameter cannot be reserved by the system.

This command cannot be entered during upgrade.

Notes

None

Output

If no parameters are specified, all links in test are displayed.

If only the `loc` parameter is specified, all links in test on the specified card are displayed.

If the `loc` and `link` parameters are specified, the specified link on the specified card is displayed.

If the `loopback` parameter is specified, all links in the specified type of loopback test are displayed.

rept-stat-user

Report Status User

Use this command to show which users are logged into the system. The command shows user names, terminal identification numbers, the time that the last valid command was issued, and the current state of the last command entered.

Parameters

This command has no parameters.

Example

```
rept-stat-user
```

Dependencies

None

Notes

None

Output

```
rept-stat-user
```

```
e5oam 09-04-03 17:25:57 MST EAGLE 41.0.0
REPT STAT USER COMPLD
USER ID          TERM #  IDLE SINCE          COMMAND          STATE
eagle            3      02-01-03 17:19:04  rept-stat-applsock  IDLE
eagle            6      02-01-03 17:25:57  rept-stat-user     PROCESSING
REPORT COMPLETED
```

Legend

- **USER ID**—The user ID of the users logged onto the system.
- **TERM #**—The terminal port to which the user's terminal is connected.
- **IDLE SINCE**—The date and time of day that the user last entered a command.
- **COMMAND**—The last command the user entered.
- **STATE**—The state of the command the user last entered.

rept-stat-xlist

Report Status X-List Storage Area Statistics

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries
- The percentage of space in the x-list reserved area currently in use
- The percentage of x-list space that must be in use before an alarm is issued

Parameters

This command has no parameters.

Example

```
rept-stat-xlist
```

Dependencies

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

Notes

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:
$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated X-LIST space (for example, 99.1% is not rounded up to 100%).

Output

```
rept-stat-xlist
```

```
rlghncxa03w 04-02-18 03:32:42 EST   EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries     = 156
Current X-LIST occupancy   = 31 %(see "Notes")
X-LIST occupancy threshold = 80 %
;
```

rls-alm

Release Alarm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

Parameters

lvl (optional)

The alarm level.

Range:

crit

majr

minr

Default:

All alarms are cleared

Example

```
rls-alm
rls-alm:lvl = crit
```

Dependencies

No other action command can be in progress when this command is entered.

Notes

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

Output

```
rls-alm
```

```
rlghncxa03w 04-01-07 09:27:24 EST EAGLE 31.3.0
rls-alm
Command entered at terminal #8.

rmv-card

Remove Card

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM or E5-TSM card or physically remove it from the shelf.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.

force (optional)

This parameter is required if the card is the last GLS or SCCP card.

Range:

yes

no

Default:

no

Example

```
rmv-card:loc=1101
```

```
rmv-card:loc=1201:force=yes
```

Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all $xy09$ and $xy10$ locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The force parameter is required to force the last GLS (if the Integrated GLS feature is not turned ON) or SCCP card out of service.

If the card has active TCP/IP links, all TCP/IP data links assigned to it must be placed out of service.

Notes

The function of this command is the same as the `inh-card` command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the `dact-slk` command, before the command is accepted.

Inhibiting a card running the VSCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an E5-TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit a card that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the `canc-dlk` command, before the command is accepted.

Output

```
rmv-card:loc=1101
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been inhibited.

rmv-imt

Remove IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

Caution: Use this command only when directed by the Customer Care Center.

Parameters

bus (mandatory)

The IMT bus to be inhibited.

Range:

a

b

Example

```
rmv-imt:bus=a
```

Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test.

Notes

Cards that are not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the other IMT bus.

The function of this command is the same as the `inh-imt` command.

Output

```
rmv-imt:bus=a
```

rmv-trm

Remove Terminal

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) , and to set the secondary state to MANUAL . The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

Parameters

trm (mandatory)

The ID of the serial port to be inhibited.

Range:

1 - 40

force (optional)

This parameter forces the removal of the terminal, even if it is the last in-service SEAS terminal available.

Range:

yes

no

Default:

no

Example

```
rmv-trm:port=5
```

```
rmv-trm:trm=1:force=yes
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified as values for the trm parameter.

The force=yes parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

Output

```
rmv-trm
```

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Inhibit message sent to terminal
;

rst-card

Reset Card

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful. If the loading fails, the card status is OOS-MT (Out-of-Service-Maintenance).

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 -

4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118,
5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

code (optional)

GPL type to be loaded.

Range:

appr

approved GPL

trial

trial GPL

utility

utility GPL, used primarily by the factory for loading special GPLs for testing purposes

Default:

No GPL type is given.

Example

```
rst-card:loc=2301:code=trial
```

```
rst-card:loc=1101:data=persist
```

Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all *xy09* and *xy10* locations (where *x* is the frame and *y* is the shelf).

The shelf and card must be equipped.

If the card is a LIM, it must have a signaling link assigned to it before it can be allowed.

No other action command can be in progress when this command is entered.

The LNP feature must be turned on before the data parameter can be specified.

Notes

The function of this command is the same as the `alw-card` command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the data parameter for reloading GTT data. The system does not support persistent GTT data loading, and the data parameter is now used in support of the warm restart feature.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure

client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated

Reset Destination Circular Routing Status

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)

dpci (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

force (optional)

This parameter specifies whether to reset all dynamic data for the specified route in the Route table to the initial values.

Range:

yes

reset the data

no

do not reset the data

Default:

no

Example

```
rst-dstn:dpc=1-2-*
rst-dstn:dpc=20-2-5
rst-dstn:dpc=p-20-2-5
rst-dstn:dpc=20-2-5:force=yes
rst-dstn:dpcn16=125-2-10
```

Dependencies

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC as *ni-nc-*** or *ni-nc-**** cannot be specified.

Notes

None.

Output

```
rst-dstn:dpc=20-2-5:force=yes

rst-imt

Reset IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

Parameters

bus (mandatory)

The IMT bus to be returned to service.

Range:

a

b

Example

```
rst-imt:bus=a
```

Dependencies

None

Notes

The function of this command is the same as the `alw-imt` command.

This command returns an inhibited IMT bus to service.

Output

```
rst-imt:bus=a
```

```
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
Allow IMT Bus A command issued.

rst-trm

Reset Terminal

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

Parameters

trm (mandatory)

ID of the serial port to be put into service.

Range:

1 - 40

Example

```
rst-trm:trm=5
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the trm parameter.

The terminal specified by the trm parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

An IPSM card must be provisioned for the specified SEAS terminal before this command can be entered.

The SEAS Over IP feature must be turned on before this command can be entered for a SEAS terminal.

If the SEAS terminal is auto-inhibited, then this command cannot be entered.

The terminal specified by the trm parameter cannot be configured as type=none (see the `chg-trm` command).

Notes

The function of this command is the same as the `alw-trm` command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

Output

```
rst-trm:trm=12
```

```

rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Allow message sent to terminal

rtrv-acg-mic

Display ACG Manually Initiated Control

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits.

Parameters

dgts (optional)

Digits

Range:

3 digits, 6 - 10 digits

Valid values are 000-999, 000000-9999999999

serv (optional)

Query service

Range:

ain

in

type (optional)

Type of control

Range:

all

sd

Example

Display all MICs:

```
rtrv-acg-mic
```

Display the MIC(s) that apply to particular services and digits:

```
rtrv-acg-mic:type=sd
```

Display the MIC(s) that apply to AIN queries:

```
rtrv-acg-mic:serv=ain
```

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

```
rtrv-acg-mic:serv=in:dgts=919460
```

Dependencies

If the type=all parameter is specified, then the serv and dgts parameters cannot be specified.

The dgts parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on before this command can be entered.

Notes

None

Output

```
rtrv-acg-mic:type=sd
```

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0

rtrv-acg-noc

Display ACG Node Overload Control

Use this command to display the definitions of node overload levels. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the overload level.

Parameters

lvl (optional)

Overload level

Range:

1 - 10

Example

```

rtrv-acg-noc
rtrv-acg-noc:lvl=3

```

Dependencies

The LNP feature must be turned on before this command can be entered.

Notes

None

Output

This example displays all defined overload levels:

```
rtrv-acg-noc
```

```

rtrv-ainpopts

Retrieve AINP Options

Use this command to retrieve AINP-specific options.

Parameters

This command has no parameters.

Example

```
rtrv-ainpopts
```

Dependencies

None.

Output

If the RNAI or RNAIV option is not provisioned, then the RNAI mnemonic default value is displayed. If the RNAI or RNAIV option is provisioned, then the RNAI mnemonic string for the option is displayed.

If the RNP or RNPV option is not provisioned, then the RNP mnemonic default value is displayed. If the RNP or RNPV option is provisioned, and the RNPV option can be set using RNP, then the RNP mnemonic string for the option is displayed. If the RNPV option cannot be provisioned using RNP, then the RNPV numerical value is displayed.

Each DIALPFX and DIALNAI option is displayed with its associated DLTPFX and SNAI option, respectively.

If the NEC option is not provisioned, then the default is displayed.

This example shows output with default AINP options.

rtrv-appl-rtkey

Retrieve Application Route Key Table

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 2500 routing keys per system (if E5-ENET or E5-ENET-B cards exist).

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

asname (optional)

Application Server (AS) name assigned to this routing key.

Range:

ayyyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

cice (optional)

The end range of circuit identification codes assigned to the routing key.

Range:

0 - 4294967295

See [Table 57: Valid CIC Ranges for SI and MSU Types](#) for valid CIC values for specified SI and MSU types.

cics (optional)

The start range of circuit identification codes assigned to the routing key.

Range:

0 - 4294967295

See [Table 57: Valid CIC Ranges for SI and MSU Types](#) for valid CIC values for specified SI and MSU types.

display (optional)

The type of output to display.

Note: Output includes the type of card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

Range:*all*

The KEY and the ATTRIBUTE sections of the routing key are displayed

brief

Only the KEY section of the routing key is displayed

Default:*brief***dpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*dpca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

Default:

50

opc (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

opca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Originating point code.

opci (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmi* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opc24 (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

opc16 (optional)

16-bit ITU national originating point code with subfields *unit number sub number area main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

rcontext (optional)

Routing Context. The routing key with the specified routing context.

Range:

0 - 4294967295

si (optional)

Service indicator.

Range:

0 - 15

The following equivalent text values can be specified:

Number = Text—Description

0=snm

Signaling network management messages

1=regtest

Signaling network testing and maintenance regular

2=spltest

Signaling network testing and maintenance special

3=sccp

SCCP

4=tup

Telephone user part

5=isup

ISDN user part

13=qbicc

ssn (optional)

Subsystem number.

Range:

0 - 255

type (optional)

The type of routing key.

Range:

all

full

partial

default

Default:

all

Example

```
rtrv-appl-rtkey
```

```
rtrv-appl-rtkey:dpc=123-234-255:si=3
```

```
rtrv-appl-rtkey:dpc=123-234-255
```

```
rtrv-appl-rtkey:cics=1:cice=1000:num=3
```

```
rtrv-appl-rtkey:cice=19
rtrv-appl-rtkey:opc=122-124-125
rtrv-appl-rtkey:type=partial
rtrv-appl-rtkey:display=all
rtrv-appl-rtkey:rcontext=7
rtrv-appl-rtkey:dpcn16=121-10-15
```

Dependencies

The `ssn` parameter must be specified and is valid only when the `si=3` (*sccp*) parameter is specified.

The value specified for the `cics` parameter must be less than or equal to the value specified for the `cice` parameter.

A circuit identification code range (`cics` to `cice`) that overlaps an existing routing key cannot be specified.

The `ssn` parameter cannot be specified when `opc`, `cics`, and `cice` parameters are specified. See [Table 6: Valid Parameter Combinations for chg-appl-rtkey Routing Key Types](#) for valid parameter combinations.

When the DPC is ANSI and the `si=4` parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The `opc`, `cics`, and `cice` parameters can be specified with the `si` parameter only if the `si` parameter has a value of 4, 5, or 13 (or *tup*, *isup*, or *qbicc*).

[Table 57: Valid CIC Ranges for SI and MSU Types](#) shows valid CIC values for SI types 4, 5, and 13.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

If the `type=default` parameter is specified, then the `dpc`, `si`, `ssn`, `opc`, `cics`, and `cice` parameters cannot be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The `display=all` parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (s-).

Output

rtrv-appl-rtkey

```

Related Commands

chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey

rtrv-as

Retrieve Application Server

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

Parameters

aname (optional)

Name of the association.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Default:

Retrieve all

asname (optional)

Name of the Application Server.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
rtrv-as
```

```
rtrv-as:aname=as1
```

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

rtrv-as

```

rlghncxa03w 05-06-05 08:40:18 EST EAGLE5 34.0.0
AS Name      Mode      Tr ms     Association Names

AS Table is (2 of 250) 1% full
;

```

Related Commands

[chg-as](#), [dlt-as](#), [ent-as](#), [rept-stat-as](#)

rtrv-assoc

Retrieve Association

Use this command to retrieve the configuration data from the IP Socket/Association (IPAPSOCK) table.

Parameters

adapter (optional)

The adapter layer for this association.

Range:

diam

m2pa

m3ua

sua

Default:

Retrieve all

alhost (optional)

```

rtrv-assoc:aname=swbel132
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=sua
rtrv-assoc:rhosttype=alternate:display=all
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=diam

```

Dependencies

A valid value must be specified for the host parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The IPASOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port.

When the command is entered with the `aname`, `lhost`, or `alhost` parameters, the output displays SCTP buffer usage information (used and total buffer space on the card).

Heartbeat timer value is in milliseconds.

Output

AS names are displayed for IPGWx-M3UA and SUA linksets.

LS names are displayed for IPSG linksets.

This example shows buffer usage (used and total buffer space) and card location information:

```
rtrv-assoc:aname=ipsgm3ua05
```

```

rtrv-atinpopts

rtrv-atinpopts

Use this command to retrieve the data that is used for ATI number conditioning.

Parameters

This command has no parameters.

Example

```
rtrv-atinpopts
```

Dependencies

The ATINP feature must be enabled before this command can be entered.

Output

This example shows output with default ATINPQ options:

```
rtrv-atinpopts
```

```
tekelecstp 12-01-04 07:53:46 EST EAGLE 45.0.0
```

```
ATINPQ OPTIONS
```

```
-----
ATIACKIMSI      = NONE
ATIACKMSISDN    = MSISDN
ATIACKRN        = RN
ATIDFLTRN       = NONE
ATIDLM          = NONE
ATINPTYPE       = ANY
ENTITYLEN       = NONE
SNAI            = INTL
SPORTTYPE       = GSM
ATISUPPLOCINFO  = OFF
VLRNUMLEN       = 40
ATIACKVLRNUM    = RNSPMSISDN
```

```
;
```

This example shows output when the Location Information request is supported:

```
rtrv-atinpopts
```

```
tekelecstp 12-01-25 12:22:38 EST EAGLE 45.0.0
```

```
ATINPQ OPTIONS
```

```
-----
ATIACKIMSI      = GRN
ATIACKMSISDN    = GRNDLMSISDN
ATIACKRN        = GRNDLMRNSP
ATIDFLTRN       = NONE
ATIDLM          = 454555817324228
ATINPTYPE       = ANY
ENTITYLEN       = NONE
SNAI            = NAI
SPORTTYPE       = NONE
ATISUPPLOCINFO  = ON
VLRNUMLEN       = 40
ATIACKVLRNUM    = RNSPMSISDN
```

```
;
```

Legend

- **ATIACKIMSI**—IMSI parameter for ACK response message
- **ATIACKMSISDN**—MSISDN parameter for ACK response message
- **ATIACKRN**—Routing Number format
- **SNAI**—NAI of the incoming MSISDN digits
- **ATIDLM**—Outbound message delimiter
- **ATIDFLTRN**—Default Routing Number
- **ATINPTYPE**—Number Portability Type
- **SPORTTYPE**—Service Portability Type
- **GRN**—Generic Routing Number

- **ATISUPPLOCINFO**—Support ATINP query with LocationInformation request if ATINP feature is activated
- **VLRNUMLEN**—Maximum number of digits that could be encoded as VLR-number in ATI ACK response message
- **ATIACKVLRNUM**— VLR-number format

Related Commands

None.

rtrv-atm-lps

Retrieve ATM Link Parameter Set

Use this command to display the parameter values for the ATM link parameter sets in the database configured with the `chg-atm-lps` command, along with the non-configurable ATM parameters.

Parameters

lpset (optional)

The ATM link parameter set to be displayed.

Range:

1 - 30

Default:

All ATM link parameter sets are displayed

Example

```
rtrv-atm-lps:lpset=5
```

```
rtrv-atm-lps
```

Dependencies

None

Notes

None

Output

Note: Dashes (--) in the FC NR and FC BC fields indicate that this implementation is not supported on ATM high-speed signaling links.

rtrv-atm-lps:lpset=5

```

Legend

- **LPSET**—Link parameter set being changed. The system default value for this parameter is 1 for ANSI and , 21 for ITU.
- **ACTION**—Copy a set of ATM signaling link parameters from one parameter set to another.
- **SCRLPSET**—ATM signaling link parameter set used as a source for the action=copy parameter.
- **MAXCC**—Maximum number of transmissions of a BGN, END, ER, or RS PDU
- **MAXPD**—Maximum number of SD PDUs that can be sent before a POLL is sent
- **MAXSTAT**—Maximum number of list elements in a STAT PDU
- **TMRCC**—Timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs
- **TMRKALIVE**—Timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up
- **TMRNOSP**—Timer, in seconds, used to check that STAT PDUs are arriving often enough
- **TMRPOLL**—Timer, in seconds, used to guarantee that POLL PDUs are sent often enough
- **TMRIDLE**—Timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase
- **TMRT1**—Time, in seconds, between a link release action and the next link reestablish action during alignment
- **TMRT2**—Total time, in seconds, that SSCF will attempt alignment
- **TMRT3**—Time, in seconds, between proving PDUs
- **N1**—Number of PDUs sent during proving
- **MAXNRP**—Maximum number of retransmitted PDUs during proving
- **TMR SREC**—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring.

- **TMRNOCRED**—The timer, in seconds, used when the no credit exists and PDUs are available to be sent.
- **TMRERM**—The error rate monitor interval, in seconds.
- **NBLK**—The number of monitoring intervals per block.
- **TMRPROV**—The timer, in seconds, used to monitor the status of a link after it is placed into service.
- **SDU SIZE**—The SSCOP SDU size (set to 272 octets).
- **UU SIZE**—The SCOP UU size (set to 4 octets).
- **N**—The monitoring intervals spanning a .4 second error event (set to 9).
- **FC NR**—The fixed credit increment value.
- **FC BC**—The fixed credit allocation frequency.
- **TSUP**—The superblock timer for layer management, in seconds.
- **TLOSS**—The loss timer for layer management, in seconds.
- **ERMSM**—The error rate monitor smoothing factor.
- **THRES**—The error rate monitor threshold.

rtrv-atm-prm

Retrieve ATM Parameters

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

Parameters

This command has no parameters.

Example

```
rtrv-atm-prm
```

Dependencies

None

Notes

None

Output

```
rtrv-atm-prm
```

```
tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
3622 3622 4528 4528 210 100 3 0 1 16 12
;
```

Legend

The ATM traffic descriptors are displayed in the following fields:

- **BT**—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.
- **CDVT**—The amount of cell delay variation for the VCL in the network ingress direction.
- **PCR**—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.
- **QOS**—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.
- **SCR**—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.
- The ATM interface parameters are displayed in the following fields:
- **MAX VCCs**—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.
- **MAX VPCs**—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).
- **VCI BITS**—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.
- **VPI BITS**—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

[chg-attr-seculog](#)

rtrv-bip

Retrieve Board Identification PROMs

Use this command to show the board identification PROM (BIP) data for the main assembly at the specified card location.

The following information is displayed for the main assembly: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing date, and the software match ID.

For main assemblies, the port A Ethernet address (if ENT01 record exists) and port B Ethernet address (if ENT02 record exists) are also displayed.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

Example

The following example displays the BIP data for the main assembly.

```
rtrv-bip:loc=1201
```

Dependencies

The card location must be valid for the command.

Notes

The `tst-bip` command verifies that the PROM is good by writing to and reading from the PROM. The `rtrv-bip` command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the `rtrv-bip` command fails, this indicates that communication to the card has failed, and you might need to replace the card. Contact My Oracle Support (MOS) to find out if the card can be reprogrammed.

Output

For main assemblies, the Max Power Rating is also displayed. If the Card Power value is not present in BIP data, then the Max Power Rating is displayed as *Undef*.

This example shows the 7-digit serial number of a main assembly card manufactured on the eleventh week of 1993):

```
rtrv-bip:loc=1201
```

```
tekelecstp 10-03-14 23:32:51 IST EAGLE 42.0.0
-----
Location: 1201 MBD

Part Number: 850-0187-03

Revision:      A                               Week/Year:      11/2003
Serial Number: 10105365048

Software Match ID:   EG - 001                      Max Power Rating :  646 mA
-----
END OF REPORT
;

```

Legend

- **Location**—Card location for the BIP information
- **Part Number**—Part number of the card in the specified card location
- **Revision**—Hardware version of the card
- **Serial Number**—Serial number of the card. Serial number formats are:
 - 7-digit serial number—ywwxxxx
 - 8-digit serial number—yywwxxxx
 - 11-digit serial number—nnnyywwxxxx
 - 12-digit serial number—nnnyyww*xxxx

- 14-digit serial number—nnnyyyyww*xxxx
 - y = year digit (0–9)
 - w = week digit (0–9)
 - n = product identifier digit (0–9)x = serial number digit (0–F hexadecimal)
 - * = special character (0–9, a–z, or A–Z, alphanumeric characters)
- **Software Match ID**—Used to check hardware and board type for the BIP information.
- **Max Power Rating**—Maximum power rating of the card.
- **Week/Year**—Week (1–52) and year (4 digits) of the card. The serial number formats are:
 - 7-digit: ywwxxxx
 - 8-digit: yywwxxxx
 - 11-digit: nnnyywwxxxx
 - 12-digit: nnnyyww*xxxx
 - 14-digit: nnnyyyyww*xxxx
 - where y=year, w=week, n=product identifier, x=serial number (0-F, hexadecimal), *=special character (0–9, a–z, or A–Z)

rtrv-card

Retrieve Card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined by the *ent-card* command. If the *loc* parameter is specified, the command displays information for the specified card only.

Parameters

links (optional)

Links Provision Status. For the card in the location specified by the *loc* parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

Range:

all

Display all possible links for the card.

equip

Display links that are equipped on the card.

unequip

Display links that are allowed but not equipped on the card.

ipsg

Display the SLKTPS and total card TPS used for a particular card or for all cards configured with the IPSG GPL.

Default:

equip

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115, 6201 - 6208, 6211 - 6218, 6301 - 6108, 6311 - 6118

Default:

Retrieve all

Example

```
rtrv-card
rtrv-card:loc=1205
rtrv-card:links=ipsg
rtrv-card:loc=1111:links=ipsg
rtrv-card:loc=6201
```

Dependencies

The card location slot must be between 1 and 18 and not 9 or 10.

The card location cannot be 1114, 1116, 1117, or 1118.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, 61xx, 62xx, or 63xx.

The specified card location must be equipped in the database.

Notes

None

Output

rtrv-card

```

Legend

- **CARD**—Card location as stenciled on the shelf of the system
- **TYPE**—Type of card
- **APPL**—Application associated with each card
- **LSET NAME**—Linkset name associated with the cards
- **LINK**—Signaling link associated with the linkset.
- **SLC**—Signaling link code
- **UNEQUIPPED LINKS**—Signaling links that are unequipped on the provisioned card
- **SLKTPS**—Transactions Per Second configured for signaling links provisioned on the card
- **DATA**—Type of RTDB data loaded on the card. Displayed when the EPAP Data Split feature is turned on.
- **SRVNAME**- Server Name of the E5APPB Card or Telco Switch.

[chg-cmd](#)

rtrv-cmdclass

Retrieve Command Class

Use this command to retrieve the name and description of one command class or all command classes.

Parameters

class (optional)

The command class whose name and description are to be retrieved.

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

Example

```
rtrv-cmdclass:class=krb
```

```
rtrv-cmdclass
```

Dependencies

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the class parameter.

The value of the class parameter must be a valid configurable or non-configurable command class name.

Notes

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

Output

In the following examples, classes *u01*, *u03*, *u05*, and *u32* are default configurable command class names. Classes *krb* and *dab* are user-assigned configurable command class names. Default command class name *u02* was changed to *krb* and command class name *u04* was changed to *dab*. Descriptions of classes *krb* and *dab* were entered with the *descr* parameter when the class names were changed with the *chg-cmdclass* command.

```
rtrv-cmdclass:class=krb

VFLEX

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24 (optional)

Point code. The *ds* or a point code parameter must be specified.

pci (optional)

ITU international point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfnti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pn (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The `rtrv-ctrl-feat` command description shows the part number in the command output example.

Note: The `pn` or `feature` parameter must be specified to identify the feature.

Range:

893000000 - 893999999

The first 3 digits are 893. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

893012301

EIR

893015501

IDP Screening for Prepaid

893034201

Info Analyzed Relay Base

893016001

Prepaid IDP Query Relay

893016701

VFLEX

scpgta (optional)

Signaling Control Point (SCP) Global Title Address (GTA).

Note: The scpgta parameter is used only by the Prepaid IDP Query Relay feature.**Range:**1 - 21 digits, *none*1 - 21 hexadecimal digits. Valid digits are *0-9, a-f, A-F***Example**

rtrv-csl

rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789

rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc

rtrv-csl:feature="IDP Screening for Prepaid":list=insl:ds=123456789abcdEF

rtrv-csl:scpgta=12345

rtrv-csl:feature="EIR":list=imsipfx:ds=401923423

Dependencies

The value specified for the feature parameter must be a valid feature name for a feature that uses a Common Screening List. The feature must be specified as it appears in the `rtrv-ctrl-feat` command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The specified feature name must be valid for a feature that uses a Common Screening List.

The following parameters are allowed with the indicated common screening list type:

- list=ccnc—ds parameter
- list=gt—ds parameter
- list=imsipfx—ds parameter
- list=insl—ds parameter
- list=skbcsm—ds or scpgta parameter
- list=skts—ds parameter
- list=trig—ds parameter
- list=vmpfx—ds parameter

Only one of the ds, pc, and scpgta parameters can be specified in the command.

The pn or feature parameter must be specified before the list parameter can be specified.

Notes

None

Output

rtrv-cspc

Retrieve Concerned Signaling Point Code

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

Parameters

grp (optional)

Group name

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default:

Retrieve all.

Example

```
rtrv-cspc
```

```
rtrv-cspc:grp=grp01
```

Dependencies

If specified, the group name must exist in the database.

Notes

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

Output

This example shows output when the ANSI/ITU SCCP Conversion feature is enabled:

```
rtrv-cspc
```

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp02 ANSI, ITU, ITU-N24 3%
Grp03 ITU 2%
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is enabled:

```
rtrv-cspc:grp=grp02
```

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PC Type
GRP02 001-012-123 A
      001-012-124 A
      7-089-0 I
      s-2-021-4 I
      s-00789 N
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is not enabled:

```
rtrv-cspc:grp=groupi
```

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PCI
groupi 7-089-0
      s-2-021-4
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is not enabled:

```
rtrv-cspc:grp=grn16
```

```
tekelecstp 13-10-18 12:27:33 EST 45.1.0-64.77.0
CSPC GRP PCN16
Grn16 001-02-03
;
```

Legend

- **CSPC PC TABLE IS 15% FULL**—Relative size of the CSPC point code tables
- **CSPC GRP**—Name of the CSPC broadcast group

- **NETWORK**—Network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The grp parameter must be specified to list the point codes in the specified group.)
- **PERCENT FULL**—Relative size of the CSPC broadcast group
- **PC**—Point codes that make up the CSPC broadcast group
- **Type**—Network type of the point code in the group. (The grp parameter is specified in the command to list the point codes in the specified group.)

rtrv-ctrl-feat

Retrieve Controlled Feature

Use this command to retrieve the status of feature access key controlled features that are purchased and enabled in the system.

Parameters

enable (optional)

Retrieve controlled features that are enabled with either temporary feature access keys or permanent feature access keys.

Range:

temp
perm

Default:

Retrieve controlled features for both temporary and permanent feature access keys.

expired (optional)

Retrieve controlled features with expired temporary feature access keys.

Range:

yes
no

Default:

no

partnum (optional)

The Part Number to retrieve or the command.

Range:

893000000 - 893999999

Do not include dashes in the 9-digit number.

Default:

Retrieve all controlled features

status (optional)

Retrieve features with the specified status (On or Off).

Range:

on

off

Default:

Retrieve features with On and Off status

Example

```
rtrv-ctrl-feat
rtrv-ctrl-feat:enable=perm
rtrv-ctrl-feat:partnum=893005911
```

Dependencies

None

Notes

When the enable=perm parameter is specified, the expired parameter value is understood to be *no*.

The product right-to-use features (EAGLE5, EAGLE, and IP7) are not mutually exclusive. The hierarchy for product right-to-use features is EAGLE5, then EAGLE, then IP7. This means that if the EAGLE5 feature is on, the product is EAGLE5 regardless of the setting of the other product right-to-use features. Some EAGLE features require that a specific product right-to-use feature is enabled and turned on.

For systems being upgraded, the product right-to-use feature for the specific product is turned on. For example, upgrading from an EAGLE release in a system that uses no EAGLE features to a release that uses at least one EAGLE feature causes the EAGLE product right-to-use feature to be enabled and turned on during the conversion.

For new installation, no product right-to-use features are on. The appropriate product right-to-use feature for the highest required product in the hierarchy must be enabled and turned on.

Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. A feature must be purchased before you can enable the feature and turn the feature on. If you are not sure whether you have purchased a feature, contact your Oracle Sales Representative or Account Representative.

If a Part Number (partnum parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part

Number is for a different quantity. The output will also include the temporary enabled information, if applicable .

rtrv-data-rtdb

Retrieve Data RTDB

This command retrieves data from the RTDB on an active Service Module card. If the *loc* parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card. If the *loc* parameter is not specified, the data is retrieved on the active Service Module card that has the lowest IMT address. The RTDB status on the active Service Module card can be coherent or incoherent.

For LNP database items (TN) all Service Module cards are queried for the existence of the specified item. Either the Service Module card specified by the *loc* parameter or the Service Module card with the lowest IMT address returns full item information. Any remaining Service Module cards return either COHERENT or INCOHERENT if the item is found in the RTDB on the card.

Parameters

dn (optional)

Dialed Number.

Range:

5 - 15 digits

entity (optional)

Network Entity.

Range:

1 - 15 digits

entitytype (optional)

Entity Type.

Range:

sp

Service Provider: Any 10-digit TN

rn

Routing Number: Any 10-digit TN

vmsid

Voice Mail Server ID: Any 1-15 digit hexadecimal number

grn

Generic Routing Number: Any 1-15 digit hexadecimal number

imei (optional)

International Mobile Equipment Identity.

Range:

14 digits

imsi (optional)

International Mobile Subscriber Identity.

Range:

5 - 15 digits

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1117, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lrn (optional)

Location Routing Number.

Range:

10 digits

npanxx (optional)

Numbering Plan Area.

Range:

6 digits

tn (optional)

Telephone Number.

Range:

10 digits

Example

```
rtrv-data-rtdb:tn=9194663133
```

```
rtrv-data-rtdb:npanxx=919466
```

```
rtrv-data-lrn=9194460000
```

```
rtrv-data-rtdb:imsi=12345
```

```
rtrv-data-rtdb:dn=12345
```

```
rtrv-data-rtdb:entity=abcdefghijklm
```

Retrieve DN information from a specific Service Module card.

```
rtrv-data-rtdb:dn=19195554444:loc=1107
```

Retrieve entity data from a specific Service Module card.

```
rtrv-data-rtdb:entity=12345:loc=1107
```

Dependencies

The specified card location must be equipped in the database.

At least one of the `imsi`, `dn`, `entity`, `imei`, `entitytype`, `npanxx`, `lrn`, or `tn` parameters must be specified.

Only one of the `tn`, `lrn`, or `npanxx` parameters can be specified in the command.

If the `npanxx`, `lrn`, or `tn` parameter is specified, the LNP ELAP Configuration feature must be on.

If the AINPQ, EIR, G-Flex, G-Port, INP, Prepaid IDP Relay Query, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the `imsi`, `dn`, `entity`, `imei`, or `entitytype` parameter must be specified.

If the `imsi` parameter is specified, then the G-Flex, EIR, or S13 feature must be turned on.

The G-Flex, G-Port, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the `entity` parameter can be specified.

If the `entitytype` parameter is specified, the `entity` parameter must be specified.

If the `imei` parameter is specified, the EIR or S13 feature must be turned on.

The destination specified by the `loc` parameter must correspond to a Service Module card running the VSCCP application.

The destination specified by the `loc` parameter must correspond to a Service Module card that is IS-NR.

A primary Service Module card must be provisioned.

The card location slot must be between 1 - 16 and not 9 or 10.

The frame location must be 1xxx, 2xxx, 3xxx, 4xxx, 5xxx, 6xxx.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

An EPAP-related feature must be turned on before the `entity`, `entitytype`, or `dn` parameter can be specified.

The value specified by the `loc` parameter must indicate a DN or IMSI card before the `dn` or `imsi` parameter can be specified, respectively.

Notes

For DN and DN Block entries, whichever entity is provisioned in the order of SP/RN, VMSID, GRN, will become EntIdx1.

Output

Note: A value of "---" in the TT column indicates that the service does not have a translation type defined in the EAGLE 5 ISS and that call processing will ignore the override data displayed.

Legend

- **Card Loc**—Location of the card that contains the retrieved information
- **Status**—RTDB database status; Coherent or Incoherent
- **IMSI**—International Mobile Subscriber Identity
- **EntIdx, EntIdx1, EntIdx2**—Hexadecimal index where the Network Entity data is stored in the Entity Bucket on the Service Module card
- **IMEI Index**—Hexadecimal index at which the IMEI data is stored in the IMEI Bucket on the Service Module card or S13 card running DEIRHC GPL.
- **Entity Address**—Hexadecimal Network Entity address
- **Type**—Network Entity type; Service Provider (SP), Routing Number (RN), Voice Mail Server ID (VMSID) or Generic Routing Number (GRN)

- **PC** (*type of PC*)—Point code and type of point code (ANSI; NATL - ITU National with or without group code (-gg))
- **RI**—Routing Indicator
- **SSN**—Subsystem Number
- **TT**—Translation Type
- **NP**—Numbering Plan
- **DA**—Digits action (Prefix, Suffix, or none)
- **SRFIMSI**—Signaling Relay Function IMSI
- **IMSI**—International Mobile Subscriber Identity.
- **NSSN**—New Subsystem Number (yes or no)
- **CCGT**—Cancel GT (yes or no)
- **NTT**—New Translation Type
- **NNP**—New Numbering Plan
- **NNAI**—New Nature of Address Indicator.
- **IMEI**—International Mobile Equipment Identity
- **VERSION**—IMEI data version
- **BLACK, WHITE, GRAY**—Equipment Identity Register search lists
- **DN**—Dialed Number
- **ASD Address**—Additional Subscriber Data address
- **Portability Type** (*number*)—
 - 0—Not known to be ported
 - 1—Own number ported out
 - 2—Foreign number ported to Foreign network
 - 3—Prepaid Short Message Service (PPSMS) subscriber on server #1
 - 4—PPSMS subscriber on server #2
 - 5—IS41 to GSM migrated subscriber with only GSM handset active
 - 6—PPSMS subscriber on server #3
 - 7—PPSMS subscriber on server #4
 - 8—PPSMS subscriber on server #5
 - 9—PPSMS subscriber on server #6
 - 10—PPSMS subscriber on server #7
 - 11—PPSMS subscriber on server #8
 - 12—PPSMS subscriber on server #9
 - 13—PPSMS subscriber on server #10
 - 14—PPSMS subscriber on server #11

rtrv-dconn

Retrieve Diameter Connection

Use this command to retrieve Diameter connection entries. The DCONN table supports the provisioning information related to the diameter connections.

Parameters

aname (optional)

Association name configured in the association table and linked with a diameter connection.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

Default:

No change to the current value

System Default:

null

dcname (optional)

Diameter connection name. This parameter specifies the unique logical name assigned to each diameter connection.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

Default:

No change to the current value

System Default:

null

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rtrv-dconn
rtrv-dconn:dcname=connection1
rtrv-dconn:aname=assoc12d
rtrv-dconn:loc=1103
```

Dependencies

The S13/S13' EIR feature must be enabled before retrieving any diameter connection entry.

The DCONN table should be accessible.

The specified card location must be equipped.

A DEIR card must be present at the specified location.

DCNAME must be present in DCONN table.

The value specified for the ANAME parameter must be present in the IPAPSOCK table and referred by a diameter connection.

Multiple combinations of optional parameters are not allowed.

Notes

Multiple combinations of optional parameters are not allowed.

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```
rtrv-dconn
```

```
tekelecstp 14-03-21 02:59:22 EAGLE 46.0.0 65.11.0

```

Legend

This section defines the fields used in the rtrv-dconn command output:

- **DCNAME** --- Diameter connection name.
- **ANAME** --- Association name configured in IPAPSOCK table which is associated with the diameter connection.
- **LOC** --- Specifies the DEIR card location on which the particular diameter connection is configured.
- **RSVDTPS** --- This (Reserved TPS) is the guaranteed TPS for a diameter connection.
- **MAXTPS** --- This is the maximum TPS for a diameter connection.
- **Tw** --- This (Diameter Watchdog Timer) timer is used to control how long the S13 process will wait for a DWA (Diameter Watchdog Answer) response before sending a DWR (Diameter Watchdog Request).
- **Td** --- This (Diameter Peer Disconnect Timer) is used to control how long the S13 process will wait for a DPA (Disconnect Peer Answer) response before sending a DPR (Disconnect Peer Request).

Retrieve Diameter EIR Options

Use this command to retrieve S13/S13' diameter EIR configuration options.

Parameters

This command has no input parameters.

Example

```
rtrv-deirops
```

Dependencies

The S13/S13' EIR Feature must be enabled before retrieving Diameter EIR configuration options.

The DEIROPTS table should be accessible.

Output

This example shows output with default DEIR options.

```
rtrv-deirops
```

```
tekelecstp 13-03-16 11:43:52 EST EAGLE 45.1

```

```
DEIRDFLTIMSSICRN = off           DEIRDFLTIMSILKUP = both
DEIRDFLTIMSIRESP = blacklist
```

Legend

- **DEIRGRSP** -- S13/S13' EIR Global Response Type. The Global Response Type is used to override the response that is sent back to the MME.
- **DEIRRSPTYPE** -- S13/S13' EIR Response Type. The Response Type is used to determine how the lists are to be searched.
- **DEIRIMSICHK** -- Indicates whether IMSI will be used when determining if an IMEI is to be "black" listed or not.
- **CONGERR** -- It displays the diameter response to be sent by DEIRHC card at the time of card congestion.
- **VENDID** -- S13 local Vendor ID. All the outgoing messages that require Vendor ID in Vendor-Specific-Application-ID AVP will use this configured value.
- **APPLID** -- Authentication Application ID. The application ID configured should match with the Auth-Application-Id (AVP Code 258) value in Vendor-Specific-Application-ID AVP. This application ID is fixed and cannot be changed.
- **PRODUCT** -- It contains the vendor-assigned name for the product. All the outgoing messages that require Product name AVP will use this configured value.
- **DPR Cause** -- It is a Disconnect Cause in DPR (Disconnect Peer Request) message sent by the DEIRHC card.
- **DEIRIMSISCRN** -- Indicates whether the IMSI Screening for Diameter Equipment Identity Register (EIR) will be done before the IMEI check.
- **DEIRLOGWL** -- Indicates whether the white list logging for Diameter Equipment Identity Register (EIR) will be on.
- **DEIRDFLTIMSSICRN** -- Indicates whether the default IMSI Screening for Diameter Equipment Identity Register (EIR) will be on.
- **DEIRDFLTIMSILKUP** -- Indicates the order of IMEI table lookup for default IMSI screening.
- **DEIRDFLTIMSIRESP** -- Indicates the default IMEI status for default IMSI screening.

rtrv-dlk

Retrieve Data Link

Use this command to show the parameters of a TCP/IP data link.

Parameters

ipaddr (optional)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where *192.126.100* is the network number and *5* is the machine's host number.

Range:

1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Default:

Display all.

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All TCP/IP data links are shown.

Example

```
rtrv-dlk
```

```
rtrv-dlk:loc=1201
```

```
rtrv-dlk:ipaddr=193.4.201.34
```

Dependencies

The loc and ipaddr parameters cannot be specified in the same command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

Notes

None

Output

In this example, cards at location 1201 and 1203 are E5-ENET or E5-ENET-B cards running the STPLAN application. For these cards, the value of the auto parameter is defaulted to *no*, and the value of the duplex parameter is defaulted to half.

The cards at location 1101, 1103 and 1107 are DCM, E5-ENET, or E5-ENET-B cards running the STPLAN application. For these cards, if the auto=yes parameter is specified, then the values of speed and duplex parameters are not shown.

```
rtrv-dlk
```

```
tekelecstp 07-02-06 11:12:47 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit  FULL    NO
1103 192.168.63.11    10Mbit   HALF    NO
1107 192.168.63.12    -----  ----    YES
1201 192.168.63.13    10Mbit   HALF    NO
1203 192.168.63.14    10Mbit   HALF    NO
;
```

```
rtrv-dlk:loc=1101
```

```
tekelecstp 07-02-01 14:09:13 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101 192.168.63.34    100Mbit  FULL    NO
;
```

```
rtrv-dlk:ipaddr=192.168.63.11
```

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1103 192.168.63.11    10Mbit   HALF    NO
;
```

This example shows the output when the specified IP address is not assigned to a TCP/IP data link:

```
rtrv-dlk:ipaddr=193.4.201.28
```

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR not assigned to a TCP/IP Link.
;
```

This example shows the output when there are no TCP/IP data links in the database.

```
rtrv-dlk
```

```
tekelecstp 07-02-02 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
No TCP/IP Links are defined in the database.
;
```

This example shows the output when the specified IP address is assigned to a TCP/IP node instead of a TCP/IP data link:

```
rtrv-dlk:ipaddr=193.4.201.63
```

```
tekelecstp 07-02-01 12:12:10 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
```

```
IPADDR assigned to a TCP/IP Node.
;
```

Legend

- **IPADDR**—IP address associated with the interface on the data link
- **LOC**—Card location containing the data link
- **LINK SPEED**—Bandwidth for the interface in megabits per second, **10** or **100**
- **AUTO**—Whether or not to automatically determine duplex and speed. If the value is *yes*, then duplex and speed are automatically determined. If the value is *no*, then duplex and speed are not automatically determined.
- **DUPLEX**—Mode of operation of the interface

rtrv-dstn

Retrieve Destination

Use this command to show the destination point code entries in the Destination point code table.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

aliasa (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni=001–005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006–255*.

When `chg-sid:pctype=ansi` is specified, *ni-*-** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

aliasa/aliasi/aliasn/aliasn24/aliasn16 (optional)

Alias point code.

aliasi (optional)

ITU international alias point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*). If this parameter is specified with an ITU international destination (*dpci*) point code, the prefix subfields cannot be the same, i.e. both spare or both non-spare.

If an ITU international destination (*dpci*) point code is entered, then the *dpci* and *aliasi* *prefix* subfields cannot be the same, (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

aliasn (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). If this parameter is specified with an ITU national destination (*dpcn*) point code, the prefix subfields cannot be the same, i.e. both spare or both non-spare.

If an ITU national destination (*dpcn*) point code is entered, then the *dpcn* and *aliasn* *prefix* subfields cannot be the same, (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

aliasn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

aliasn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

cli (optional)

Common Language Location Identifier. The Common Language Location Identifier assigned to the link.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default:

none

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

*p-, 000-255, *, **, ****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values ***, ****, and ***** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

*s-, p-, ps, 0-16383, aa-zz, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (

) can be specified either for the node or for the group code, but not both.

prefix—*s*-, *p*-, *ps*-

nnnnn—0-16383, *

gc—*aa-zz*, *

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or *-*-*-* when the point code includes a group code.

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

homescp (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SCP flag set to the specified value.

Range:

yes

the DPC is considered a Home SCP for messages with no Global Title Address Digits

no

the DPC is not considered a Home SCP for messages with no Global Title Address Digits

homesmsc (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SMSC flag set to the specified value.

Range:

yes

the DPC is considered a Home SMSC for messages with no Global Title Address Digits

no

the DPC is not considered a Home SMSC for messages with no Global Title Address Digits

msar (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The *summary* or *detail* report appears following the destination information that is requested by entering the command with or without other parameters. The only parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

Range:

detail

only

summary

Default:

detail

if `rtrv-dstn` is entered with no parameters

summary

if `rtrv-dstn` is entered with parameters

ncai (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes, or clusters that do not allow nested cluster point codes are displayed.

Range:

yes

Display clusters with NCAI set to *yes*

no

Display clusters with the NCAI set to *no*

nprst (optional)

NM bits reset. This parameter displays all entries with the specified value of the nprst option.

Range:

off

Display entries with an NPRST value of *off*

on

Display entries with an NPRST value of *on*

pcst (optional)

Point code subtype. This parameter displays point codes with the specified subtype.

Range:

none

Display only point codes without subtype prefixes

p

Display only private point codes

ps

Display only private and spare point codes

s

Display only spare point codes

pctype (optional)

Point code domain. This parameter displays point codes of the specified domain type.

Range:

ansi

Display only ANSI point codes

itui

Display only ITU International point codes

itun

Display only ITU National point codes

itun24

Display only 24-bit ITU National point codes

itun16

Display only 16-bit ITU National point codes

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

The proxy point code must be a full point code.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code.

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ppcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point*(*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

ppcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---*000---127

*sna---*000---15

*mna---*000---31

prx (optional)

Proxy point code indicator.

Range:

yes

Will be used as a proxy point code

no

Will not be used a proxy point code.

sccpmsgcnv (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. The type of conversion performed on messages for the specified destination.

Range:

none

conversion is not required on messages for the destination

udt2xudt

convert all UDT(S) messages for the destination to XUDT(S) messages

xudt2udt

convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

sxudt2udt

convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

spca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmiti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—*0-16383*

gc—*aa-zz*

m1-m2-m3-m4—*0-14* for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, *000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—*000-255*

ssa—*000-255*

sp—*000-255*

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, *000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

un—*000---127*

sna—*000---15*

mna---000---31

splitiam (optional)

IAM/SAM split. This parameter displays all entries with the specified splitiam parameter value.

Range:

15 - 31, none

Example

This example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

```
rtrv-dstn:dPCA=20-2-***
```

This example displays the destination with an ANSI alias of 222-200-200 :

```
rtrv-dstn:aliasa=222-200-200
```

This example displays all encountered ANSI alias destination point codes that have a network indicator of 222 and a network cluster of 200:

```
rtrv-dstn:aliasa=222-200-**
```

This example displays the destination with a CLLI of rlghncbb001:

```
rtrv-dstn:clli=rlghncbb001
```

This example displays the secondary point code 6 :

```
rtrv-dstn:spc=6-6-6
```

This example displays a single cluster (the NRT feature must be turned on):

```
rtrv-dstn:dpc=010-*-*
```

This example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

```
rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr
```

This example displays all ITU national group codes by duplicate point code:

```
rtrv-dstn:dpcn=2050-*
```

This example displays all ITU national point codes within a group code:

```
rtrv-dstn:dpcn=*-fr
```

This example displays 24-bit ITU national point code 15-100-10:

```
rtrv-dstn:dpcn24=15-100-10
```

This example displays 24-bit ITU national alias point code 4:

```
rtrv-dstn:aliasn24=4-4-4
```

This example displays a private point code:

```
rtrv-dstn:dPCA=p-12-12-12
```

This example displays a private and spare point code:

```
rtrv-dstn:dpci=ps-1-234-1
```

This example displays all ANSI private point codes:

```
rtrv-dstn:pctype=ansi:pcst=p
```

This example displays all ITU national private and spare point codes:

```
rtrv-dstn:pctype=itun:pcst=ps
```

This example displays all ANSI point codes that do not have point code subtype prefixes:

```
rtrv-dstn:pctype=ansi
```

This example displays all point codes that do not have point code subtype prefixes:

```
rtrv-dstn:pcst=none
```

This example displays all private point codes:

```
rtrv-dstn:pcst=p
```

This example displays all spare point codes:

```
rtrv-dstn:pcst=s
```

This example displays all proxy destinations.

```
rtrv-dstn:prx=yes
```

This example displays all destinations using a specified proxy point code.

```
rtrv-dstn:ppc=1-1-1
```

This example displays full DPCs when the homescp=yes parameter is specified.

```
rtrv-dstn:homescp=yes
```

This example displays all point codes where the sccpmsgcnv=udt2xudt parameter is specified.

```
rtrv-dstn:sccpmsgcnv=udt2xudt
```

This example displays 16-bit ITU national point code 125-2-25:

```
rtrv-dstn:dpcn16=125-2-25
```

This example displays a 16-bit ITU national alias point code:

```
rtrv-dstn:aliasn16=2-3-4
```

Dependencies

Note: A full point code contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLLI parameter can be specified in the command; these parameters cannot be specified together in the command.

If the dpcn or aliasn parameter is specified, the format must match the format that was assigned with the `chg-stpopts:npfmt i` parameter.

If specified (except when `spc=none`), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

When the `msar=only` parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

The `pcst` parameter value `s` or `ps` cannot be specified when the `pctype` value `ansi` or `itun24` or `itun16` is specified.

The `pctype` and `pcst` parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, `clli`, `msar=only`, and `ncai` parameters.

The `clli=none` parameter cannot be specified.

The Proxy Point Code feature must be enabled before the `prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The `prx` parameter can be specified with only the `pctype`, `pcst`, or `msar` parameter.

The `ppc` parameter can be specified with only the `msar` parameter.

A valid value must be specified for the `prx` parameter.

The point code specified by the `ppc` parameter must be a full point code.

Proxy point codes, as specified by the `ppc` parameter, cannot be private.

PRX point codes cannot be private.

The XUDT UDT Conversion feature must be turned on before the `scpmsgcnv` parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (`s-`). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (`ps-`). All of the point code types support the private (internal) point code subtype prefix (`p-`). Aliases do not support the private (internal) point code prefix.

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- `rtrv-dstn:dpc=ni-nc-ncm` —Report for fully provisioned destination `ni-nc-ncm`
- `rtrv-dstn :dpc=ni-*-*` —Report for provisioned network destination with the specified network indicator. If `*` is specified in the `nc` field, `*` must be specified in the `ncm` field.
- `rtrv-dstn :dpc=ni-***` —Report for the full network cluster for the specified `ni`
- `rtrv-dstn :dpc=ni-***-*` —Report for the full network cluster and the network cluster address (if any) for the specified `ni`
- `rtrv-dstn :dpc=ni-nc-*` —Report for provisioned cluster destination `ni-nc-*`
- `rept-stat-dstn:dpc= ni-nc-**` —Report showing all destinations whose network (`ni`) and cluster (`nc`) components match those specified. The network cluster address on `ni-nc-*` (if it exists) is not reported.

- `rtrv-dstn :dpc=ni-nc-***` —Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is also reported.
- `rtrv-dstn :dpcn24 =msa-ssa-sp` —Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

Asterisks in ANSI Point Codes

Two asterisks in the *ncmsubfield* of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, *20-2-****). This does not include the specified cluster point code (for example, *20-2-**).

Three asterisks in the *ncmsubfield* of a cluster point code (for example, *20-2-****) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (*lsn* parameter) and the *dpc/dpca* parameter *ncmsubfield* is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified *dpc/dpca* parameter subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, *10101-**).
- An asterisk (*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **-ab*).

When the ITUDUPPC feature is on and the STP flexible point code option (*npcfmti*) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, 15)
- An asterisk (*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, ** , *-15-*-*-*ab* is not valid).

If the Proxy Point Code feature is enabled, then the values specified for the *ppc* and *dpc* parameters must be full point codes. Cluster point codes and private point codes are not supported.

Output

Destination Table Memory Space Accounting Information

Each output example for this command shows the display of destination table memory space accounting information. The *msar* parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

Summary Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the *msar* parameter values. The detail report cannot be displayed. The summary information appears at the end of the requested destination information, or appears without any other destination information when the *msar=only* parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The `msar=summary` parameter is the default in this case.)
- When the command is entered with only the `msar=summary` parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The `chg-stpopts` command `mtpdpcq` parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the `valuex`, the allowed maximum is the `valuey`, and the table percent full is the `valuez` shown in the following first line of the summary report:

Destination table is (xofy) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, 8000, or 10,000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The number currently provisioned is the `thexvalue`, the allowed maximum is the `theyvalue`, and the table percent full is the `thezvalue` shown in the following second line of the summary report:

Alias table is (xofy) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.
- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.
- When the 7000 or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.
- When the 10000 Routesets quantity feature is enabled, a maximum of 10000 aliases can be provisioned.

Detail Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The `msar=detail` parameter value is the default in this case.)
- When the `msar=detail` parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.

- When the `msar=only` parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The `chg-stpoptsmtpdpcq` parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the `DESTINATION ENTRIES ALLOCATED` value. The list of values under the allocated value includes the `TOTAL DPCs` currently provisioned and the Destination table `CAPACITY (% FULL)`.

The allowed maximum number of aliases is the `ALIASES ALLOCATED` value. The list of values under the allocated value include the current number of `ALIASES USED` and the Aliases table `CAPACITY (% FULL)`. The possible maximum numbers of aliases are described in the *Summary Report* section.

The output for the `rtrv-dstn` command does not change when the Proxy Point Code feature is on. Abbreviated output is indicated by 3 vertical dots as shown:

```
.
.
.
```

This example shows destination table memory space accounting information contained in a summary report. In the example, the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

```
rtrv-dstn:msar=only

rtrv-e1

Retrieve E1 Information

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the `ent-e1` command for an HC-MIM or E5-E1T1/E5-E1T1-B card used as an E1 or SE-HSL card.

Parameters

e1port (optional)

E1 port number

The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card (loc parameter).

Range:

1 - 8

Default:

If not specified, all E1 ports are listed.

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If not specified, all E1 card locations are listed.

Example

```
rtrv-e1
rtrv-e1:loc=1307:e1port=2
rtrv-e1:loc=1311:e1port=1
```

Dependencies

The loc and e1port parameters must be specified together in the command.

The E1 interface of the E1 card specified by the loc parameter must already be defined (see the ent -e1 command) before this command can be entered.

The card specified by the loc parameter must be a LIME1 card type.

An E1 interface must already be defined on the port specified by the e1port parameter before this command can be entered.

The following card locations (loc parameter) are not valid for this command: 1113 through 1118 and all *xy09* and *xy10* locations (where *x* is the frame and *y* is the shelf).

Notes

None.

Output

This example shows HC-MIM cards used as E1 cards. Cards with CHANBRDG=MASTER or CHANBRDG=SLAVE have 2 ports configured in channel bridging mode to allow non-signaling data pass-through.

1307 8 ON --- HDB3 LINE -- -- ----- UNCHAN 2000
1311 1 OFF ON AMI LINE 1 1 ----- CHAN ----
;
```

Legend

- **LOC**—E1 card location
- **E1PORT**—E1 port number on an E1 card
- **CRC4**—CRC4 indicator
- **CAS**—CAS/CRC indicator (*on*: CAS is used; *off*: CRC is used)
- **ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding
- **E1TSEL**—E1 timing source indicator (*external*: master timing source; *line*: slave timing source; *recovered*: the timing source for the even-numbered port in a channel bridged port is recovered from the odd-numbered port of the pair.)
- **SI**—Value of two Spare International bits of NFAS data
- **SN**—Value of five Spare National bits of NFAS data
- **CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.
- **LINKCLASS**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN)
- **MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.
- **TSx**—Timeslot

rtrv-eisopts

Retrieve EAGLE Support for Integrated Sentinel Options

Use this command to retrieve the status of the copy functions for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Parameters

This command has no parameters.

Example

```
rtrv-eisopts
```

Dependencies

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

Notes

None

Output

```
rtrv-eisopts
```

```

rtrv-feat

Retrieve Feature

Use this command to show the status of optional features in the system that are controlled with the `chg-feat` command.

Parameters

This command has no parameters.

Example

```
rtrv-feat
```

Dependencies

None

Notes

This command is not allowed in upgrade mode.

Output

Caution: The following output example may differ from the output shown at your terminal and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative. After you turn on a feature with the `chg-feat` command, you cannot turn it off.

rtrv-frm-pwr

Retrieve Frame Power Threshold

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

Parameters

frm (optional)

Frame ID. This parameter displays the FPT table entry for the specified provisioned frame.

Range:

cf00

Control frame

ef00

First extension frame

ef01

Second extension frame

ef02

Third extension frame

ef03

Fourth extension frame

ef04

Fifth extension frame

Example

Retrieve all provisioned Frame Power Threshold table entries.

```
rtrv-frm-pwr
```

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00).

```
rtrv-frm-pwr:frm=cf00
```

Dependencies

The following values are valid for the frm parameter: *CF00, EF00, EF01, EF02, EF03, EF04*.

The frm parameter value must specify a provisioned frame.

The frm parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

Output

This example retrieves all Frame Power Threshold table entries:

```
rtrv-frm-pwr
```

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0

Frame          Power Threshold (Amps)

rtrv-ftp-serv

Retrieve FTP Server Entry

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

Parameters

app (optional)

Application. This parameter specifies the FTP Client application that interfaces with the FTP Server.

Range:

meas

Measurements Platform application

user

FTP-based Table Retrieve Application (FTRA)

db

Database Backup\Restore application

dist

EAGLE 5 ISS Software Release Distribution application

ipaddr (optional)

IP Address of the FTP Server.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

mode (optional)

Full or brief report indicator.

Range:

full

brief

Default:

brief

Example

```
rtrv-ftp-serv
rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100
rtrv-ftp-serv:mode=brief
rtrv-ftp-serv:app=meas
rtrv-ftp-serv:ipaddr=1.255.0.100
rtrv-ftp-serv:mode=full
```

Dependencies

The app parameter must specify an application that uses the FTP Support feature.

The ipaddr parameter must specify a valid IP address for the FTP server.

The mode parameter allows you to display either the full 100 characters of the path string for each entry (mode=full), or the first 29 characters of the path string for each entry (mode=brief).

Notes

The LOGIN and PATH are displayed in mixed case.

Output

```
rtrv-ftp-serv
```

```
tekelecstp 12-09-19 15:15:04 EST 45.0.0-64.42.0

rtrv-gpl

Retrieve Generic Program Load

Use this command to show the version numbers of the GPLs stored on each fixed disk or drive and the system release table stored on each fixed disk.

Parameters

Note: As of Release 43.0, the BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1 GPLs are replaced with the BLIXP GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

gpl (optional)

Generic program load. The GPL for which to retrieve information.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc—Used by E5-ATM and E5-ATM-B cards to allow the card to support up to 3 signaling links

blbepm—Flash GPL containing the BIOS ROM image on E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards

blbios—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

blbsmg—Flash GPL containing the BIOS ROM image on E5-SM4G and E5-SM48G-B cards

blcpld—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards that are used for E1 or T1 signaling links

bldiag6—Flash GPL containing the diagnostic code on E5-E1T1, E5-E1T1-B, HC-MIM, E5-ENET, and E5-ENET-B cards

blixp—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ATM, E5-IPSM, E5-TSM, E5-ENET, and E5-SM4G cards

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

blrom1—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

blvxw6—Flash GPL containing the VxWorks operating system on HC-MIM, E5-ATM/E5-ATM-B, E5-E1T1/E5-E1T1-B, E5-ENET/E5-ENET-B, E5-IPSM, E5-MCPM-B, E5-SM4G/E5-SM8G-B, and E5-TSM cards

cdu—Used in the card manufacturing process

deirhc—Used by E5-SM8G-B cards to support the S13/S13' EIR feature

erthc—Used by E5-ENET and E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

glshc—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

hipr—Communication software used on the High Speed IMT Packet Router (HIPR) card

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

imtpci—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, E5-E1T1-B, E5-ENET, and E5-ENET-B cards

ipghc—Used by E5-ENET and E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

iplhc—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

ipshc—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

mcpshc—Used by E5-MCPM-B cards for the Measurements Platform feature

oamhc—Used by E5-MCAP cards for enhanced OAM functions

pldpmc1—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

scpphc—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM4G or E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

siphc—Used by E5-SM8G-B Cards to support the SIP application

slanhc—Used by E5-ENET and E5-ENET-B cards to support the STPLAN application

ss7hc—Used by HC-MIM, E5-E1T1, and E5-E1T1-B cards. Allows the card to support up to 32 (E5-E1T1) or 64 (HC-MIM and E5-E1T1-B) signaling links for E1 and T1 functions.

utility—Used by the factory for testing, and when directed by My Oracle Support

vcd—Used in the card manufacturing process

Default:

Display all

Example

```
rtrv-gpl
rtrv-gpl:gpl=hipr2
```

Dependencies

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

The value specified for the *gpl* parameter must be supported.

Notes

To check the version of the EPAP or ELAP application, use the `rept-stat-mps` command.

If no application is specified, the approved and trial versions for all GPLs are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the `act-gpl` command.

The trial GPL is the version of the GPL that was downloaded from the removable drive, but not activated by the `act-gpl` command.

When the `act-gpl` command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the utility and OAM GPL trial versions on the fixed disk and for all GPLs on the removable drive when the removable drive is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (`rtrv-gpl`) and for each RUNNING GPL (`rept-stat-gpl`) that does not match the GPL in the RELEASE column of the `rtrv-gpl` output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the `rept-stat-gpl` command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

Output

This example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

```
rtrv-gpl
```

```
e1080402 13-03-25 15:16:33 EST EAGLE 45.1.0
```

Legend

- **GPL**—GPL associated with each card in the display
- **APPROVED**—GPL version that is the approved GPL.
- **CARD**—Card location.
- **RELEASE**—Version number of each GPL that is required to be installed and approved for a specific release of software for the system.
- **REMOVE TRIAL**—GPL version that is on the removable cartridge or drive.
- **TRIAL**—GPL version that is the trial GPL.
- -----—GPL is not present at the specified location.
- **ALM**—Alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.
- **CORRUPTED**—Data audit has determined that the GPL is corrupted.

rtrv-gserv-data

Retrieve G-Port Query for Prepaid Service Data

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

display (optional)

Use this parameter to display a specified category of entries in the GSERV table.

Range:

all

Display all entries in the GSERV table.

gta

Display all calling party (CgPA) global title addresses in the GSERV table.

opc

Display all message transfer part (MTP) originating point codes in the GSERV table.

tt

Display all called party (CdPA) translation types in the GSERV table.

gta (optional)

Global title address. Use this parameter to specify a CgPA global title address.

Range:

1 - 21 digits

opc (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member*(*ni-nc-ncm*). The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym:

opca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

opc/opca/opci/opcn/opcn24 (optional)

Originating point code. Use these parameters to specify MTP originating point codes.

opci (optional)

ITU international originating point code with subfields *zone-area-id*.

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmiti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point(msa-ssa-sp)*.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

tt (optional)

Translation type. Use this parameter to specify a CdPA translation type.

Range: 0 - 255

Example

```
rtrv-gserv-data:display=all
rtrv-gserv-data:tt=26
rtrv-gserv-data:display=opc
```

Dependencies

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The gta , opc/opca/opci/opcn/opcn24 , tt , or display parameter must be specified.

The display , tt , opc , and gta parameters cannot be specified together in the command.

Output

```
rtrv-gserv-data:display=all
```

```

rtrv-gsm-msg

Retrieve Configured GSM Message

Use this command to display the configured GSM test message parameter values.

Parameters

msgn (mandatory)

Message number. The test message number that is retrieved.

Range:

1 - 10

Example

```
rtrv-gsm-msg:msgn=5
```

Dependencies

None

Output

```
rtrv-gsm-msg:msgn=1
```

```

Related Commands

[chg-gsm-msg](#), [tst-msg](#)

rtrv-gsmmap-scrn

Retrieve GSM MAP Screening Entry

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

Parameters

opname (mandatory)

User-defined name for the operation code. This value references the operation code defined with the `ent-gsms-opcode` command.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

action (optional)

Screening action to take if a message is forbidden as defined by the *forbid* parameter.

Range:

pass

Route the message as normal to the destination.

discard

Discard the MSU.

atierr

Generate an ATI reject message. This option is only valid for ATI MAP operation codes.

route

Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

forward

Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

duplicate

Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

dupdisc

Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

Default:

Display all screening actions

cdsr (optional)

CdPA Screening Reference.

Range:

ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

cgsr (optional)

CgPA Screening Reference.

Range:

ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

eaddr (optional)

Ending origination address, in association with npv and naiv for the CGPA address to be screened.

Range:

1–15 hexadecimal digits. Valid digits are 0–9, a-f, A-F

forbid (optional)

Forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter.

Range:

all

All parameters are forbidden. Take the specified screening action defined by the *action* parameter for messages arriving at the system.

location

Take the specified screening action defined by the action parameter for messages arriving at the system that contain *location* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

none

None of the parameters are forbidden. Route the message to its destination.

state

Take the specified screening action defined by the action parameter for messages arriving at the system that contain *state* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

Default:

Display all forbidden parameter values

mapset (optional)

MAP set ID.

Range:

1 - 36000, *dflt*

dflt —Default MAP set

naiv (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses.

Range:

0 - 127, *

npv (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

Range:

*0 - 15, **

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range:

gt

ssn

saddr (optional)

Starting origination address in association with npv and naiv for the single entry or range of entries of the CGPA address to be screened.

Range:

*1 - 15 digits, **

1-15 hexadecimal digits. Valid digits are 0-9, a-f, A-F

Default:

tt (optional)

Translation type. This parameter specifies the value that the CdPA translation type is set to as the result of Enhanced GSM Map Screening.

Range:

0 - 255, none

Default:

Display all translation types

Example

The following example retrieves all CgPA entries for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=e
```

The following example retrieves the specified CgPA range entry for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=ati:saddr=91946200000000:eaddr=91946300000000
```

The following example retrieves all CdPA entries for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela
```

The following example retrieves the specified CDSR entry for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4
```

The following examples retrieves the specified RI for the specified OPNAME:

```

rtrv-gsmmap-scrn:opname=e:ri=ssn
rtrv-gsmmap-scrn:opname=e:mapset=dflt:ri=gt
rtrv-gsmmap-scrn:opname=rr:cgsr=au:cdsr=aj
rtrv-gsmmap-scrn:opname=test4:tt=12

```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The `cgsr` parameter can be specified.
- The `cdsr` parameter can be specified.
- The `saddr=*` parameter can be specified.
- The `saddr` and `eaddr` parameters can contain hexadecimal digits.

The specified `opname` parameter value must exist in the GSM Map Op-Code table.

If the `eaddr` parameter is specified, its value must contain the same number of digits as the `saddr` parameter value.

If the `eaddr` parameter is specified, its value must be greater than the `saddr` parameter value.

If the `eaddr` parameter is specified, the `saddr` parameter must be specified.

If the `saddr=*` parameter is specified, then the `eaddr` parameter cannot be specified.

If the `saddr` parameter is specified, the `cgsr` and `cdsr` parameters cannot be specified.

The `saddr`, `npv`, and `naiv` parameters must be specified together in the command.

If any of the `saddr/eaddr/npv/naiv` and `cdsr` parameters are specified, then the `forbid` and `action` parameters cannot be specified.

A value of *state* or *location* cannot be specified for the `forbid` parameter unless the operation code referenced by the `opname` parameter is 71. The `forbid` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

The `action=atierr` parameter cannot be specified unless the operation code referenced by the `opname` parameter is 71. The `atierr` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

If the `cdsr` parameter is specified, then the `cgsr` parameter must be specified.

The specified `cgsr` parameter value must exist in the database.

The specified `cdsr` parameter value must exist in the database.

The `opname` parameter must consist of alphanumeric characters.

The `opname` parameter must be entered.

The `cgsr` and `cdsr` parameters must each begin with an alphabetic character.

The `cgsr` and `cdsr` parameters must each consist of 1-4 alphanumeric characters.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist.

Notes

None

Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

rtrv-gsmmap-scrn:opname=e

```

Legend

- **Single Entries/Range Entries**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.
- **CgPA**—Calling Party Address entry
- **CdPA**—Called Party Address entry
- **OPNAME**—User-defined MAP operation code name.
- **SADDR**—Start origination address.
- **EADDR**—End origination address. This column is displayed for range entries only.
- **NPV**—Numbering plan value.
- **NAIV**—Nature of address indicator value.
- **FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter. (Some values are abbreviated; for example, *locat* means *location* .)
- **ACTION** or **ACT**—Screening action, if forbidden. Possible actions are *pass*, *discard* (*disc*), *atierr*, *route*, *forward*, *duplicate* (*dupl*), and *dupdisc*.
- **PC** or **PCA**—ANSI Point Code
- **PCI**—ITU International Point Code
- **PCN**—ITU National Point Code
- **PCN24**—24-bit ITU National Point Code
- **SSN**—Subsystem Number
- **CGSR**—CgPA Screening Reference
- **CDSR**—CdPA Screening Reference
- **MAPSET**—MAP set
- **RI**—Routing Indicator
- **TT**—Translation Type

rtrv-gsms-opcode

Retrieve GSM MAP Screening Operation Code

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

Parameters

mapset (optional)

MAP set ID.

Range:

1 - 36000, dflt

dflt —Default MAP set

opcode (optional)

MAP operation code.

Range:

*0 - 255, **

Default:

Display all MAP operation codes

opname (optional)

User-defined name for the operation code. This value is defined with the `ent-gsms-opcode` command.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

Default:

Display all operation code names

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range:

gt

ssn

tt (optional)

Translation type. The value the CdPA TT is set to as the result of Enhanced GSM Map Screening.

Range:

0 - 255

Default:

Display all translation types

Example

```
rtrv-gsms-opcode
rtrv-gsms-opcode:opname=ati
rtrv-gsms-opcode:ri=gt
rtrv-gsms-opcode:tt=11
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The opcode=* parameter can be specified.
- An opname parameter can be specified that refers to an opcode=* parameter.

The opcode and opname parameters cannot be specified together in the command.

The value of the opcode parameter must be between 0 - 255 or * .

The specified opname parameter must exist in the GSM MAP Op-Code table.

If the opname parameter is specified, then it must be alphanumeric.

The opname parameter must be no more than 8 characters in length.

The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.

The specified MAP set must exist.

Notes

None

Output

rtrv-gsms-opcode

```

tekelecstp 08-08-22 00:32:17 EST  EAGLE 39.2.0

rtrv-gsmssn-scrn

Retrieve GSM Subsystem Number Screening Entry

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

Parameters

ssn (optional)

Subsystem number.

Range:

000 - 255

Default:

Display all

type (optional)

Subsystem type.

Range:

orig

Origination SSN
dest
 Destination SSN

Default:
 Display all

Example

```
rtrv-gsmssn-scrn
rtrv-gsmssn-scrn:ssn=0:type=dest
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

A valid value must be specified for the ssn parameter.

A valid value must be specified for the type parameter.

Notes

If specified, the ssn/type parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
```

```
No matching entries with the specified criteria found.
```

Output

```
rtrv-gsmssn-scrn:ssn=10:type=orig
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
010 Yes Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;
```

```
rtrv-gsmssn-scrn
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 Yes No
```

```

010 Yes Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;

```

Legend

- **SSN**—Subsystem number
- **ORIG**—Specifies whether the subsystem type is origination
- **DEST**—Specifies whether the subsystem type is destination

Related Commands

dlt-gsmssn-scrn, *ent-gsmssn-scrn*

rtrv-gta

Retrieve Global Title Address Information

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

Note: If the EGTT feature is turned on, then the GTT Selector (*ent/chg/dlt/rtrv-gttset*), GTT Set (*ent/dlt/rtrv-gttset*), and GTA (*ent/chg/dlt/rtrv-gta*) commands replace the Translation Type (*ent/dlt/rtrv-tt*) and Global Title Translation (*ent/chg/dlt/rtrv-gtt*) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

Note: See *Point Code Formats and Conversion* for a detailed description of point code formats, rules for specification, and examples.

gttsn (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters

acn (optional)

Application context name. The ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, *, none

The *acnfield* supports up to 7 subfields separated by a dash (e.g.,1-202-33-104-54-26-007).

* —any valid value in the ITU TCAP *acnfield* in the incoming MSU

none —there is no ITU TCAP *acnfield* in the incoming MSU

actsn (optional)

GTT Action Set Name.

Range:

ayyyyyyyyy, none

1 leading alphabetic character and up to 8 following alphanumeric characters

cdssn (optional)

Starting CdPA subsystem number.

Range:

0 - 255

cggmod (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range:

yes

no

cgpc (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member*(*ni-nc-ncm*).

Synonym:

cgpca

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni =006-255*.

The point code *000-000-000* is not a valid point code.

cgpci (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

cgpcn (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

cgpcn16 (optional)

16-bit ITU national CgPA point code with subfields *unit number-sub number area-main number area*(*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

cgpcaction (optional)

This parameter is used to provide the required abilities, indicating what any particular translation needs to do with CgPA PC.

Range:

dflt

protocol will be allowed to perform all the required processing/conversion with CGPC.

ignore

CGPC will be left as it was in incoming MSU.

remove

CGPC will be removed from outgoing MSU.

Default:

dflt

cgssn (optional)

Starting CgPA subsystem number.

Range: 0 - 255

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member*(*ni-nc-ncm*).

Synonym:

dpca

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, `nc=000` is valid if `ni=006-255`.

When `chg-sid:pctype=ansi` is specified, `ni-**-*` is valid if `ni=006-255`.

The point code `000-000-000` is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Point Code.

dpci (optional)

ITU international destination point code with subfields `zone-area-id`. The `prefix` subfield indicates a spare point code (`prefix-zone-area-id`).

Range:

`s-`, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

`prefix—s`

`zone—0-7`

`area—000-255`

`id—0-7`

The point code `0-000-0` is not a valid point code.

dpcn (optional)

ITU destination point code in the format of a 5-digit number (`nnnnn`); or 2, 3, or 4 numbers (members) separated by dashes (`m1-m2-m3-m4`) as defined by the `chg-stpopts:npcfmiti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (`nnnnn-gc`, `m1-m2-m3-m4-gc`). The `prefix` subfield indicates a spare point code (`prefix-nnnnn`, `prefix-nnnnn-gc`, `prefix-m1-m2-m3-m4`, `prefix-m1-m2-m3-m4-gc`).

Range:

`s-`, 0-16383, `aa-zz`

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

`prefix—s-`

`nnnnn—0-16383`

`gc—aa-zz`

`m1-m2-m3-m4—0-14` for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields `main signaling area-sub signaling area-signaling point` (`msa-ssa-sp`).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

16-bit ITU national destination point code with subfields *unit number-sub number area-main number area(un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

ecdssn (optional)

Ending CdPA subsystem number.

Range:

0 - 255

ecgssn (optional)

Ending CgPA subsystem number.

Range:

0 - 255

egta (optional)

End global title address. The end of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are *0-9* .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are *0-9, a-f, A-F*

Default:

The first gta entry for the given GTT selector

family (optional)

The ANSI TCAP *family* field in the incoming MSU.

Range:

*0 - 255, *, none*

any valid value in the ANSI TCAP *family* field in the incoming MSU

none

there is no value in the ANSI TCAP *family* field in the incoming MSU

force (optional)

Display more than 1000 entries.

Range:

yes

no

Default:

no

gta (optional)

Global title address. The beginning of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F

Default:

The first gta entry for the given GTT selector

gtmodid (optional)

Global title modification identifier.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

displays all GT Modification Indicators for the GTA

loopset (optional)

SCCP loopset name. This parameter retrieves translation entries associated with the specified loopset.

Range:

ayyyyyyy, none

1 alphabetic character followed by up to 7 alphanumeric characters.

none —Translation entries with no association to any loopset.

mapset (optional)

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

Range:

1 - 36000, dflt

dflt —Default MAP set

Default:

Retrieves GTA information for the default MAP set.

mrnset (optional)

MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.

Range:

1 - 3000, dflt, none

dflt —Default MRN set

none —The GTA translation does not participate in any loadsharing.

num (optional)

Number of entries to display.

Range:

1 - 1000000

Default:

1 —if *gta* is specified

20 —if *gta* is not specified

opc (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

Synonym:

opca

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, `ni-**-*` is valid if `ni=006-255`.

The point code `000-000-000` is not a valid point code.

opci (optional)

ITU international originating point code with subfields `zone-area-id`. The `prefix` subfield indicates a spare point code (`prefix-zone-area-id`).

Range:

`s-`, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

`prefix—s`

`zone—0-7`

`area—000-255`

`id—0-7`

The point code `0-000-0` is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (`nnnnn`); or 2, 3, or 4 numbers (members) separated by dashes (`m1-m2-m3-m4`) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (`nnnnn-gc`, `m1-m2-m3-m4-gc`). The `prefix` subfield indicates a spare point code (`prefix-nnnnn`, `prefix-nnnnn-gc`, `prefix-m1-m2-m3-m4`, `prefix-m1-m2-m3-m4-gc`).

Range:

`s-`, 0-16383, `aa-zz`

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

`prefix—s-`

`nnnnn—0-16383`

`gc—aa-zz`

`m1-m2-m3-m4—0-14` for each member; values must sum to 14

opcn24 (optional)

24-bit ITU originating point code with subfields `main signaling area-sub signaling area-signaling point` (`msa-ssa-sp`).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

`msa—000-255`

ssa—000–255

sp—000–255

opc16 (optional)

16-bit ITU originating point code with subfields *unit number-sub number area-main number area(un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

opcode (optional)

The TCAP *opcode* field in the incoming MSU.

Range:

*0 - 255, *, none*

*** —any valid value in the TCAP *opcode* field in the incoming MSU

none —there is no value in the TCAP *opcode* field in the incoming MSU

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pci (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmiti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area(un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p-- , 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

pctype (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

Range:

ansi

itui

itun

itun16

itun24

ituis

ituns

Default:

Display all point code types

pkgtype (optional)

Package type. The ANSI TCAP and ITU TCAP package type.

Range:

ansiuni

ANSI unidirectional

qwp

Query with Permission

qwop

Query with out Permission

resp

Response

cwp

Conversation with Permission

cwop

Conversation with out Permission

ansiabort

ANSI abort

any

Wildcard value

bgn

Begin

end

End

cnt

Continue

ituabort

ITU abort

ituuni

ITU unidirectional

ANSI TCAP PKGTYPE

ansiuni, qwop, qwop, resp, cwp, cwop, ansiabort, any

ITU TCAP PKGTYPE

bgn, ituabort, ituuni, any, end, cnt

ppmeasreqd (optional)

Per Path Measurement required.

Range:

yes

no

refgttsn (optional)

Referred GTT set name. The GTT Set Name referred in the GT Translation Entry by the optsn, opcsn , and cgcvnsvn parameters.

Range:

ayyyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters

ssn (optional)

Subsystem number.

Range:

002 - 255

Default:

Display all

testmode (optional)

Test mode. This parameter displays all translation entries that have a specified value of the testmode parameter.

Range:

on

off

Default:

off

xlat (optional)

Translate indicator. This parameter specifies translation actions and routing actions.

Range:

dpc

dpcngt

dpcssn

none

Example

```

rtrv-gta:gttsn=gtt1:cgpcaction=dflt

```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before the pctype parameter can be specified.

The gttsn parameter must be specified, cannot have a value of *none*, and must match an existing gttsn .

The pc/pca/pci/pcn/pcn24/pcn16, cgpc/cgpcacgpci/cgpcn/cgpcn24/cgpcn16, opc/opca/opci/opcn/opcn24/opcn16, and dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameters must have valid values within the range for each subfield.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code that is of a different domain than the GTT set specified by the gttsn parameter can be specified.

If the egta parameter is specified, the gta parameter must be specified. The gta and egta parameters must be the same length, and the value for the egta parameter must be greater than the value for the gta parameter.

If the specified num parameter value is greater than 1000, the force=yes parameter must be specified.

The number of digits in the specified gta parameter must be at least the number of digits provisioned for the GTT set specified by the gttsn parameter. If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

If the Flexible GTT Load Sharing feature is not enabled, then the mapset parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the ecgssn/ecdssn parameter is specified, the cgssn/cdssn parameter must be specified.

If the ecgssn/ecdssn parameter is specified, the cgssn/cdssn parameter must be specified, and the ecgssn/ecdssn parameter must be greater than the cgssn/cdssn parameter.

The OBSR feature must be enabled before the cgpc/cgpcacgpci/cgpcn/cgpcn24/cgpcn16, opc/opca/opci/opcn/opcn24/opcn16, cgssn, or ecgssn parameter can be specified.

The range specified by the cgssn/ecgssn or the cdssn/ecdssn parameters must exist for the specified GTT set.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the gta and egta parameters.

The SCCP Loop Detection feature must be enabled before the loopset parameter can be specified.

The value of the loopset parameter must already exist in the database.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the `mrnset` parameter.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggtmod` parameter can be specified.

The `xlat=none` parameter must be specified before the `mapset` and `mrnset` parameters can be specified together in the command.

A TOBR quantity feature must be turned on before the `opcode`, `pkgtype`, `acn`, or `family` parameter can be specified.

The `opcode`, `pkgtype`, and `family` parameters must be specified together for ANSI TCAP translations. The `opcode`, `pkgtype`, and `acn` parameters must be specified together for ITU TCAP translations.

The `acn` and `family` parameters cannot be specified together in the command.

If the `family` parameter is specified, then a value of `ansiuni`, `qwop`, `qwop`, `resp`, `cwp`, `cwop`, `ansiabort`, or `any` must be specified for the `pkgtype` parameter.

If the `acn` parameter is specified, then a value of `bgn`, `ituabort`, `ituuni`, `any`, `end`, or `cnt` must be specified for the `pkgtype` parameter.

If the `pkgtype=ituabort` is specified, then a value of `none` must be specified for the `acn` and `opcode` parameters can.

If the `pkgtype=ansiabort` parameter is specified, then a value of `none` must be specified for the `family` and `opcode` parameters.

The `cgpc`, `cgssn`, `gta`, `opc`, `cdssn`, and `opcode` parameters cannot be specified together in the command.

If the `cgssn` and `cdssn` parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The value specified by the `actsn` parameter must already exist in the database.

The FLOBR feature must be turned on before the `dpc`, `cdssn`, or `ecdssn` parameter can be specified.

The specified point code must be a full point code.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

A value of `none` cannot be specified for the `gttsn` and `refgttsn` parameters.

If the `xlat=none` parameter is specified, then the `pc/pca/pci/pcn/pcn24/pcn16`, `force`, `ssn`, and `ccgt` parameters cannot be specified.

The specified GTT set must have a set type of `opcode` (see the `ent-gttset` command) before the `opcode/acn/pkgtype` or `opcode/family/pkgtype` parameters can be specified. The specified GTT set must have a set type of `cdssn`, `cgssn`, `cdgta/cgta`, `opc`, or `cgpc` before the `cdssn`, `cgssn`, `gta`, `opc`, or `cgpc` parameter, respectively, can be specified.

If the `cgssn` parameter is specified, then the `ecdssn` parameter cannot be specified. If the `cdssn` parameter is specified, then the `ecgssn` parameter cannot be specified.

If the `opc` or `dpc` parameter is specified, then the `(e)gta`, `(e)cgssn`, `(e)cdssn`, and `opcode` parameters cannot be specified.

Notes

The percentage full and number of cells used report that is provided with a `rtrv-gta` command reflects the total entries in the GTA table without regard to the selector specified.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If the `rtrv-gta` command is entered with only the `gta` parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if `gta=8005556666` is specified, the six-digit GTT set `800555` would be a match. If the VGTT feature is turned on and the `egta` parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Output

Note: The Start GTA (`gta`) and End GTA (`egta`) fields are sized according to the `ndgt` parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.

This example retrieves all GTAs for the specified GTT Set:

```
rtrv-gta:gttsn=t800:num=65535:force=yes
```

Legend

- **GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.
- **NETDOM**—The network domain.
- **NDGT**—The number of digits required for GTAs associated with this set.
- **START GTA**—The start global title address.
- **END GTA**—The end global title address.
- **XLAT**—The translate indicator.
- **RI**—The routing indicator.
- **PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24, ITUN16 PC**—Translated point code.
- **SSN**—The translated subsystem number.
- **CCGT**—The cancel called global title indicator.
- **MRN**—Mated Relay Node
- **MRNSET**—MRN set ID
- **MAPSET**—MAP set ID
- **CGGTMOD**—Calling Party Global Title Modification Indicator
- **ACTSN**—GTT Action Set Name

- **GTMODID**—Global Title Modification Identifier
- **PPMEASREQD**—Per Path Measurement Required
- **OPCODE**—TCAP opcode field
- **ACN**—Application context name. ITU TCAP*acn*field.
- **PKGTYPE**—TCAP package type
- **FAMILY**—ANSI TCAP*family*field
- **TESTMODE**—Invokes a Test Tool to debug the FLOBR/TOBR rules
- **DPC**—Destination point code
- **CGPC**—CgPa point code
- **OPC**—Originating point code

Retrieve Global Title Conversion

Use this command to display entries in the Default Global Title Conversion table.

Parameters

dir (optional)

Direction of conversion.

Range:

atoi

ANSI to ITU conversion

itoa

ITU to ANSI conversion

both

Conversion in both directions

gtixlat (optional)

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range:

22

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

nai (optional)

Nature of address indicator.

Range:

*0 - 63, **

np (optional)

Numbering plan.

Range:

*0 - 15, **

tta (optional)

ANSI translation type.

Range:

*0 - 255, **

tti (optional)

ITU translation type.

Range:

*0 - 255, **

Example

```
rtrv-gtcnv
```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the command can be entered.

Notes

None

Output

This example displays output containing decimal global title digits:

```
rtrv-gtcnv
```

```
tekelecstp 06-11-07 13:44:12 EST EAGLE 35.3.0
DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi  22      10   5   --- ---  10  pfx  123
GTCNV  table is (1 of 1000) 1% full.
;
```

This example shows output containing hexadecimal global title digits:

rtrv-gtcnv

```
tekelecstp 06-11-07 11:52:58 EST EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi  22    1    3   --- ---  ---  pfx  abcdef0123456789abcdf
ittoa  24    5    6    2  1   ---  sfx  abcdef0123456789abcef

GTCNV  table is (2 of 1000) 1% full.
;
```

Legend

- **DIR**—Direction of the translation: ANSI to ITU or ITU to ANSI
- **GTIXLAT**—GTI translation
- **TTA**—ANSI translation type
- **TTI**—ITU translation type
- **NP**—Numbering plan
- **NAI**—Nature of address indicator
- **DEL**—Deletion status, listing the number of incoming MSUs that will be deleted prior to translation
- **POS**—Prefix or Suffix
- **ADD**—Global title address

rtrv-gtmod

Retrieve GT Modification Data

Use this command to display entries from the GTMOD table. A GTMOD entry consists of a GTMOD ID and GTMOD specific data.

Parameters

Note: Definitions for the feature options specified by theonandoffparameters are located in the Notes section.

cgpassn (optional)

Calling Party Subsystem number. The calling party subsystem address that receives the message.

Range:

002 - 255

gtmodid (optional)

GT Modification Identifier.

Range:

ayyyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

ngti (optional)

New Global Title Indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

Range:

2

4

none

nnai (optional)

New nature of address indicator. The value used to replace the received NNAI.

Range:

0 - 127, *none*

nnp (optional)

New numbering plan. The value used to replace the received numbering plan.

Range:

0 - 15, *none*

npdd (optional)

Number of prefix digits to be deleted. The number of digits to be deleted from the prefix of the received GT address.

Range:

1 - 21, *none*

npds (optional)

New prefix digits string. The digits to be prefixed to the received GT address.

Range:

1 - 21 digits, *none*

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

Default:

Display all

nsdd (optional)

Number of suffix digits to be deleted. The number of digits to be deleted from the suffix of the received GT address.

Range:

1 - 21, none

nsds (optional)

New suffix digits string. The digits to be suffixed to the received GT address.

Range:

1-21 digits, none

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

ntt (optional)

New Translation Type. The value that is used to replace the received Translation Type.

Range:

0 - 255, none

off (optional)

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

gt0fill

on (optional)

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:

gt0fill

refcnt

precd (optional)

Precedence. This parameter specifies whether the prefix or suffix takes precedence when modifying the received GT address

Range:

px

sfx

Example

```
rtrv-gtmod:gtmodid=id2
rtrv-gtmod:npdd=5:on=refcnt
rtrv-gtmod:nsdd=10:precd=sfx:nnai=2:nnp=5
rtrv-gtmod:ngti=4:on=gt0fill:cgpasn=12
```

Dependencies

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the npds and nsds parameters.

The `gtmodid=none` parameter cannot be specified.

If the `gtmodid` parameter is specified, then the `on=refcnt` parameter is the only other parameter that can be specified.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The same value cannot be specified for the on and off parameters.

Notes

on/off options

- *gt0fill* —GT zero fill. Specifies whether the last 0 of the GTA is a treated as a valid digit (OFF) or as filler (ON) during GT Modification for the `gti(x)=2` to `gti(x)=4` scenario.
- *refcnt* —Reference count. Specifies the number of entries in the GTT Table that references the GTMOD entry. This option is ON only.

Output

[chg-gtmod](#), [dlt-gtmod](#), [ent-gtmod](#)

rtrv-gtt

Retrieve Global Title Translation

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the *type* parameter specified.

Note: If the EGTT feature is turned on, then the GTT Selector ([ent/chg/dlt/rtrv-gttset](#)), GTT Set ([ent/dlt/rtrv-gttset](#)), and GTA ([ent/chg/dlt/rtrv-gta](#)) commands replace the Translation Type ([ent/dlt/rtrv-tt](#)) and Global Title Translation ([ent/chg/dlt/rtrv-gtt](#)) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cggtmod (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range:

yes

no

egta (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

Default:

If the gta parameter is specified, the egta parameter default value is the specified gta parameter value.

force (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

Range:

yes

no

Default:

no

gta (optional)

Global title start address. The beginning of a range of global title digits.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

Default:

The first GTT entry for the given translation type.

gtmodid (optional)

Global Title Modification Identifier.

Range:

ayyyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

loopset (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters.

none —Translation entries with no association to any loopset.

mapset (optional)

MAP set ID.

Range:

1 - 36000, dflt

dflt —Default MAP set

mrnset (optional)

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

Range:

1 - 3000, dflt, none

dflt —Default MRN set

none —The GTA translation does not participate in any loadsharing.

num (optional)

The number of entries to be shown.

Range:

1 - 1000000

1-1000 —if force=yes is not specified

1-1000000 —if force=yes is specified

Default:

- 1 —if gta is specified
- 20 —if gta is not specified

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p-*

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

Default:

Display all

pc/pca/pci/pcn/pcn24 (optional)

Point code.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

Default:

Display all

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcffmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

Display all

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm(prefix-ni-nc-ncm)*.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

Default:

Display all

pctype (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

Range:

ansi

itui

itun

itun24

ituis

ituns

Default:

Display all

ssn (optional)

Subsystem number. The subsystem address that is to receive the message.

Range:

002 - 255

Default:

Display all

ttn (optional)

Translation name.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

None given

type/typea/typeei/typen/typen24/typeis/typens (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The type and typea parameters specify an ANSI network.

The typeei parameter specifies an ITU-international network.

The typen parameter specifies an ITU-national network.

The typen24 parameter specifies a 24-bit ITU-national network.

The typeis parameter specifies an ITU-international spare network.

The typens parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (type or typea) and as an ITU type (typeei/typen/typen24/typeis/typens). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

0 - 255

Default:

None given

Example

```

```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the pctype parameter can be specified.

If the pcn parameter is specified, its format must match the format that was assigned with the `chg-stpopts:npcfmti` parameter.

The first character of the translation name must be a letter.

The value of the tt parameter must exist in the Translation Type table.

The value specified for the tt parameter must correspond to a value of the `type/typea/typei/typen/typen24/typeis/typens` parameter (see the `ent/chg-gtt` command).

If the value of the num parameter exceeds 1000, then the force=yes parameter must be specified.

The type or ttn parameter must be specified.

The value of the pc/pca/pci/pcn/pcn24 parameter must be a full point code.

If the egta parameter is specified, the gta parameter must be specified.

If the system is defined as an ANSI system, the pc/pca parameter must be specified as a valid ANSI point code.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified `gta` parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the `ent-gtt` command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the `tt` parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `gta` and `egta` parameters.

The value of the `num` parameter must not exceed the maximum table size.

The length of the `egta` parameter must equal the length of the `gta` parameter.

The value of the `egta` parameter must be greater than the value of the `gta` parameter.

If the `tt` parameter is not specified, then the value of the `ttn` parameter must match the value of a `tt` parameter in the STP database.

The value of the `gta` parameter must exist.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the `mrnset` parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggtmod` parameter can be specified.

The `mapset` and `mrnset` parameters cannot be specified together in the command.

The GTT set associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The value specified for the `gtmodid` parameter must already exist in the GTMOD table

The `ttn=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command).

Notes

If the `rtrv-gtt` command is entered with only the `gta` parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if `gta=8005556666` is specified, the six-digit translation type `800555` would be a match. If the VGTT feature is turned on and the `egta` parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the F9 function key or the `canc-cmd` command. See `canc-cmd` for more information.

If you do not know either the translation type or the translation type name, use the `rtrv-tt` command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The number of entries to be shown (the num parameter) can be specified for any valid combination of parameters.

If the gta parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the num and gta parameters are not specified, then up to 20 entries are shown.

If the gta parameter is specified, but the num parameter is not specified, then only one entry is shown.

If the num parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the num parameter.

If the gta and egta parameters are specified, then the entry that matches the gta parameter, or is the nearest entry below the gta parameter, is the first entry shown for the specified range.

The rtrv-gtt command can retrieve only CdGTA entries that were provisioned through GTA commands when the OBSR or FLOBR feature is turned on.

Output

```
rtrv-gtt:type=10:num=65535:force=yes
```

```

rtrv-gttact

Retrieve a GTT Action Entry

Use this command to display entries from the Global Title Translations (GTT) Action table.

Parameters

Note: Definitions for the feature options specified by theonandoffparameters are located in the Notes section.

act (optional)

Action. The action applied to the message.

Range:

disc

discard message with no return error

dup

route a copy of the message to a specified duplicate node

fwd

route the original message to a specified forward node instead of the destination indicated by the GTT/ DB data

srvc

apply service (GPORT/GFLEX/SMSMR) on the message.

tcaperr

discard message that has a specified TCAP error

udts

discard message and send udts/xudts

actid (optional)

GTT Action Id.

Range:

ayyyyyyy

1 leading alphabetic followed by up to 8 alphanumeric characters

atcaperr (optional)

ANSI TCAP Error Cause. The reason for discarding the message containing the ANSI TCAP portion that is associated with the TCAPERR GTT Action.

Range:

0 - 255

cdgtmodid (optional)

Called party global title modification identifier.

Range:

ayyyyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

cggtmodid (optional)

Calling party global title modification identifier.

Range:

ayyyyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

cgpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

cgpca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

cgpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*, *p*-, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

cgpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

cgpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

cgpcogmsg (optional)

The data that is used as the Calling Party Point Code in the outgoing message.

Range:

cgpcicmsg

CgPA PC data from the incoming MSU

dflt

Default. The standard Global Title Translation process provides the CgPA PC.

opcicmsg

OPC data from the incoming MSU

provcgpc

provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24 data in the GTT Action

remove

CGPC will be removed from the outgoing MSU

defactid (optional)

Default Action ID. The Action Id associated with the Forward action.

Range:

disc

GTT Action ID of type *disc*

udts

GTT Action ID of type *udts*

tcaperr

GTT Action ID of type *tcaperr*

fallback

The MSU is routed using routing data in the incoming MSU.

itcaperr (optional)

ITU TCAP Error Cause. The reason for discarding the message containing the ITU TCAP portion that is associated with the TCAPERR GTT Action.

Range:

0 - 255

loopset (optional)

SCCP loopset name. This parameter retrieves action entries that are associated with the specified loopset.

Range:

ayyyyyyy

One alphabetic character followed by up to 7 alphanumeric characters.

none —Action entries with no association to any loopset.

mapset (optional)

MAP Set ID. The Mated Application Set ID.

Range:

1 - 36000, dflt

dflt —Default MAP set

mrnset (optional)

MRN Set ID. The Mated Relay Node Set ID.

Range:

1 - 3000, dflt

dflt

Default MRN Set ID

none

The GTT Action table entry with no association to any mrnset.

off (optional)

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

uimreqd

useicmsg

on (optional)

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Upto 8 feature options can be specified in the list.

Range:

refcnt

uimreqd

useicmsg

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The value "none" indicates that the Origin Point Code (OPC) field in the message will be used in place of CGPC.

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area*(*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point*(*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

ri (optional)

Routing indicator.

Range:

gt

ssn

snai (optional)

The service nature of address indicator.

Range:

ccr^{ndn}

Country code, routing number, and national directory number

intl

International number

Natl

National significant number

rnidn

Routing number prefix and international dialed/directory number

rnndn

Routing number prefix and national dialed/directory number

rnsdn

Routing number prefix and subscriber dialed/directory number

Sub

Subscriber number

***snp* (optional)**

The service numbering plan.

Range:

e164

E.164 numbering plan

e212

E.212 numbering plan

e214

E.214 numbering plan

***svocerr* (optional)**

The action to be taken when Service triggered by GTT Action Service fails. The MSU can be processed by either applying the results of the pre-Service GTT, or continuing with the specific Service error processing.

Range:

SRVC

Continue with specific service error

GTT

Apply the result of pre-GTT service

Default:

SRVC

***svocname* (optional)**

Service to be applied on the MSU when act is set to svoc .

Range:

GFLEX, GPORT, SMSMR

ssn (optional)

Subsystem number.

Range:

2 - 255, none

udtserr (optional)

UDTS error cause. This parameter specifies the reason for discarding the message that is associated with UDTS GTT Action.

Range:

0 - 255

Example

```
rtrv-gttact:actid=disc1
rtrv-gttact:cggmodid=idda1
rtrv-gttact:cggmodid=cggt1:cdgtmodid=cdgt2
rtrv-gttact:defactid=fallback
rtrv-gttact:pcn16=1-14-0
rtrv-gttact:act=srvc
rtrv-gttact:svrcname=gflex
```

Dependencies

The specified GTT Action entry must already exist in the database.

If the Flexible GTT Load Sharing feature is not enabled, then the mapset parameter cannot be specified.

The value specified for the *pc/pca/pci/pcn/pcn24/pcn16* and *cgpc/cgpc/cgpci/cgpcn/cgpcn24/cgpcn16* parameters must be a full point code and must have valid value within the range for each subfield.

The Flexible GTT Load Sharing feature must be enabled before the *mrnset* parameter can be specified.

The *mapset* and *mrnset* parameters cannot be specified together in the command.

A value of *none* or *fallback* cannot be specified for the *actid* parameter.

A value of *disc*, *udts*, or *tcaperr* must be specified for the *act* parameter before a value of *uimreqd* can be specified for the *on* or *off* parameter.

A value of *dup* or *fwd* must be specified for the *act* parameter before the *pc*, *ssn*, *ri*, *mrnset*, *mapset*, *loopset*, *cgpc*, *cgpcogmsg*, *cggmodid* or *cdgtmodid* parameters can be specified and before a value of *useicmsg* can be specified for the *on* or *off* parameter.

The *act=fwd* parameter must be specified before the *defactid* parameter can be specified.

The *pc*, *ssn*, *ri*, *mrnset*, *mapset*, *loopset*, *cgpc*, *cgpcogmsg*, and *defactid* parameters cannot be specified in the same command as the *atcaperr*, *itcaperr*, or *udtserr* parameters.

Values of *useicmsg* and *uimreqd* cannot be specified for the *on* or *off* parameters in the same command.

If the *actid* parameter is specified, then the *ri*, *pc*, *ssn*, *mrnset*, *mapset*, *loopset*, *on*, *off*, *atcaperr*, *itcaperr*, *udtserr*, *act*, *cgpc*, *cgpcogmsg*, *defactid*, *cggtmodid*, *cdgtmodid*, *snp snai*, *svrcerr* and *svrcname* parameters cannot be specified.

The *act=tcaperr* parameter must be specified before the *atcaperr* or *itcaperr* parameter can be specified.

The *act=udts* parameter must be specified before the *udtserr* parameter can be specified.

The *udtserr*, *svrcerr* and the *atcaperr* or *itcaperr* parameters cannot be specified in the same command.

The *pc*, *ri*, *ssn*, *mrnset*, *mapset*, *loopset*, *on/off=useicmsg*, *cdgtmodid*, *defactid*, *cgpc*, *cgpcogmsg*, and *cggtmodid* parameters cannot be specified in the same command with the *on/off=uimreqd*, *atcaperr*, *itcaperr*, and *udtserr* parameters.

The *svrcname*, *snp*, *snai* and *svrcerr* parameters can only be specified when *act* is set to *svrc*.

The point code specified for the *pc/pci/pcn/pcn24/pcn16* and *cgpc/cgpci/cgpcn/cgpcn24/cgpcn16* parameters must be a full point code.

The SCCP Loop Detection feature must be enabled before the *loopset* parameter can be specified.

The value specified for the *loopset* parameter must already exist in the database.

The value specified for the *cdgtmodid* or *cggtmodid* parameter must already exist in the GTMOD table.

The *defactid=none* parameter cannot be specified.

The value specified for the *pc/pca/pci/pcn/pcn24/pcn16* and *cgpc/cgpcn/cgpci/cgpcn/cgpcn24/cgpcn16* parameters must have the same domain.

The same value cannot be specified for the *on* and *off* parameters.

The specified MAP set must already exist in the MAP table.

The specified MRN set must already exist in the MRN table.

Notes

on/off options

- *uimreqd* —UIM required. Specifies whether a UIM should be generated.
- *useicmsg* —Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).

rtrv-gttapath

Retrieve GTT Action Path Entry

Use this command to retrieve a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

Parameters

acn (optional)

Application context name. The ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, none

none—there is no ITU TCAP *acn* field in the incoming MSU

cdgta (optional)

Called Party Global Title Address.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

cdgttsn (optional)

GTT set name (CDPA type).

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters

cggta (optional)

Calling Party Global Title Address.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

cggtsn (optional)

GTT set name (CGPA type).

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

family (optional)

The ANSI TCAP *family* field in the incoming MSU.

Range:

0 - 255, *, *none*

none —there is no value in the ANSI TCAP *family* field in the incoming MSU

gttpn (optional)

GTT Path name.

Range:

ayyyy

1 leading alphabetic character and up to 4 following alphanumeric characters.

opcode (optional)

The TCAP *opcode* field in the incoming MSU.

Range:

0 - 255, *, *none*

none —there is no value in the TCAP *opcode* field in the incoming MSU

opgttsn (optional)

GTT set name (Opcode type).

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

pkgtype (optional)

The ANSI and ITU TCAP package type.

Range:

ituuni

ITU unidirectional

qwp

Query with Permission

qwop

Query without Permission

resp

Response

cwp

Conversation with Permission

cwop

Conversation without Permission

any

Wildcard value

bgn

Begin

end

End

cnt

Continue

ituabort

ITU abort

ansiabort

ANSI abort

ansiuni

ANSI unidirectional

ANSI TCAP Package Types—*ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any*

ITU TCAP Package Types—*bgn, ituabort, ituuni, any, end, cnt*

Example

```
rtrv-gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2:cggtsn=cgsn3:
cggta=987654:cdgttsn=cdsn1:cdgta=123456

rtrv-gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2

rtrv-gttapath
```

Dependencies

The *acn* and *family* parameters cannot be specified together in the command.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

A value of *none* cannot be specified for the *opgttsn*, *cggtsn*, and *cdgttsn* parameter(s).

The *opcode*, *pkgtype*, and *family* parameters must be specified together for ANSI TCAP translations. The *opcode*, *pkgtype*, and *acn* parameters must be specified together for ITU TCAP translations.

If the *family* parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the *pkgtype* parameter.

If the *acn* parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the *pkgtype* parameter.

If the *pkgtype=ituabort*, then a value of *none* must be specified for the *acn* and *opcode* parameters.

If the *pkgtype=ansiabort* is specified then a value of *none* must be specified for the *family* and *opcode* parameters.

If the *family* and *pcode* parameters are specified in the command, than either both parameters must have a value of *none* or neither parameter can have a value of *none*.

At least one GTT set-value combination must be specified.

The value specified for the *gttpn* parameter must already exist in the database.

Both Path name and set-value combination(s) cannot be specified together.

The value specified for the *gttpn* parameter cannot be a reserved word.

Output

```
rtrv-gttapath:gttpn=path3
```

```

Related Commands

chg-gttapath, dlt-gttapath, ent-gttapath

Use this command to display entries from the Global Title Translations (GTT) Action Set table.

Parameters

Note: Definitions for the feature options specified by the onand offparameters are located in the Notes section.

actid1 (optional)

GTT Action ID 1. This parameter specifies the first action ID associated with the GTT action set.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid2 (optional)

GTT Action ID 2. This parameter specifies the second action ID associated with the GTT action set.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid3 (optional)

GTT Action ID 3. This parameter specifies the third action ID associated with the GTT action set.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid4 (optional)

GTT Action ID 4. This parameter specifies the fourth action ID associated with the GTT action set.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid5 (optional)

GTT Action ID 5. This parameter specifies the fifth action ID associated with the GTT action set.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid6 (optional)

GTT Action ID 6. This parameter specifies the sixth action ID associated with the GTT action set.

Range:

ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actsn (optional)

GTT Action Set Name.

Range:

ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

testmode

on (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:

testmode

refcnt

Example

```
rtrv-gttaset:actid1=disc1  
rtrv-gttaset:actsn=asetdisc1:on=refcnt  
rtrv-gttaset:on=testmode
```

Dependencies

The specified GTT Action Set must already exist in the database.

The actsn=none parameter cannot be specified.

If the actsn parameter is specified, then the on=refcnt parameter is the only other parameter that can be specified.

A value of *fallback* or *none* cannot be specified for the *actid1/actid2/actid3/actid4/actid5/actid6* parameters.

The EGTT feature must be on before this command can be entered.

The action ID specified by the *actid1/actid2/actid3/actid4/actid5/actid6* parameter(s) must already exist in the GTT Action table.

The *actid1/actid2/actid3/actid4/actid4/actid5/actid6* parameters must each specify a unique GTT Action ID in the command.

Only one Action ID with an action of *disc, udts, tcaperr* or *orsrv* can be specified.

If an Action ID with an act of *fwd* is specified, then no other Action ID in the Action Set with an act of *disc, udts, tcaperr, fwd* or *orsrv* can be specified.

If an Action ID associated with an action of *orsrv* is specified, then no other Action ID in the same Action Set can be associated with an act of *fwd, disc, udts, tcaperr, orsrv*.

If 5 Action IDs with an act of *dup* are specified then the remaining Action ID with an act of *dup* cannot be specified.

The same value cannot be specified for the on and off parameters.

Notes

When only the *actidX* (where X=1, 2, 3, 4, 5, 6) parameter is specified, and its value matches any action set, then all such matches will be displayed.

on/off options

- *testmode* —Invokes a field-safe Test Tool in order to debug the GTT Action Set rules.
- *refcnt* —Reference Count. Displays the number of GTTs that reference the GTT Action Set. This feature option is ON only.

Output

rtrv-gttaset

```

Related Commands

[chg-gttaset](#), [dlt-gttaset](#), [ent-gttaset](#)

rtrv-gttset

Retrieve GTT Selectors

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

Note: If the EGTT feature is turned on, then the GTT Selector ([ent/chg/dlt/rtrv-gttset](#)), GTT Set ([ent/dlt/rtrv-gttset](#)), and GTA ([ent/chg/dlt/rtrv-gta](#)) commands replace the Translation Type ([ent/dlt/rtrv-tt](#)) and Global Title Translation ([ent/chg/dlt/rtrv-gtt](#)) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

Note: The nature of address indicator parameters (naivornai) can be specified using a mnemonic or an explicit value. Either value can be specified: however, both values cannot be specified at the same time for the same parameter. [NAIV/NAI Mapping](#) shows the mapping between the naiv and thenaip parameter values.

Note: The numbering plan parameters (npvornp) can be specified using a mnemonic or an explicit value. Either value can be specified: however, both values cannot be specified at the same time for the same parameter. [NPV/NP Mapping](#) shows the mapping between the npv and npp parameter values.

cdgtasn (optional)

CdPA GTA GTT set name.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

cdgttsn (optional)

CdPA GTT set.

Range:

ayyyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

cggtsn (optional)

CgPA GTA GTT set name.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

cggtsn (optional)

CgPA GTT set.

Range:

ayyyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

cgpcsn (optional)

CgPA PC GTT set name.

Range:

ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

cgssn (optional)

CgPA subsystem number.

Range:

0 - 255

eaglegen (optional)

This parameter specifies whether the selector is used by EAGLE 5 ISS generated messages.

Range:

yes

The selector is used by EAGLE 5 generated messages

gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16 (optional)

Global title indicator.

For all EGTT selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national), GTIN24 (24-bit ITU national), GTIIS (ITU international spare), and GTINS (ITU national spare) and GTIN16 (16-bit ITU National).

For the selector commands, GTI and GTIA are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains. For example, if an entry with gtii=2 and tt=4 already exists, an entry with gtin=2 and tt=4 can be specified.

Range:

0, 2, 4

Supported value for ANSI: gti=0, 2 and gtia=0, 2

Supported values for ITU: gtii/gtin/gtin24/gtiis/gtins/gtin16=0, 2, 4

Default:

display all gti(x) parameter values

gttsn (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

Default:

Display all

lsn (optional)

Linkset name.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

nai (optional)

Nature of Address indicator.

Range:

sub
rsvd
natl
intl
dflt

Default:

Display all

naiv (optional)

Nature of Address indicator value.

Range:

0 - 127

Default:

Display all

np (optional)

Numbering Plan.

Range:

e164
generic
x121
f69
e210
e212
e214
private
dflt

Default:

Display all

npv (optional)

Numbering Plan value.

Range:

0 - 15

Default:

Display all

ovrlapd (optional)

Overlapped GTT Selectors.

Range:

yes

Default:

no

selid (optional)

Selector ID.

Range:

0 - 65534, none

tt (optional)

Translation type.

Range:

0 - 255

Default:

Display all

Example

```
rtrv-gtttsel
rtrv-gtttsel:gtii=2
rtrv-gtttsel:tt=0:np=e164
rtrv-gtttsel:gti=2:tt=10
rtrv-gtttsel:gttsn=setint000
rtrv-gtttsel:gtia=2:tt=21:cggtsn=setcGPC:cdgtsn=setcdgta:cgssn=20:selid=1:
lsn=ls10
rtrv-gtttsel:gtia=2:tt=2:lsn=ls1010
rtrv-gtttsel:gtia=2:eagleGen=yes
rtrv-gtttsel:cdgtsn=setdpc
rtrv-gtttsel:ovrlapd=yes
rtrv-gtttsel:gtin16=2
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

Only entries that exactly match all specified parameters will be displayed. If no match is found, the following message is displayed in the Scroll Area of the terminal: "No GTT Selectors matching the specified criteria were found."

The np and npv parameters cannot be specified together in the same command.

The nai and naiv parameters cannot be specified together in the same command.

The gti/gtia=4, gti(x)=1, and gti(x)=3 parameters cannot be specified.

If the gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16=2 parameter is specified, then the np/npv and nai/naiv parameters cannot be specified.

If a full GTT selector key is specified by the gti(x), tt, np/npv, nai/naiv, cgssn, selid, and lsn parameters, then the GTT set specified by the cgpcsn, cggtsn, or cggtsn parameters cannot be specified.

The OBSR feature must be enabled before the cggtsn, cgpcsn, cgssn, or cdgtsn parameters can be specified.

The GTT set specified by the cggtsn or cgpcsn parameter must exist in the database before it is assigned to a GTT selector.

The set type of the cggtsn or cgpcsn parameter must match the set type of the corresponding entry in the GTT set table. For example, the cggtsn parameter should have a set type of *cggta*, and the cgpcsn parameter should have a set type of *cgpc*.

The FLOBR feature must be turned on before the lsn, eaglegen, cdgtsn, or cggtsn parameter can be specified.

If the eaglegen=yes parameter is specified, then the lsn, selid, gtsn, cgssn, cggtsn, and cgpcsn parameters cannot be specified.

The value specified for the cdgtsn or gtsn parameter must match the name of an existing GTT set.

The GTT set specified by the cdgtsn or gtsn parameter must have a set type of *cdgta* (see the `ent-gttset` command).

If the OBSR feature is enabled or the FLOBR feature is turned on, then the gtsn parameter cannot be specified.

The linkset specified by the lsn parameter must already exist in the Linkset table.

The CdPA GTT Set specified by the gtsn, cdgtsn, or cdgtsn parameter must already exist in the GTT Set table.

A value of *dflt* must be specified for the np and nai parameters, or neither value can be *dflt*.

If a full GTT selector key is specified by the gti(x), tt, np/npv, nai/naiv, selid, and lsn parameters, then the GTT set specified by the gtsn, cdgtsn, or cdgtsn parameters cannot be specified.

If the lsn parameter is specified, then the cdgtsn or cggtsn parameter must be specified.

The cggtsn, cgpcsn, and cggtsn parameters cannot be specified together in the command.

The gtsn, cdgtsn, and cdgtsn parameters cannot be specified together in the command.

If the gtsn, cdgtsn, or cdgtsn parameter is specified, then the cgssn parameter cannot be specified.

If the eaglegen=yes parameter is specified, then the lsn, selid, gtsn, cdgtsn, cgssn, cggtsn, cggtsn, or cgpcsn parameters cannot be specified.

If the FLOBR feature is turned on, then the cdgtsn, cggtsn, and cgpcsn parameters cannot be specified.

If a value of *dflt* is specified for the *np* and *nai* parameters, then the *cggtasn*, *cgpcsn*, *cgssn*, *selid*, *lsn*, *cggttsn*, and *eagle* parameters cannot be specified.

A value of *none* cannot be specified for the *gttsn*, *cdgtasn*, *cdgttsn*, *cggttsn*, *cggtasn*, and *cgpcsn* parameters.

If the *gti(x)=0* parameter is specified, then the *eagle*, *tt*, *np/npv*, and *nai/naiv* parameters cannot be specified.

Notes

There is no J7 FAK dependency on the GTIA/GTIN16/GTIN24 parameters. The command can be entered successfully whether the J7 FAK is enabled or not enabled.

GTT Selector entries configured using GTIN24/GTIN16 parameters shall be treated as ITU-N24 entries if the J7 FAK is disabled and shall be treated as ITU-N16 entries if the J7 FAK is enabled.

Also, if the J7 Support feature is enabled, the *rtrv-gttset* output displays the GTIN16 header and if the J7 feature is not enabled, the *rtrv-gttset* output displays the GTIN24 header.

Output

This example retrieves all GTT selectors when EGTT is ON:

```
rtrv-gttset
```

```

Legend

- GTI/GTIA/GTII/GTIN/GTIN24/GTIN16—Global title indicator

- **TT**—Translation type
- **NP**—Number plan
- **NAI**—Nature of address indicator
- **GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Related Commands

chg-gttset, dlt-gttset, ent-gttset

rtrv-gttset

Retrieve GTT Set

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

Note: If the EGTT feature is turned on, then the GTT Selector (*ent/chg/dlt/rtrv-gttset*), GTT Set (*ent/dlt/rtrv-gttset*), and GTA (*ent/chg/dlt/rtrv-gta*) commands replace the Translation Type (*ent/dlt/rtrv-tt*) and Global Title Translation (*ent/chg/dlt/rtrv-gtt*) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

actsn (optional)

GTT Action Set Name.

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

gtmodid (optional)

Global title modification identifier.

Range:

ayyyyyyyy

Default:

Display all

gttsn (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

netdom (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

Range:

ansi

itu

cross

Default:

Display all

refcnt (optional)

GTT set reference count. The count of GTT set being referred in GTT Selectors, GTA Translations, BPARTYGTTSN and IS41SMSCGTTSN options in GSM SMSOPTS table and BPARTYGTTSN option in IS41SMSOPTS table.

Range:

yes

setidx (optional)

GTT set index. This parameter allows GTT set information to be retrieved based on the GTT index number.

Range:

0 - 1999

settype (optional)

GTT set type.

Range:

cdgta

cggtta

cgpc

cgssn

opc

cdssn

opcode

dpc

Default:

Display all

Example

```
rtrv-gttset
rtrv-gttset:netdom=ansi
rtrv-gttset:gttsn=t800
rtrv-gttset:netdom=ansi:settype=cdssn
rtrv-gttset:settype=opcode
rtrv-gttset:setidx=1
rtrv-gttset:actsn=actdisc1
rtrv-gttset:refcnt=yes
rtrv-gttset:gtmodid=set1
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

If the gttsn parameter is specified, it cannot have a value of *none*, and must match an existing gttsn.

If the netdom parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

```
No GTT Sets matching the specified criteria were found.
```

The netdom=cross parameter is valid only if the settype=cdgta parameter is specified.

If the gttsn parameter is specified then the settype, netdom, actsn, and gtmodid parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the settype parameter is *cggtta*, *cgssn*, *opc*, or *cgpc*.

The ANSI/ITU SCCP Conversion feature must be enabled before the netdom=cross parameter can be specified.

The TOBR feature must be turned on before the opcode=settype parameter can be specified.

If the setidx parameter is specified, then no other parameter can be specified in the command.

The FLOBR feature must be turned on before a value of *cdssn* or *dpc* can be specified for the settype parameter.

The value specified for the gtmodid parameter must already exist in the GTMOD table.

Notes

When the Origin-based SCCP Routing feature is turned on, the settype parameter is displayed regardless of feature key status. If the feature key is not enabled, the settype=cdgta parameter (default value) is displayed.

Output

This example retrieves all GTT sets:

```
rtrv-gttset
```

```

Related Commands

[chg-gtw-stp](#)

rtrv-gtwy-acthresh

Retrieve the Gateway Screening Activity Threshold

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

Parameters

lsn (optional)

Linkset name.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all

Example

```
rtrv-gtwy-acthresh:lsn=wy644368
```

```
rtrv-gtwy-acthresh
```

Dependencies

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

Notes

None

Output

This example shows the thresholds of all linksets:

```
rtrv-gtwy-acthresh
```

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN          REJ      RECV     INTRVL
WY644368    10       1000     10

rtrv-gws-actset

Retrieve Gateway Screening Stop Action Sets

Use this command to display the values defined for gateway screening stop actions.

Parameters

actid (optional)

The identification number of the gateway screening stop action.

Range:

4 - 16

Default:

Display all

actname (optional)

The name of the gateway screening stop action set.

Range:

ayyyyy

One alphabetic character followed by up to five alphanumeric characters.

Default:

Display all

Example

```
rtrv-gws-actset
rtrv-gws-actset:actname=cr
rtrv-gws-actset:actid=6
```

Dependencies

Either actname or actid can be specified, but not both.

Notes

If neither actname nor actid are specified, all gateway screening stop actions are displayed.

Output

```
rtrv-gws-actset:actname=cr
```

```

rtrv-home-smsc

Retrieve HOME SMSC Address

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

Parameters

force (optional)

Display more than 50 entries.

Range:

yes

no

Default:

no

num (optional)

Number of entries to display. The force parameter must also be specified to display more than 50 entries.

Range:

1 - 500

Default:

50

smsc (optional)

Short Message Service Center address.

Range:

1-21 hexadecimal digits

Example

```
rtrv-home-smsc
rtrv-home-smsc:smsc=552611646
rtrv-home-smsc:num=100:force=yes
```

Dependencies

One of the following features must be enabled

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP
- Portability Check for Mobile Originated SMS

When the specified num parameter value is greater than 50, the force=yes parameter must also be specified.

The HOME SMSCADDR table must be accessible.

The GSM DBMM table must be accessible.

Notes

None

Output

```

rtrv-inpopts

Retrieve INP Options

Use this command to retrieve INP-specific options.

Parameters

This command has no parameters.

Example

```
rtrv-inpopts
```

Dependencies

None.

Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

If no NEC value has been provisioned, a value of *none* is displayed.

If a RELCAUSE value was not provisioned, then the default value of 31 is displayed.

Output

This example shows output with default INP options:

rtrv-inpopts

```

```
rtrv-ip-card
```

Dependencies

The value specified for the loc parameter must correspond to the location of a card that can run an IP application (other than the EROUTE application, which is not supported by this command).

Notes

None

Output

rtrv-ip-card:loc=1211

```

```

Legend

- **LOC**—Card location
- **SRCHORDR**—Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVRONLY indicates that only the Domain server is searched.
- **DNSA**—IP address of Domain Server A
- **DNSB**—IP address of Domain Server B
- **DEFROUTER**—IP address for the default router
- **DOMAIN**—TDomain name of the Domain server
- **SCTPCSUM**—SCTP checksum algorithm type
- **BPADDR**—Bonded port IP address
- **BPSUBMASK**—Bonded port IP submask
- **DSCP**—Subfield in IP header. Applicable to SIGTRAN-based cards only

SIP connection is not allowed to receive SIP traffic.

prot (optional)

Underlying SIP connection protocol.

Range:

tcp

Transmission Control Protocol.

Example

```
rtrv-ip-conn
rtrv-ip-conn:cname=conn1101a
rtrv-ip-conn:loc=1101
rtrv-ip-conn:prot=tcp
rtrv-ip-conn:lhost=lss1
rtrv-ip-conn:open=yes
```

Dependencies

SIPNP Feature must be enabled before retrieving any SIP connection entry.

IPCONN table should be accessible.

The value specified for the HOST parameter must begin with an alphabetic character and can contain a..z, A..Z, 0..9, - (hyphen), or . (period).

The specified card location must be equipped.

The location specified with this command should be of a SIP card.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Output

This example displays output when no parameter is specified:

```
rtrv-ip-conn
```

```
tekelecstp 12-06-25 16:14:24 EST EAGLE 45.0.0
rtrv-ip-conn
Command entered at terminal #4.
```

```

CNAME          PROT    LPORT    RPORT    OPEN

Related Commands

[dlt-ip-conn](#), [ent-ip-conn](#), [chg-ip-conn](#)

rtrv-ip-host

Retrieve Internet Protocol Hostname

Use this command to retrieve the IP Host table. The IP Host table defines local host names for IP addresses.

Parameters

display (optional)

This parameter displays the provisioned local or remote IP Host entries.

Range:

all

displays all provisioned local and remote IP Host entries.

detail

```

rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1
rtrv-ip-host:host=gw100.nc.tekelec.com
rtrv-ip-host:ipaddr=150.1.1.1
rtrv-ip-host
rtrv-ip-host:display=all
rtrv-ip-host:num=10
rtrv-ip-host:type=local:num=3
rtrv-ip-host:display=detail
rtrv-ip-host:realm=abc.com

```

Dependencies

A valid value must be specified for the host parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

A valid value must be specified for the realm parameter. If the realm contains a hyphen, then the host name must be enclosed within quotation marks.

Display=all and realm parameter must not be specified together.

Notes

If optional parameters are specified, only the entries that match the entered parameters are retrieved.

Realm is mandatory for all the IP hosts associated with diameter connections.

Output

If this command is entered without any parameters, then the command displays up to a maximum of 50 entries. The display=all parameter must be specified to display all entries in the IP Host table.

This example displays output when no other parameter is specified:

```
rtrv-ip-host
```

```

rtrv-ip-lnk

Retrieve Internet Protocol Link

Use this command to retrieve the IP link table.

Parameters

loc (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

Default:

All card location link data are displayed.

port (optional)

Ethernet interface port ID.

Range:

a, b

Default:

All IP link port data associated with all ports on the card are displayed.

Example

```
rtrv-ip-lnk:loc=1211:port=a
rtrv-ip-lnk:loc=1211
rtrv-ip-lnk
```

Dependencies

The value specified for the loc parameter must correspond to the location of a card that can run an IP application (other than the EROUTE application, which is not supported by this command).

The card in the location specified by the loc parameter must support the port specified by the port parameter.

Notes

None

Output

```

```

Legend

- **LOC**—Card location
- **PORT**—Ethernet interface port ID
- **IPADDR**—IP address for the specified port
- **SUBMASK**—Subnet mask of the IP interface
- **DUPLEX**—Mode of operation of the interface
- **SPEED**—Bandwidth for the interface in megabits per second
- **MACTYPE**—Media Access Control Type of the interface. 802.3 indicates the IEEE standard number 802.3 for Ethernet 1, and DIX indicates the Digital/Inter/Xerox de facto standard for Ethernet 2.
- **AUTO**—Whether to automatically determine duplex and speed. If YES, duplex and speed are automatically determined. If NO, duplex and speed are not automatically determined.
- **MCAST**—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the Service Module card to the MPS system.

Related Commands

[chg-ip-lnk](#)

rtrv-ip-node

Retrieve IP Node

Use this command to display one or more nodes that are directly connected to a IP data link. This command can display a connection, an application on a node, or an entire node. No parameters are required to display an entire node. An application can be specified by giving either the application name or its IP port on the node.

Parameters

ipaddr (optional)

Remote host IP address. This address is expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range:

1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Default:

Display all

ipappl (optional)

IP application supported by the node.

Range:

stplan

ipport (optional)

Logical IP port that addresses the application on the node.

Range: 1024 - 5000

Default:

Display all

iprte (optional)

Default router IP address. This address is expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is *192.126.100.5*, where *192.126.100* is the network number and *5* is the machine's host number.

Range:

1-223, 0-255

4 numbers, separated by dots

1-223-first number

0-255-the other three numbers

Default:

Display all

loc (optional)

The card location as stenciled on the shelf of the system that contains the link that will be directly connected to the node.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Display all

Example

```
rtrv-ip-node
```

```

rtrv-ip-node:ipappl=stplan
rtrv-ip-node:ipaddr=193.4.201.50
rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024
rtrv-ip-node:loc=1201

```

Dependencies

Only one of the ipappl, ipport, or loc parameters can be specified in the command.

The ipaddr parameter must be specified before the ipport parameter can be specified.

The shelf and card must be equipped.

If the loc parameter is specified, the card location must be equipped with an IP data link.

If the iprte parameter is not specified, then all IP nodes meeting the display criteria are displayed. If the IP node has no IP router assigned to it, dashes are displayed in the IPRTE field.

rtrv-ip-rte

Retrieve IP Route

Use this command to display all static IP route entries in the Static IP Route table, entries for a specific card, entries for a specific destination IP address, or entries for a specific gateway IP address.

Parameters

dest (optional)

Destination IP Address. The IP Address of a remote destination host or network.

Range:

gtwy (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

The IP address 0.0.0.0 is not valid.

loc (optional)

Card location. The unique identifier of a specific IP card in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rtrv-ip-rte
rtrv-ip-rte:loc=1301
rtrv-ip-rte:dest=128.252.10.5
rtrv-ip-rte:gtwy=140.190.15.3
```

Dependencies

Only one optional parameter can be specified in a single command.

The value specified for the loc parameter must not correspond to an E5 TDM-A or TDM-B

The specified destination IP address (dest parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (gtwy parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

rtrv-isup-msg

Retrieve ISUP Message

Use this command to display one ISUP test message or all ISUP test messages from the TESTMSG table. The TIF Test Tool processes ISUP test messages to verify the TIF and NPP provisioned configuration in the system.

Parameters

msgn (optional)

ISUP Test Message number. The ISUP test message number for which parameter values are displayed.

Range:

1 - 10

Dependencies

None.

Example

```
rtrv-isup-msg
```

Output

```
rtrv-isup-msg
```

```
tekelecstp 08-10-30 14:55:45 EST  EAGLE 40.0.0

Legend

MSG—ISUP Test Message number

ACTIVE—Indicates whether the ISUP test message will be sent to the network card in the test (0=NO, 1=YES)

CGPN_NAI—Calling Party Number Nature of Address Indicator

CGPN_CAT—CgPN Category

CGPN—Calling Party Number Digits

CDPN_NAI—Called Party Number Nature of Address Indicator

CDPN—Called Party Number Digits

NMBITS—Nm Bits that indicate whether a number portability lookup has already been performed in the network

rtrv-j1

Retrieve J1 Interface

Use this command to retrieve information for a specified J1 interface or for all J1 interfaces that have been defined by the ent-j1 command.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All T1 card locations having J1 interfaces configured are listed.

j1port (optional)

J1 port number. The value must be a J1 port that has already been configured with a J1 interface on the specified J1 card having application as CCS7ITU.

Range:

1-8

Default:

If not specified, all T1 card locations having J1 interfaces configured are listed.

Example

```
rtrv-j1
rtrv-j1:loc=1101:j1port=1
```

Dependencies

The loc and j1port parameters must be specified together, if any parameters are specified for the command.

The J1 interface of the J1 card specified by the loc parameter must already be defined before this command can be entered.

The card specified by the loc parameter must be a LIMT1 card type and the application must be CCS7ITU.

The Card (IMT) table must be accessible.

The J1 table must be accessible.

The port specified by the j1port parameter on the card specified by the loc parameter must already be equipped with a J1 interface.

The following card locations (loc parameter) are not valid for this command: 1113 - 1118 and all *xy*09 and *xy*10 locations (where *x* is the frame and *y* is the shelf).

The j1port parameter must be in the range from 1 to 8.

Notes

None.

Output

```
rtrv-j1
```

```

rtrv-l2t

Retrieve Level 2 Timers

Use this command to display the values of the SS7 MTP Level 2 timers. The timers are organized in 40 timer sets of 10 timer values each. The timer sets are grouped and system default values are initialized by specification (ANSI, ITU, High Speed for China, High Speed for Q.703 Annex A, JT Q703, and High Speed for Unchannelized T1). Each timer set is administered individually by the `chg-l2t` command. The `ent-slk` command is used to assign an SS7 signaling link to any of the timer sets. Each assigned link is associated with a timer set.

Parameters

l2tset (optional)

Level 2 timer set identifier, or timer set number. Up to 40 different SS7 MTP Level 2 timer sets can be defined.

Range:

1 - 40

Default:

Displays all timer sets

Example

```
rtrv-l2t
rtrv-l2t:l2tset=36
```

Dependencies

None.

Notes

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the `chg-l2t` command.

Output

The timer values are shown in the output for this command in seconds.

rtrv-l3t

Retrieve Level 3 Timers

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

Parameters

l3tset (optional)

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the `ent-ls` or `chg-l3t` command.

Range:

1

Default:

Display table

Example

```
rtrv-l3t:l3tset=1
```

Dependencies

Only one timer set is supported in this release.

Notes

The timer output for this command is in seconds, even though it could have been entered in milliseconds in the `chg-l3t` command.

Output

```
rtrv-l3t:l3tset=1
```

```

- **T7**—Amount of time, in seconds, to wait for signaling data link connection acknowledgment
- **T8**—Transfer-prohibited inhibited timer (transient solution)
- **T10**—Amount of time, in seconds, to wait before repeating the signaling-route-set-test message
- **T11**—Transfer-restricted timer
- **T12**—Amount of time, in seconds, to wait for uninhibit acknowledgment
- **T13**—Amount of time, in seconds, to wait for force uninhibit
- **T14**—The amount of time, in seconds, to wait for inhibition acknowledgment
- **T15**—Amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test
- **T16**—Amount of time, in seconds, to wait for route-set-congestion status update
- **T17**—Delay, in seconds, to avoid oscillation of initial alignment failure and link restart
- **T18**—Repeat TFR once by response method timers
- **IT18**—Timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.
- **T19**—Failed link craft referral timer
- **IT19**—Amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages
- **T20/IT22**—Amount of time, in seconds, to wait before repeating the local inhibit test
- **IT20**—Amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts
- **T21/IT23**—Amount of time, in seconds, to wait before repeating the remote inhibit test
- **IT21**—Overall MTP restart timer at a signaling point adjacent to one whose MTP restarts
- **T22**—Timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available
- **T23**—Timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.
- **T24**—Timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.
- **T25**—Timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).
- **T26**—Timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.
- **T28**—Timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.
- **T29**—Timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.
- **T30**—Timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message
- **T31**—False link congestion detection timer
- **T32**—Link oscillation timer—Procedure A

rtrv-lbp

Retrieve Loopback Point Attributes

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

Parameters

lbp (optional)

Loopback point ID. A far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range:

1 - 32

Default:

Display all

link (optional)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym:

port

Range:

Default:

Display all

loc (optional)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 531, 6101 - 6108, 6111 - 6118

Default:

All card locations.

Example

```
rtrv-lbp
```

```
rtrv-lbp:loc=1202
rtrv-lbp:loc=1202:link=a
rtrv-lbp:loc=1202:link=a:lbp=3
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the loc parameter cannot be reserved by the system.

If the link parameter is specified, the loc parameter must be specified. If the lbp parameter is specified, the loc and link parameters must be specified.

The card location (loc parameter) must identify a provisioned LIMDS0, LIMT1, or LIMCH (associated to a LIMT1) card configured with either an SS7ANSI or CCS7ITU application.

The card location specified in the loc parameter must be equipped.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This example displays the attributes for the loopback points for SS7 links assigned to the STP:

```
rtrv-lbp
```

```

rtrv-log

Display Records from the Log

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

Parameters

dir (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

Range:

fwd

Display entries from nearer the beginning of the log toward entries at the end of the log

bkwd

Display entries from nearer the end of the log toward entries at the beginning of the log

Default:

fwd

edate (optional)

End date. Report only log entries that were created on or before the specified date (*dir=fwd*), or only log entries that were created on or after the specified date (*dir=bkwd*). See the Notes section for usage information.

Range:

000101 - 991231

(in the form *yyymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default:

Report log entries regardless of their creation date

enum (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

Range:

1 - 1499

1-999 —Alarms (UAMs)

1000-1499 —UIMs

Default:

If *enum* is not specified and:

If *snum* is specified, the default *enum* value is the same as the specified *snum* value.

If *snum* is not specified and *type* is *alarm* or not specified, the default *enum* value is *999*.

If *snum* is not specified and *type* is *all* or *uim*, the default *enum* value is *1499*.

etime (optional)

End time. Report only log entries that were created on or before the specified time (*dir=fwd*), or only log entries that were created on or after the specified time (*dir=bkwd*). See the Notes section for usage information.

Range:

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59)) y)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as *130503* .

Default:

Report log entries regardless of their creation time

mode (optional)

Log display mode; display all information or just summary information from each log entry.

Note: If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.

Range:

brief

Display only the first "Summary" line of the log entry

full

Display all information available in the log entry

Default:

full

next (optional)

Number of additional records to display using the same direction (*dir*) and filtering criteria of *outgrp*, *type*, *slog* , and *mode* that were used for the previous successful *rtrv-log* command at the same terminal.

Range:

1 - 65500

num (optional)

Number of records that can be displayed before the report is stopped.

Range:

1 - 65500

Default:

15

outgrp (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on.

Range:

<i>all</i>	Retrieve information for all Output Groups
<i>appserv</i>	Application Server
<i>appss</i>	Application Subsystem
<i>card</i>	Card
<i>clk</i>	Clock
<i>db</i>	Database
<i>dbg</i>	Debug
<i>gtt</i>	GTT Maintenance
<i>gws</i>	GWS Maintenance
<i>link</i>	Link Maintenance
<i>meas</i>	Measurements Maintenance
<i>mon</i>	Monitoring (Sentinel or IMF) Maintenance
<i>mps</i>	MPS Maintenance
<i>pu</i>	Program Update
<i>sa</i>	System Administration
<i>seas</i>	SEAS (Sentinel or IMF)
<i>slan</i>	SLAN Maintenance
<i>sys</i>	System Maintenance

traf

Traffic

Default:

If the next parameter is not specified, the default is *all* .

If the next parameter is specified, the output is the same as the immediately previous successful `rtrv-log` command that was entered at the same terminal (and no `rtrv-log` command was entered at another terminal).

sdate (optional)

Start date. Report only log entries that were created on or after the specified date (`dir=fwd`), or only log entries that were created on or before the specified date (`dir=bkwd`). See the Notes section for usage information.

Range:

000101 - 991231

(in the form *yyymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default:

Report log entries regardless of their creation date

slog (optional)

Source of log. The OAM Maintenance log to access.

Range:

act

Active OAM

stb

Standby OAM

Default:

act

snum (optional)

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the `outgrp` parameter is specified.

Range:

1 - 1499

1-999 —Alarms (UAMs)

1000-1499 —UIMs

Default:

All entries for the specified type are displayed.

If `type=all`, `alarm` , or not specified, the default value is *1* .

If type=uim , the default value is 1000 .

stime (optional)

Start time. Report only log entries that were created on or after the specified time (dir=fwd), or only log entries that were created on or before the specified time (dir=bkwd). See the Notes section for usage information.

Range:

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503 .

Default:

Report log entries regardless of their creation time

type (optional)

Type of Maintenance log to access for the report.

Range:

all

UAMs and UIMs

alarm

UAMs

uim

UIMs

Default:

alarm

Example

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

Dependencies

No other rtrv-log command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the `rtrv-log` command can be entered.

If the `sdate` and `edate` parameters are specified,

- In the forward direction, the `sdate` value must be less than or equal to the `edate` value.
- In the backward direction, the `sdate` value must be greater than or equal to the `edate` value.

The month component of the `sdate` and `edate` parameters must be in the range 1–12.

The day component of the `sdate` and `edate` parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the `stime` and `etime` parameters must be in the range 00–59.

The minutes component of the `stime` and `etime` parameters must be in the range 00–59.

If the `sdate` parameter value is equal to the `edate` parameter value,

- In the forward direction, the `stime` value must be less than or equal to the `etime` value.
- In the backward direction, the `stime` value must be greater than or equal to the `etime` value.

The `sdate` parameter value plus the `stime` parameter value must be less than the current time and date combination.

If `dir=bkwd` is specified with a date and time range, `sdate/stime` must be greater than `edate/etime`.

When the `enum` parameter is specified, the `snum` parameter must be specified with a value less than or equal to the specified `enum` value.

The specified `enum` parameter value and the specified `snum` value must be within the same range: 1-999 for Alarms (UAMs) and 1000-1499 for UIMs.

The `type` parameter and the `snum/enum` parameters cannot be specified together in the command.

The `rtrv-log:next=` command must be entered on the same terminal where the previous successful `rtrv-log` command was entered in the system. No other parameters can be entered with the `next` parameter in the command.

The `rtrv-log:next=` command cannot be entered following a `rtrv-log` command that contained the `type=all` parameter. A `rtrv-log` command without the `type=all` parameter must be entered before the `rtrv-log::next=` command can be entered.

Because entries can be overwritten between the entry of a `rtrv-log` command without the `next` parameter and the entry of a `rtrv-log:next=` command, the `rtrv-log:next:` command might not execute successfully. Another `rtrv-log` command without the `next` parameter must be entered before the `rtrv-log:next:` command can be entered again.

The values specified for the `edate` with the `stime` parameter combination must be valid.

The values specified for the `edate` with `stime` and `etime` parameter combination must be valid.

When an `enum` parameter is specified, it requires an `snum` as its mated parameter.

No other parameters can be entered with the `next` parameter in the command.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

- years 95–99 = 1995 through 1999
- years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any sdate/edate value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of the num and dir parameters. The num parameter determines the maximum number of entries to display, and the dir parameter determines whether entries are displayed from the oldest end (dir=fwd or not specified) or the newest end (dir=bkwd).

When sdate is specified and edate is not specified in the forward direction, edate is defaulted to be the end of the log.

When edate is specified and sdate is not specified in the forward direction, sdate is defaulted to be the beginning of the log.

When sdate is specified and edate is not specified in the backward direction, edate is defaulted to be the beginning of the log.

When edate is specified and sdate is not specified in the backward direction, sdate is defaulted to be the end of the log.

When stime is specified and etime is not specified in the forward direction, etime is defaulted to 235959.

When etime is specified and stime is not specified in the forward direction, stime is defaulted to 000000.

When stime is specified and etime is not specified in the backward direction, rtime is defaulted to 000000.

When etime is specified and stime is not specified in the backward direction, stime is defaulted to 235959.

When stime or etime is specified but neither the sdate or edate parameters are specified, sdate and edate are each defaulted to the value *today* .

The num parameter is used to control the maximum number of entries to be displayed by one command.

The dir parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the dir parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (outgrp) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When `outgrp=all` is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The next parameter is used to display a specified number of additional log records after the previous `rtrv-log` entry at the terminal. New records that are logged after the previous `rtrv-log` command was entered will not be displayed when the `rtrv-log:next=` command is entered. The next parameter is valid only under the following conditions:

- The `rtrv-log:next=` command is entered at the same terminal from which the previous `rtrv-log` command was entered. The previous `rtrv-log` command must not include the `type=all` parameter.
- No other terminal has issued a `rtrv-log` command after the `rtrv-log` command entered at the terminal from which the `rtrv-log:next=` command is entered.
- The next parameter is the only parameter specified in the `rtrv-log` command.
- There are still logs present that match the conditions (except `time/date/num`) specified in the previous `rtrv-log` command.

When either a single `snum` or range of `snum/enum` is specified, only those Alarms or UIMs within the specified range are displayed.

When `snum` is specified and `enum` is not specified, the `enum` value defaults to the specified `snum` value.

When `enum` is specified, an `snum` value must be specified that is less than or equal to the specified `enum` value.

If an `snum` is specified within the range 1-999, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1-999.

If an `snum` is specified within the range 1000-1499, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1000-1499.

When `enum` is not specified and the specified `snum` Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the `snum` value is out of range.

If `snum` and `enum` are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

Output

In this example, the sequence numbers that are replaced by the dashes (---) represent the UIMs that were discarded due to the UIM thresholding feature:

```
rtrv-log:type=uim:sdate=960715:stime=220000:num=50
```

```

Related Commands

None.

rtrv-loopset

Retrieve Loop Set Command

Use this command to retrieve loopset data from the database.

Parameters

disp (optional)

Display method. The manner in which the retrieved data is displayed.

Range:

detail

Provides detailed information for a loopset entry.

list

Provides a list of loopset entries.

Default:

detail

force (optional)

Range:

yes

mode (optional)

Mode of operation. Retrieves loopset entries that have been assigned the specified mode.

Range:

notify

Generates a UIM without discarding the message.

discard

Generates a UIM and discards the message.

name (optional)

Loopset name.

Range:

ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters.

num (optional)

The number of entries to be retrieved.

Range:

1 - 1000

Default:

50

Example

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

```
rtrv-loopset
```

This example provides detailed information for the loopset entry RTP1.

```
rtrv-loopset:name=rtp1
```

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:num=100:force=yes
```

This example provides a list of the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:force=yes:num=100:disp=list
```

This example provides detailed information for the first 100 valid loopset entries set to *discard* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=discard
```

This example provides a list of the first 100 valid loopset entries set to *notify* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=notify:disp=list
```

Dependencies

If the value of the num parameter is greater than 50 , then the force=yes parameter must be specified.

The value of the name parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The name=none parameter cannot be specified.

If the name parameter is specified, then the disp=list parameter cannot be specified.

Output

This example displays loopset entry details for loopset RTP1:

```
rtrv-loopset:name=rtp1
```

Retrieve Linkset

Use this command to show the linkset information.

Parameters

apc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

apc/apca/apci/apcn/apcn24/apcn16 (optional)

Adjacent point code.

apci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

apcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

apcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000–255

ssa—000–255

sp—000–255

apcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The prefix indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

cggmod (optional)

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

Range:

yes

no

islsrsb (optional)

Incoming rotated signaling link selection (SLS) bit. This parameter displays the linksets with the specified rotated bit.

Range:

1 - 8

ITU linksets— *1-4*

ANSI linksets— 1-8

Default:

Display all link sets

itutfr (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the itutfr parameter.

This parameter is valid for ITU national linksets only.

Range:

on

off

Default:

Display all link sets

lsn (optional)

Linkset name

Range:

ayyyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all link sets

lst (optional)

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

Range:

prx

Display proxy links.

mtrse (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range:

yes

equipped

no

not equipped

Default:

Display all link sets

pct (optional)

This parameter displays the linksets where the Point Code and CIC Translation has the specified status.

Range:

on

off

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member(ni-nc-ncm)*.

The proxy point code must be a full point code.

Synonym:

ppca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code.

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ppcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

ppcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

randsls (optional)

Random SLS (signaling link selection). This parameter displays linksets that have the specified value of the `randsls` parameter.

Range:

off

Displays all linksets where random SLS is disabled.

class0

Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

all

Displays ITU linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled and ANSI linksets where random SLS generation for Class0 and ISUP traffic is enabled.

Default:*off***slsobit (optional)**

Other CIC (Circuit Identification Code) Bit. This parameter displays the linksets that have the slsobit parameter set to a value from 5 - 16.

Range:*

*

Specifies all possible values (5-16)

Default:

Display all link sets

slsrsb (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

Range:

1 - 4

Default:

Display all link sets

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member*(*ni-nc-ncm*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000–255

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area(un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna--000---15

mna---000---31

Example

Display all linksets having the parameter `pct=on` :

```
rtrv-ls:pct=on
```

Display the attributes of all link sets:

```
rtrv-ls
```

Retrieve linkset LS1:

```
rtrv-ls:lsn=ls1
```

Retrieve all link sets with the `mtprse=yes` parameter:

```
rtrv-ls:mtprse=yes
```

Retrieve all link sets that use the `slsocbit` parameter with a value from 5 - 16 :

```
rtrv-ls:slsocbit=*
```

Display an ITU linkset to view the settings for the `slrsb` or `slsocbit` parameters:

```
rtrv-ls:lsn=lsitu
```

Retrieve all ITU national linksets that have the `itutfr` parameter set to *on* :

```
rtrv-ls:itutfr=on
```

Retrieve the specified ITU national linkset and display its setting for the `itutfr` parameter:

```
rtrv-ls:lsn=lsitun
```

Retrieve all linksets where random SLS generation is enabled for SCCP ITU traffic and Class0 ANSI traffic.

```
rtrv-ls:randsls=class0
```

Display all proxy linksets.

```
rtrv-ls:lst=prx
```

Display all linksets using a specified proxy point code.

```
rtrv-ls:ppc=11-11-11
```

Display all linksets using a specified secondary point code.

```
rtrv-ls:spc=2-2-2
```

Display all linksets using a specified adjacent point code.

```
rtrv-ls:apc=1-1-2
```

Retrieves all linksets where calling party global title modification is requested:

```
rtrv-ls:cggtmod=yes
```

Retrieves all link sets with the ISLSRSB value 6.

```
rtrv-ls:islsrsb=6
```

Display all linksets using a specified adjacent point code.

```
rtrv-ls:apcn16=121-10-15
```

Dependencies

A PCT quantity feature must be enabled before the pct parameter can be specified.

The specified linkset must be in the database.

All optional parameters, except for the combination of the slsobit and slsrsb parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the apcn parameter is specified as the Adjacent Point Code, then the format of the apcn parameter must match the format dictated by the chg-stpopts:npcfnti parameter.

The SLSOCB feature must be enabled before the slsobit parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the apc and spc parameters can be specified.

At least one linkset must be associated with the value of the apc parameter.

The Proxy Point Code feature must be enabled before the lst=prx parameter can be specified.

The Proxy Point Code feature must be enabled before the ppc parameter can be specified.

The value specified for the ppc parameter must be a full point code.

The value specified for the ppc parameter must already exist in the Destination table, and the prx=yes parameter must have been specified.

The value specified for the apc parameter must be a full point code.

The value specified for the spc parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the cggtmod parameter can be specified.

The ISLSRSB feature must be enabled before the islsbr parameter can be specified.

The PPC specified must not be a private point code.

4722 E4722 Cmd Rej: PPC not supported for Private PC

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The `CLLI`, `TFATCABMLQ`, `MTPRSE`, and `ASL8` fields are displayed only when a specific linkset is specified. The `SLSOCBIT` and `SLSRSB` fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the `tfatcabmlq` parameter database value is 0 for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or 1 if there are 2 or fewer links in the linkset).

If the `tfatcabmlq` parameter database value is 0, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 to be a minimum of 1 for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the `rtrv-ls` command output.

If the `tfatcabmlq` parameter value is set to a specific value greater than 0, then the EAGLE 5 does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the `rtrv-ls` command output.

The EAGLE 5 `ent-ls` command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE 5 `ISS` command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS `vfyls` command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS `vfyls` output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The value specified for the `ppc` parameter must be a full point code. Cluster point codes and private point codes are not supported.

The `ICNIMAP` and `OGNIMAP` fields are displayed only if the linkset name is specified in the command, the ITU Spare Point Code feature is enabled, and an ITUN or ITUI point code is associated with the linkset.

IPSG linksets have `SLKTPS` configured rather than `IPTPS`. `SLKTPS` configures the transactions per second for each link assigned to the IPSG linkset as opposed to `IPTPS` which configures the combined transactions per second for the entire IPGW linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated `SLKTPS` of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support `SLKTPS`.

If a linkset contains a mixture of `IPLIMx M2PA` and `IPSG-M2PA` links, then the command does not report any data below the TPS header or raise alarms.

Output

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

This example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic for ITU linksets and Class0 and ISUP traffic for ANSI linksets:

```
rtrv-ls:randsls=all
```

In this example:

- The TFATCABMLQ and MTPRSE fields are displayed only when a linkset is specified. The FE-PC of this link set has no CLLI; therefore the CLLI is shown as "-----".
- The SLSOCBIT and SLSRSB fields are not displayed for ANSI linksets.
- RANDSLS information is displayed for an ANSI linkset.

Legend

- **LSN**—Name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the apcntype=itunchina parameter specified.
- **APC/APCI/APCN/APCN24/APCN16**—Adjacent DPC of the linkset
- **SPC/SPCI/SPCN/SPCN24/SPCN16**—Secondary PC of the linkset
- **SCRN**—Screen set assigned to the linkset
- **L3TSET**—Level 3 timer set value assigned to the linkset

- **SLTSET**—SLTM record associated with the linkset
- **BEI**—Broadcast exception indicator. Indicates whether TFP (transfer prohibited) messages can be broadcast on the linkset.
- **LST**—Type of links in the linkset (access links, bridge links, etc.)
- **LNKS**—Number of links in the linkset
- **GWSA**—Shows whether gateway screening is used on the specified linkset
- **GWSM**—Shows whether the display of messages generated for each screened message is turned on or off
- **GWSD**—Shows whether the gateway screening message discard function is turned on or off
- **SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset
- **NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset
- **CLLI**—The far end Common Language Location Identifier (CLLI)
- **TFATCABMLQ**—the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted
- **MTPRSE**—Shows whether the adjacent node is equipped with MTP restart
- **ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs
- **MULTGC**—Shows whether multiple group codes are allowed
- **IPGWAPC**—Shows whether the adjacent point code is an IP Gateway adjacent point code
- **MATELSN**—Name of the mate IP Gateway linkset
- **IPTPS**—Provisioned or default TPS for the specified IPGWx linkset. This value is a user-defined or default portion of the total enabled system IP Signaling TPS.
- **LSUSEALM**—Percent of the linkset TPS (IPTPS) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured IPTPS value for the linkset
- **SLKUSEALM**—Percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured IPTPS. The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.
- **LOC**—Location of the card containing the signaling links that make up the linkset
- **PORT**—Port on the card containing the signaling link
- **SLSOCBIT**—Setting of the Other CIC (Circuit Identification Code) Bit
- **SLRSRB**—Setting of the Rotated SLS (Signaling Link Selection) Bit
- **ISLSRSB**—setting of the Incoming Rotated SLS (Signaling Link Selection) Bit
- **GSMSCRN**—Shows whether the GSM MAP screening indicator is turned on or off
- **ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off
- **L2TSET**—Level 2 timer set value associated with the signaling link
- **SLC**—Signaling link code of the signaling link
- **TYPE**—Type of card
- **BPS**—Transmission rate for the link in bits per second
- **E1PORT**—E1 port with the E1 interface that services the link
- **E1LOC**—Card location of the E1 card with the E1 interface that services the link
- **T1PORT**—T1 port with the T1 interface that services the link
- **T1LOC**—Card location of the T1 card with the T1 interface that services the link
- **TS**—Timeslot assigned to the link that is serviced by the E1 or T1 interface
- **E1ATMCRC4**—Indicator of whether CRC4 multi-frame structure is enabled or disabled

- **E1ATMSI**—Value of two Spare International bits of NFAS data
- **E1ATMSN**—Value of five Spare National bits of NFAS data
- **RANDSLS**—The setting of linkset for Random SLS generation
- **ADAPTER**—Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset
- **RSVDSLKTPS**—Guaranteed SLKTPS for an IPSP linkset
- **MAXSLKTPS**—Maximum SLKTPS for an IPSP linkset
- **RCONTEXT**—Routing context ID of IPSP M3UA linkset
- **ASNOTIF**—Shows whether AS notifications will be generated for IPSP M3UA linkset
- **ANAME**—Association name configured for signaling link of IPSP linkset
- **SLKTPS**—Provisioned TPS for concerned signaling link of the specified IPSP linkset
- **CGGTMOD**—Shows whether calling party global title modification indicator is yes or no for the linkset
- **PPC/PPCI/PPCN/PPCN24/PPCN16**—The proxy point code of the linkset
- **NUMSLKALW**—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state
- **NUMSLKRSTR**—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state
- **NUMSLKPROH**—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state
- **ICNIMAP**—Incoming NI Map
- **OGNIMAP**—Outgoing NI Map
- **RSL8**—Shows whether the incoming SLS is rotated by 8 bits
- **PCT**—Shows whether the Point Code & CIC Translation (PCT) feature is applied to messages coming in or going out on links of a particular link set
- **RFT**—Shows whether the linkset is in SLT Reflect mode
- **J1PORT**—J1 port with the J1 interface that services the link

rtrv-m2pa-tset

Retrieve M2PA Timer Set

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

Parameters

tset (optional)

The name of the M2PA timer set to be retrieved.

Range:

1 - 20

ver (optional)

The M2PA version supported by the association.

Range:

*d6**rfc*

Example

```
rtrv-m2pa-tset
rtrv-m2pa-tset:tset=1
```

Dependencies

None

Notes

If a timer set is not specified in the command, all timer sets are retrieved.

Output

```
rtrv-m2pa-tset:tset=1:ver=d6
```

```

[chg-m2pa-tset](#)

rtrv-map

Retrieve Mate Applications

Use this command to show the mated application relationship information and Alternate RI Mate information maintained by the system. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to view Alternate RI Mate information. This information is used to support the routing of SCCP management SSP/SSA messages.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

Note: Definitions for the feature options specified by the on parameter are located in the Notes section.

mapset (optional)

MAP set ID.

Range:

1 - 36000, *dflt*

dflt —Default MAP set

Default:

dflt

The default value is *dflt* only when the Flexible GTT Load Sharing feature is not enabled.

on (optional)

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

Range:

refcnt

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

Point code.

pci (optional)

ITU international point code in the form of *zone-area-id*.

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (optional)

16-bit ITU national point code in the form of *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

ssn (optional)

Subsystem number

Range:

2 - 255

Default:

All subsystem numbers and their mates are shown for the given point code.

Example

```
rtrv-map
rtrv-map:pc=2-2-2
rtrv-map:pca=1-1-4:ssn=15
rtrv-map:mapset=2
rtrv-map:mapset=df1t:pcn=s-10155-ab
rtrv-map:pcn=1001:on=refcnt
rtrv-map:pcn16=1-2-3
```

Dependencies

The value of the pc/pca/pci/pcn/pcn24/pcn16 parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See the `canc-cmd` command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (*s-*).

If the Flexible GTT Load Sharing feature is enabled, then the retrieved MAP examples contain the MAPSET ID for each MAP set. MAP sets that were configured before the Flexible GTT Load Sharing feature was enabled are shown as MAPSET ID=DFLT after the Flexible GTT Load Sharing feature is enabled.

The `pc/pca/pci/pcn/pcn24/pcn16`, `ssn`, and `mapset` parameters can be used to screen the output of all MAP sets. These parameters allow retrieval of only those MAP sets that contain the desired parameters.

A MAP set can contain one primary entry and up to 31 mated entries.

If no parameters are entered, all defined mated point codes (up to 36,000) are shown.

If the Flexible Final GTT Loadsharing feature is not enabled, then the number of entries in the MAP table is based on unique point codes. Point codes that are duplicated in MRN sets using different SSNs are counted only once in the number of entries.

If the Flexible Final GTT Loadsharing feature is enabled, then the number of entries in the MAP table is based on unique point code and SSN combinations. Point codes that are duplicated in MRN sets are counted in the number of entries).

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MRNSET and MRNPC fields, is displayed for all MAP Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

on option

refcnt—displays the MAPSET, MAPSET/PC, and MAPSET/PC/SSN reference counts

Output

All subsystem numbers for the specified point code and its mates are shown.

The NET column is shown only when a MAP set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

If an MRC value is preceded with an "*", then the MRC value is not applicable for the current multiplicity mode (MULT field). The MRC value is only valid when MULT is *DOM*.

If an SRM value is preceded with an "*", then the SRM value is not applicable for the current multiplicity mode (MULT field). The SRM value is only valid when MULT is *DOM* or *COM*.

If an SSN REFCNT value is preceded with an "*", then the entry can be deleted if any other entry with the same point code exists in that MAP set.

This example retrieves an ANSI MAP set for a specified point code:

```

Legend

- **MAPSET ID**—MAP set number or DFLT when numbered MAP sets are allowed
- **PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the primary application resides
- **NET**—Mate network type of the point code when an ITU MAP set contains both ITU-I and ITU-N point codes. The field can show I if the MATE PC is an ITU-I point code or N if the MATE PC is an ITU-N point code.
- **MATE PC/PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the mate application resides
- **SSN**—Applications subsystem number
- **RC**—Relative cost of the point code/subsystem
- **MULT**—Multiplicity mode SOL (Solitary), DOM (Dominant), SHR (Shared), or COM (Combined - Shared and Dominant) Load sharing. See the "Notes" section in the `ent-map` command description for an explanation of multiplicity modes.
- **SRM**—Specifies whether subsystem routing messages are transmitted is on (YES), off (NO), not applicable (*Y) but would be YES if applicable, or not applicable (*N) but would be NO if applicable. See the "Notes" section in the command description for SRM non applicable Load sharing modes.
- **MRC**—Specifies whether message routing under congestion is on (YES), off (NO), not applicable (*Y) but would be YES if applicable, or not applicable (*N) but would be NO if applicable. See the "Notes" section in the `rtrv-map` command for MRC non applicable Load sharing modes.
- **GRP NAME**—Name of a group of point codes (broadcast list group name) to be notified of the subsystem status
- **SSO**—Subsystem Status Option. Subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.
- **WT**—Weight assigned to the PC
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.
- **MRNSET**—Alternate RI Mate MRN Set ID
- **MRNPC**—Alternate RI Mate point code

- **MAPSET REFCNT**—Count of GTT Translation table entries with XLAT=NONE that refer to the corresponding MAP set
- **MAPSETPCSSN REFCNT**—Count of entries from MRN, GSM MAP Screening, GSM MAP Opcode, GTT Translation and GTT Action tables that refer a MAP entry with a MAPSET/PC/SSN combination
- **MAPSETPC REFCNT**—Count of entries from MRN, GTT Translation, GSM MAP Screening, GSM MAP Opcode and Prepaid SMS Options tables that refer a MAP entry with a MAPSET/PC combination

Retrieve Measurements Schedule

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for OAM based measurements.

This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see *rtrv-measopts*).

Refer to the *Measurements Manual* for specific details on measurement reports.

Parameters

This command has no parameters.

Example

```
rtrv-meas-sched
```

Dependencies

None

Notes

None

Output

Output with measurement collection on.

```
rtrv-meas-sched
```

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = on
GTWYLSFLTR   = both
```

```

-----
SYSTOT-STP      = on
SYSTOT-TT      = off
SYSTOT-STPLAN  = off
COMP-LNKSET    = on
COMP-LINK      = on
GTWY-STP      = on
GTWY-LNKSET    = on
MTCD-STP      = on
MTCD-LINK      = on
MTCD-STPLAN    = on
MTCD-LNKSET    = on
;

```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

rtrv-meas-sched

```

rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT        = off
GTWYLSFLTR    = (both)
-----
SYSTOT-STP    = (off)
SYSTOT-TT    = (off)
SYSTOT-STPLAN = (off)
COMP-LNKSET   = (off)
COMP-LINK    = (off)
GTWY-STP     = (off)
GTWY-LNKSET  = (off)
MTCD-STP     = (on)
MTCD-LINK    = (on)
MTCD-STPLAN  = (on)
MTCD-LNKSET  = (on)
;

```

Legend

- **COLLECT**—Shows whether measurement collection is on or off.
- **GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:
 - *both*—Only gateway linksets are included in the report to the terminal and SEAS.
 - *stp*—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.
 - *seas*—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.
 - *none*—All defined linksets are included in the report to the terminal and SEAS.
- **SYSTOT-STP**—System total–STP measurement collection is on or off.
- **SYSTOT-TT**—System total–translation type measurement collection is on or off.
- **SYSTOT-STPLAN**—System total–STP LAN measurement collection is on or off.
- **COMP-LNKSET**—Component–linkset measurement collection is on or off.
- **COMP-LINK**—Component–link measurement collection is on or off.
- **GTWY-STP**—Gateway administration–STP measurement report is on or off.
- **GTWY-LNKSET**—Gateway administration–LNKSET measurement report is on or off.

- **MTCD-STP**—Maintenance daily–STP measurement collection is on or off.
- **MTCD-LINK**—Maintenance daily–link measurement collection is on or off.
- **MTCD-STPLAN**—Maintenance daily–STP LAN measurement collection is on or off.
- **MTCD-LNKSET**—Maintenance daily–LNKSET measurement report is on or off.

```

;

Legend

- **PLATFORMENABLE**—status of the Measurements Collection function
- **COLLECT15MIN**—status of the 15 Minute Measurements collection function
- **OAMHCMEAS**—Indicates the status of the Integrated Measurements collection function on an E5-OAM card
- **UNCHLINKLABEL**—status of the unchannelized link label for high-speed MTP2 links
- **CLLIBASEDNAME**—indicates whether the CLI-based file name option is turned on or off
- **SYSTOTSTP**—System Total measurements report for the entire STP
- **SYSTOTTT**—System Total report for Translation Type measurements
- **SYSTOTSTPLAN**—System Total report STP LAN measurements
- **SYSTOTIDPR**—System Total measurements report for the entire IDPR Measurements
- **SYSTOTSIP**—System Total measurements report for the entire SIP Measurements
- **COMPLINK**—Component measurements report for links
- **COMPLNKSET**—Component measurements report for link sets
- **COMPSCTPASOC**—Component measurements report for SCTP associations
- **COMPSCTPCARD**—Component measurements report for SCTP cards
- **COMPUA**—Component measurements report for M3UA and SUA application server/association pairs
- **GTWYORIGNI**—Gateway Administration measurements report per originating network (large network uniquely identified by NI only)
- **GTWYORIGNINC**—Gateway Administration measurements report per originating network (small network identified by NI-NC)
- **GTWYLSORIGNI**—Gateway Administration measurements report per link set and originating network
- **GTWYLSDESTNI**—Gateway Administration measurements report per link set and destination network

- **GTWYLSNISM**T—Gateway Administration measurements report per link set, per originating network, per ISUP message type
- **NMLINK**—Network Management measurements report for links
- **NMLNKSET**—Network Management measurements report for link sets
- **NMSTP**—Network Management measurements report for the entire STP
- **AVLINK**—Hourly Availability report for links
- **AVLSTPLAN**—Hourly Availability report for STP LAN
- **AVLDLINK**—Daily Availability report for links

rtrv-mrn

Retrieve Mated Relay Node

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE 5 ISS. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing feature is on and the Flexible GTT Load-Sharing feature is enabled, then use this command to retrieve MRN set information.

If the GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature is enabled, then use this command to display Alternate RI Mate information.

Parameters

Note: See *Point Code Formats and Conversion* for a detailed description of point code formats, rules for specification, and examples.

Note: Definitions for the feature options specified by the on parameter are located in the Notes section.

mrnset (optional)

MRN set ID.

Range:

1 - 3000, dflt

dflt —Default MRN set

on (optional)

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

Range:

refcnt

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*pca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

Post-GTT-translated point code.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383*

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Example

```
rtrv-mrn
rtrv-mrn:pc=1-1-2
rtrv-mrn:pcn=s-1-1-1-123-aa
rtrv-mrn:pci=1-55-1:mrnset=2
rtrv-mrn:pcn=1001:mrnset=df1t:on=refcnt
rtrv-mrn:pcn16=1-2-3:mrnset=df1t
```

Dependencies

A point code that is specified in the command must already exist in the MRN table.

The mrnset parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If any entries are provisioned in the SCCP-SERV table, then the maximum number of entries shown for the MRN table are reduced by that amount.

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MAPSET, MAPPC, and MAPSSN fields, is displayed for all MRN Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

on options

refcnt —displays the MRNSET and MRNSET/PC reference counts

Output

The NET column is shown only when an MRN set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

Legend

- **MRNSET**—MRN set ID
- **NET**—Mmated network type of the point code when an ITU MRN set contains both ITU-I and ITU-N point codes. The field can show I if the PC is an ITU-I point code or N if the PC is an ITU-N point code.
- **PC/PCI/PCN/PCN24/PCN16**—Point Code
- **RC**—Relative Cost
- **WT**—PC Weight
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within a RC group falls below the in-service threshold, that RC group is considered out-of-service, and traffic is routed to the next lowest RC group.
- **MAPSET**—Secondary mate MAP Set
- **MAPPCN**—Alternate RI Mate point code
- **MAPSSN**—Alternate RI Mate subsystem number
- **MRNSET REFCNT**—Count of GTA table entries with XLAT=NONE that refer to the corresponding MRN set
- **MRNSETPC REFCNT**—Count of entries from the MAP, GTT Translation, GTT Action, and Prepaid SMS Options tables that refer to the corresponding MRN entry with an MRNSET/PC combination

chg-netopts

rtrv-npp-as

Retrieve NPP Action Set(s)

Use this command to display a Numbering Plan Processor (NPP) Action Set (AS) entry.

Parameters

asn (optional)

Action set name. The name of the AS.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

mode (optional)

This parameter allows the command to display Service Action optional numerical and digit string data values.

Range:

full

Example

```

rtrv-npp-as
rtrv-npp-as:asn=asn6
rtrv-npp-as:mode=full

```

Dependencies

None

Output

Note: The `asn` or `mode=full` parameter must be specified before FA list information is displayed in the `rtrv-npp-as` output.

This example displays all AS entries:

rtrv-npp-as

```

Retrieve a NPP Service Rule Set

Use this command to display a Numbering Plan Processor (NPP) Service Rule Set entry.

Parameters

asn (optional)

Action set name.

Range:

ayyyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

fdl (optional)

Filter digit length. The number of digits on the incoming digit string that is filtered by the NPP.

Range:

*1 - 32, **

*—multiple lengths of digit strings can be filtered

fnai (optional)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

Range:

intl, natl, nai1, nai2, nai3, unkn

intl—filter messages with NAI=INTL

natl—filter messages with NAI=NATL

nai1—filter messages with NAI=NAI1

nai2—filter messages with NAI=NAI2

nai3—filter messages with NAI=NAI3

unkn—filter messages with NAI=UNKN

The *chg-npp-serv* command is used to assign values to the various FNAI classes.

fpx (optional)

Filter prefix. The prefix used to filter incoming digit strings.

Range:

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; Valid digits are ?, *, 0-9, a-f, A-F.

srvn (optional)

Service name.

Range:

nppt

Example

Display all NPP Service Rule Set table entries for a given service.

```
rtrv-npp-srs
```

Display NPP Service Rule Set table entries for a specified digit length.

```
rtrv-npp-srs:fdl=*
```

Display NPP Service Rule Set table entries for a specified filter prefix and filter digit length.

```
rtrv-npp-srs:fpfx=91:fdl=16
```

Dependencies

The value specified for the fpfx parameter cannot have a ? as the final character.

Output

```
rtrv-npp-srs
```

```

rtrv-obit

Retrieve Obituary Report

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

Parameters

loc (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

Range:

1113, 1115

mode (optional)

Display mode

Range:

c

Continuous mode; shows obituaries already logged and new obituaries as they occur.

m

Manual mode; shows obituaries on demand only, when this command is entered.

Default:

c

num (optional)

The number of obituaries to display.

Range:

1 - 150

Default:

150

Example

```
rtrv-obit:loc=1115:num=2
```

Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the mode parameter is specified without the num parameter, the entire log is displayed.

Only one `rtrv-obit` or `rtrv-trbl` command at a time can be in progress throughout the entire system.

The card location specified by the `loc` parameter must be either 1113 or 1115.

If the `loc` parameter specifies the card that is running the standby OAM, that card must be available.

The `num` parameter value must be between 1 - 150.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command when the command is entered for the active OAM. See `canc-cmd` for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the `mode=m` parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which includes MUX and HC-MIM cards) contains significantly more information than an obituary from an X86-based processor card. The data in an IXP obituary is spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

Output

This example shows output for two obituaries from an x86-based card:

```
rtrv-obit:loc=1115:num=2
```

rtrv-pct

Display Point Code and CIC Translation entries

Use this command to display Point Code and CIC Translations.

Parameters

ecice (optional)

The end of the Emulated Circuit Identification Code range.

Range:

0 - 4294967295, *

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

Default:

*

ecics (optional)

The start of the Emulated Circuit Identification Code range.

Range:

0 - 4294967295, *

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

Default:

*

epc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

epca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

epci (optional)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

epcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

filtpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

filtpca

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-*-** is valid if *ni =006-255*.

The point code *000-000-000* is not a valid point code.

filtpci (optional)

ITU international destination point code with subfields *zone-area-id*.

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

filtpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

*16363, aa-zz, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

rcice (optional)

The end of the Real Circuit Identification Code range.

Range:

*0 - 4294967295, **

- *0-4095* —ITU TUP/ISUP
- *0-16383* —ANSI ISUP

- 0-4294967295 —ANSI Q.BICC

Default:

*

rcics (optional)

The start of the Real Circuit Identification Code range.

Range:

0 - 4294967295, *

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

Default:

*

realpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

Range:**realpci (optional)**

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

realpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

relcause (optional)

Release Cause

Range:

0 - 127

Default:

0

si (optional)

Service Indicator

Range:

0

NM

3

SCCP

5

ISUP

4

TUP

13

ANSI Q. BICC

Default:

ssn (optional)

SCCP Subsystem number

Range:

*0 - 255, **

Default:

*

Example

```
rtrv-pct:epc=1-1-1
```

```
rtrv-pct:realpc=2-2-2
```

Dependencies

If the `ssn` or `ecics` parameter is specified, then the `si` parameter must be specified.

A full point code must be specified as the value for the `realpc/realpca/realpci/realpcn` and `epc/epca/epci/epcn` parameters.

The value specified for the `ecice/rcice` parameter must be equal to or greater than the value specified for the `ecics/rcics` parameter, respectively.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters must have the same domain.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must have at least one route for each value defined in the Route table.

If a groupcode is specified then the values specified for the `realpc`, `filtpc`, and `epc` parameters must have the same group code.

A spare point code cannot be specified as a value for the `epci/epcn`, `filtpci/filtpcn`, and `realpci/realpcn` parameters.

The `ecics` or `rcics` parameter must be specified before the `relcause` parameter can be specified.

The `si=3` parameter must be specified before the `ssn` parameter can be specified.

If the `ecice` or `rcice` parameter is specified, then the `ecics` or `rcics` parameter must be specified, respectively.

If the `ecics`, `ecice`, and `rcics` parameters are specified, then the `rcice` parameter must be specified.

A value of 4, 5, or 13 must be specified for the `si` parameter before the `ecice/ecics` and `rcice/rcics` parameters can be specified.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP point code.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP capability point code.

The `epc/epca/epci/epcn` or `realpc/realpca/realpci/realpcn` parameter must be specified if any other optional parameter is specified.

The values specified for the `ecics/ecice` and `rcics/rcice` parameters must be within the range specified by the parameter definition.

The difference between the values specified for the `ecice` and `ecics` parameters must be equal to the difference between the values specified for the `rcice` and `rcics` parameters.

A value of 5 or 13 must be specified for the `si` parameter before the `relcause` parameters can be specified.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must already exist in the Route table.

The `ssn` and `cic` parameters cannot be specified together in the command.

If the `ecics`, `rcics`, and `rcice` parameters are specified, then the `ecice` parameter must be specified.

If the same value is specified for the `epc` and `realpc` parameters, then the values specified for the `ecics/ecice` and `rcics/rcice` parameters cannot indicate the same range.

Only one of the `filtpc/filtpca/filtpci/filtpcn` parameters can be specified in the command.

The value specified for the `epc/epci/epcn` parameter cannot be the same as a secondary point code.

Output

rtrv-pct

```

rtrv-ppsopts

Retrieve Prepaid SMS Options

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

Parameters

ppt (optional)

Prepaid portability type. An IN platform.

Range:

1 - 32

Example

```
rtrv-ppsopts
rtrv-ppsopts:ppt=2
```

Dependencies

The Prepaid SMS Intercept Ph1, IDP A-Party Routing, or IDP Service Key Routing feature must be enabled and turned on before this command can be entered.

The Prepaid SMS Options Table must be available.

Output

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.

This example displays Prepaid SMS options for a specific Prepaid Type:

```
rtrv-ppsopts:ppt=1
```

```
tekelecstp 08-12-17 15:07:01 EST EAGLE 40.1.0

rtrv-rte

Retrieve Route

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

Parameters

Note: See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cli (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default:

No value given

dpc (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-**-** is valid if *ni=006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmi* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix*

subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps*, 0-16383, *aa-zz*, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (

) can be specified either for the node or for the group code, but not both.

prefix—s-, *p-*, *ps-*

nnnnn—0-16383, *

gc—aa-zz, *

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or **-*-** when the point code includes a group code.

dpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

lsn (optional)

Linkset name

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all

mode (optional)

The method used to display the output report.

Range:

full

pcst (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

Range:

none

Display all point codes that do not have subtype prefixes

s

Display only spare point codes

p

Display only private point codes

ps

Display only private and spare point codes

pctype (optional)

Point code domain. This parameter displays the point codes of the specified domain type.

Range:

ansi

itui

itun

itun24

Example

```

rtrv-rte
rtrv-rte:dpc=240-012-004:lsn=ls000001
rtrv-rte:clli=dp1:lsn=ls000001
rtrv-rte:dpc=140-012-008
rtrv-rte:clli=dp1rtrv-rte
rtrv-rte:dpcn=3-15-15-15-fr
rtrv-rte:lsn=elm3itun
rtrv-rte:dpcn24=10-100-14
rtrv-rte:pcst=s
rtrv-rte:pcst=none
rtrv-rte:pctype=ansi
rtrv-rte:pctype=itun24:pcst=none
rtrv-rte:dpc=1-1-**
rtrv-rte:dpc=1-1-***
rtrv-rte:dpc=1-**-*
rtrv-rte:dpc=1-***-*
rtrv-rte:dpc=1-***-*:lsn=ab64
rtrv-rte:dpc=1-***-*:lsn=xx64
rtrv-rte:dpcn=1000-*
rtrv-rte:dpcn=1000-*:lsn=dpcn64
rtrv-rte:dpcn=p-*-aa
rtrv-rte:dpcn=s-9000-*
rtrv-rte:pctype=itun16:pcst=none

```

Dependencies

The value of the dcp/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must exist in the Destination Point Code table.

The value specified for the lsn parameter must exist in the routeset of the destination if the dpc parameter is specified.

If the dpcn parameter is specified, its format must match the format that was assigned with the `chg-stpopts` command `npcfnti` parameter.

If the pctype parameter has a value of *ansi* or *itun24*, then the pcst parameter cannot have a value of *s* or *ps*.

The `pctype` and `pcst` parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, `clli`, `msar=only`, and `ncai` parameters.

When using network routing, if the destination point code has a value of `*` in the `nc` field, the `ncm` field must also be `*` (for example, `dpc=21-*-*`).

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be a valid point code.

If the `clli` parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The database must be consistent.

The value specified for the `lsn` parameter must already be assigned to the specified routeset.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (`s-`) and the private and spare point code subtype prefix (`ps-`). All of the point code types support the private (internal) point code subtype prefix (`p-`).

Asterisks in ANSI Point Codes

Two asterisks in the `ncm` subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, `20-2-***`). This does not include the specified cluster point code (for example, `20-2-*`).

Three asterisks in the `ncm` subfield of a cluster point code (for example, `20-2-***`) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified and the `dpc/dpca` parameter `ncm` subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified `dpc/dpca` parameter subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (`*`) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, `10101-*`).
- An asterisk (`*`) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, `*-ab`).

When the ITUDUPPC feature is on and the STP flexible point code option (`npcfmti`) is used to change the ITU-N point format to four members (`m1-m2-m3-m4-gc`),

- An asterisk (`*`) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, `15`).
- An asterisk (`*`) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, `*`, `*-15-*-*-ab` is not valid).

Output

In these command output examples, the point code prefixes *s-*, *p-*, and *ps-* indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

Abbreviated output is indicated by 3 vertical dots as shown:

.
.

.

.

This example displays output when the Route table is provisioned. The example displays abbreviated output.

rtrv-rte

```

tekelecstp 10-10-15 14:52:32 EST EAGLE 43.0.0
rtrv-rte

;

```

This example displays the output when the Route table is empty:

```
rtrv-rte
```

```

tekelecstp 08-01-01 12:31:35 EST EAGLE 38.0.0
rtrv-rte
Command entered at terminal #4.

No routes meeting the requested criteria were found
;

```

This example retrieves a route by linkset name:

```
rtrv-rte:lsn=e2e1
```

```

eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
rtrv-rte:lsn=e2e1
Command entered at terminal #4.
Extended Processing Time may be Required

LSN          DPCA          RC
e2e1         001-001-000  10

```

```

                                001-101-001  10
                                004-101-001  20
