This chapter provides a brief description of the G-Port feature of the Oracle Communications EAGLE. The chapter also includes the scope, audience, and organization of the manual; how to find related publications; and how to contact Oracle for assistance.

Overview

This manual provides an overview of the GSM Mobile Number Portability (G-Port) feature of the Oracle Communications EAGLE. The G-Port feature implements Mobile Number Portability for GSM networks according to ETSI GSM 03.66. In response to governmental mandates for telecommunication networks, this feature focuses on service provider number portability on GSM networks.

G-Port minimizes the challenges for GSM network operators while enabling them to meet regulatory obligations. G-Port supports the Signaling Relay Function (SRF) for direct and indirect routing. SRF-based Mobile Number Portability (MNP) processing examines MAP messages for ported numbers. For call-related messages, G-Port acts as an NP HLR for exported number by responding with a MAP SRI message; G-Port performs a message relay function for calls to imported numbers and non-call related messages.

The G-Port feature allows subscribers to be moved easily from one Home Location Register (HLR) to another. The G-Port feature applies to ANSI, ITU-I (international), and ITU-N (national) networks.

Scope and Audience

This manual is intended for anyone responsible for installing, maintaining, and using the G-Port feature of Oracle Communications EAGLE. Users of this manual and the others in the EAGLE family of documents must have a working knowledge of telecommunications and network installations.

Documentation Admonishments

Admonishments are icons and text throughout this manual that alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

Table 1: Admonishments

Icon	Description
 DANGER	Danger: (This icon and text indicate the possibility of <i>personal injury</i> .)
 WARNING	Warning: (This icon and text indicate the possibility of <i>equipment damage</i> .)

Icon	Description
 CAUTION	Caution: (This icon and text indicate the possibility of <i>service interruption</i> .)
 TOPPLE	Topple: (This icon and text indicate the possibility of <i>personal injury and equipment damage</i> .)

Manual Organization

This document is organized into the following chapters:

- [Introduction](#) contains general information about the G-Port documentation, the organization of this manual, and how to request technical assistance.
- [Feature Description](#) provides a description of the G-Port feature and related features, including network perspectives, assumptions and limitations, database overview, Service Module card provisioning and reloading, and G-Port protocol.
- [Commands](#) describes the commands that support the G-Port and related features.
- [Feature Configuration](#) describes how to activate the G-Port feature and related features.
- [Measurements](#) describes the measurements information available for G-Port.
- [Maintenance](#) describes G-Port maintenance information including Oracle Communications EAGLE Application Processor (EPAP) status and alarms, hardware verification messages, system status reports and commands, code and application data loading, and alarms.

My Oracle Support (MOS)

MOS (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support (CAS) can assist you with MOS registration.

Call the CAS main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select **2** for New Service Request
2. Select **3** for Hardware, Networking and Solaris Operating System Support
3. Select one of the following options:
 - For Technical issues such as creating a new Service Request (SR), Select **1**
 - For Non-technical issues such as registration or assistance with MOS, Select **2**

You will be connected to a live agent who can assist you with MOS registration and opening a support ticket.

MOS is available 24 hours a day, 7 days a week, 365 days a year.

Emergency Response

In the event of a critical service situation, emergency response is offered by the Customer Access Support (CAS) main number at 1-800-223-1711 (toll-free in the US), or by calling the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem with the installed equipment that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical situations affect service and/or system operation resulting in one or several of these situations:

- A total system failure that results in loss of all transaction processing capability
- Significant reduction in system capacity or traffic handling capability
- Loss of the system's ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions
- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity/traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with Oracle.

Related Publications

For information about additional publications that are related to this document, refer to the *Related Publications Reference* document, which is published as a separate document on the Oracle Help Center site. See [Locate Product Documentation on the Oracle Help Center Site](#) for more information.

Customer Training

Oracle University offers training for service providers and enterprises. Visit our web site to view, and register for, Oracle Communications training:

<http://education.oracle.com/communication>

To obtain contact phone numbers for countries or regions, visit the Oracle University Education web site:

www.oracle.com/education/contacts

Locate Product Documentation on the Oracle Help Center Site

Oracle Communications customer documentation is available on the web at the Oracle Help Center (OHC) site, <http://docs.oracle.com>. You do not have to register to access these documents. Viewing these files requires Adobe Acrobat Reader, which can be downloaded at <http://www.adobe.com>.

1. Access the Oracle Help Center site at <http://docs.oracle.com>.
2. Click **Industries**.
3. Under the Oracle Communications subheading, click the **Oracle Communications documentation** link.
The Communications Documentation page appears. Most products covered by these documentation sets will appear under the headings "Network Session Delivery and Control Infrastructure" or "Platforms."
4. Click on your Product and then the Release Number.
A list of the entire documentation set for the selected product and release appears.
5. To download a file to your location, right-click the **PDF** link, select **Save target as** (or similar command based on your browser), and save to a local folder.

This chapter describes the G-Port feature and related features which include:

- MT-Based GSM SMS NP
- MT-Based GSM MMS NP
- G-Port SRI Query for Prepaid
- GSM MAP SRI Redirect to Serving HLR

Introduction

Throughout the world, an increasing number of governments are mandating that telecommunications network operators support service provider number portability. These mandates are intended to promote competition among service providers and apply to both wireline and mobile phone networks. The GSM Mobile Number Portability (G-Port) feature is focused on service provider portability in GSM (Global System for Mobile Communications) networks.

Service provider portability allows a consumer to change service providers while retaining the same phone number. While consumers benefit from number portability, the implementation can present challenges for network operators. G-Port minimizes the challenges for GSM network operators, while enabling them to efficiently meet their regulatory obligations.

G-Port implements Mobile Number Portability for GSM networks according to the ETSI GSM 03.66 standard. The focus is on service provider portability among GSM networks in a defined portability cluster, usually a country. With service provider portability, subscribers can change operators while retaining their MSISDNs (Mobile Station international ISDN number). The MSISDN is the number dialed by a caller trying to reach the subscriber. The IMSI (International Mobile Station Identifier) number is not portable. The IMSI identifies the SIM (Subscriber Identity Module) card, which plugs in as a module to the GSM handset.

The G-Port feature is based on the EAGLE platform, and is deployed in a node that is also performing the STP function. G-Port uses the Real Time Database (RTDB) to derive the portability status of subscribers.

MNP Circular Route Prevention

The MNP Circular Route Prevention (MNPCRCP) feature detects circular routing caused by incorrect information in one or more of the network number portability databases. For example, a subscriber may have ported from network A to network B. Network A has the correct routing information, indicating the subscriber now belongs to network B. However, network B may have incorrect routing information, indicating that the subscriber still belongs to network A. In this case, network A routes the call to network B, based on its portability data, but network B routes the call back to network A, based on its incorrect data. The result is a circular route. The MNPCRCP feature provides logic to prevent the circular routing from occurring.

The MNP Circular Route Prevention feature (MNPCRCP) is enhanced to allow Circular Route Prevention based on the Translation Type (TT) of the SCCP CdPA to be performed for SRI messages when a Home Routing Number (HomeRN) is not present. For the Circular Route Prevention on Translation Type processing to be performed, the `crptt` parameter of the `chg-gsmopts` command must be set to a value between 0 and 255. If the `crptt` parameter of the `chg-gsmopts` command is set to the default value of `none`, then no Circular Route Prevention on Translation Type processing is performed. The MNP Circular Route Prevention feature cannot be turned off if the `crptt` parameter is provisioned to any value other than `none`. If a message is processed for Circular Route Prevention based on HomeRN, then Circular Route Prevention on Translation Type processing does not occur.

SRI messages must meet these criteria to be eligible for Circular Route Prevention on Translation Type:

- The message is selected for G-Port or IS41 GSM Migration processing.
- The message is not identified as G-Port SRI Query for Prepaid.
- The message is not MTP-routed. (The CdPA is Route-on-GT.)

- The translation type of the SCCP CdPA matches the provisioned translation type (`crptt`).
- The ITU TCAP Package type is ITU Begin.
- The OpCode is an SRI (hexadecimal 16).
- The Optimal Routing Interrogation Parameter (Tag = 0x04) is not present.
- The MSISDN is not assigned to the subscriber's network provider.

DigitAction Expansion

The DigitAction Expansion feature provides more flexibility to formulate the SCCP Called Party Address - Global Title Address (GTA) field of the MAP messages relayed by G-Port. Without DigitAction Expansion, G-Port supports four options (none, insert, prefix, and replace) to overwrite the SCCP CdPA GTA field. With DigitAction Expansion, four additional options (`delcc`, `delccprefix`, `spare1`, and `spare2`) are included to overwrite the SCCP CdPA GTA field.

DigitAction Expansion is provisioned via the PDBI Enter Network Entity or Update Network Entity commands. DigitAction Expansion can also be modified via the Add an NE and Update an NE GUI screens.

Digit Action DELCCPREFIX

The Digit Action to delete country code if present and prefix database entity feature allows the DELCCPREFIX Digit Action to be applied to the Called Party Global Title Address (CdPA GTA) when the GTA has a National format, as well as when the GTA has an International format. The DELCCPREFIX option in the SCCPOPTS table specifies how the DELCCPREFIX digit action is applied to a Called Party Global Title Address (CdPA GTA).

- When the SCCPOPTS:DELCCPREFIX option is set to `PFXWCC`, the DELCCPREFIX digit action is applied to the CdPA GTA only when the address has a International format. The Country Code is deleted and the GTA is prefixed with the Entity ID.
- When the SCCPOPTS:DELCCPREFIX option is set to `PFX4ALL`, the DELCCPREFIX digit action is applied to the CdPA GTA in all cases. For an International format, the Country Code is deleted and the GTA is prefixed with the Entity ID. For a National format, the GTA is prefixed with the Entity ID.

The `chg-sccpopts` command is used to specify the `delccprefix` parameter value to configure the DELCCPREFIX Digit Action functionality.

G-Port SCCP Service Re-Route

The G-Port SCCP Service Re-Route feature is used when the G-Port subscriber database is incoherent with MPS data and the GTT data is valid. The G-Port SCCP Service Re-Route feature provides the capability to re-route the traffic from the EAGLE to other G-Port subscriber database nodes and inform the originating nodes to re-route the G-Port service related traffic to other G-Port service nodes.

The G-Port SCCP Service Re-Route feature is designed to handle and control re-routing of G-Port traffic from an affected node to alternate nodes within an operators network. This feature is an optional feature and does not affect the normal G-Port functionality. This feature also provides the option to mark G-Port offline to perform a controlled re-routing during this state.

Multiple Country Code

The Multiple Country Code (MULTCC) feature supports up to 10 MULTCCs for customers having one MNP node servicing several countries, or areas with differing country codes. The MULTCCs are not used for conditioning of non-International numbers to International format for database lookup. The MULTCCs are used for the construction of the Mobile Station Roaming Number (MSRN) parameter in the case of a Send Routing Information acknowledgement (SRI Ack) message from G-Port, and in certain cases for the formulation of the SCCP CdPA. The DEFCC parameter in STPOPTS is used for conditioning of numbers to International format when necessary, and also for constructing the MSRN and SCCP CdPA parameters in addition to a MULTCC list. The MULTCC list is optional. If no values are provisioned, G-Port uses the DEFCC to process messages. If values are provisioned, G-Port automatically uses both the DEFCC and the MULTCC to process messages. The `chg-gsmopts` command along with the MULTCC and NMULTCC parameters are used to provision Multiple Country Code list entries.

MSISDN Truncation Support for G-Port

The MSISDN Truncation Support for G-Port feature is an optional feature that allows an operator to specify a certain number of digits to be deleted from the beginning of the National MSISDN (MSISDN without Country Code) prior to formulating the MSRN parameter of the SRI Ack message. This feature only changes the behavior of the encoding of the MAP MSRN parameter in an SRI Ack message formulated by the EAGLE. It does not affect the encoding of any other parameters or any other messages processed by G-Port. The International MSISDN is 12 digits long, and the RN is 5 digits long. So when the RN is added to form the MSRN parameter, it will exceed 15 digits in length. Some carriers require MSISDN digits to be truncated when formulating the MSRN parameter of SRI Ack message in G-Port to maintain a maximum length of 15 digits. This feature works in conjunction with the MULTCC Support feature. The DefCC and MULTCC table are used to determine which digits are the CC and which digits are the National MSISDN. If a match is not found on the leading digits of the International MSISDN, then the truncation is not performed and standard G-Port processing is followed. The `chg-gsmopts` command along with the MISDNTRUNC parameter is used to set-up the MSISDN Truncation Support feature.

Mobile-Originated Based GSM SMS Number Portability

The MO-Based GSM SMS NP feature provides network information to the Short Message Service Center (SMSC) for subscribers using the GSM network. This information allows the SMSC to select a protocol to deliver SMS messages to the called party. For more information about the MO-Based GSM SMS NP feature, refer to *MO SMS User's Guide*.

Mobile-Terminated Based GSM SMS Number Portability

The Mobile Terminated (MT)-Based GSM SMS NP feature allows wireless operators to route short message service (SMS) messages destined to mobile subscribers within a number portability (NP) environment. If the MT-Based GSM SMS NP feature is not enabled and turned on, then messages are processed by the G-Port feature.

In general, there are two kinds of messages of concern to number portability: call related and non-call related. The call-related messages query the HLR in real time for delivering the call to the subscriber. The G-port feature handles these.

Non-call related messaging involves the Short Message Service Center (SMSC) querying the HLR for the destination subscriber for SMS delivery. For SMS, these query messages are called SRI_SM. The HLR responds to these messages with routing information that can be used by the querying node

(SMSC) to deliver the SMS message. In this feature, the EAGLE intercepts SRI_SM messages destined to the HLR and replies with routing information for out-of-network destination subscribers.

The MT-Based GSM SMS NP feature intercepts SRI_SM messages and replies with routing information for out-of-network destination subscribers using the following process:

1. An SRI_SM message from the SMSC is intercepted by the EAGLE before the message reaches the home location register (HLR).
2. The message destination address (SCCP Called Party GTA), is extracted, the digits are conditioned, and lookup is performed in the Real Time Database (RTDB).
3. If the destination address/subscribers belongs to a foreign network, then a reply message is sent to the SMSC with routing information. If the destination address/subscribers belongs to a local network, then the SRI_SM message is relayed to the HLR according to the options set for normal G-Port processing.

The feature provides configurable options for controlling processing of SRI_SM messages and the content of the response:

- Selecting the SMSC response message type and digit format
- Specifying when an RTDB lookup is considered to be successful
- Specifying the format of digits encoded in the response message.

Mobile-Terminated Based GSM MMS Number Portability

The MT-Based GSM MMS NP feature provides routing information to the Multimedia Message Service Center (MMSC) for subscribers using the GSM network. This information can be used by the MMSC to route the MMS messages to the called party.

Note: The MT-Based GSM MMS NP feature can be used only in conjunction with the MT-Based GSM SMS NP feature.

The MT-Based GSM MMS NP feature intercepts SRI_SM messages and replies with routing information for out-of-network destination subscribers using the following process:

1. An SRI_SM message from the MMSC is intercepted by the EAGLE before the message reaches the home location register (HLR).
2. The message destination address (SCCP Called Party GTA), is extracted, the digits are conditioned, and lookup is performed in the RTDB.
3. If the destination address/subscribers belongs to a foreign network, then a reply message is sent to the MMSC with routing information. If the destination address/subscribers belongs to a local network, then the SRI_SM message is relayed to the HLR according to the options set for normal G-Port processing.

The feature provides the following configurable options for controlling processing of SRI_SM messages and the content of the response:

- Selecting the MMSC response message type and digit format
- Specifying when an RTDB lookup is considered to be successful
- Specifying the format of digits encoded in the response message.

Routing Options

The ETSI standards for SRF-based MNP define two routing options, direct routing and indirect routing. G-Port supports both options:

- With direct routing, the network where the call is originated is responsible for determining whether the called party has ported and routing the call to the new subscription network.
- With indirect routing, this is the responsibility of the network that originally owned the number.

Dialed Number Lengths

Number lengths vary between countries and may even vary within a country. As a result, the G-Port subscriber database structure supports numbers of varying length in a flexible way without necessitating software modifications. A maximum number length of 15 digits for ported numbers is supported. This length is based on the maximum length for MSISDN numbers as defined in the ETSI GSM 03.03 standard.

SRF vs INAP Mobile Number Portability

The ETSI standards are defined so that GSM carriers can choose to implement either Signaling Relay Function (SRF)-based (using MAP protocol) MNP or IN-based (using INAP protocol) MNP. G-Port supports only the SRF-based solution for MNP. (INAP-based MNP processing is similar to wireline networks; this function is supported by the INP feature.)

SRF-based MNP processing involves intercepting existing MAP messages to check for ported numbers. For call-related messages, G-Port acts as an NP HLR in the case where the number has been exported, by responding to the switch with a MAP SRI Ack message. For calls to imported numbers and non-call related messages, G-Port performs message relay.

G-Port SRI Query for Prepaid

The G-Port SRI Query for Prepaid feature allows the EAGLE to provide portability information to a Service Control Point (SCP) database. This information enables the database to determine the network used by a called subscriber. The G-Port SRI Query for Prepaid feature enables the following Message Signal Unit (MSU) values to be provisioned in the EAGLE GSERV table:

- translation type (TT)—The TT of the called party (CdPA)
- originating point code (OPC)—The OPC from the message transfer part (MTP) layer
- global title address (GTA)—The GTA of the calling party (CgPA)

These values are used to determine whether an SRI should receive G-Port SRI Query for Prepaid service or normal G-Port SRI service.

Service Portability (S-Port) support for the G-Port SRI Query for Prepaid feature allows subscribers to retain their same subscriber numbers after moving between different network technologies (example: IS41 and GSM) within the same operator. Service Portability applies to only own-network subscribers.

GSM MAP SRI Redirect to Serving HLR

The GSM MAP SRI Redirect to Serving HLR feature provides the capability to resolve the incompatibility introduced by the proprietary implementation of the GSM MAP SRI message. This feature is an extension to the G-Port protocol. The GSM MAP SRI Redirect to Serving HLR feature is compatible with other G-Port enhancement features.

Additional Subscriber Data Support

The G-Port feature is enhanced to support new Mobile Station Routing Number (MSRN) formatting options that use Additional Subscriber Data (ASD). ASD information is inserted into the outgoing SRI

Ack messages. If the GSMOPTS:MSRNDIG digit formatting option specifies the use of ASD information and a successful database lookup returns ASD, then the ASD is encoded into the outgoing message and the existing behavior for encoding messages for G-Port is followed.

ROP Support

The G-Port feature allows Small Geographic Areas (CNLs) to be grouped into Large Geographic Areas (ROPs). This grouping simplifies the routing and allows a call to be delivered as close to the interconnection destination as possible. ROP information is stored in the Generic Routing Number (GRN) field. Both CNL and ROP information can be provisioned for a single subscriber entry; however, only one of the CNL or ROP fields can be selected for the outgoing message.

The G-Port SRI Query for Prepaid, SRI Redirect, IS41 GSM Migration (IGM), AINPQ, INP, and ATINP features also support ROP.

Include Optional CUG Parameter in SRI Ack Messages

The Include Optional CUG Parameter in SRI Ack Messages functionality allows an existing Closed User Group-CheckInfo (CUG-CheckInfo) parameter in an incoming SRI message to be included in the outgoing SRI Ack message.

The Include Optional CUG Parameter in SRI Ack Messages functionality is controlled by the `encodecug` option of the `chg-gsmopts` command `off` and `on` parameters. The `encodecug` option of the `chg-gsmopts off/on` parameter can be changed only if the G-Port or IGM feature is enabled.

The CUG-CheckInfo parameter in an incoming SRI message is copied in the original sequence to the outgoing SRI Ack message when these conditions are met:

- The `encodecug` option of the `chg-gsmopts` command is set to `on`.
- The CUG-CheckInfo parameter is present in an incoming SRI message.
- The CUG-CheckInfo parameter in an incoming SRI message is encoded in definite length format that is less than or equal to 30 bytes.

If the three conditions described above are met, the original CUG-CheckInfo sequence from the incoming SRI message is copied into the SRI Ack message. If encoded in the SRI Ack message, the CUG-CheckInfo parameter is located after the MSRN (Tag = 0x04) and before the MSISDN (Tag = 0x8C) or NPS parameter (Tag = 0x8D), if either MSISDN or NPS parameter is present. The CUG-CheckInfo parameter in an SRI Ack message uses Tag = 0xA3.

If the CUG-CheckInfo parameter is greater than 30 bytes and all other conditions for encoding are met, then only the CUG-Interlock and CUG-OutgoingAccess parameters are copied from an incoming SRI message to the outgoing SRI Ack message. The ExtensionContainer is omitted.

When the `encodecug` option is set to `off`, the CUG-CheckInfo parameter is not encoded in the SRI Ack message.

If the `encodecug` option is set to `on` but the CUG-CheckInfo parameter in an incoming SRI message uses an indefinite length format, the CUG-CheckInfo parameter is not encoded in the SRI Ack message.

Route SRI_SM and ReportSMSDeliveryStatus for Non-local or Ported-out Subscribers using GTT

The Route SRI_SM and ReportSMSDeliveryStatus for Non-local or Ported-out Subscribers using GTT functionality modifies SRI_SM and ReportSMSDeliveryStatus messages to allow routing of the message to an alternate network using Global Title Translation (GTT). This functionality allows processing to

occur when the Directory Number (DN) in the database is associated with both the Service Point (SP) and Generic Routing Number (GRN) network elements and the GRN is not present in the EAGLE HomeRN table, or when the subscriber is ported out and associated with the Routing Number (RN).

The message is altered by changing the SCCP Called Party Address (CdPA) to the Country Code (CC) + GRN + DN or to CC + RN + DN. This alteration allows GTT to redirect the query to an alternate network. If a CC is not located in the DN, then the SCCP CdPA is converted to a GRN + DN or RN + DN format.

This conversion is performed only on ITU TCAP Begin MSUs with Op Code of SRI_SM or ReportSMSDeliveryStatus delivered to the GPort or MNP service selector for processing. If the MT-Based GSM SMS NP feature or the IS41 GSM Migration (IGM) feature generates a response for the SRI_SM message, then this functionality is not applicable.

The Route SRI_SM and ReportSMSDeliveryStatus for Non-local or Ported-out Subscribers using GTT functionality is controlled by the `srismgttrtg` option of the `chg-gsmopts` command `off` and `on` parameters. The `srismgttrtg` option of the `chg-gsmopts off/on` parameter can be changed only if the G-Port or IGM feature is enabled.

Option to Suppress NumberPortabilityStatusIndicator in SRI Ack

The Option to Suppress NumberPortabilityStatusIndicator in SRI Ack functionality allows the Number Portability Status Indicator (NPSI) to be omitted from all SRI Ack messages.

The Option to Suppress NumberPortabilityStatusIndicator in SRI Ack functionality is controlled by the `encodenps` option of the `chg-gsmopts` command `off` and `on` parameters. The `encodenps` option of the `chg-gsmopts off/on` parameter can be changed only if the G-Port or IGM feature is enabled. The default setting of the `encodenps` option is `on`.

The NumberPortabilityStatusIndicator parameter is encoded in an SRI Ack message when these conditions are met:

- The `encodenps` option of the `chg-gsmopts` command is set to `on`.
- SRI is considered MAP Phase 2+.
- DN Portability Type is 0, 1, 2, or 36. (Portability Type = 36 is encoded as Portability Type = 0.)

Note: MAP Phase is set based on the dialog portion, unless the dialog portion does identify. If the dialog portion does not identify, then the MAP Phase is based on `GSMOPTS:DEFMAPVR`.

The NumberPortabilityStatusIndicator parameter is not encoded in any SRI Ack message if the `encodenps` option of the `chg-gsmopts` command is set to `off`.

G-Port Considerations

- G-Port can be turned on, but cannot be turned off.
- The G-Port, A-Port, IGM, G-Flex C7 Relay, INP, and AINPQ features can run concurrently on an EAGLE node.
- When G-Port and G-Flex run on the same node, interactions between the two features must be addressed.
- G-Port and North American LNP are mutually exclusive on an EAGLE node, unless the Dual ExAP Configuration feature is enabled.

- G-Port SCCP Service Re-Route Capability is not supported for the Prepaid Short Message Service Intercept feature.
- G-Port, A-Port, or IGM must be turned on before the MNP Circular Route Prevention feature can be turned on.

G-Port Protocol

Main Functions

G-Port and MNPCRCP provide these main functions:

Message Discrimination

Because the G-Port feature provides translation of ported numbers, the feature provides a method to identify which messages should receive G-Port or GTT. This task of identification is provided by a service selector table in which the user can define G-Port service for a combination of selectors. If a selector match is not found then, G-Port falls through to GTT.

RN Prefix Deletion - SCCP

The decoded SCCP CdPA digits can have a RN concatenated with the MSISDN number in two forms:

- RN + DN
- CC+RN+DN

When the SNAI is either RNIDN, RNNDN, or RNSDN, G-Port compares the decoded MSISDN number with the list of provisioned home RN prefixes defined in the RTDB. If a match is found, G-Port removes the RN digits from the number.

Number conditioning, if required, is performed after deleting the RN.

When the SNAI is CCRNDN, G-Port first compares the CC to the DEFCC/MULTCC list:

- If CC is not equal to the DEFCC/MULTCC, then no prefix deletion is performed and G-Port processing continues.
- If CC=DEFCC/MULTCC then, G-Port compares the digits after CC with the list of provisioned Home RN prefixes that are defined in the RTDB. If a match is found, then G-Port strips off the RN digits from the number. If no match is found, the no-prefix deletion is performed and G-Port processing continues.

RN Prefix Deletion - TCAP

The decoded MAPMSISDN digits can have a RN concatenated with the MSISDN number in two forms:

- RN + DN
- CC+RN+DN

The MAP NAI is used to determine the type: International, National or Subscriber. If MNPCR is OFF, RN prefix deletion is not attempted. If MNPCR is ON, then RN prefix deletion is attempted on all MSISDNs. If the MAPNAI indicates International, then a check is performed for the DEFCC/MULTCC prefix on the MSISDN. If DEFCC/MULTCC is detected, then HomeRN deletion is attempted using the CC+RN+DN format. All other MSISDNs will use the RN+DN format. G-Port compares the decoded MSISDN number with the list of provisioned home RN prefixes defined in the RTDB. If a match is found, the G-Port strips off the RN digits from the number.

Number conditioning, if required, is performed after deleting the RN.

If CC+RN+DN search is performed, G-Port compares the digits after CC with the list of provisioned home RN prefixes defined in the RTDB. If a match is found, G-Port strips off the RN digits from the number. If no match is found, then no prefix deletion is performed and G-Port processing continues.

Number Conditioning

The RTDB stores international MSISDNs only. The received MSISDN number or SCCP CdPA digits may need to be converted to an international number to perform a database lookup.

When G-Port is required to be performed on a message and the number is not international (that is, the NAI of MSISDN number is "National (Significant) Number" or "Subscriber Number", or the SNAI is NATL or SUB or RNNNDN or RNLNDN), the National/Local to International number is triggered.

For a National (Significant) Number, the received CdPA/MAP MSISDN digits are prepended with the default country code; for a Subscriber number, the CdPA/MAP MSISDN digits are prepended with the default country code and the default network code.

Database Lookup

G-Port performs an RTDB lookup using the MSISDN in international format. RTDB individual subscriber records have precedence over subscriber range records. If the MSISDN does not represent an individual subscriber in the RTDB, then the subscriber range records are searched. If the MSISDN is not represented by an individual subscriber record or by a subscriber range record in the RTDB, then the RTDB lookup fails.

If the first RTDB lookup fails but the MSISDN contains an even number of digits, ends with zero, and does not include a method for determining the exact number of digits (for example, an odd/even indicator), then the G-Port repeats the RTDB lookup using the MSISDN without the last digit.

If both RTDB lookup attempts fail, then G-Port does not process the message further; the message is passed to GTT to be routed out of the EAGLE.

Since a DN may be the target of the A-Port, G-Port, or IS41 GSM Migration (IGM) message processing in a hybrid network, where an operator owns both GSM and IS41 networks, message processing call disposition is based on which applications are turned on. [Table 2: G-Port Database Lookup](#) shows call dispositions for these configurations:

G-Port Only ([Table 2: G-Port Database Lookup](#))

G-Port and IGM ([Table 3: IGM and G-Port Message Processing](#))

The following notations apply to [Table 2: G-Port Database Lookup](#) and [Table 3: IGM and G-Port Message Processing](#):

PT = Portability Type for the DN values:

0 – Not known to be ported

- 1 – Own number ported out
- 2 – Foreign number ported to foreign network
- 3 – Prepaid1, Prepaid Short Message Service Intercept (PPSMS) subscriber on server #1
- 4 – Prepaid2, PPSMS subscriber on server #2
- 5 – IS41 GSM migrated subscriber with only GSM handset active
- 6 – Prepaid3, PPSMS subscriber on server #3

through

35– Prepaid32, PPSMS subscriber on server #32

36 - Not identified to be ported

FF - No Status, None, No Portability Type

RN = Routing Number

SOR = Support for Optimal Routing

SRI = Send Routing Information

SP = Signaling Point

NE = Network Entity

Table 2: G-Port Database Lookup summarizes the actions taken based on the database result, and assumes that the IS41 GSM Migration feature is not turned on.

Table 2: G-Port Database Lookup

Message Type	MSISDN Found	Entity Result	MNPCRPN and HomeRN deleted from DN	Action
SRI	Yes	RN	No	SRI Ack using RN prefix. If Portability Type = 0, 1, 2, or 36 is present with MSISDN, NPS will be encoded. For Portability Type = 36, NPS will have a value of 0.
SRI	Yes	RN	Yes	Issue UIM 1256 and fall through to GTT
SRI	Yes	SP	N/A	Forward SRI message to the destination using SP data
SRI	Yes	None	No	Portability Type result is 0, 1, 2, 36, or no status. SRI Ack using MSISDN. Portability Type = 36 or <i>no status</i> will map to NPS=0 in response. Portability Type = 0, 1, or 2 will have the values of 0, 1, or 2.
SRI	Yes	None	No	Portability Type result is 3 - 35. Fall through and perform GTT

Message Type	MSISDN Found	Entity Result	MNPCRPN and HomeRN deleted from DN	Action
SRI	Yes	None	Yes	Portability Type result is 0, 1, 2, 36, or no status. Issue UIM 1256 and fall through to GTT
SRI	No	N/A	N/A	Fall through and perform GTT
Non-SRI or SRI-SOR	Yes	RN	No	Forward the message to the next node using RN data
Non-SRI or SRI-SOR	Yes	RN	Yes	Issue UIM 1256 and fall through to GTT
Non-SRI or SRI-SOR	Yes	SP	N/A	Forward the message to the next node using SP data
Non-SRI or SRI-SOR	Yes	None	No	Fall through and perform GTT
Non-SRI or SRI-SOR	Yes	None	Yes	Issue UIM 1256 and fall through to GTT
Non-SRI or SRI-SOR	No	N/A	N/A	Fall through and perform GTT

Table 3: IGM and G-Port Message Processing

NE/PT	SRI	SRI_SM	Other GSM
RN and PT = 0	MIGRPFIX = single: ACK (use GSM2IS41 prefix) MIGRPFIX = multiple: ACK (RN from EPAP)	SRI_SM_ACK with Return Error Component	Relay
RN and PT ≠ 0	ACK (RN from EPAP)	Relay	Relay
SP and PT = 5	Relay	Relay	Relay
SP and PT ≠ 5	Relay	Relay	Relay
No NE and PT = 5	GTT	GTT	GTT
No NE PT= 0, 1, 2, or No PT	ACK (no NE)	GTT	GTT
No DN entry found	GTT	GTT	GTT

Database lookup results in the following:

1. Fall through to GTT or
2. Relaying the message to the destination as noted in the database or
3. Returning an acknowledge message to the originating switch.

Message Relay describes how the EAGLE formulates a relayed message or a returned Ack.

Message Relay

The rules for formatting the SCCP CdPA GTA field are based on the value specified in the DigitAction field. If DigitAction = none, the EAGLE does not overwrite the SCCP CdPA GTA. For all other values, the EAGLE formats the SCCP CdPA GTA according to the value assigned to DigitAction. Refer to [Table 4: DigitAction Applications](#) for examples of DigitAction Expansion on the SCCP CdPA GTA of an outgoing message when the Entity ID = 1404 and the default country code = 886...

Table 4: DigitAction Applications

DigitAction	Value in Incoming CdPAGTA	Value in Outgoing CdPAGTA	Meaning
none	886944000213	886944000213	No change to the Called Party GTA (default)
prefix	886944000213	1404886944000213	Prefix Called Party GTA with the entity id
replace	886944000213	1404	Replace Called Party GTA with the entity id
insert	886944000213	8861404944000213	Insert entity id after country code. (CC + Entity Id + NDC + SN)
delccprefix	886944000213	1404944000213	Delete country code and add prefix (No action is taken if country code is not present.)
delcc	886944000213	944000213	Delete country code
spare1	886944000213	treated as none	No change to the Called Party GTA (default)
spare2	886944000213	treated as none	No change to the Called Party GTA (default)

Returning Acknowledgement

When an SRI Ack message is returned, the EAGLE follows the SRI Ack encoding rules along with these enhancements for added flexibility:

1. Allow users to specify which SRI parameter (the TCAP MSRN parameter) encodes the RN (and/or DN) information.
2. Allow users to specify the value to encode the Nature of Address field of the TCAP MSRN parameter.
3. Allow users to specify the value to encode the Numbering Plan field of the TCAP MSRN parameter.

MSRN Encoding

Refer to *Commands User's Guide* for detailed descriptions of the `chg-gsmopts` command, parameters, and parameter values.

The MSRN is encoded based on the MSRNDIG, MSRNNAI and DN NAI values.

If MSRNDIG and MSRNNAI are not provisioned in the GSMOPTS table, these default values are used:

- MSRNDIG = RN
- MSRNNAI = National Significant (0x02)
- MSRNNP = ISDN (0x01)

MSRN NAI that is not International (0x01) or Subscriber (0x04) is treated as National Significant (0x02) for the digit encoding format. The NAI field will be encoded with the original GSMOPTS value.

DN and DN NAI are determined by the SRIDN setting.

- If SRIDN = SCCP, then the DN is from CdPA and DN NAI is the Service NAI for the message as specified in the Service Selector information.
- If SRIDN = TCAP, then the DN is the MSISDN and DN NAI is the MSISDN NAI from the MAP portion of the message.

DN NAI that is not International (0x01) or Subscriber (0x04) is treated as National Significant (0x02). DN digits used for encoding have the HomeRN prefix, ST, and filler digits deleted. The DN is carried by an incoming message. An RN, SP, ASD, or GRN is extracted from the RTDB. If the RN is not found during the RTDB lookup, then MSRN is encoded with MAP MSISDN information.

When searching for a CC match, the DEFCC list and MULTCC list are searched. The Best CC Match from the DEFCC list or MULTCC List is referred to as *MatchCC*. The Best CC Match is defined as the largest number of identical leading digits during a comparison of Country Code digits against an MSISDN. If a DEFCC list or MULTCC list contains 1, 12, and 124 and the MSISDN is 12345, then the Best CC Match is 12.

If DEFCC or DEFNDC is not provisioned, those fields are ignored during MSRN encoding. No insertion or deletion of the DEFCC or DEFNDC occurs

To keep the transmitted MSRN from being too large after RN addition, MSISDN National Leading Digit (NLD) Truncation is allowed. When provisioned, a selected number of leading digits are removed from the National portion of the MSISDN before encoding the MSRN.

Some MSRN generation rules are not applied because the rules represent scenarios that result in processing of the message in a way that does not require MSRN generation. For example, RTDB queries are performed based on DS values in International format. If G-Port encounters an MSISDN with a National NAI and the STPOPTS:DEFCC value is not defined, then the MSISDN cannot be converted

to the International format as required for an RTDB query. The system does not generate an MSRN if an RTDB query cannot be performed first.

SRI Ack Message Encoding

Table 5: G-Port SRI Ack message: TCAP/MAP Portion summarizes the possible changes by G-Port to the TCAP/MAP fields.

Table 5: G-Port SRI Ack message: TCAP/MAP Portion

Field	Value
Invoke ID	copied from SRI Invoke Id
Sequence Tag	0x30 for MAP Phase 1 or Phase 2 0xA3 for MAP Phase 2+
Parameter Sequence Length	adjusted based on the parameters included in the response
IMSI digits	RFIMSI digits obtained from SRF data associated with the RN - If SRFIMSI is not available, then the GSMOPTS table will be searched for an MCCMNC match to the CCNC from DN. If an MCCMNC match is not available, DEFMCC is padded to 5 digits and used. If DEFMCC is not provisioned, a length of 0 is used.
CUG-CheckInfo	copied from the SRI message
MSRN NAI	obtained from MSRNNAI in GSMOPTS table or National
MSRN Numbering Plan	obtained from MSRNNP in GSMOPTS table or E.164
MSRN digits	Refer to MSRN Encoding .
MSISDN (optional)	copied from SRI MSISDN parameter sequence based on whether non-concatenated MSRN is selected with MSRNDIG option in the GSMOPTS table
NumberPortabilityStatus (optional)	Number Portability Status parameter will be included in the SRI Ack message only if: <ul style="list-style-type: none"> • MAP phase is 2+. • The ENCODENPS option in the GMSOPTS table is set to on and the DN is found in the RTDB with Portability Type (PT) = 0, 1, 2, or 36.

Field	Value
	<ul style="list-style-type: none"> The ENCDNPSPTNONE option in the GSMOPTS table is set to on and the DN is found in the RTDB with PT = 255. The ENCDNPSDNNOTFOUND option in the GSMOPTS table is set to on and the DN is not found in the RTDB. <p>SRI Ack message is sent by G-Port SRI Query for Prepaid feature if the DN is not found in the RTDB.</p>

Determination of MAP Phase

The phase or version of the MAP protocol is determined from the ACN.

If ACN received is found to be from SRI (in the form: map-ac-locInfo retrieval(s) version xx, such as '04000010005xx'), the last byte ('xx') of the ACN determines the version/phase of the MAP, as shown in [Table 6: MAP Phase Determination](#). If the ACN does not match the one defined in ETSIGSM 03.18, the MAP version/phase is assumed to be from the `defmapvr` parameter of GSMOPTS specification.

Table 6: MAP Phase Determination

Last Byte in ACN	MAP Phase
00	Specified by <code>defmapvr</code> parameter of a GSMOPTS command
01	Phase 1
02	Phase 2
03	Phase 2+
Greater than 3	Specified by <code>defmapvr</code> parameter of a GSMOPTS command

G-Port Message Handling

G-Port performs message handling in the following steps.

1. The message arrives at the EAGLE *route-on-gt*. The EAGLE decodes the SCCP portion and uses the data to perform the G-Port selection based on the CdPA GT fields other than the ES and GTAI. The result of the selection provides a service indicator. The service indicator is G-Port if it is determined that MNP-SRF is required. If a G-Port selector does not match the incoming GT fields, the message is passed on for GTT selection.
2. If step #1 indicates that MNP SRF is required and the message is not a UDTS generated by the EAGLE, then the EAGLE performs SSN-based discrimination. If the message is a UDTS generated by the EAGLE, then regular GTT is performed on the message.
3. MNP-SRF first decodes the Operation Code of the MAP message to distinguish the SRI or SRI_SM message from the rest. If the Operation Code is SRI, the OR Interrogation indicator is absent, and the GSMOPTS parameter SRIDN=TCAP, then the MSISDN parameter is decoded from the MAP portion of the message. If the Operation Code is SRI_SM and the GSMSMSOPTS parameter

SRISMDN=TCAP, then the MSISDN parameter is decoded from the MAP portion of the message. If the value is SCCP for GSMOPTS parameter SRIDN (if an SRI message) or for GSMSMSOPTS parameter SRISMDN (if an SRI_SM message), or if the message is not SRI or SRI_SM, then , the digits available in the SCCP CdPA GTAI are used for database lookup.

4. The decoded DN from either the MAP MSISDN or SCCP CdPA is conditioned to an international number before performing the database lookup. The conditioning which is performed depends on whether the digits are obtained from SCCP or TCAP part of the message.
 - If the digits are from the SCCP part, the number conditioning is based on SNAI value. The RN prefix deletion is performed, followed by conversion to an international number based on its value. Conversion to international format is based on DEFCC and DEFNDC, as required. If the incoming number is CCRNDN, DEFCC and MULTCC are used to determine the Best Match CC to locate the RN digits for RN prefix deletion
 - If the digits are from the MAP part, the number conditioning is based on NAI of MSISDN parameter. Prefix deletion is performed if MNPCRCP is on. The number is converted to an international number, if necessary. Conversion to international format is based on DEFCC and DEFNDC, as required. If the incoming number is international, DEFCC and MULTCC are used to determine if the format is CCRNDN or RNIDN. If a Best Match CC is located, then it is used to locate the RN digits for RN prefix deletion.
5. The database lookup is performed in two steps:
 - The exception or individual number database is searched for a match. If the match is found, the data associated with this entry is considered.
 - If the conditioned number is absent in the exception database, the number range database is searched. If the match is found, the data associated with this range entry is considered. If the search is unsuccessful, the result is no match.
6. If the number is found and an RN prefix is present for this entry, then:
 - *for SRI message:* If MNPCRCP is off or if MNPCRCP is on with CRP on Translation Type off and a HomeRN was not present in the incoming DN (a HomeRN was not deleted from the SCCP CdPA/MAP MSISDN), then G-Port generates an SRI Ack message with the RN prefix in the Routing Number parameter.
 - If SRI_SM GTT Routing is on, then SRI_SM messages are not relayed. The CdPA GTA in the message is modified in CC + RN + DN format, or RN + IDN format if a CC match is not found in the leading digits. The NAI of CdPA GTA is set to International and the SRI_SM message falls through to GTT.
 - *for non-SRI message:* If MNPCRCP is off or if MNPCRCP is on and a HomeRN was not present in the incoming DN (a HomeRN was not deleted from the SCCP CdPA), then G-Port uses the translation data for the number to alter the CdPA digits and route the message to the destination.
 - *for SRI or non-SRI message:* If MNPCRCP is on and a HomeRN was present in the incoming DN (a HomeRN was deleted from the SCCP CdPA/MAP MSISDN), then G-Port generates UIM #1256 and the message falls through to GTT. In most network implementations the message contains RN+DN which will cause a GTT failure. This GTT failure results in the EAGLE sending a UDTs to the originator if the Return Message on Error flag was set in the incoming UDT.

7. If the number is found and an SP entity is present for this entry, G-Port uses the SP translation data as the number to route the message to the destination. This is true whether or not the MNPCRCP feature is on. However, the SRI_SM message is not relayed if SRI_SM GTT Routing on, the GRN is associated along with the SP entity with the DN, and the GRN is not present in the HomeRN table. In this case, the CdPA GTA of the SRI_SM is modified in CC + GRN + DN format , or GRN + IDN format if a CC match is not found in the leading digits. The NAI of CdPA GTA is set to International and the SRI_SM message falls through to GTT.
8. If the number is found and neither SP nor RN data is associated with it (direct routing case with number not known to be ported or not identified to be ported), these occur:
 - *for SRI message:* If MNPCRCP is off, or if MNPCRCP is on and no HomeRN is present in the incoming DN (a HomeRN was not deleted from the SCCP CdPA/MAP MSISDN), and the portability type associated with the DN entry is other than 3 through 35, then G-Port generates an SRI Ack message with the MSISDN in the Routing Number parameter. If MNPCRCP is off, or if MNPCRCP is on and no HomeRN was present in the incoming DN (a HomeRN was not deleted from the SCCP CdPA/MAP MSISDN), and the portability type associated with the DN entry has a value of 3 through 35, then the SRI falls through to GTT and no SRI Ack message is generated.
 - *for non-SRI message:* If MNPCRCP is off, or if MNPCRCP is on and no HomeRN is present in the incoming DN (a HomeRN was not deleted from the SCCP CdPA), then the message falls through to GTT.
 - *for SRI or non-SRI message:* If MNPCRCP is on and a HomeRN was present in the incoming DN (a HomeRN was deleted from the SCCPCdPA/MAP MSISDN), then G-Port generates UIM #1256, and the message falls through to GTT. In most network implementations, the message contains RN+DN which will cause a GTT failure. This GTT failure results in the EAGLE sending a UDTs to the originator if the Return Message on Error flag was set in the incoming UDT.
 - The Number Portability Status Indicator (NPSI) is encoded in the SRI Ack message if either (1) GSMOPTS:ENCODENPS=ON and the DN is associated with PT = 0, 1, 2, 36 or (2) GSMOPTS:ENCDNPSPTNONE=ON and the DN is associated with PT = no status
9. If the number is not found in the database, then the GSMOPTS:SRIDNNOTFOUND option is consulted if the query is not G-Port SRI Query for Prepaid. if the query is identified as G-Port SRI Query for Prepaid, then an SRI Ack message is returned. The Number Portability Status Indicator (NPSI) is encoded in the SRI Ack message if GSMOPTS:ENCDNPSDNNOTFOUND=ON.
10. If the GSMOPTS:SRIDNNOTFOUND option is set to SRINACK, then a negative acknowledgement is generated in response to the message.
11. If the GSMOPTS:SRIDNNOTFOUND option is set to GTT, then GTT is performed on the message.

G-Port Call Flows

This section contains several illustrative sample call flows: G-Port supports all call flows identified in GSM 03.66 other than noted exceptions. This section contains a mix of call flows using both indirect and direct routing.

These call flows, including calls to imported or non-portable numbers, show one possible scenario regarding how messages are routed in the network and where various stages of GTT are performed. G-Port may perform intermediate or final GTT depending on the message received and provisioned data.

Several call flows refer to non-call related messages. Examples of non-call related messages are SRI for Short Message Service and SRI for Optimal Routing.

In all G-Port call flows, the MSISDN used for the database search is converted to an international number, if necessary, prior to the database search.

Mobile Terminated Call to Non-Ported or Imported Number (Indirect Routing)

The first call flow example is for a mobile terminated call to a non-ported or imported number by indirect routing. Refer to [Figure 1: Mobile Terminated Call by Indirect Routing](#).

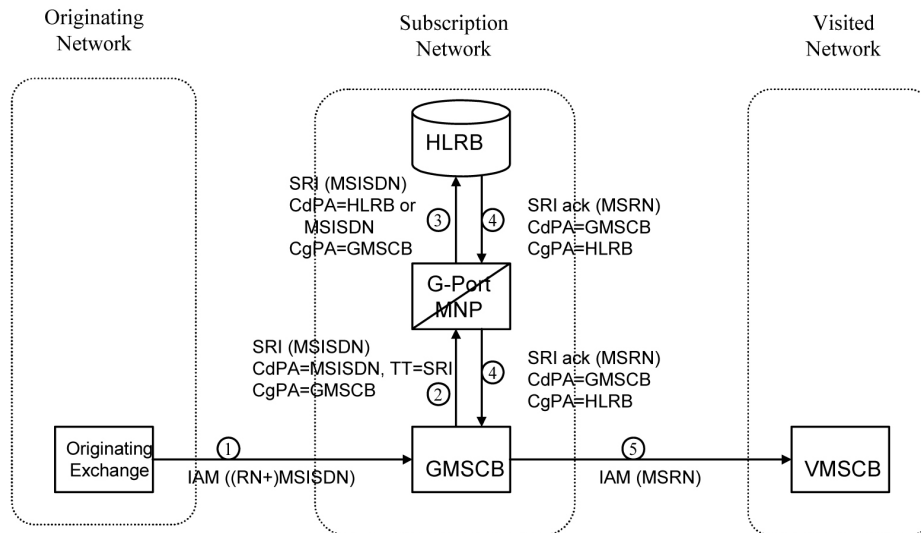

Figure 1: Mobile Terminated Call by Indirect Routing

1. The originating exchange sends an IAM message to GMSCB in the subscription network. When the number is imported, the original number range owner network has already performed a database lookup and determined the new subscription network (Routing Number). As shown in the figure, this could be sent in the IAM along with the MSISDN.
2. GMSCB sends an SRI request to the MNP-SRF. This request may or may not contain the new TT = SRI. Global title information triggers G-Port processing. The MNP-SRF determines the message is an SRI and uses the MSISDN from the MAP message to search the database. A match is found with no Routing Number and an HLR GT address for HLRB, or no match is found and falls through to GTT, producing a routing to HLRB. Alternatively and not illustrated in the figure, GTT could route to another node, possibly in a different network.
3. The message is routed to HLRB.
4. HLRB responds to GMSCB with an SRI ack. This message can be GT routed through the STP or MTP routed.
5. GMSCB sends an IAM with the roaming number to the visited network.

Mobile Originated/Terminated Call to an Exported Number (Direct Routing)

This call flow example is for a call that is mobile originated or terminated to an exported number by direct routing. Refer to [Figure 2: Call to an Exported Number by Direct Routing](#).

Figure 2: Call to an Exported Number by Direct Routing

This call flow assumes the originating network is not the subscription network. If indirect routing were used in this example, the originating network would first route the call to the number range owner network, according to pre-portability rules, where the MNP-SRF and NPDB are accessed to locate the Routing Number.

1. When the call is originated, VMSCA sends an IAM message to GMSCA.
2. GMSCA sends an SRI request to the MNP-SRF. This may or may not contain the new TT = SRI. Global title information triggers G-Port processing. The MNP-SRF determines the message is an SRI and uses the MSISDN from the MAP message to search the database. A match is found with the Routing Number field populated.
3. The MNP-SRF responds to GMSCA with an SRI ack containing the Routing Number prefixed to the MSISDN number as the Roaming Number.
4. GMSCA sends an IAM with the roaming number to the subscription network. The Routing Number is used by GMSCA and possibly by transit exchanges to route the call to the subscription network.

MO/MT Call to a Number Not Known to be Ported (Direct Routing)

This call flow example is for a call that is mobile originated (MO) or mobile terminated (MT) to a foreign number that is not known to be ported by direct routing. Refer to [Figure 3: MO/MT Call to Number Not Known to be Ported \(Direct Routing\)](#).

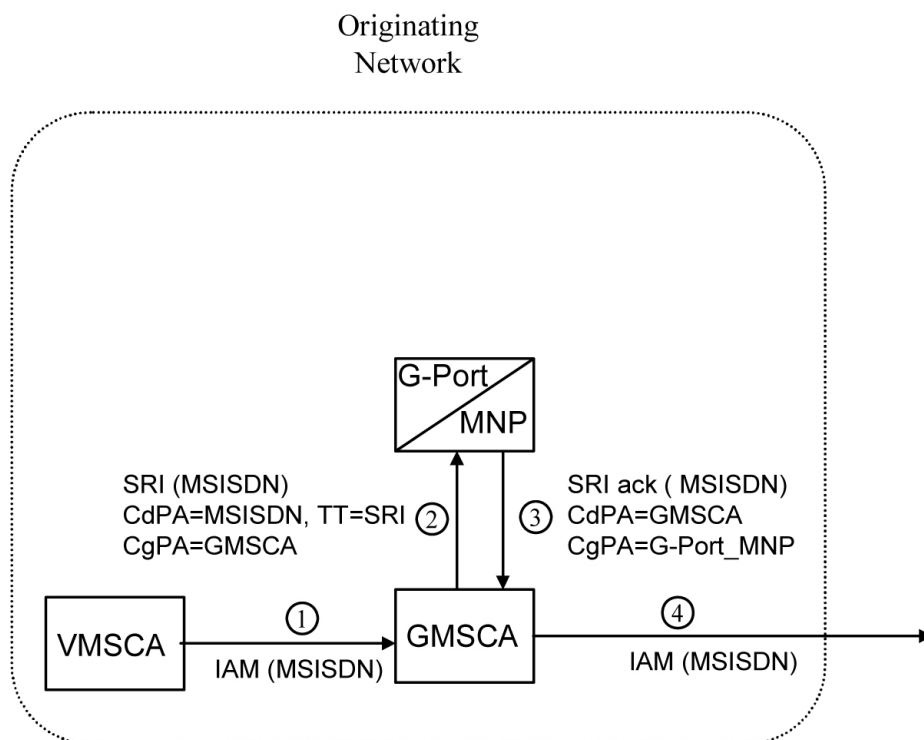

Figure 3: MO/MT Call to Number Not Known to be Ported (Direct Routing)

This call flow assumes the originating network is not the subscription network.

1. When the call is originated, VMSCA sends an IAM message to GMSCA.
2. GMSCA sends an SRI request to the MNP-SRF. This request may or may not contain the new TT = SRI. Global title information triggers G-Port processing. The MNP-SRF determines the message is an SRI and uses the MSISDN from the MAP message to search the database. A match is found, but the Routing Number and HLR Address fields are not populated.
3. The MNP-SRF responds to GMSCA with an SRI ack containing the MSISDN number.
4. GMSCA sends an IAM with the roaming number to the subscription network.

Non-Call Related Message for Non-Ported Number (Indirect Routing)

This call flow example is for a non-call related message for a non-ported number by indirect routing. Refer to [Figure 4: Non-Call Related Message for Non-Ported Number](#).

Figure 4: Non-Call Related Message for Non-Ported Number

1. The Interrogating Network Entity (INE) sends the non-call related message to MNP-SRFB in the number range owner network. The SCCP CdPA contains the MSISDN number of the subscriber and the TT. The TT may be either 0 as shown in the figure, or another value depending upon the service, such as TT=17 for CCBS service.
2. Global title information triggers G-Port processing. MNP-SRFB determines the message is non-call related (i.e. not an SRI that doesn't require Optimal Routing) and uses the MSISDN from the SCCP CdPA to search the database. No match is found, so MNP-SRFB uses GTT to locate the GT address associated with the MSISDN to route the message to HLRB.

Non-Call Related Message for Ported Number (Indirect Routing)

This call flow example is for a non-call related message for a ported number by indirect routing. Refer to [Figure 5: Non-Call Related Message for Ported Number](#).

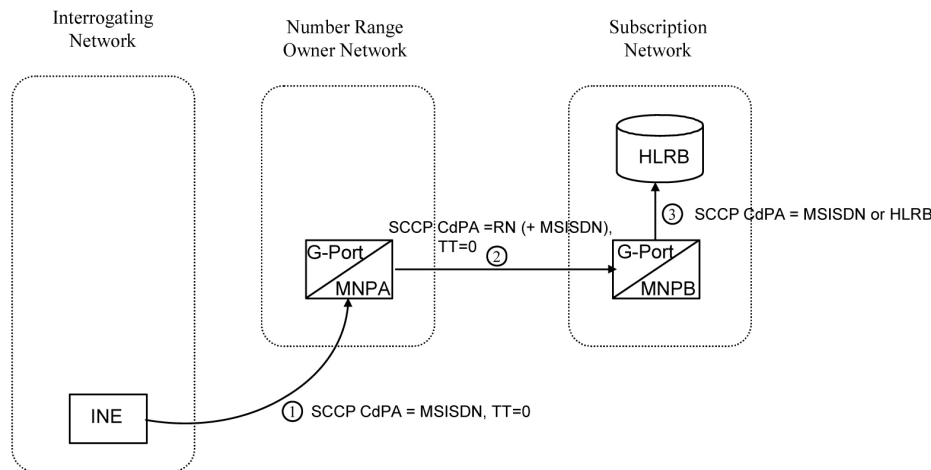

Figure 5: Non-Call Related Message for Ported Number

1. The Interrogating Network Entity (INE) sends a non-call related message to MNP-SRFA in the number range owner network. The SCCPCdPA contains the MSISDN number of the subscriber and the TT. The TT may be either 0 as shown in the figure, or another value depending upon the service, such as TT=17 for CCBS service.
2. Global title information triggers G-Port processing. MNP-SRFA determines the message is one requiring message relay (that is, not an SRI that doesn't require Optimal Routing) and uses the MSISDN from the SCCPCdPA to search the database. A match is found, and MNP-SRFA uses the Message Relay GT address associated with the match to route the message to the subscription network.
3. MNP-SRFB receives the message and determines the message is one requiring message relay (that is, not an SRI that does not require Optimal Routing). It checks if the SCCPCdPA begins with a Prefixed RN. If it does, it removes the prefix. In either case, it uses the MSISDN from the SCCPCdPA to search the database. A match is found, and MNP-SRFB uses the HLRGT address associated with the match to route the message to HLRB.

Non-Call Related Message for Ported or Non-Ported Number (Direct Routing)

This call flow example is for a non-call related message for either a ported or non-porting number by direct routing. Refer to [Figure 6: Non-Call Related Message for Any Number](#).

Figure 6: Non-Call Related Message for Any Number

This call flow assumes the originating network is not the subscription network.

1. The Interrogating Network Entity (INE) sends the non-call related message to MNP-SRFA in the interrogating network. The SCCP CdPA contains the MSISDN number of the subscriber and the TT. The TT may be either 0 as shown in the figure, or another value depending upon the service, such as TT=17 for CCBS service.
2. Global title information triggers G-Port processing. MNP-SRFA determines the message is one requiring message relay (that is, not an SRI that doesn't require Optimal Routing) and uses the MSISDN from the SCCP CdPA to search the database.
 - If a match is found (ported case), MNP-SRFA uses the Message Relay GT address associated with the match to route the message to the subscription network.
 - If a match is not found (non-ported case), MNP-SRFA uses GTT to route the message to MNP-SRFB.
3. MNP-SRFB receives the message and determines the message requires message relay (that is, not an SRI that does not require Optimal Routing). It checks to see if the SCCP CdPA begins with a Prefixed RN. If so, it removes the prefix. In either case, it uses the MSISDN from the SCCP CdPA to search the database.
 - If a match is found (imported case), MNP-SRFB uses the HLR GT address associated with the match to route the message to HLRB.
 - If a match is not found, MNP-SRFB uses GTT to route the message to HLRB.

Network Perspectives

GSM Mobile Number Portability (G-Port) provides the capability for a mobile subscriber to change the GSM subscription network within a portability cluster while retaining the original MSISDNs.

Because the IMSI is not ported, the recipient network of the porting process issues a new IMSI for the ported subscriber.

In a Public Land Mobile Network (PLMN) that supports G-Port, SCCP messages that are sent to an HLR can be relayed by either:

- An MNP-SRF
- An EAGLE with G-Port depending on the type of message (call-related or non-call-related) and on the porting status of the called subscriber.

For call-related messages, MNP-SRF either generates an SRI_ACK response with the routing number if the number is ported, or relays the message to an appropriate HLR if the number is not ported.

For non-call related messages, MNP-SRF can modify the SCCP called party address and route the message to the HLR of the recipient network or to the subscription network.

Figure 7: G-Port Node in GSM Network shows the location of the G-Port in a GSM network. Note the basic functions G-Port performs:

- G-Port performs a query/response for call-related SRI messages when the number is ported-out, not known to be ported, or not identified to be ported.
- G-Port performs a message relay function for non-call-related messages and for call-related messages when the number is non-porting or porting-in.

G-Port performs the following actions based on the message received and number status:

- If the message received is call-related SRI (not-SOR) and the number is porting-out, not known to be ported, or not identified to be ported, G-Port sends the SRI ack to the MSC with the Routing Number information in the MAP portion of the message.
- If the number is porting-out and the message received is non-call related (non-SRI), G-Port performs a message relay function and forwards the translated message based on the Routing Number information.
- If the number is non-porting or porting-in, G-Port performs an HLR translation and forwards the translated message to the HLR.

An additional user option allows configuration of G-Port to modify the above processing as follows:

- If the number is not found in the RTDB (individual or range), then G-Port returns a negative acknowledgement in response to an SRI.

Figure 7: G-Port Node in GSM Network

G-Port Considerations

The following items must be considered before installing and operating the G-Port feature.

1. SRI responses are routed by both MTP and Global Title Translation.
2. The maximum length of the Application Context Name Object Identifier is 32 digits.
3. For G-Port Message Relay messages with E.164 numbers in the SCCP CdPA, it is assumed that no truncation occurred if and when the routing number was prepended and that SCCP CdPA has the full DN of the subscriber.
4. G-Port Message Relay to the EAGLE local subsystem is not supported.
5. Only the first 21 digits of the CdPA are decoded for G-Port Message Relay. For example, if the CdPA contains an RN prefixed to a DN, the RN is seven digits, and the DN is 15 digits, then the total is 22 digits, and the DN used for processing will be only 14 digits (21 total digits less 7 RN digits).
6. With the Hex Digit Support for GTT feature enabled and turned on, Message Signaling Units (MSUs) containing either decimal or hexadecimal digits in the Called Party Address (CdPA) are

processed. Unless the Hex Digit Support for GTT feature is enabled and turned on, GTT processes decimal digits only.

If the Hex Digit Support for GTT feature is not enabled and not turned on and an operator or country is using hexadecimal digits *A* through *F* in RNs and the operator is providing GTT to messages that have RN prefixes other than its own prefixes, then the operator must enter the RN + DN number ranges as DN ranges in the RTDB. The beginning and ending DNs can be only 15 digits, which may not be sufficient for an RN + DN.

7. In this document, Mobile Number Portability (MNP) applies within a single portability cluster. This is defined as a set of networks in a country or multi-country region having a common numbering plan and across which a subscriber already inside the cluster can port. Any individual G-Port node is required to support only an MNP within such a portability cluster.
8. The EAGLE examines the TCAP portion of the MAP message to determine the message type. Although GSM 03.66 defines a new translation type for SRI-MNP messages, G-Port does not rely upon the use of this TT.
9. The routing number found in the database is either prefixed to the dialed number to form a new concatenated roaming number that is returned to the switch, or is sent on its own as the roaming number.
10. No MAP overload procedures, as defined in GSM 09.02, need to be supported by G-Port.
11. All non-call related messages affected by MNP contain the MSISDN number in the SCCP CdPA. In the case of the SRI message, G-Port may get the number from the MAP level.
12. TCAP operation codes uniquely distinguish MAP SRI messages and do not change from one phase (or version) of MAP to another.
13. PCs or PC + SSNs that are in the entity table of the database and referenced by subscriber entries do not necessarily have the required data present on the EAGLE to route messages to them. For example, the point code may not have a route or the PC + SSN may not be in the MAP table for a final GTT. In this event, a UIM is output only when a message is discarded because of the lack of data.
14. The parameters of the SRI Ack message generated by G-Port are based solely on the provisioned data or options; they are not based on the MAP phase of the SRI message. For example, if the message received is phase 1 or 2, MSRNDIG=RN, and the portability status is "NotKnownToBePorted", G-Port generates an SRI Ack message containing IMSI, MSRN, MSISDN, and NPS parameters, despite the MSISDN and NPS parameters not being defined for phase 1 or 2.
15. If SRFIMSI is not provisioned with an RN entity and an incoming message is an SRI message, G-Port sets IMSI parameter as one of these options:
 - a. If a CCNDC>MCCMNC match in GSMOPTS is found, then the MCCMNC is encoded.
 - b. If DefMCC is provisioned in GSMOPTS, then DefMCC is encoded.
 - c. Zero digits are encoded.
16. G-Port uses the MTP route for the SRI Ack message, even when the final GTT is performed on the response.
17. When the concatenated number (RN + MSISDN) option is selected for encoding the Routing Info (MSRN) in the SRI Ack message, G-Port encodes the complete concatenated number because the

concatenated number length may otherwise exceed 16 digits, which is the maximum allowed in MSRN.

18. Routing an SRI Ack message to a network domain different from the network domain from which query was received is not supported by G-Port. Routing failures or unexpected routing of SRI Ack messages may result.

General Numbering Requirements

Incoming called party numbers, from the SCCP portion, destined for G-Port processing are conditioned to fit the GDB requirements where possible. The following factors are used to condition the SCCP numbers.

- Based on provisioning: If the GTT selectors available in the incoming message match an entry in the G-Port selector table, then the service numbering plan from the selector table entry uses that number's numbering plan. Further conditioning is applied based on this new numbering plan.
- Based on configurable options: If the GTT selectors available in the incoming message match an entry in the G-Port selector table, then the service nature of address from the selector table entry uses that number's nature of address. Further conditioning is applied based on this new nature of address.
- If the nature of address is Subscriber, the default CC + default NC (network code for E.164) are prepended to the number. The default codes to be used by the EAGLE must be previously provisioned by the EAGLE operator. If not, a UIM is issued, and the message falls through to GTT.

Numbers with fewer than five digits after the above conditioning are not used for G-Port. In this case, a UIM is issued, and the message falls through to GTT.

Numbers with more than fifteen digits after the above conditioning are not used for G-Port. In this case, a UIM is issued, and the message falls through to GTT.

G-Port SCCP Service Re-Route Capability

This feature is designed to handle and control re-routing of G-Port traffic from an affected node to alternate nodes within an operators network. This feature is an optional feature and doesn't affect the normal G-Port functionality. This feature consists to the following main functions:

- *Service State*
- *MNP Re-Routing*
- *MNP Capability Point Codes*

G-Port SCCP Service Re-Route Capability is not supported for the Prepaid SMS Intercept feature. G-Port SCCP Service Re-Route Capability is supported for the IS-41 to GSM Migration feature.

Service State

Service state is part of the G-Port SCCP Service Re-Route Capability. Service state is used to indicate the current state of G-Port, either `ONLINE` or `OFFLINE`. Service state also gives the user the option to mark G-Port as `OFFLINE` or `ONLINE` based on the current behavior. If a G-Port problem is identified, G-Port can be marked `OFFLINE` to initiate the re-routing procedure. This feature also provides the option to mark G-Port `OFFLINE` to perform a controlled re-routing during this state.

MNP Re-Routing

MNP Re-Routing is an optional feature and is enabled by defining a list of alternate PCs or by defining the GTT option. G-Port re-routing is activated by marking G-Port `OFFLINE`. When G-Port is `OFFLINE` and alternate PCs are provisioned, any messages destined for G-Port are re-routed to the available alternate PCs that are defined for G-Port. If alternate PCs are not provisioned or none are available, then the GTT option is used. If the GTT option is set to `YES`, then messages destined for G-Port will fall through to GTT as part of the re-routing procedure.

Re-Routing is applied to all G-Port messages (based on `SRVSEL`). There is no distinction of DPC of the messages. The DPC of the message can be either `True`, `Secondary`, or `Capability Point code`.

MNP Capability Point Codes

Capability Point Codes (CPC) are also supported for G-Port. The use of MNP capability point code aids the adjacent nodes in knowing about G-Port outages. When G-Port is brought down through administrative commands, all traffic destined to this G-Port node will generate a Transfer Prohibited (TFP) message to the adjacent node about the G-Port CPC. The TFP response to the adjacent node causes the traffic originating nodes to stop sending G-Port traffic to this node. All G-Port traffic coming into this node is sent to the alternate G-Port nodes. Adjacent nodes will initiate route-set-test procedures after receipt of the TFP response.

If the messages are destined to the EAGLE true point code, then TFP messages are not generated when the G-Port service is `OFFLINE`. The originator would not be aware of the outage.

Once G-Port is back in service on the EAGLE, a Transfer Allowed (TFA) message is sent to the traffic adjacent nodes in response to route-set-test message. The traffic originating nodes will then start sending G-Port traffic to the original G-Port node.

MNP Capability point codes can be provisioned when the G-Port feature is on. There can be more than one Capability Point Code assigned to G-Port CPC Type.

When the G-Port feature is turned on and the G-Port service state is set to `offline`, the user can change the service to `online` at any point. After the feature is turned `online`, G-Port starts processing messages if at least one Service Module card is `IS-NR`.

The G-Port service can be set to `OFFLINE` at any point. This causes the EAGLE to stop processing G-Port traffic and re-routing is performed.

The G-Port service state is persistent. Booting the OAM or all the Service Module cards will not change the service state. Commands must be used to change the service state.

G-Port supports up to seven alternate PCs per domain. All six domains (`ANSI`, `ITU-I`, `ITU-I Spare`, `ITU-N`, `ITU-N Spare`, and `ITU-N24`) are supported. An entire set of alternate PCs is considered as a re-route set. A GTT option is supported for G-Port re-route. When the G-Port service is `OFFLINE`, G-Port messages fall through to GTT based on the GTT option. This option is set to `YES` by default.

G-Port SCCP Service Re-Route Capability Summary

If the G-Port service is not normal (because the RTDB is not in sync with MPS or if cards are misrouting G-Port messages) then the G-Port service state should be changed to OFFLINE .

Before changing G-Port service to OFFLINE , it should be decided what kind of re-routing will be used during the outage. The EAGLE supports re-routing data to alternate point codes or falling through to GTT as two possible options. Rerouting to alternate point code has priority over falling through to GTT. Examples of the two options follow:

Option 1

Define alternate point codes to re-route G-Port traffic. This is the recommended option. Up to 7 alternate G-Port nodes can be provisioned to re-route all the incoming G-Port traffic. Once provisioned, the G-Port service can be changed to OFFLINE . This example has any incoming being G-Port traffic being load-shared to point codes based on the relative cost.

```
chg-sccp-serv:serv=gport:pci1=1-1-1:rc1=10:pci2=2-2-2:rc2=10:pci3=3-3-3:rc3=10:pci4=4-4-4:rc4=10
```

```
chg-sccp-serv:serv=gport:pci1=5-5-5:rc1=10:pci2=6-6-6:rc2=10:pci3=7-7-7:rc3=10:pci4=8-8-8:rc4=10
```

```
chg-sccp-serv:serv=gport:state=offline
```

Option 2

With this option default GTT translations are provisioned for G-Port service. Then the `chg-sccp-serv` command is used to provision GTT=YES. All G-Port messages will fall through to GTT. An example command follows:

```
chg-sccp-serv:serv=gport:gtt=yes (it is yes by default)
```

Once the G-Port re-routing data is provisioned, G-Port service can be changed to OFFLINE . At this point all G-Port traffic will be re-routed. The user can take necessary steps to correct the G-Port service on the node. Until all the cards or enough cards are in active state with valid G-Port database, G-Port service should not be changed to ONLINE .

[Table 7: G-Port SCCP Service Re-Route Capability Summary](#) shows the actions taken when the G-Port service is offline, a message arrives at the affected node requiring G-Port service, and Service Module cards are available.

Table 7: G-Port SCCP Service Re-Route Capability Summary

Result of service selector	DPC	Alternate point code defined and available	GTT to be performed as fall through	Message Handling	Network Management
G-Port	G-Port Capability PC	Yes	N/A	Re-Route to alternate point code based on relative cost	TFP concerning CPC
G-Port	G-Port Capability PC	No*	Yes	Fall through to GTT and perform GTT	TFP concerning CPC

Result of service selector	DPC	Alternate point code defined and available	GTT to be performed as fall through	Message Handling	Network Management
G-Port	G-Port Capability PC	No [*]	No	Generate UDTS (return cause = network failure)	TFP concerning CPC
G-Port	G-Port Capability PC	Not Defined	Yes	Fall through to GTT and perform GTT	TFP concerning CPC
G-Port	G-Port Capability PC	Not Defined	No	Generate UDTS (return cause = no xlation for this addr)	TFP concerning CPC
Not G-Port	G-Port Capability PC	N/A	N/A	Perform appropriate Service/GTT	None
G-Port	True or Secondary PC or non-G-Port CPC	Yes	N/A	Re-Route to alternate point code based on relative cost	None
G-Port	True or Secondary PC or non-G-Port CPC	No [*]	No	Generate UDTS (return cause = network failure)	None
G-Port	True or Secondary PC or non-G-Port CPC	No [*]	Yes	Fall through to GTT and perform GTT	None
G-Port	True or Secondary PC or non-G-Port CPC	Not Defined	Yes	Fall through to GTT and perform GTT	None
G-Port	True or Secondary PC or non-G-Port CPC	Not Defined	No	Generate UDTS (return cause = no xlation for this addr)	None
Not G-Port	True or Secondary PC or non-G-Port CPC	N/A	N/A	Perform appropriate Service/GTT	None

Alternate point codes are defined and unavailable (prohibited or congested).

Table 8: G-Port LIM Re-Route Message Handling Summary shows the actions of LIM re-route functionality when Service Module cards are unavailable or down.

Table 8: G-Port LIM Re-Route Message Handling Summary

Routing Indicator in Incoming Message	DPC	Full or Partial Failure	G-Port Service Status	Message Handling	Network Management
rt-on-gt	G-Port Capability PC	Full	N/A	Generate UDTS	TFP concerning CPC, UPU
rt-on-gt	Non G-Port Capability PC	Full	N/A	Generate UDTS	TFP concerning CPC, UPU
rt-on-gt	True PC	Full	N/A	Generate UDTS	UPU
rt-on-gt	G-Port Capability PC	Partial*	ONLINE	Generate UDTS	None
rt-on-gt	True PC or non G-Port Capability PC	Partial*	ONLINE	Generate UDTS	None
rt-on-gt	G-Port CPC	Partial*	OFFLINE	Generate UDTS	TFP concerning CPC, UPU
rt-on-gt	True PC or non-G-Port CPC	Partial*	OFFLINE	Generate UDTS	None

A partial failure occurs if some Service Module cards are available but are overloaded.

MT-Based GSM SMS NP

The Mobile Terminated-Based GSM SMS NP feature allows wireless operators to route short message service (SMS) messages destined to mobile subscriber within a number portability environment. If the Mobile Terminated (MT)-Based GSM SMS NP feature is not enabled and turned on, then messages are processed by the G-Port feature.

The MT-Based GSM SMS NP feature allows database lookup to be performed on short message service (SMS) messages that are routed from a short message service center (SMSC).

The MT-Based GSM SMS NP feature intercepts SRI_SM messages and sends response messages with routing information for out-of-network destination subscribers using the following process:

1. An SRI_SM message is intercepted by the EAGLE before the message reaches the home location register (HLR).
2. The message destination address (SCCP Called Party GTA) is extracted, the digits are conditioned, and lookup is performed in the database.

3. If the destination address/subscribers belongs to a foreign network, then a reply message is sent to the SMSC with routing information. If the destination address/subscribers belongs to a local network, then the SRI_SM message is relayed to the HLR.

Options

The MT-Based GSM SMS NP feature provides configurable options for controlling processing of SRI_SM messages and the content of the response:

- Selecting the SMSC response message type and digit format
- Specifying when a database lookup is considered to be successful
- Specifying the format of digits encoded in the response message.

Feature Control Requirements

The MT-Based GSM SMS NP feature has the following control requirements:

- The defcc parameter in the `chg-stpopts` command must be set to a value other than **none** before the feature can be turned on.
- The defmcc parameter in the `chg-gsmopts` command must be set to a value other than **none** before the feature can be turned on.
- Part number 893-0200-01
- The G-Port feature must be enabled before the MT-Based GSM SMS NP feature can be enabled.
- The G-Port feature must be turned on before the MT-Based GSM SMS NP feature can be turned on.
- The MT-Based GSM SMS NP feature cannot be enabled if the LNP feature is enabled.
- The feature cannot be turned off after it has been turned on.

System Options for MT-Based GSM SMS NP

The system level options that control the MT-Based GSM SMS NP feature are stored in the GSMSMSOPTS database table. The MT-Based GSM SMS NP feature must be enabled before the following options in the GSMSMSOPTS table can be provisioned.

The content of the GSMSMSOPTS table is used to help perform number conditioning, response generation, and other feature-specific options. [Table 9: MT-Based GSM SMS NP Options](#) shows the options stored in the GSMSMSOPTS table, their possible values, and the action taken for each value.

Table 9: MT-Based GSM SMS NP Options

GSMSMSOPTS Option	Value	Action in the EAGLE
MTSMSIMSI	RN	This setting specifies the required format of digits which will be encoded in the "IMSI" parameter of the SRI_SM return result response (ACK).
	RNDN	
	CCRNDN	
	DN	Note: The MT-Based GSM SMS NP feature will require STPOPTS:DefCC to be set before the feature can be activated. Also, DefCC will not be allowed to

GSM SMS OPTS Option	Value	Action in the EAGLE
		change to "NONE" as long as this feature is turned ON.
	SRFIMSI	IMSI is encoded from the "SRFIMSI" parameter from the RTDB entity.
	MCCRNDN (default)	IMSI is encoded as MCCRNDN. The MCC will be encoded using the GSM OPTS:DefMCC setting. Note: The MT-Based GSM SMS NP feature requires GSM OPTS:DefMCC to be set before the feature can be turned on. GSM OPTS:DefMCC will not be allowed to change to "NONE" as long as this feature is turned ON.
MT SMS NNI	RN (default)	This setting specifies the required format of digits which will be encoded in the "Network Node Number" parameter ISDN digits field within the LocationInfoWithLMSI TCAP parameter in the of the SRI_SM response (ACK). In the response, the Nature of Number field will always be encoded as "International" (0x1) and the numbering plan will always be encoded as ISDN/Telephony Numbering (Rec ITU-T E.164) (0x1).
	RNDN	
	CCRNDN	
	DN	
	SRFIMSI	IMSI is encoded from the "SRFIMSI" parameter from the RTDB entity.
	MCCRNDN	IMSI is encoded as MCCRNDN. The MCC will be encoded using the GSM OPTS:DefMCC setting. Note: The MT-Based GSM SMS NP feature requires GSM OPTS:DefMCC to be set before the feature can be turned ON. GSM OPTS:DefMCC will not be allowed to change to "NONE" as long as this feature is turned ON.
	NONE	This parameter is not encoded in the response message. The LocationInfoWithLMSI TCAP parameter is included; the Network Node number sub-parameter is present; however the length of the parameter is 0.
MT SMS TYPE	SP	When the lookup in the RTDB has entitytype=SP, then the lookup is considered successful.
	RN (default)	When the lookup in the RTDB has entitytype=RN, then the lookup is considered successful.
	SPRN	When the lookup in the RTDB has entitytype=SP or RN, then the lookup is considered successful.

GSMSMSOPTS Option	Value	Action in the EAGLE
	ALL	When the lookup in the RTDB has entitytype=SP or RN or no_entity, then the lookup is considered successful.
	NONSP	When the lookup in the RTDB does not have an entitytype SP, then the lookup is considered successful. This could mean that no entity was found or an entity with type RN was found.
	Note: This option is applied to messages in which the source is considered to be a Home SMSC.	
MTSMSACKN	ACK (default)	This indicates that when the SRI_SM lookup is considered successful, a SRI_SM_ACK (Return Result Last) is sent back.
	NACK	This indicates that when SRI_SM look is considered successful, a SRI_SM_NACK (Return Error) is sent back.
	Note: This option is applied to messages in which the source is considered to be a Home SMSC.	
MTSMSDLTR	NO (default)	This option specifies if delimiter digit(s) need to be inserted in the MTSMSIMSI and MTSMSNNI digits. A value of NO means that no delimiter is inserted.
	PRERN	This option specifies that a delimiter (MTSMSDLTRV) is to be inserted before the RN when the RN is used in the MTSMSIMSI and MTSMSNNI digits. (RN included in the digit format is MTSMSDLTRV + RN from RTDB)
	POSTRN	This option specifies that a delimiter (MTSMSDLTRV) is to be inserted after the RN when the RN is used in the MTSMSIMSI and MTSMSNNI digits. (RN included in the digit format is RN from RTDB + MTSMSDLTRV)
MTSMSDLTRV	1-5 hex digits	This specifies if delimiter digit(s) need to be inserted in the MTSMSIMSI and MTSMSNNI if required (per MTSMSDLTR). This value can consist of 1-5 hexadecimal digits. A value must be defined here before MTSMSDLTR can be set to PRERN or POSTRN. Once set, the MTSMSDLTRV can never be configured to "NONE" again.
MTSMSNAKERR	0-255 (default is 0x1 - Unknown Subscriber)	This specifies the TCAP error choice code to be included in the SRI_SM_ACK generated by SMS_MT. Note: This option will affect only the Error code choice byte. Certain error code choices (e.g., systemFailure and callBarred) have additional mandatory data as

GSMSMSOPTS Option	Value	Action in the EAGLE
		<p>per GSM specifications. However, the MT-Based GSM SMS NP feature will not encode any additional data in SRI_SM_NACK.</p> <p>Note: The MTSMSNAKERR is applicable to responses generated to both the SMSC and MMSC.</p>
MTSMSCHKSRC	YES	<p>This parameter value specifies that the SCCP CgPA GTA of the message will be used to determine whether the source of the message is a Home SMSC.</p> <p>If this option is set to YES and the SCCP CgPA GTA is present and there is not a match in the Home SMSC list, the source of the message is not considered to be a Home SMSC. In this case, the message is considered inapplicable for MT-SMS processing.</p> <p>If this option is YES and SCCP CgPA GTA is not present or has a 0 length, then it is assumed that the source is a Home SMSC.</p> <p>If this option is YES and SCCP CgPA GTA is present and there is a match in the Home SMSC list, then the message source is considered to be Home SMSC.</p> <p>Note: The order of checks performed follows:</p> <ol style="list-style-type: none"> 1. Home MMSC check is performed. If a Home MMSC check is to be performed (The MT-Based GSM MMS NP Feature is turned ON and GSMSMSOPTS:MTMMSGTA is not "NONE"), the SCCP CgPA GTA will be compared against GSMSMSOPTS:MTMMSGTA for a match. A match identifies the source to be a Home MMSC. This option (MTSMSCHKSRC) does not influence this first check for Home MMSC. 2. If the Home MMSC check is not successful, AND MTSMSCHKSRC is YES, then Home SMSC check is required if SCCP CgPA GTA is present.
	NO (default)	<p>This parameter value specifies that EAGLE will not validate the SCCP CgPA GTA for Home SMSC check. If the initial check for Home MMSC is not successful and if this option is NO, then the source is assumed to be Home SMSC.</p> <p>This option may be used by the service provider to disable SCCP CgPA-checking for Home SMSC check, if the service provider ensures that only in-network nodes will send SRI_SM and receive the response generated by this feature.</p>

GSMSMSOPTS Option	Value	Action in the EAGLE
SRISMDN	SCCP	<ul style="list-style-type: none"> • After number conditioning, G-Port uses the SCCP CdPA as the database search key for SRI_SM messages. • MNP Circular Routing (MNPCR) uses the SNAI processing of G-Port to determine if the DN of the incoming SRI_SM message contains an RN concatenated with the DN. If no RN is present, then the entire DN is used as the database search key after number conditioning. • If an RN is present, the HomeRN table is searched to determine: <ul style="list-style-type: none"> - if the RN is a HomeRN to be stripped from the DN before performing the query. - if the RN is not a HomeRN allowing the entire DN to be used as the database search key.
	TCAP	<ul style="list-style-type: none"> • G-Port decodes up to 22 digits in the MSISDN of the SRI_SM message. The 22nd digit can only be a STOP (<i>x0F</i>) digit; in this case, G-Port strips the last digit and uses the remaining digits to perform number conditioning for database lookup. • G-Port conditions the decoded MSISDN number to International number based on the NAI value of the MSISDN. • If the number of digits is greater than 15 after number conditioning is performed, the MSU falls through to GTT and UIM 1246 is issued. • After number conditioning, G-Port uses the MAP MSISDN as the database search key for SRI_SM messages. • HomeRN prefix deletion from SRI_SM messages is performed only when MNP Circular Route Prevention (MNPCR) is turned on. This is similar to SRI message processing when SRIDN=TCAP. • If MNPCR is turned on and a circular route is detected, then MNPCR processing is applied to the SRI_SM message. • If the SRI_SM message is to be relayed after deleting HomeRN lookup results in SP, the TCAP section of the SRI_SM message is reformatted and the HomeRN digits are removed from the MSU.

GSMSMSOPTS Option	Value	Action in the EAGLE
		<ul style="list-style-type: none"> • If GSMSOPTS parameter SRISMGTTTRTG=ON and an MT-Based GSM SMS NP response is not required, then to comply with GTT the SCCP CdPA digits are conditioned to international number (CC+NDC+SN) depending on the SNAI. <p>An SRI_SM Nack is generated if decoding the TCAP MSISDN parameter of the SRI_SM returns an error for any of these reasons:</p> <ul style="list-style-type: none"> • Length field of TCAP MSISDN parameter is invalid. • Length of MSISDN is less than the mandatory fixed length. • The number of digits is zero or greater than 21. (UIM 1294 is generated.)

MT-Based GSM SMS and MMS NP Call Flows

This section illustrates the sequence of messages that occur in the processing of SMS and MMS messages destined for mobile-terminated subscribers in a number portability environment. Two scenarios exist:

- The called subscriber that is in the same network as the calling subscriber
- The called subscriber that is in a different network from the calling subscriber

MT-Based GSM SMS and MMS NP Call Flow for In-Network Subscriber

Figure 8: MT-Based GSM SMS and MMS NP Call Flow for In-Network Subscriber depicts the message and control flows for a called subscriber that is in the same network as the calling subscriber.

Figure 8: MT-Based GSM SMS and MMS NP Call Flow for In-Network Subscriber

Call considerations:

- The TCAP calling party is a wireless GSM subscriber.
- The TCAP called party is a non-ported or ported-in wireless subscriber that belongs to the same carrier.
- The call type is SMS or MMS.
- SMSC has to be reconfigured to generate SRI_SM to the HLR, regardless of called subscriber number being in or out of its own numbering range.
- In case called subscriber is ported-in, it has to be provisioned individually.
- In case called subscriber is TDMA, the EAGLE Migration feature ensures that the message gets delivered in the TDMA network.

MT-Based GSM SMS and MMS NP Call Flow for Other-Network Subscriber

Figure 9: MT-Based GSM SMS and MMS NP Call Flow for Other-Network Subscriber depicts the message and control flows for a called subscriber that is a different network from the calling subscriber.

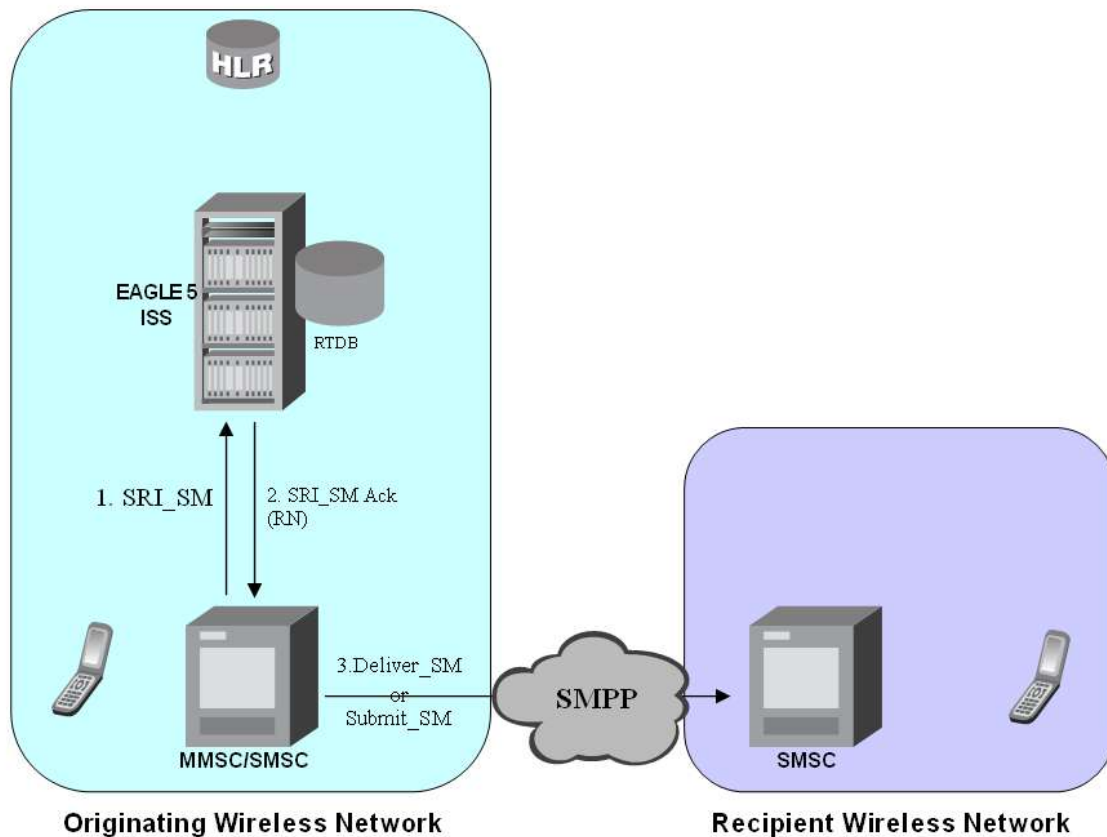

Figure 9: MT-Based GSM SMS and MMS NP Call Flow for Other-Network Subscriber

Call considerations:

- The TCAP calling party is a wireless GSM subscriber.
- The TCAP called party is a non-ported or ported-out wireless subscriber that belongs to a different carrier from the TCAP calling party.
- The call type is SMS or MMS.
- The SMSC (Short Message Service Center) has to be configured to associate the RNs to their respective carriers.
- The called subscriber must be provisioned individually.

MT-Based GSM MMS NP

The Mobile Terminated (MT)-Based GSM MMS NP feature allows wireless operators to route Multimedia Message Service (MMS) messages destined to mobile subscriber within a number portability (NP) environment. If the MT-Based GSM MMS NP feature is not enabled and turned on, then messages are processed by the G-Port feature.

The Mobile Terminated (MT)-Based GSM MMS NP feature allows database lookup to be performed on MMS messages that are routed from a Multimedia Message Service Center (MMSC).

The MT-Based GSM MMS NP feature intercepts SRI_SM messages and sends response messages with routing information for out-of-network destination subscribers using the following process:

1. An SRI_SM message is intercepted by the EAGLE before it reaches the home location register (HLR).
2. The message destination address (SCCP Called Party GTA) is extracted, the digits are conditioned, and lookup is performed in the database.
3. If the destination address/subscribers belongs to a foreign network, then a reply message is sent to the MMSC with routing information. If the destination address/subscribers belongs to a local network, then the SRI_SM message is relayed to the HLR or according to the options set for normal G-Port routing.

Options

The MT-Based GSM MMS NP feature provides the following configurable options for controlling processing of Multimedia Message Service (MMS) routing request messages and the content of the response:

- Selecting the Multimedia Message Service Center (MMSC) response message type and digit format
- Specifying when a database lookup is considered to be successful
- Specifying the format of digits encoded in the response message
- Specifying the number of digits in the SRI_SM ACK response message

Feature Control Requirements

The MT-Based GSM MMS NP feature has the following control requirements:

- The MT-Based GSM MMS NP feature must be enabled and turned on.
- Part number 893-0241-01
- The feature cannot be turned off after it has been turned on.

System Options for MT-Based GSM MMS NP

The system level options that control the MT-Based GSM MMS NP feature are stored in the GSMSMSOPTS database table. The MT-Based GSM MMS NP feature must be enabled before the GSMSMSOPTS table can be provisioned.

The content of the GSMSMSOPTS table is used to help perform number conditioning, response generation, and other feature-specific options. [Table 10: MT-Based GSM MMS NP Options](#) shows the feature-specific options stored in the GSMSMSOPTS table, their possible values, and the action taken for each value.

Note: The options described in [Table 10: MT-Based GSM MMS NP Options](#) are accessible only when the MT-Based GSM MMS NP feature is enabled. Processing of MSUs from MMSCs will also require the use of the GSMSMSOPTS options described for the MT-Based GSM SMS feature in [Table 9: MT-Based GSM SMS NP Options](#).

Table 10: MT-Based GSM MMS NP Options

GSMSMSOPTS	Value	Action in the EAGLE
MTMMSGTA	5-21 hex digits (default is NONE)	<p>This option pertains to Home MMSC check. When an SCCP CgPA GTA is present in the message, this option is used to compare the SCCP CgPA GTA of the incoming SRI_SM message to determine whether the originator is a Home MMSC. If a match is found, the MTMMSTYPE and MTMMSACKN options are used to determine whether SRI_SM ACK or NACK is to be sent, and the conditions when lookup is considered to be successful for MMS.</p> <p>The nature of match is a “Prefix match”. That is, the leading digits must match all the digits provisioned in MTMMSGTA.</p> <p>Note: The digits for compare can have more than the number of digits configured in MTMMSGTA</p> <p>This option can be set to NONE at any time.</p> <p>A value of NONE implies that the special processing of MMS is not required, and MT-Based SMS NP processing will follow. A setting of NONE will not match any SCCP CgPA GTA.</p>
MTSMSTYPE	SP	When the lookup in the RTDB has entitytype=SP, then the lookup is considered successful.
	RN (default)	When the lookup in the RTDB has entitytype=RN, then the lookup is considered successful.
	SPRN	When the lookup in the RTDB has entitytype=SP or RN, then the lookup is considered successful.
	ALL	When the lookup in the RTDB has entitytype=SP or RN or no_entity, then the lookup is considered successful.
	NONSP	When the lookup in the RTDB does not have an entitytype SP, then the lookup is considered successful. This could mean that no entity was found or an entity with type RN was found.
	<p>Note:</p> <p>This option is applied to messages in which the source is considered to be a Home SMSC.</p> <p>Duplicate options are provided for this parameter for MTMMS and MTSMS in order to be able to control processing of messages from the Home MMSC independently from those coming from a Home SMSC.</p>	

GSMSMSOPTS	Value	Action in the EAGLE
MTMMSACKN	ACK (default)	This indicates that when the SRI_SM lookup is considered successful, a SRI_SM_ACK (Return Result Last) is returned.
	NACK	This indicates that when SRI_SM lookup is considered successful, a SRI_SM_NACK (Return Error) is returned.
	<p>Note:</p> <p>This option is applied to messages in which the source is considered to be a Home SMSC.</p> <p>Duplicate options are provided for this parameter for MTMMS and MTSMS in order to be able to control processing of messages from the Home MMSC independently from those coming from a Home SMSC.</p>	
MTMMSENTYLEN	1 - 15 (default is NONE)	This indicates the maximum number of digits used from the entity value of a returned RN, SP, or SRFIMSI entity for MMS processing. Digits that exceed the configured maximum are concatenated. numbers. The parameter value <i>NONE</i> indicates that all returned digits are used.
MTMMSLEN	1 - 24 (default is NONE)	This indicates the maximum number of digits used in the returned IMSI or NNN fields for MMS processing. Digits that exceed the configured maximum are concatenated. numbers. The parameter value <i>NONE</i> indicates that all digits are used.

MT-Based GMS MMS NP Call Flows

The MT-Based GMS MMS NP feature call flows are identical to those used by the MT-Based GMS SMS NP feature and are described in [MT-Based GSM SMS and MMS NP Call Flows](#).

G-Port SRI Query for Prepaid

When the G-Port SRI Query for Prepaid feature is enabled and turned on, incoming SRI TT, OPC, and GTA values are compared against the values in the GSERV table. If no match is found, or if no values are provisioned in the GSERV table, normal G-Port SRI processing is performed on the message. If a match is found for one or more of the values, the message is treated as a Prepaid Query. The G-Port SRI Query for Prepaid feature affects only SRI messages. All other messages, including SRI-SM and SRI-GPRS messages, are processed by normal G-Port service.

After an SRI message is identified as requiring G-Port SRI Query for Prepaid service, the EAGLE performs a Mobile Number Portability (MNP) database lookup on the Mobile Station Integrated Services Digital Number (MSISDN). The results of the lookup are returned to the SCP that originated the query.

A TCAP/MAP error specifically related to a decoding error in the SRI MSISDN parameter causes an “Unsupported/Unexpected Data Value” MAP error. All other TCAP/MAP errors cause the message to be relayed to a Home Location Register (HLR), which then returns the appropriate MAP error based on the status of the subscriber (e.g. Unknown, Barred, etc.)

If a TCAP error is detected, then the message relay is based on information in the Real Time Database (RTDB). SCCP level errors cause the return on a UDTs message to the Prepaid SCP.

The G-Port SRI Query for Prepaid feature cannot be turned off after it is turned on.

Service Portability support for G-Port SRI Query for Prepaid

Service Portability support for the G-Port SRI Query for Prepaid feature allows the RTDB GRN Entity digits to be used in digits formats for own-network GSM and IS41 subscribers in place of the SP entity digits or RN/PT=0 entity digits, where RN or SP is Network Entity Type and PT is Portability Type.

The Service Portability support for the G-Port SRI Query for Prepaid feature can be turned off after it is turned on.

The SPORTTYPE configuration option indicates whether Service Portability will apply to SRI Query for Prepaid messages for own-network subscribers (IS41, GSM, or all). When Service Portability is applicable, GRN digits are used in place of RN digits during construction of the MSRN.

The Default RN configuration option is applicable in general to Number Portability, and can be used whether Service Portability feature is on or off. When the Service Portability feature is on, the Default RN is applicable in cases where Service Portability usage of GRN does not apply. Refer to [Table 11: RN Digits for Subscriber Type = RN/0 \(Own Subscriber - IS41\) with Service Portability On](#) and [Table 12: RN Digits for Subscriber Type = SP \(Own Subscriber - GSM\) with Service Portability On](#). When the Service Portability feature is off, Default RN digits can be used for own-network subscribers during construction of the MSRN. Refer to [Table 13: RN Digits with Service Portability Off](#).

G-Port SRI Query for Prepaid must be enabled to provision the GSMOPTS:DFLTRN option. Both G-Port SRI Query for Prepaid and Service Portability must be enabled to provision the GSMOPTS:SPORTTYPE option. RTDB DN data must be provisioned with RN or SP entity for Service Portability support for the G-Port SRI Query for Prepaid feature. Other EPAP-related features that use the GRN field are mutually exclusive with the Service Portability feature.

Table 11: RN Digits for Subscriber Type = RN/0 (Own Subscriber - IS41) with Service Portability On

GSMOPTS:SPORTTYPE Value	GSMOPTS:DFLTRN = NONE	GSMOPTS:DFLTRN = DIGITS
NONE	RN=RTDB RN Entity ID	RN=DFLTRN
GSM	RN=RTDB RN Entity ID	RN=DFLTRN
IS41	RN=GRN If GRN is not provisioned, DFLTRN is not used. MSISDN digits are sent. The subscriber is incorrectly provisioned and needs to have a GRN assigned.	
ALL	RN=GRN	

GSMOPTS:SPORTTYPE Value	GSMOPTS:DFLTRN = NONE	GSMOPTS:DFLTRN = DIGITS
	If GRN is not provisioned, DFLTRN is not used. MSISDN digits are sent. The subscriber is incorrectly provisioned and needs to have a GRN assigned.	

Table 12: RN Digits for Subscriber Type = SP (Own Subscriber - GSM) with Service Portability On

GSMOPTS:SPORTTYPE Value	GSMOPTS:DFLTRN = NONE	GSMOPTS:DFLTRN = DIGITS
NONE	RN=RTDB SP Entity ID	RN=DFLTRN
GSM	RN=GRN If GRN is not provisioned, DFLTRN is not used. MSISDN digits are sent. The subscriber is incorrectly provisioned and needs to have a GRN assigned.	
IS41	RN=RTDB SP Entity ID	RN=DFLTRN
ALL	RN=GRN If GRN is not provisioned, DFLTRN is not used. MSISDN digits are sent. The subscriber is incorrectly provisioned and needs to have a GRN assigned.	

Table 13: RN Digits with Service Portability Off

Subscriber Type returned from RTDB	GSMOPTS:DFLTRN = NONE	GSMOPTS:DFLTRN = DIGITS
RN/PT = 0	<i>IGM feature ON or OFF:</i> RN=RTDB RN Entity ID	<i>IGM feature ON:</i> RN=DFLTRN <i>IGM feature OFF:</i> RN=RTDB RN Entity ID
SP (own GSM)	<i>IGM feature ON or OFF:</i> RN=RTDB SP Entity ID	<i>IGM feature ON or OFF:</i> RN=DFLTRN
RN/PT ≠ 0 (Other Licensed Operator)	<i>IGM feature ON or OFF:</i> RN = RTDB RN Entity ID	
No Entity Found	<i>IGM feature ON or OFF:</i> RN=EMPTY (Only B-Party Number)	

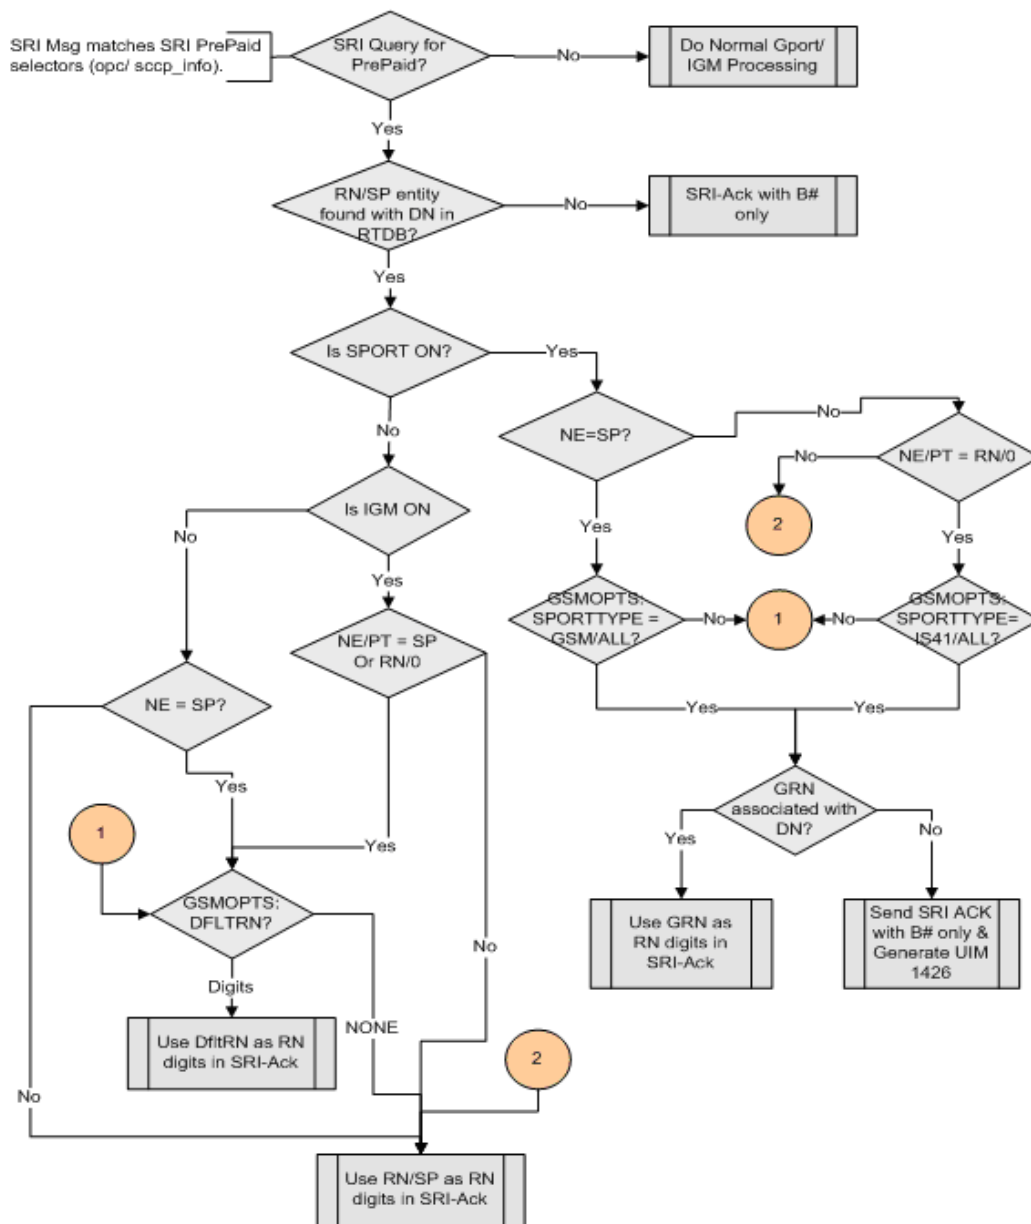

Figure 10: Message Processing - Service Portability Support for SRI Query for Prepaid

GSM MAP SRI Redirect to Serving HLR

The GSM MAP SRI Redirect to Serving HLR feature provides the capability to resolve network problems introduced by maintaining equipment from multiple manufacturers with vendor-specific proprietary implementations. Normally, the G-Port feature relays an SRI message to an operator's own HLR for a ported-in number. This feature allows the operator to route those messages based on the type of

equipment at the source MSC and destination HLR. Vendor Type, Vendor Number, and Vendor Prefix are used to provision this information.

If the originating Mobile Switching Center (MSC) of the Send Route Information (SRI) message and the destination Home Location Register (HLR) are the same vendor type, the message is relayed to the HLR associated in the RTDB to the service provider. If the originating MSC of the SRI message and the destination HLR are not the same vendor type, G-Port checks whether the vendor type is deployed in more than one network; each network has its own vendor/network prefixes. MSC SRI message Home Location Register (HLR)

If the vendor types of the originating MSC and destination HLR are different and the destination HLR vendor type is deployed in more than one network, the vendor/network prefix that points to the network where the hosting HLR resides is appended. If the vendor types of the originating MSC and destination HLR are different and the vendor type of destination HLR is deployed in only one network, the vendor/network prefix that is assigned to the network is appended.

The GSM MAP SRI Redirect to Serving HLR feature supports provisioning of a Vendor Prefix List of up to 32 entries, a Vendor Type List of up to 32 entries, and a Vendor ID List of up to 500 entries. Each Vendor Prefix List entry contains the Vendor Number and associated Vendor Prefix (maximum of six digits). Each Vendor ID List entry contains the Vendor ID, Vendor Type, and Vendor (network) Number. All Vendor IDs must be the same length which is provisionable for 1 to 15 digits using the `ent-vendid` command. A Vendor ID cannot be entered into the database until the associated Vendor Prefix is defined.

Table 14: Vendor Prefix List example

Vendor Number	Vendor Prefix
1	1004
2	1003
3	1004

Table 15: Vendor ID List example

Vendor/Network Type	Vendor Number	Vendor ID
1	1	886932
1	1	886935
1	3	886938
2	2	886936

Intra Network Number Portability

With the introduction of the Intra Network Number Portability feature and the new GSMOPTS:SRIRDCTENT option, the Generic Routing Number (GRN) can be used to identify intra-circle and inter-circle calls. Before the Intra Network Number Portability feature, the GSM MAP SRI Redirect to Serving HLR feature identified the serving HLR based on only the Circle Type and Circle Number for operators. With the Intra Network Number Portability feature, each Circle has a unique GRN, a unique Vendor Type, and a unique Vendor Number. The new GSMOPTS:SRIRDCTENT option has two possible values: GRN and SP. Intra Network Number Portability customers use the

GSMOPTS:SRIRDCTENT option set to GRN. The GSM MAP SRI Redirect to Serving HLR feature must be enabled before the GSMOPTS:SRIRDCTENT option can be configured.

Table 16: Example: EPAP Provisioning for Intra Network Number Portability

DNs	GRN
All DNs of Circle1	GRN1
All DNs of Circle2	GRN2
All DNs of Circle3	GRN3

Table 17: Example: EAGLE Vendor ID Table for Intra Network Number Portability

Vendor ID	Vendor Type	Vendor Number
MSCGT1	T1	V1
MSCGT2	T2	V2
MSCGT3	T3	V3
GRN1	T1	V1
GRN2	T2	V2
GRN3	T3	V3

Table 18: Example: EAGLE Vendor PrefixTable for Intra Network Number Portability

Vendor Number	Vendor Prefix
V1	GRN1
V2	GRN2
V3	GRN3

If after RTDB lookup, SP and GRN are found corresponding to the DN, EAGLE uses GRN for lookup in the Vendor ID table. If the GRN is found in the Vendor ID table, EAGLE checks whether the CgPA has a valid length GTA. Then EAGLE uses the CgPA GTA to lookup in the Vendor ID table. If the CgPA GTA is found in the Vendor ID table, EAGLE compares the two vendor types associated with the CgPA GTA and the GRN.

Scenario 1 : If both Vendor Types are same, the CdPA and the originating MSC belong to the same circle. EAGLE relays the SRI message to the HLR as determined by the SP.

Scenario 2 : If the two vendor types are different, that means the CdPA and the originating MSC belongs to different circles. EAGLE generates an SRI_ACK using the Vendor Prefix (GRN of destination circle) as the RN. The SRI_ACK is then sent to the originating GMSC.

If after RTDB lookup, the RN is found corresponding to the DN then normal G-Port processing is continued.

Calling party / Operator	Called Party /Operator	Called Party Ported Status	Result
Circle 1 / Operator A	Circle 1 / Operator A	Not Ported	Relay
Circle 1 / Operator A	Circle 2 / Operator A	Ported to Circle 1 / Operator A	Relay
Circle 1 / Operator A	Circle 2 / Operator A	Ported to Circle 3 / Operator A	SRI_ACK with GRN3A
Circle 1 / Operator A	Circle 1 / Operator B	Not Ported	SRI_ACK with RN 1B
Circle 1 / Operator A	Circle 1 / Operator B	Ported to Circle 1 / Operator A	Relay
Circle 1 / Operator A	Circle 2 / Operator B	Ported to Circle 3 / Operator B	SRI_ACK with RN 3B
Circle 1 / Operator A	Circle 2 / Operator B	Ported to Circle 3 / Operator C	SRI_ACK with RN 3C
Circle 1 / Operator A	Circle 2 / Operator B	Ported to Circle 1 / Operator B	SRI_ACK with RN 1B
Circle 1 / Operator A	Circle 2 / Operator B	Ported to Circle 2 / Operator C	SRI_ACK with RN 2C

GSM MAP SRI Redirect to Serving HLR Call Flows

Refer to [Figure 11: GSM MAP SRI Redirect to Serving HLR Call Flows](#) for a graphical representation of the GSM MAP SRI Redirect to Serving HLR call flow. This call flows assumes that GSMOPTS:SRIRDCTENT=SP.

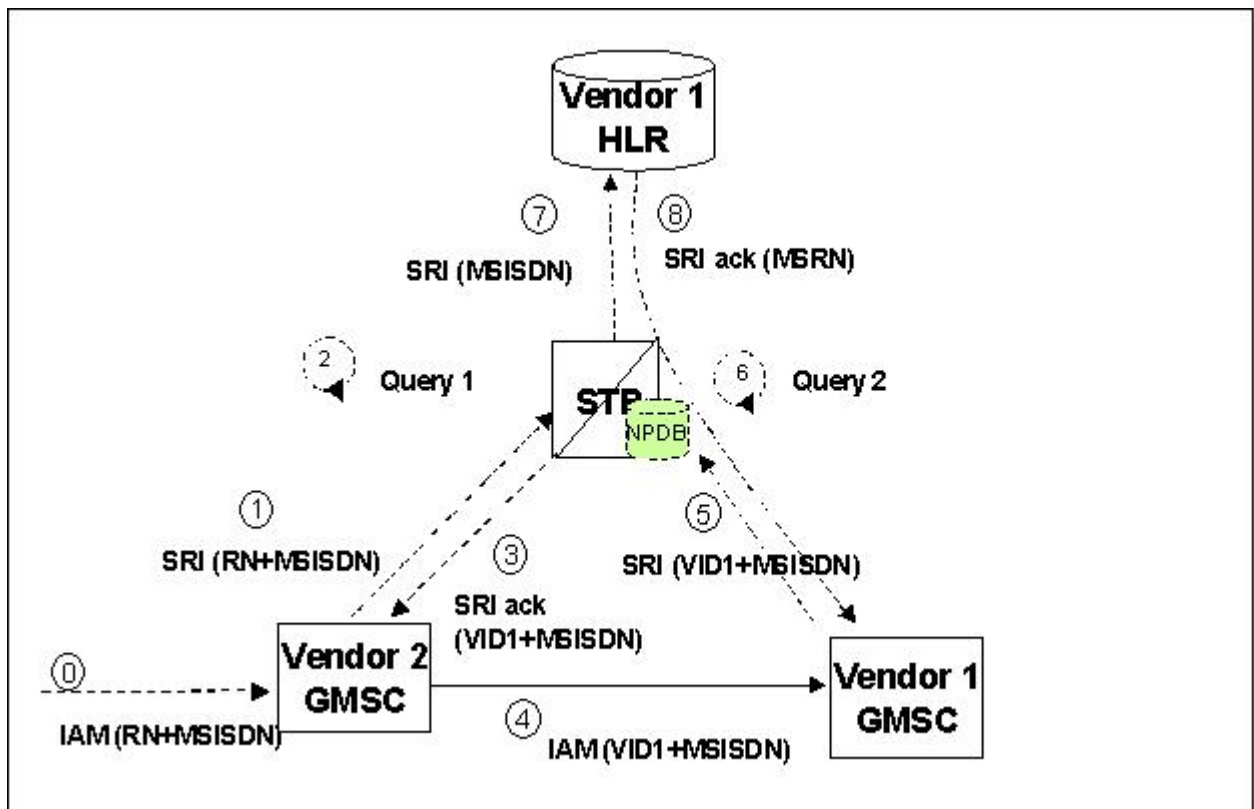

Figure 11: GSM MAP SRI Redirect to Serving HLR Call Flows

For a ported-in number, Gateway Mobile Switching Center (GSMC) Vendor 2 receives an Initial Address Message (IAM) with CdPN.

1. The receiving GMSC interrogates the Home Location Register (HLR) for the current location of the subscriber by issuing a Send Route Information (SRI) message.
2. When an SRI message is received that meets the G-Port service selector criteria, HomeRN deletion and number conditioning are performed on the DN. The DN database is searched. If the DN is found in the database with a service provider (HLR entity address) associated with the called party MSISDN, the Vendor ID list is searched for the service provider. If the service provider is found in the Vendor ID list, the CgPA is checked for a valid length GTA. The Vendor ID list is searched for the CgPA GTA. If the CgPA GTA is found in the Vendor ID list, the two vendor numbers associated with the CgPA GTA and the service provider are compared. If the GMSC and the HLR are the same vendor type, go to step #7. If the GMSC and the HLR are different vendor types, go to step #3.
3. If the destination network belongs to a vendor type that is deployed in more than one network, an SRI_ACK is generated using the Vendor Prefix of the destination network as the RN. The MSRN is filled using various options provisioned in the GSMOPTS table for the G-Port SRI_ACK. The SRI_ACK is sent to the originating GMSC.
4. Based on the Vendor Prefix, the originating GMSC routes the call to the GMSC of the network associated with the vendor by the IAM.

5. The subscription network GMSC formulates and sends an SRI message to the EAGLE to interrogate the current location of the subscriber.
6. G-Port performs a database lookup based on the MSISDN in the SRI and determines that the number belongs to its network. The service provider (HLR entity address) associated with the MSISDN and the CgPA GTA (GMSC/MSC) are confirmed to be the same vendor type. .
7. The SRI is relayed to the HLR associated to the service provider.
8. The HLR returns an SRI_ACK to the GMSC through the EAGLE.

Hardware Requirements

EPAP-related features that perform an RTDB lookup require Service Module cards (E5-SM4G cards or E5-SM8G-B cards) running the SCCPHC application. The EAGLE can be equipped with up to 32 (31+1) Service Module cards.

Features that do not perform an RTDB lookup require Service Module cards only for GTT processing that might be performed for the feature. These features can coexist in systems with EPAP, but do not require an EPAP connection.

MPS/EPAP Platform

Oracle provides the Multi-Purpose Server (MPS) platform as a subsystem of the Oracle Communications EAGLE. The MPS provides support for EPAP-related features that perform Real Time Database (RTDB) lookups.

The MPS is composed of hardware and software components that interact to create a secure and reliable platform. For details about the MPS hardware, refer to *Application B Card Hardware and Installation Guide*. The MPS provides the means of connecting the customer provisioning application with the EAGLE and accepts the customer number portability data, while accommodating numbers of varying lengths.

The Oracle Communications EAGLE Application Processor (EPAP) is software that runs on the MPS hardware platform. EPAP collects and organizes customer provisioning data, and forwards the data to the EAGLE Service Module cards. For detailed information about EPAP, refer to *Administration Guide* for EPAP.

In this manual, Service Module card refers to an E5-SM4G card or an E5-SM8G-B card unless a specific card is required. For more information about the supported cards, refer to *Hardware Reference*.

Chapter 3

Commands

Topics:

- *Introduction.....65*
- *EAGLE Options Commands.....65*
- *EAGLE GSM Options Commands.....65*
- *EAGLE GSM SMS Options Commands.....69*
- *EAGLE G-Port Service Selector Commands.....70*
- *EAGLE SCCP Service Commands.....73*
- *EAGLE Feature Control Commands.....74*

This chapter contains brief descriptions of the EAGLE commands that are used for the configuration, control, maintenance, and measurements of the G-Port, MT-Based GSM SMS NP, and MT-Based GSM MMS NP features.

Introduction

This chapter describes the EAGLE commands used to administer the G-Port feature. The command descriptions include parameters that are used with the G-Port feature. Refer to *Commands User's Guide* for complete command descriptions including parameter names, valid parameter values, examples, and dependencies.

EAGLE Options Commands

The STP system options commands (`stpopts`) change and display STP-wide options in the EAGLE database. The following sections describe the commands: `chg-stpopts` and `rtrv-stpopts`. For details about these commands, refer to *Commands User's Guide*.

- **chg-stpopts: Change STP System Options Command** – The `chg-stpopts` command changes STP system options in the database. This command updates the STPOPTS table. The `defcc` and `defndc` parameters are used to convert non-international numbers received in the MSU to an international number. The `defcc` and `defndc` parameters can be specified only if the G-Port, Prepaid IDP Query Relay (IDPR), Prepaid SMS Intercept (PPSMS), V-Flex, or ATINP feature is enabled, or if the G-Flex, INP, or AINPQ feature is turned on.

Command example:

```
chg-stpopts:defcc=333:defndc=22345
```

Where:

`defcc`={1-3 digits, none} Default country code
`defndc`={1-5digits, none} Default network destination code

- **rtrv-stpopts: Retrieve STP System Options Command** – The `rtrv-stpopts` command is used to retrieve all STP options from the database. The options that appear in the output vary, depending on the features that are enabled or turned on.

EAGLE GSM Options Commands

The `gsmopts` commands change and display Global System for Mobile Telecommunications (GSM) options in the EAGLE database. The following sections describe the two variations: `chg-gsmopts` and `rtrv-gsmopts`. For details about these commands, refer to *Commands User's Guide*.

chg-gsmopts

Change GSM Options Command – The `chg-gsmopts` command changes G-Port-specific system options in the database. This command updates the GSMOPTS table. The default parameters are always overwritten when specified.

Table 19: chg-gsmopts Parameters - Class = DATABASE

Parameter	Range	Description
crptt	0-255, none	Circular Route Prevention Translation Type The MNP Circular Route Prevention feature must be turned on before this parameter can be provisioned to any value other than none. The MNP Circular Route Prevention feature cannot be turned off if this parameter is provisioned to any value other than none. The default value is none.
defmapvr	1-3	Default MAP version
defmcc	1-3 digits, none	E212 default mobile country code
dfltrn	1-15 digits, none	Default Routing Number This parameter specifies the default routing number to use as the routing number portion of the <code>msrndig</code> parameter when an SRI is processed by the G-Port SRI Query for Prepaid feature, an RTDB match is found for an own-network subscriber, and Service Portability is not applied. The default value is none.
gsm2is41	1-15 digits, none	GSM to IS41 migration prefix
is412gsm	1-15 digits, none	IS-41 to GSM migration prefix
migrpfx	multiple, single	Migration Prefix
msisdntrunc	1 digit (0-5)	Number of MSISDN digits to delete from the MISISDN before formulating the MSRN for the SRI Ack message
msrndig	rn, rndn, ccrndn, rnccdn, rnasd, asdrn, rnasddn, asdrndn, ccrnasddn, ccasdrndn, rnasdcdn, asdrnccdn, rngrn, grnrn, rngrndn, grnrndn, ccrngrndn, ccgrnrndn, rngrnccdn, grnrccdn	RN used <i>as is</i> or with MSISDN
msrnlcn	1-30	Number of digits in the MAP Routing Info portion of the returned SRI Ack message. Default value is 30.
msrnnai	0-7	Nature of Address Indicator Value (NAIV) for the MSRN

Parameter	Range	Description
msrnp	0-15	Numbering plan for the MSRN
multcc	1 to 3 digits (0-9, a-f, A-F)	Multiple Country Code
nmultcc	1 to 3 digits (0-9, a-f, A-F), none	New Multiple Country Code
off	encdnpsdnnotfound, encdnpsptnone, encodecug, encodenps, srismgttrtg	<p>This parameter turns off specified options. Up to 8 comma-separated unique options can be specified.</p> <ul style="list-style-type: none"> • encdnpsdnnotfound - NPSI for DN not found option This option specifies whether the NPSI is included in SRI Ack messages when the DN is not found. The default setting is <code>off</code>. • encdnpsptnone - NPSI for PT = none This option specifies whether the NPSI is included in SRI Ack messages when the Portability Type = none. The default setting is <code>off</code>. • encodecug - Closed User Group (CUG) option This option specifies whether the Closed User Group (CUG) Checkinfo from the SRI message is included in the SRI Ack message. The default setting is <code>off</code>. • encodenps - Number Portability Status Indicator (NPSI) option This option specifies whether the Number Portability Status Indicator (NPSI) is omitted from all SRI Ack messages. The default setting is <code>on</code>. • srismgttrtg - SRI_SM Routing option This option specifies whether the SRI_SM and ReportSMSDeliveryStatus routing to GTT is on. The default setting is <code>off</code>.
on	encdnpsdnnotfound, encdnpsptnone, encodecug, encodenps, srismgttrtg	<p>This parameter turns on specified options. Up to 8 comma-separated unique options can be specified. Refer to <code>off</code> parameter for option descriptions.</p>

Parameter	Range	Description
serverpfx	1-4 digits, none	Server SRI prefix
sporttype	gsm, is41, all, none	Service Portability Type This parameter specifies whether Service Portability applies to G-Port SRI Query for Prepaid for own-network subscribers. Default value is none.
srfaddr	1-15 digits, none	Entity address of MNP_SRF node
srfnai	0-127	NAIV of the MNP_SRF
srfnp	0-15	Numbering plan value of the MNP_SRF Network Code
sridn	tcap, sccp	SRIDN location
sridnnotfound	gtt, srinack	When G-Port encounters an RTDB query result that indicates that the given DN is not known, the SRIDNNOTFOUND parameter value determines further processing. The default value is gtt.
srirdctent	grn, sp	This parameter indicates whether the Intra Network Number Portability feature (grn) or the MAP SRI Redirect to Serving HLR feature (sp) is used to match Vendor Type of CgPA GTA.

Command examples:

- `chg-gsmopts:srfnai=4:srfnp=2:srfaddr=331111111111`
- `chg-gsmopts:srfaddr=333221234567890:msrndig=rn:srfnai=1:srfnp=1:msrnnai=4:msrnp=10`
- `chg-gsmopts:sridn=tcap`
- `chg-gsmopts:is412gsm=0123456789abcde`
- `chg-gsmopts:srirdctent=grn`

rtrv-gsmopts

Retrieve G-Port System Options Command

The `rtrv-gsmopts` command displays all GSM-specific system options from the database.

EAGLE GSM SMS Options Commands

The GSM SMS options (`gsmsmsopts`) commands change and display specific SMS and MMS options in the EAGLE database for the MT-based GSM SMS NP and MT-based GSM MMS NP features. The following sections describe the two variations: `chg-gsmsmsopts` and `rtrv-gsmsmsopts`. For details about these commands, refer to *Commands User's Guide*.

The `mtmmsackn`, `mtmmsentynlen`, `mtmmsgta`, `mtmmslen`, and `mtmmstype` parameters apply to only messages that are modified by the MT-Based GSM MMS NP feature. The MT-Based GSM MMS NP feature must be enabled to specify these parameters.

The `mtsmsackn`, `mtsmschksrc`, `mtsmsdltr`, `mtsmsdltrv`, `mtsmsimsi`, `mtsmsnakerr`, `mtsmsnni`, and `mtsmstype` parameters apply to only messages that are modified by the MT-Based GSM SMS NP feature. The MT-Based GSM SMS NP feature must be enabled to specify these parameters.

chg-gsmsmsopts

Change GSM SMS Options Command – The `chg-gsmsmsopts` command changes GSM SMS system options in the database. This command updates the GSMSMSOPTS table. The default parameters are always overwritten when specified.

Table 20: chg-gsmsmsopts Parameters Class = DATABASE

Parameter	Range	Description
<code>mtmmsackn</code>	ack, nack	MT-based MMS acknowledgement
<code>mtmmsentynlen</code>	1-15, none	MT-based MMS entity length
<code>mtmmsgta</code>	5-21 digits, none	MT-based MMS GTA
<code>mtmmslen</code>	1-24, none	MT-based MMS length
<code>mtmmstype</code>	sp, rn, sprn, all, nonsp	MT-based MMS type
<code>mtsmsackn</code>	ack, nack	MT-based SMS acknowledgement
<code>mtsmschksrc</code>	yes, no	MT-based SMS check source
<code>mtsmsdltr</code>	no, prern, postrn	MT-based SMS delimiter
<code>mtsmsdltrv</code>	1-5 digits	MT-based SMS delimiter value
<code>mtsmsimsi</code>	rn, rndn, ccrndn, dn, srfimsi, mccrndn	MT-based SMS IMSI
<code>mtsmsnakerr</code>	0-255	MT-based SMS negative acknowledgement error
<code>mtsmsnni</code>	rn, rndn, ccrndn, dn, srfimsi, mccrndn, none	MT-based SMS network node indicator
<code>mtsmstype</code>	sp, rn, sprn, all, nonsp	MT-based SMS type

Parameter	Range	Description
srismdn	sccp, tcap	SRI_SM DN location This parameter specifies whether the MT-Based GSM SMS NP feature selects the MSISDN from the SCCP CdPA or TCAP CdPN section of the SRI_SM message. The MT-Based GSM SMS NP feature must be enabled and turned on to specify this parameter.

Command example:

- `chg-gsmsmsopts:mtmmsgta=51111:mtmstype=sp:mtmmsackn=nack:mtmmsentylen=7:mtmmslen=10`

rtrv-gsmsmsopts

Retrieve GSM SMS Options Command

The `rtrv-gsmsmsopts` command displays all GSM SMS and MMS options from the database.

EAGLE G-Port Service Selector Commands

The G-Port service selector (`srvsel`) commands are used to provision new selectors for the G-Port service, providing greater flexibility when provisioning the type of messages that require G-Port processing. The following sections describe the four variants: `ent-srvsel`, `chg-srvsel`, `dlt-srvsel`, and `rtrv-srvsel`. For further details on the EAGLE G-Port service selector commands (such as command rules and output format), refer to *Commands User's Guide*.

ent-srvsel: Enter G-Port Service Selectors Command – The `ent-srvsel` command specifies that the applicable G-Port service selectors indicating G-Port processing are required. The available parameters are described in [Table 21: ent-srvsel Parameters - Class = DATABASE](#).

Table 21: ent-srvsel Parameters - Class = DATABASE

Parameter	Range	Description
gti, gtia, gtii, gtin, gtin24	2, 4	Global Title Indicator
serv	eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp, vflex, atinp	GSM service
snai	1sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn	Service Nature Of Address Indicator
snp	1e164, e212, e214	Service Numbering Plan
ssn	0-255, *	Subsystem Number
tt	0-255	Translation Type

Parameter	Range	Description
nai	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	0-127	NAI Value
np	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	0-15	Numbering Plan Value

chg-srvsel: Change G-Port Service Selector Command – The `chg-srvsel` command specifies the applicable G-Port selectors required to change an existing G-Port selector entry. The available parameters are described in [Table 22: chg-srvsel Parameters - Class = DATABASE](#).

Table 22: chg-srvsel Parameters - Class = DATABASE

Parameter	Range	Description
gti, gtia, gtii, gtin, gtin24	2, 4	Global Title Indicator
ssn	0-255, *	Subsystem Number
tt	0-255	Translation Type
nai	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	0-127	NAI Value
np	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	0-15	Numbering Plan Value
nserv	eir, gflex, gport, inpq, inpmr, smsmr, idpr, idps, mnp, vflex, atinp	New GSM service
nsnai	sub, natl, intl, rmidn, rncdn, rnsdn, ccrndn	New Service Nature Of Address Indicator
nsnp	e164, e212, e214, none	New Service Numbering Plan

dlt-srvsel: Delete G-Port Service Selector Command – The `dlt-srvsel` command deletes a G-Port service selector. The available parameters are described in [Table 23: dlt-srvsel Parameters - Class = DATABASE](#).

Table 23: dlt-srvsel Parameters - Class = DATABASE

Parameter	Range	Description
gti, gtia, gtii, gtin, gtin24	2, 4	Global Title Indicator

Parameter	Range	Description
ssn	0-255, *	Subsystem Number
tt	0-255	Translation Type
nai	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	0-127	NAI Value
np	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	0-15	Numbering Plan Value

rtrv-srvsel: Retrieve G-Port Service Selector Command – The `rtrv-srvsel` command displays a list of administered G-Port service selector combinations. All output is sorted first by service, then by global title domain (ANSI first, followed by ITU), GTI, translation type, numbering plan, and by the nature of address indicator. The output can be filtered by specifying any optional parameter. The available parameters are described in [Table 24: rtrv-srvsel Parameters - Class = DATABASE](#)

Table 24: rtrv-srvsel Parameters - Class = DATABASE

Parameter	Range	Description
gti, gtia, gtii, gtin, gtin24	2, 4	Global Title Indicator
nai	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	0-127	NAI Value
np	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	0-15	Numbering Plan Value
serv	eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp, vflex, atinp	GSM service
snai	sub, natl, intl, rmidn, rwndn, rnsdn, ccrndn	Service Nature Of Address Indicator
snp	e164, e212, e214	Service Numbering Plan
ssn	0-255, *	Subsystem Number
tt	0-255	Translation Type

EAGLE SCCP Service Commands

The `sccp-serv` commands allow for services to be taken online and offline and for their processing load to be shifted to other designated nodes. These commands also support the assignment of point codes to service groups used for service re-route assignment. Three variations are described in this section: `chg-sccp-serv`, `dlt-sccp-serv`, and `rtrv-sccp-serv`.

Entries using the `chg-sccp-serv` command are provisioned in the SCCP-SERV table, and are shown by the `rtrv-sccp-serv` command output. This reduces the maximum number of entries that the MRN table can contain by the number of entries shown in the `rtrv-sccp-serv` command output. For information on provisioning MRN tables, refer to *Database Administration - GTT User's Guide*.

Refer to *Commands User's Guide* for additional details about the EAGLE SCCP service commands.

chg-sccp-serv: Change SCCP Service Command – The `chg-sccp-serv` command is used to add point codes to an existing service group, or to change the Relative Cost (RC) of existing point codes in a group. SCCP Service groups are organized by service and point code network type (ANSI, ITU-I, ITU-I Spare, ITU-N, ITU-N Spare, or ITU-N24). Up to seven point codes may be in a network type grouping for service re-route load sharing. This command allows for additions or modifications of up to four point codes. The point code parameters support the Spare Point Code subtype prefix `s-` for ITU-I and ITU-N point codes.

Table 25: chg-sccp-serv Parameters - Class = DATABASE

Parameter	Range	Description
serv	gport, gflex, mnp	Service
gtt	no, yes	Global Title Translation
pc1, pca1, pci1, pcn1, pcn241	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
rc1	00-99	Relative Cost
pc2, pca2, pci2, pcn2, pcn242	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
rc2	00-99	Relative Cost
pc3, pca3, pci3, pcn3, pcn243	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
rc3	00-99	Relative Cost
pc4, pca4, pci4, pcn4, pcn244	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
rc4	00-99	Relative Cost
state	offline, online	Service State

dlt-sccp-serv: Delete G-Port SCCP Service Command – The `dlt-sccp-serv` command is used to remove entries from the SCCP Service table. A single command may remove either a PCU from a group or the entire group. The available parameters follow:

Table 26: dlt-sccp-serv Parameters - Class = DATABASE

Parameter	Range	Description
serv	gport, gflex, mnp	Service
pc1, pca1, pci1, pcn1, pcn241	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
pc2, pca2, pci2, pcn2, pcn242	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
pc3, pca3, pci3, pcn3, pcn243	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
pc4, pca4, pci4, pcn4, pcn244	Refer to <i>Commands User's Guide</i>	Post GTT-translated PC
all	no, yes	Yes deletes all point codes from a service

rtrv-sccp-serv: Retrieve SCCP Service Command – The `rtrv-sccp-serv` command is used to display the SCCP Service application relationship information maintained by the EAGLE. Point codes are grouped by service.

EAGLE Feature Control Commands

These commands are used to enable, turn on, and display the feature status of the G-Port, MNPCRCP, MT-Based GSM SMS NP, and MT-Based GSM MMS NP features on the EAGLE. You must be entitled to use a feature before it can be enabled. If you are not sure whether you are entitled to use a feature, contact your Oracle Sales Representative or Account Representative.

After the feature G-Port feature is turned on, it cannot be turned off.

enable-ctrl-feat: Enable Controlled Feature Command – The `enable-ctrl-feat` command is used for enabling of controlled features. An example of the command using the G-Port part number is:

```
enable-ctrl-feat:partnum=893017201
```

chg-ctrl-feat: Change Controlled Feature Command – The `chg-ctrl-feat` command is used to turn on controlled features: G-Port, MNPCRCP, MT-Based GSM SMS NP, and MT-Based GSM MMS NP. The MNPCRCP, MT-Based GSM SMS NP, and MT-Based GSM MMS NP features require the G-Port feature to be enabled as a prerequisite. This command is also used to turn off ON/OFF features.

Command example using the MNPCRCP part number:

```
chg-ctrl-feat:partnum=893007001:status=on
```

rtrv-ctrl-feat: Retrieve Controlled Feature Command – The `rtrv-ctrl-feat` command is used display the on/off status of controlled features.

Feature Configuration

Topics:

- *Introduction.....76*
- *EPAP Entity Provisioning.....77*
- *Prerequisites.....77*
- *EAGLE HLR Configuration.....78*
- *G-Port Feature Activation Procedure.....84*
- *MT-Based GSM SMS NP Feature Activation Procedure.....87*
- *MT-Based GSM MMS NP Feature Activation Procedure.....89*
- *G-Port SRI Query for Prepaid Feature Activation Procedure.....90*
- *GSM MAP SRI Redirect to Serving HLR Feature Activation Procedure.....91*

This chapter describes the prerequisites, considerations, and steps to configure and activate the G-Port feature. This chapter also includes feature activation procedures for these features:

- MT-Based GSM SMS NP
- MT-Based GSM MMS NP
- G-Port SRI Query for Prepaid
- GSM MAP SRI Redirect to Serving HLR

Introduction

This chapter identifies prerequisites for the G-Port feature activation procedure and provides the feature activation procedures for the following features:

- G-Port
- MT-Based GSM SMS NP
- MT-Based GSM MMS NP
- G-Port SRI Query for Prepaid
- Service Portability support for G-Port SRI Query for Prepaid
- GSM MAP SRI Redirect to Serving HLR

These feature activation procedures are performed at the EAGLE.

The G-Port feature and other related features are optional and you must be entitled to use them in your system. Contact your Oracle Sales or Account Representative to determine whether you are entitled to use a specific feature or for additional information. The following features are related to the G-Port feature:

- Global Title Translation (GTT)
- Enhanced Global Title Translation (EGTT)
- Variable-Length Global Title Translation (VGTT)
- EAGLE Application Processor (EPAP)
- Mobile Number Portability Circular Route Prevention (MNPCRCP)

In addition, the following performance-related feature is related to G-Port:

- E5-SM4G Throughput Capacity

Note:

After a permanently-on feature has been enabled and turned on with the `enable-ctrl-feat` and `chg-ctrl-feat` commands, the feature cannot be turned off. Because this feature may affect other features or system databases, confirm that a feature license and technical support from Oracle are available before turning on this feature. Contact your Oracle Sales or Account Representative to verify whether you are entitled to use the feature.

Summary of Feature Activation

This table summarizes the feature activation attributes for the features in this chapter.

Table 27: Feature Activation Summary

Feature Name	Part Number	Permanently On?
GSM Mobile Number Portability (G-Port)	893017201	Yes

Feature Name	Part Number	Permanently On?
MNP Circular Route Prevention (MNPCRCP)	893007001	No
MT-Based GSM SMS NP	893020001	Yes
MT-Based GSM MMS NP	893024101	Yes
G-Port SRI Query for Prepaid	893017701	Yes
Service Portability	893034301	No
GSM MAP SRI Redirect to Serving HLR	893014001	Yes

EPAP Entity Provisioning

Oracle recommends that EPAP entity (SP or RN) administration not be performed until after the Point Code and/or Subsystem Number has been entered into the EAGLE MAP table.

- EPAP-administered entity data can become out-of-sync with the EAGLE MAP table when the creation of Point Codes and/or Subsystem Numbers in the MAP table is performed after EPAP database administration.
- If this mismatch is discovered in real-time operations, a UIM is sent to the EAGLE maintenance terminal. (Example UIMs: SCCP did not route - DPC not in MAP tbl, SCCP did not route - SS not in MAP tbl.)

Prerequisites

The G-Port feature activation assumes that the feature Global Title Translation (GTT), Enhanced Global Title Translation (EGTT), or Variable-Length Global Title Translation (VGTT) is already provisioned. Refer to *Database Administration - GTT User's Guide* for provisioning procedures.

The G-Port feature activation assumes that the EPAP software is already configured; refer to EPAP Software Configuration in *Administration Guide* for EPAP.

The G-Port feature activation assumes that the Service Module cards to be installed are identified.

- Note installed Service Module card locations, if any.
- Note available odd-even card slots for Service Module card installation.
- Determine Service Module card IP addresses and have the addresses available during the activation procedure.

For in-service systems, schedule Service Module card replacement during a maintenance window that allows the reboot of Service Module cards (`init-card`) one at a time.

For in-service systems with another EPAP-feature enabled, perform only [G-Port Feature Activation Procedure](#) to enable and turn on the G-Port feature. With another EPAP-feature enabled, the Service Module cards already contain the Real Time Database (RTDB).

For new systems, all Service Module cards may be rebooted at the same time using the `init-card:appl=vsccp` command. The GTT, EGTT, or VGTT feature must be turned on prior to adding the Service Module cards.

EAGLE HLR Configuration

This procedure configures the EAGLE system for Home Location Register (HLR) destinations before activating the GSM Mobile Number Portability (G-Port) feature. This procedure assumes that the EAGLE is an existing system in which the G-Port feature is being activated. The route to the HLR database may already be configured. Perform this procedure to verify that all HLR destinations for the feature are provisioned and to configure changes, as needed. The G-Port feature applies to ITU-I (international), ITU-N (national), and ANSI networks.

Refer to *Commands User's Guide* for detailed descriptions of the commands used in this procedure.

Procedure Overview

- Display current PCs, CPCs, DPCs, routes, and linksets using [Step 1](#) through [Step 6](#).
- Change current PCs, CPCs, DPCs, routes, linksets, and LIM cards using [Step 7](#) through [Step 25](#).

For detailed information about specific configuration activities in this procedure, refer to *Database Administration - SS7 User's Guide*. Useful procedures include:

- Adding a Point Code to the Self-Identification of the EAGLE
- Changing the Self-Identification of the EAGLE
- Adding a Destination Point Code
- Adding an SS7 Linkset
- Adding an SS7 Signaling Link
- Adding a Route Containing an SS7 DPC

1. Display the current self-identification characteristics (PC and CPC) of the system using the `rtrv-sid` command.

The self-identification characteristics of the system displayed by the `rtrv-sid` command include the point code (PC) assigned to the system, the CLLI code of the system, the capability point code of the STP (CPC), and the type of point codes supported by the system.

If the ITUDUPPC (ITU national duplicate point code) feature is on, the ITU national point code also contains a group code. The group code is a two-character field from *aa* to *zz* that is entered as the last subfield of an ITU national point code, *nnnnn-gc* (for example, 2112-aa).

2. Display the current destination point codes (DPC) in the Destination point code table (`dpc/dpca/dpci/dpcn`) using the `rtrv-dstn` command.
3. Display the current route and linkset configuration using the `rtrv-rte` command.
4. If the system point code (`pci/pcn`) or capability point code (`cpc/cpca/cpci/cpcn`) to be configured in this procedure is shown in [Step 1](#), [Step 2](#), or [Step 3](#), choose another point code to configure with this procedure. If configuring an ITU-N network, continue to [Step 5](#). If configuring a mated application but not configuring an ITU-N network, proceed to [Step 6](#). Otherwise, proceed to [Step 7](#).

5. Use the `rtrv-stpopts` command to display the PC or CPC format when configuring the system point code or capability point code (`pcn` or `cpcn`) of an ITU-N network.

The ITU-N point code format option `npcfmt` determines the format of the ITU-N point code in the database and how it is displayed in all system outputs. The defined value is shown in the `NPCFMT` field displayed in the output of the `rtrv-stpopts` command.

To change the format of the ITU-N point code, refer to "Point Code Formats" in *Database Administration - SS7 User's Guide*.

Continue to [Step 6](#) to display mated applications in the database. Otherwise, proceed to [Step 7](#).

6. Display the mated applications in the database using the `rtrv-map` command.
 - a) If the point code of the system is displayed in the `rtrv-map` command output (`PCA`, `PCI`, `PCN`, `MPCA`, `MPCI`, or `MPCN` fields), remove the system point code from the mated application table. Refer to procedure "Removing a Mated Application" in *Database Administration - Features User's Guide*.
 - b) If the point code of the system or capability point code is a destination point code of a route, select a point code that is not in the destination point code table (refer to output in [Step 2](#)) and not the destination point code of a route (refer to output in [Step 3](#)).
7. Change the point code of the system and capability point code by network type using procedures "Adding a Point Code to the Self-Identification of the EAGLE" and "Changing the Self-Identification of the EAGLE" in *Database Administration - SS7 User's Guide*.
8. Enter a destination point code for the HLR location in the Destination table by network type using the `ent-dstn` command.

Command examples:

```
ent-dstn:dpci=2-100-2
```

```
ent-dstn:dpcn=21112
```

where:

:dpc/dpca/dpci/dpcn

Destination point code to add to the database

9. Verify the changes using the `rtrv-dstn` command and specifying the DPC entered in [Step 8](#).

Command examples:

```
rtrv-dstn:dpci=2-100-2
```

```
rtrv-dstn:dpcn=21112
```

Example of possible output for the **DPCI** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
DPCI          CLLI          BEI  ELEI  ALIASA          ALIASN/N24  DMN
2-100-2      -----          no   ---   -----          -----      SS7
```

Example of possible output for the **DPCN** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

```
DPCN      CLLI      BEI ELEI  ALIASA      ALIASI  DMN
21112    -----    no  ---    -----    -----  SS7
```

10. Enter a linkset with the `ent-ls` command and assign the linkset to the destination point code by network type.

Command examples:

```
ent-ls:apci=2-200-2:lsn=ls400001:lst=a
```

```
ent-ls:apcn=21122:lsn=ls500001:lst=a
```

where:

:apc/apca/apci/apcn

Adjacent point code - the DPC of the adjacent signaling node at the far end of the linkset

:lsn

Linkset name

:lst

Linkset type

11. Verify the changes using the `rtrv-ls` command and specifying the linkset name.

Command example:

```
rtrv-ls:lsn=ls400001
```

```
rtrv-ls:lsn=ls500001
```

Example of possible output for **lsn400001** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0

LSN          APCI  (SS7)  SCRN  L3T  SLT          GWS GWS GWS
ls400001     2-200-2  scr1    1    2    no  a    0    on  off  off  no  on
CLLI        TFATCABMLQ  MTPRSE  ASL8
RLGHNCXA03W  1          no      no
LOC  PORT  SLC  TYPE  L2T  L1          PCR  PCR
SET  BPS  MODE  TSET  ECM  N1  N2
```

Example of possible output for **lsn500001** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0

LSN          APCN  (SS7)  SCRN  L3T  SLT          GWS GWS GWS

LOC  PORT  SLC  TYPE  L2T  L1          PCR  PCR
SET  BPS  MODE  TSET  ECM  N1  N2
```

12. Add the LIM cards to the database using the `ent-card` command.

Command examples:

```
ent-card:appl=ccs7itu:loc=1105:type=lime1
ent-card:appl=ccs7itu:loc=1106:type=lime1
```

where:

:appl

Specifies that the application is CCS7ITU.

:loc

Specifies the slot number for the card.

:type

Specifies that the card is a LIME1 card.

13. Enter the E1 interface using the `ent-e1` command.

Command examples:

```
ent-e1:loc=1105:e1port=1
```

```
ent-e1:loc=1106:e1port=1
```

where:

:loc

Card location or slot as stenciled on the shelf

:e1port

E1 card port number

14. Verify the changes using the `rtrv-card` command with the card location specified.

Command examples:

```
rtrv-card:loc=1105
```

```
rtrv-card:loc=1106
```

Example of possible output for command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

CARD	TYPE	APPL	LSET NAME	LINK	SLC	LSET NAME	LINK	SLC
1105	LIME1	CCS7ITU	1s400001	A	00	-----	B	--
1106	LIME1	CCS7ITU	1s500001	A	00	-----	B	--

15. Assign signaling links to the LIM cards using the `ent-slk` command.

Command example:

```
ent-slk:l2tset=1:link=a:loc=1105:lsn=1s400001:slc=0:e1port=1:ts=1
```

```
ent-slk:l2tset=1:link=a:loc=1106:lsn=1s500001:slc=0:e1port=1:ts=1
```

where:

:l2tset

Level 2 timer set. A signaling link can be assigned to any of the thirty timer sets.

:link

Signaling link assigned on the card specified in the `loc` parameter

:loc

Card location to which the signaling link is assigned

:lsn

Unique linkset name

:slc

Signaling link code. The `slc` must be unique within the linkset, and must be the same at both the system location and the distant node.

e1port

Port for E1 interface on the E1 card to which the signaling link and timeslot are being assigned

ts

E1 timeslot for the assigned signaling link

Signaling links are the only elements in the database supported directly by a hardware device. When a link is added to a linkset, the link remains in Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD) state until it is activated; see [Step 23](#).

16. Verify the changes using the `rtrv-slk` command, specifying the card location and ID of the signaling link entered in [Step 15](#).

Command examples:

```
rtrv-slk:loc=1105:link=a
```

```
rtrv-slk:loc=1106:link=a
```

17. Add a route for the new DPC by network type using the `ent-rte` command.

Command examples:

```
ent-rte:dpci=2-100-2:lsn=ls400001:rc=10
```

```
ent-rte:dpcn=21112:lsn=ls500001:rc=10
```

where:

:dpc/dpca/dpci/dpcn

Destination point code of the node to which the traffic is bound

:lsn

Linkset name associated with this route

:rc

Relative cost or priority of this route

18. Verify the changes using the `rtrv-rte` command and specifying the destination point code of the route.
19. Add a mated application by network type to the database using the `ent-map` command.

Command examples:

```
ent-map:grp=grp03:materc=99:mpci=3-200-1:mssn=50:pci=2-100-1:ssn=12:rc=20
ent-map:grp=grp07:materc=99:mpcn=11114:mssn=250:pcn=11112:ssn=12:rc=10
```

where:

:grp

Concerned point code broadcast list (CSPC) group name. This parameter specifies the name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN.

:materc

Mate relative cost

:mpc/mpca/mpci/mpcn

Mate remote point code.

:mssn

Mate subsystem number – the subsystem address of the backup point code that is to receive the message

:pci/pcn

ITU international/national point code

:rc

Relative cost

:ssn

Subsystem number – the subsystem address of the primary point code that is to receive the message

20. Verify the changes using the `rtrv-map` command.
21. Allow the LIM cards that were entered in [Step 12](#) using the `alw-card` command.

Command examples:

```
alw-card:loc=1105
```

```
alw-card:loc=1106
```

This message appears:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
Card has been allowed.
```

22. Verify In-Service-Normal (IS-NR) state of the cards using the `rept-stat-card` command.
23. Activate the signaling links entered in [Step 15](#) using the `act-slk` command.

Command examples:

```
act-slk:loc=1105:link=a
```

```
act-slk:loc=1106:link=a
```

The link changes state from Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD) to In-Service-Normal (IS-NR). The output confirms the activation.

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
Activate Link message sent to card
```

24. Verify In-Service-Normal (IS-NR) state of the signaling link using the `rept-stat-slk` command.

Command examples:

```
rept-stat-slk:loc=1105
```

```
rept-stat-slk:loc=1106
```

25. Display the new LIM cards in the database using the `rtrv-card` command.

Example of a possible output:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
CARD   TYPE      APPL      LSET NAME      LINK SLC LSET NAME      LINK SLC
1105   LIME1     CCS7ITU   1s400001       A    00  -----      B    --
1106   LIME1     CCS7ITU   1s500001       A    00  -----      B    --
```

The HLR destinations are now configured and ready for G-Port feature activation.

G-Port Feature Activation Procedure

Use this procedure to enable, turn on, and configure the GSM Mobile Number Portability (G-Port) feature. Refer to *Commands User's Guide* for detailed descriptions of the commands that are used in this procedure.

CAUTION

Caution: Before starting this procedure, contact [My Oracle Support \(MOS\)](#) for assistance in performing the feature activation procedure. Do not proceed without consulting with Technical Services.

1. Enter the `enable-ctrl-feat` command to enable the G-Port feature:
`enable-ctrl-feat:partnum=893017201`
2. Enter the `chg-ctrl-feat` command to turn on the G-Port feature:
`chg-ctrl-feat:partnum=893017201:status=on`
3. Enter the default country code and default network destination code to convert the nature of address indicator (NAI) of MSISDNs to the international format (`nai=intl`) with the `chg-stpopts` command.

Command example:

```
chg-stpopts:defcc=1:defndc=38:dsmad=on:npcfmti=2-9-2-1
```

where:

:defcc

Default country code

:defndc

Default network destination code

:dsmaud

Service Module card checksum audit running state (*on* or *off*)

:npcfmti

ITU National Point Code Format Identifier, which identifies how the ITU national point code is entered into the database and how it is displayed in all EAGLE outputs. The ITU national point code is a 14-bit integer.

4. Verify the new country code and network destination code using the `rtrv-stpopts` command.
5. Change the GSM system options in the database using the `chg-gsmopts` command.

Command example:

```
chg-gsmopts: defmapvr=2:msrndig=ccrndn:srfaddr=23448:srfnai=7:srfnp=15
```

where:

:defmapvr

Default MAP version

:msrndig

Routing number to be used as is or to be concatenated with the MSISDN

:srfaddr

Entity address of the MNP_SRF node

:srfnai

Nature of address indicator value of the MNP_SRF

:srfnp

Numbering plan value of the MNP_SRF

6. Verify the changes using the `rtrv-gsmopts` command to display all GSM system options from the database.
7. Add routing number prefixes for the operating network using the `ent-homern` command. Add Home RNs that are prefixed to DNs for incoming INPMR messages. Up to 100 routing number prefixes for the operating network can be added to the HOMERN table.

Command example:

```
ent-homern:rn=34
```

where:

:rn

Home routing number prefix. Parameter value is 1 to 15 hex digits (0-F).

8. Verify the changes using the `rtrv-homern` command to retrieve a list of routing number prefixes that belong to the operating network.
9. Display the list of administered service selector combinations using the `rtrv-srvsel` command.

Avoid lengthy output by filtering the list using various parameter combinations. The service selector table can have over 1,000 entries.

10. Enter the G-Port service selectors by network type, if necessary, using the `ent-srvsel` command. This command assigns applicable service selectors required to specify the service entry for Service Module card services.

Command example:

```
ent-srvsel:gtii=4:nai=intl:np=e164:serv=gport:snai=intl:snp=e164:ssn=9:tt=1
```

where:

:gtii

Global title indicator, ITU international

:nai

Nature of address indicator

:np

Numbering plan

:serv

Service feature

:snai

International Service Nature of Address Indicator

:snp

Service numbering plan

:ssn

Subsystem number

:tt

Translation type

11. Verify the changes using the `rtrv-srvsel` command to retrieve the list of administered service selector combinations.

Avoid lengthy output by filtering the list using various parameter combinations. The service selector table can have over 1,000 entries.

Command examples:

```
rtrv-srvsel:gtii=2
```

```
rtrv-srvsel:gtii=4
```

where:

gtii

Global title indicator, ITU international

Caution: GTT, EGTT, and VGTT traffic is routed based on the global titles in the OAM database while G-Flex, G-Port, A-Port, and INP traffic is routed based on the global title in the RTDB. Rebooting a Service Module card running the SCCPHC application causes both the OAM databases and the RTDB on the Service Module card to reload.

12. Verify that the Service Module card returns to In-Service-Normal (IS-NR) state using the `rept-stat-card` command.

Warning: Do not proceed until In-Service-Normal (IS-NR) state of the Service Module card is restored.

13. After In-Service-Normal (IS-NR) state of the Service Module card is restored and verified using the `rept-stat-card` command, repeat [Step 12](#) for each Service Module card in the system.
14. Set the G-Port service state online using `chg-sccp-serv: serv=gport: state=online`.
15. Confirm that the activation steps were successful by performing the following verifications:
 - Verify that all Service Module cards are loaded and are in In-Service-Normal (IS-NR) state using the `rept-stat-sccp` command.
 - Verify that all Service Module cards and the EPAP are connected and operational using the `rept-stat-mps` command.
 - Verify that database levels are identical for the EPAP PDB and RTDB. Display the RTDBs on the Service Module cards using `rept-stat-db: display=all`.

The GSM Mobile Number Portability (G-Port) feature is now enabled, turned on, and operating in the system.

MT-Based GSM SMS NP Feature Activation Procedure

This procedure is used to activate the MT-Based GSM SMS NP feature.

Before this feature can be enabled, the G-Port feature must be enabled.

Before the MT-Based GSM SMS NP feature can be turned on, the G-Port Feature must be turned on.

The MT-Based GSM SMS NP feature can be enabled before the G-Port feature is turned on.

For details about the commands used in this procedure, refer to *Commands User's Guide*.

1. Verify that the G-Port Feature is enabled using the `rtrv-ctrl-feat` command.
2. If the G-Port Feature is not enabled, enable it using [G-Port Feature Activation Procedure](#) before proceeding.
3. Enter the `enable-ctrl-feat` command to enable the MT-Based GSM SMS NP feature.
`enable-ctrl-feat: partnum=893020001`
4. Enter the `chg-stpopts` command to set the default country code and, if desired, the default network destination code to convert the nature of address indicator (NAI) of MDNs to the international format (`nai=intl`).

The parameters in this command are used for number conditioning.

For example, enter this command:

```
chg-stpopts: defcc=49: defndc=177
```

where:

defcc

The default country code.

defndc

The default network destination code.

5. Verify the new country code and network destination code using the `rtrv-stpopts` command.
6. Enter the `rtrv-gsmopts` command to view the values of the GSMOPTS table options.
7. Change the value DefMCC in the GSMOPTS table using the `chg-gsmopts` command. If desired, other GSM system options may also be changed with this command.

Note: GSMOPTS:DefMCC must be set to a valid value before the MT-Based GSM SMS NP feature can be turned on.

For example, enter this command:

```
chg-gsmopts: defmcc=253
```

where:

defmcc

Specifies the E212 default mobile country code.

8. Verify the changes using the `rtrv-gsmopts` command.
This command displays GSM system options from the database.
9. Enter the `rtrv-gsmsmsopts` command to view the values of the GSMSMSOPTS table options.
10. If desired, change the GSM SMS options in the database for the MT-Based GSM SMS NP feature using the `chg-gsmsmsopts` command.

Note: MTSMSDLTRV must be set to a value other than "NONE" before MTSMSDLTR can be set to either PRERN or POSTRN. For details about all options that can be changed using the `chg-gsmsmsopts` command, refer to *Commands User's Guide*.

For example, enter this command:

```
chg-gsmsmsopts: mtsmsimsi=mccrndn: mtsmstype=rn
```

where:

mtsimsi

Specifies the format of the IMSI parameter of the SRI_SM ACK response.

mtsmstype

Indicates the entity type for which a database lookup is considered successful.

11. Verify the changes using the `rtrv-gsmsmsopts` command.
This command displays all GSM SMS options from the database.
12. If the value of GSMSMSOPTS:MTSMSCCHKSRC=YES, then provision the home SMSC table entries using the `ent-home-smsc` command.

For example, enter this command:

```
ent-home-smsc:smc=552611646
```

13. Verify the SMSC table contents using the `rtrv-home-smsc` command.
This command retrieves the HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database.
14. Verify that the G-Port Feature is turned on using the `rtrv-ctrl-feat` command.
15. If the G-Port Feature is not turned on, see [G-Port Feature Activation Procedure](#) before proceeding.
16. Enter the `chg-ctrl-feat` command to turn on the MT-Based GSM SMS NP feature.
`chg-ctrl-feat:partnum=893020001:status=ON`

The MT-Based GSM SMS NP feature is now enabled, turned on, and operating in the system.

MT-Based GSM MMS NP Feature Activation Procedure

This procedure is used to activate the MT-Based GSM MMS NP feature.

Before this feature can be enabled, the MT-Based GSM SMS NP feature must be enabled.

Before the MT-Based GSM MMS NP feature can be turned on, the MT-Based GSM SMS NP feature must be turned on.

The MT-Based GSM MMS NP feature can be enabled before the MT-Based GSM SMS NP feature is turned on.

For details about the commands used in this procedure, refer to *Commands User's Guide*.

1. Verify that the MT-Based GSM SMS NP feature is enabled using the `rtrv-ctrl-feat` command.
2. If the MT-Based GSM SMS NP feature is not enabled, enable it using [MT-Based GSM SMS NP Feature Activation Procedure](#) before proceeding.
3. Enter the `enable-ctrl-feat` command to enable the MT-Based GSM MMS NP feature.
`enable-ctrl-feat:partnum=893024101`
4. Enter the `rtrv-gsmsmsopts` command to view the values of the GSMSMSOPTS table option.
5. If desired, MT-Based GSM MMS NP feature options may be changed with this command.

For example, enter this command:

```
chg-gsmsmsopts:mtmsgta=12345:mtmmsackn=ack:mtmmstype=rn
```

where:

mtmsgta

Specifies the GTA that is compared to the SCCP CgPA GTA of an SRI_SM message to determine whether the originator of the messages is a Home MMSC.

mtmmsackn

Specifies the message that is generated in response to a successful RTDB lookup for an SRI_SM message from a Home MMSC.

mtmmstype

Specifies the value of the entity type that indicates that a successful lookup occurred in the RTDB for messages that are modified by the MT-Based GSM MMS NP feature.

Note: For details about all of the options that can be changed using the `chg-gsmsmsopts` command, refer to *Commands User's Guide*.

6. Verify the changes using the `rtrv-gsmsmsopts` command.
This command displays the GSM SMS options from the database.
7. Verify that the MT-Based GSM SMS NP feature is turned on using the `rtrv-ctrl-feat` command.
8. If the MT-Based GSM SMS NP feature is not turned on, refer to [MT-Based GSM SMS NP Feature Activation Procedure](#) before proceeding.
9. Enter the `chg-ctrl-feat` command to turn on the MT-Based GSM MMS NP feature.
`chg-ctrl-feat:partnum=893024101:status=ON`

The MT-Based GSM MMS NP feature is now enabled, turned on, and operating in the system.

G-Port SRI Query for Prepaid Feature Activation Procedure

This procedure is used to activate the G-Port SRI Query for Prepaid feature.

Before this feature can be enabled, the G-Port feature must be enabled and turned on.

The G-Port SRI Query for Prepaid feature cannot be turned off after the feature is turned on.

The Service Portability support for G-Port SRI Query for Prepaid feature can be turned off after it is turned on.

For details about the commands used in this procedure, refer to *Commands User's Guide*.

1. Verify that the G-Port Feature is enabled and turned on using the `rtrv-ctrl-feat` command.
2. If the G-Port Feature is not enabled and turned on, enable and turn on the G-Port feature using [G-Port Feature Activation Procedure](#) before proceeding.
3. Enter the `enable-ctrl-feat` command to enable the G-Port SRI Query for Prepaid feature.
`enable-ctrl-feat:partnum=893017701`
4. Enter the `ent-gserv-data` command to provision the translation type, originating point code, or global title address data in the GSERV table.

The `tt` parameter is used to specify a called party (CdPA) translation type, the `opc/opca/opci/opcn/opcn24` parameters are used to specify message transfer part (MTP) originating point codes, and the `gta` parameter is used to specify a calling party (CgPA) global title address. These values determine whether a Send Routing Information (SRI) request receives G-Port SRI Query for Prepaid service or normal G-Port service.

Command example:

```
ent-gserv-data:tt=77
```

where:

tt

Translation type

5. Verify the new values of the GSERV table using the `rtrv-gserv-data` command.
6. Provision the default routing number in the GSMOPTS table using the `chg-gsmopts` command, if required. The default routing number is used to determine the digits to use as the routing number portion of the `msrndig` parameter.

Command example:

```
chg-gsmopts:dfiltrn=135
```

where:

dfiltrn

Default routing number

7. Enable Service Portability if Service Portability support for G-Port SRI Query for Prepaid feature is required. If Service Portability support for G-Port SRI Query for Prepaid feature is not required, continue to [Step 10](#).

Command example:

```
enable-ctrl-feat:partnum=893034301
```

8. Provision the Service Portability Type in the GSMOPTS table using the `chg-gsmopts` command.

Command example:

```
chg-gsmopts:sporttype=all
```

where:

sporttype

Service Portability Type

9. Turn on the Service Portability feature using the `chg-ctrl-feat` command.

Command example:

```
chg-ctrl-feat:partnum=893034301:status=ON
```

10. Turn on the G-Port SRI Query for Prepaid feature using the `chg-ctrl-feat` command.

Command example:

```
chg-ctrl-feat:partnum=893017701:status=ON
```

The G-Port SRI Query for Prepaid feature is now enabled, turned on, and operating in the system. SRI messages received for G-Port SRI Query for Prepaid will receive Service Portability processing only if the optional Service Portability feature is enabled and turned on.

GSM MAP SRI Redirect to Serving HLR Feature Activation Procedure

This procedure is used to activate the GSM MAP SRI Redirect to Serving HLR feature.

Before this feature can be enabled, the G-Port feature must be enabled and turned on.

The GSM MAP SRI Redirect to Serving HLR feature cannot be turned off after the feature is turned on.

For details about the commands used in this procedure, see *Commands User's Guide*.

1. Verify that the G-Port Feature is enabled and turned on using the `rtrv-ctrl-feat` command.
2. If the G-Port Feature is not enabled and turned on, enable and turn on the G-Port feature using [G-Port Feature Activation Procedure](#) before proceeding.

3. Enter the `enable-ctrl-feat` command to enable the GSM MAP SRI Redirect to Serving HLR feature.

```
enable-ctrl-feat:partnum=893014001
```

4. Enter the `chg-prefix-feat` command to relate the GSM MAP SRI Redirect to Serving HLR feature to vendor prefix values, and to specify the prefix numbers that associate to entries in the Vendor ID List. A maximum of three prefix values can be entered in the Vendor Prefix Table for the GSM MAP SRI Redirect to Serving HLR feature.

Command examples:

```
chg-prefix:feature="gsm map sri redirect"prefixnum=1:prefix=1004
```

```
chg-prefix:feature="gsm map sri redirect"prefixnum=2:prefix=1003
```

```
chg-prefix:feature="gsm map sri redirect"prefixnum=3:prefix=1004
```

where:

feature

Feature Name.

prefixnum

Prefix Number. GSM MAP SRI Redirect to Serving HLR feature uses 1 - 3.

prefix

Prefix Value.

5. Verify the Vendor Prefix Table entries using the `rtrv-prefix` command.
6. Enter Vendor ID Length for the Vendor ID List using the `ent-vendid` command.

Command example:

```
ent-vendid:vendidlen=6
```

where:

vendidlen

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect to Serving HLR feature must contain this number of digits.

7. Enter the Vendor IDs and Vendor Numbers using the `ent-vendid` command.

Command example:

```
ent-vendid:vendid=886932:vendnum=1:vendtype=1
```

```
ent-vendid:vendid=886936:vendnum=1:vendtype=1
```

```
ent-vendid:vendid=886935:vendnum=2:vendtype=2
```

```
ent-vendid:vendid=886938:vendnum=3:vendtype=1
```

where:

vendid

Vendor ID.

vendnum

Vendor Number, used as a reference to the Vendor prefix.

vendtype

Vendor Type.

8. Verify that all G-Port provisioning information is specified: service selector, HomeRN deletions, default GTT, and GSMOPTS values.
9. Enter the `chg-ctrl-feat` command to turn on the GSM MAP SRI Redirect to Serving HLR feature.

```
chg-ctrl-feat:partnum=893014001:status=ON
```

The GSM MAP SRI Redirect to Serving HLR feature is now enabled, turned on, and operating in the system.

Chapter 5

Measurements

Topics:

- [G-Port Measurements.....95](#)

This chapter describes the measurements information available from the EAGLE for the G-Port feature.

G-Port Measurements

Refer to *Measurements Reference* for information about measurement systems and reporting.

Refer to *Commands User's Guide* for descriptions of commands used to generate, schedule, and transfer measurements reports.

Refer to *Database Administration - System Management User's Guide* for provisioning information and procedures for these measurement systems:

- Measurements Platform
- E5-OAM Integrated Measurements

[Table 28: Pegs for Per System G-Port Measurements](#) describes the peg counts of Message Signalling Units (MSUs) supported per-system for the G-Port feature.

Table 28: Pegs for Per System G-Port Measurements

Event Name	Description	Type	Unit
GPSRRCV	Number of call-related SRI messages received. Peg counts for register GPSRRCVPP are not included in this register.	System	Peg count
GPSRGTT	Number of call-related SRI messages that fell through to GTT. Peg counts for register GPSRGTTTPP are not included in this register.	System	Peg count
GPSRREP	Number of call-related SRI messages that received G-Port service. Peg counts for register GPSRREPPP are not included in this register.	System	Peg count
GPSRERR	Number of call-related messages that cause SRI negative ack messages because of G-Port service failure. Peg counts for register GPSRERRPP are not included in this register.	System	Peg count

[Table 29: Pegs for Per SSP G-Port Measurements](#) describes the peg counts of Message Signalling Units (MSUs) supported per-SSP for the G-Port feature.

Table 29: Pegs for Per SSP G-Port Measurements

Event Name	Description	Type	Unit
GPSRACK	Number of call-related SRI ack messages. Peg counts for register GPSRACKPP are not included in this register.	Point Code	Peg count
GPSRNACK	Number of call-related SRI negative ack messages in successful G-Port service	Point Code	Peg count

Event Name	Description	Type	Unit
GPSRRLY	Number of call-related SRI messages relayed	Point Code	Peg count

Table 30: Pegs for Per System and Per SSP G-Port Measurements describes the peg counts of Message Signalling Units (MSUs) supported both per-system and per-SSP for the G-Port feature.

Table 30: Pegs for Per System and Per SSP G-Port Measurements

Event Name	Description	Type	Unit
GPNOCL	Number of non-call-related messages relayed by G-Port	System, Point Code	Peg count
GPNOCLGT	Number of non-call-related messages that fell through to GTT	System, Point Code	Peg count
GPSRSMREP	Number of SRI_SM messages that result in SRI_SM_ACK or SRI_SM_NACK responses	System, Point Code	Peg count
GPSRSMERR	Number of SRI_SM messages that result in error	System, Point Code	Peg count
GPSRSMRCV	Number of SRI_SM messages received	System, Point Code	Peg Count
MNPCRCD	Number of times Circular Route is detected	System, Point Code	Peg Count

Table 31: Pegs for G-Port SRI Query for Prepaid Measurements describes the peg counts of Message Signalling Units (MSUs) supported for the G-Port SRI Query for Prepaid feature.

Table 31: Pegs for G-Port SRI Query for Prepaid Measurements

Event Name	Description	Type	Unit
GPSRACKPP	Number of call-related SRI ack messages for G-Port SRI Query for Prepaid feature. Peg counts for register GPSRACK are not included in this register.	Point Code	Peg Count
GPSRGTTTPP	Number of call-related SRI messages that fell through to GTT for G-Port SRI Query for Prepaid feature. Peg counts for register GPSRGTT are not included in this register.	System	Peg Count
GPSRRCVPP	Number of call-related SRI messages received for G-Port SRI Query for Prepaid feature. Peg counts for register GPSRRCV are not included in this register.	System	Peg Count
GPSRERRPP	Number of call-related messages that cause SRI negative ack messages for G-Port SRI Query for	System	Peg Count

Event Name	Description	Type	Unit
	Prepaid feature. Peg counts for register GPSRERR are not included in this register.		
GPSRREPPP	Number of call-related SRI messages that received G-Port service for G-Port SRI Query for Prepaid feature. Peg counts for register GPSRREP are not included in this register.	System	Peg Count

The following equations apply:

$$\text{GPSRRCV} = \text{GPSRGTT} + \text{GPSRREP} + \text{GPSRERR}$$

$$\text{GPSRCVPP} = \text{GPSRGTTTPP} + \text{GPSRREPPP} + \text{GPSRERRPP}$$

$$\text{GPSRREP} = \sum \text{GPSRACK} + \sum \text{GPSRRLY} + \sum \text{GPSRNACK}$$

The following measurement events are included on the STP Daily Maintenance (MTCD) and STP Day-to-Hour (MTCPTH) measurement reports and include peg counts for G-Port MSUs.

MSSCCPFL	MSUs discarded due to SCCP routing failure.
GTTUN0NS	GTT unable to perform; no such type
GTTUN1NT	GTT unable to perform: no translation on this address
GTTPERFD	Total number of GTT performed

This implementation does not discriminate between the MSSCCPFL, GTTUN0NS, GTTUN1NT, or GTTPERFD pegs for G-Port or GTT applications. For example, a search failure could result from a problem in either the G-Port or GTT database.

Chapter 6

Maintenance

Topics:

- *G-Port Related Alarms.....99*
- *G-Port Related UIMs.....99*
- *Maintenance Commands.....102*
- *Debug Commands103*
- *Status Reporting and Problem Identification...104*

This chapter describes the maintenance information available from the EAGLE for the G-Port feature. The information includes status, alarms (UAMs), and information messages (UIMs).

G-Port Related Alarms

Refer to *Unsolicited Alarm and Information Messages Reference* for a complete description and the associated corrective procedure for all EAGLE-related alarms (UAMs). Refer to *Alarms and Maintenance Guide* for EPAP for the descriptions and corrective procedures for MPS-related alarms.

G-Port Subsystem Alarms

The same alarms that are output for an SCCP subsystem are output for the G-Port functions, including G-Port traffic.

Table 32: G-Port Subsystem Alarms

UAM #	Severity	Message Text	Output Group (UI Output Direction)
0328	None	SCCP is available	gtt
0329	None	SCCP capacity normal, card(s) abnormal	gtt
0330	Major	SCCP TPS Threshold exceeded	gtt
0331	Critical	SCCP is not available	gtt
0335	None	SCCP is removed	gtt
0336	Major	LIM(s) have been denied SCCP service	gtt
0526*	None	Service is available	sys_maint
0527*	Minor	Service abnormal	sys_maint
0528*	Critical	Service is not available	sys_maint
0529*	Critical	Service is disabled	sys_maint
0530*	None	Service is removed	sys_maint
*GPORT is displayed in the text of the message if the G-Port feature is enabled without the additional features of A-Port or IGM being enabled. If the A-Port and/or IGM features are enabled, the text GPORT will be replaced with the text MNP.			

G-Port Related UIMs

G-Port UIM formats for the EGTT feature support GTT requirements.

Unsolicited Alarm and Information Messages Reference contains a complete description of all UIM text and formats. [Table 33: G-Port UIMs](#) lists UIMs used to support the G-Port feature.

Table 33: G-Port UIMs

UIM	Text	Description	Action
1035	SCCP rsp did not route - invalid GTI.	The SCCP response did not route due to an invalid GTI.	Use a valid GTI in the CGPA part of the query.
1036	SCCP rsp did not route - invalid TT.	The SCCP response did not route due to an invalid TT.	Provision the CGPATT in the GTT TT table.
1037	SCCP rsp did not route - bad Xlation	The SCCP response did not route due to a bad translation	Provision the CGPAGTA address in the GTT database.
1038	SCCP rsp did not route - SSP not True PC.	The SCCP response did not route because SSP is not true point code.	Use the true point code in the CGPA point code or OPC of the query.
1039	SCCP rsp did not route - bad Selectors	The SCCP response did not route due to invalid selectors.	Provision the CGPAGTI, TT, NP, and NAI in the EGTT selector table.
1169	SCCP rcvd inv TCAP portion	This indicates that SCCP discarded a message because the TCAP provided in the called party address is invalid in the EAGLE.	No action is necessary.
1227	SCCP did not route - DPC not in MAP tbl	This message indicates that SCCP did not route a message because the destination point code was not in the mated application (MAP) table. The message was discarded.	If the DPC indicated in the message should not be routed to, no further action is necessary.
1230	SCCP did not route - SS not in MAP tbl	This message indicates that SCCP did not route a message because the destination subsystem was not in the Mated Application (MAP) table. The message was discarded.	No action is necessary.
1242	Conv to intl num - Dflt CC not found	Conversion to international number failed because default CC was not found.	Define the default CC with <code>chg-stpopts :defcc=xxx.</code>
1243	Conv to intl num - Dflt NC not found	Conversion to international number failed because default NC was not found.	Define the default NDC with <code>chg-stpopts :defndc=xxxxxx.</code>
1246	Invalid length of conditioned digits	Length of conditioned international number is less than 5 or greater than 15 (invalid length of conditioned digits).	Use an international number with length in the acceptable range.

UIM	Text	Description	Action
1256	MNP Circular Route Detected	This message indicates the network has incorrect number portability data for a subscriber.	Verify and update number portability data.
1294	Invalid digits in MAPMSISDN parameter	No digits are found in MAP MSISDN parameter.	Specify valid digits in the MSISDN.
1295	Translation PC is EAGLE's	PC translation is invalid because it is one of EAGLE PCs.	Change the point code.
1296	Translation PC type is ANSI	PC translation is invalid because it is an ANSI point code.	Change the point code.
1297	Invalid length of prefix/suffix digits	Attempted digit action of prefixing entity ID is invalid because combined length of entity ID and GT digits was greater than 21 digits.	Change the attempted digit action or decrease the length of the entity ID and/or GT digits.
1374	SMS NP destination address decode failed	An error was detected during decode of SMS message destination address.	The message should be analyzed to determine the error, and the originating node should be contacted to send corrected message.
1375	SMS NP failed to modify TCAP message	The formatted outbound digit string length generated by SMS NP for encoding the TCAP message exceeded system limits.	The message and outbound digits formatting options should be analyzed to determine the error and the originating node or the requested outbound digit formatting option should be modified to correct the encoding error.
1376	SMS NP outbound digits leng exceed limit	During processing of SMS message, the formatted outbound digit string length exceeded limit for number of digits.	The message and the digit format provisioning should be analyzed to determine the error and the originating node or the requested outbound digit formatting option should be modified to correct the encoding error.
1426	S-Port: Missing GRN for srcv prtd subs	Service Portability is to be applied; GRN is required, but is not provisioned for the DN.	Provision the GRN for the DN.

Maintenance Commands

The following commands can be used for maintenance when an EPAP-related feature is on.

Refer to *Commands User's Guide* for complete descriptions of the commands, including parameters, valid parameter values, rules for using the commands, and output examples.

Table 34: Maintenance Commands

Command	Description
rept-stat-sys	Reports the status of system entities, including cards. The output includes the number of Service Module cards that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).
rept-stat-sccp	Reports operating status of services and subsystems, CPU usage, and Service Module card status. When the loc parameter is specified, the command displays detailed card traffic statistics, including cards that are denied SCCP service. See the section in this manual that describes the use of the <code>rept-stat-sccp</code> command.
rept-stat-mps	Displays the overall status of the EPAP application running on the MPS (multi-purpose server). Command output for the various reports of this command include overall MPS alarm status and card status, and status for a specific Service Module card when a feature is on.
rept-stat-trbl	Includes a summary of any trouble notifications (UAMs) for local subsystems, cards, and linksets. The severity of each alarm is indicated in the output report.
rept-stat-alm	Displays the alarm counts and totals for local subsystems and Service Module card/EPAP IP links.
rept-stat-db	Displays the status information for the EAGLE databases. This includes the level information for each Service Module card, and for the active and standby EPAP RTDB. The command reports database exception status such as corrupted, incoherent, or inconsistent, as well as providing the birth dates and levels. It shows the status of each PDB and RTDB when an EPAP-related feature is enabled.
rtrv-tbl capacity	Retrieves table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value. Information is shown for some tables only if the feature that uses the table is enabled.
inh-card/alw-card	<p>The <code>inh-card</code> command is used to change the operating state of the card from In-Service Normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A craftsperson then can test the card or physically remove it from the shelf.</p> <p>The <code>alw-card</code> command is used to change the card from OOS-MT-DSBLD (Out-of-Service Maintenance-Disabled) to IS-NR (In-Service Normal) if card loading is successful.</p>

Command	Description
inh-alm/unhb-alm	Used to allow and inhibit reporting of alarms for a given device, including the Service Module card ports. The commands allow both Port A and Port B to be specified. Inhibited alarms will not generate UAMs or cause alarm indicators to be turned on. All <code>rept-stat-xxx</code> commands continue to display the alarms with an indication that the device has its alarms inhibited.
rtrv-data-rtdb	Retrieves Entity data, DN data, IMEI data, IMSI data, TN data, NPANXX data, and LRN data from the RTDB on an active Service Module card. If the <code>loc</code> parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card. If the <code>loc</code> parameter is not specified, the RTDB data is retrieved on the active Service Module card that has the lowest IMT address. The RTDB status on the active Service Module card can be coherent or incoherent.

rept-stat-sccp

The `rept-stat-sccp` command provides statistics for Service Module cards and for the services that execute on the cards. The statistics can be displayed for all Service Module cards or for a specified card.

Refer to *Commands User's Guide* for a description of the `rept-stat-sccp` command, including parameter names, valid parameter values, rules for using the command, and output examples.

The `rept-stat-sccp` command reports current MNP statistics. An MSU is considered to be a G-Port MSU after service selection.

Debug Commands

Commands User's Guide contains descriptions of debug commands that can be used in assessing and modifying system status and operation. Most debug commands are used only under the direction of Oracle support personnel. Refer to *Commands User's Guide* for a complete description of the debug commands, including the `ent-trace` command.

G-Port uses the `ent-trace` command to provide a trap-and-trace function for MSUs on the Service Module cards. G-Port also includes a trigger so that the user can trigger on DN and IMSI.

The user can create an MSU trigger on the Service Module card on one or more criteria (both old and new) defined in the following using the `ent-trace` command. When multiple trigger criteria are entered, the MSU is trapped when any one of the criteria is satisfied.

Caution: As with other debug commands, the `ent-trace` command can cause OAM to reset if too many MSUs are trapped.

- **RN or SP address (Entity ID)** - Use this new criterion to trap messages immediately after performing the RTDB lookup. If the RN or SP obtained from the database lookup matches the Entity ID provisioned in the command, the message is trapped. This parameter supports a variable number of hexadecimal digits from 1 to 15 digits, and the Entity ID specified must be the one stored in the RTDB.
- **E.164 MSISDN number (DN)** – Use this criterion to trap messages immediately before performing a G-Port search based on the MSISDN numbers defined in the RTDB. This parameter accepts a range of digits, from 5 to 15. The number specified must be an International E.164 number (MSISDN or Entity Number).
- **Global Title digits (GT)** – Use this criterion to trap messages based on CdPA Global Title Address (either MSISDN (+ST) number or RN + MSISDN (+ST)) present in the SCCP part of the message.
- **Origination point code SSPI/SSPN)** – Use this criterion to trap messages based on CgPASPC present in the SCCP part of the message. If no point code is present in the CgPA SPC, the criteria is matched with the OPC present in the MTP part of the message.

A trace must be set on all Service Module cards; specify card=sccp-all. Use a repetition parameter (rep) to control the number of MSUs that are trapped.

MSUs that satisfy any trigger criteria are trapped on the Service Module cards, are forwarded to OAM, and are displayed. Refer to *Commands User's Guide* for a complete description of the `ent-trace` command, including parameters, valid parameter values, rules for using the command, and output examples.

Status Reporting and Problem Identification

EAGLE commands can be used to obtain status and statistics for the EAGLE system, the EPAP systems, system devices including Service Module cards, EPAP-related features, local subsystems, and SCCP services.

Refer to *Commands User's Guide* for complete descriptions of the commands, including parameters and valid values, rules for using the commands correctly, and output examples.

Refer to *Unsolicited Alarm and Information Messages Reference* for descriptions and recovery procedures for UAMs and UIMs.

Refer to *Administration Guide* for EPAP for descriptions of EPAP functions and operation.

Refer to *Alarms and Maintenance Guide* for descriptions and recovery procedures for EPAP alarms.

Refer to the appropriate feature User's Guide for information about the functions and operation of EPAP-related features.

Table 35: Status Reporting for EPAP-Related Features

Reports, Status, and Statistics	Command
EAGLE	

Reports, Status, and Statistics	Command
Maintenance Status Report - indicates whether Maintenance, Routing, and SCCP Baselines have been established.	rept-stat-sys
Alarms and operating state for system devices, including Service Module ("SCCP") cards.	rept-stat-sys
Unsolicited Alarm Messages (UAMs) and Unsolicited Information Messages (UIMs)	rept-stat-alm rept-stat-trbl
EPAP/MPS (from the EAGLE)	
EPAP code version and operating state for each EPAP.	rept-stat-mps
MPS hexadecimal alarm strings for the active and standby EPAPs.	rept-stat-mps
Operating state and alarm status of equipped Service Module cards and their DSM ports and IP connections.	rept-stat-mps rept-stat-mps:loc=<Service Module card location>
Amount of memory used by the RTDB on the specified card, as a percent of available Service Module card memory.	rept-stat-mps:loc=<Service Module card location>
EPAP Provisioning Database (PDB), EPAP Real Time Database (RTDB), and Service Module card RTDB status information - Coherent, birthdate (date and time of creation), and exception (condition when a problem was detected).	rept-stat-db rept-stat-db:db=mps
Service Module Cards, EPAP-Related Features, Services, Local Subsystems	
Status of the Service Module cards, and the services executing on the cards for EPAP-related features that are turned on. Includes Service Report, Subsystem Report, and Alarm Status; Total Service Statistics.	rept-stat-sccp
Operating state and alarm status of equipped Service Module cards and their DSM ports and IP connections; EPAP-related feature status per card.	rept-stat-mps:loc=<Service Module card location>
Alarms and operating state for Service Module ("SCCP") cards.	rept-stat-sys rept-stat-mps
Any cards that are denied SCCP service.	rept-stat-sccp

Reports, Status, and Statistics	Command
Detailed view of the status of SCCP services provided by the specified Service Module card. Includes Card Alarm Status, Card Service Statistics	<code>rept-stat-sccp:loc=<Service Module card location></code>
General SCCP traffic performance for Service Module cards. Message rates for TVG performance.	<code>rept-stat-sccp:mode=perf</code>
Statistics for EPAP-related feature local subsystems - Subsystem Report	<code>rept-stat-sccp</code>
Statistics for EPAP-related features	<code>rept-stat-sccp</code>

EPAP Status and Alarm Reporting

Because EPAP has no direct means of accepting user input or displaying output messages on EAGLE terminals, EPAP maintenance, measurements, and status information are routed through a Service Module card. EPAP sends two types of messages to the Service Module card: *EPAP Maintenance Blocks* and *DSM Status Requests and DSM Status Messages*. Each message type is discussed in the following sections.

EPAP Maintenance Blocks

The EPAP forwards all status and error messages to the Service Module cards in maintenance blocks. Maintenance blocks are asynchronously sent whenever the EPAP has something to report. The status information that is displayed when a `rept-stat-mps` command is issued includes information that came from the maintenance blocks.

The active EPAP generates and sends maintenance blocks to the primary Service Module card. One maintenance block is sent as soon as the IP link is established between the active EPAP and the primary Service Module card. Additional maintenance blocks are sent whenever the EPAP needs to report any change in status or error conditions. The information returned in maintenance blocks is included in the output of the `rept-stat-mps` and `rept-stat-sccp` commands.

The EPAP sends maintenance blocks that contain at least the following information:

- Status of EPAP A - actual states are active, standby, and down (inoperative). Maintenance blocks include a field for this information so that it can be available for the output of the `rept-stat-mps` command.
- Status of EPAP B - actual states are active, standby, and down (inoperative). Maintenance blocks include a field for this information so that it can be available for the output of the `rept-stat-mps` command.
- Identification of Active EPAP - a field to identify the active EPAP.
- Congestion Indicator - an indicator showing provisioning link congestion. The link between the EPAPs and the external source of provisioning data can become congested in high-provisioning traffic situations. When this occurs and subsequently as the congestion clears, the EPAP sends maintenance blocks to the Service Module card.

- Alarm Conditions - an error code field. If the EPAP needs to report an alarm condition, it puts an appropriate UAM identifier in this field.
- Current MPS Database Size - a field indicating the current RTDB size. The Service Module card uses this information to calculate the percentage of memory used by the RTDB.

DSM Status Requests and DSM Status Messages

When the EPAP needs to know the status of a Service Module card, the EPAP sends a DSM Status Request to all Service Module cards, and each Service Module card returns its status to the EPAP.

Service Module cards send a DSM Status Message to the EPAP when any the following events occur in the Service Module card:

- The Service Module card is booted.
- The Service Module card receives a DSM Status Request message from the EPAP.
- The Service Module card determines that it needs to download the entire RTDB; for example, the Service Module card determines that the RTDB needs to be downloaded because it is totally corrupted, or a user requests that the RTDB be reloaded. The Service Module card sends a Full Download Request message to the EPAP
- The Service Module card starts receiving RTDB downloads or updates. When a Service Module card starts downloading the RTDB or accepting updates, the Service Module card sends a DSM Status Message informing the EPAP of the first record received. This helps the EPAP keep track of downloads in progress.

The DSM Status Message provides the following information to the EPAP:

- **DSM Memory Size.** When the Service Module card is initialized, it determines the amount of memory present. The EPAP uses the value to determine if the Service Module card has enough memory to hold the RTDB.
- **Load Mode Status.** This indicator indicates whether or not a sufficient number of the IS-NR (In-Service Normal) LIMs have access to SCCP services.

Hourly Maintenance Report

The Hourly Maintenance Report, generated automatically, includes the alarm totals of the G-Port subsystem and Service Module card /EPAP IP links. A sample follows.

A

ANSI
American National Standards Institute
An organization that administers and coordinates the U.S. voluntary standardization and conformity assessment system. ANSI develops and publishes standards. ANSI is a non-commercial, non-government organization which is funded by more than 1000 corporations, professional bodies, and enterprises.

ASD
Additional Subscriber Data
Additional data that is associated with a subscriber (DN) or a range of subscribers.

C

CC
Connection Confirmed
Country Code
Composite Clock

CCS7ITU
The application for the ITU SS7 signaling links that is used with card types `limds0`, `limch`, `lime1`, and `limt1`.

CdPA
Called Party Address - The field in the SCCP portion of the MSU that contains the additional addressing information of the destination of the MSU. Gateway screening uses this additional information to determine if MSUs that contain the DPC in the routing label and the

C

subsystem number in the called party address portion of the MSU are allowed in the network where the EAGLE is located.

CgPA

Calling Party Address - The point code and subsystem number that originated the MSU. This point code and subsystem number are contained in the calling party address in the SCCP portion of the signaling information field of the MSU. Gateway screening uses this information to determine if MSUs that contain this point code and subsystem number area allowed in the network where the EAGLE is located.

CLLI

Common Language Location Identifier

The CLLI uniquely identifies the STP in terms of its physical location. It is usually comprised of a combination of identifiers for the STP's city (or locality), state (or province), building, and traffic unit identity. The format of the CLLI is:

- The first four characters identify the city, town, or locality
- The first character of the CLLI must be an alphabetical character
- The fifth and sixth characters identify state or province
- The seventh and eighth characters identify the building
- The last three characters identify the traffic unit

CNL

Small Geographic Area

CPC

Capability Point Code

C

A capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

CUG

Closed User Group

D

DEFCC

Default Country Code

Destination

The node to which the signaling link traffic is routed. This destination is identified by a point code, either a full point code or a cluster point code.

DN

Directory number

A DN can refer to any mobile or wireline subscriber number, and can include MSISDN, MDN, MIN, or the wireline Dialed Number.

DPC

Destination Point Code - DPC refers to the scheme in SS7 signaling to identify the receiving signaling point. In the SS7 network, the point codes are numeric addresses which uniquely identify each signaling point. This point code can be adjacent to the EAGLE, but does not have to be.

DPCI

Destination Point Code International

DPCN

Destination Point Code National

E

E

EGTT	<p>Enhanced Global Title Translation</p> <p>A feature that is designed for the signaling connection control part (SCCP) of the SS7 protocol. The EAGLE uses this feature to determine to which service database to send the query message when a Message Signaling Unit (MSU) enters the system.</p>

ETSI

European Technical Standards Institute

G

G-Port

GSM Mobile Number Portability
 A feature that provides mobile subscribers the ability to change the GSM subscription network within a portability cluster, while retaining their original MSISDN(s).

GRN

Generic Routing Number

GSM

Global System for Mobile Communications

A second generation digital PCS mobile phone standard used in many parts of the world.

G

GT	Global Title Routing Indicator
GTA	Global Title Address
GTI	Global Title Indicator
GTT	Global Title Translation A feature of the signaling connection control part (SCCP) of the SS7 protocol that the EAGLE uses to determine which service database to send the query message when an MSU enters the EAGLE and more information is needed to route the MSU. These service databases also verify calling card numbers and credit card numbers. The service databases are identified in the SS7 network by a point code and a subsystem number.

H

HLR	Home Location Register A component within the Switching Subsystem of a GSM network. The HLR database is the central database within the GSM architecture. This is where information about the mobile communications subscribers who are assigned to a specific location area is stored. The subscriber data is used to establish connections and control services. Depending on the network size, the number of subscribers and the network organization, a number of HLRs can exist within a GSM network.
-----	---

I

IAM	Initial Address Message
-----	-------------------------

I

Ensures the services offered are compatible with the reception devices, and can be used. For example, IAM prevents a phone being connected to a facsimile.

ID

Identity
Identifier

IMSI

International Mobile Subscriber
Identity
International Mobile Station
Identity
A unique internal network ID
identifying a mobile subscriber.

IN

Intelligent Network
A network design that provides an
open platform for developing,
providing and managing services.

INAP

Intelligent Network Application
Part
A standardized interface for
intelligent networks (IN). This
interface allows Service Providers
to offer their own services.

INE

Intelligent Network Entity
Interrogating Network Entity

INP

INAP-based Number Portability
INP can be deployed as a
stand-alone or an integrated signal
transfer point/number portability
solution. With a stand-alone NP
server, no network reconfiguration
is required to implement number
portability. The NP server delivers

I

a much greater signaling capability than the conventional SCP-based approach.

Intelligent Network (IN) Portability

IP

Intelligent Peripheral

Internet Protocol - IP specifies the format of packets, also called datagrams, and the addressing scheme. The network layer for the TCP/IP protocol suite widely used on Ethernet networks, defined in STD 5, RFC 791. IP is a connectionless, best-effort packet switching protocol. It provides packet routing, fragmentation and re-assembly through the data link layer.

IS-41

Interim Standard 41

Same as and interchangeable with ANSI-41. A standard for identifying and authenticating users, and routing calls on mobile phone networks. The standard also defines how users are identified and calls are routed when roaming across different networks.

IS-NR

In Service - Normal

ISDN

Integrated Services Digital Network

Integrates a number of services to form a transmission network. For example, the ISDN network integrates, telephony, facsimile, teletext, Datex-J, video telephony and data transfer services, providing users with various digital service over a single

I

interface: voice, text, images, and other data.

ITU-I

ITU-International

ITU-N

ITU-National

ITUDUPPC

ITU National Duplicate Point Code

This feature applies only to 14-bit ITU national point codes. This feature allows an EAGLE mated pair to route traffic for two or more countries that may have overlapping point code values.

L

LIM

Link Interface Module

Provides access to remote SS7, IP, and other network elements such as a Signaling Control Point (SCP) through a variety of signaling interfaces (DS0, MPL, E1/T1 MIM, LIM-ATM, E1-ATM, IPLIMx, IPGWx). The LIMs consist of a main assembly and possibly, an interface appliqué board. These appliqué boards provide level one and some level two functionality on SS7 signaling links.

LNP

Local Number Portability

The ability of subscribers to switch local or wireless carriers and still retain the same phone number.

M

MAP

Mated Application Part

Mobile Application Part

M

An application part in SS7 signaling for mobile communications systems.

MNP

Mobile Number Portability

Allows a user to keep his or her mobile phone number despite changing provider. The subscriber also keeps the network carrier code.

MNP Circular Route Prevention

A G-Port MNP feature that detects instances of circular routing caused by incorrect information in one or more of the network number portability databases. If a circular route has been detected, a message will be generated by the EAGLE and returned to the originator.

MO

Magneto Optical
Managed Object
Mobile Originated

Refers to a connection established by a mobile communication subscriber. Everything initiated by the mobile station is known as mobile originated.

MPS

Multi-Purpose Server

The Multi-Purpose Server provides database/reload functionality and a variety of high capacity/high speed offboard database functions for applications. The MPS resides in the General Purpose Frame.

Messages Per Second

A measure of a message processor's performance capacity. A message is any Diameter message (Request

M

or Answer) which is received and processed by a message processor.

MRN

Message Reference Number

An unsolicited numbered message (alarm or information) that is displayed in response to an alarm condition detected by the system or in response to an event that has occurred in the system.

Mated Relay Node

A mated relay node (MRN) group is provisioned in the database to identify the nodes that the traffic is load shared with, and the type of routing, either dominant, load sharing, or combined dominant/load sharing.

MSISDN

Mobile Station International Subscriber Directory Number

Mobile Subscriber Integrated Services Digital Network [Number]

The MSISDN is the network specific subscriber number of a mobile communications subscriber. This is normally the phone number that is used to reach the subscriber.

Mobile Station International Subscriber Directory Number. The unique, network-specific subscriber number of a mobile communications subscriber.

MSISDN follows the E.164 numbering plan; that is, normally the MSISDN is the phone number that is used to reach the subscriber.

MSRN

Mobile Station Roaming Number

MSU

Message Signal Unit

M

The SS7 message that is sent between signaling points in the SS7 network with the necessary information to get the message to its destination and allow the signaling points in the network to set up either a voice or data connection between themselves. The message contains the following information:

- The forward and backward sequence numbers assigned to the message which indicate the position of the message in the traffic stream in relation to the other messages.
- The length indicator which indicates the number of bytes the message contains.
- The type of message and the priority of the message in the signaling information octet of the message.
- The routing information for the message, shown in the routing label of the message, with the identification of the node that sent message (originating point code), the identification of the node receiving the message (destination point code), and the signaling link selector which the EAGLE uses to pick which link set and signaling link to use to route the message.

MT

Mobile Terminated

All transmissions that reach the mobile station and are accepted by it, such as calls or short messages.

MTP

Message Transfer Part

The levels 1, 2, and 3 of the SS7 protocol that control all the

M

functions necessary to route an SS7 MSU through the network

Module Test Plan

N

NAI

Nature of Address Indicator

Standard method of identifying users who request access to a network.

Network Access Identifier

The user identity submitted by the client during network authentication.

NC

Network Cluster

Network Code

Not Compliant

North Carolina

NDC

Network Data Collection

Network Data Collection

NE

Network Element

An independent and identifiable piece of equipment closely associated with at least one processor, and within a single location.

In a 2-Tiered DSR OAM system, this includes the NOAM and all MPs underneath it. In a 3-Tiered DSR OAM system, this includes the NOAM, the SOAM, and all MPs associated with the SOAM.

The devices, servers, or functions within a wireless network with which Policy Management systems interact.

Network Entity

N

NP

Number Plan
 Numbering Plan
 Number Portability
 A capability that permits telecommunications users to maintain the same telephone access number as they change telecommunication suppliers.

O

OAM

Operations, Administration, and Maintenance
 The application that operates the Maintenance and Administration Subsystem that controls the operation of many products.

OOS-MT-DSBLD

Out of Service - Maintenance Disabled
 The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

OPC

Within an SS7 network, the point codes are numeric addresses which uniquely identify each signaling point. The OPC identifies the sending signaling point.

own-network

Belonging to or assigned to this operator.

P

PC

Point Code
 The identifier of a signaling point or service control point in a network. The format of the point code can be one of the following types:

P

- ANSI point codes in the format network indicator-network cluster-network cluster member (**ni-nc-ncm**).
- Non-ANSI domestic point codes in the format network indicator-network cluster-network cluster member (**ni-nc-ncm**).
- Cluster point codes in the format network indicator-network cluster-* or network indicator-*-*.
- ITU international point codes in the format **zone-area-id**.
- ITU national point codes in the format of a 5-digit number (**nnnnn**), or 2, 3, or 4 numbers (members) separated by dashes (**m1-m2-m3-m4**) as defined by the Flexible Point Code system option. A group code is required (**m1-m2-m3-m4-gc**) when the ITUDUPPC feature is turned on.
- 24-bit ITU national point codes in the format main signaling area-subsignaling area-service point (**msa-ssa-sp**).

PDB

Provisioning Database

PDBI

Provisioning Database Interface

The interface consists of the definition of provisioning messages only. The customer must write a client application that uses the PDBI request/response messages to communicate with the PDDB.

PLMN

Public Land Mobile Network

A wireless communications network that uses land-based radio

P

transmitters or base stations, intended for public use by terrestrial subscribers in vehicles or on foot. A PLMN is identified by its Mobile Country Code (MCC) and Mobile Network Code (MNC).

PT Portability Type

R

RN Routing Number
The number provided by the Freephone Service Provider (FSP) to the Access Service Provider (ASP) to enable a pre-determined routing of traffic to a specific network/carrier/customer.

ROP Large Geographic Area (Groups of CNLs)

Route A signaling path from an LSP to an RSP using a specified Link Set.

RTDB Real Time Database

S

SCCP Signaling Connection Control Part
The signaling connection control part with additional functions for the Message Transfer Part (MTP) in SS7 signaling. Messages can be transmitted between arbitrary nodes in the signaling network using a connection-oriented or connectionless approach.

Service Nature of Address Indicator See SNAI.

S

Service Portability	See S-Port.
SIM	<p>Subscriber Identity Module</p> <p>An ID card the size of a credit card for GSM network subscribers, and is typically referred to as a chip card or smartcard.</p>
SMS	<p>Short Message Service</p> <p>A communication service component of the GSM mobile communication system that uses standard communications protocols to exchange short text messages between mobile phone devices. See also GSM.</p> <p>Shared Metric Service</p>
SMSC	<p>Short Message Service Center</p> <p>A network element in the mobile telephone network that stores, forwards, converts and delivers SMS messages.</p>
SNAI	<p>Service Nature of Address Indicator</p> <p>An internal G-Port parameter that allows a user to specify how to interpret the signaling connection control part (SCCP) called party address (CdPA) GTA of a LOCREQ/SMSREQ message.</p>
SOR	Support of Optimal Routing System Out of Service Request
S-Port	Service Portability

S

A number portability extension which allows a subscriber to retain the same subscriber number when moving from one network type or service technology to another within the network of a single operator. Service Portability provides different routing number digits for formats that require routing numbers. Service Portability does not affect message flows.

SP

Service Provider

Signaling Point

A set of signaling equipment represented by a unique point code within an SS7 domain.

SPC

Secondary Point Code

The SPC enables the EAGLE to assume more than one point code for SS7 routing. The EAGLE uses the SPC for routing and provisioning as if the SPC were an actual point code of the EAGLE. The EAGLE supports one ANSI true point code and up to seven secondary point codes.

Service Provisioning over COPS (Common Open Policy Service protocol)

Signaling Point Code

Spare Point Code

Stored Program Control

SRF

Service Resource Function

Provide resources to a call, such as announcements, voice prompting, and voice recognition. An example

S

of a SRF is a Voice Recognition Unit (VRU).

Signaling Relay Function

The SRF determines the HLR of the destination mobile station. If the mobile station is not ported, the original HLR is queried. If the mobile station is ported, the recipient HLR is queried.

SRI

Send Routing Information

Send_Route_Information Message

SSP

Subsystem Prohibited network management message

Subsystem Prohibited SCCP (SCMG) management message. (CER)

Service Switching Point (SS7 Network)

Signal Switching Point

Signal Switching Points are switches that originate, terminate, or tandem calls. An SSP sends signaling messages to other SSPs to setup, manage, and release voice circuits required to complete a call.

STP

Signal Transfer Point

The STP is a special high-speed switch for signaling messages in SS7 networks. The STP routes core INAP communication between the Service Switching Point (SSP) and the Service Control Point (SCP) over the network.

Spanning Tree Protocol

T

TCAP

Transaction Capabilities Application Part

T

A protocol in the SS7 protocol suite that enables the deployment of advanced intelligent network services by supporting non-circuit related information exchange between signaling points using the Signaling Connection Control Part connectionless service. TCAP also supports remote control - ability to invoke features in another remote network switch.

TFA TransFer Allowed (Msg)

TFP TransFer Prohibited (Msg)
A procedure included in the signaling route management (functionality) used to inform a signaling point of the unavailability of a signaling route.

U

UAM Unsolicited Alarm Message
A message sent to a user interface whenever there is a fault that is service-affecting or when a previous problem is corrected. Each message has a trouble code and text associated with the trouble condition.

UDTS Unitdata Transfer Service
An error response to a UDT message.

UIM Unsolicited Information Message
A message sent to a user interface whenever there is a fault that is not service-affecting or when a previous problem is corrected. Each

U

message has a trouble code and text associated with the trouble condition.

UPU

User Part Unavailable

An MTP3 management message.

V

VGTT

Variable Length GTT

A feature that provides the ability to provision global title entries of varying lengths to a single translation type or GTT set. Users are able to assign global title entries of up to 10 different lengths to a single translation type or GTT set.
