## Overview

This guide provides the data mapping information from the Oracle Utilities Work and Asset Management source system to the Oracle Utilities Extractors and Schema target product, along with the rules of data transformation.

### Terminologies

This section describes the terminology used for data maps included in the document.

#### <Table Name>

The Table Name indicates the name of the fact or the dimension in a star schema in the data warehouse.

#### Properties

The Properties table lists properties of the table independent of each field. The following properties are listed in the table.

Property	Value
Target Table	Name of the table in the target schema (data warehouse) into which data is loaded
Table Type	Fact or Dimension
SCD Type	<b>Type 1</b> - Existing records are updated directly.  <b>Type 2</b> - Existing records are deactivated and changes are captured by inserting new effective records. The existing records are deactivated by assigning an effective end date of the current date. The new records will have effective start date of the current date and effective end date of a significantly future date.

Property	Value
Fact Type	Whether this is a snapshot or transactional fact table.  <b>Snapshot</b> - Captures a snapshot view of the data as available in the source system during that period (monthly or weekly). Each snapshot's data is stored independently.  <b>Accumulation</b> - Data from the source system is accumulated periodically. Changes from source system will be merged with the existing data. Multiple copies of the same data will not be maintained.
Source System Driver Table	Name of the table in source database on which the data is primarily based.
Oracle Data Integrator Package	Name of the ODI package that needs be executed to extract data from the source application and populate a specific target table in the data warehouse.
ETL View	Resides in the replication layer and fetches the base values from the replication tables as a starting point for further transformations to be done by the Oracle Data Integrator interfaces.
Materialized View	Names of the materialized views delivered with the product for a specific fact table.  These materialized views are designed to support all of the OBIEE answers delivered with the product. Refreshing these materialized views will be taken care by separate ETL jobs.

## Fields

The Fields table lists the individual properties of each field in the fact or dimension table. It includes the following columns:

Property	Value
Target Field	Name of the column in the fact or dimension table present in the data warehouse. The extracted/transformed data is loaded here.
Description	Description of the target field
Source Field	Name of the field from the source application used to load the target field either directly or after transformation.
Transformation Logic	Specifies the details of how the data from the source field is transformed before being populated into the target field.

## Field Categories

This table lists the categories under which the fields in a particular fact or dimension are grouped. The categories presented are as below:

Category	Details
Surrogate Key	The primary key on the fact/dimension table maintained within the data warehouse.

Category	Details
Natural Keys	<p>The set of columns from the source system define the granularity of the fact or dimension table. The natural key columns from the source along with certain other data load attributes can be used to uniquely identify a record in the table.</p> <p>The additional columns needed for the identification depend on the type of the table as listed below:</p> <ul style="list-style-type: none"> <li>• SCD Type 1 Dimension - Data Source Indicator</li> <li>• SCD Type 2 Dimension - Effective Start Date, Effective End Date, Data Source Indicator</li> <li>• Accumulation Fact - Data Source Indicator</li> <li>• Snapshot Fact - Snapshot Date, Data Source Indicator</li> </ul>
Attributes	Hold descriptive data from the source system and are typically available in dimension tables.
Measures	Hold numerical values based data that is calculated from the source system data and are typically available on fact tables.
Degenerate Dimensions	Hold descriptive data from the source system and are typically available in fact tables. These cannot be included into any of the available dimensions.
Foreign Keys	Foreign key references on the fact tables to the dimension tables.
User Defined Attributes	Additional fields available to customers for extending the star schemas. These fields will not be populated out of the box. Customers need to customize the ETL and populate these fields.
Data Load Attributes	Hold the date/time information, job number details, etc, related to the ETL processes, that are needed for audit purposes.

## Shared Dimensions

Shared dimensions are used in the star schemas of other source products as well. The other products also populate these shared dimensions with their data. The data source indicator (DSI) column plays a vital role in identifying the records belonging to a specific source product.

### Address Dimension

The Address dimension extracts data from the Location/Node entity in the Oracle Utilities Operational Device Management system. The address constituents from the location are retrieved and stored in the target dimension.

## User Defined Dimensions

A user defined dimension (UDD) is a means of extension for an existing fact. These dimensions have a foreign key reference to a fact; however no out-of-box ETL is delivered. Customers can define an ODI ETL process to populate these dimensions with the source data as per their requirement. Each fact is provided with two such user defined dimensions. For details about extending using UDDs see the *Oracle Utilities Analytics Developer's Guide*.

All user defined dimensions have the same structure. The only technical difference is the column name of the primary key, which follows the pattern of using the fact for which it is linked to.

Below is the structure of the **Fields** table which is common for all user defined dimensions.

## Asset Snapshot Fact

The Asset Snapshot fact is a periodic snapshot of the asset details in the source system. It stores information, such as the asset's disposition at the end of the snapshot, how long the asset has been installed, how old since it was received, and more. Only those assets are extracted whose business object names have been configured as part of the extract parameter setup in source system.

For more details, see **Configuring Source** in the *Oracle Utilities Analytics Administration Guide*.
