Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Part I

Introduction to Oracle Cloud Adapter for Salesforce.com

This chapter provides an introduction to the Oracle Cloud Adapter for Salesforce.com.

With an exponential increase in adoption of Cloud Based Applications across Enterprises, there is also an increased need for simplified, reliable and secure connectivity between these applications with other Cloud and On-Premise Applications. Most Cloud Applications in the market today have their own distinct data model and unique mechanisms for enabling connectivity, authentication, authorization and session management, etc. This disparity adds complexity in the development and maintenance of integrations, and an increased time-to-market as the number of Applications in the Enterprise integration mix grows. Oracle Fusion Middleware has significantly simplified integrations with these Cloud Applications by providing a standard platform for integration that not only enables connectivity, but also lays a strong foundation to address aspects of audits, compliance, security and governance.

The Oracle Cloud Adapters, a key component of the Oracle SOA Suite, builds on the above platform to enable Standards based Connectivity to Cloud based Applications from On-Premise, Legacy and other Cloud Applications, while significantly simplifying the overall life-cycle and user experience. It shields the integration modeler from hand-coding and configuring dedicated logic for handling connectivity, security, and session management etc. individually for each Cloud Application being integrated with. It also safeguards the user from the need for in-depth expertise on the complex functional and technical knowledge of the applications. Thus, with these Adapters addressing all the requisites for managing integration with the applications, the Developers can focus on building the business logic for the integration and business processes.

This chapter contains the following sections:

- [Section 1.1, "Architecture"](#)
- [Section 1.2, "Lifecycle"](#)

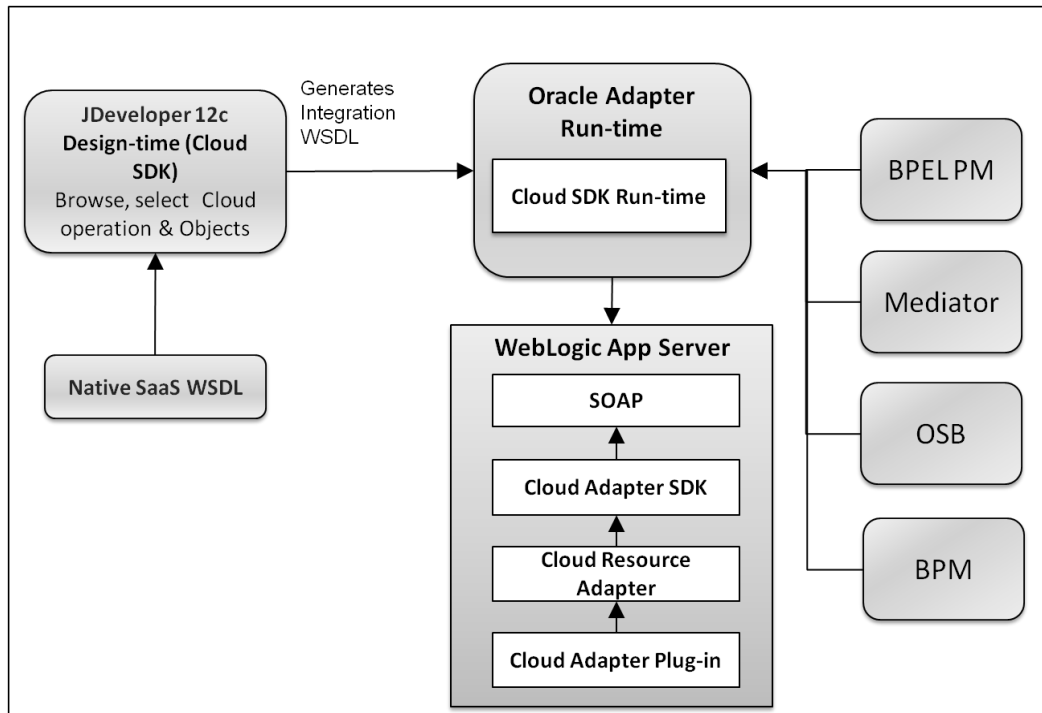

1.1 Architecture

Oracle Cloud Adapter framework and SDK are the new offerings provided by Oracle in Oracle SOA Suite. [Figure 1-1](#) depicts the architecture of Oracle Cloud Framework. The Oracle Cloud Framework has two main components:

Design-time: Oracle Cloud Adapters are configured at design-time via the Adapter Configuration Wizard in JDeveloper. The Wizard leverages the underlying Cloud SDK to facilitate browsing of cloud application metadata and generation of project artifacts to be used at runtime.

Run-time: It includes Oracle run-time cloud SDK which helps in creation of cloud application (e.g. Salesforce.com) adapter run-time plug-in. Oracle WebLogic server is having Cloud Framework running, supported by Oracle Cloud Run-time SDK, which is a backbone of all cloud adapters. Cloud Framework uses one common JNDI name which is being referred by all cloud adapters.

Figure 1-1 Architecture of Oracle Cloud Adapter

1.1.1 Architecture of Oracle Cloud Adapter for Salesforce.com

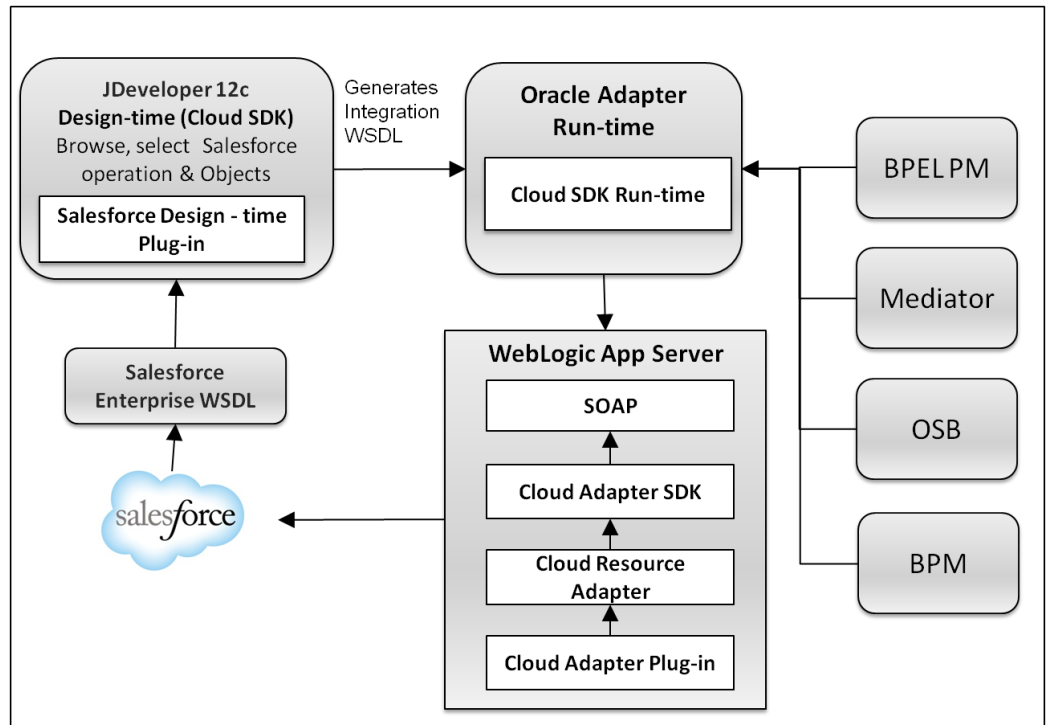

The Oracle Cloud Adapter for Salesforce.com was built using the Oracle Cloud Adapter Framework.

Design-time: The Salesforce.com Adapter is configured using the Adapter Configuration Wizard within JDeveloper. User can drag and drop the adapter from the component palette to the External References swim lane to start configuring the adapter. The Wizard enables the user to graphically browse and select Business Objects and Operations of interest for integration.

Run-time: The Runtime component of the Salesforce adapter implements the Cloud Runtime SDK to interact with Salesforce.com Enterprise WSDL SOAP APIs.

Figure 1-2 shows the Architecture of Oracle Cloud Adapter for Salesforce.com.

Figure 1-2 Architecture of Oracle Cloud Adapter for Salesforce.com

1.2 Lifecycle

In general, the lifecycle of an Oracle Cloud Adapter for Salesforce.com instance includes the following four stages, as shown in Figure 1-3.

Figure 1-3 lifecycle of Oracle Cloud Adapter for Salesforce.com

Deployment: Oracle Cloud Adapter for Salesforce.com gets installed and deployed as per the instructions provided in the section, “[Deploy the Composite](#)”.

Configuration: Oracle Cloud Adapter for Salesforce.com installation and deployment happens with a default configuration provided by Oracle. If you want to change design-time configuration files, refer to the section, “[Deploy the Composite](#)”.

Start and Stop of Adapter: Since Oracle Cloud Adapters architecture is different from JCA Adapters, the deployment section of WebLogic console does not show cloud adapters. The Cloud Adapter instances are stopped when the WebLogic server is shut down and similarly the instances are started when WebLogic server is booted.

Upgrade: Oracle will release the latest version of Oracle Cloud Adapter for Salesforce.com either in the form of OPatch or bundled with new versions of the Oracle SOA Suite. Oracle Cloud Adapter for Salesforce.com can be upgraded without impacting current functionalities. Future upgrades of Oracle Cloud Adapter for Salesforce.com will also have backward

compatibility, so that the existing composites do not become obsolete in the upgraded environment.

Part II

Oracle Cloud Adapter for Salesforce.com

This part provides an overview of the Oracle Cloud Adapter for Salesforce.com. It contains the following chapters:

- [Oracle Cloud Adapter for Salesforce.com](#)
- [Getting Started](#)
- [Oracle Cloud Adapter for Salesforce.com - Supported Features](#)
- [Design-Time: Using Oracle Cloud Adapter for Salesforce.com Configuration Wizard](#)
- [Integration with Different Service Components \(BPEL/Mediator\) in Oracle SOA Suite](#)
- [Configuring Processes Using Oracle Service Bus](#)
- [Configuring the Oracle Cloud Adapter for Salesforce.com on Oracle WebLogic Server](#)
- [Troubleshooting and Error Messages](#)
- [Migration Support](#)
- [Oracle Cloud Adapter for Salesforce.com Use Cases](#)

Oracle Cloud Adapter for Salesforce.com

The Oracle Cloud Adapter for Salesforce.com enables integration to Salesforce CRM using Oracle SOA Suite and BPM.

This chapter contains the following topics:

- [Section 1.1, "Overview"](#)
- [Section 1.2, "Supported Versions and Platforms"](#)

1.1 Overview

Oracle Cloud Adapter for Salesforce.com is a key component within Oracle Fusion Middleware that enables Integration of On-Premise and SaaS applications with Enterprise, Unlimited or Developer Editions of Salesforce.com

1.1.1 Functional Overview

The Oracle Cloud Adapter for Salesforce.com allows seamless connection of different systems to Salesforce.com. It uses the Oracle SOA Suite to communicate with Salesforce.com, leveraging the SOAP API of Salesforce and supports all the major operations of SOAP API for standard as well as custom objects. The Salesforce.com WSDLs are polymorphic, for instance, the element sObject can refer to a plethora of objects, say account, contact, lead, etc. The support for this polymorphic behavior is limited in other options available in the market to integrate with Salesforce.com. The Oracle Cloud Adapter for Salesforce.com provides extensive support for this polymorphic behavior of Salesforce.com WSDLs through a simplified user interface. It enables you to define the operation you wish to perform in your API call and the object you wish to modify with this call. The integration WSDL that is generated is not polymorphic and contains the selected operation and object. The Oracle Cloud Adapter for Salesforce.com also provides a market-leading session management capability.

The adapter is compatible with the last six versions of Salesforce.com as described in section Salesforce.com ["Supported Versions"](#).

The Oracle Cloud Adapter for Salesforce.com is based on the Cloud Adapter Framework. The Cloud Framework relies on an underlying JCA framework which uses a common JNDI for all cloud adapters in Oracle SOA Suite 12c. The operations to be performed (CREATE, UPDATE, DELETE, etc.) are modeled using the design-time wizard. (For more information, refer to the section ["Design-Time: Using Oracle Cloud Adapter for Salesforce.com Configuration Wizard"](#)). The inputs and outputs of the Oracle Cloud Adapter for Salesforce.com are XML; this allows the Oracle Cloud Adapter for Salesforce.com to be plugged into Oracle Fusion Middleware and enable the use of other SOA tools for XML transformations and assignments.

To connect to Salesforce.com, there are certain prerequisites:

- Enterprise WSDL. For more information, refer to the section ["A.1 Generating the Enterprise WSDL"](#)
- Valid Salesforce.com credentials. For more information, refer to the section ["A.1 Generating the Enterprise WSDL"](#)

Oracle Cloud Adapter for Salesforce.com Connection Parameters”.

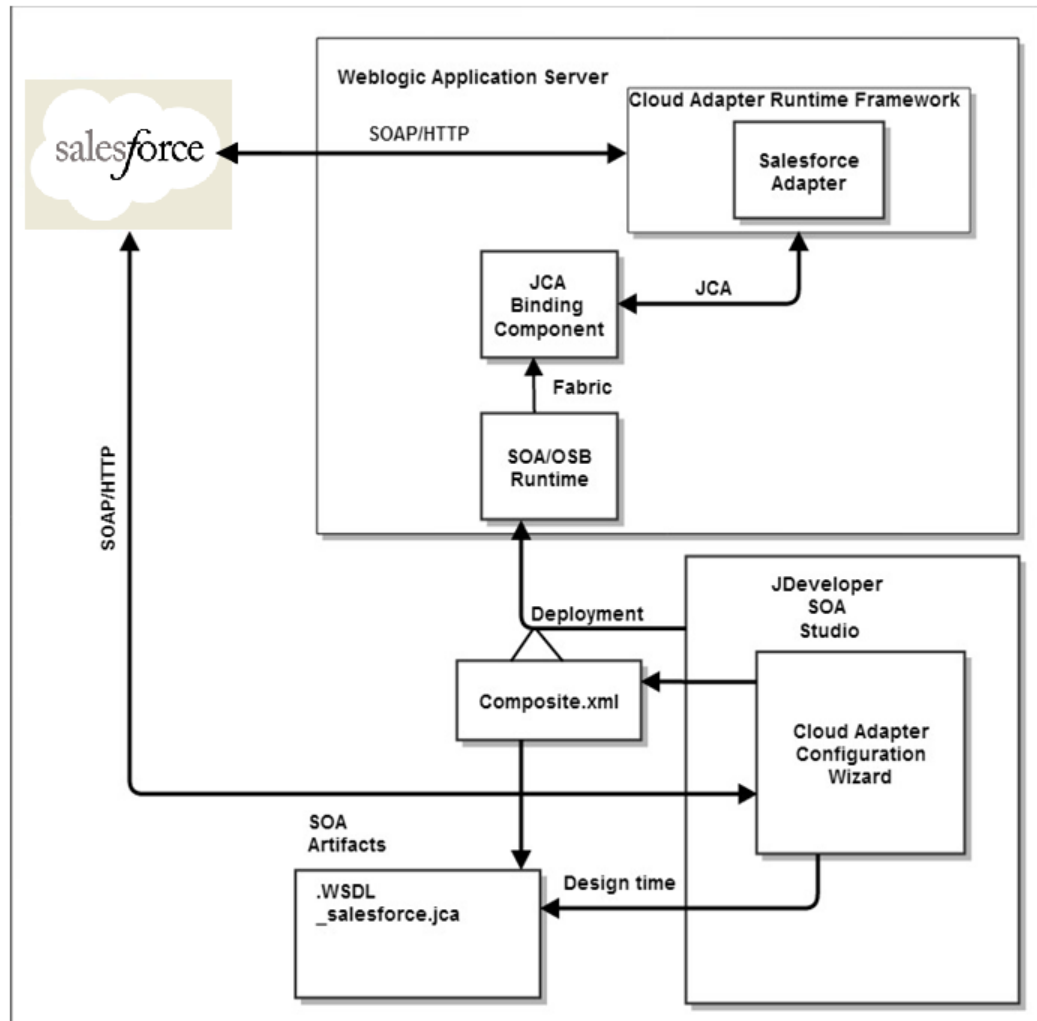

- Client certificates. For more information, refer to the section “[Importing Salesforce.com Certificate into Client/Server](#)”.

The Oracle Cloud Adapter for Salesforce.com can be used at present, in an SOA/OSB/BPM process as described in section “[Designing a Composite for Service Integration](#)”.

1.1.2 Design Overview

This section gives an overview about the design of Oracle Cloud Adapter for Salesforce.com. [Figure 1-1](#) shows how the Oracle Cloud Adapter for Salesforce.com interacts with the various design-time and deployment artifacts.

Figure 1-1 How the Oracle Cloud Adapter for Salesforce.com Works

Description of [Figure 1-1](#) How the Oracle Cloud Adapter for Salesforce.com works.

- The Oracle Cloud Adapter for Salesforce.com is an adapter which has been built using the Oracle cloud SDK. For more information on deployment, refer to the section, “[Deploy the Composite](#)”.
- The Oracle Cloud Adapter for Salesforce.com can have multiple adapter instances; an adapter instance is basically a configured Oracle Cloud Adapter for Salesforce.com, which can connect with Salesforce.com and invoke the Salesforce Cloud operation which has been selected by the user during the configuration. Each adapter instance has its own artifacts i.e. Integration WSDL and JCA file.

- Because each adapter instance points to a single Salesforce operation, there is a one-to-one correspondence from adapter instances to Salesforce.com cloud operation. To see the list of supported operation, refer to the section “[Supported SOAP API Operations](#)”.
- The adapter instances are part of the SOA composites. Each time the adapter wizard is run, it creates one instance of the Cloud Adapter. A Cloud Adapter instance consists of a jca file, a WSDL, and a reference element added to the composite.xml.

For more information, refer to the section “[Oracle Cloud Adapter for Salesforce.com Walkthrough](#)”.

- The artifacts generated in the above steps are used by the Oracle Cloud Adapter for Salesforce.com which is part of the Cloud Adapter Run-time framework for processing the request and response from Salesforce.com.

[Table 1-1](#) shows the Adapter Configuration Wizard Generated SOA Composite Adapter Artifacts.

Table 1-1 Adapter Configuration Wizard Generated SOA Composite Adapter Artifacts

File	Description
<serviceName>.wsdl	The Oracle Cloud Adapter for Salesforce.com generates this non-polymorphic integration WSDL for seamless integration to Salesforce.com. An abstract WSDL that defines, the name of operations and objects selected along with the request and response structures. Unlike the Enterprise WSDL available from Salesforce.com, it is not polymorphic and is therefore much more integration-friendly.
<serviceName>_salesforce.jca	The JCA file contains the internal implementation details used by the adapter during run-time. It contains the different interaction and connection properties used by the adapter. The operations describe the action that needs to be taken against the end point, such as Create, Update, etc. The contents of the file are determined by choices made during the Adapter Configuration.

1.2 Supported Versions and Platforms

This section provides an overview of the different versions and platforms of Salesforce.com as well as of different operating systems supported by the Oracle Cloud Adapter for Salesforce.com.

1.2.1 Salesforce.com

1.2.1.1 Supported Versions

The Oracle Cloud Adapter for Salesforce.com supports the previous six versions of Salesforce.com starting from the current version. For more information about the latest Salesforce.com versions supported by the adapter, refer the link [Oracle Fusion Middleware Supported System Configurations](#).

1.2.1.2 Supported WSDLs

A Web Service Description Language (WSDL) file is required to access the Salesforce.com Web Service. It defines the available web service. It is used by the development platform to generate the API required to access Salesforce.com web service. The WSDL can be generated directly from Salesforce.com UI if one has access to the download page, or it can be requested from the organization’s Salesforce administrator. Web Service Description

Language (WSDL) contains all the relevant information required to invoke a web service. It is extensible and allows the description of endpoints and their messages irrespective of the network protocols and message formats. Oracle Cloud Adapter for Salesforce.com supports integration with Salesforce.com via the Enterprise WSDL.

Generate the most-recent WSDL for the organization by clicking on Setup>Develop>API. For steps on how to generate the Enterprise WSDL for your Salesforce.com organization, see section “[A.1 Generating the Enterprise WSDL](#)”.

- **Enterprise WSDL** – Most enterprise users use this API to develop client applications for their organization. It is a strongly typed representation of the organization’s data. It contains the information about data types, schema, and fields of the development environment. This allows for a tight integration between the Salesforce.com Web service and the WSDL. The Enterprise WSDL is object dependent, i.e. if custom objects or custom fields are created in the organization’s Salesforce configuration, it changes. The Enterprise WSDL also contains the versions of the installed packages in the organization. This adds an extra step in WSDL generation where the user has to select the versions of managed packages.

When generating the enterprise WSDL, keep in mind the following scenarios:

- Addition of custom objects.
- Modification of custom objects.
- Addition of custom fields.
- Modification of custom fields.
- Changes/updates to installed packages.

For all the above-mentioned scenarios, the WSDL file needs to be regenerated to permit access to these changes. Also, for any change in the installed packages, the WSDL needs to be regenerated with the specific package version. The new WSDL will have the objects and fields of only the packages selected during generation.

1.2.1.3 Supported API

SOAP API

To meet the needs of the complex business processes that an organization may need to orchestrate, Salesforce.com provides a number of ways for advanced administrators and developers to implement different functionalities. SOAP API is one such way.

SOAP API can be used to fetch and manipulate different records of standard as well as custom objects in Salesforce.com through operations like create, update, delete, query, etc. It supports all languages that support Web Services.

The organization must use Enterprise Edition, Unlimited Edition, or Developer Edition to be able to use SOAP API. An existing Salesforce.com customer can upgrade to either Enterprise or Unlimited Edition by contacting their account representative.

1.2.1.4 Support for Outbound

The Oracle SOA Suite Oracle Cloud Adapter for Salesforce.com does not support Salesforce making outbound synchronous calls to SOA Suite, that scenario must be implemented using the standard Web Service Binding in SOA Suite. It will be supported in the adapter in a future

release. Automatic triggering of SOA Composite based services upon occurrence of SFDC events can be done by registering SOA Composite services end points manually within SFDC.

1.2.2 Oracle SOA Versions

Oracle Cloud Adapter for Salesforce.com is available in the following Oracle SOA Suite versions:

- 11g (11.1.1.7.0), alternatively referred as Oracle SOA Suite 11g PS6. Kindly refer the document [User Guide for Oracle Cloud Adapter for Salesforce.com](#) for more details.
- 12c (12.2.1.1.0): This document is intended for 12c version of SOA Suite.

This section provides a quick-start guide to enable the use of Oracle Cloud Adapter for Salesforce.com. This chapter explains the basic steps the user must follow to ensure that the Oracle SOA Suite 12c is properly configured for the Oracle Cloud Adapter for Salesforce.com. You must follow these steps to successfully connect with Salesforce.com and then proceed with implementing your integration. This chapter contains the following topics:

- [Section 2.1, "Oracle Cloud Adapter for Salesforce.com Connection Parameters"](#)
- [Section 2.2, "IP Address Registration and Restrictions"](#)
- [Section 2.3, "Salesforce.com Permissions"](#)
- [Section 2.4, "Importing Salesforce.com Certificate into Client/Server"](#)
- [Section 2.5, "Enabling Cloud Adapter for Salesforce.com in Design-time and Run-Time"](#)

2.1 Oracle Cloud Adapter for Salesforce.com Connection Parameters

The Oracle Cloud Adapter for Salesforce.com requires the user's Salesforce.com login credentials to successfully integrate with Salesforce.com.

The required connection parameters are:

- Username (in the form of an e-mail address).
- Password + Security token.
- CSF (Credential Store Framework) key.

Let us first begin with the description of connection parameter for Salesforce.com.

2.1.1 User Name

Salesforce.com provides every user in an organization a unique username. This username is in the form of an e-mail address. It could either be the same as the registered e-mail address of the user or some other username but always in an e-mail format.

For Example, if you have the registered e-mail id as *john.doe@oracle.com*, your username for Salesforce.com can be *john.doe@oracle.com* or you can choose another username in the form of an e-mail address like *john.doe@salesforce.com*

2.1.2 Password

The design of Salesforce.com APIs is such that the security token generated at the time of password reset is required to be appended at the end of the password. For example, if the security token automatically generated by Salesforce.com is SSSSSSSSSSS and the password is "password", then the user is required to enter "passwordSSSSSSSSSS" to log in.

The security token can be obtained by changing the password or resetting the security token through the Salesforce.com UI. The security token is sent by mail to the e-mail address of the user registered with Salesforce.com for that particular organization. This token is valid until the user resets the security token for his/her account or changes the password.

Note: In case the user generates a new security token, then all the existing composites using the old security token in their passwords will need to be updated.

2.1.3 CSF Key

The Adapter uses the Credential Store Framework to retrieve the username and password required for Salesforce.com authentication. This key identifies a user's Salesforce.com login credentials during design-time and has to be configured as exactly the same in Enterprise Manager on WebLogic Server under the CSF Map name "SOA" (Case sensitive).

From release 12.2.1.1.0 onwards, CSF Key and MAP will automatically create when we deploy the project, but for backward compatibility projects, we need to create CSF Map and Key. Refer Section A.2, "[CSF Key in Enterprise Manager](#)".

2.1.4 Downloaded Enterprise WSDL

A copy of the Enterprise WSDL of your Salesforce.com organization is needed for successful connection of the Oracle Cloud Adapter for Salesforce.com to Salesforce.com. To view steps on how to generate the enterprise WSDL, refer to the section "[A.1 Generating the Enterprise WSDL](#)".

2.2 IP Address Registration and Restrictions

When a user tries to access Salesforce.com via a new IP address or machine, Salesforce.com requires a verification code to be entered for the user. This code is mailed to the user's registered e-mail address. To circumvent this login challenge, a list of IP address ranges can be set for all users from which they can always log in without facing such issues.

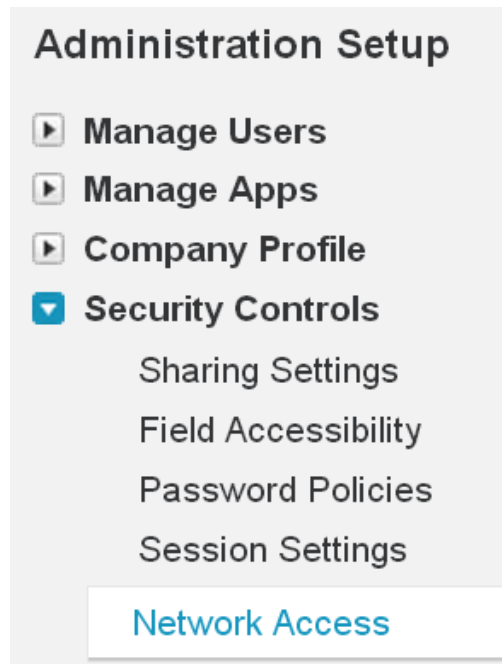

Restricting Login IP Ranges for the Organization

A list of IP addresses can be specified in Salesforce.com to protect the organization's data and from these addresses, the users can always log in without receiving a login challenge:

To register the list of IP addresses, follow the steps given below:

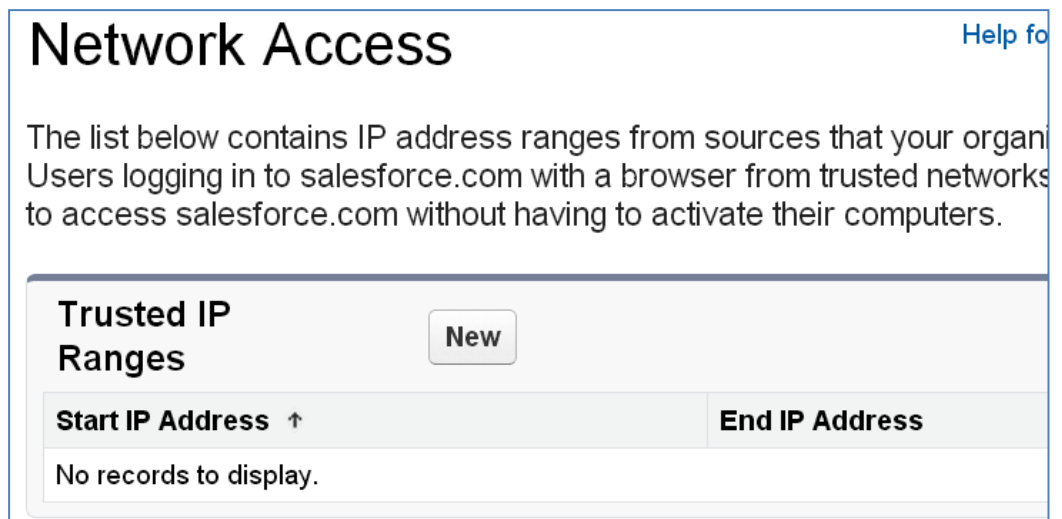

1. Log in to the salesforce.com using a valid user name and password.
2. Click on **User Menu** for user name, and then click on **Setup**.
3. Under **Administration Setup**, Expend **Security Controls** and click on **Network Access**, as shown in [Figure 2-1](#).

Figure 2-1 Setup Window

4. Network Access page is displayed, as shown in Figure 2-2.

Figure 2-2 Network Access Page

5. Click New, the Trusted IP Range Edit page is displayed, as shown in Figure 2-3.

Figure 2-3 Trusted IP Range Edit Page

Network Access [Help for this Page](#) ?

Trusted IP Range Edit

Enter the range of valid IP addresses from which user logins are trusted. Users logging in from trusted IP addresses are not asked to activate their computers and may use their user password instead of a security token to log in to the API or a desktop client such as Connect for Outlook, Connect Offline, Connect for Office, Connect for Lotus Notes, or the Data Loader.

Please specify IP range ! = Required Information

Start IP Address End IP Address

6. Enter a valid IP address in the **Start IP Address** field and a higher IP address in the **End IP Address** field.

The range of allowed IP addresses from which users can log in is defined by the start and end addresses. To allow logins from only one address, the administrator can enter that particular address. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses. The start and end IP addresses in an IPv4 range must include no more than 33,554,432 addresses (2^{25} , a /7 CIDR block). Here are some examples of valid ranges:

- 0.0.0.0 to 1.255.255.255
- 132.0.0.0 to 132.255.255.255
- 132.0.0.0 to 133.255.255.255

However, ranges like 0.0.0.0 to 2.255.255.255 or 132.0.0.0 to 134.0.0.0 are too large. The start and end IP addresses in an IPv6 range must include no more than 79,228,162,514,264,337,593,543,950,336 addresses (2^{96} , a /32 CIDR block). For example, the following range is valid: 2001:8000:: to 2001:8000:ffff:ffff:ffff:ffff:ffff:ffff. However, ranges like :: to ffff:fff:fff:fff:fff:fff:fff:ffff or 2001:8000:: to 2001:8001:: are too large.

7. Click **Save**.

When users log in to Salesforce.com via the API, Salesforce.com confirms that the login is authorized as follows:

1. Salesforce.com checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. Salesforce.com then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, any login from an undesignated IP address is denied, and any login from a specified IP address is allowed.
3. If profile-based IP address restrictions are not set, Salesforce.com checks whether the user is logging in from an IP address they have not used to access Salesforce.com before:

- If the user's login is from an IP address in your organization's trusted IP address list, the login is allowed.
- If the user's login is not from a trusted IP address the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce.com must verify the user's identity.

For access via the API or a client, the user must add their security token to the end of their password in order to log in.

2.3 Salesforce.com Permissions

The Cloud Adapter for Salesforce.com is based on the SOAP API of Salesforce.com. For the users to successfully make calls for different operations (create, update, deleted, query, etc.) they must have the requisite permissions for performing these operations on specific objects. This section provides an overview of the permissions the user must have to make the following calls:

- **Create:** You must have permission to create the particular object that is selected during design time. For example, if you are trying to create an account, you must have the permission to create new accounts.
- **Retrieve:** If you are trying to fetch the records of a certain object, you must have at least the read permission for that object. If you are trying to fetch a record of the Campaign object, you must have the permission to access Campaign object in Salesforce.com.
- **Update:** You must have permission to update the particular object that is selected during the design-time. For example, if you are trying to update an account, you must have the permission to change the account records.
- **Delete:** You must have the permission to delete the records of the object selected during the run-time. For example, if you have selected Lead object during design time, you must have the permission to delete Leads.
- **Upsert:** A user trying to use the upsert operation must have both create and update privileges for the said object to successfully make the upsert call.
- **ConvertLead:** A user trying to convert a lead to account and/or opportunity must have read and write permissions for the aforementioned objects.
- **Merge:** The merge operation works only on Account, Lead, and Contact objects. You must have full access to these objects.
- **Query:** This operation can be used to fetch records for several objects. To be able to successfully fetch these records you must have the permission to access these objects and their fields.
- **Search:** This operation is used to search records in the Salesforce.com organization and only the objects to which the user performing the operation has access to can be fetched. For instance, if you do not have access to Pricebooks, the records from Pricebook that match the search string will not be fetched.

2.4 Importing Salesforce.com Certificate into Client/Server

This section provides an overview of how to generate and import the Salesforce.com certificate for your organization into your client/server. The Oracle Cloud Adapter for Salesforce.com uses the certificate generated by Salesforce.com to establish a two-way SSL authentication. This enhances the security as the target of SOAP calls made by the Oracle Cloud Adapter for Salesforce.com receives the certificate and can use it to authenticate the request against its keystore.

2.4.1 Generating Salesforce.com Certificate

The Salesforce.com Client certificate has to be downloaded from the Salesforce.com application user interface. This certificate has to be imported into the server for successful handshaking with Salesforce.com. The Oracle Cloud Adapter for Salesforce.com uses two-way SSL when interacting with Salesforce.com and hence requires this certificate. On the WebLogic server, these certificates are required to be imported.

To download the certificate, use the following procedure:

1. Log in to the salesforce.com using a valid user name and password.
2. Click on **User** menu for **user name**, and select **Setup**.
3. Under **App Setup**, Expand **Develop** and click on **API** to display the **WSDL download** page, as shown in [Figure 2-4](#).

Figure 2- 4 API WSDL Download Page

4. Click on the **lock** icon as indicated in the above [Figure 2-4](#). A small window will pop up. Click on the **view certificates**, as shown in [Figure 2-5](#).

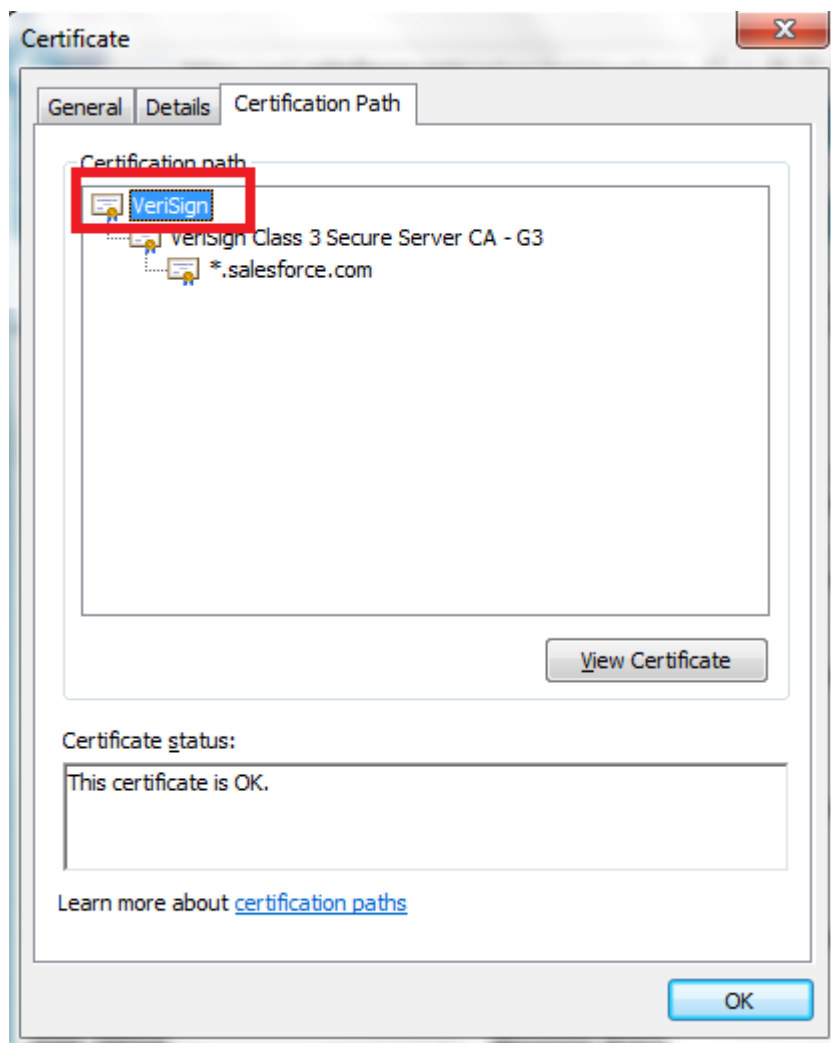

Note: Here, internet explorer (version 10) is used for demonstration. Experience may differ if you will be using other browser or other version of internet explorer. But idea here is to click on security lock to fetch the certificate information.

Figure 2-5 View Certificates

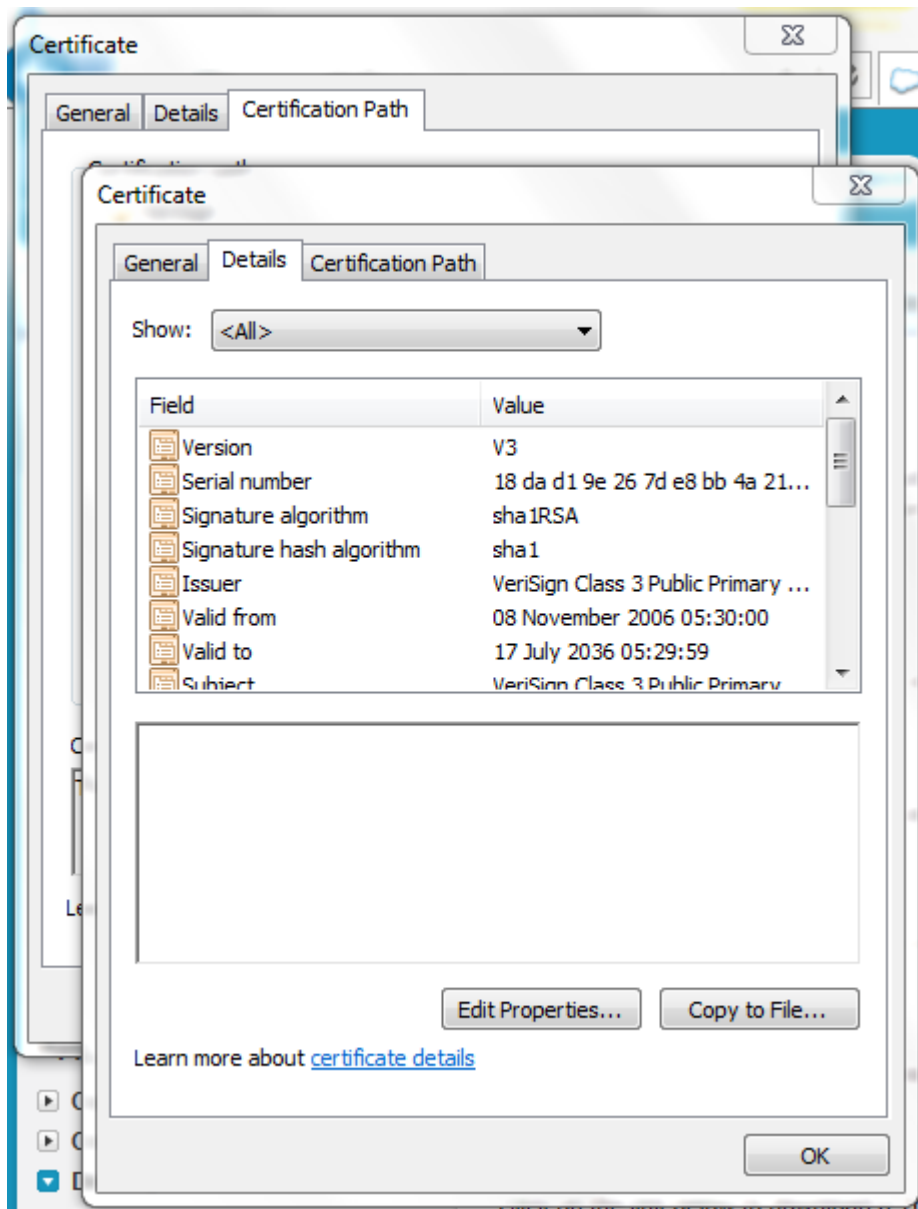

5. After clicking on the view certificates another window pops up providing the details of the certificate. Open the **Certification Path** tab and select VeriSign as shown in the screenshot below. The **View Certificate** button would be enabled, click the same to view certificate details.

Figure 2-6 Selecting Certification Path

6. A new page opens above the existing page, open the **Details** tab and click on **Copy to File** button, as shown in Figure 2-7.

Figure2-7 Details Tab

7. Now, Certificate Export wizard opens. Click on next button and select **Base-64 encoded X.509 (.CER)** option, as shown [Figure 2-8](#).

Figure2- 8 Certificate Export Wizard

8. Click **Next** and browse to the location where you want to save the certificate. Provide an appropriate name to the certificate file and save it.
9. Double-click and open the Saved certificate, it should be similar to the screenshot provided below.

Figure 2-9 Certificate Information

10. Import the downloaded certificate into your application server, and configure your application server to request the client certificate. The application server then checks that the certificate used in the SSL/TLS handshake matches the one you downloaded.

2.4.2 Importing Salesforce.com Certificate using Keytool

1. Provide a suitable location on your system to save the certificate authority. You would now add this certificate to Keystore.
2. Make sure that KSS for demo is disabled.
3. To disable KSS, go to the WebLogic console (<http://url:port/console/>).
4. Click on Domain → Security → Advanced page and unselect “Use KSS for Demo”.
5. Click **Save**.
6. To know the WebLogic server’s trust Keystore location: On the home page, proceed to **Servers** under **Environment** subsection.
7. Select the Admin server out of the list of servers displayed.
8. Proceed to the **Keystores** tab, as shown in [Figure 2-10](#).

Figure 2- 10 Configuration Keystores Tab

9. Under **Keystores** tab, select the **Demo Trust Keystore** path. This is the path where our keystore resides.
10. It would be of the form {Middleware_Home}/wlserver/server/lib. Next, you need to import this certificate from the authority into WebLogic server's trust store.
11. If you are using a window based system, use a command prompt to navigate to the path mentioned in the above step.
12. At this path, run the following keytool command:

```
keytool -import -trustcacerts -alias SalesForceCA -file  
<Filename with location> -keystore DemoTrust.jks -  
storepass DemoTrustKeyStorePassPhrase
```

For e.g., assuming downloaded certificate is kept at the location as mentioned in the step 8 and name of the certificate is **Salesforce.cer** then keytool command would look like:

```
keytool -import -trustcacerts -alias SalesForceCA -file  
Salesforce.cer -keystore DemoTrust.jks -storepass  
DemoTrustKeyStorePassPhrase
```

13. A message **Certificate was added to keystore** is displayed, which confirms the successful import of the certificate. If you get a 'Certificate already exists in the Keystore message', enter 'Y'(yes) and proceed to import the certificate.
14. You can verify the same by enlisting all the certificates using the following command:

```
keytool -list -keystore DemoTrust.jks -storepass  
DemoTrustKeyStorePassPhrase
```
15. The newly imported certificate appears as part of existing certificates in the keystore, as shown Figure 2-11.

Figure2- 11 Run Command Screen

```
[oracle@JCADEV2 lib]$ keytool -list -keystore DemoTrust.jks
Enter keystore password:

Keystore type: JKS
Keystore provider: SUN

Your keystore contains 7 entries

salesforceca, Mar 13, 2014, trustedCertEntry,

```

16. Restart the server to bring the modifications made in the previous steps into effect.

2.5 Enabling Oracle Cloud Adapter for Salesforce.com in Design-Time and Run-Time

This section provides an overview that enables you to access the Oracle Cloud Adapter for Salesforce.com in both Design-Time and Run-Time.

The Oracle Cloud Adapter for Salesforce.com comes pre-installed with Oracle SOA Suite 12c unlike 11g PS6 where it has to be enabled using an OPatch for JDeveloper and WebLogic Server.

2.5.1 What is Design-time and Run-time?

The Cloud Adapter for Salesforce.com has two components:

1. **Design-Time** – This is the Adapter Configuration Wizard that allows an easy generation of artifacts that are needed to invoke and consume Web services. It consists of six simple configuration windows that create the artifacts needed to communicate with Salesforce.com.

Below flowchart diagram (Figure 2-12) explains the complete design-time lifecycle.

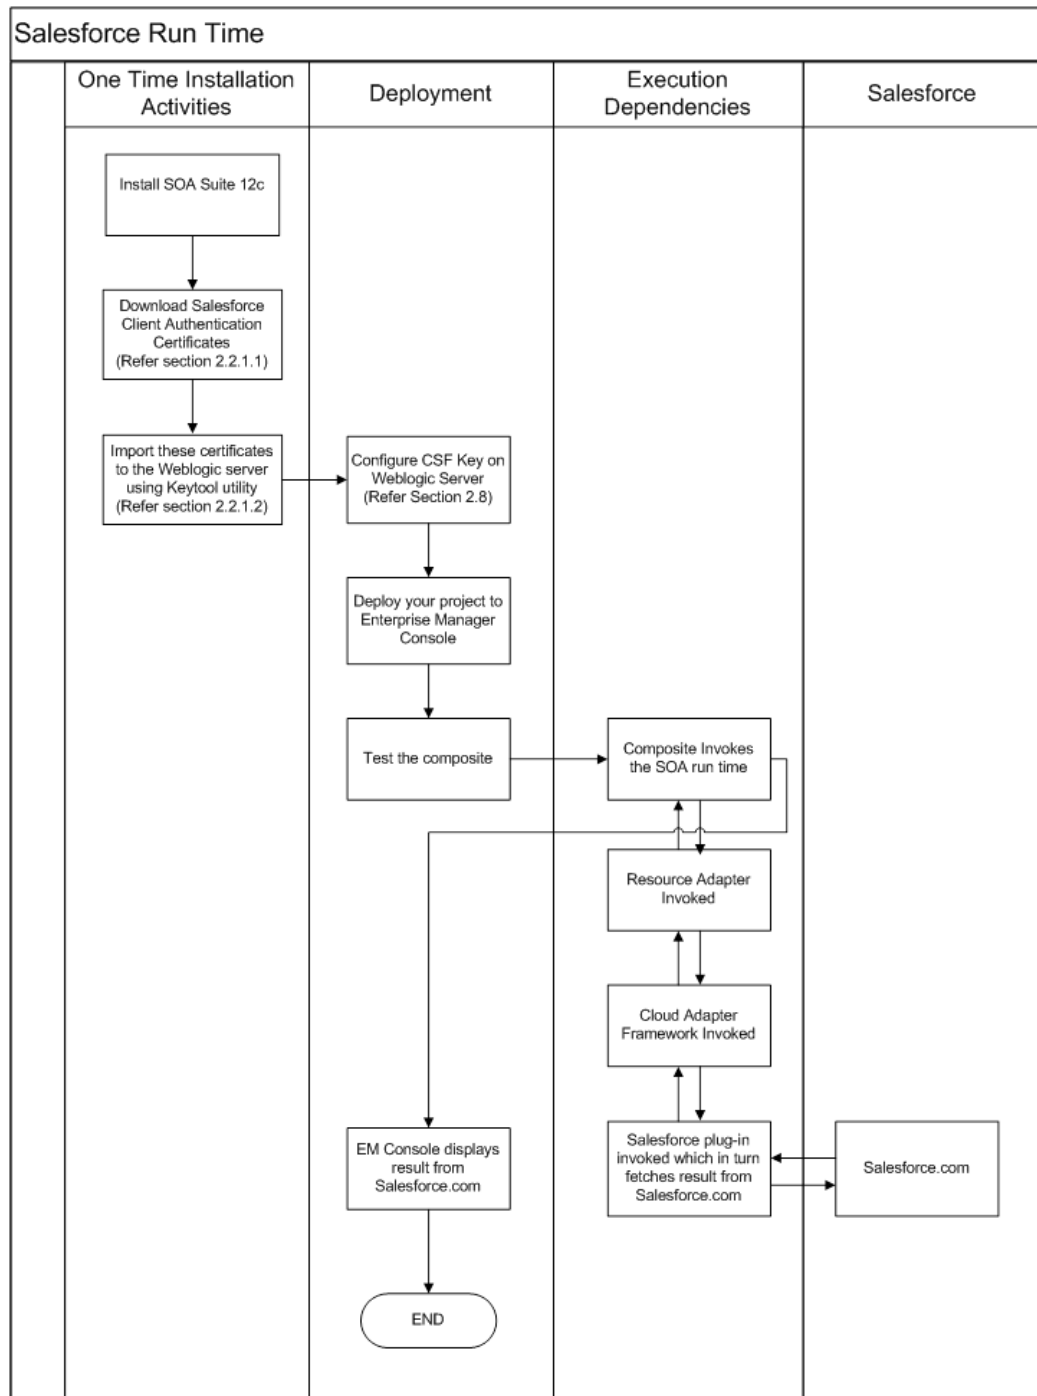

Figure2- 12 Design-Time Lifecycle

2. **Run-Time** – The run-time part of the adapter is utilized for delivering the information generated during the design-time to the service end point. This is where the actual invocation of Salesforce.com Web Service happens.

Below flowchart diagram (Figure 2-13) explains the complete run-time lifecycle.

Figure2- 13 Run-Time Lifecycle

2.5.2 Import the WSDL File into your Development Platform

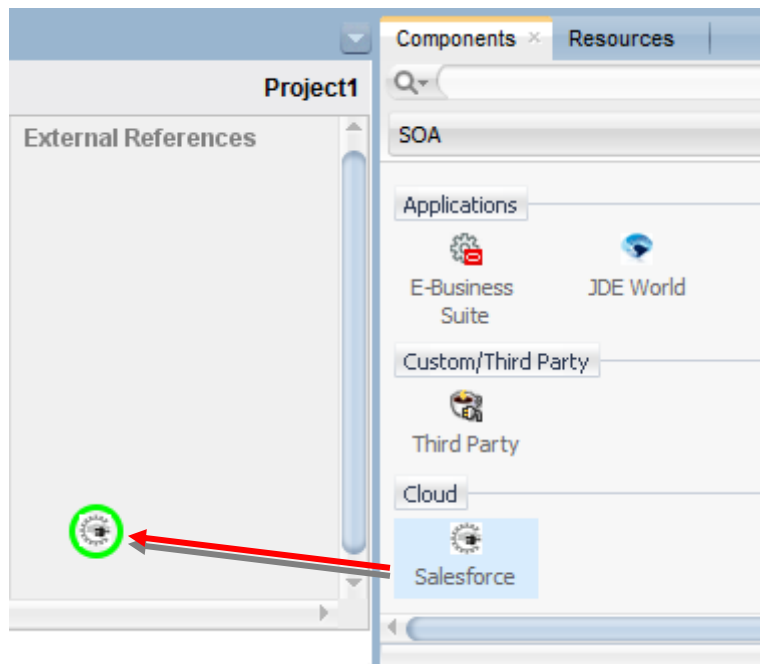

Once you have the WSDL file, it has to be imported into the development platform so that the development environment can generate the necessary objects for use in building client Web service applications in that environment. This section provides instructions for importing the WSDL into Oracle SOA Suite JDeveloper:

1. Open JDeveloper.
2. Drag and drop the **Salesforce Adapter** component from the Service Adapters pane to the **External References** pane, as shown in [Figure 2-14](#).

OR

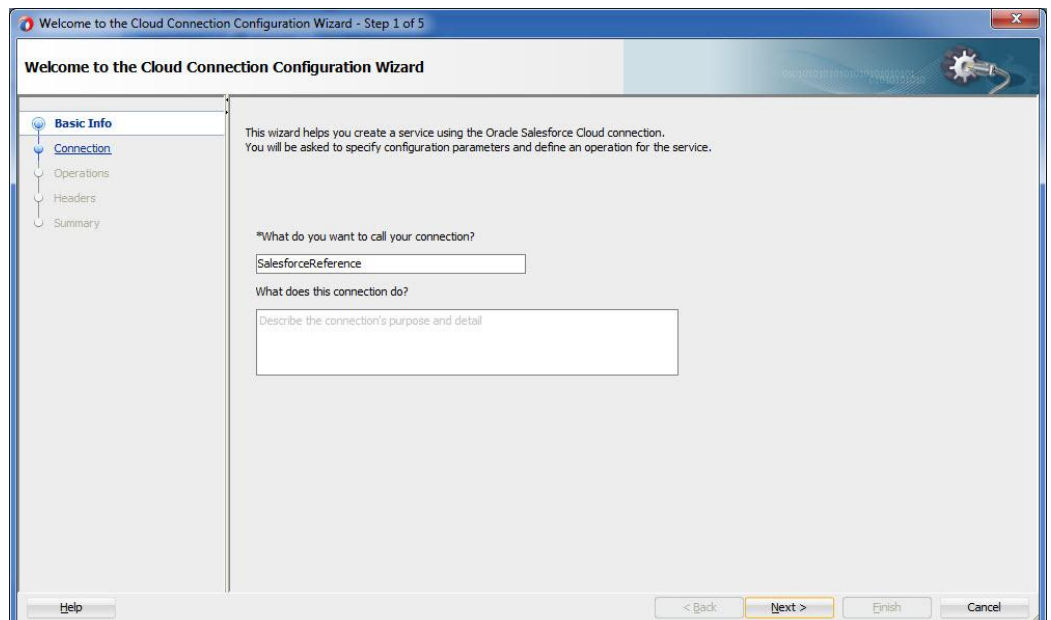

Right-click on the **External References** pane in JDeveloper and click on the **Salesforce Adapter**.

Figure 2- 14 *Salesforce Adapter Component*

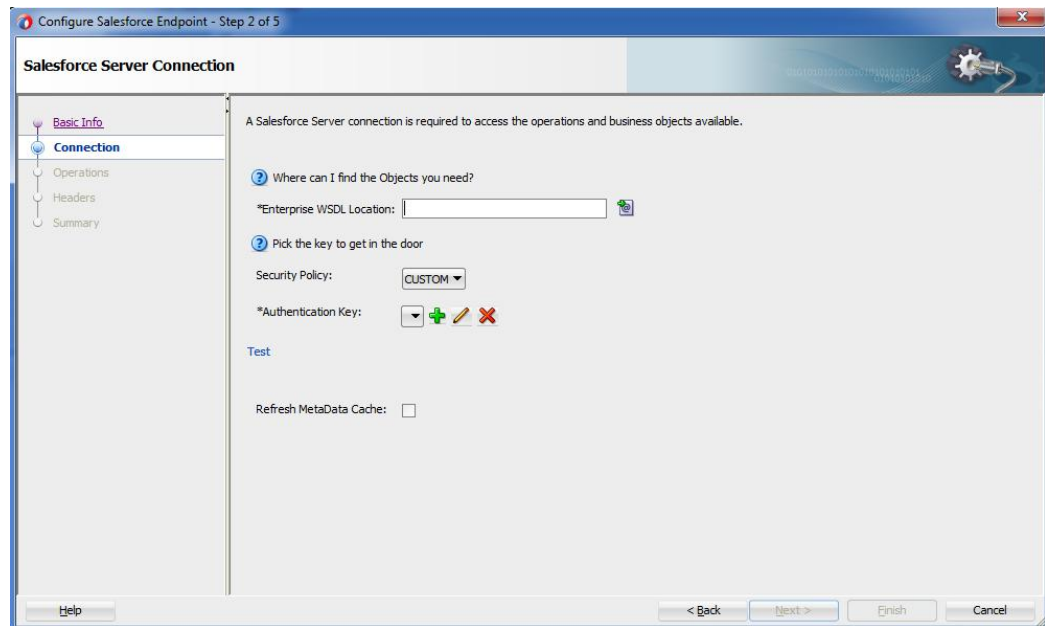

3. The **Salesforce Cloud Adapter Configuration Wizard- Welcome** page dialog is displayed, as shown in [Figure 2-15](#).

Figure 2- 15 *Salesforce Cloud Adapter Configuration Wizard*

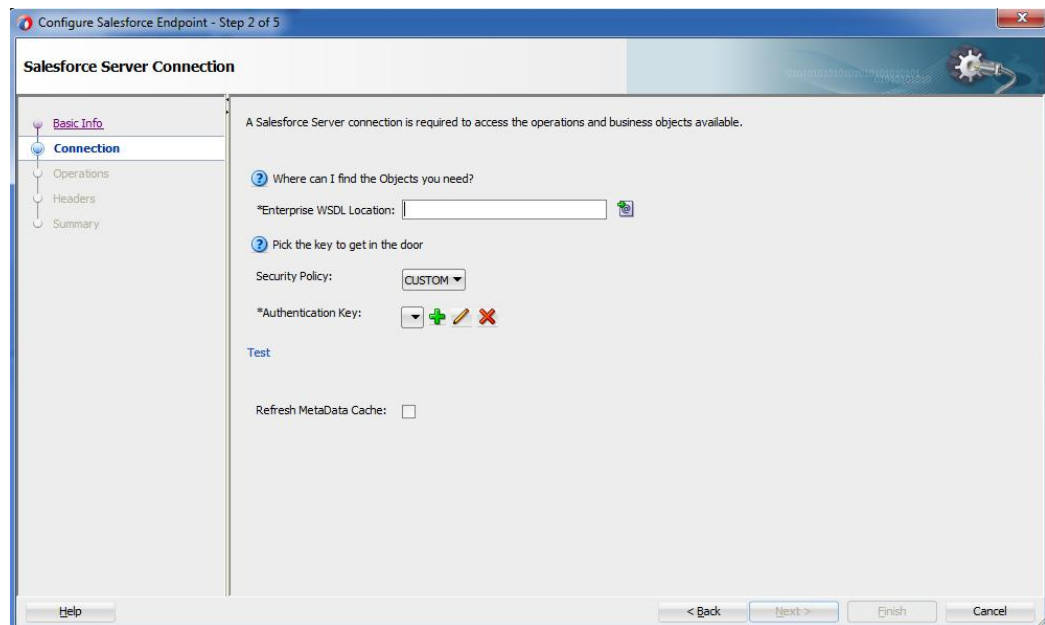

4. The **Name** box is already populated. It picks up these values from the cache. You can re-enter **Reference Name** if you want to use a different Reference Name.
5. Click **Next** to continue.
6. The **Salesforce Cloud Server Connection** page is displayed, as shown in [Figure 2-16](#).

Figure 2-16 Salesforce Cloud Server Connection Page

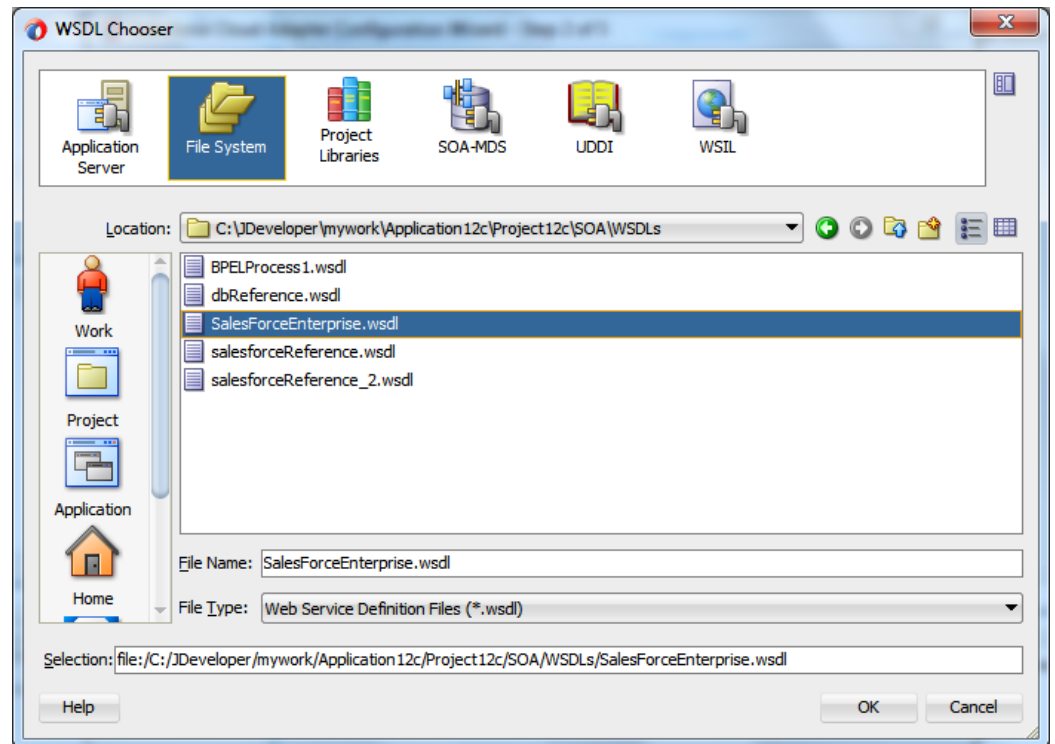

7. On the **Salesforce Cloud Server Connection** page, click the **Find existing WSDLs** icon, which is located to the right of the **Enterprise WSDL Location** field, as shown in [Figure 2–17](#).

Figure 2-17 Salesforce Cloud Server Connection Page

8. The **WSDL Chooser** dialog is displayed, browse and select the downloaded Enterprise WSDL either from the file system or resource palette (MDS) and click **OK**. [Figure 2–18](#) shows the file system option.

Figure 2-18 WSDL Chooser

Oracle Cloud Adapter for Salesforce.com - Supported Features

The chapter offers a comprehensive guide to various Salesforce.com features supported by Oracle Cloud Adapter for Salesforce.com.

It contains the following topics:

- [Section 3.1, "SOAP API"](#)
- [Section 3.2, "Supported SOAP API Operations"](#)
- [Section 3.3, "Salesforce.com SOAP Headers"](#)
- [Section 3.4, "Session Management"](#)
- [Section 3.5, "Handling Polymorphic Behavior of Salesforce.com Schema"](#)
- [Section 3.6, "Test Functionality"](#)
- [Section 3.7, "Fault Handling"](#)
- [Section 3.8, "Salesforce.com Limit and Restriction Handling"](#)

3.1 SOAP API

Nature of SOAP API calls are mentioned below:

- **Request and Response:** The adapter submits a request to Salesforce.com, and Salesforce.com processes the request and returns a response which the adapter handles.
- **Synchronous:** Every call to Salesforce.com SOAP API is synchronous, i.e. after invoking the adapter, calling process waits until it receives a response from the service. It does not support asynchronous calls.
- **Automatic Commit v/s Rollback:** Every operation that writes to a Salesforce.com object like create, upsert etc. is by default committed. Moreover, operations that write multiple objects in a single operation call treat every record as a separate transaction.

3.2 Supported SOAP API Operations

Following category of operations are supported by the Oracle Cloud Adapter for Salesforce.com, as shown in [Table 3-1](#).

Table 3-1 Supported Operations

Supported Category	Supported Operations
CORE	convertLead, getDeleted, getUpdated, merge, undelete, upsert
CRUD	create , retrieve, update, delete
MISC	getUserInfo, process
SOSL / SOQL	query,queryAll, search, queryMore

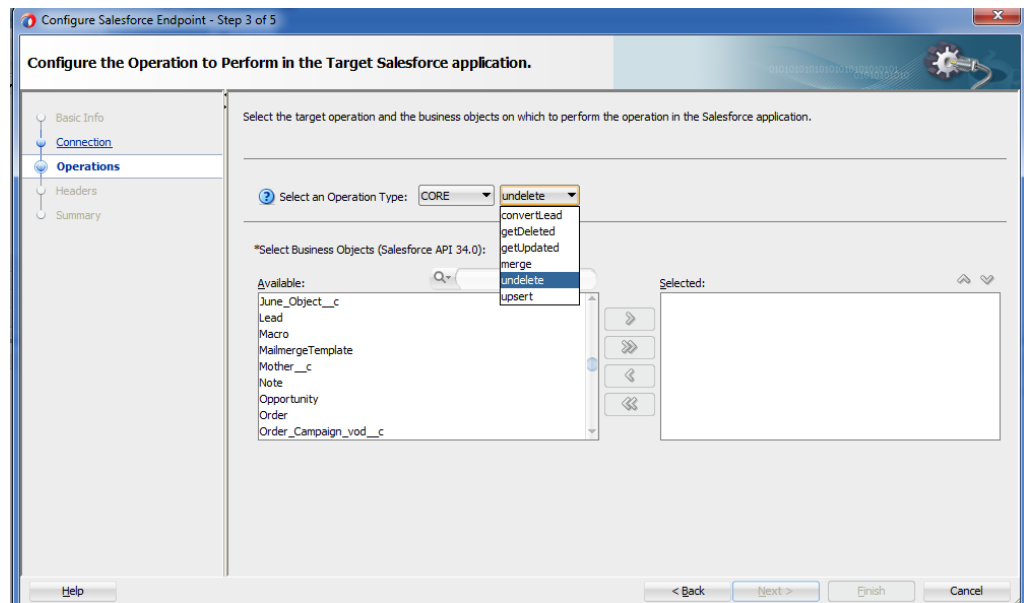

3.2.1 CORE Operations

This category contains all the core operations that are supported by Salesforce.com. The operation calls, falling under this category are:

- `convertLead`
- `getDeleted`
- `getUpdated`
- `merge`
- `undelete`
- `upsert`

Figure 3-1 shows the list of operation calls, falling under CORE category.

Figure 3- 1 SFDC Operation Calls

3.2.1.1 `convertLead`

- This operation converts a Salesforce.com Lead into an Account, Contact, and optionally into an Opportunity.
- The permissions required for `convertLead` operation are 'Convert Leads' and 'Edit' on Lead, in addition to 'Create' and 'Edit' on Account, Contact and Opportunity objects.
- In a simple and straightforward manner, a qualified lead on Salesforce.com is converted into a new or updated account, contact, and opportunity.
- An organization can have its own set of guidelines for determining when a lead is qualified, or it can follow the Salesforce.com default.

Supported Headers

- AllowFieldTruncationHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- PackageVersionHeader

Figure 3-2 shows a sample request and response message for convertLead operation on Salesforce.com.

Figure 3-2 Request and Response Message for convertLead Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<Invoke_convertLead_inputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">

        <contactId xmlns="urn:enterprise.soap.sforce.com">00990000000d13kAA</contactId>
        <leadId xmlns="urn:enterprise.soap.sforce.com">00Q900000P89V1EAL</leadId>
        <opportunityId xmlns="urn:enterprise.soap.sforce.com">0069000000HylpAAB</opportunityId>
        <success xmlns="urn:enterprise.soap.sforce.com">true</success>
      </tns:LeadConvertResult>
    </tns:convertLeadResponse>
  </part>
</Invoke_convertLead_outputVariable>
</messages>
```

3.2.1.2 getDeleted

- This call fetches the list of individual records that have been deleted in a particular time span.
- The specified endDate must sequentially follow the specified startDate.
- Only those records are returned on which user has access permissions.
- Only data modified in the last 30 days can be fetched, this is a Salesforce.com limitation.

Supported Headers

- LimitInfoHeader

Figure 3-3 shows a sample request and response message for getDeleted operation on Salesforce.com.

Figure 3-3 Request and Response Message for getDeleted Operation

```

    </tns:getUpdatedResponse>
  </part>
</Invoke1_getUpdated_OutputVariable>
</messages>

```

3.2.1.4 merge

- Merge operation is used to merge child record of an object into the master record.
- A maximum of three records can be merged into one call.
- A single merge call consists only of one business object. Merge doesn't work for multiple business objects in one call.
- Lead, Contact and Account are the only supported object types.
- The **masterRecord** field specifies the master record into which the child records are merged.

Supported Headers

- AllowFieldTruncationHeader
- AssignmentRuleHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- MruHeader
- PackageVersionHeader

Figure 3-5 shows a sample request and response message for merge operation on Salesforce.com.

</ns:MergeResult>
</ns:MergeResponse>
</part>
</InvokeMerge_OutputVariable>
</messages>
```

3.2.1.5 undelete

- Undelete is used to recover already deleted records from Recycle Bin.
- Objects with undeletable property set as true, will be available for undelete.
- In an attempt to undelete an entity which is removed from the recycle bin as well, you will encounter the 'UNDELETE_FAILED' error, stating that 'An object could not be undeleted because it does not exist or has not been deleted.'

Supported Headers

- AllOrNoneHeader
- AllowFieldTruncationHeader
- DebuggingHeader
- LimitInfoHeader

- PackageVersionHeader

Figure 3-6 shows a sample request and response message for undelete operation on Salesforce.com.

Figure 3-6 Request and Response Message for undelete Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<Invoke_undelete_InputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">

      </tns:UndeleteResult>
    </tns:undeleteResponse>
  </part>
</Invoke_undelete_OutputVariable>
</messages>
```

3.2.1.6 upsert

- Upsert is a combination of create and update operations.
- If a record already exists, this operation updates it, otherwise it creates a new record with the corresponding details.
- To avoid redundant records, it is better to use upsert operation instead of create operation.
- Contrary to insert and update operation, where you can process multiple objects in a single call, upsert operation lets you process only a single business object per call.

Supported Headers

- AllOrNoneHeader
- AllowFieldTruncationHeader
- AssignmentRuleHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- MruHeader
- PackageVersionHeader

Figure 3-7 shows a sample request and response message for upsert operation on Salesforce.com.

Figure 3-7 Request and Response Message for upsert Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<Invoke1_upsert_InputVariable>

      </tns:UpsertResult>
    </tns:upsertResponse>
  </part>
</Invoke1_upsert_OutputVariable>
</messages>
```

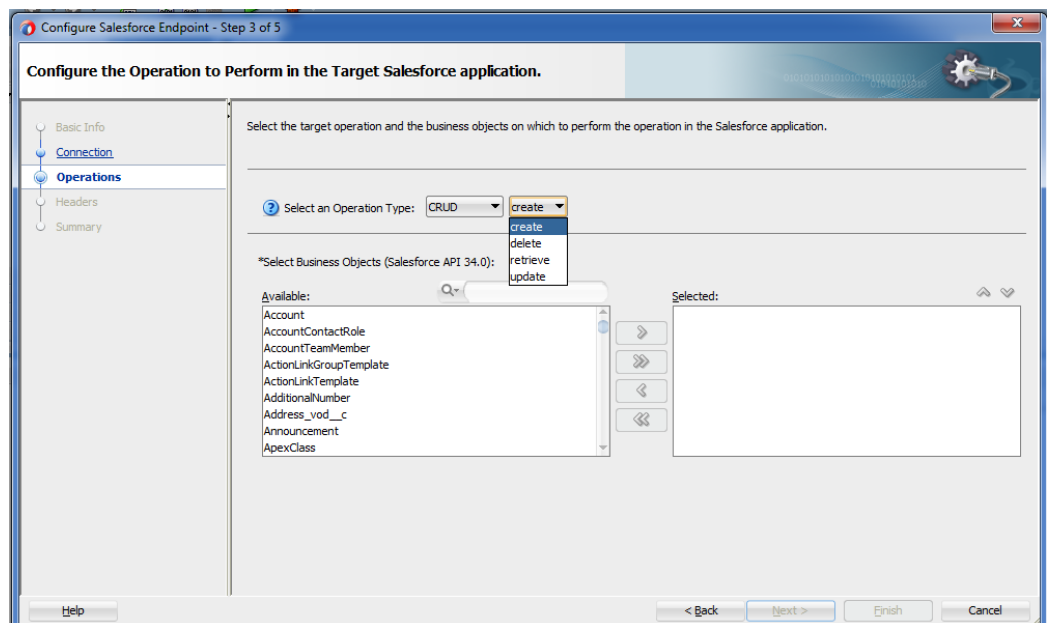

3.2.2 CRUD Operations

CRUD is an acronym for Create Retrieve Update and Delete. This category contains operations associated with manipulating the objects on Salesforce.com. The following operations fall under this category:

- create
- retrieve
- update
- delete

Figure 3-8 shows the operations falling under CRUD category.

Figure 3-8 List of Operation under CRUD Category

3.2.2.1 create

- Create operation is used to add individual records to the organization’s data.
- It can process records belonging to multiple business objects in a single call to Salesforce.com.
- It is similar to the Insert operation in SQL.

Supported Headers

- AllOrNoneHeader
- AllowFieldTruncationHeader
- AssignmentRuleHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- MruHeader
- PackageVersionHeader

Figure 3-9 shows a sample request and response for create operation on Salesforce.com.

Figure 3-9 Request and Response for CreateOperation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<Invoke_create_InputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <create xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Automation12c/createLead/createLead" xmlns:
      tns:Lead>
      <ens:Company>*****</ens:Company>
      <ens:LastName>*****</ens:LastName>
      <ens:Status>Open - Not Contacted</ens:Status>
    </tns:Lead>
  </create>
</part>
</Invoke_create_InputVariable>
<Invoke_create_OutputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <tns:createResponse xmlns:tns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Automation12c/createLead/c
      <tns:SaveResult>
        <id xmlns="urn:enterprise.soap.sforce.com">00Q9000000PHvavEAD</id>
        <success xmlns="urn:enterprise.soap.sforce.com">true</success>
      </tns:SaveResult>
    </tns:createResponse>
  </part>
</Invoke_create_OutputVariable>
</messages>
```

3.2.2.2 retrieve

- Fetches specific information for a sObject based on the ID of the object.
- The fields of the object, required to be fetched, are the inputs of the element ‘fieldList’ of the request message. As shown in Figure 3-10, “Origin” and “Status” are sent as fieldList in the request message.
- Retrieve call doesn’t fetch deleted records.

Supported Headers

- LimitInfoHeader
- MruHeader
- PackageVersionHeader
- QueryOptionsHeader

Figure 3-10 shows a sample request and response message for retrieve operation on Salesforce.com.

Figure 3- 10 Request and Response Message for retrieve Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<InvokeRetrieve_InputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<retrieve xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/BPEL_Projects/S_E_B_03_001_01/retrieve" xmlns:wadl="http://
<tns:fieldList>Name,Id</tns:fieldList>
<tns:ids>70190000000YnrM</tns:ids>
</retrieve>
</part>
</InvokeRetrieve_InputVariable>
<InvokeRetrieve_OutputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<tns:retrieveResponse xmlns:tns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/BPEL_Projects/S_E_B_03_001_01/retrieve">
<tns:CampaignResult xsi:type="sf:Campaign">

<sf:Name xmlns:sf="urn:object.enterprise.soap.sforce.com">GC Product Webinar - Jan 7, 2002</sf:Name>
</tns:CampaignResult>
</tns:retrieveResponse>
</part>
</InvokeRetrieve_OutputVariable>
</messages>
```

3.2.2.3 update

- Update operation is used to update existing objects on Salesforce.com.
- This option can update multiple sObjects in one call.
- Only those objects are available under this operation whose updatable property is set to true.

Supported Headers

- AllOrNoneHeader
- AllowFieldTrunactionHeader
- AssignmentRuleHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- MruHeader
- PackageVersionHeader

Figure 3-11 shows a sample request and response message for update operation on Salesforce.com.

Figure 3- 11 Request and Response Message for update Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<InvokeUpdateaccount_update_InputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<update xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Automation12c/updateDemo/updatea
<tns:Account>
<ens:Id>00190000000tBeKH</ens:Id>
<ens:Name></ens:Name>
</tns:Account>
</update>
</part>
</InvokeUpdateaccount_update_InputVariable>
<InvokeUpdateaccount_update_OutputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">

<tns:SaveResult>
<id xmlns="urn:enterprise.soap.sforce.com">00190000000tBeKHAA0</id>
<success xmlns="urn:enterprise.soap.sforce.com">true</success>
</tns:SaveResult>
</tns:updateResponse>
</part>
</InvokeUpdateaccount_update_OutputVariable>
</messages>
```

3.2.2.4 delete

- Delete operation is used to delete one or more records on Salesforce.com.
- Operates on more than one sObject at one time.
- Similar to DELETE statement in SQL.
- Only those objects are available under this operation whose deletable property is set to true.

Supported Headers

- AllOrNoneHeader
- AllowFieldTruncationHeader
- DebuggingHeader
- EmailHeader
- LimitInfoHeader
- PackageVersionHeader

Figure 3-12 shows a sample request and response message for delete operation on Salesforce.com.

Figure 3- 12 Request and Response Message for delete Operation

```
<?xml version="1.0" encoding="UTF-8"><messages>
<Invoke1_delete_inputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <delete xmlns="http://xmlns.oracle.com/pobpel/adapter/salesforce/Automation12/deleteDemo/deleteDemo" xmlns:wSDL="http://schemas.xmlsoap.org/wSDL/"
      <tns:id>0019000000tBehm</tns:id>
    </delete>
  </part>
</Invoke1_delete_inputVariable>
<Invoke1_delete_outputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <tns:deleteResponse xmlns:tns="http://xmlns.oracle.com/pobpel/adapter/salesforce/Automation12/deleteDemo/deleteDemo">
      <tns>DeleteResult>
        <id xmlns="urn:enterprise.soap.sforce.com">0019000000tBehmJAC</id>
        <success xmlns="urn:enterprise.soap.sforce.com">true</success>
      </tns>DeleteResult>
    </tns:deleteResponse>
  </part>
</Invoke1_delete_outputVariable>
</messages>
```

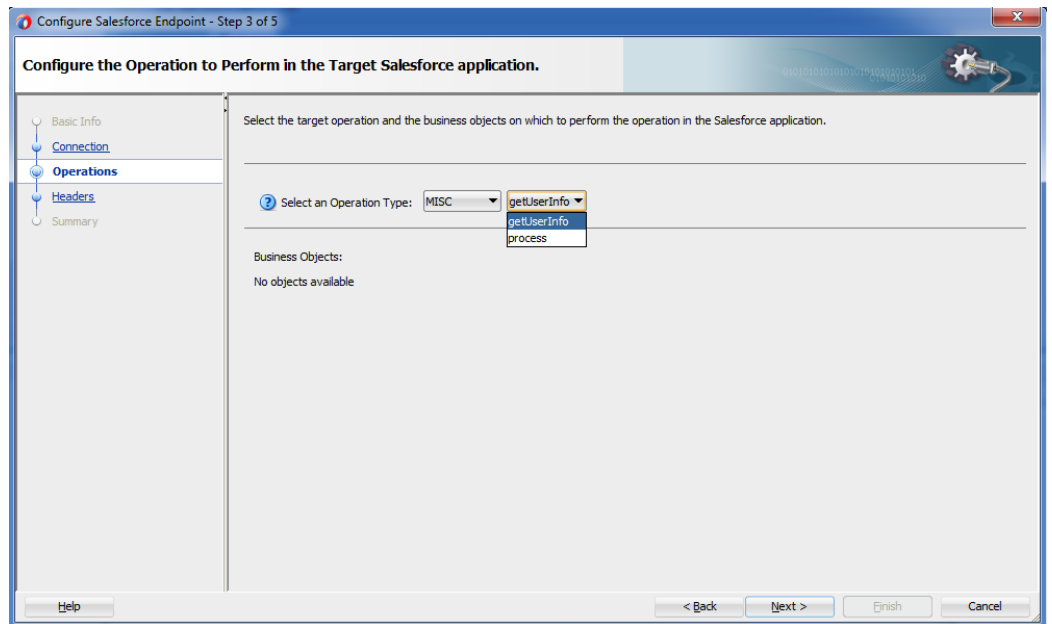

3.2.3 MISC Operations

This category contains all the miscellaneous operations supported by Salesforce.com. Following are the operations falling under this category:

- getUserInfo
- process

Figure 3-13 shows all the operations falling under this category.

Figure 3-13 Options Available for MISC Category

3.2.3.1 getUserInfo

- The call fetches information of the user associated with the current session.
- Information returned from this call includes currency, profile, email and other user information.
- To obtain additional information about the user, you can also use the retrieve operation on User object providing the required fields in the fieldList element.
- Standard information pertinent to the current user is returned.

Supported Headers

- LimitInfoHeader

Figure 3-14 shows a sample request and response message for getUserInfo operation on Salesforce.com.

Figure 3- 14 Request and Response Message for getUserInfo Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<Invoke1_getUserInfo_InputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<getUserInfo xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/getuserinfo/salesforceReference"/>
</part>
</Invoke1_getUserInfo_InputVariable>
<Invoke1_getUserInfo_OutputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">

<userLanguage xmlns="urn:enterprise.soap.sforce.com">en_US</userLanguage>
<userLocale xmlns="urn:enterprise.soap.sforce.com">en_IN</userLocale>
<userName xmlns="urn:enterprise.soap.sforce.com">.....</userName>
<userTimeZone xmlns="urn:enterprise.soap.sforce.com">.....</userTimeZone>
<userType xmlns="urn:enterprise.soap.sforce.com">Standard</userType>
<userUiSkin xmlns="urn:enterprise.soap.sforce.com">Theme3</userUiSkin>
</ns1:GetUserInfoResult>
</part>
</Invoke1_getUserInfo_OutputVariable>
</messages>
```

3.2.3.2 process

- It submits an array of approval process instances for approval, or processes an array of approval process instances to be approved, rejected, or removed.
- Process operation either submits an approval process or processes an already submitted process.

Supported Headers

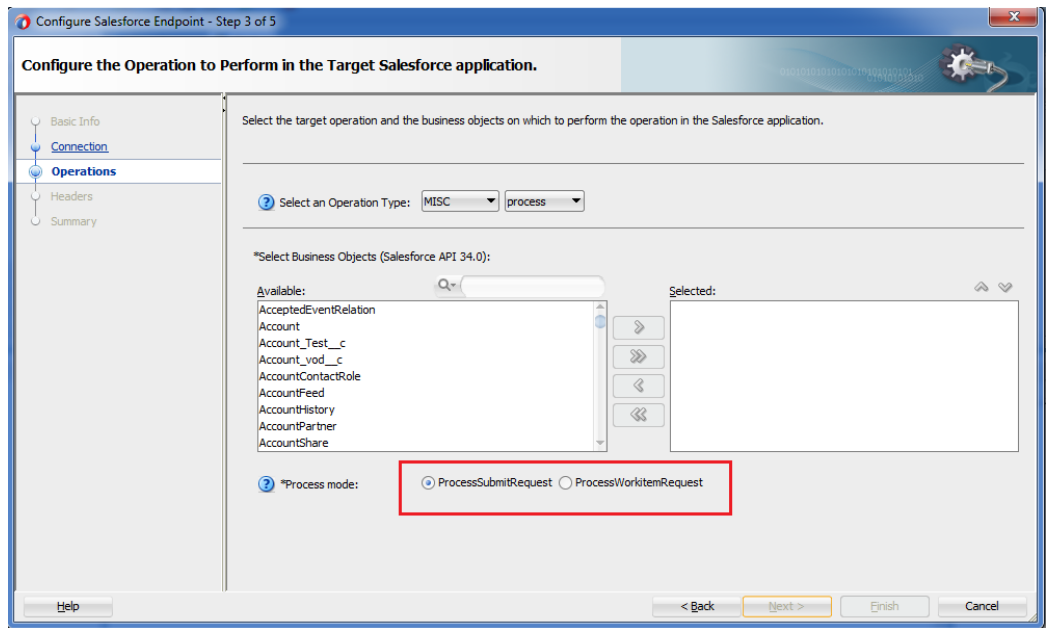

- AllowFieldTruncationHeader
- DebuggingHeader
- LimitInfoHeader
- PackageVersionHeader

Process operation is divided into two parts:

- Process Submit Request
- ProcessWorkItemRequest

Two radio buttons appear once you select **process** as the operation, as shown in [Figure 3-15](#).

Figure 3-15 Radio Button under process Operation

ProcessSubmitRequest: This option is used to submit an object for approval. The response of this operation generates a **WorkItemId** and the actor (user) to whom this object is submitted for approval. The WorkItemId is a unique identifier of the object submitted for approval.

Figure 3-16 shows a sample request and response message for ProcessSubmitRequest operation on Salesforce.com.

Figure 3-16 Request and Response Message for ProcessSubmitRequest Operation

```

- <messages>
- <Invoke_ProcessSubmitId_process_InputVariable>
- <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
- <process xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/SFDC_Complex/SFDC12c_MasterProcess/ProcessCampaignSubmitId">
- <ProcessSubmitRequest>
- <comments xmlns="urn:enterprise.soap.sforce.com"/>
- <objectId xmlns="urn:enterprise.soap.sforce.com">781900000000ThTVAAK</objectId>
- <submitterId xmlns="urn:enterprise.soap.sforce.com"/>
- <processDefinitionNameOrId xmlns="urn:enterprise.soap.sforce.com"/>
- <skipEntryCriteria xmlns="urn:enterprise.soap.sforce.com">true</skipEntryCriteria>
- </ProcessSubmitRequest>
- </process>
- </part>
- </Invoke_ProcessSubmitId_process_InputVariable>
- <Invoke_ProcessSubmitId_process_OutputVariable>
- <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
- <ns1:processResponse xmlns:ns1="http://xmlns.oracle.com/pcbpel/adapter/salesforce/SFDC_Complex/SFDC12c_MasterProcess/ProcessCampaignSubmitId">
- <ns1:ProcessResult>
- <actorIds xmlns="urn:enterprise.soap.sforce.com">005900000015SKBAAU</actorIds>
- <entityId xmlns="urn:enterprise.soap.sforce.com">781900000000ThTVAAK</entityId>
- <instanceId xmlns="urn:enterprise.soap.sforce.com">04g90000007V1FIAA0</instanceId>
- <instanceStatus xmlns="urn:enterprise.soap.sforce.com">Pending</instanceStatus>
- <newWorkitemIds xmlns="urn:enterprise.soap.sforce.com">04190000007Fq2KAA0</newWorkitemIds>
- <success xmlns="urn:enterprise.soap.sforce.com">true</success>
- </ns1:ProcessResult>
- </ns1:processResponse>
- </part>
- </Invoke_ProcessSubmitId_process_OutputVariable>
</messages>

```

ProcessWorkItemRequest: This option is used to process an object already submitted for approval. The actor can approve or reject a process. To perform the approval actions on the object already submitted for approval, the WorkItemId generated in ProcessSubmitRequest response is needed.

Figure 3-17 shows a sample request and response message for ProcessWorkItemRequest operation on Salesforce.com.

Figure 3- 17 Request and Response Message for ProcessWorkItemRequest Operation

- <success xmlns="urn:enterprise.soap.sforce.com">true</success>
- </ns1:ProcessResult>
- </ns1:processResponse>
- </part>
- </Invoke_ProcessWorkItemId_process_OutputVariable>
- </messages>

```

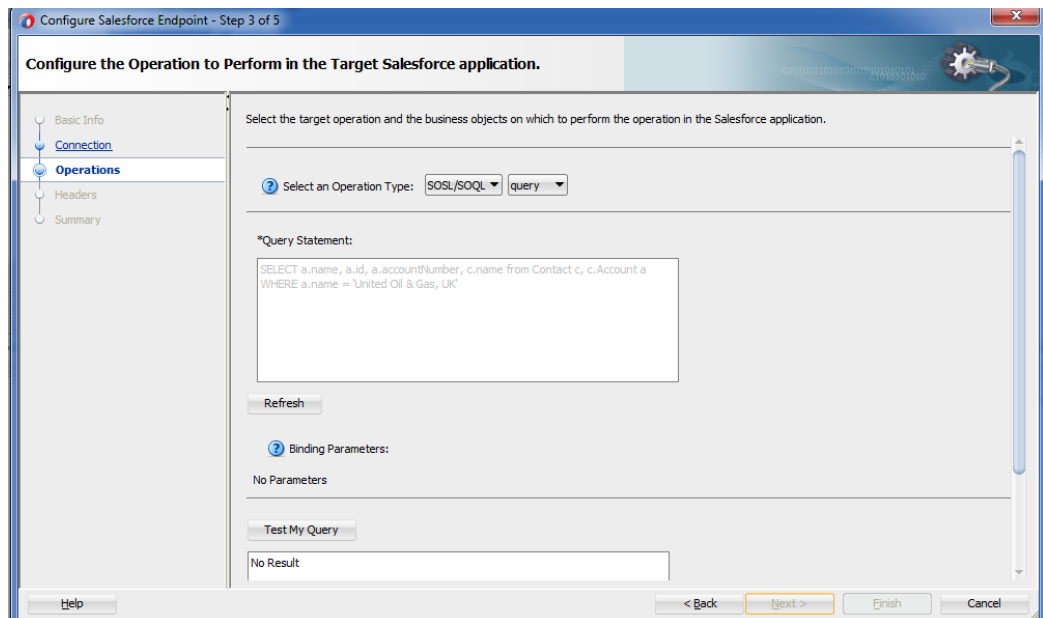

3.2.4 SOSL and SOQL Operations

SOSL and SOQL allow you to search your organization’s Salesforce.com data for specific information. Following are the operations falling under this category:

- query
- queryAll
- search
- queryMore(supported internally)

Figure 3-18 shows the list of operations falling under SOSL/SOQL category.

Figure 3- 18 Option Available under SOSL/SOQL Category

3.2.5 query

- The query operation executes a query against a particular criteria and returns data that matches that particular criteria.
- Uses the SOQL (Structured Object Query Language).

- The query returns only those records that have not been deleted from your Salesforce.com account.
- Oracle Cloud Adapter for Salesforce.com provides functionality for using bind parameters in query operation. Using this functionality, you can dynamically provide an input to your query. For more information, refer to the section “Support for Bind Parameters”

Supported Headers

- LimitInfoHeader
- MruHeader
- PackageVersionHeader
- QueryOptionsHeader

Figure 3-19 shows a sample request and response message for query operation on Salesforce.com.

Figure 3- 19 Request and Response Message for query Operation

```
<?xml version="1.0" encoding="UTF-8"><messages>
<InvokeQueryInputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <query xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query"/>
  </part>
</InvokeQueryInputVariable>
<InvokeQueryOutputVariable>
  <part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
    <ns0:QueryResponse xmlns:ns0="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">
      <ns0:QueryResults>
        <done xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">true</done>
        <queryLocation xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query" xsi:nil="true"/>
        <records xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query" xsi:type="sf:Account">
          <sf:Id xmlns:sf="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">00190000001BekMBA0</sf:Id>
          <sf:Name xmlns:sf="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">...</sf:Name>
        </records>
        <records xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query" xsi:type="sf:Account">
          <sf:Id xmlns:sf="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">00190000001BeKHA0</sf:Id>
          <sf:Name xmlns:sf="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">...</sf:Name>
        </records>
        <size xmlns="http://xmlns.oracle.com/pdbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">2</size>
      </ns0:QueryResults>
    </ns0:QueryResponse>
  </part>
</InvokeQueryOutputVariable>
</messages>
```

3.2.6 queryAll

- queryAll has a wider scope than query operation, in another word the syntax is same as query (SOQL) but it also fetches the deleted records present in the recycle bin.
- Oracle Cloud Adapter for Salesforce.com provides functionality for using bind parameters in queryAll operation. Using this functionality, you can dynamically provide an input to your queryAll. For more information, refer to the section “Support for Bind Parameters”
- The main difference between query and queryAll is that queryAll returns the records, even if they have been deleted and are present in the recycle bin, while query only returns the records that are currently a part of Salesforce.com organization’s active data.

Supported Headers

- LimitInfoHeader
- QueryOptionsHeader

Figure 3-20 shows a sample request and response message for queryAll operation on Salesforce.com.

Figure 3-20 Request and Response Message for queryAll Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<InvokeI_query_InputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<query xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query"/>
</part>
</InvokeI_query_InputVariable>
<InvokeI_query_OutputVariable>

</records>
<records xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query" xsi:type="sf:Account">
<sf:Id xmlns:sf="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">0019000000BebmAAc</sf:Id>
<sf:Name xmlns:sf="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">...</sf:Name>
</records>
<size xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application7/QueryProject1/salesforceReference_query">2</size>
</ns0:QueryResult>
</ns0:queryResponse>
</part>
</InvokeI_query_OutputVariable>
</messages>
```

3.2.7 search

- Based on a search string, the search operation fetches records from Salesforce.com.
- Uses the SOSL (Structured Object Search Language) to fetch records from Salesforce.com.
- Oracle Cloud Adapter for Salesforce.com provides a provision for using bind parameters in search. Using this functionality, you can dynamically provide a search string as an input to your search operation.

Supported Headers

- LimitInfoHeader
- PackageVersionHeader

Figure 3-21 shows a sample request and response message for search operation on Salesforce.com.

Figure 3-21 Request and Response Message for search Operation

```
<?xml version="1.0" encoding="UTF-8"?><messages>
<InvokeI_search_InputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">
<search xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Automation/A_U_M_T_09_014_04/search1"/>
</part>
</InvokeI_search_InputVariable>
<InvokeI_search_OutputVariable>
<part xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" name="parameters">

<ns0:SearchResults>
<ns0:ContactRecord xsi:type="sf:Contact">
<sf:Id xmlns:sf="urn:subject.enterprise.soap.sforce.com">00390000000tdi3kAAc</sf:Id>
</ns0:ContactRecord>
</ns0:SearchResults>
</ns0:searchResponse>
</part>
</InvokeI_search_OutputVariable>
</messages>
```

3.2.8 queryMore

- queryMore operation retrieves a next set of records against a specified query string.
- To use queryMore operation, you are required to provide queryLocator value that has been returned as a result of query or queryAll operation, and you can use that queryLocator value to use queryMore call.
- queryMore operation is supported internally so it is not visible in the operations page in Oracle Cloud Adapter for Salesforce.com configuration wizard.

- Since it internally uses the query and queryAll, the request and response structure for queryMore could be of either of them, depending upon which operation's queryLocator is called.

Supported Headers

The headers supported for query and queryAll operations hold to for queryMore operation.

Figure 3-22 shows how you can set the value of 'queryLocator' at the design-time.

Figure 3-22 Set Value of 'queryLocator' at Design-Time

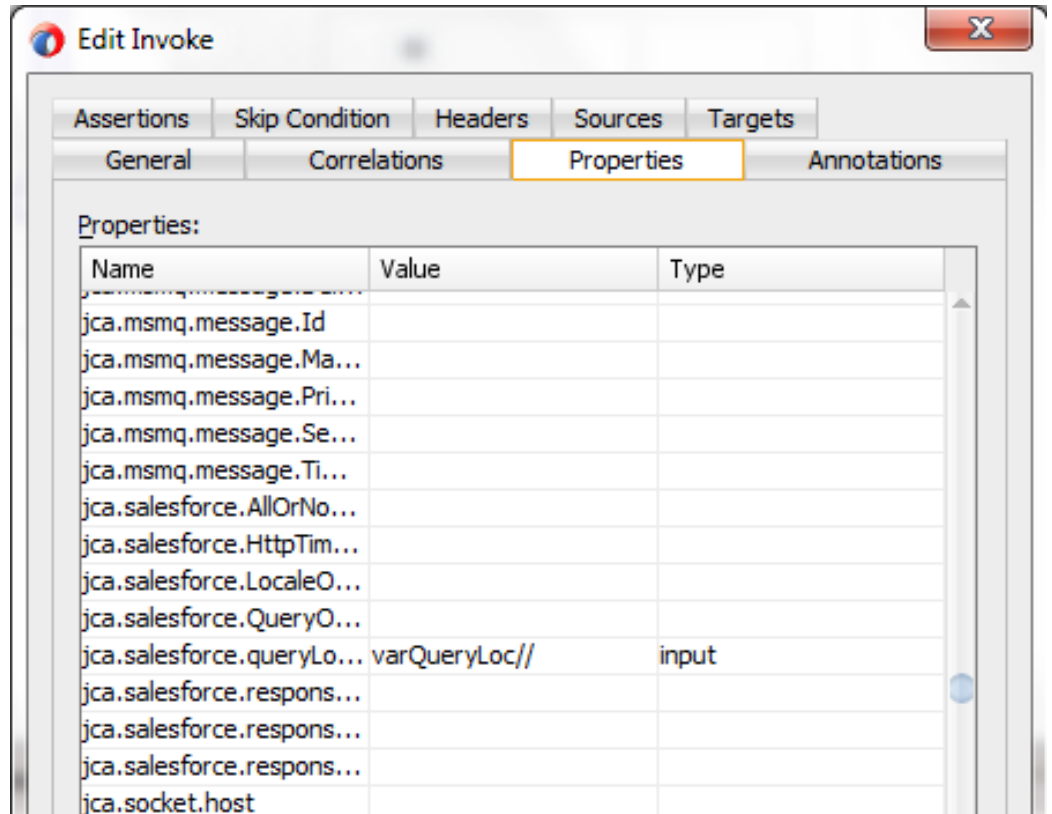

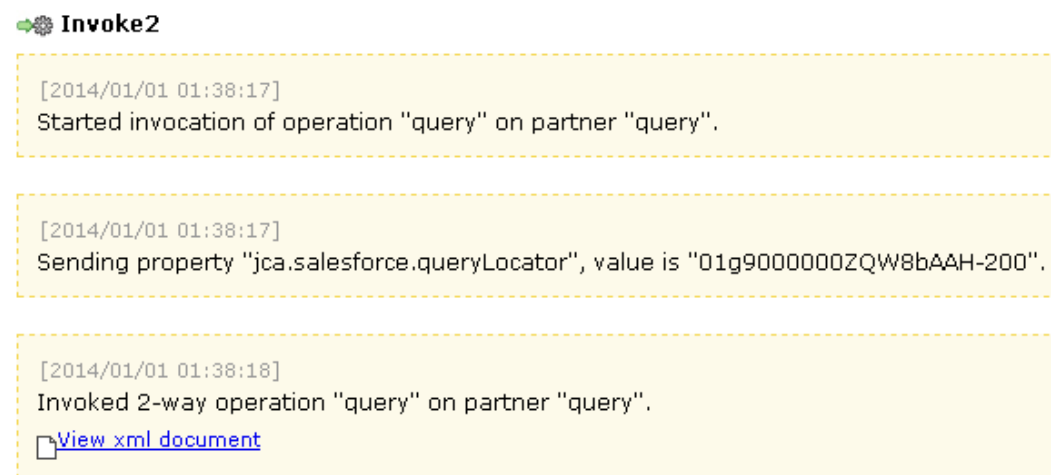

Figure 3-23 shows how the value of 'queryLocator' is passed at the run-time.

Figure 3-23 Set Value of 'queryLocator' at Run-Time

3.3 Salesforce.com SOAP Headers

The section (Table 3-2) explains what all headers are maintained by every supported operation of Oracle Cloud Adapter for Salesforce.com. Salesforce.com puts into effect what SOAP headers are available for each operation. Moreover, this functionality is enforced by the adapter UI, that is, the headers available for a particular operation on the Headers and Properties page is in accordance to the recommended headers for that operation. For more information on Salesforce.com headers, follow the link (http://www.salesforce.com/us/developer/docs/api/Content/soap_headers.htm).

Table 3-2 Salesforce.com SOAP Headers

Operation Type	Operation Name	All or None Header	Allow Field Truncation Header	Assignment Rule Header	Debugging Header	Email Header	Limit Info Header	Mru Header	Package Version Header	Query Options Header
Core Operations	convertLead		Y		Y		Y		Y	
	getDeleted						Y			
	getUpdated						Y			
	merge		Y	Y	Y	Y	Y	Y	Y	
	undelete	Y	Y		Y		Y		Y	
	upsert	Y	Y	Y	Y	Y	Y	Y	Y	
CRUD Operations	create	Y	Y	Y	Y	Y	Y	Y	Y	
	retrieve						Y	Y	Y	Y
	update	Y	Y	Y	Y	Y	Y	Y	Y	
	delete	Y	Y		Y	Y	Y		Y	
MISC Operations	getUserInfo						Y			
	process		Y		Y		Y		Y	
SOSL and SOQL Operations	query						Y	Y	Y	Y
	queryAll						Y			Y
	queryMore						Y			Y
	search						Y		Y	

3.3.1 Request Headers

Headers that come under this category are the one that are being sent along with the request call made to Salesforce.com. Following is the explanation of each header that comes under this category:

3.3.1.1 AllOrNoneHeader

This header allows transactional behavior for Salesforce.com operations. This means if you set this header to “true” then the call to Salesforce.com will get committed only if it gets completed without any error, otherwise it will rollback. The default behavior is to commit partial records without any error.

This header was added in API version 20.0

Supported Operations:

Create(), update(), upsert(), delete(), undelete()

Fields :

Element Name	Type	Description
allOrNone	Boolean	<p>True: If one record in a payload fails, all records are rolled back, i.e. none of them are committed on Salesforce.com. A record is committed only when all records in a payload are successfully written.</p> <p>False: Indicates if any record in a payload fails, only those records are rolled back, all other records are committed to Salesforce.com</p>

3.3.1.2 AllowFieldTruncationHeader

This header enables the truncation behavior for the following fields, which are of string data type.

- anyType: anyType can be anyone from rest of the list.
- email
- picklist
- encryptedstring
- textarea
- mulitpicklist
- phone
- string

This header was added in API version 15.0.

Supported Operations:

Create(), update(), upsert(), undelete(), process(), merge(), convertLead()

Fields:

Element Name	Type	Description
allowFieldTruncation	Boolean	<p>True: If a user attempts to enter a value of 25 characters in a field of 20 characters, first 20 records are inserted into the field and, the transaction is a success.</p> <p>False: If a user attempts to enter a value of 25 characters in a field of 20 characters, an error is thrown and the transaction does not commit.</p>

3.3.1.3 AssignmentRuleHeader

The AssignmentRuleHeader specifies the assignment rule to use when creating or updating an Account, Case, or Lead. The assignment rule can be active or inactive in your Salesforce.com organization. The ID can be retrieved by querying the AssignmentRule object. If the ID is specified, then you do not need to specify useDefaultRule. The MALFORMED_ID exception is returned, if the value is not a correct ID and the call fails.

This element is ignored for accounts, because all territory assignment rules are applied.

A MALFORMED_ID exception is returned, if the value is not a correct ID and the call fails.

Supported Operations:

Create(), update(), merge(), upsert()

Fields:

Element Name	Type	Description
assignmentRuleId	ID	The ID of the assignment rule which you want to use. The Id is not validated by Oracle Cloud Adapter for Salesforce.com, whether it exists or not in Salesforce.com. The validation takes place during the run-time.
useDefaultRule	Boolean	True: The default (active) assignment rule is used. False: The default (active) assignment rule is not applied.

3.3.1.4 EmailHeader

This header enables you to specify whether a notification email should be sent or not.

Supported Operations: Create(), update(),delete(), upsert(), merge()

Fields:

Element Name	Type	Description
triggerAutoResponseEmail	Boolean	True: It triggers auto-response rules for leads and cases. False: Auto-response rules for leads and cases are not triggered.
triggerOtherEmail	Boolean	True: The email is triggered outside the organization. False: The email is not triggered outside the organization.
triggerUserEmail	boolean	True: The email is triggered and sent to users in the organization. This email is triggered by a number of events like adding comments to a case or updating a task. False: The email is not triggered and sent to users in the organization.

3.3.1.5 DebuggingHeader

Logging level for debugging purposes, following are different levels that can be mentioned in this header:

Supported Operations:

create(), upsert(), undelete(), merge(), convertLead(), update(), delete(), process()

Fields:

Element Name	Type	Description
debugLevel	Logtype	The following list orders the log levels from least (NONE) to most verbose (DETAIL): NONE DEBUGONLY DB PROFILING CALLOUT DETAIL

3.3.1.6 MruHeader

Recent Items section in Salesforce.com shows most recently used items. In API version 7.0 or later, the list would not get updated by itself. The MruHeader must be used in order to update that list. Note that using this header may impact performance negatively.

Supported Operations:

Create(), update(), merge(), upsert(), query(), retrieve()

Fields:

Element Name	Type	Description
updateMru	Boolean	True: The list of most recently used item is updated on Salesforce.com. False: The list of most recently used item is not updated on Salesforce.com.

3.3.1.7 PackageVersionHeader

A Package version is basically the identification of components in a package. Package version has a specific format majorNumber.minorNumber.patchNumber. For example, 3.4.5,(where” 3” refers to majorNumber, “4” refers to minorNumber and “5” refers to patchNumber)

This header is used to specify package version for any installed package.

Supported Operations:

create(), retrieve(), update(), delete(), undelete(), merge(), upsert(), process(), query(), search(), convertLead()

Fields:

Element Name	Type	Description
majorNumber	Int	Major version number of a package version.
minorNumber	Int	Minor version number of a package version.
Namespace	String	Namespace of the managed package.

3.3.1.8 QueryOptions

This header is used to specify batch size for queries. Default value for batch size is 500. Minimum value for this is 200 and maximum value is 2000.

Supported Operations:

retrieve(), queryMore(), query(), queryAll()

Fields:

Element Name	Type	Description
batchSize	Int	The batch size of the number of records returned in a query call. The minimum size is 200. If you enter a value less than 200, for example, 40 and your actual query has a size of 1200, it would not throw any error, but would return 200 records. The maximum size is 2000. The configuration wizard doesn't let you enter a value more than 2000.

3.3.2 Response Headers

Headers that come under this category are ones that are being received along with the response message that is being sent by Salesforce.com. Following is the explanation of each header that comes under this category:

3.3.2.1 DebuggingInfo

This response header will be returned only if debugLevel request header has been sent along request payload to Salesforce.com.

Fields:

Element Name	Type	Description
debugLog	String	The log information returned from the adapter invocation. This header is part of the SOAP response once debugLevel is sent as a part of the SOAP request.

3.3.2.2 LimitInfoHeader

This header provides the information about the limitations of API calls on per-day basis for organization. This response header is introduced in API version 29.0

Fields:

Element Name	Type	Description
current	string	The number of calls that have already been used in the organization.
Limit	String	Organization's limit for specified limit type.
Type	String	Limit information type specified in the header API REQUESTS—contains limit information about API calls for the organization.

3.4 Session Management

Oracle Cloud Adapter for Salesforce.com provides session management capabilities to maintain transactions related to a particular Salesforce.com user. Attempts have been made to reduce the number of calls to Salesforce.com either for a login call or for any subsequent calls to fetch metadata. With this reduction in the number of calls, the adapter responds faster and the limitations that Salesforce.com imposes on the number of calls are also taken care of.

Configuration for session support is provided in two phases.

- Design Phase
- Execution Phase

3.4.1 Design Phase

- **Login:** While creating an adapter service, a single login call is fired to Salesforce.com during the complete Salesforce Cloud Adapter Configuration Wizard cycle. Once the user provides an Enterprise WSDL and the CSF key in the connection page, only one login call is made to Salesforce.com till the completion of adapter configuration. The next login does not happen unless a CSF key for another

user is selected or a different Enterprise WSDL is selected. Even the 'Run Query Test Tool' follows the same session that was initialized during the connection configuration page.

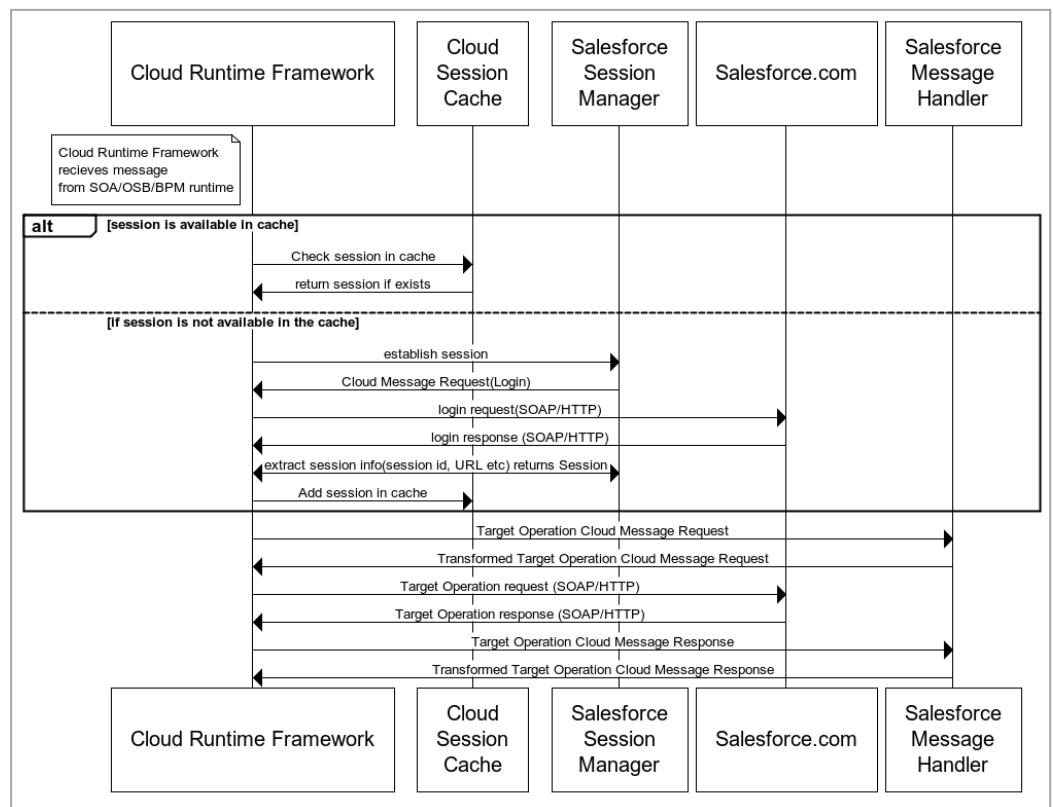

3.4.2 Execution Phase

During the execution phase, Cloud Runtime frame work receives the request message from SOA/OSB/BPM runtime.

Oracle Cloud Runtime framework takes care of the session management as it internally maintains a Session Cache (in the form of Map) which stores the session details. A session is uniquely defined for the user and version of the enterprise WSDL.

If a session is not found in Session Cache then framework establishes the session with Salesforce.com and then adds the session information in Session Cache. If we have different composites which are using the same credentials and the version of the enterprise WSDL then all threads would be provided the same session details. This helps in avoiding the additional login call to Salesforce as we already have the session details available in the cache. [Figure 3-24](#) shows Execution Phase.

Figure 3-24 Execution Phase

- A single login call made by the Oracle Cloud Adapter for Salesforce.com maintains the session across composites deployed in the server for a particular user and for a fixed version of Enterprise WSDL.
- During run-time as well, the fetch metadata calls are minimal.

You are no longer required to create a complex process, where you first need to invoke a login operation on Salesforce.com whose output payload provides two important details which must be supplied during each subsequent operation. These are:

- **ServerURL:** This is the URL that needs to be called for all subsequent operations (query, update etc.) for this user using the dynamic partner link concept.
- **Session ID:** This ID needs to be sent as part of header information for all operations post login.

Session management is now completely handled by the Oracle Cloud Adapter for Salesforce.com making the task of Salesforce.com operation invocation flawless and effortless.

3.5 Handling Polymorphic Behavior of Salesforce.com Schema

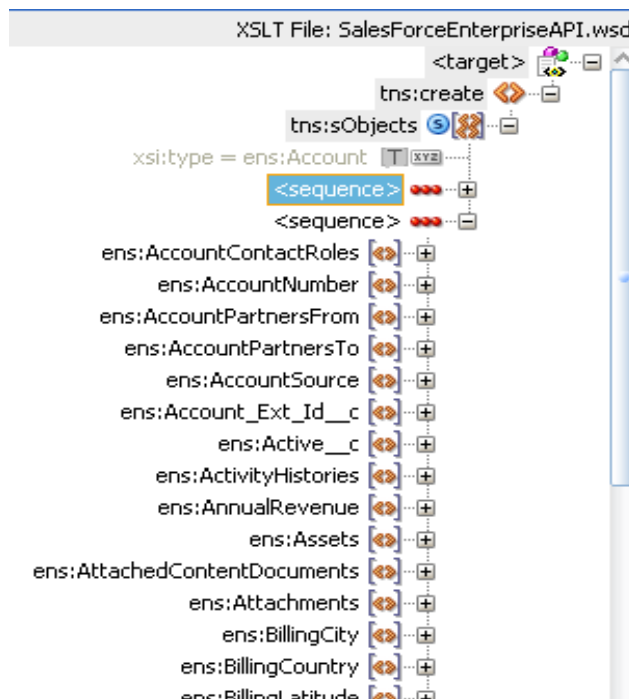

Due to the polymorphic nature of the Salesforce.com XML schema, it was cumbersome to write multiple objects in a single operation call to Salesforce.com using a Web service adapter. For instance, creation of a lead, account and a contact consisted of four steps, as mentioned below:

- You had to create an invoke activity for login operation.
- You had to create account.
- You had to create contact.
- You had to create lead.

All of this is done separately, however; with the introduction of Oracle Cloud Adapter for Salesforce.com to Oracle SOA Suite, integration to Salesforce.com has become a lot easier. Now the above mentioned four-step process has been reduced to a single step.

Figure 3-25 shows how only a single sObject was manipulated during the design-time.

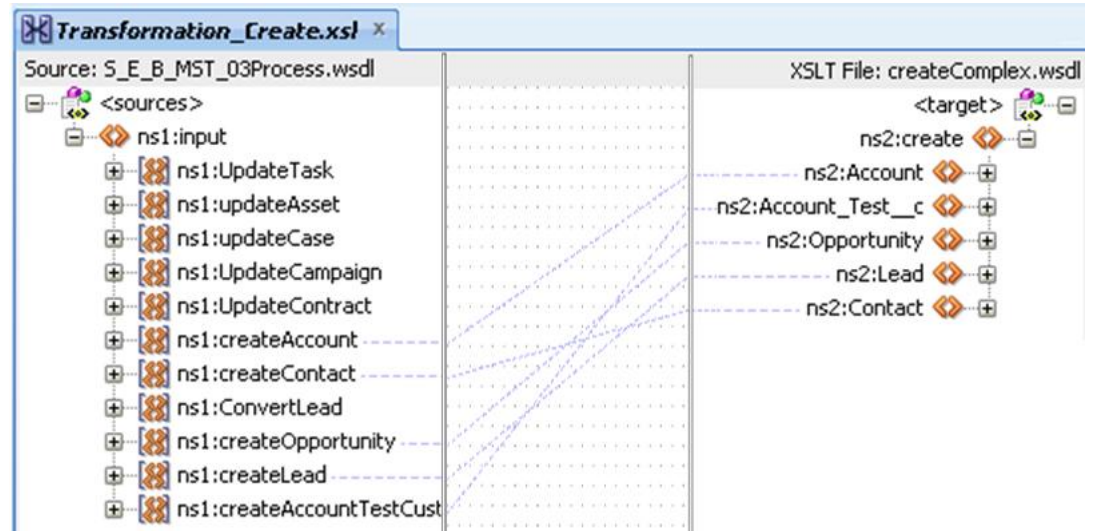

Figure 3- 25 Transformation Create Account

On the other hand, the polymorphic behavior of Salesforce.com schema is handled by Oracle Cloud Adapter for Salesforce.com and multiple sObjects can be written with a lot more ease, as shown in [Figure 3-26](#).

Note that this behavior is possible only for operations where multiple insertion/writes are allowed by the Salesforce.com Enterprise API.

Figure 3-26 Transformation Create Account

3.6 Security Management

If the Salesforce.com API is invoked without using the Oracle Cloud Adapter for Salesforce.com, the credentials for login to Salesforce.com are sent with payload during login operation invocation. Instead, SFDC adapter uses CSF key to externalize the credentials from the SOA composites. Moreover, existing OWSM policies cannot be used to pass user credentials with the payload. Oracle Cloud Adapter for Salesforce.com provides security in the following ways:

- The Credential Store Framework translates the key into credentials and sends it over the network. We are relying upon SSL to have this encrypted to eliminate any possibility of eavesdropping.
- While creating the CSF key either in the configuration wizard or in the Enterprise Manager Console, the password characters are not exposed, thereby enforcing additional security.

For information on how to configure CSF key, refer to the section [“A.2 CSF Key in Enterprise Manager”](#).

3.7 Test Functionality

The test functionality is a distinctive feature of the Oracle Cloud adapter for Salesforce.com that is available in two forms – one in the form of testing the connection parameters, while the other is to validate and execute the SOQL/SOSL query. The section below talks more about these two features.

3.7.1 Design-Time Test Functionality

Design-time test functionalities include the following test functionalities:

1. **Test Salesforce.com Cloud Connection:** There is a **Test** button on **Connection Configuration** page of Salesforce Cloud Adapter Configuration Wizard.

By clicking on **Test Connection** button you will see below message:

- Success! - For successful connection
 - Error! - For any exception during login
2. **Query Test Tool:** This tool helps to run and test query. By clicking on **Test** button on **Operation Configuration** page of Salesforce Cloud Adapter Configuration Wizard, a test dialogue box appears with a **Query Statement** text box and **Results** box showing result of query executed. A provision is provided to add bind parameters to the query. A box corresponding to each bind parameter appears, wherein you can provide a value to the parameter and then test the query.

For more information, refer to the section “

[Design-Time: Using Oracle Cloud Adapter for Salesforce.com Configuration Wizard](#)”.

3.8 Fault Handling

Errors from Salesforce.com are returned in the following ways:

- **Salesforce Faults:** Error scenarios where the composite execution cannot proceed further and a **binding exception** is raised in the BPEL process.
- **Salesforce Exceptions:** Error scenarios where composite execution proceeds even if there are issues with committing some records. The records for which the transaction does not succeed returns a success status as ‘false’, while the records for which transaction commits to return a success status as ‘true’.
- **Salesforce Host Unreachable:** Error scenarios in which the Salesforce.com host is not reachable, a **remote exception** is raised in business process.

The remote and binding faults are handled at the BPEL level using either fault policies or placing fault handlers in the process, i.e. using catch and catchAll blocks.

For exceptions returned from Salesforce.com, the error message is returned as part of the payload. [Figure 3-27](#) shows the payload structure containing exception details.

Figure 3- 27 Payload Structure Containing Exception Details

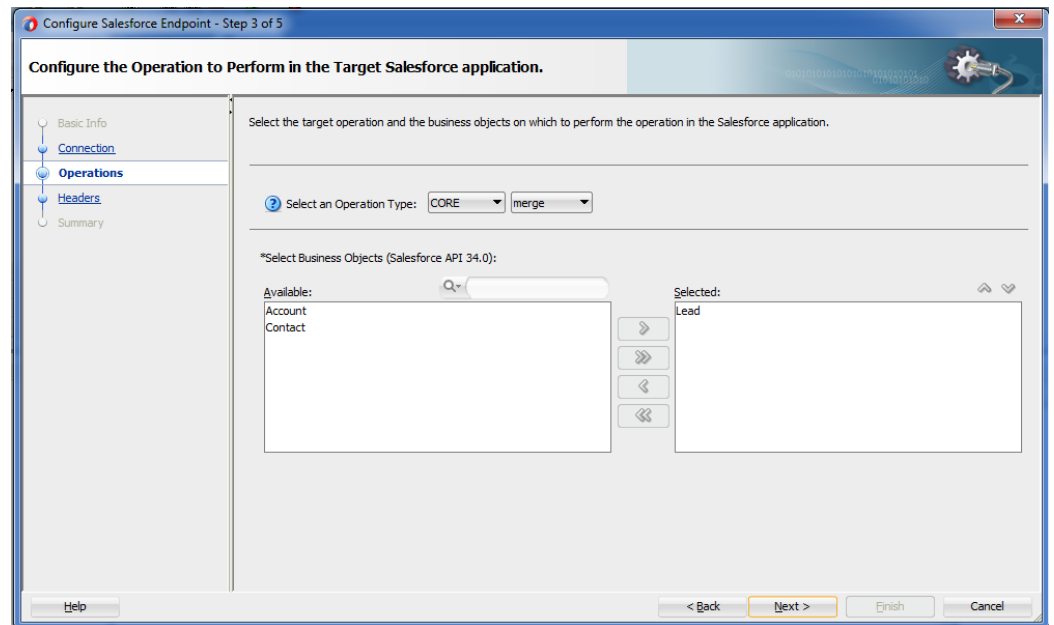

```
<xsd:complexType name="Error">
  <xsd:sequence>
    <xsd:element name="fields" type="xsd:string" nillable="true"
      minOccurs="0" maxOccurs="unbounded"/>
    <xsd:element name="message" type="xsd:string"/>
    <xsd:element name="statusCode" type="tns:StatusCode"/>
  </xsd:sequence>
</xsd:complexType>
```

For Salesforce.com standard faults and exception details, refer to the section “[Troubleshooting and Error Messages](#)”.

3.9 Salesforce.com Limit and Restriction Handling

Operation specific Object Selection: The list of objects available for a particular operation is dynamic and is updated separately for every operation. For instance, if you select **merge** operation under “Operation Category” **CORE**, only Account, Contact, and Lead objects are available in the list of “Available” under Business objects, as shown in [Figure 3-28](#).

Figure 3-28 Available Business Options in CORE Operation Category

This section is further divided into the following subsections:

- Multiple Object Selection
- Single Object Selection
- Header Restrictions

Multiple Object Selection

For certain operations, there is a provision to manipulate more than one business object in a single call to Salesforce.com. An important example of this feature is the “**create**” operation, where you can select more than one object in one configuration wizard cycle, as shown in [Figure 3-29](#).

Figure 3- 29 Create Operation in Cloud Operation Configuration Wizard

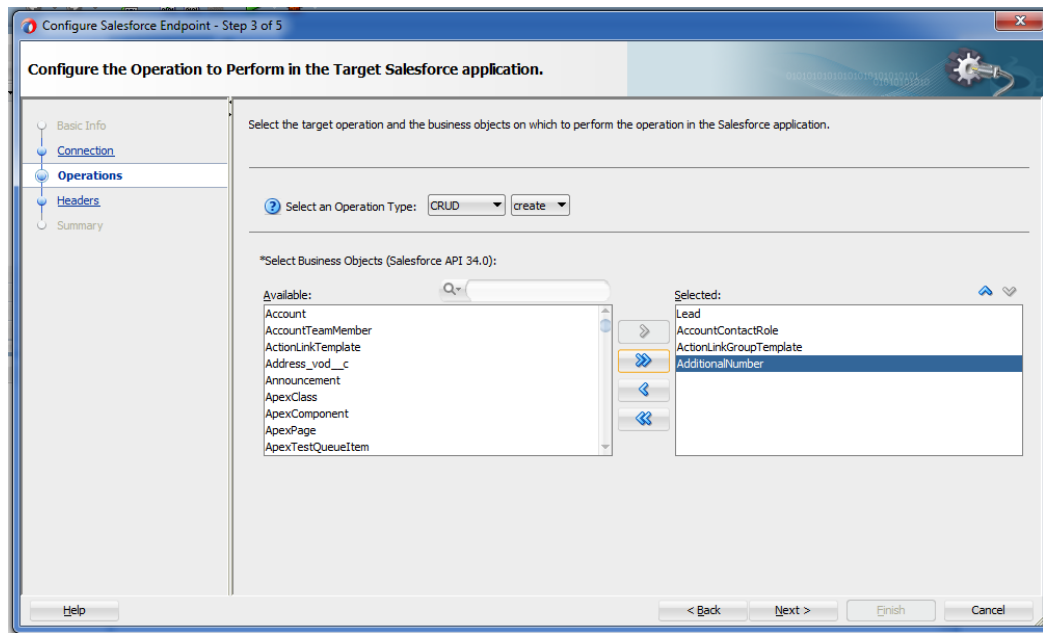

Table 3-33 shows an insight into the maximum number of objects you can select for a specific operation.

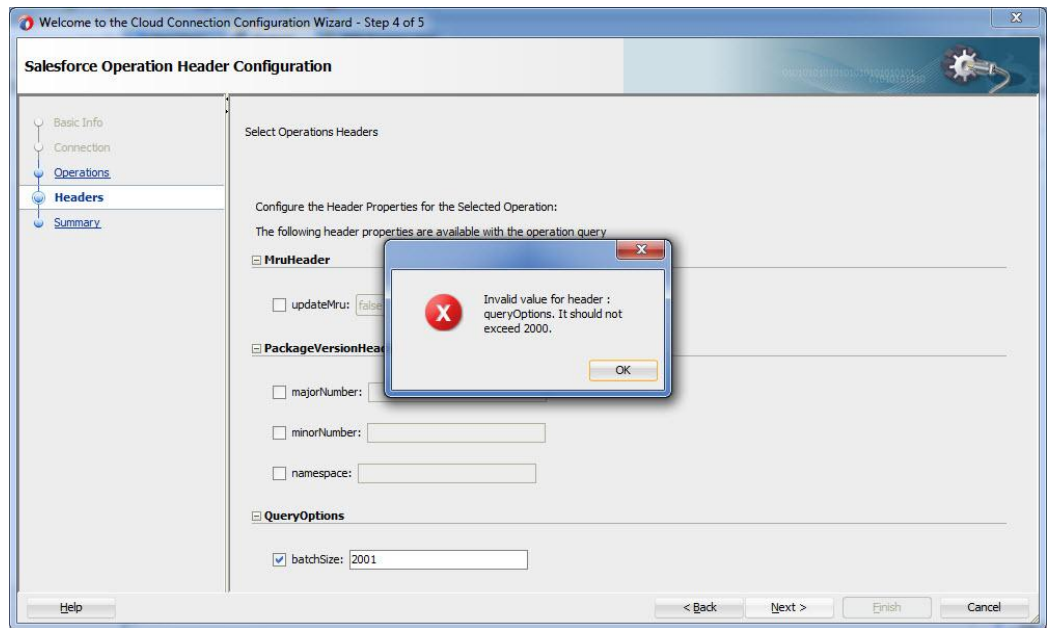

Table 3- 33 Maximum Number of Objects

#	Operation Name	Max Objects
1	Create	10
2	retrieve	1
3	update	10
4	delete	Unbounded
5	upsert	1
6	undelete	Unbounded
7	convertLead	1
8	process	1
9	merge	1
10	getDeleted	1
11	getUpdated	1
12	getUserInfo	0

Header Restrictions

The Oracle Cloud Adapter for Salesforce.com saves the user from making any wrong selections at design-time, which may lead to erroneous conditions at run-time. For example, the maximum value for batch size in “Query” options header is 2000. The configuration wizard does not allow you to enter a value greater than 2000. If you enter a value which is greater than 2000, an error message is displayed, as shown in Figure 3-30.

Figure 3-30 Invalid header value Message

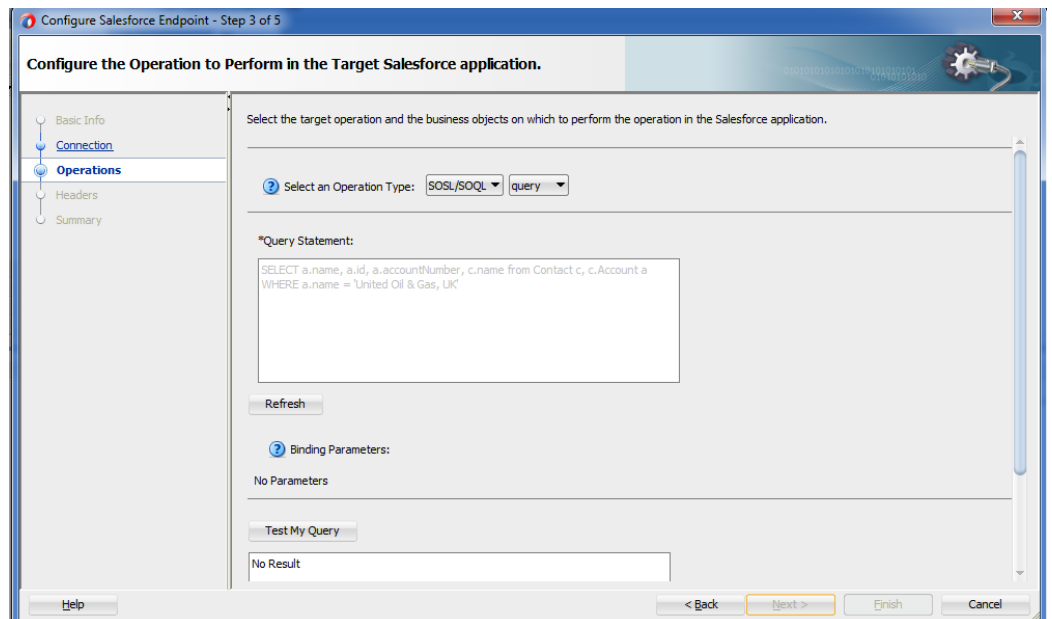

3.10 Support for Bind Parameters

The operations falling under the SOSL/SOQL category gives you the privilege to provide inputs to your query/search statement dynamically. This is made possible using the concept of bind parameters.

Consider the following query:

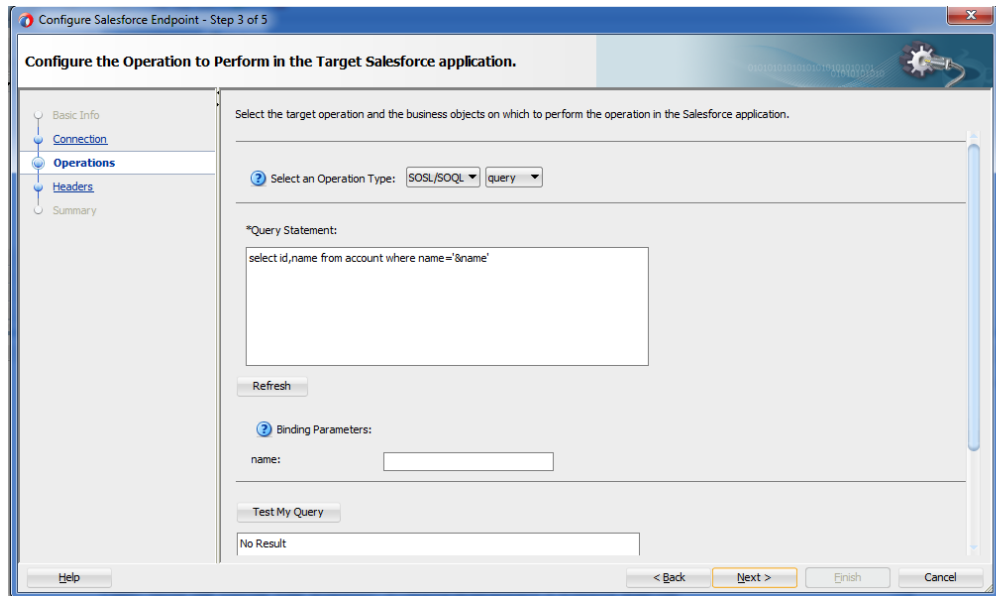

1. **Select id, Name from Account where id = '0019000000sgbCW'**
2. The Oracle Cloud Adapter for Salesforce.com gives you an option to give inputs to your query in the form of bind parameters, as shown in [Figure 3-31](#).

Figure 3-31 Give Inputs to your Query in the Form of Bind Parameters

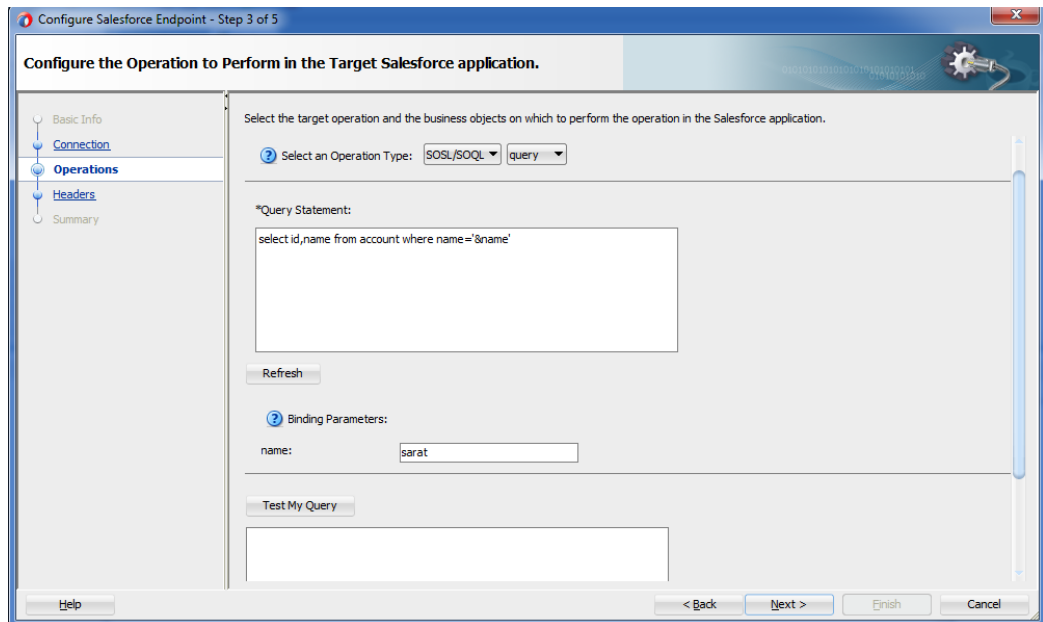

3. Here, the ampersand ‘&’ symbol prefix to **vid** indicates that it is a bind parameter.
4. Click on the **Run Query Test** tool to see how it works for bind parameters, as shown in [Figure 3-32](#).

Figure 3- 32 Run Query Test

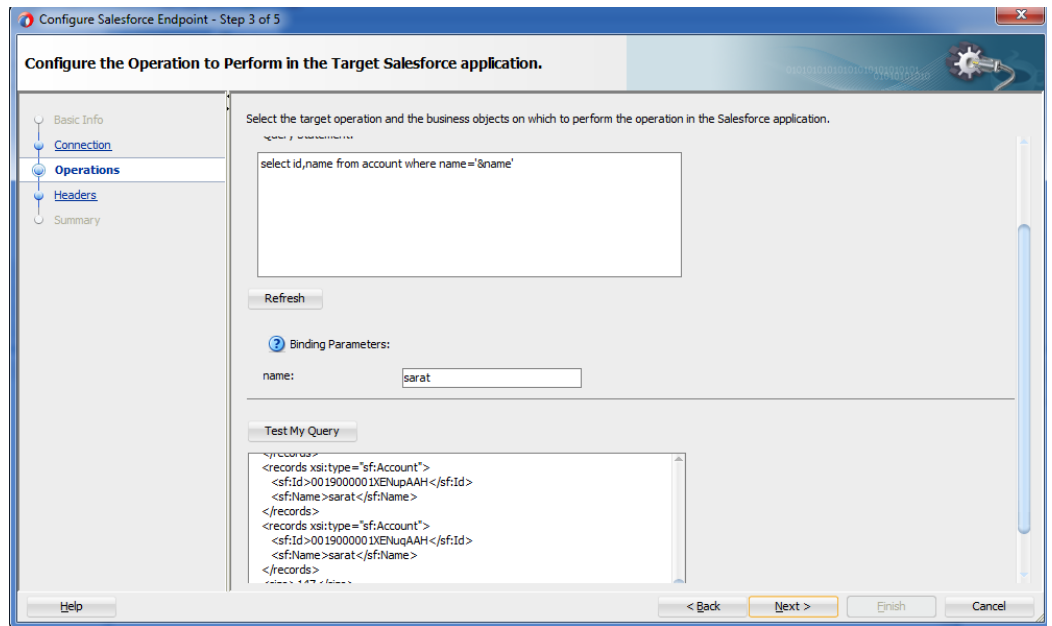

5. As shown in [Figure 3-33](#), the **Run Query Test** tool prompts you to provide a value for the bind parameter, ‘**vid**’ in this case.

Figure 3- 33 Provide a Value for the Bind Parameter

6. On providing an appropriate value to the bind parameter and clicking the ‘**Execute Query**’ button, you can view the result set for that particular query, as shown in [Figure 3-34](#).

Figure 3-34 Result of the Query

7. The WSDL generated for this particular adapter contains the bind parameter as part of input schema, as shown in [Figure 3-35](#).

Figure 3-35 Input Schema

```
<xs:schema xmlns="http://xml.oracle.com/types/salesforceReference_2" elementFormDefault="qualified"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" targetNamespace="http://xml.oracle.com/types/salesforceReference_2"
  xmlns:ns3="http://xml.oracle.com/types/salesforceReference_2">
  <xs:complexType name="QueryParameters">
    <xs:all>
      <xs:element name="vid" type="xs:string" minOccurs="1" maxOccurs="1"/>
    </xs:all>
  </xs:complexType>
</xs:schema>
```

Design-Time: Using Oracle Cloud Adapter for Salesforce.com Configuration Wizard

This chapter defines how you can configure Oracle Cloud Adapter for Salesforce.com by walking through a complete Adapter Configuration Wizard scenario. Moreover, you will also get to know what artifacts are being generated after completing the Oracle Cloud Adapter for Salesforce.com Wizard.

The Oracle Cloud Adapter for Salesforce.com can be used for both inbound as well as outbound processes. This chapter explains configuration for both of these processes in detail.

It contains the following topics:

- [Section 4.1, “Oracle Cloud Adapter for Salesforce.com-Outbound”](#)
- [Section 4.2, “Oracle Cloud Adapter for Salesforce.com-Inbound”](#)

4.1 Oracle Cloud Adapter for Salesforce.com-Outbound

This section describes the configuration process for Oracle cloud Adapter for Salesforce.com when used for the outbound connection.

4.1.1 Oracle Cloud Adapter for Salesforce.com Plug-in

Oracle Cloud Adapter for Salesforce comes preinstalled with Oracle SOA Suite 12c (12.2.1.1.0) and is available under the Cloud subsection of Component Palette in JDeveloper.

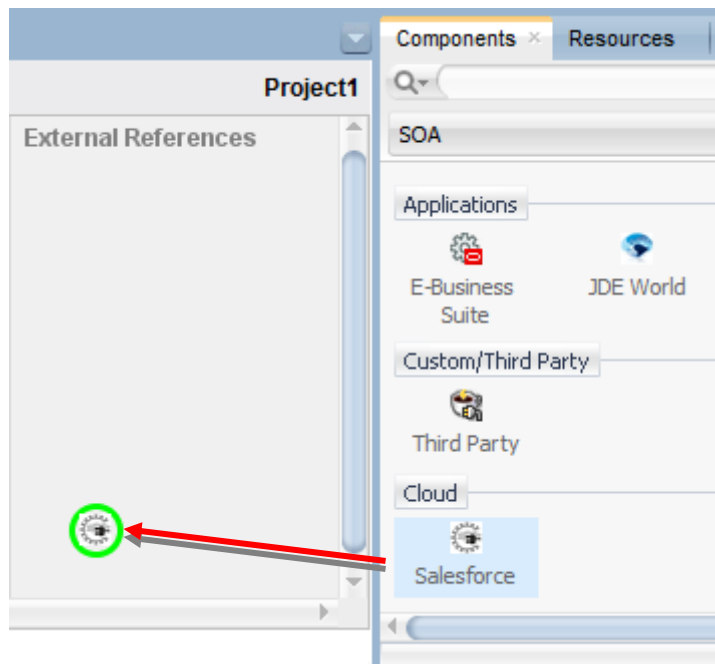

4.1.2 Oracle Cloud Adapter for Salesforce.com Walkthrough

This section describes the Adapter Configuration Wizard and how you can define an Oracle Cloud Adapter for Salesforce.com by using the Adapter Configuration Wizard. Contrary to 11g wherein all adapters were part of the ‘Service Adapters’ subsection, 12c distinguishes adapters based on their usage. Salesforce adapter is visible under the ‘Cloud’ subsection, a section dedicated to cloud based adapters.

1. In the **Component Palette**, select **SOA**.
2. Under the **Cloud** subsection you should be able to find an icon for Oracle Cloud Adapter for Salesforce.com

3. Drag and drop **Salesforce** Adapter to the **External References** swim-lane in the composite.xml page, as shown in [Figure 4-1](#).

Figure 4- 1 Salesforce Adapter

The **Salesforce Cloud Adapter Configuration Wizard** dialog is displayed.

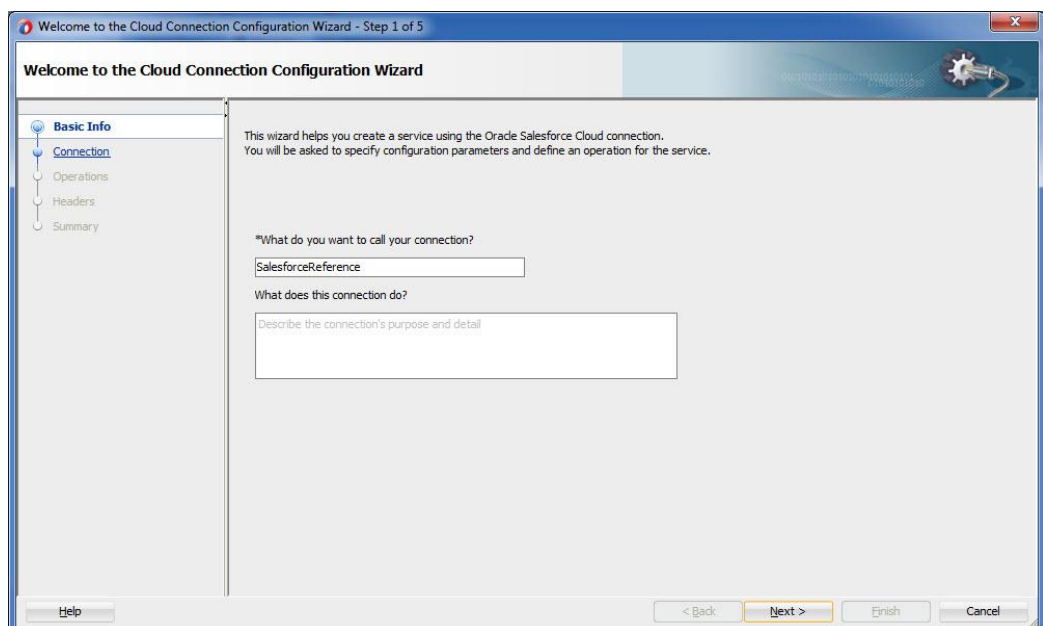

4.1.2.1 Welcome Page

The first page of Salesforce Cloud Adapter Configuration Wizard is – Welcome page, as shown in [Figure 4-2](#).

Service Adapters enable your Oracle BPEL process or Oracle Mediator Component to interact with database tables, database queues, file systems, FTP servers, Java Message Services (JMS), IBM WebSphere MQ, Oracle applications, or Cloud applications.

Click **Next** to continue or **Cancel** to exit the wizard.

Figure 4- 2 Welcome Page

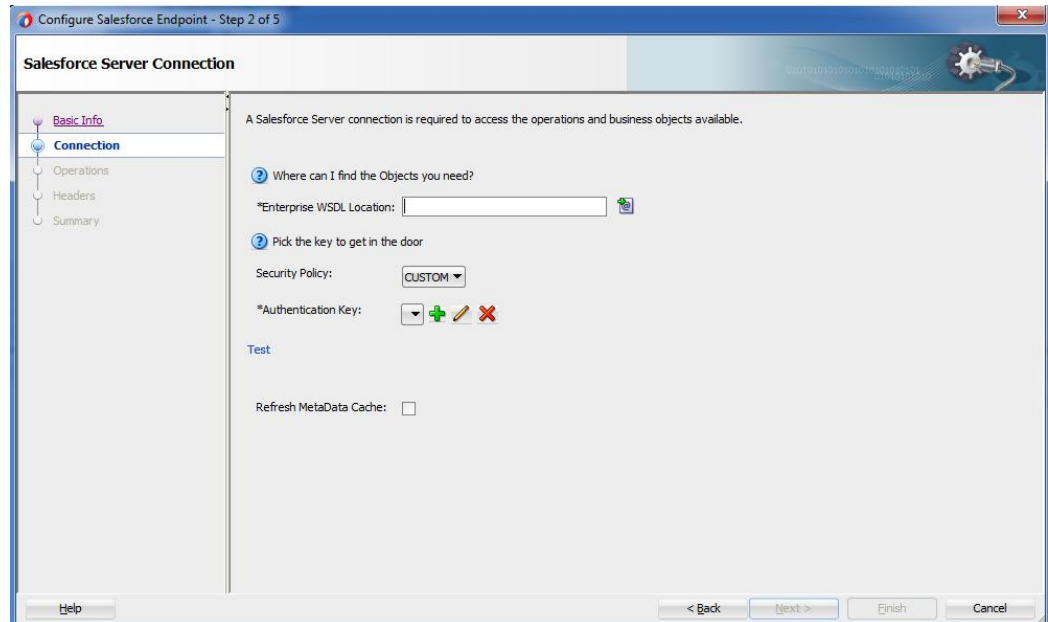

4.1.2.2 Salesforce Cloud Server Connection Page

The next page of the adapter configuration wizard is – **Salesforce Cloud Server Connection**, as shown in [Figure 4-3](#).

This page enables you to either select an existing connection or create a new connection definition by providing an Authentication Key.

Figure 4-3 *Salesforce Cloud Server Connection Page*

The Salesforce Cloud Server Connection page is arranged in the following sections:

- Enterprise WSDL Location
- Security Policy
- Authentication Key
- Test Connection

Enterprise WSDL Location

In the text box corresponding to WSDL location, provide the location of your Enterprise WSDL. Using the **Find existing WSDLs** button, browse for the Enterprise WSDL. Make sure you copy the file to your local project folder and use the same while configuring the adapter. Alternatively, you can provide the MDS location of the WSDL in this text box. For more information refer to the section “[A.1 Generating the Enterprise WSDL](#)” for WSDL generation. This field is mandatory.

Find existing WSDLs: Click **Find existing WSDLs** button to find/select the existing WSDLs, as shown in [Figure 4-4](#).

Figure 4-4 *WSDL Location Option*

Authentication Key

Authentication key enables you to specify and store the Authentication credentials in the Credential Store Framework. This field is mandatory. Select the Authentication key, this key

is required to retrieve the Salesforce.com login credentials during run-time. It must match the CSF key configured on the WebLogic server. To see the steps to configure the CSF key on WebLogic server, see the section “CSF Key in Enterprise Manager”.

Add a new credential: To create a new key, click on plus (+) button, as shown in [Figure 4-5](#).

Figure 4-5 Create Authentication Key

Once you click on the + icon, the **Add Credential** pop-up window appears, as shown in [Figure 4-6](#).

Add Credential / CSF Key Creation:

Add Credential page is used to create a new password credential by supplying user name, password and key alias, as shown in [Figure 4-6](#). The new credential will be added to the *oracle.wsm.security* credential map.

On this page the following information is required:

- **User ID:** Enter the Salesforce.com user ID (typically an email address).
- **Password:** Enter the Salesforce.com password + security token.
- **CSF Key:** A user defined (CSF) key which is associated with the specified username and password. Enter the CSF Key of your choice. Credential store framework requires a key which stores the username and password and prevents the user from rewriting the same at run-time. The CSF Key created in configuration wizard should match the CSF key created on Enterprise Manager Console.

Figure 4-6 Add Credential Page

All these parameters are needed for logging into the Salesforce.com.

Test Connection Functionality

You can use **Test** button to test the connection after creating or selecting the CSF Key. By clicking on **Test** button, you will see the message as shown in [Figure 4-7](#).

- Success! - For successful connection.

- Error! - For any exception during login.

Figure 4-7 Test Connection Option

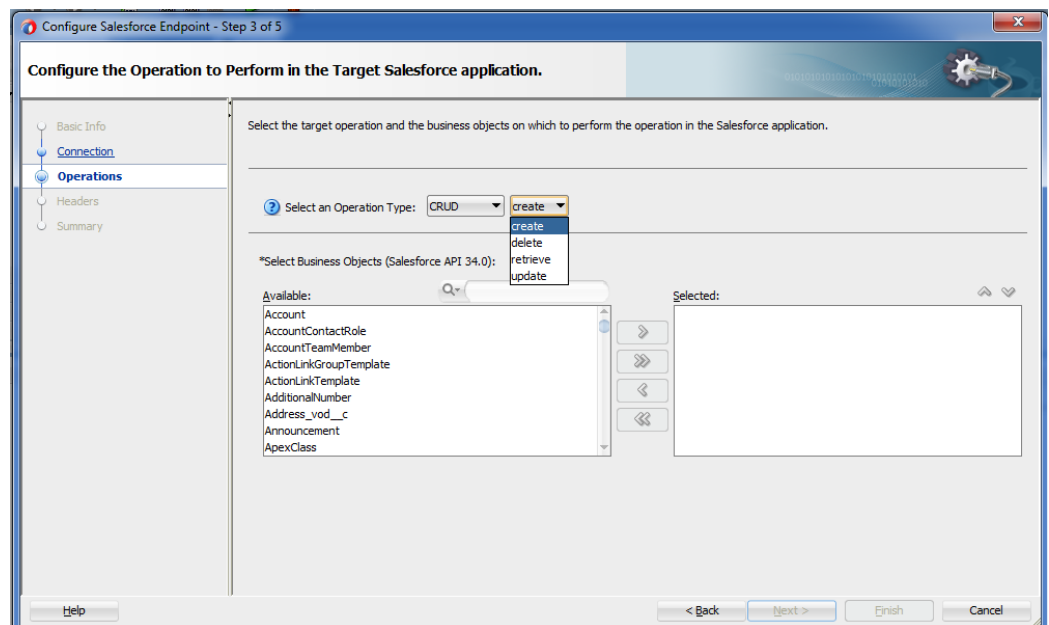

Click **Next** to continue or **Cancel** to exit the wizard.

4.1.2.3 Salesforce.com Cloud Operation Configuration Page

The next page of Salesforce Cloud Adapter Configuration Wizard is – **Cloud Operation Configuration**, as shown in [Figure 4-8](#).

Figure 4-8 Cloud Operation Configuration page

The Cloud Operation Configuration page enables you to select operation and objects(s).

The operation page enables you to select from the different kinds of operation categories, and operations. Based on the operation selected, the list of objects will be displayed in the available object list text area. You can select one or multiple objects for a specified operation. You need to follow a logical sequence in selecting objects during design-time because the request structure that the adapter creates depends upon the order of selected objects. For example, if you want to create a lead, opportunity and an account in this order, these objects have to be selected accordingly; with lead on top, followed by opportunity and then account.

The **Cloud Operation Configuration** page is arranged in the following sections:

- Select an Operation Type
- SFDC Operation
- API Version
- WSDL Operation
- Business Objects

Operation Category

This drop-down list groups a set of related Salesforce.com operations which the user can choose amongst. For more information, refer to the section “[Supported SOAP API Operations](#)”.

SFDC Operation

This includes a number of operations, based on Operation Category selected.

SFDC Operation calls represent specific operations that the Oracle Cloud Adapter for Salesforce.com can invoke at run-time to perform tasks, for example:

- Query data in your organization.
- Add, update, and delete data.

For more information, refer to the section “[Supported SOAP API Operations](#)”.

API Version

The API Version indicates which Salesforce.com WSDL (Web service) version you are using to get all the metadata information for Salesforce.com objects. This API version is read from the endpoint URL in service definition section at the bottom of the Salesforce.com WSDL.

Business Objects

Available Objects:

This area shows all the available Salesforce.com standard and custom objects that can be selected for the particular operation.

Selected Objects:

This section shows all the Salesforce.com objects selected by you. The selected operation (create, update, delete, etc.) can be performed only on these objects by your adapter instance.

Filter Field:

Filter field is used to search for a Salesforce.com object from the list of available objects.

When you click on the drop-down, following options are available.

- **All:** Combination of both standard as well as custom objects
- **Custom:** Objects created or customized by the user
- **Standard:** Objects provided by Salesforce in standard environment

SOQL and SOSL Page

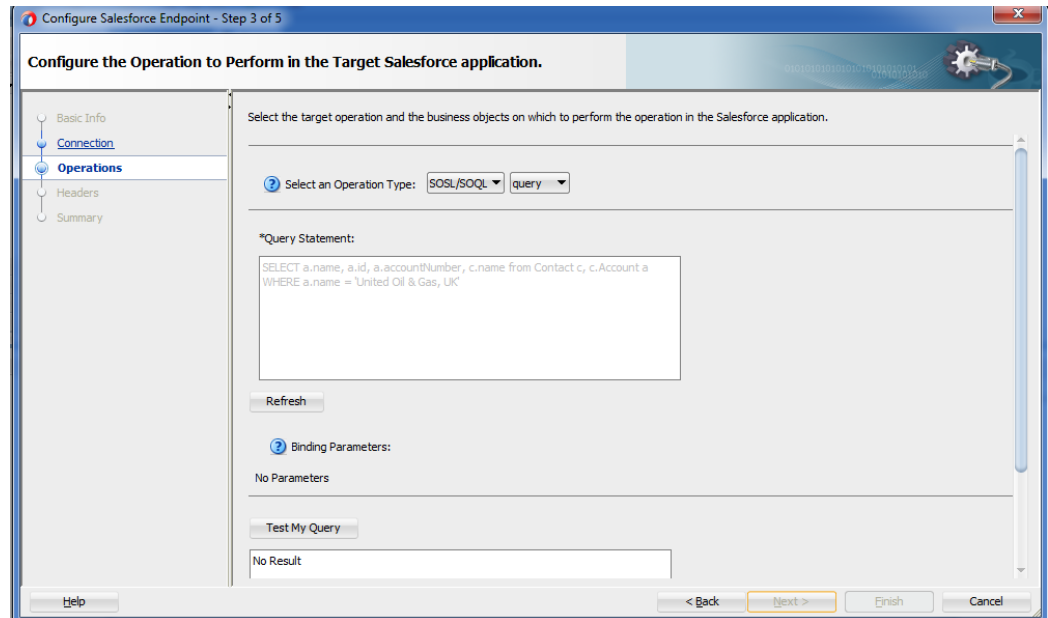

If you select SOSL/SOQL operation category, a query editor will open. Type the SOQL or SOSL statement depending on the operation selected, as shown in [Figure 4-9](#).

SOSL/SOQL enables you to search your organization’s Salesforce.com data for specific information.

Query Statement:

Query statement is used to query data from Salesforce.com. Query statement text box consists of SOQL statements according to Salesforce.com. Refer to the section “[SOQL and SOQL Operations](#)” to understand how the operation works. For detailed information on SOQL/SOQL, follow this link (http://www.salesforce.com/us/developer/docs/soql_sosl/)

Figure 4-9 Query Statement in SOQL and SOQL Option

Run Query Test Tool:

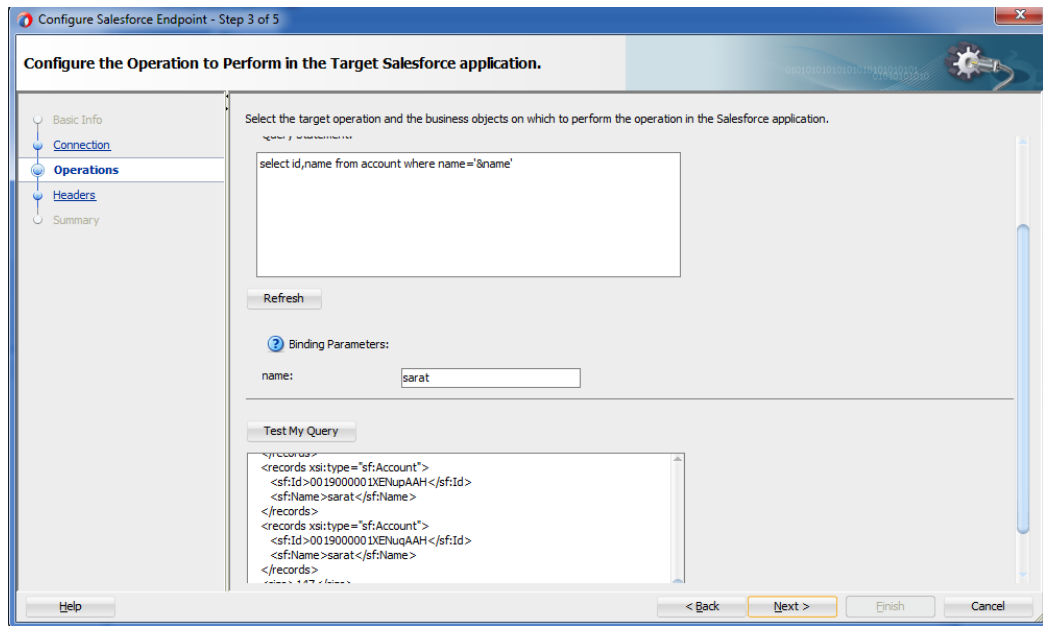

This tool helps you to test and verify the query. By clicking on **Test** icon, a test dialogue box appears.

The Query Test dialogue contains the following area:

Query Statement text box and **Results** box showing result of query executed. Result box can show results up to a maximum of 200 records. If the query has one or more bind parameters in it, then one or more input boxes will appear to provide values for these, as shown in [Figure 4-10](#).

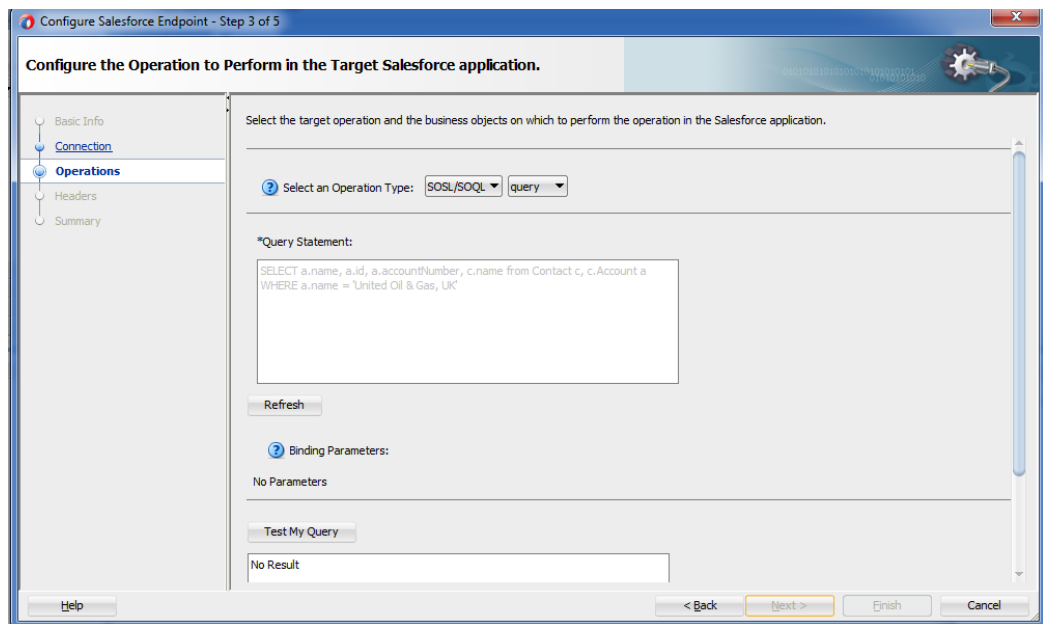

Test My Query: Test My Query button is used to execute the query.

Figure 4- 10 Query Test

Refresh Bind Parameters: Refresh Bind Parameters button is used to refresh Bind Parameters box, if there is any change in the number of bind parameters in the query statement. The screenshot below illustrates the usage of ‘Bind Parameters’

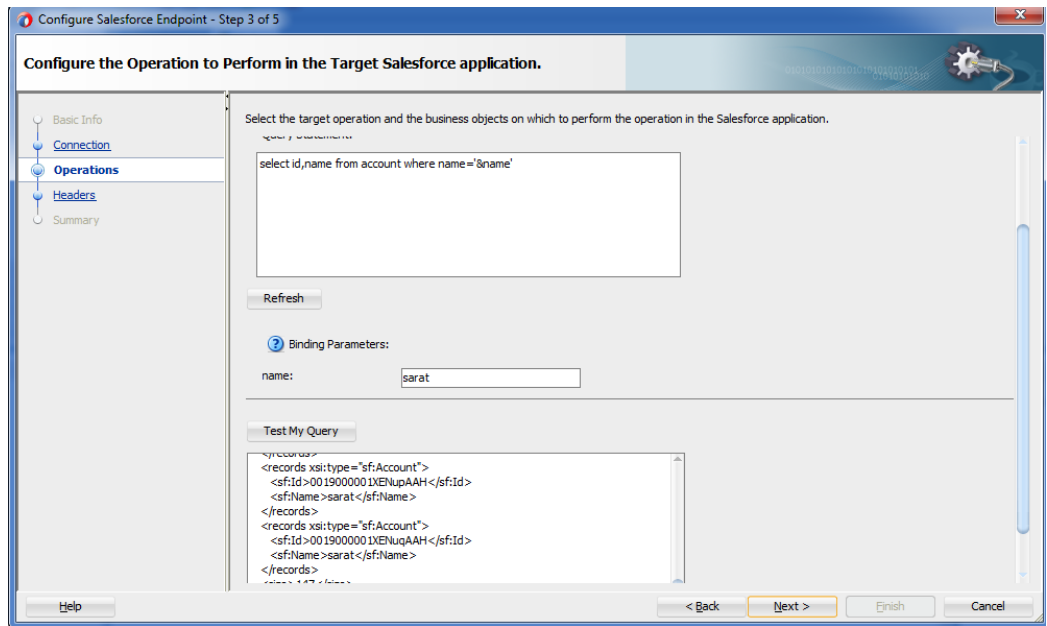

Figure 4- 11 Query Test

Search Statement:

Salesforce object Search Statement (SOSL) is used to search specific data for your organization from Salesforce.com. It retrieves records for one or more objects. Analogous to the options described in previous section, Search statement also has buttons as provision for - Run Search test Tool, Execute Search and Refresh Bind Parameters.

Figure 4- 12 Cloud Operation Configuration

4.1.2.4 Headers Page

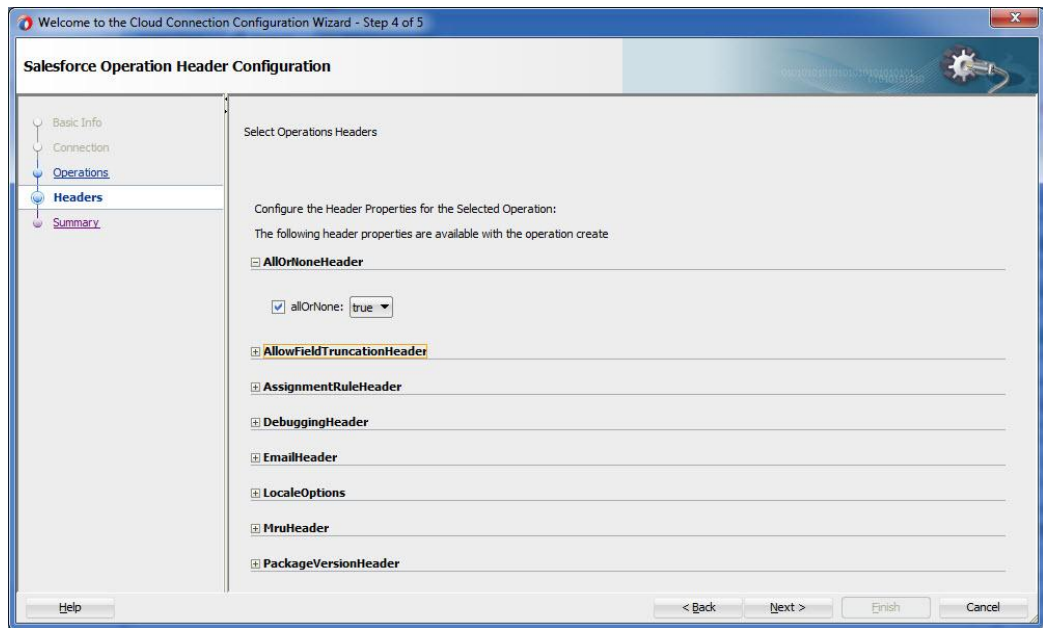

The next page in Salesforce Cloud Adapter Configuration Wizard is – **Headers** page, as shown in [Figure 4-13](#).

The **Headers** page is used to select header properties for the selected Oracle Cloud Adapter for Salesforce.com Cloud Operation. The values defined in this page can be overridden by properties defined at the composite level or in the EM console. For a detailed description of run-time properties, see section “[Oracle Cloud Adapter for Salesforce.com Run-Time Properties](#)”.

For more information on Salesforce.com headers, follow the link (http://www.salesforce.com/us/developer/docs/api/Content/soap_headers.htm).

For operation specific header information, refer to the section “[Salesforce.com SOAP Headers](#)”.

Figure 4- 13 Header and Properties Page (for create operation)

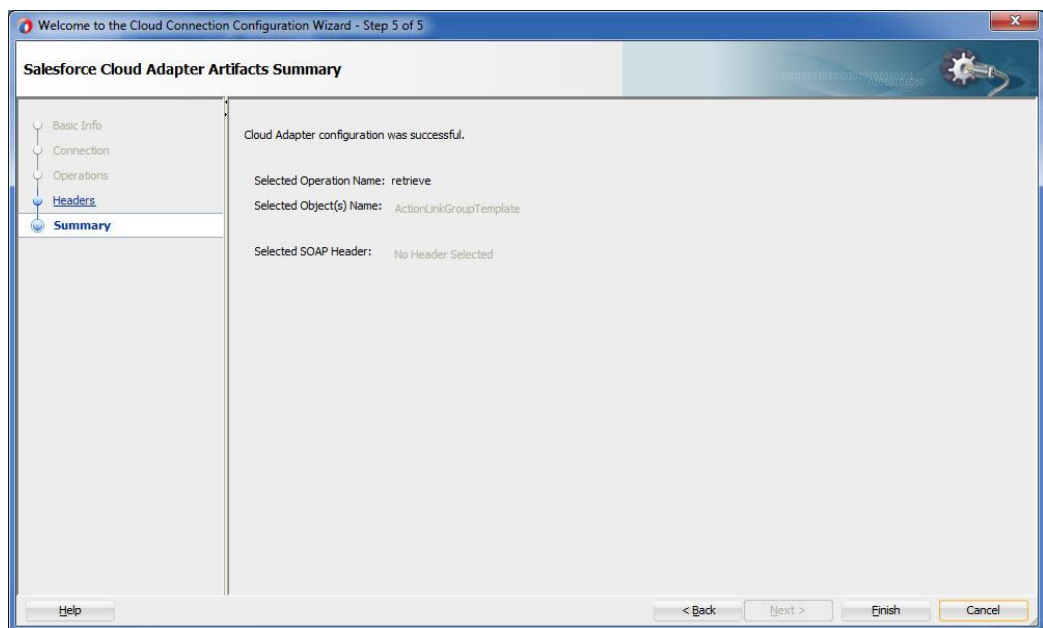

4.1.2.5 Finish Page

The next page in Salesforce Cloud Adapter Configuration Wizard is – **Finish** page. The **Finish** page summarizes the Oracle Cloud Adapter for Salesforce configuration.

When you complete the adapter configuration, a WSDL file named after the service name, you entered on the **Adapter Configuration Wizard - Service Name** page, appears in the **Application Navigator**, as shown [Figure 4-14](#).

To finish adapter configuration, Click **Finish**.

Figure 4- 14 Finish Page

4.1.3 Design-time Artifact Generation

After clicking on Finish button on the last screen of Salesforce Cloud Adapter Configuration Wizard, composite.xml gets updated by adding a reference element along with jca file and integration WSDL file.

4.1.3.1 JCA File

The JCA file provides adapter configuration information for the service. A connection factory is specified so that the adapter run-time can connect to the Salesforce Cloud Servers, as shown in [Figure 4-15](#).

Figure 4-15 Sample JCA File contents for Create operation

```
<adapter-config xsdTargetNamespace="http://xmlns.oracle.com/cloud/adapter/salesforce/SalesforceReference_2/types"
  name="SalesforceReference_2PortType" adapter="salesforce" wsdlLocation="SalesforceReference_2.wsdl"
  xmlns="http://platform.integration.oracle/blocks/adapter/fw/metadata">
  <connection-factory location="cloud/CloudAdapter">
  <non-managed-connection managedConnectionFactoryClassName="oracle.cloud.connector.salesforce.SalesforceConnectionFactory">
    <property name="targetWSDLURL" value="../WSDLs/enterpriseWSDL33.wsdl"/>
    <property name="csfkey" value="SFDC_USER"/>
    <property name="csfMap" value="oracle.wsm.security"/>
    <property name="applicationVersion" value="33.0"/>
  </non-managed-connection>
  </connection-factory>
  <endpoint-interaction portType="SalesforceReference_2PortType" operation="create">
  <interaction-spec className="oracle.tip.adapter.cloud.CloudInteractionSpec">
    <property name="targetOperation" value="create"/>
    <property name="operationPath" value=""/>
    <property name="oracle.cloud.rt.sfcdAdapterNamespace"
      value="http://xmlns.oracle.com/cloud/adapter/salesforce/SalesforceReference_2#new"/>
    <property name="selectedObjects" value="Account"/>
  </interaction-spec>
  </endpoint-interaction>
</adapter-config>
```

4.1.3.2 Integration WSDL

Integration WSDL is a simplified, abstract WSDL file as compared to the actual Salesforce WSDL. It has information in reference to selected operation and objects during configuration of the Oracle Cloud Adapter for Salesforce.com. [Figure 4-16](#) and [Figure 4-17](#) shows parts of the Sample Integration WSDL generated by Salesforce Adapter for delete operation.

Figure 4-16 Integration WSDL part showing delete operation request and response schema

```
<xs:schema xmlns="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application1/Project1/sample"
  elementFormDefault="qualified" xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application1/Project1/sample"
  xmlns:ns2="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application1/Project1/sample"
  xmlns:ns4="urn:enterprise.soap.sforce.com">
  <xs:import namespace="urn:enterprise.soap.sforce.com"/>
  <xs:element name="delete" type="ns2:deleteType"/>
  <xs:complexType name="deleteType">
    <xs:sequence>
      <xs:element name="ids" type="xs:ID"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="deleteResponse" type="ns2:deleteResponseType"/>
  <xs:complexType name="deleteResponseType">
    <xs:sequence>
      <xs:element name="DeleteResult" type="ns4:DeleteResult"/>
    </xs:sequence>
  </xs:complexType>
</xs:schema>
```

Figure 4- 17 Integration WSDL part displaying delete operation details

```
<wsdl:message name="deleteRequestMessage">
  <wsdl:part name="parameters" element="nsl:delete"/>
</wsdl:message>
<wsdl:message name="deleteResponseMessage">
  <wsdl:part name="parameters" element="nsl:deleteResponse"/>
</wsdl:message>
<wsdl:message name="UnexpectedErrorFault">
  <wsdl:part name="parameters" element="fns:UnexpectedErrorFault"/>
</wsdl:message>
<wsdl:portType name="samplePortType">
  <wsdl:operation name="delete">
    <cloud:CloudOperation xmlns:cloud="http://xml.oracle.com/types" targetOperation="delete"/>
    <wsdl:input message="nsl:deleteRequestMessage"/>
    <wsdl:output message="nsl:deleteResponseMessage"/>
    <wsdl:fault name="UnexpectedErrorFault" message="nsl:UnexpectedErrorFault"/>
  </wsdl:operation>
</wsdl:portType>
```

4.2 Oracle Cloud Adapter for Salesforce.com-Inbound

4.2.1 Oracle Cloud Adapter for Salesforce.com Plug-in

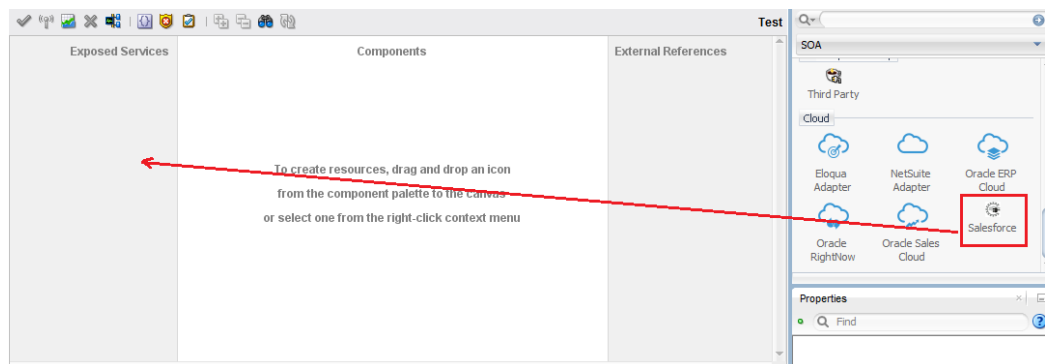

Oracle Cloud Adapter for Salesforce comes preinstalled with Oracle SOA Suite 12c (12.2.1.1.0) and is available under the Cloud subsection of Component Palette in JDeveloper.

4.2.2 Oracle Cloud Adapter for Salesforce.com Walkthrough-Inbound

This section describes the Adapter Configuration Wizard and how you can define an Oracle Cloud Adapter for Salesforce.com by using the Adapter Configuration Wizard. Contrary to 11g wherein all adapters were part of the ‘Service Adapters’ subsection, 12c distinguishes adapters based on their usage. Salesforce adapter is visible under the ‘Cloud’ subsection, a section dedicated to cloud based adapters.

1. In the **Component Palette**, select **SOA**.
2. Under the **Cloud** subsection you should be able to find an icon for Oracle Cloud Adapter for Salesforce.com
3. Drag and drop **Salesforce** Adapter to the **Exposed Services** swim-lane in the composite.xml page, as shown in Figure 4-18.

Figure 4- 18 Salesforce Adapter

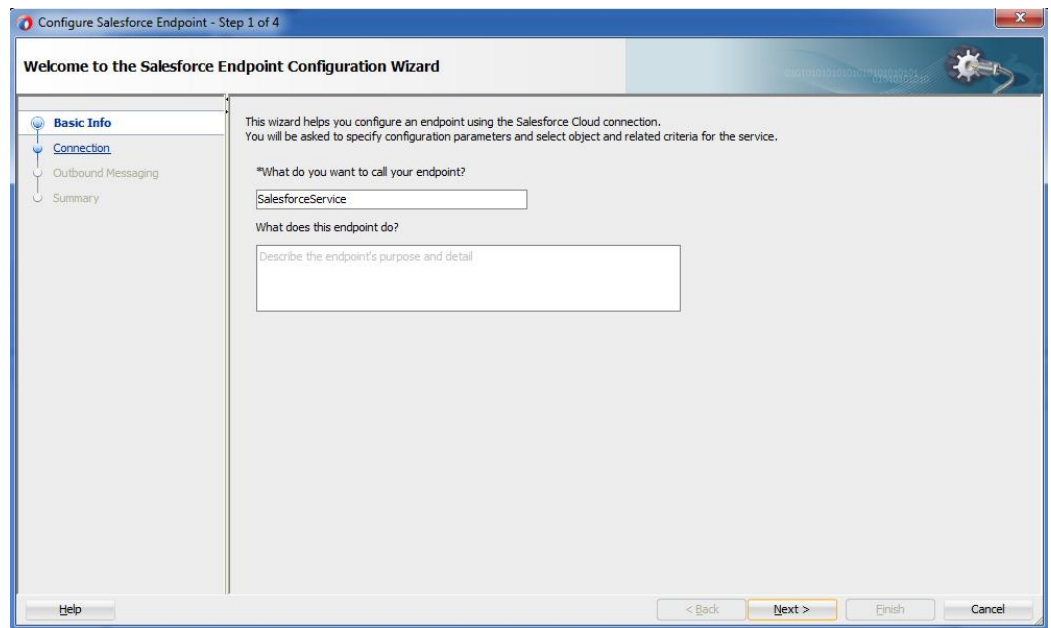

The **Salesforce Cloud Adapter Configuration Wizard** dialog is displayed.

4.2.2.1 Basic Info Page

The first page of Salesforce Cloud Adapter Configuration Wizard is – Basic Info page, as shown in figure Below. Provide the name for the endpoint.

Click **Next** to continue or **Cancel** to exit the wizard.

Figure 4- 19 Basic Info Page

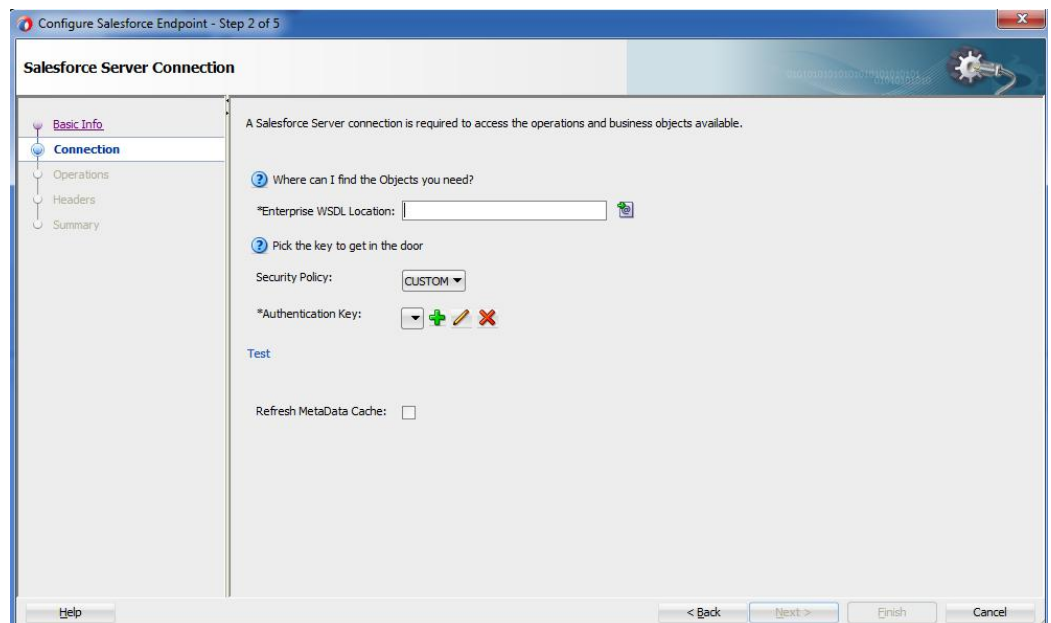

4.2.2.2 Connection Page

The next page of the adapter configuration wizard is – **Salesforce Cloud Server Connection**, as shown in Figure 4-20.

This page enables you to either select an existing connection or create a new connection definition by providing an Authentication Key.

Figure 4- 20 Salesforce Cloud Server Connection Page

The Salesforce Cloud Server Connection page is arranged in the following sections:

- Enterprise WSDL Location
- Security Policy
- Authentication Key
- Test Connection

Enterprise WSDL Location

In the text box corresponding to WSDL location, provide the location of your Enterprise WSDL. Using the **Find existing WSDLs** button, browse for the Enterprise WSDL. Make sure you copy the file to your local project folder and use the same while configuring the adapter. Alternatively, you can provide the MDS location of the WSDL in this text box. For more information, refer to the section A-2, “[CSF Key in Enterprise Manager](#)”. This field is mandatory.

Find existing WSDLs: Click **Find existing WSDLs** button to find/select the existing WSDLs, as shown in Figure 4-21.

Figure 4- 21 WSDL Location Option

Authentication Key

Authentication key enables you to specify and store the Authentication credentials in the Credential Store Framework. This field is mandatory. Select the Authentication key, this key is required to retrieve the Salesforce.com login credentials during run-time. It must match the CSF key configured on the WebLogic server. To see the steps to configure the CSF key on WebLogic server, see the section “[CSF Key in Enterprise Manager](#)”.

Add a new credential: To create a new key, click on plus (+) button, as shown in Figure 4-22.

Figure 4- 22 Create Authentication Key

Once you click on the + icon, the **Add Credential** pop-up window appears, as shown in Figure 4-23.

Add Credential / CSF Key Creation:

Add Credential page is used to create a new password credential by supplying user name, password and key alias, as shown in Figure 4-23. The new credential will be added to the *oracle.wsm.security* credential map.

On this page the following information is required:

- **User ID:** Enter the Salesforce.com user ID (typically an email address).
- **Password:** Enter the Salesforce.com password + security token.

- **CSF Key:** A user defined (CSF) key which is associated with the specified username and password. Enter the CSF Key of your choice. Credential store framework requires a key which stores the username and password and prevents the user from rewriting the same at run-time. The CSF Key created in configuration wizard should match the CSF key created on Enterprise Manager Console.

Figure 4-23 Add Credential Page

All these parameters are needed for logging into the Salesforce.com.

Note: The CSF key view/edit functionality is currently not supported. It will be provided in a subsequent release.

Test Connection Functionality

You can use **Test** button to test the connection after creating or selecting the CSF Key. By clicking on **Test** button, you will see the message as shown in Figure 4-24.

- Success! - For successful connection.
- Error! - For any exception during login.

Figure 4-24 Test Connection Option

Click **Next** to continue or **Cancel** to exit the wizard.

4.2.2.3 Outbound Messaging

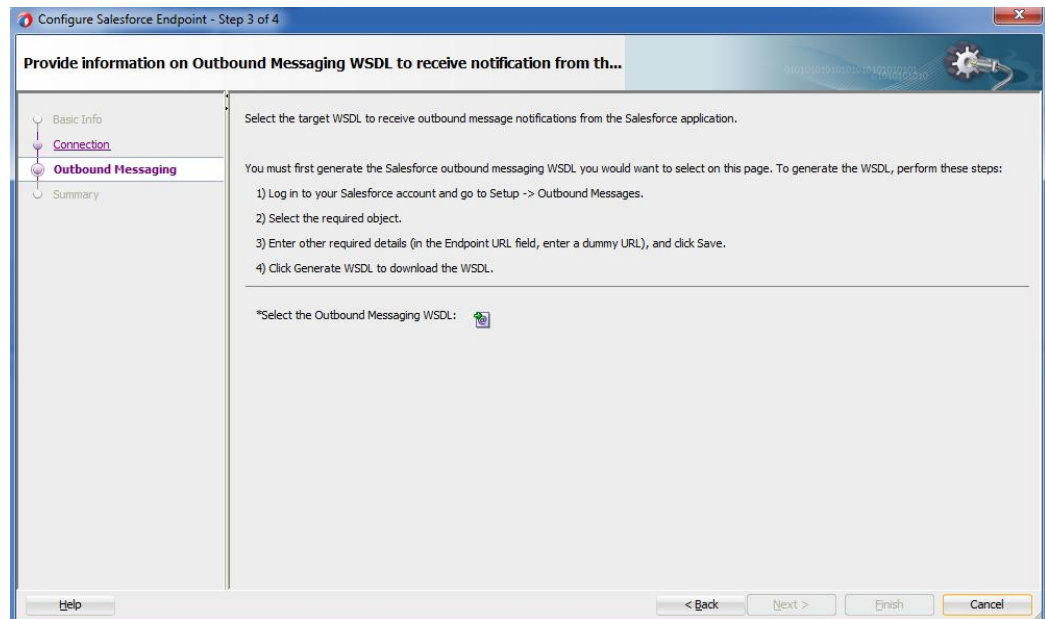

Upload the Outbound messaging WSDL by clicking on the upload  icon as shown in Figure below:

Figure 4- 25 Outbound Messaging

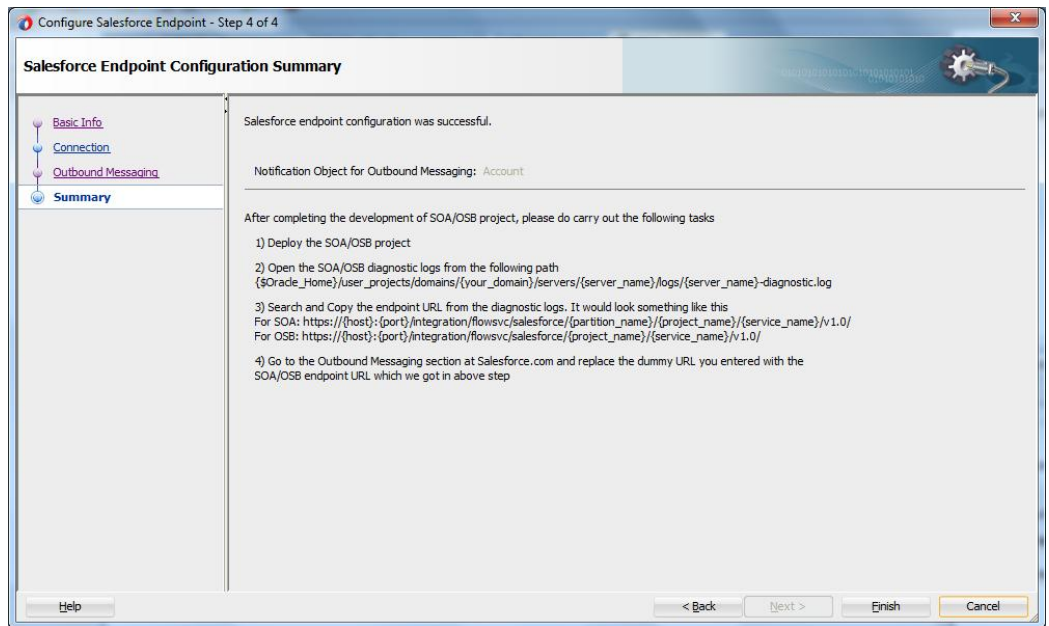

Uploading new WSDL against the option ‘**Select new Outbound Messaging WSDL**’ will replace the previously uploaded WSDL. Follow the steps below to download Outbound Messaging WSDL from Salesforce.com.

1. Open the Salesforce application.
2. Go to Setup and click Workflow option.
3. In the Workflow Rules panel, click the workflow rule.
4. Select object to which this workflow is applicable and click Next.
5. Enter Rule name, Rule condition and click Next.
6. Click Add Workflow Action and select New Outbound Messaging.
7. Enter require details and in the Endpoint URL field, enter dummy URL and click Save.
8. Now, click Generate WSDL and download the WSDL.

4.2.2.4 Summary

The next page in Salesforce Cloud Adapter Configuration Wizard is – **Summary** page. This page summarizes the Oracle Cloud Adapter for Salesforce Inbound configuration as shown in Figure below.

Figure 4-26 Summary Page

Follow the post-configuration steps:

1. Deploy the SOA/OSB project
2. Open the SOA/OSB diagnostic logs from the following path:

`{${Oracle_Home}/user_projects/domains/{your_domain}/servers/{server_name}/logs/{server_name}-diagnostic.log`

3. Search and Copy the endpoint URL from the diagnostic logs. It would look something like this:

For

SOA: `https://{host}:{port}/integration/flowsvc/salesforce/{partition_name}/{project_name}/{service_name}/v1.0`

For

OSB: `https://{host}:{port}/integration/flowsvc/salesforce/{project_name}/{service_name}/v1.0/`

4. Go to the Outbound Messaging section at Salesforce.com and replace the dummy URL you entered with the SOA/OSB endpoint URL fetched from the last step.

Click Finish to complete the configuration and Cancel to discard.

Integration with Different Service Components (BPEL/Mediator) in Oracle SOA Suite

Oracle Cloud Adapter for Salesforce.com facilitates integration to various Salesforce.com objects via operations exposed by the Salesforce.com API. This chapter walks you through a simple integration wherein user creates a new account on Salesforce.com using Oracle Cloud Adapter for Salesforce.com. The scenario would enable you to create an easy and seamless integration to Salesforce.com using BPEL Process Manager.

This section describes Oracle Cloud Adapter for Salesforce.com concepts through a use case, which is a complete walkthrough of the Adapter configuration wizard. In addition, this use case also describes how by using the Adapter configuration wizard, you can access various operations available to your Enterprise on Salesforce.com, select objects specific to your business requirements, generate corresponding WSDL to expose the necessary operations etc. These services are consumed to define partner links that are used in the BPEL process. You use the Adapter configuration wizard to both create and edit adapter services.

This chapter contains the following topics:

- [Section 5.1, "Overview"](#)
- [Section 5.2, "Designing a Composite for Service Integration"](#)
- [Section 5.3, "Configure Oracle Cloud Adapter for Salesforce.com"](#)
- [Section 5.4, "Integration with BPEL"](#)
- [Section 5.5, "Deploy the Composite"](#)
- [Section 5.6, "Test the Composite"](#)

5.1 Overview

Account is one of the various standard objects provided by Salesforce.com. An account on Salesforce.com represents an individual or business associated with the business. Oracle Cloud Adapter for Salesforce.com allows you to create an account on Salesforce.com. The below scenario would provide you step by step instructions to accomplish the same.

To integrate with Oracle BPEL Process Manager, the organization's Enterprise WSDL should be available to the user. The underlying adapter services must be exposed as WSDL files, which are generated during design-time in the configuration wizard of the Oracle Cloud Adapter for Salesforce.com. For more information, refer to the section "[A.1 Generating the Enterprise WSDL](#)".

The generated WSDL files are used to design the appropriate BPEL processes for outbound adapter services. A completed BPEL process must be successfully compiled in JDeveloper and deployed to an SOA Suite server. Upon deployment to an SOA Suite server, every newly

deployed process is viewable in the Oracle Enterprise Manager console, where you can run, monitor, administer BPEL processes, and monitor adapter events.

5.2 Designing a Composite for Service Integration

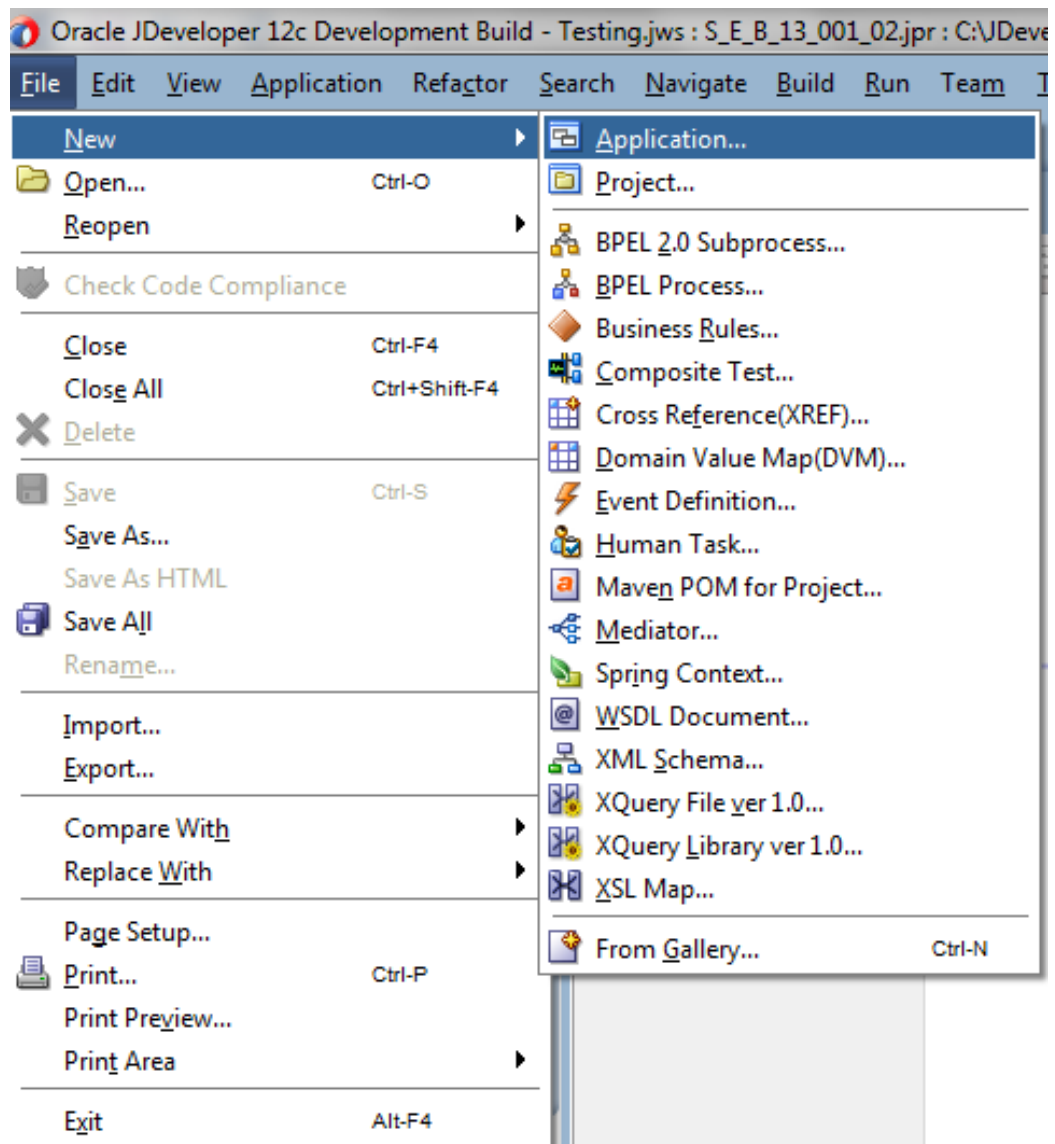

The steps mentioned below design a composite using the Oracle JDeveloper Studio Edition (12.2.1.1.0), which is a comprehensive tool for developing Oracle Fusion Middleware applications. It provides an easy-to-use Integrated Development Environment that let you create your integrations efficiently.

5.2.1 Define Composite for BPEL and Mediator

Perform the following steps to define a composite for BPEL and Mediator:

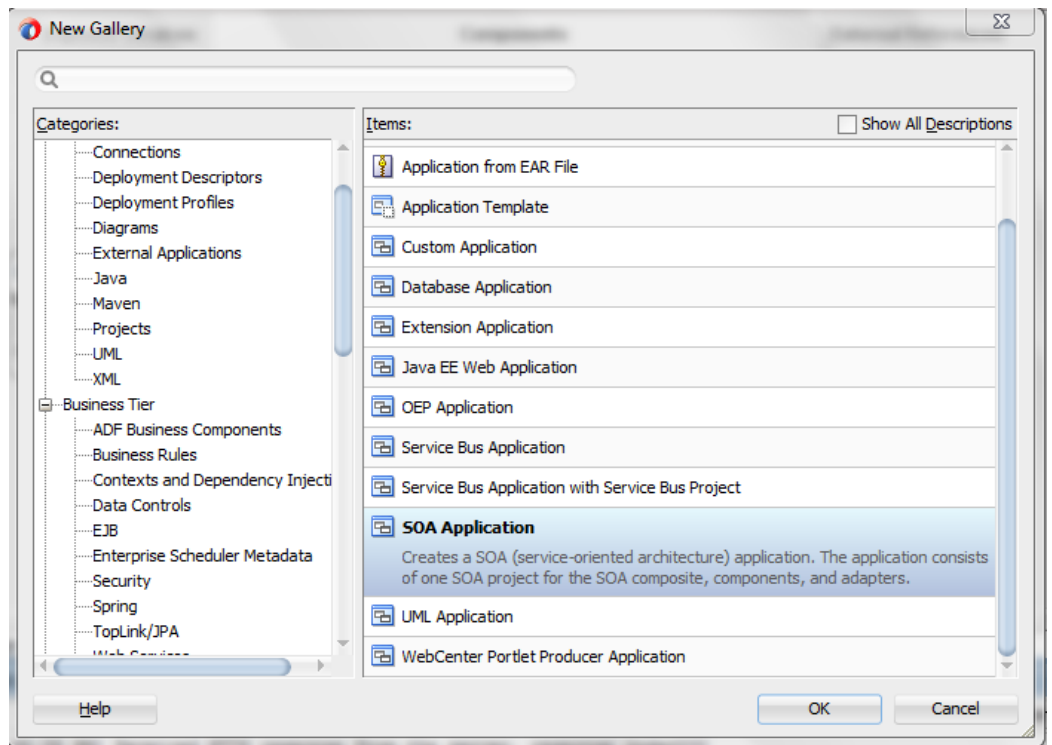

1. In the **File** menu of JDeveloper, click **New** and select **Application**.

Figure 5-1 Navigation Window

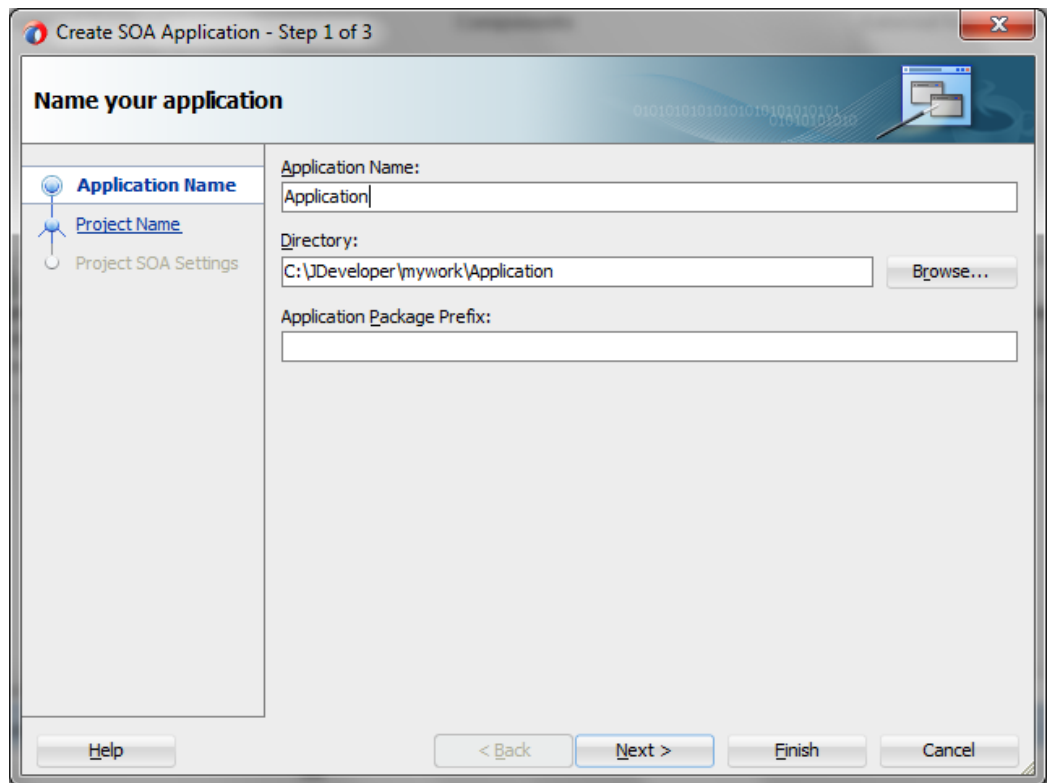

2. The **New Gallery** page is displayed. Select **SOA Application** from the **Items** list, as shown in [Figure 5-2](#).

Figure 5-2 Create SOA Application

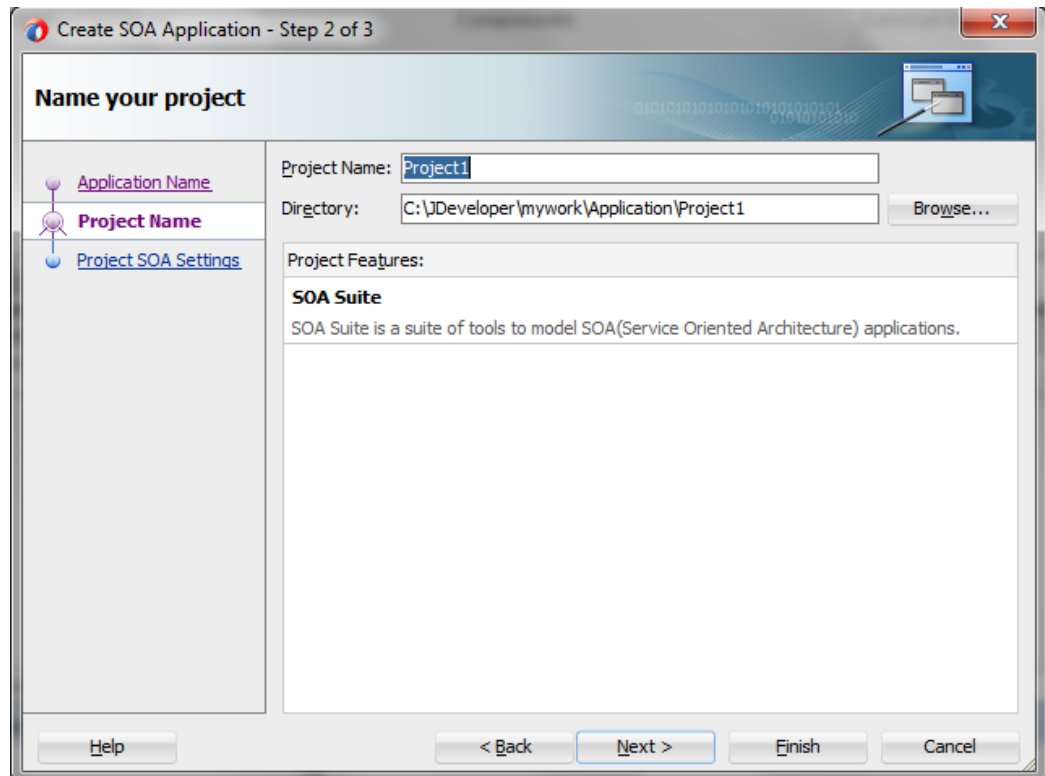

3. Provide a suitable name to your application, as shown in Figure 5-3.

Figure 5-3 Name your application

4. Click **Next** and provide a suitable name to your project, as shown in Figure 5-4.

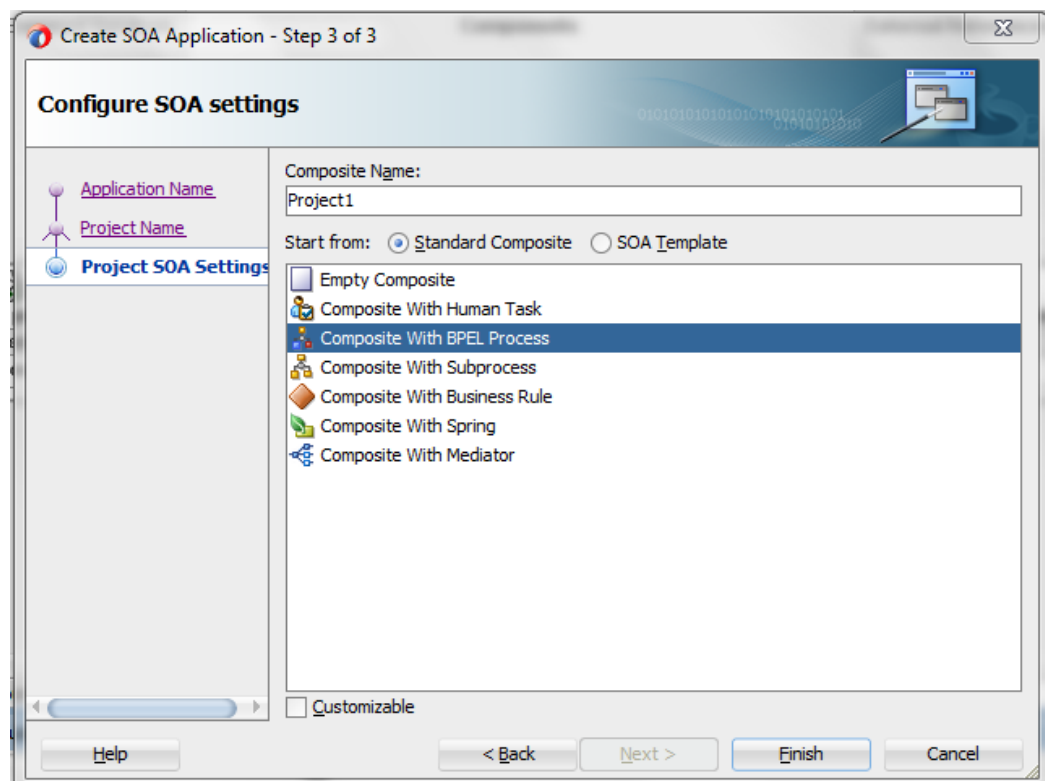

Figure 5-4 Name your project

5. Click Next.

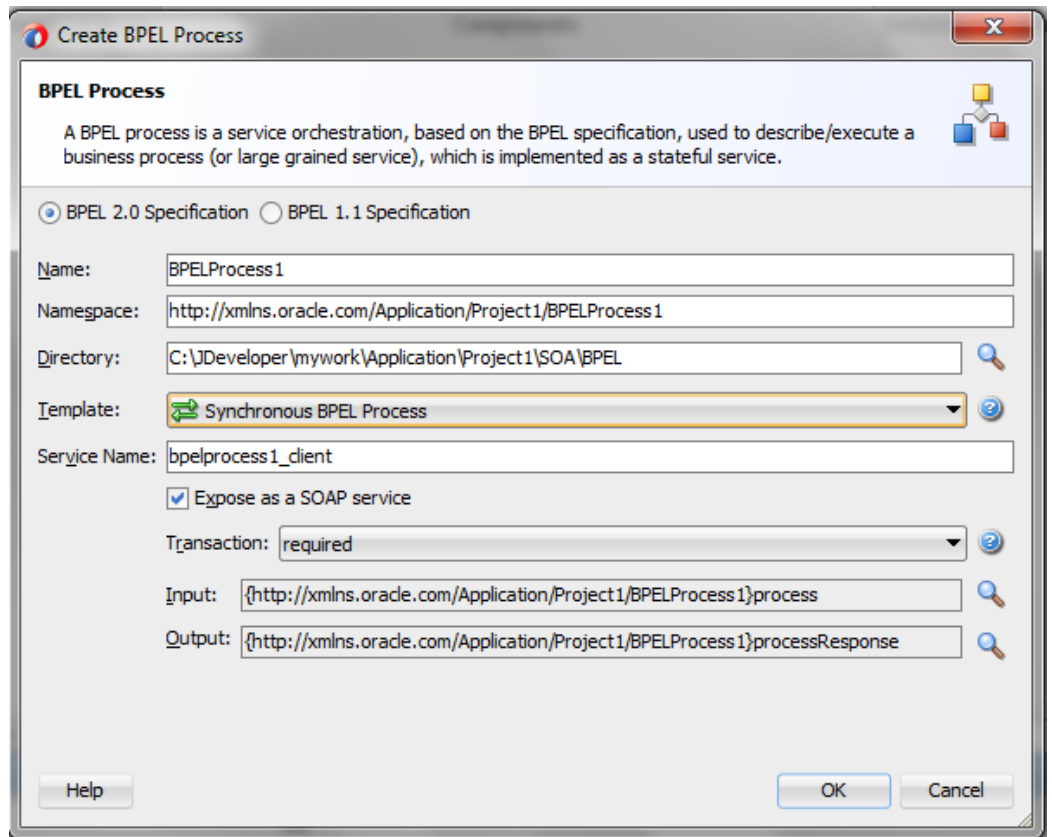

6. Select **Composite with BPEL Process** from **Standard Composite** list, as shown in Figure 5-5.

Figure 5-5 Configure SOA Setting

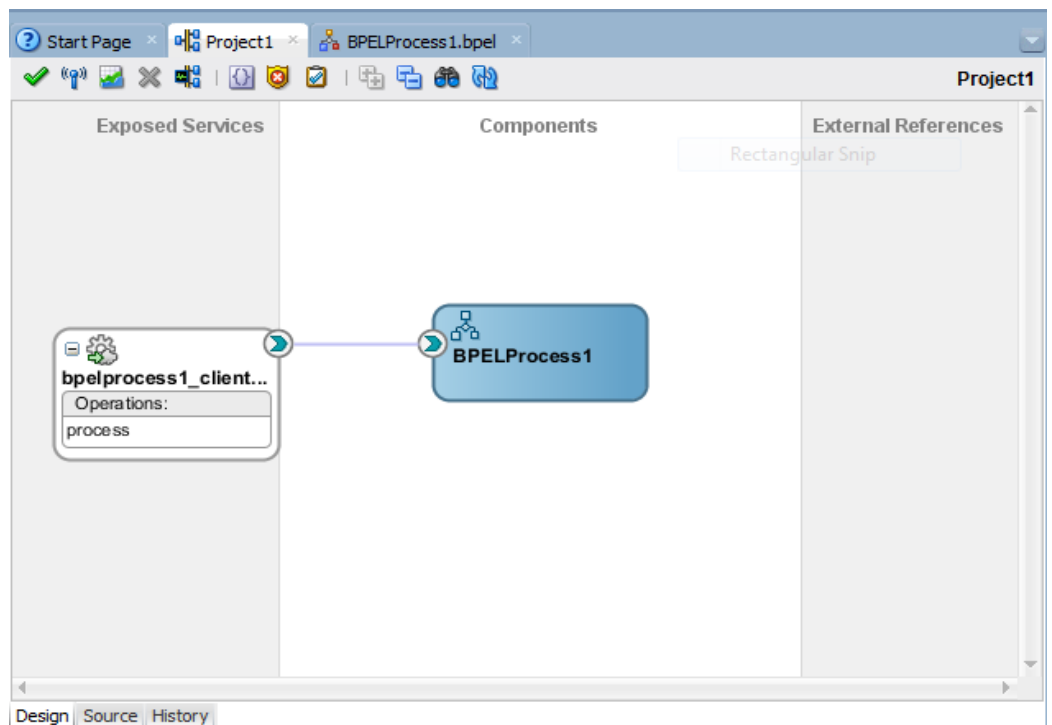

7. Click **Finish**.
8. Select the **Synchronous BPEL Process** from **Template** drop-down and click **OK**, as shown in [Figure 5-6](#).

Figure 5-6 Create BPEL Process

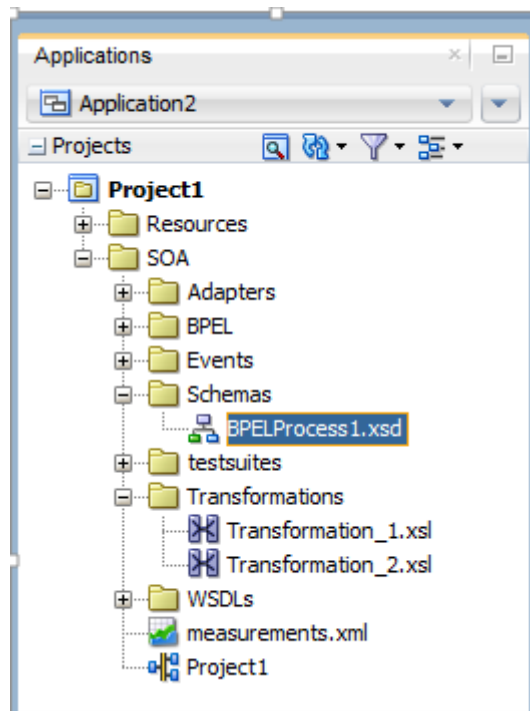

9. The composite.xml looks as shown in [Figure 5-7](#).

Figure 5-7 Composite.xml

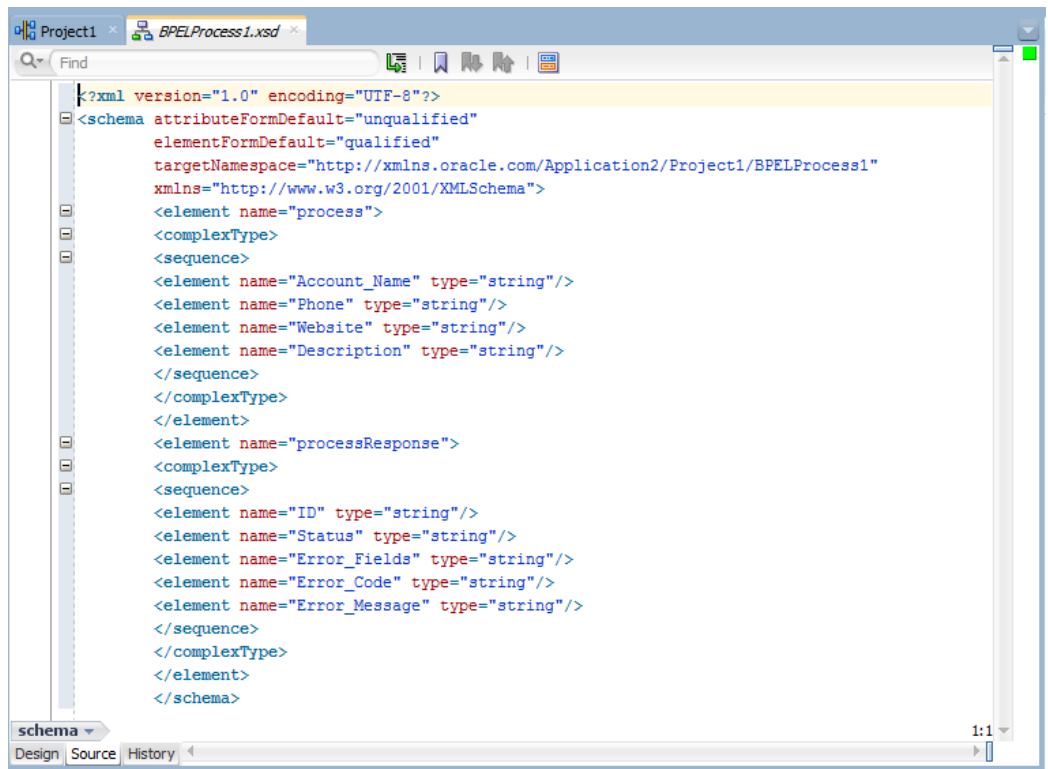

10. In the **Application Navigator**, under the **Schemas** folder, an XML schema file with the name **BPELProcess1.xsd** is displayed after BPEL process creation, as shown in [Figure 5-8](#).

Figure 5-8 XML Schema File

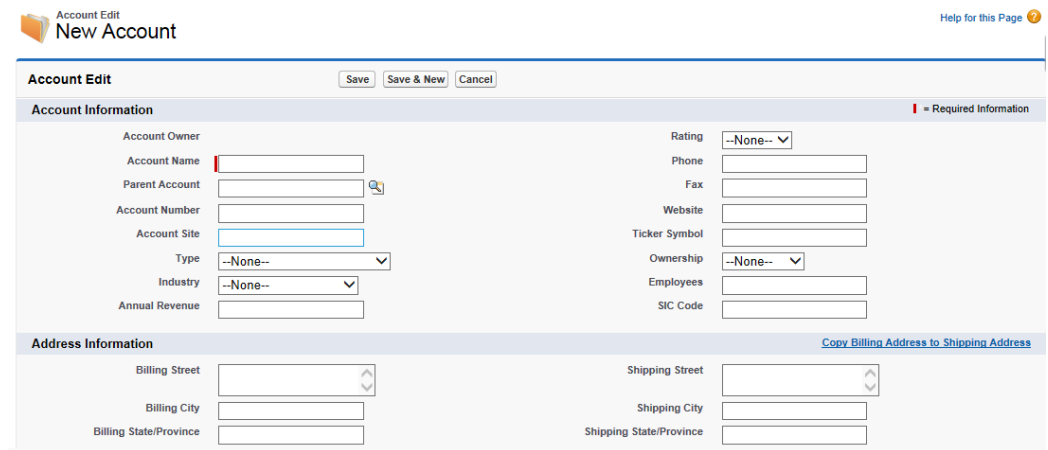

11. Edit this schema file as per your business requirement. It is the responsibility of the front-end application to enforce the data validations and to ensure that the input sent to SFDC via SOA is error free. The structure of the schema used in this use case is as shown in [Figure 5-9](#).

Figure 5-9 Edit XML Schema File

12. Figure 5-10 shows **Create Account** page on Salesforce.com. The fields with red mark are mandatory fields. This structure may vary for different organizations.

Figure 5-10 Create Account Page on Salesforce.com

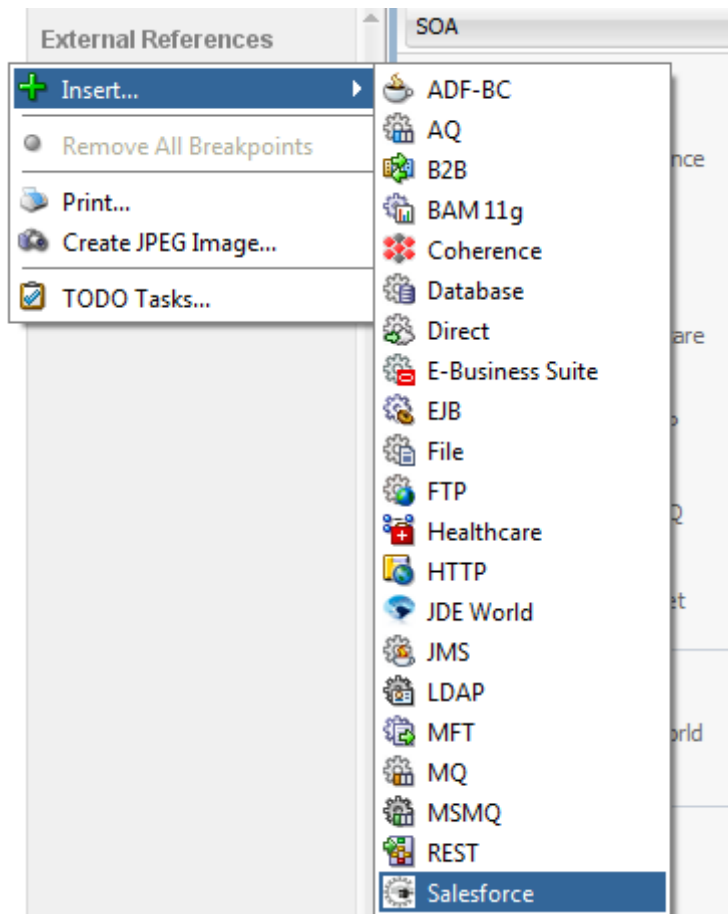

5.3 Configure Oracle Cloud Adapter for Salesforce.com

Perform the following steps to configure a New Oracle Cloud Adapter for Salesforce.com:

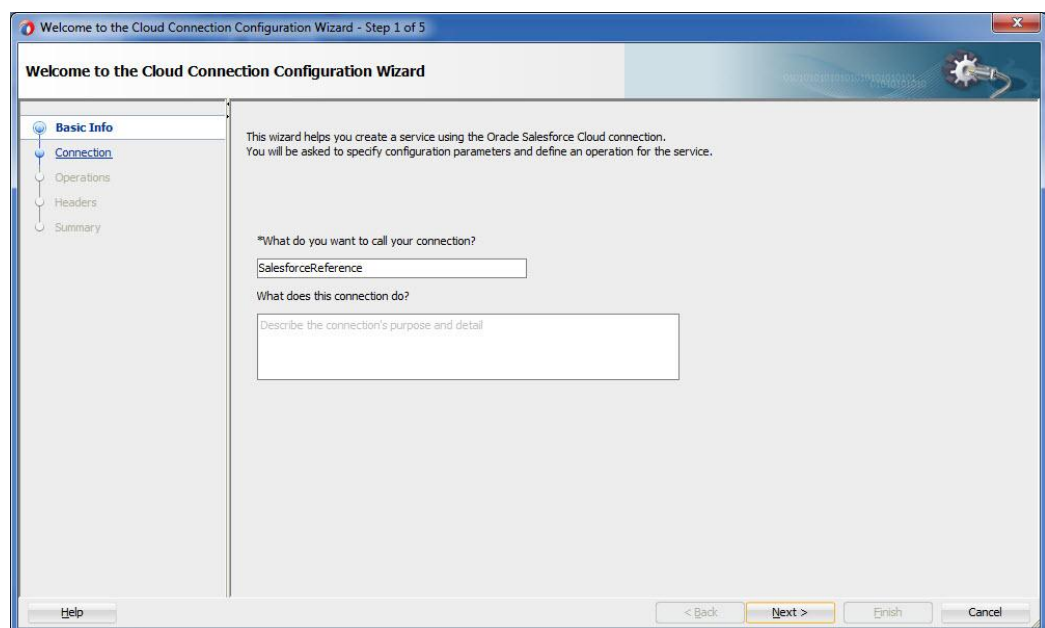

1. In **External References** swim lane of the composite.xml file, right-click and select **Salesforce** adapter, as shown in Figure 5-11.

Figure 5- 11 Salesforce Adapter

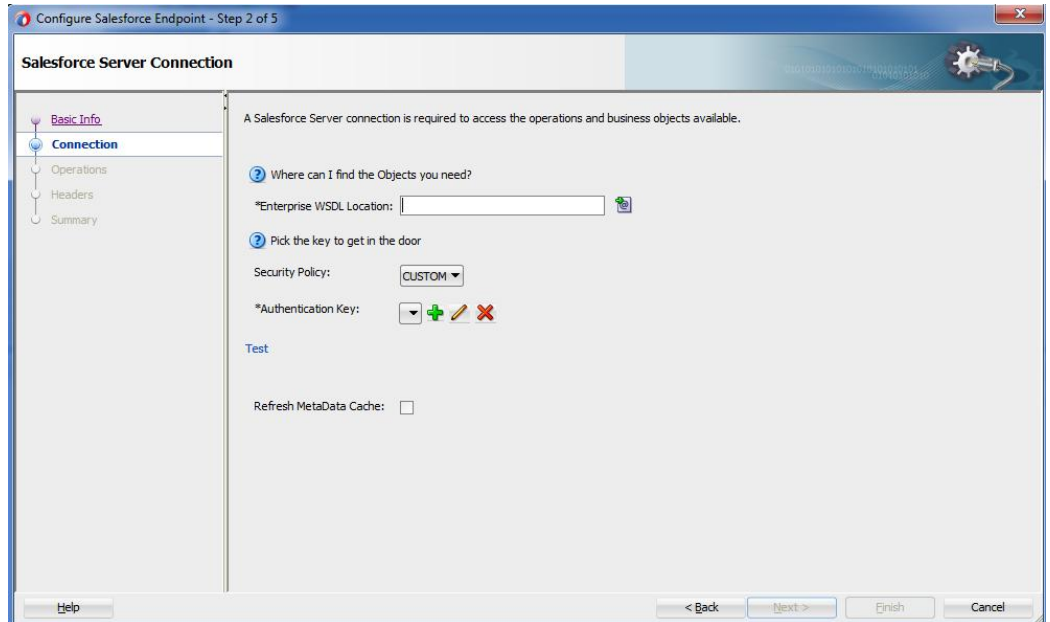

2. The Salesforce Cloud Adapter Configuration Wizard - Welcome page is displayed, as shown in [Figure 5-12](#).

Figure 5- 12 Welcome Page

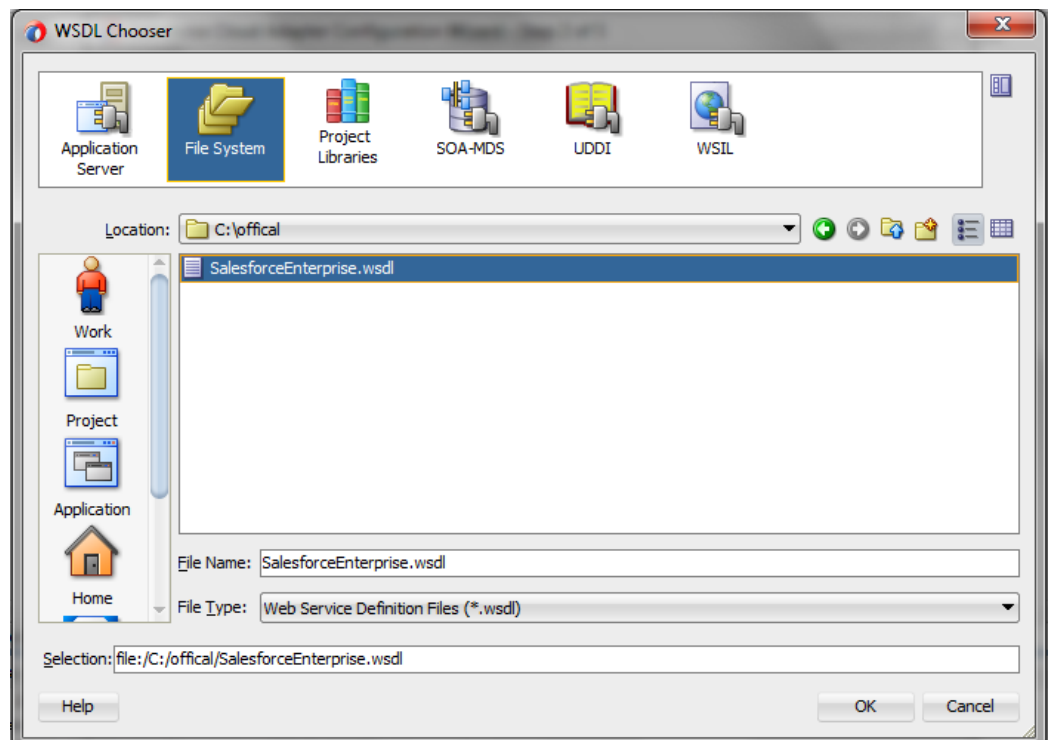

3. Click **Next**.
4. The **Salesforce Cloud Server Connection** page is displayed. The **WSDL Location** and **Authentication Key** text boxes are already populated. It picks up these values from the cache. You can re-enter these values. If you want to use a different value, click the **Find existing WSDLs** icon, which is located to the right of the **WSDL Location** field, as shown in [Figure 5-13](#).

Figure 5-13 *Salesforce Cloud Server Connection Page*

5. The **WSDL Chooser** dialog is displayed, browse and select the downloaded Enterprise WSDL and click **OK**, as shown in [Figure 5-14](#).

Figure 5-14 *SOA Resource Browser*

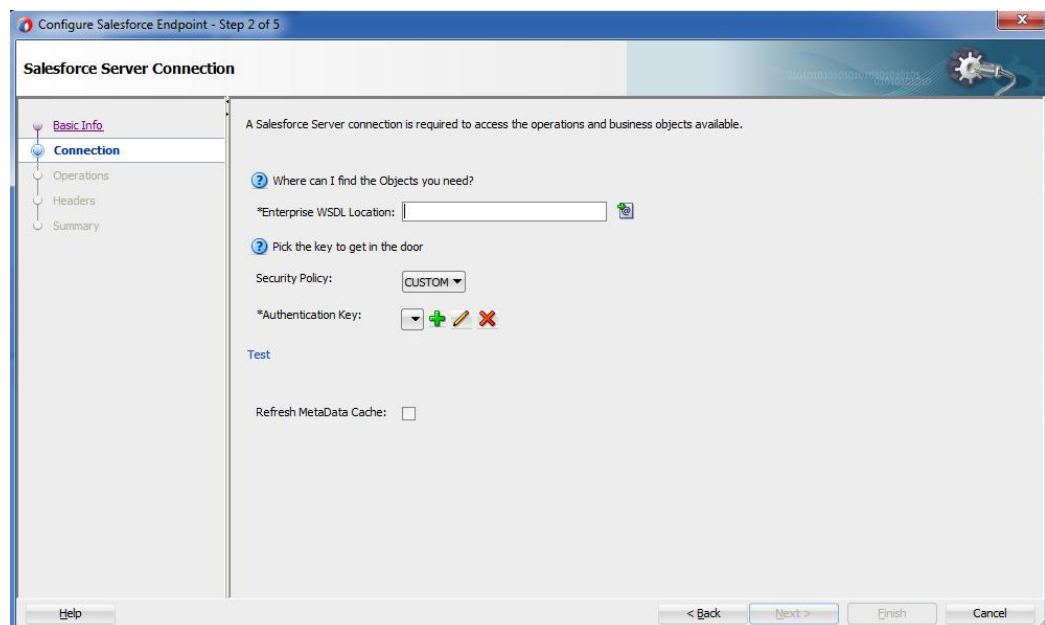

6. Click **OK**. The following screen appears as shown in [Figure 5-15](#).

Figure 5- 15 Localize Files Dialog

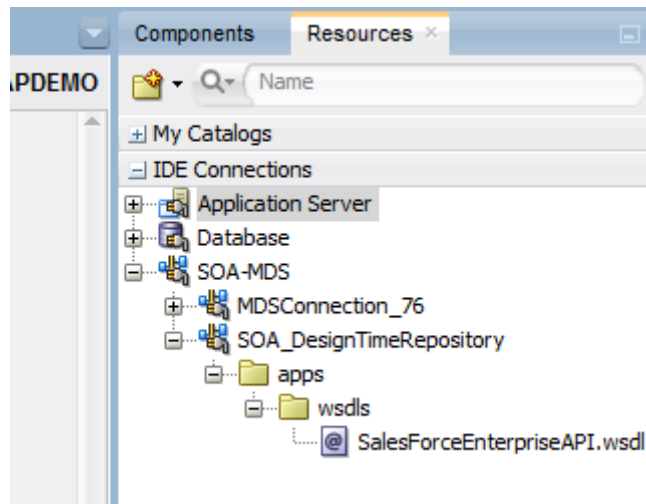

7. Click **OK**. You are returned to the Salesforce Cloud Server Connection page.

Figure 5- 16 Salesforce Cloud Server Connection Page

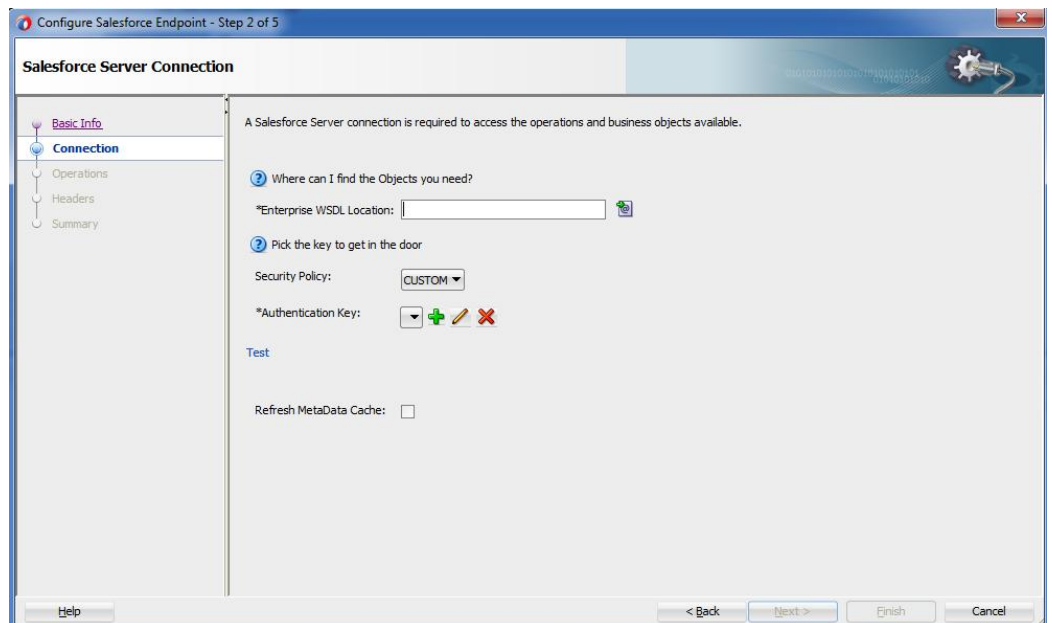

Note that as an alternative, you can store WSDL at an MDS location and access it, as shown in [Figure 5-17](#).

Figure 5-17 SOA Resource Browser

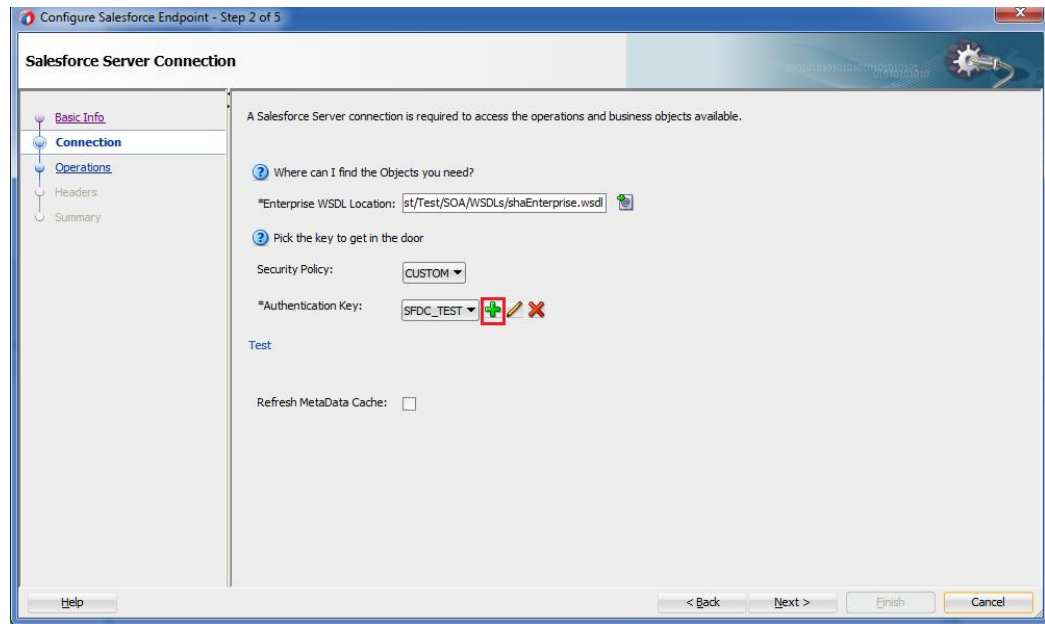

8. Traverse to IDE Connections → SOA-MDS. Select the appropriate SOA-MDS connection where you placed the Enterprise WSDL. Select the WSDL file to be used in the adapter configuration and click **OK**.
9. The WSDL location should be of the form 'oramds:/apps/SOA/WSDLs/Integration/SalesforceReference.wsdl', as shown in Figure 5-18.

Figure 5-18 WSDL location

10. Click **OK**.
11. Click “+” button to create a new Authentication Key, as shown in Figure 5-19.

Figure 5- 19 Create a New Authentication Key

12. The **Add Credential** dialog box is displayed, as shown in [Figure 5-20](#). Provide a suitable name and the Salesforce.com credentials and click **OK**.

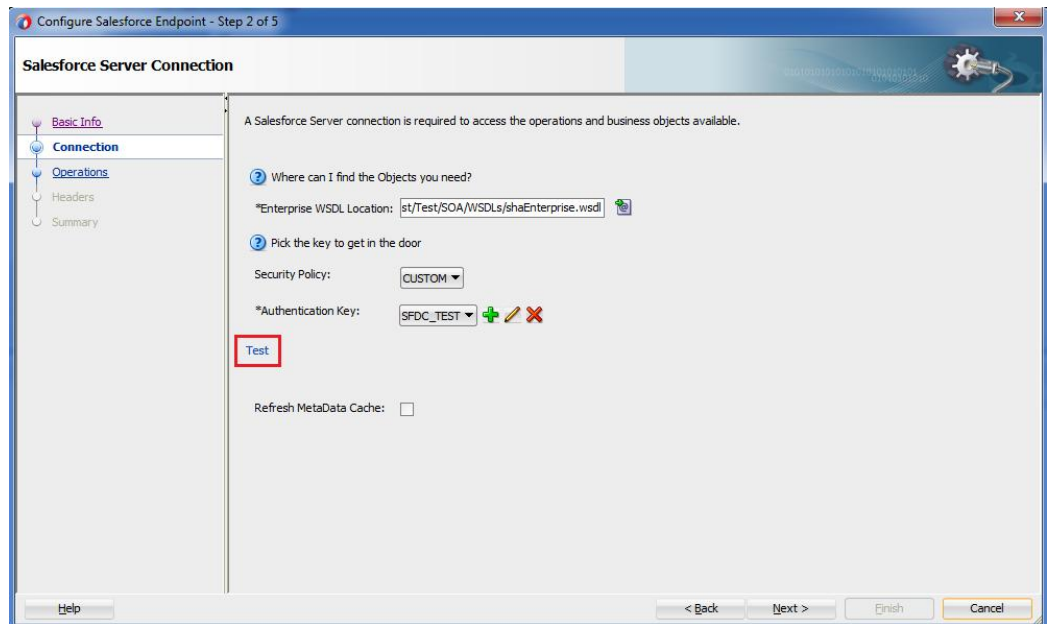

Note: The password should be a combination of Salesforce.com password and Salesforce.com Security Token.

Figure 5- 20 Add Credential

13. Click **Test Connection** button to validate the Authentication Key, as shown in [Figure 5-21](#).

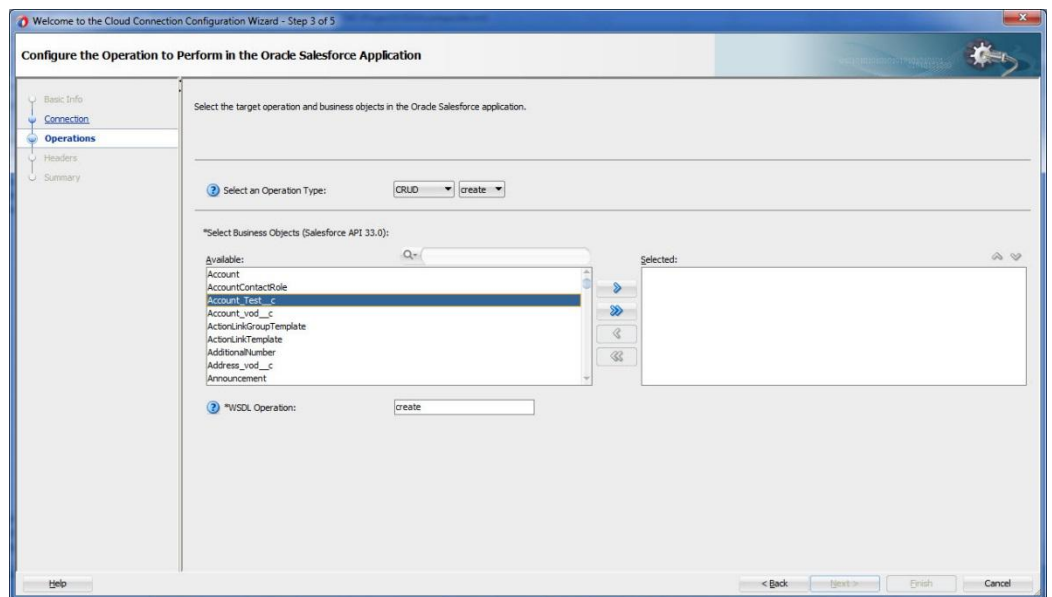

Figure 5-21 Test Connection

14. Click **Next**.

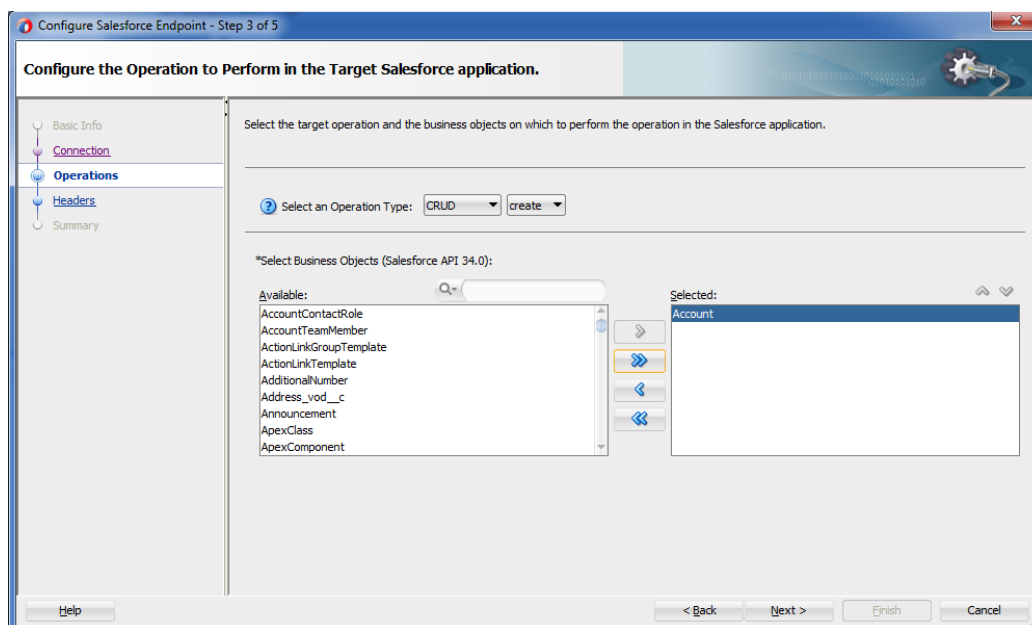

15. The **Cloud Operation Configuration** page is displayed, as shown in [Figure 5-22](#).

Figure 5-22 Cloud Operation Configuration Page

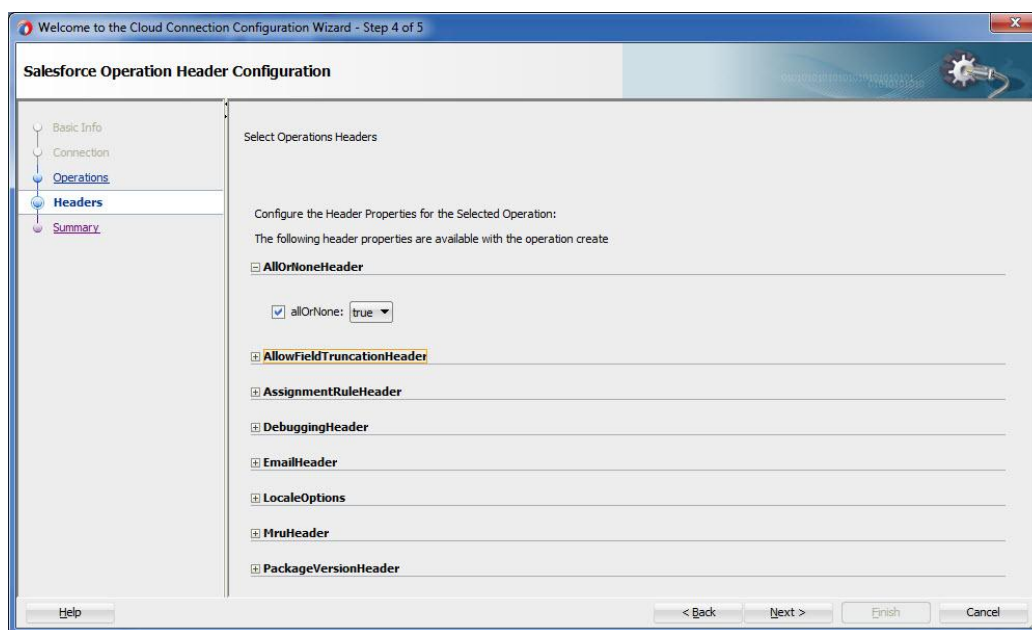

16. Since the scenario is to create an Account on Salesforce.com, select **Operation Category** as **CRUD** and **SFDC Operation** as **create**. Now move **Account** from the list of **Available** objects to the list of the **Selected** objects. The **WSDL Operation** by default is **create** (same as SFDC Operation). You can edit the same by providing an operation name suitable to your business requirement, as shown in [Figure 5-23](#).

Figure 5- 23 Cloud Operation Configuration Page

17. Click **Next**. The **Header and Properties** page is displayed, as shown in [Figure 5-24](#).

Figure 5- 24 Header and Properties Page

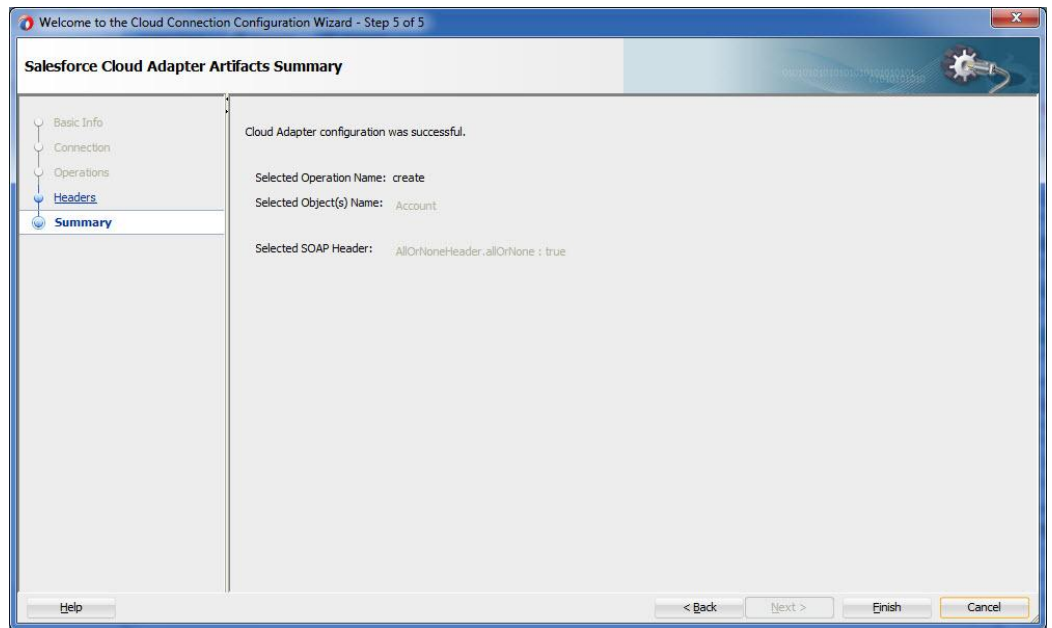

18. Select the appropriate header to your requirement. Headers displayed in this page depend on the operation selected in the previous page.

19. Click **Next**.

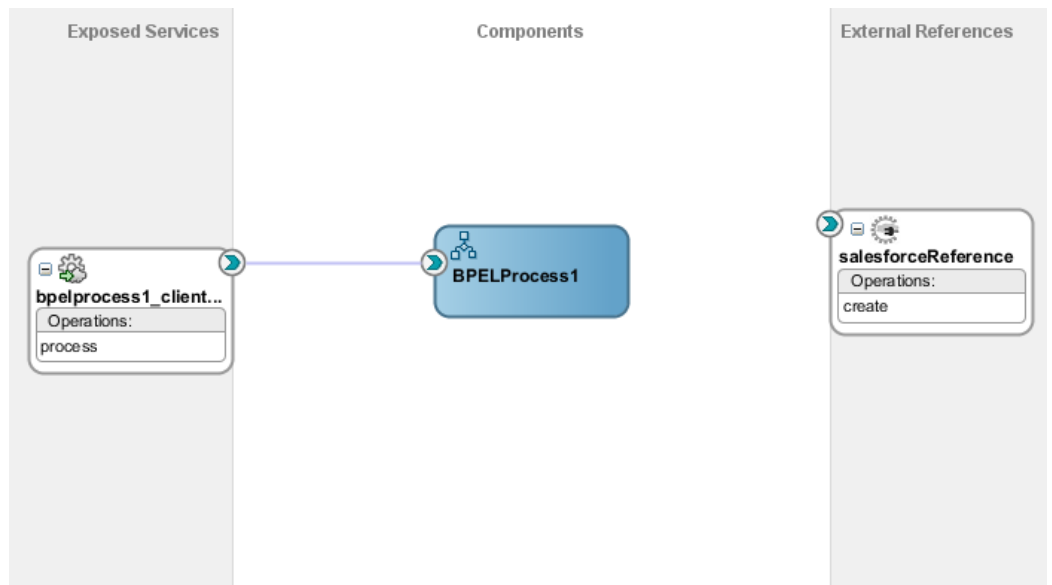

20. The finish page is displayed. It provides a complete summary of the operation selected, object on which the operation would operate and the headers selected for that operation, as shown in [Figure 5-25](#).

Figure 5-25 Finish Page

21. Click the **Finish** button to complete the Adapter Configuration Wizard.
22. After clicking on **Finish** button, the following screen appears, as shown in [Figure 5-26](#).

Figure 5-26 SFDC Cloud Account

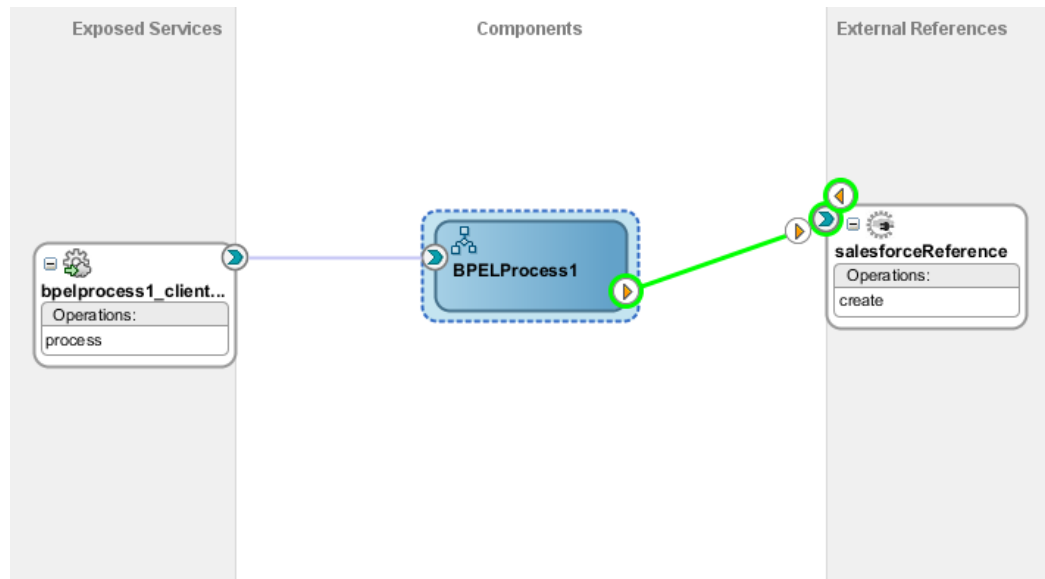

5.4 Integration with BPEL

Perform the following steps to integration with BPEL:

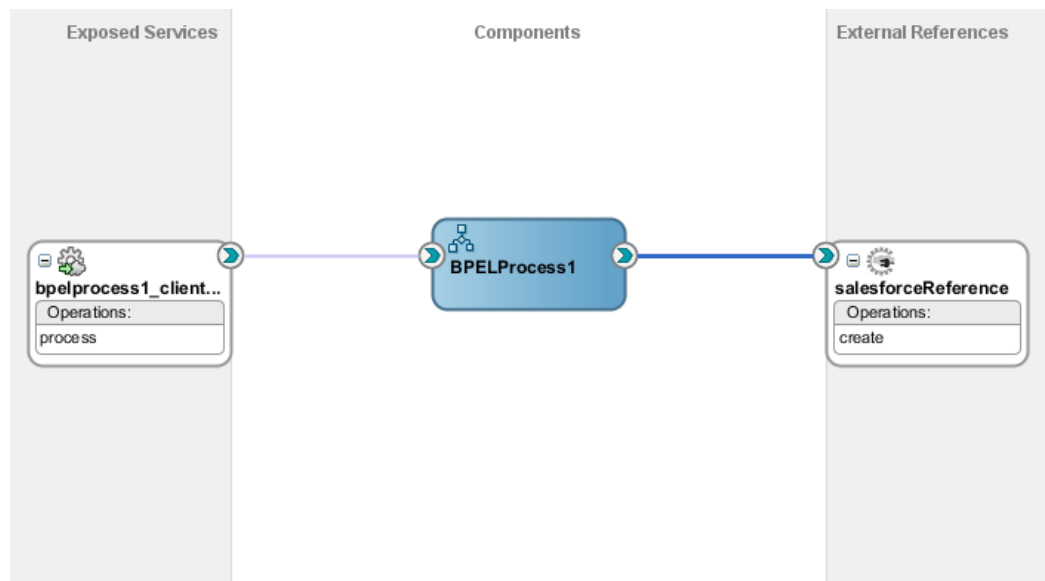

1. Connect **BPELProcess1** and **salesforceReference** via a wire, as shown in [Figure 5-27](#).

Figure 5-27 Wired BPELProcess1 and salesforceReference

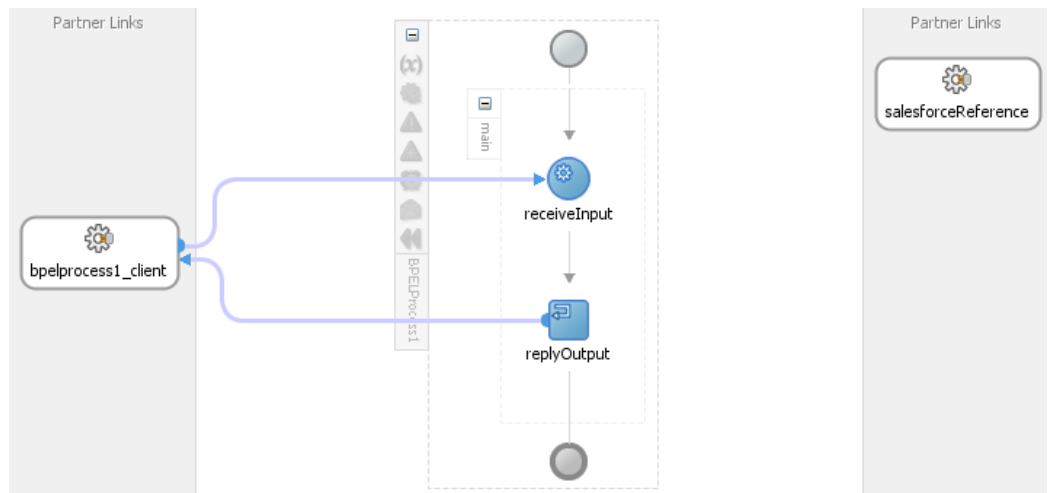

2. After wiring your composite looks like as shown in [Figure 5-28](#).

Figure 5-28 Wiring BPELProcess1 and salesforceReference

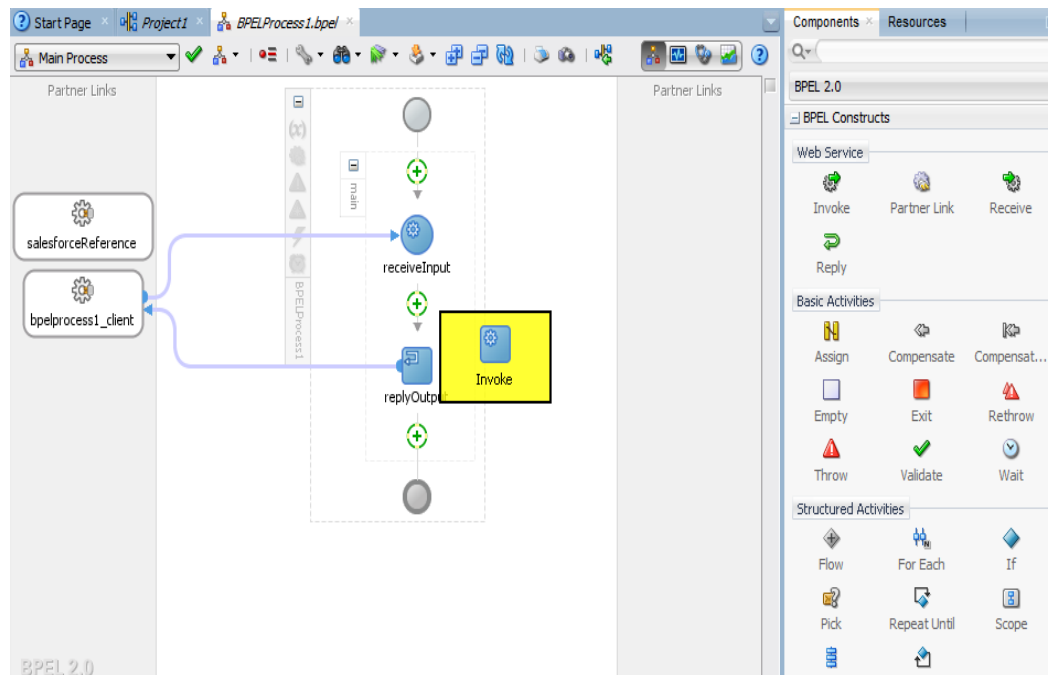

3. Double-click and open **BPELProcess1**. The salesforceReference adapter should be present as a part of the Partner Links, as shown in [Figure 5-29](#).

Figure 5-29 Open BPELProcess1

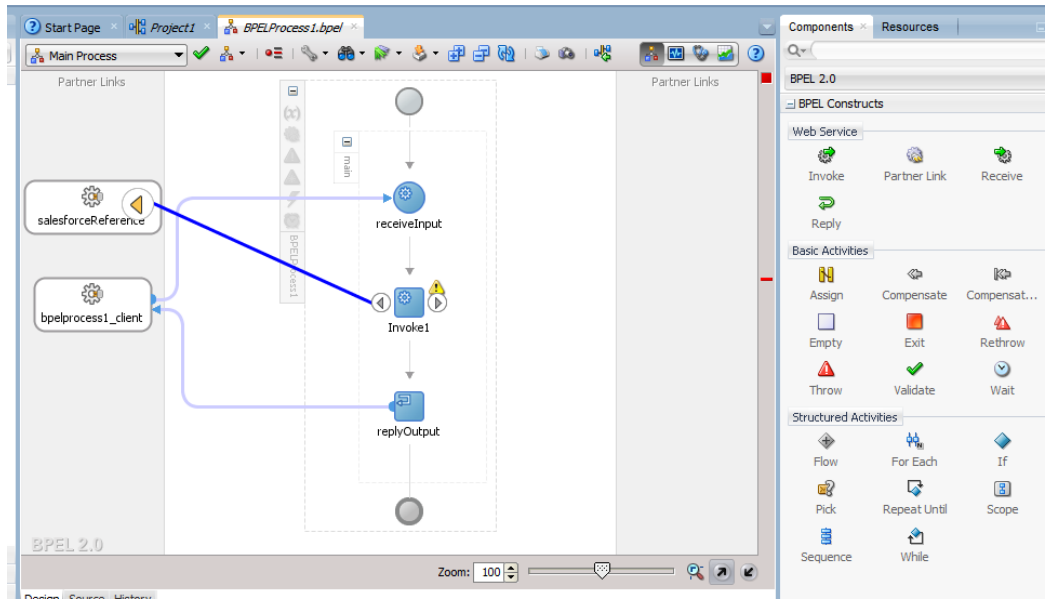

4. Add an invoke activity to invoke the salesforceReference Partner Link. To add the invoke activity, follow the below provided steps:
 - a) Drag and drop the invoke activity from the BPEL constructs, as shown in [Figure 5-30](#).

Figure 5-30 Add invoke activity to invoke the salesforceReference Partner Link

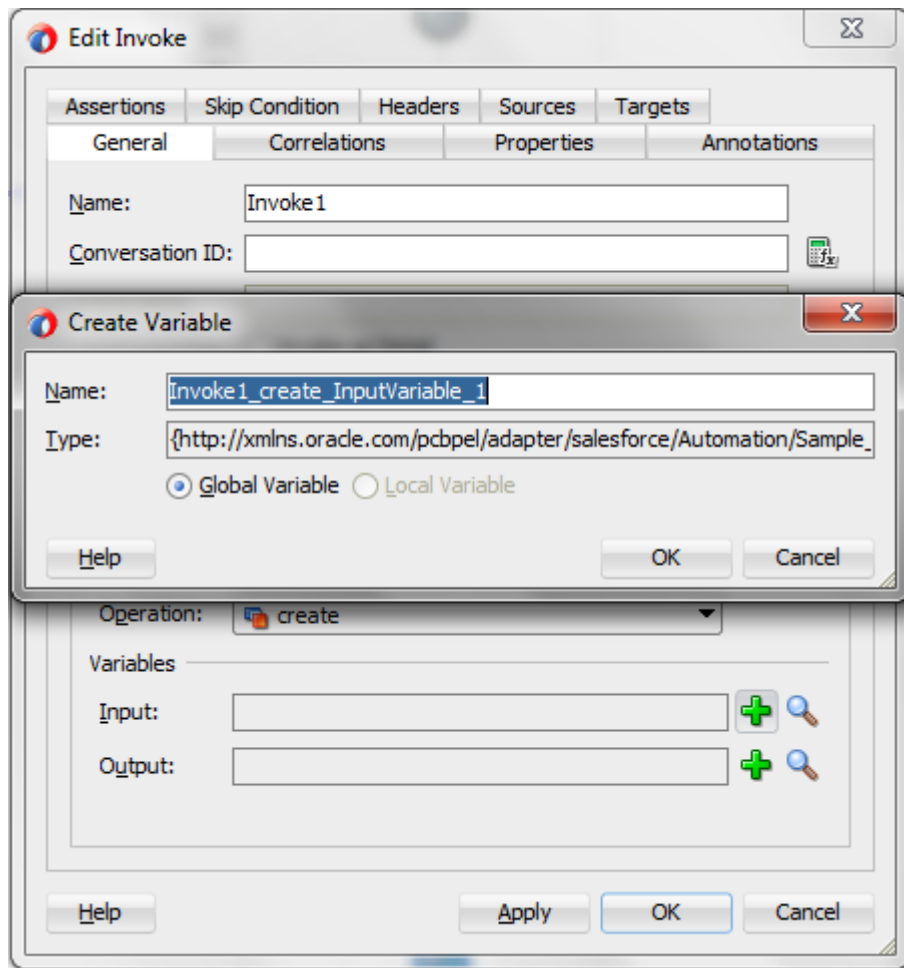

- b) After dropping the Invoke property, wire the invoke activity to the salesforceReference partner link. Now, the composite will appear as shown in [Figure 5-31](#).

Figure 5- 31 Composite Window

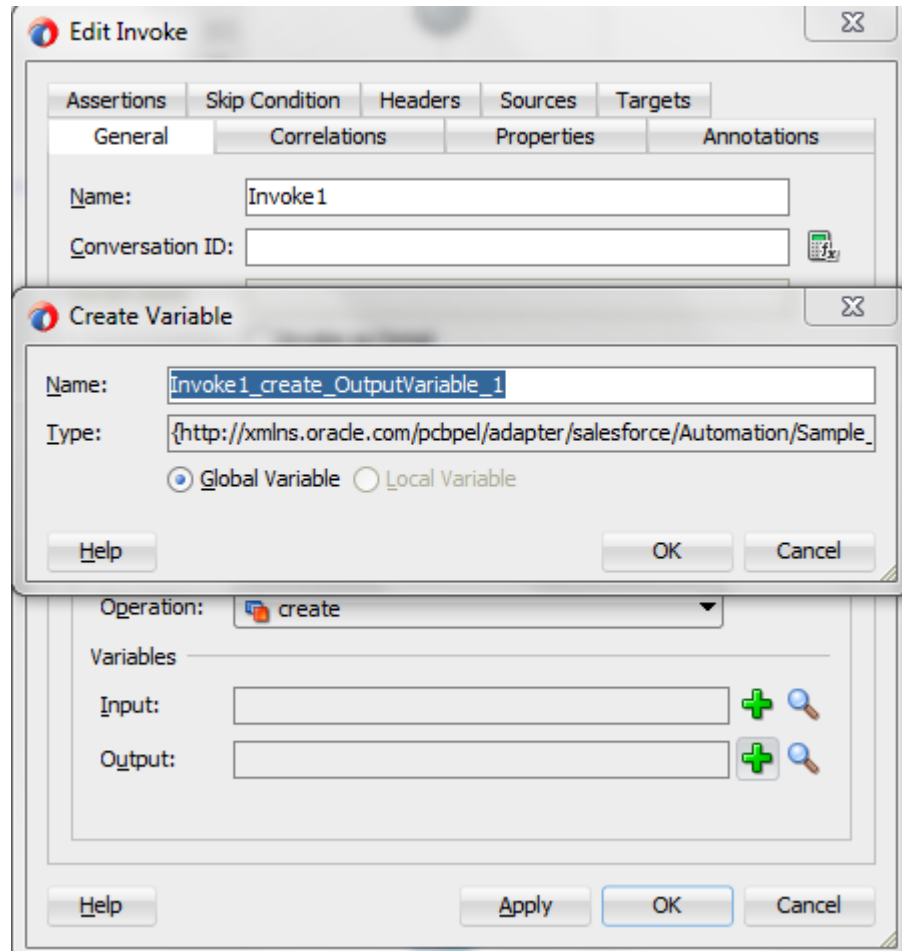

5. Create an input variable to the partner link by clicking the '+' button adjacent to **Input** text box in the **Variables** section. The **Create Variable** dialog is displayed, as shown in Figure 5-32.

Figure 5- 32 Create an Input Variable

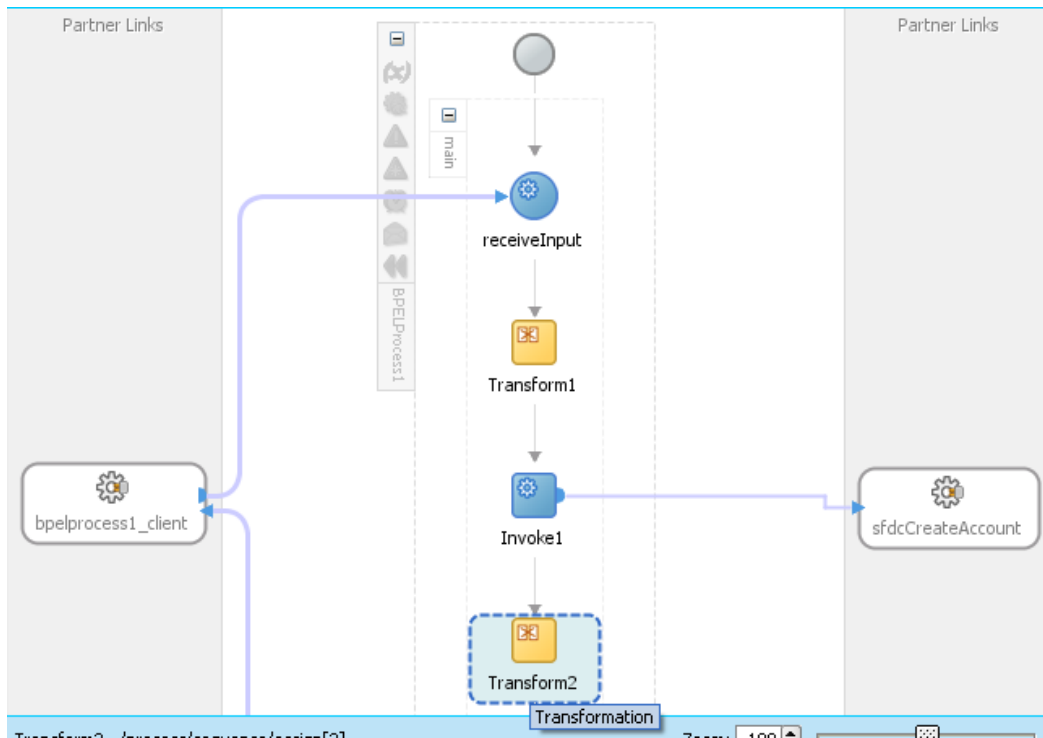

6. Create an output variable from the partner link by clicking the '+' button adjacent to **Output** text box in the **Variables** section. The **Create Variable** dialog is displayed, as shown in [Figure 5-33](#).

Figure 5-33 Create an Output Variable

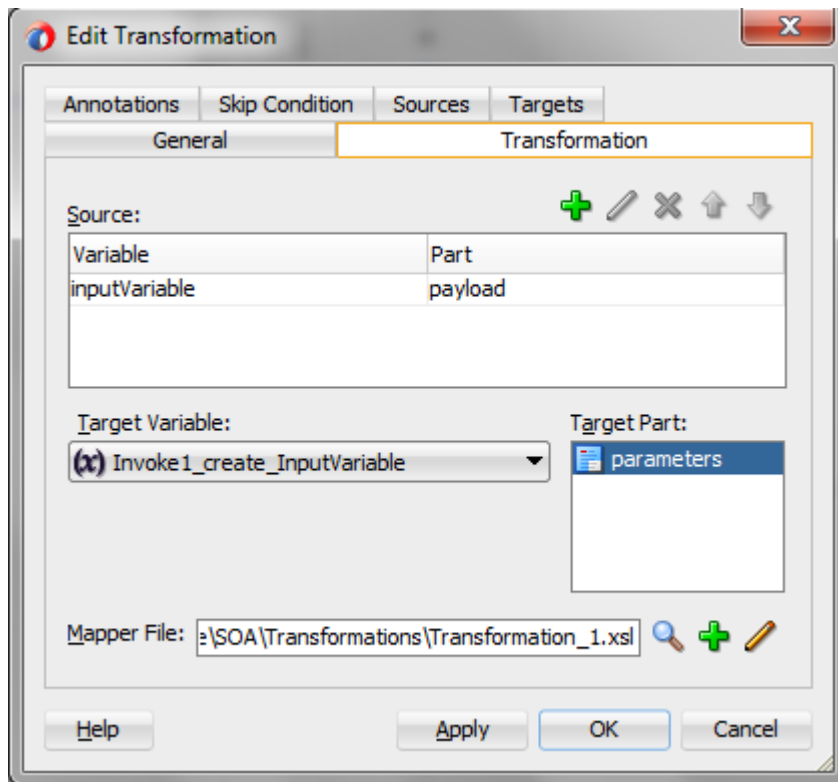

7. Introduce two transform activities, one prior to the invoke activity and another after it, as shown in [Figure 5-34](#).

Figure 5- 34 Transform Activities

8. Map Transform1 values from receive activity’s input variable to invoke activity’s input variable, as shown in [Figure 5-35](#).

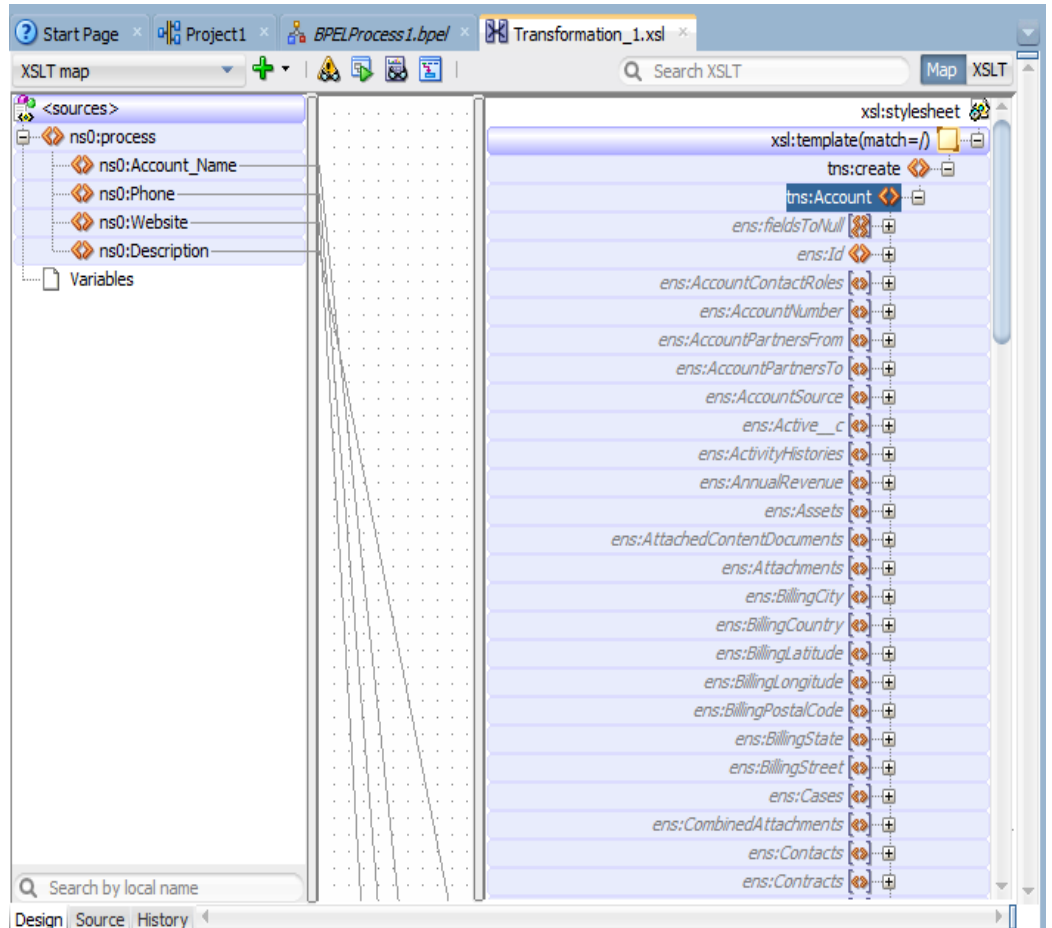

Figure 5- 35 Edit Transform

9. Click the ‘+’ button adjacent to **Mapper File** text box to open the **Transformation_1.xsl** file.
10. Perform the mapping between **inputVariable** and **Invoke1_create_InputVariable**:

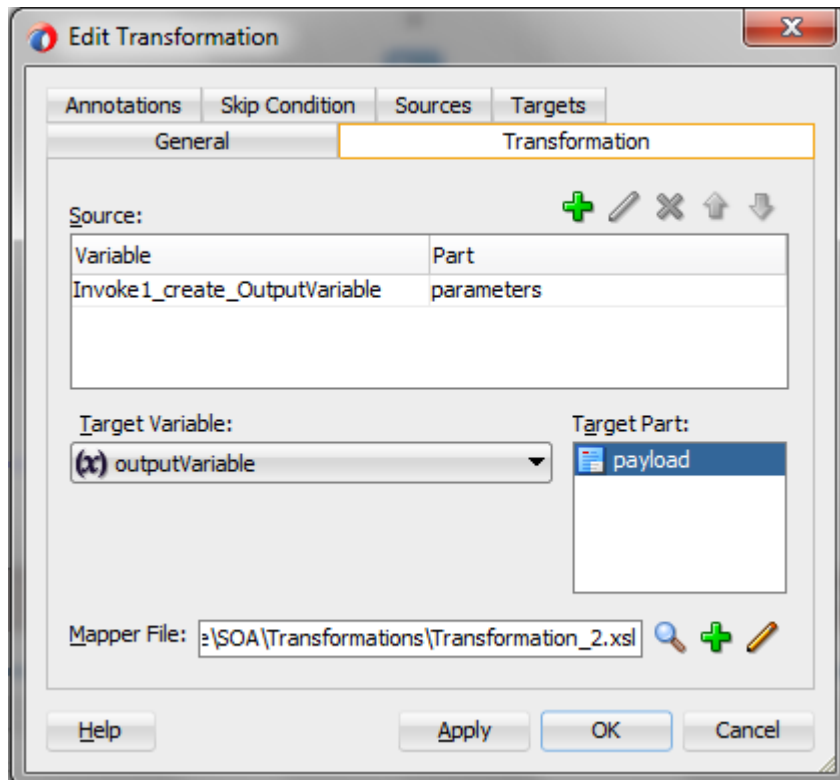

- Map Account_Name with Name.
- Map Phone with Phone.
- Map Website with Website.
- Map Description with Description, as shown in [Figure 5-36](#).

Figure 5-36 Mapping between inputVariable and Invoke1_create_inputVariable

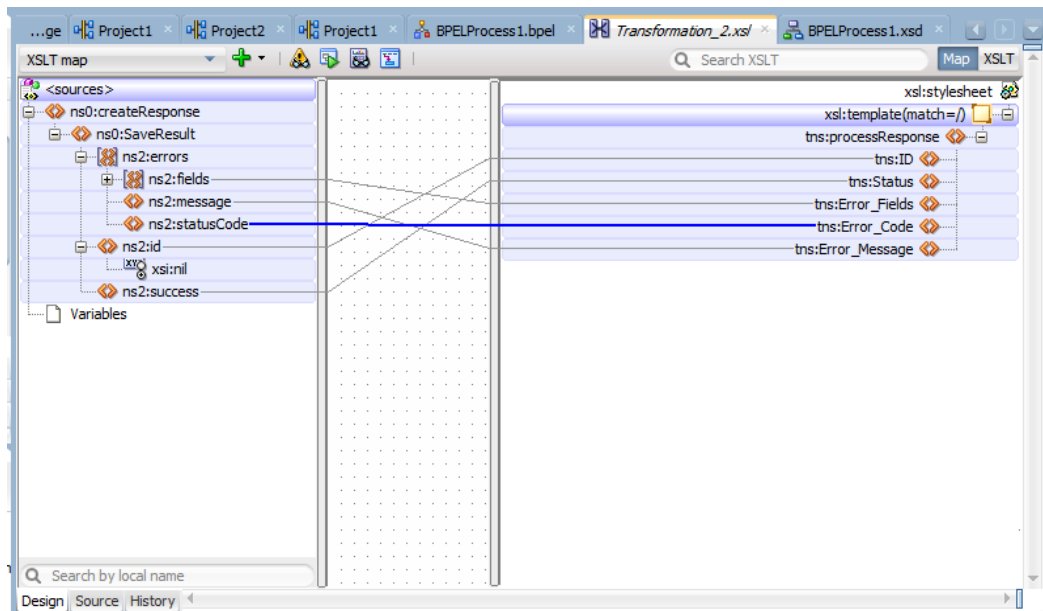

11. Map Transform2 values from invoke activity's output variable to reply activity's input variable, as shown in [Figure 5-37](#).

Figure 5- 37 Edit Transform

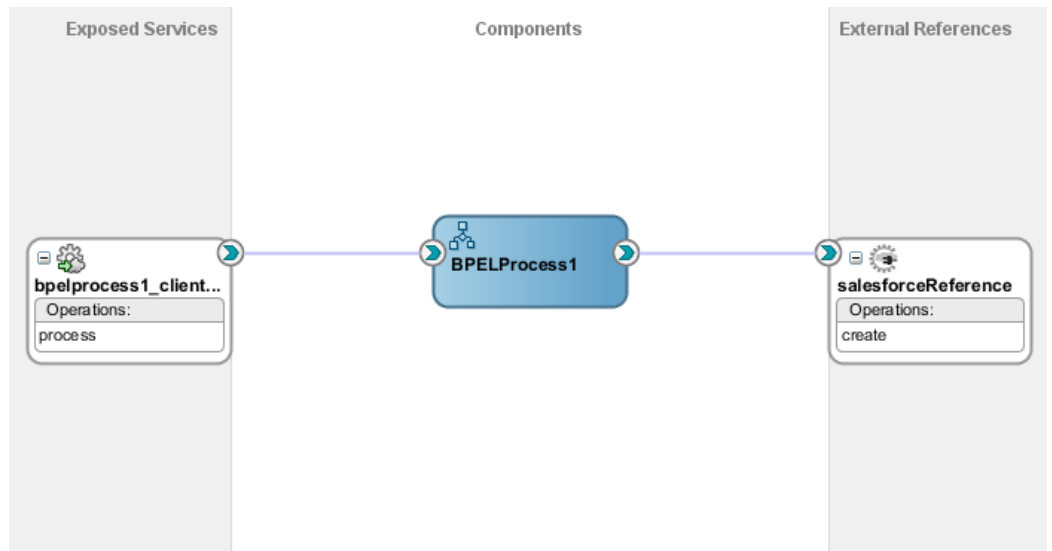

12. Perform the mappings for output variable, as shown in Figure 5-38.

Figure 5- 38 Mappings for Output Variable

13. This completes the project creation. The composite.xml looks, as shown in Figure 5-39.

Figure 5- 39 Composite.xml after Project Creation

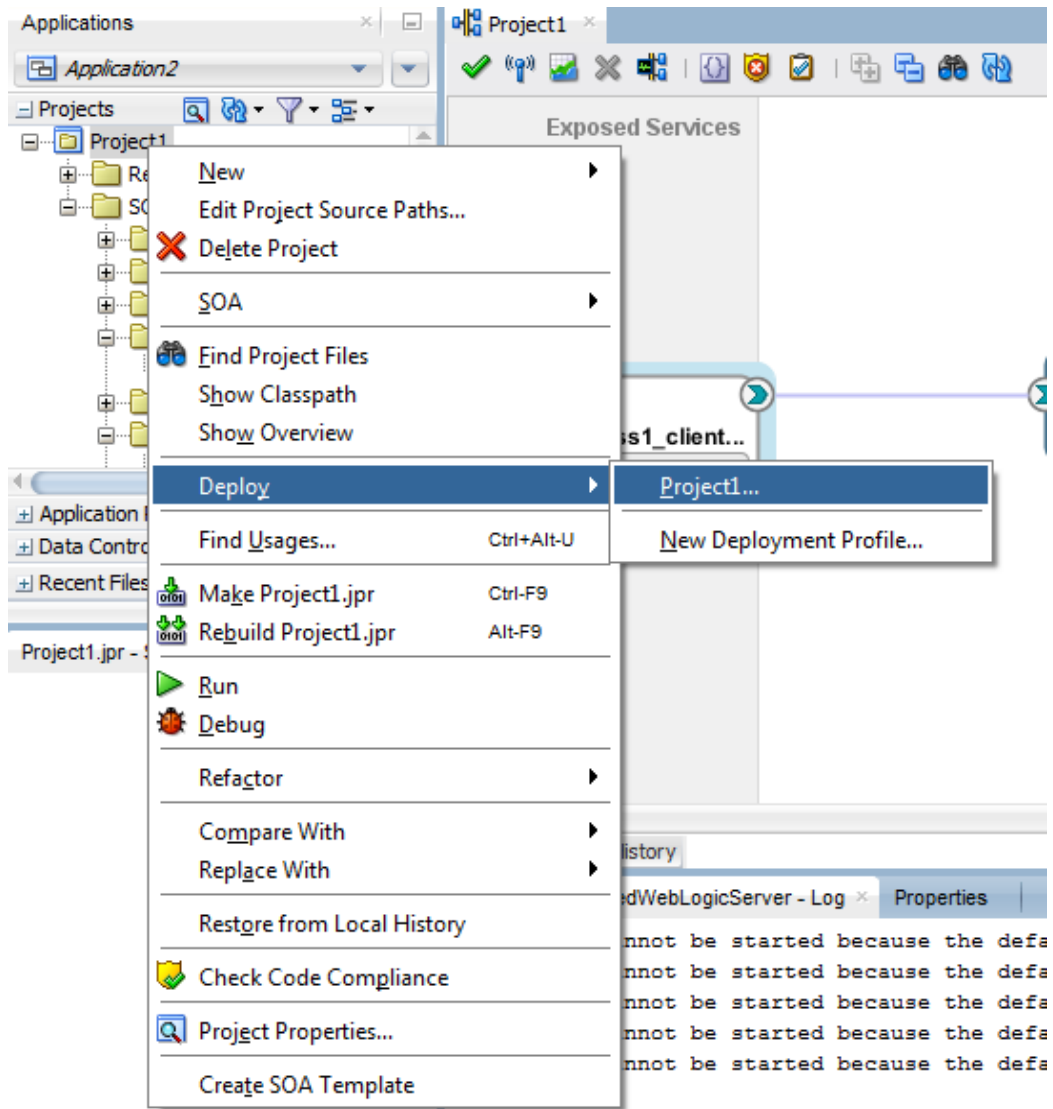

5.5 Deploy the Composite

Perform the following steps to deploy the composite.

1. In the **Application Navigator** pane, right-click **Project1** and select Deploy → Project1, as shown in [Figure 5-40](#).

Figure 5- 40 Deploy the Composite

2. Select the **Deploy to Application Server** option and follow the instructions. Using this option, you can deploy the composite on the Application server after providing the details of the server.

5.6 Test the Composite

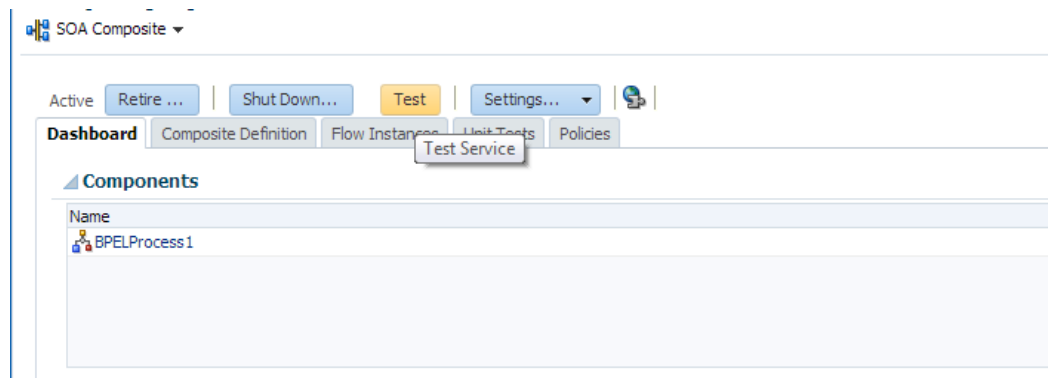

You can run and test the instances of deployed SOA composite applications from Oracle Enterprise Manager Grid Control Console. This enables you to manage a composite application, initiate and track an instance of a composite and to view detailed component instance audit trails. Perform the following process to test the composite:

5.6.1 Test the Outbound Process

Perform the following steps to test the Outbound process:

1. Login to Enterprise Manager Console for the server on which you have deployed your project.
2. Open **Project1** under the **Default** partition.
3. Click the **Test** button to test the Web service, as shown in [Figure 5-41](#).

Figure 5-41 Test the Web Service

4. Provide the input payload and click the **Test Web Service** button, as shown in [Figure 5-42](#).

Figure 5-42 Test Web Service

5. After successful execution, the response contains ID of the account created on Salesforce.com and **Status** as success, as shown in [Figure 5-43](#).

Figure 5-43 Test Status

6. Click the **Launch Flow Trace** button to view the **Audit Trail**, as shown in [Figure 5-44](#).

Configuring Processes Using Oracle Service Bus

Oracle Service Bus (OSB) make use of the Oracle Cloud Adapter for Salesforce.com via the Oracle SOA Suite components and JDeveloper IDE. This chapter describes the process of creating OSB projects using JDeveloper IDE or using OSB console, deploying the OSB services to an OSB domain, and finally testing the OSB services.

This chapter contains the following topics:

- [Section 6.1, "Overview of Application Adapter Integration with Oracle Service Bus"](#)
- [Section 6.2, "Creating Outbound Processes Using Oracle Service Bus"](#)
- [Section 6.3, "Testing OSB project from Service Bus Console"](#)
- [Section 6.4, "Configuring Processes using OSB Modelling Console"](#)

6.1 Overview of Application Adapter Integration with Oracle Service Bus

Oracle Service Bus can be leveraged to access the APIs exposed by Salesforce.com to achieve application integration via the Oracle Cloud Adapter for Salesforce.com. OSB uses the Oracle SOA Suite components and JDeveloper to employ the Oracle Cloud Adapter for Salesforce.com. This chapter will use the same business case of creating an Account in Salesforce.com as in Chapter 5:

[Integration with Different Service Components \(BPEL/Mediator\) in Oracle SOA Suite.](#)

6.2 Creating Outbound Processes Using Oracle Service Bus

Oracle Service Bus interacts with the Oracle Cloud Adapter for Salesforce.com through the 'Oracle Cloud Adapter for Salesforce.com Artifacts' generated using the SOA components. This section describes the process of generating the Oracle Cloud Adapter for Salesforce.com artifacts and creating OSB services based on these artifacts.

Oracle Service Bus provides two ways of designing OSB projects. One is JDeveloper IDE, and second option is to create projects and services directly on the Oracle Service Bus console. This chapter explains both ways of creating OSB projects and services.

6.2.1 Creating OSB Projects Using OSB Console

This section explains how to create OSB projects using OSB console. For this you first need to generate Oracle Cloud Adapter for Salesforce.com artifacts using JDeveloper 12c, and then those artifacts would be used while creating OSB projects and services using OSB console.

For information on how to test the OSB projects created using OSB console, refer to the section “[Testing OSB project from Service Bus Console](#)”.

Generating Oracle Cloud Adapter for Salesforce.com Artifacts:

To create OSB projects using OSB Console, you need to use Oracle Cloud Adapter for Salesforce.com artifacts generated using JDeveloper 12c.

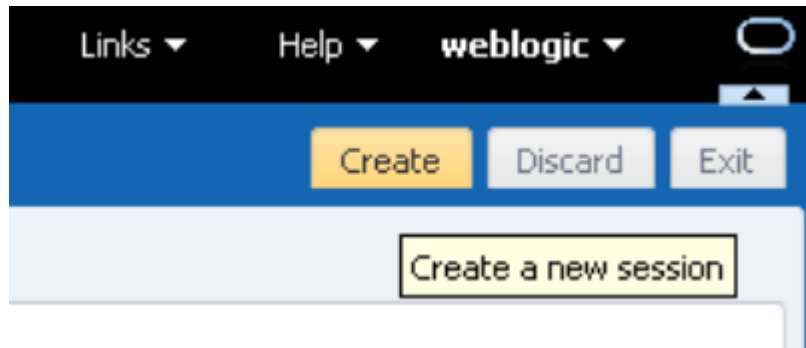

To create a BPEL composite, refer to the section “[Designing a Composite for Service Integration](#)”. Next, to configure the Oracle Cloud Adapter for Salesforce.com, refer to the section “[Configure Oracle Cloud Adapter for Salesforce.com](#)”. Save the Oracle Cloud Adapter for Salesforce.com artifacts in a directory. You will use the artifacts generated in section 5.4 “[Configure Oracle Cloud Adapter for Salesforce.com](#)” in creating OSB business services in OSB console.

Creating OSB projects and services using the OSB console:

Follow the steps given below to create OSB projects and services using the OSB console.

1. Log in to OSB Console: `<host:port/sbconsole>`
2. On right side of webpage, click on **Create**, as shown in the Figure below. This opens a new session in the OSB console to enable you to make changes.

Figure 6- 1 Create an OSB Session

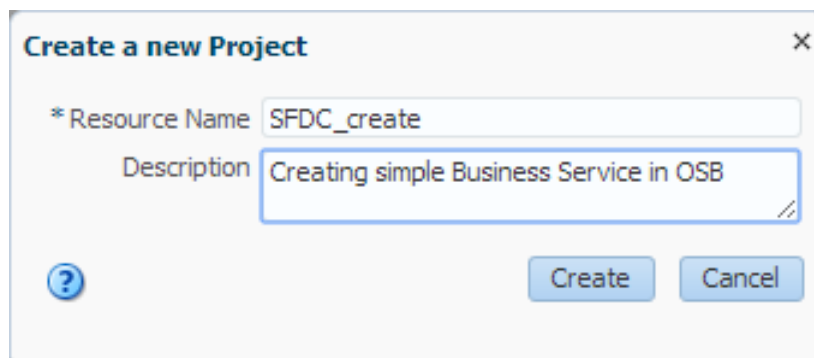

3. Enter a new project name, right-click on **All Projects** and click **Create - Project**, as shown in the Figure below.

Figure 6-2 Add a New Project to OSB

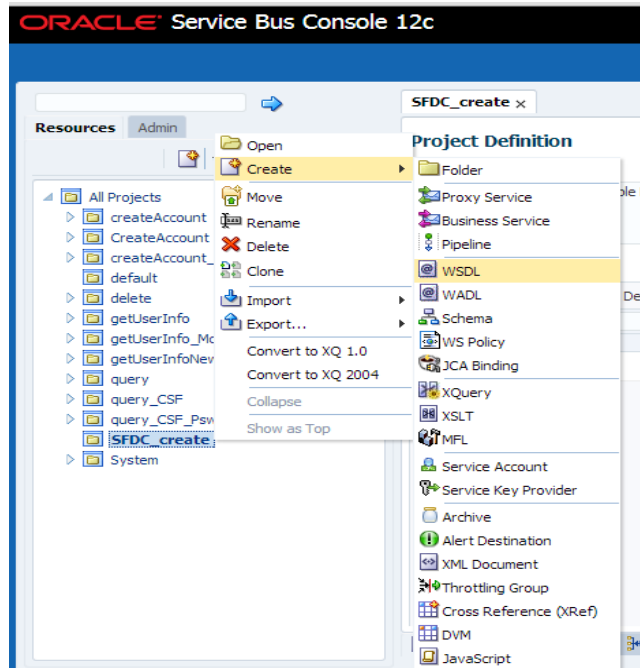

4. A dialog box will appear with title **Create a new project**.
5. Enter the project name in the **Resource Name** field, and provide the description in **Description** field, as shown in the Figure below.

Figure 6-3 Create a New Project

6. Click on **Create**. A new project named SFDC_Create appears in under **All Projects**.
7. Import the Oracle Cloud Adapter for Salesforce.com artifacts in this project. Right-click on the Project name, Select **Create** and then **WSDL** as shown in the Figure below.

Figure 6-4 Choose WSDL Resource

8. WSDL Creation Page is displayed. Click on **Browse** and browse to the directory where the artifacts received from the JDeveloper 12c are stored. Choose the Oracle Cloud Adapter for Salesforce.com WSDL, as shown in the Figure below.

Figure 6-5 Create WSDL

9. Click **Create**.
10. Again right-click on the Project name, from the menu select **Create** and then **WSDL**. Now on the WSDL Creation Page, browse for salesforceReference WSDL as shown in the Figure below.

Figure 6-6 Create WSDL

11. Click **Create**.
12. Select **JCA Binding** from the **Create** drop-down list under **Project Name**, as shown in the Figure below.

Figure 6-7 Select JCA Binding from Create Resource list

13. The JCA Binding creation dialog box is displayed. Click on **Browse** and browse to the directory where the artifacts received from the JDeveloper 12c are stored. Choose the Oracle Cloud Adapter for Salesforce.com JCA file, as shown in the Figure below.

Figure 6-8 Create Adapter JCA Binding

14. Click **Create**. You are returned to the project page.
15. You may get an error message as “The JCA Binding ‘salesforceReference_salesforce’ was successfully created with validation errors. View the JCA Binding/Conflicts to see detailed diagnostic messages.” This error is thrown because JCA binding cannot find the associated WSDL.
16. To rectify the above error, click on the JCA file created and then click on **Edit**.
17. Click **Browse**. Search for the WSDL you created and click **Submit** after choosing the WSDL, as shown in the Figure below.

Figure 6- 9 Edit JCA Binding References

18. Click **Save**.
19. Go back to the project folder.
20. Right-click on the JCA Binding just created, and click on “Generate WSDL and Service” option as shown in the Figure below.

Figure 6- 10 Generate WSDL and service from JCA Binding

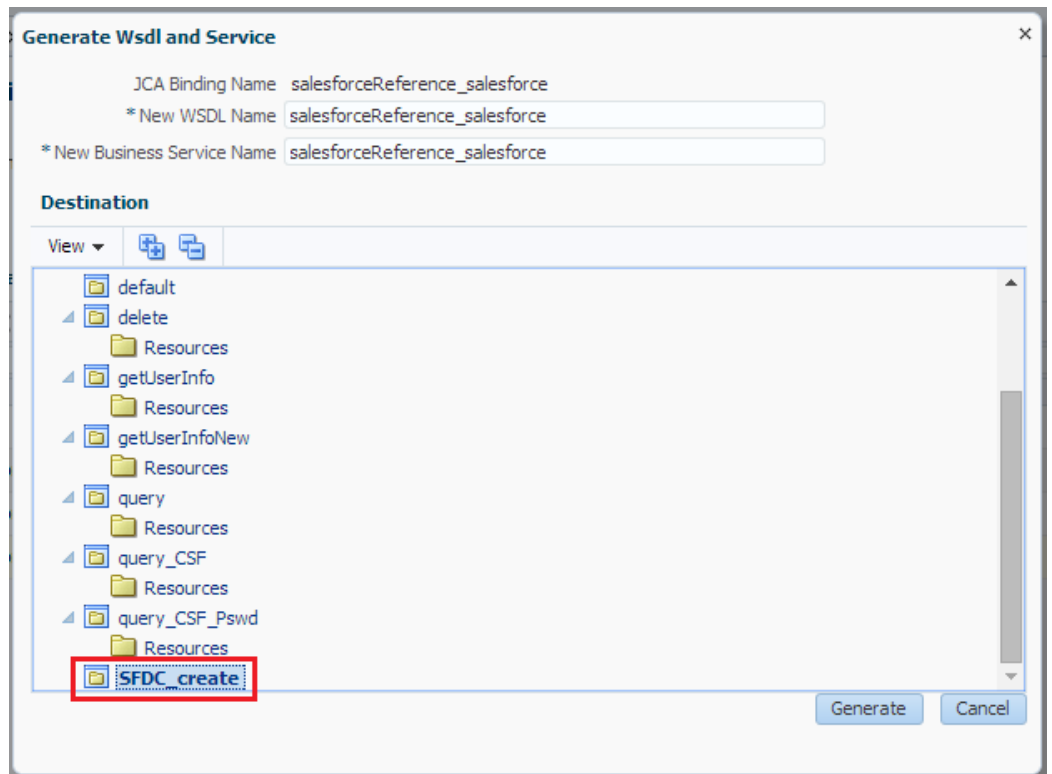

21. Enter a new name for the WSDL name in the **New WSDL Name** field and the service name in the **New Service Name** field.

Note: Choose the correct location for the new WSDL and service to be generated.

22. Click **Generate**, as shown in the Figure below.

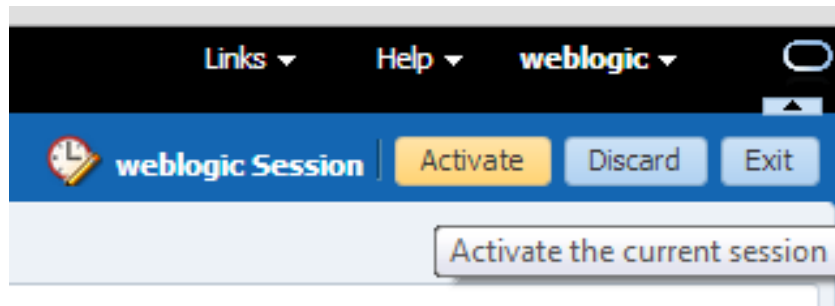

Figure 6-11 Generating WSDL and Business Service for Salesforce

23. The new WSDL and the new business service are generated.

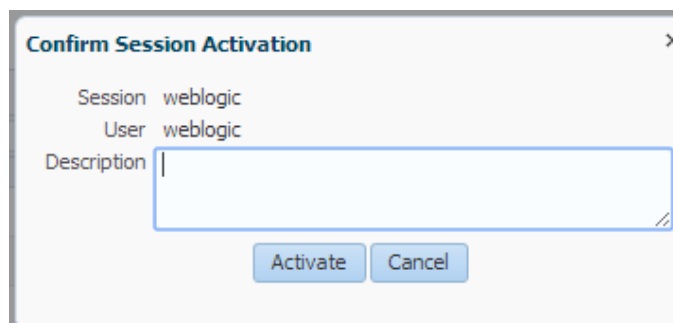

24. Activate the OSB session by clicking on **Activate** in the right corner, as shown in the Figure below.

Figure 6-12 Activate Session

25. A **Confirm Session Activation** dialog box will appear. Click on **Activate** to activate the session as shown in the Figure below.

Figure 6-13 Confirm Session Activation

Click **Activate** on the Activate Session page. Once the session is activated, all the generated artifacts and the services are deployed to the OSB server.

6.2.2 Creating OSB Projects Using JDeveloper

This section explains how to create OSB projects using JDeveloper 12c. It includes creating an empty composite for OSB, then defining an OSB outbound process and finally deploying that OSB project on server.

6.2.2.1 Create an Empty Composite for OSB

Perform the following steps to create an empty composite for OSB:

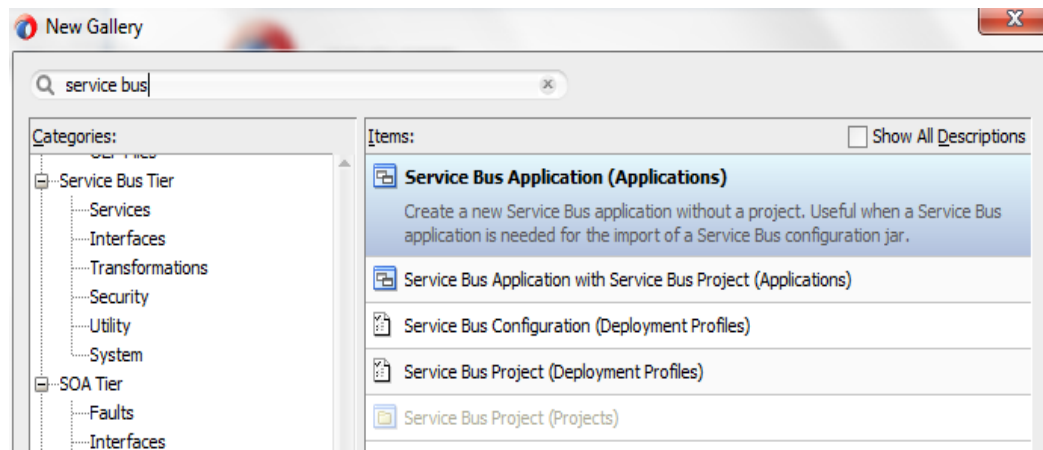

1. Create a new OSB application, Select **File** → **New** → **Application**, as shown in the Figure below.

Figure 6- 14 *New Application Page*

The New Gallery page is displayed as shown in [Figure 6- 14](#).

Figure 6- 15 *Choose Application*

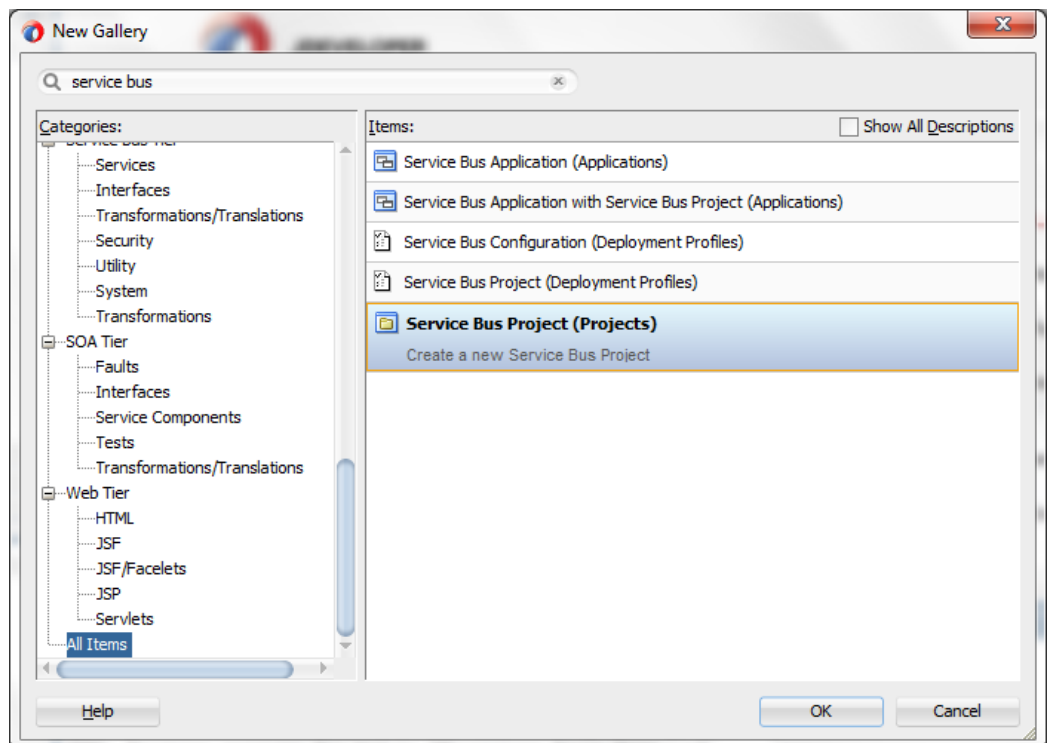

2. Enter a name for the new SOA Application and click **Finish**, as shown in the Figure below.

Figure 6- 16 Name Your Application

3. Create a new OSB application, Select **File** → **New** → **Project**, as shown in the Figure below.

Figure 6- 17 Create a new Project

4. The Name Your Project page is displayed, as shown in the Figure below.

Figure 6- 18 Name Your Project

5. Click **Finish**.

6.2.2.2 Define an OSB Outbound Process

This section describes how to define an OSB outbound process for the Salesforce.com integration using Oracle Cloud Adapter for Salesforce.com, which consists of the following stages:

1. Configure a Salesforce Adapter Component.
2. Configuring an Outbound OSB Process Component.

Configure a Salesforce Adapter Component

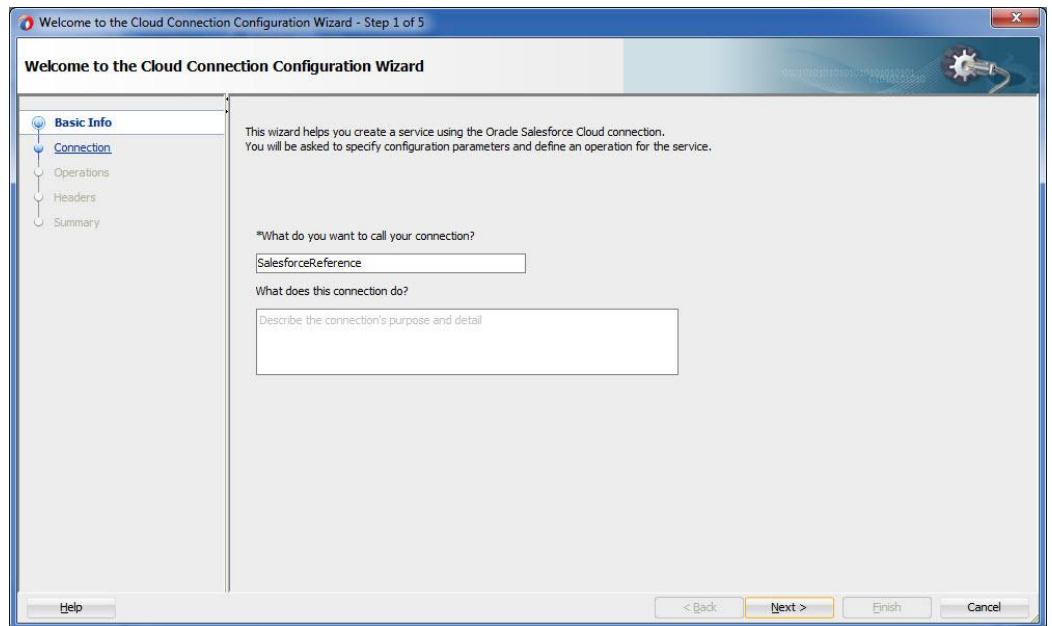

1. Open JDeveloper.
2. Drag and drop the Salesforce Adapter component from the **Resources Components** pane to the **External Service** pane, as shown in the Figure below.

Figure 6-19 Salesforce Adapter Configuration Wizard

The **Welcome** page of the Adapter configuration wizard is displayed, as shown in the Figure below.

Figure 6-20 Welcome Page

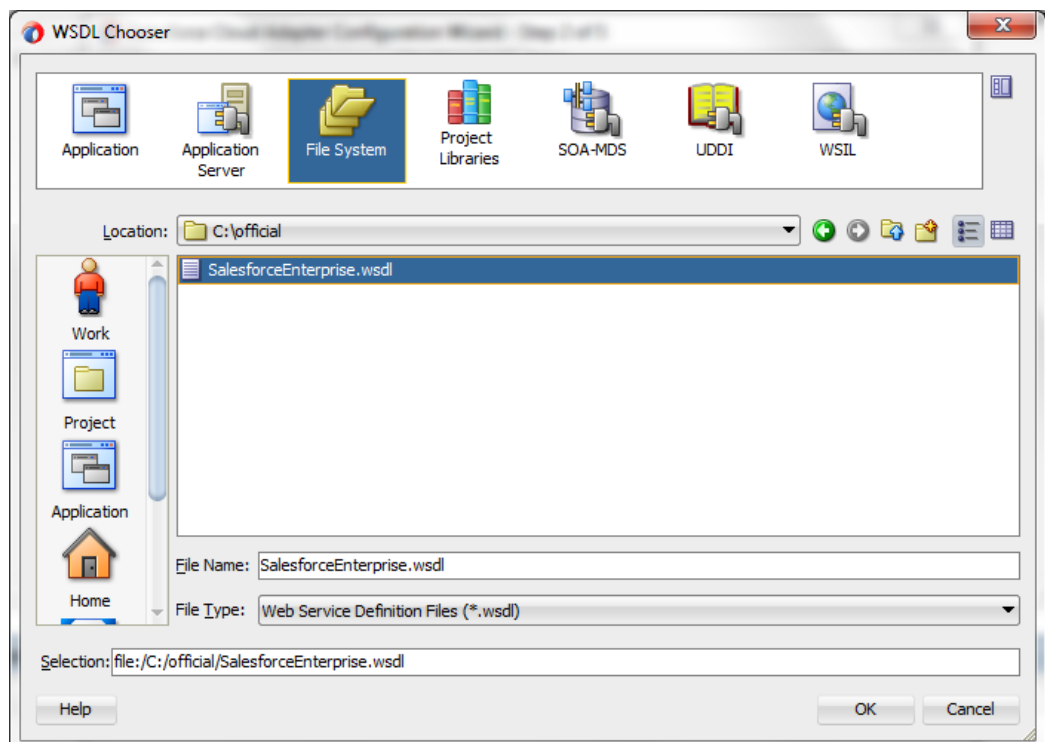

3. Enter a reference name for the Salesforce Adapter reference in the **Name** field and then click **Next**.
4. On the Connection Information page, browse for the Enterprise WSDL location by clicking on the browse button  as shown in the Figure below.

Figure 6- 21 Connection Page

5. The **WSDL Chooser** dialog is displayed. Browse and select the downloaded Enterprise WSDL and click **OK**, as shown in the Figure below.

Figure 6- 22 SOA Resource Browser

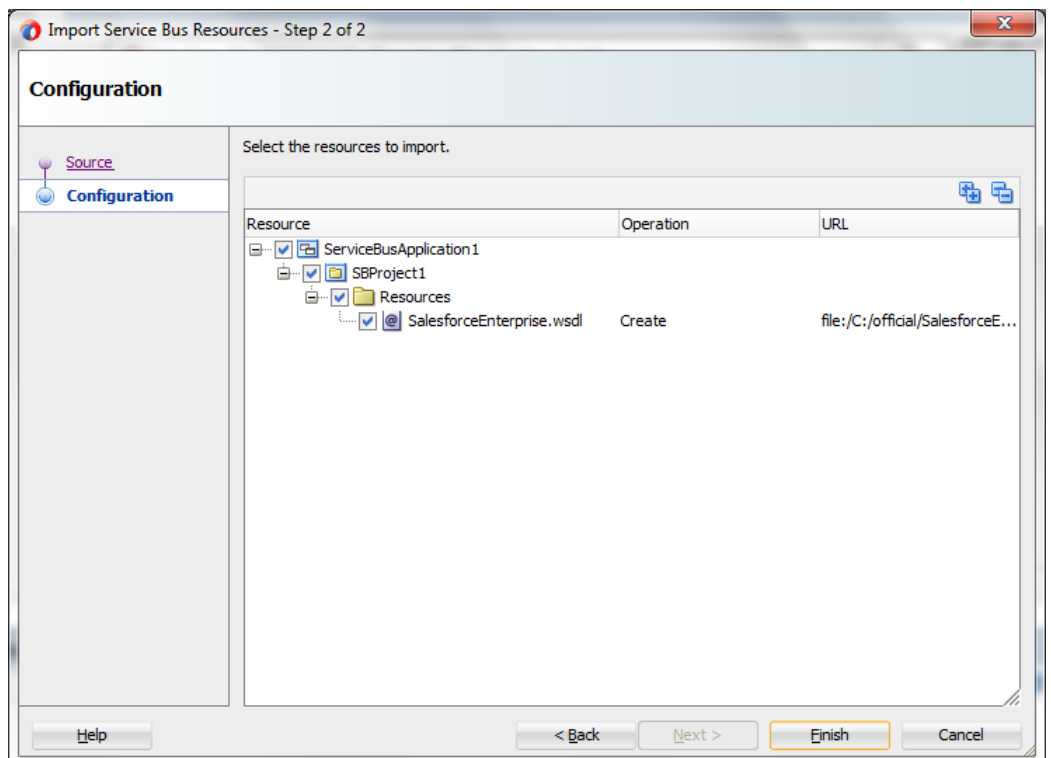

6. Click **OK**. The following screen appears as shown in the Figure below.

Figure 6-23 Import Service Bus Resources

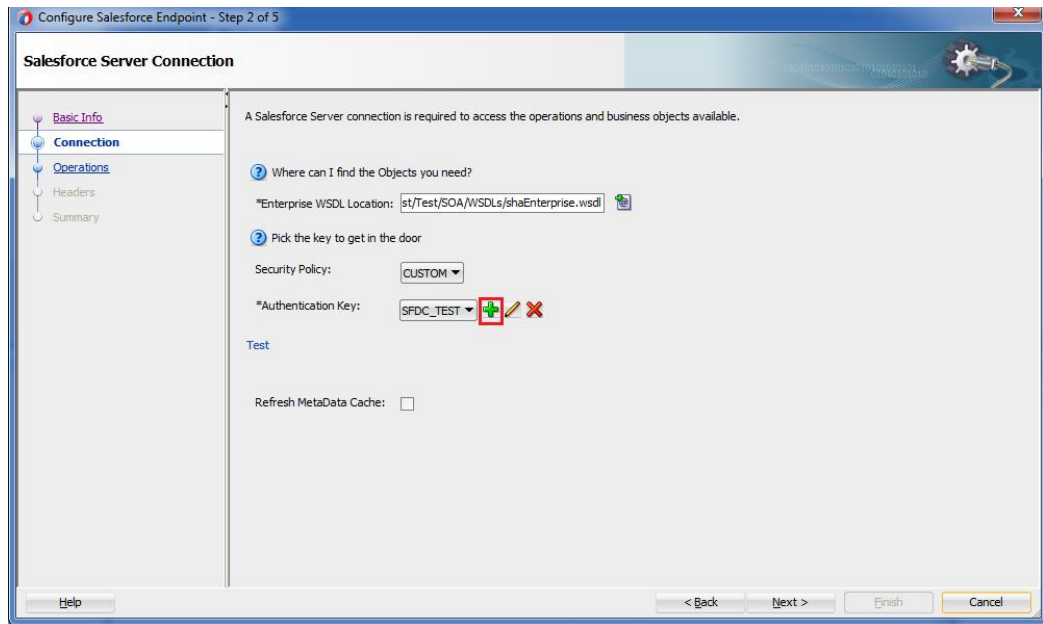

7. Click **Next**. The following screen appears as shown in the Figure below.

Figure 6-24 Import Service Bus Resources

8. Click **Finish**. You are returned to the Salesforce Cloud Server Connection page.

Figure 6- 25 Connection Page

9. Select an authentication key from the dropdown, if available, or create a new Authentication key by clicking on “+” button.
10. The **Add Credential** dialog box is displayed, as shown in the Figure below. Provide a suitable name and the Salesforce.com credentials and click **OK**.

Note: The password should be a combination of Salesforce.com password and Salesforce.com Security Token.

Figure 6- 26 Add Credential

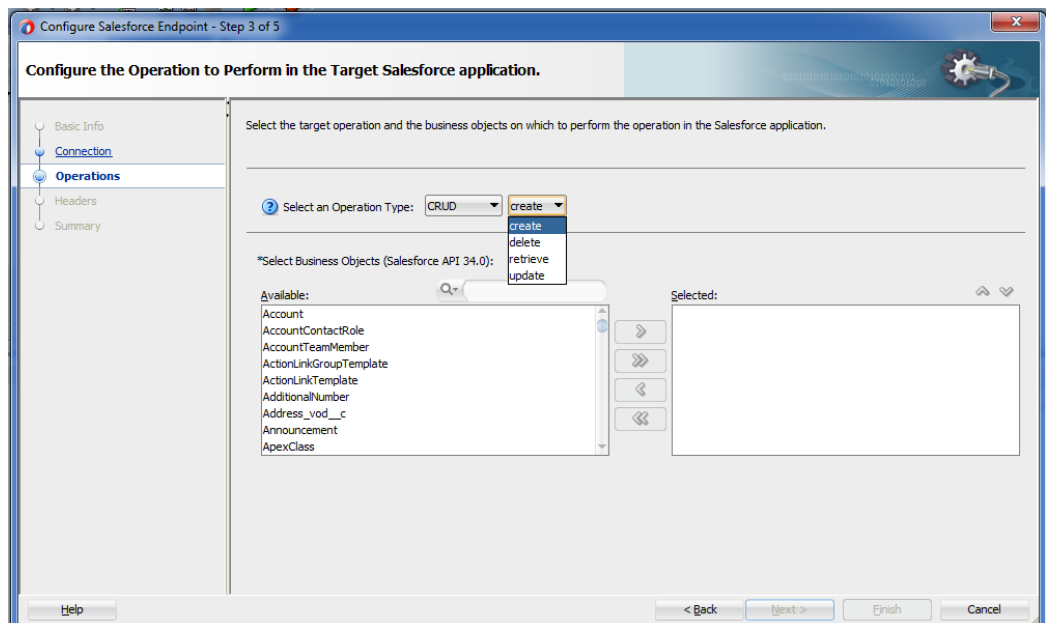

11. Click **Test Connection** button to validate the Authentication Key, as shown in the Figure below.

Figure 6-27 Connection Page

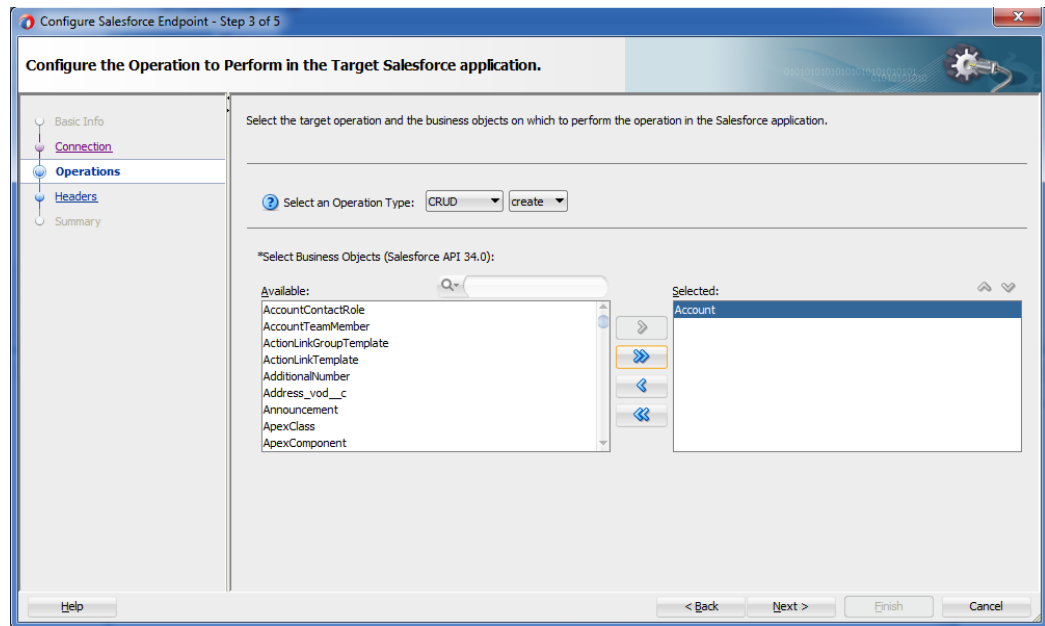

12. Click **Next**. The Operation Configuration page is displayed, as shown in the Figure below.

Figure 6-28 Operation Configuration Page

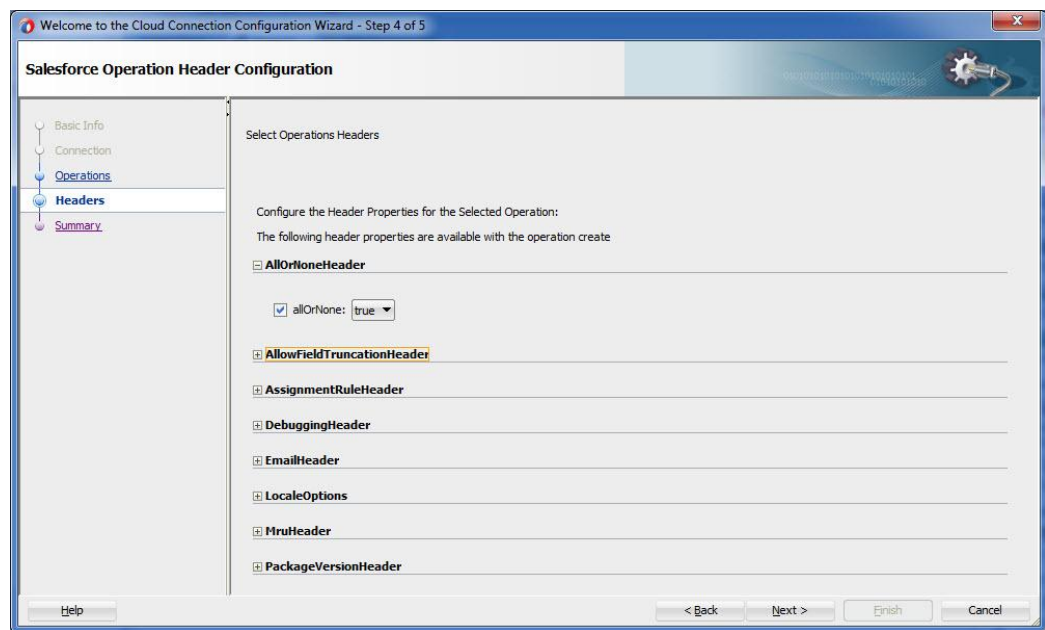

13. The default operation is create. Select the **Account** object from the Available objects list, and move to the selected objects list as shown in the Figure below.

Figure 6- 29 Operation Configuration Page

14. Click **Next**. The Header and Properties Page is visible as shown in the Figure below.

Figure 6- 30 Headers Page

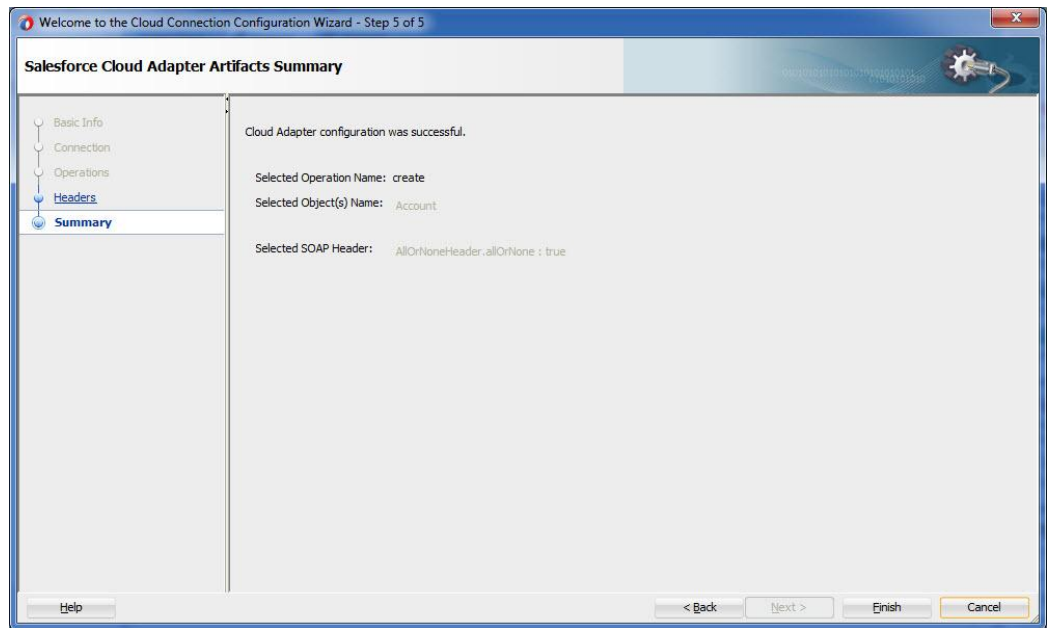

15. Select any header and provide its value.

16. Click **Next**.

The Finish page is displayed, as shown in the Figure below.

Figure 6-31 Finish Page

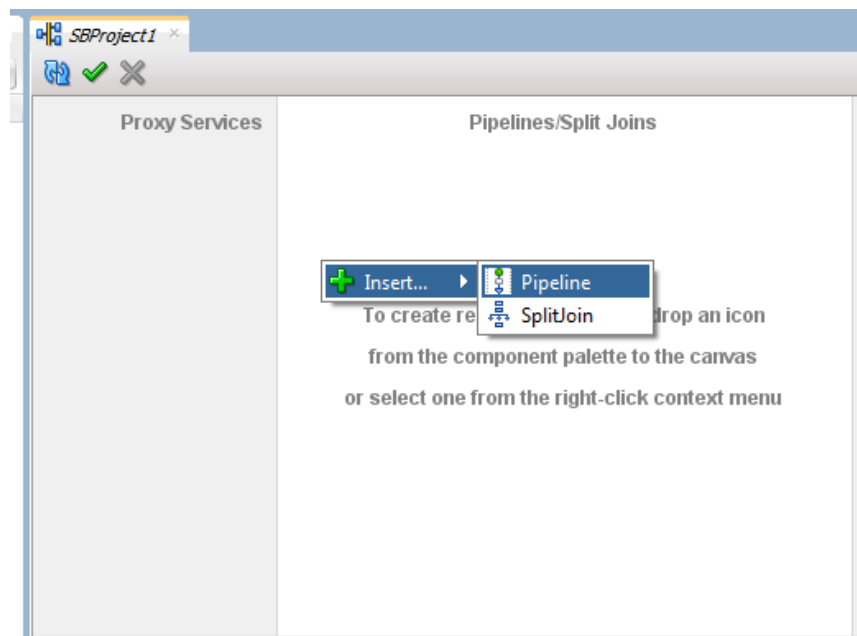

Configuring an Outbound OSB Process Component

Perform the following steps to configuring an Outbound OSB Process Component:

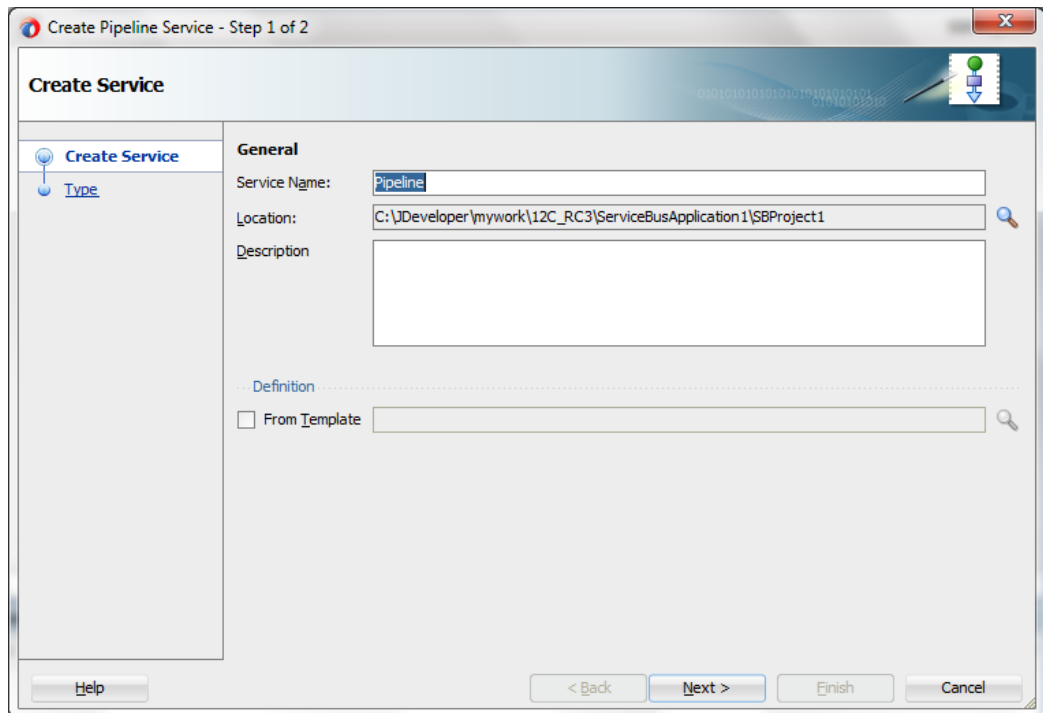

1. Right-click on **Pipeline/Split Joins** pane and click on **Insert** and then **Pipeline** as shown in the Figure below.

Figure 6-32 Pipeline Component

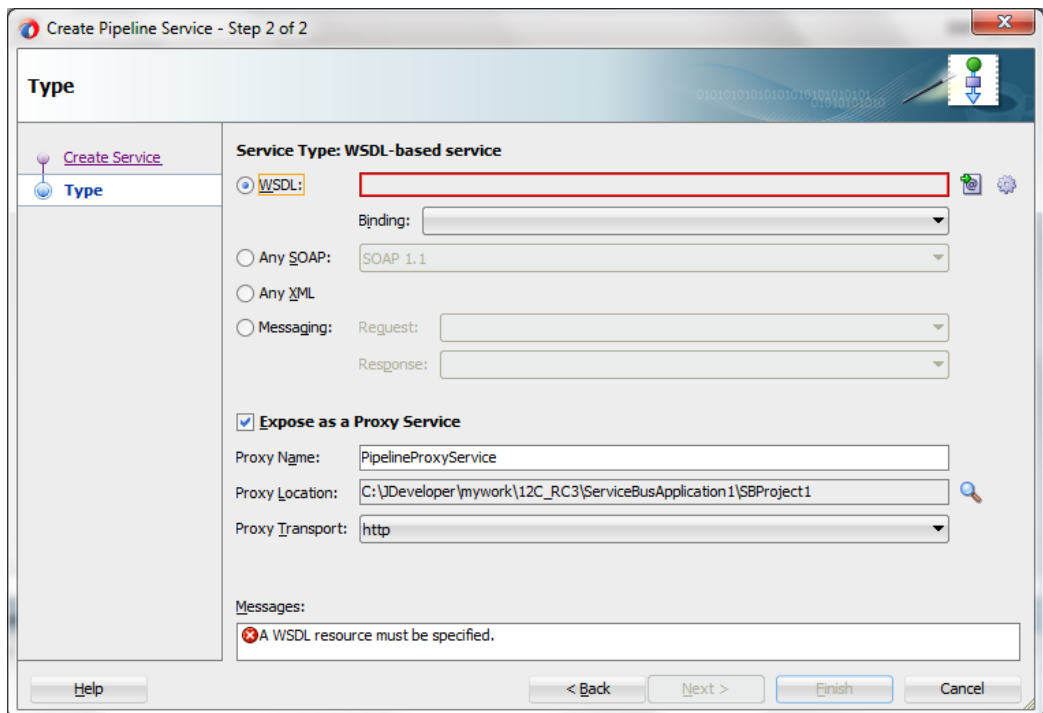

The Create Pipeline Service dialog is displayed, as shown in the Figure below.

Figure 6- 33 Create Pipeline Service

2. In the **Service Name** field, enter a name to identify the pipeline name and select the corresponding location of the project.
3. Click **Next** and select the **Service Type** as WSDL, as shown in the Figure below.

Figure 6- 34 Create Pipeline Service

4. Click **Browse** icon which is located to the right of the WSDL URL, to select the WSDL from the file system.
5. Select the appropriate WSDL file from the Application → Resources, as shown in the Figure below.

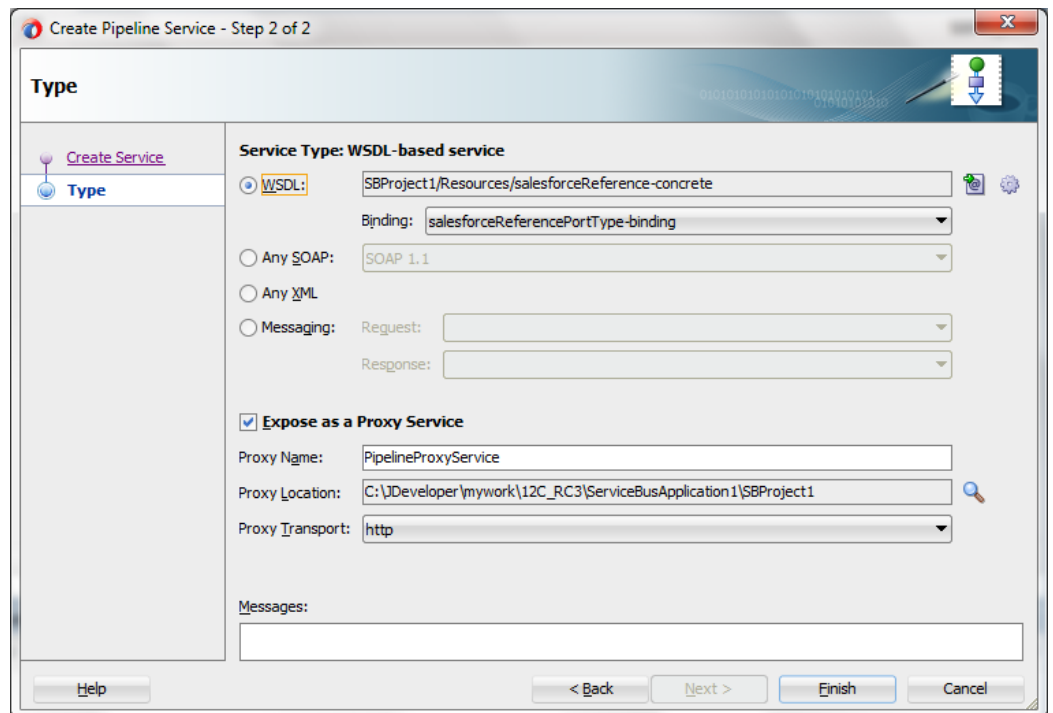

Figure 6-35 Select WSDL

6. Click **OK**.

The selected WSDL and corresponding binding is displayed, as shown in the Figure below.

Figure 6-36 Create Pipeline Service

7. Select checkbox for **Expose as a Proxy Service**.

8. Select **Proxy Transport** as **http**.

9. Click **Finish**.

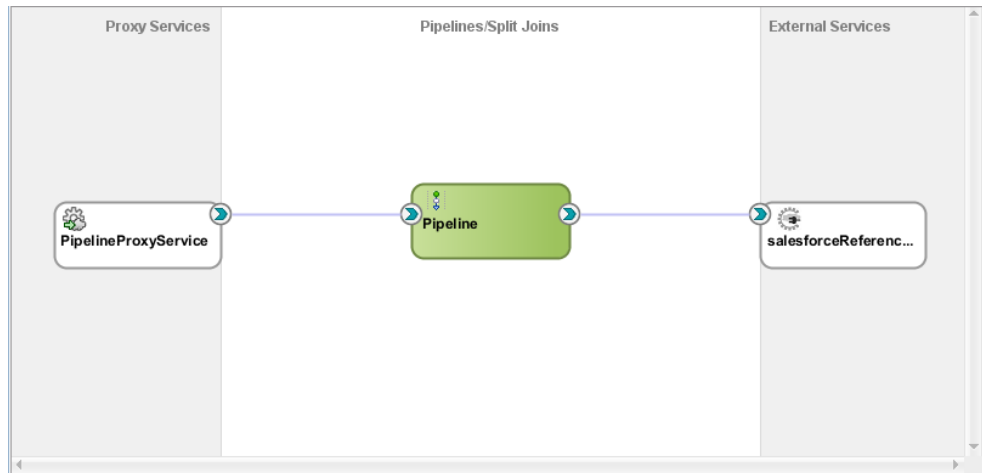

The Pipeline component is displayed as shown in the Figure below.

Figure 6- 37 Pipeline Component

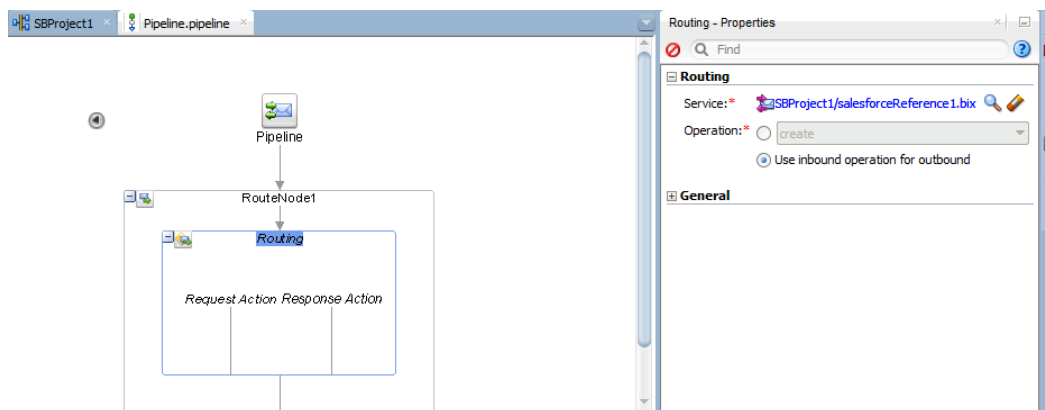

10. Connect **salesforceReference** to the **Pipeline**, as shown in the Figure below..

Figure 6- 38 Pipeline Component

11. Open the pipeline which shows the default routing. Verify the service and corresponding operation will be displayed in the Routing Properties, as shown in the Figure below.

Figure 6- 39 Routing Properties

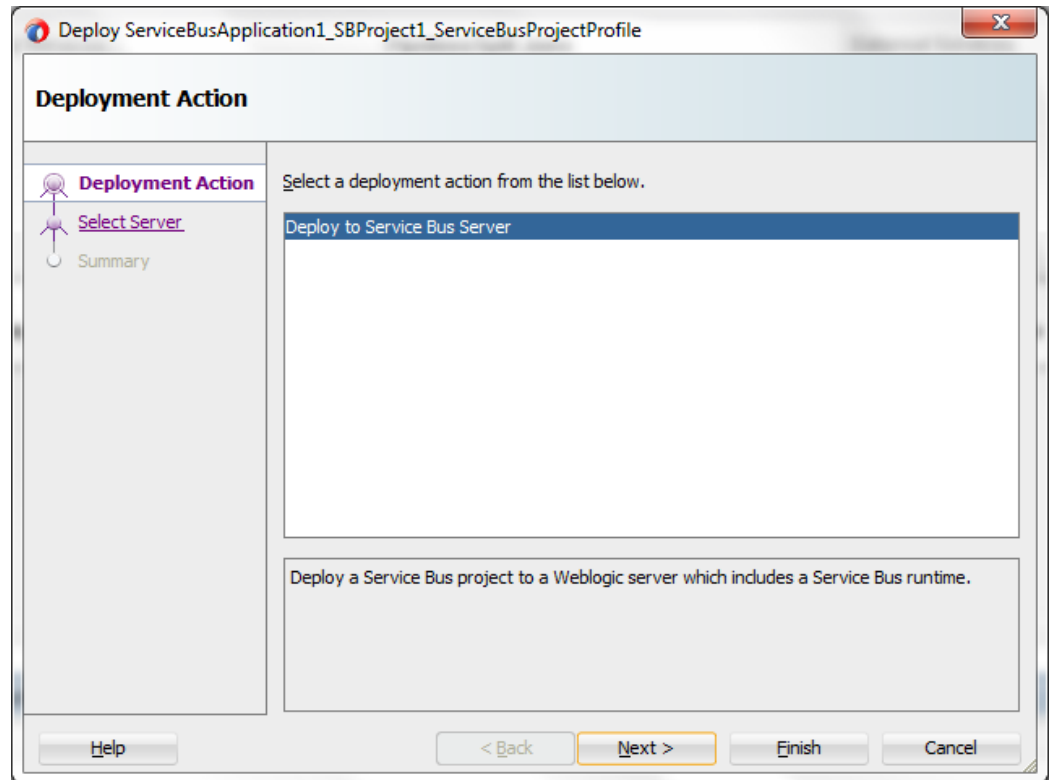

The outbound endpoint is ready to be deployed.

6.2.2.3 Deploying Outbound OSB Process

Perform the following steps to deploy the outbound OSB Process:

1. Select the project and **Deploy to Service Bus Server**, as shown in the Figure below.

Figure 6-40 Deployment Action Page

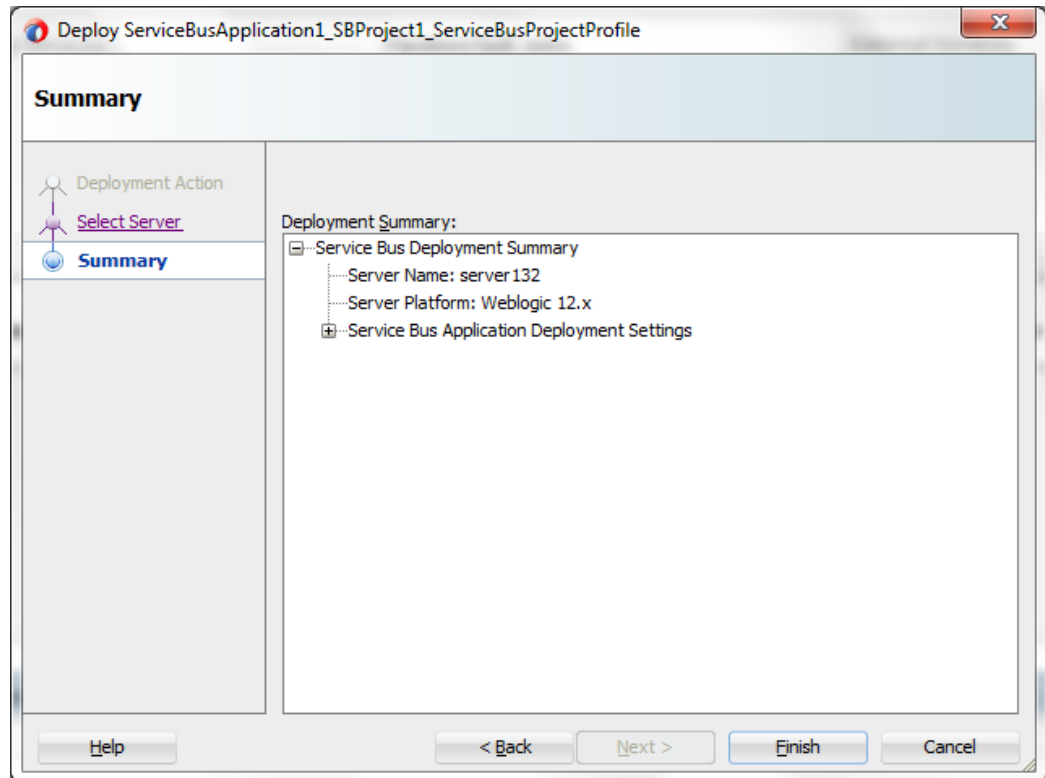

2. Select the already configured Application Server and click **Next**, as shown in the Figure below.

Figure 6-41 Select Server Page

3. Check the deployment summary and click **Finish**, as shown in the Figure below.

Figure 6- 42 Summary Page

4. The Project is successfully deployed, as shown in the Figure below.

Figure 6- 43 Success Message Page

The successfully deployed project can be tested from service bus console.

6.3 Testing OSB project from Service Bus Console

Follow the steps given below to test OSB project form Service Bus Console:

1. Open the **Service Bus Console** and enter user ID and Password, as shown in the Figure below.

Figure 6-44 Service Bus Console

2. All the deployed projects are displayed under **All Projects**, as shown in the Figure below.

Figure 6-45 Service Bus Console

3. Open the project you want to test and click on Business Service of that project. For example, **salesforceReference** in this case, as shown in the Figure below.

Figure 6- 46 Business Service Definition

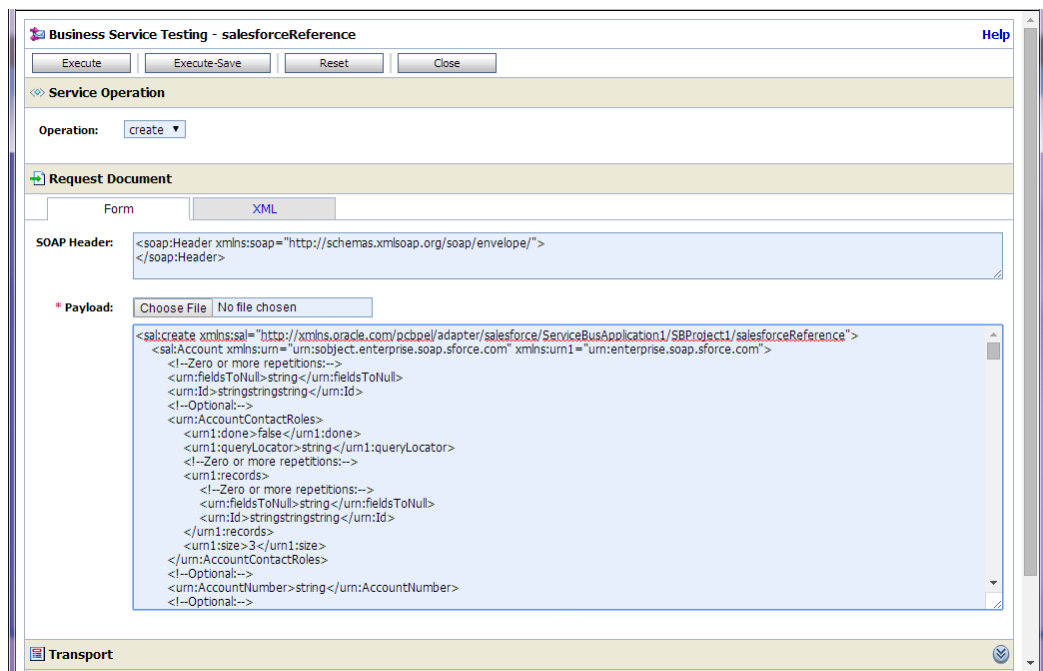

- Option for **Launch Test Console** (Green arrow button) is displayed for testing the outbound endpoint, as shown in the Figure below.

Figure 6- 47 Launch Test Console

- Launching Test Console opens new window displaying Business Service and the operation to test along with **Execute**, **Execute-Save**, **Reset** and **Close** button, as shown in the Figure below.

Figure 6- 48 Business Service Testing Page

Request Document section contains the Request Payload.

6. Provide the input and click on the **Execute** button.

This would send the payload to Salesforce and the response is displayed under **Response Document** section.

6.4 Configuring Processes using OSB Modelling Console

This section explains how to create OSB projects using OSB Modelling console. This section is divided into two parts:

- Section 6.4.1, “[Configuring Outbound Process \(Business Service\)](#)”
- Section 6.4.2, “[Configuring Inbound Process \(Proxy Service\)](#)”

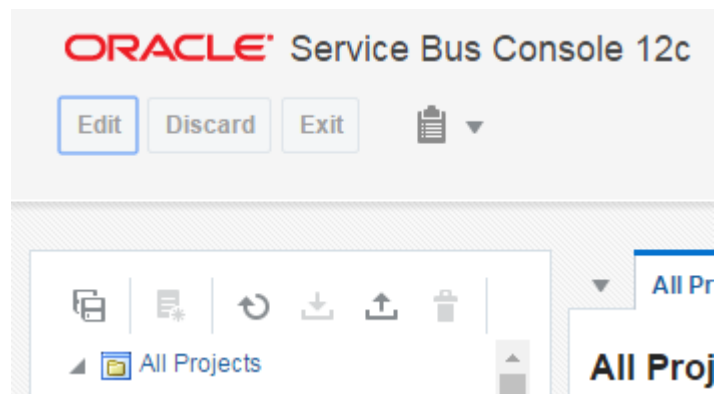

6.4.1 Configuring Outbound Process (Business Service)

Follow the below steps to create OSB projects (Outbound), and services using the OSB Modelling Console.

1. Login to the OSB Console: `<host:port/sbconsole>`
2. Click **Edit** as shown in the Figure below.

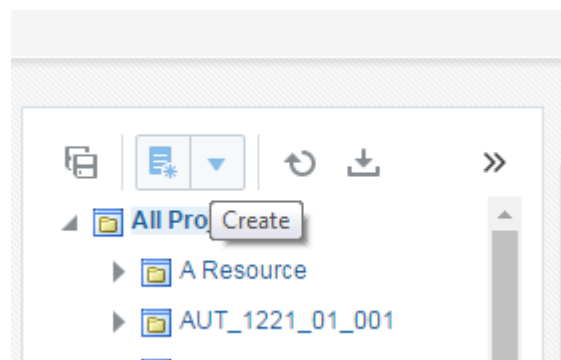

This opens a new session in the OSB console to enable you to make changes.

Figure 6- 49 OSB Console Window

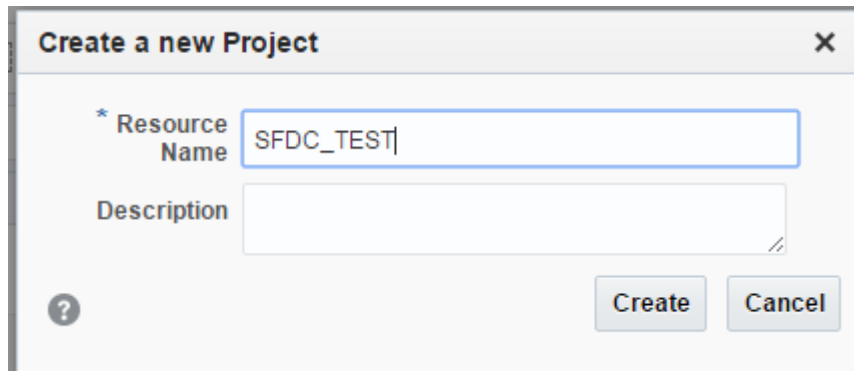

3. To create a new project in OSB, click **Create**.

Figure 6- 50 New Project OSB

4. **Create a new Project** window opens. Provide *Resource Name* and *Description*, and click **Create** to create the project or **Cancel** to dismiss the operation.

Figure 6- 51 Create a new Project window

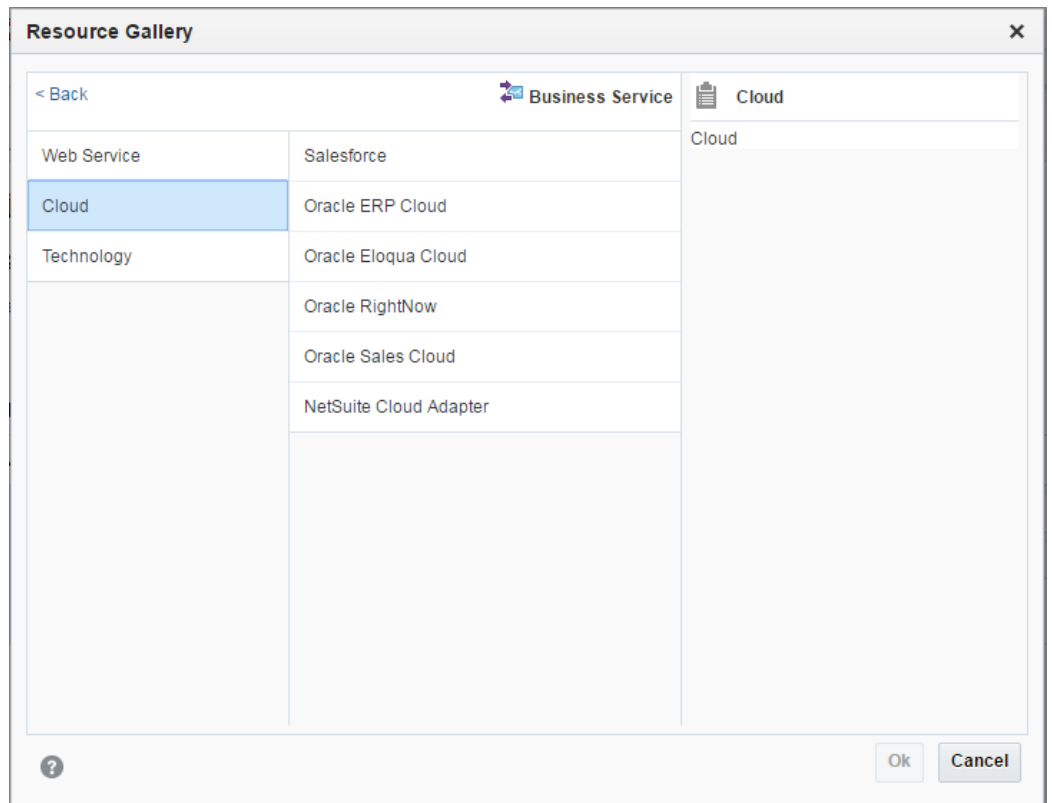

5. Click on the dropdown option and select **Resources**.

Figure 6- 52 Create a new Project Window- Dropdown option

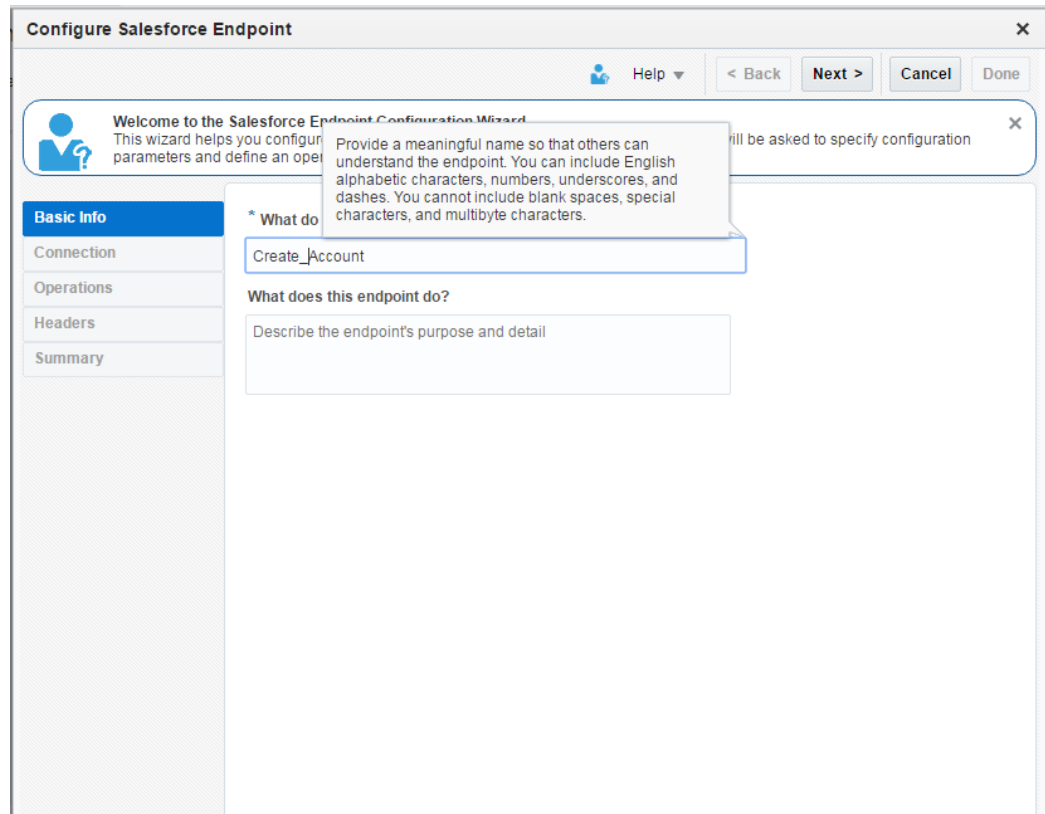

6. Select **Business Service** (Outbound SFDC) and then select **Cloud** in the **Resource Gallery** page as shown in the Figure below.

Figure 6-53 Resource Gallery Page

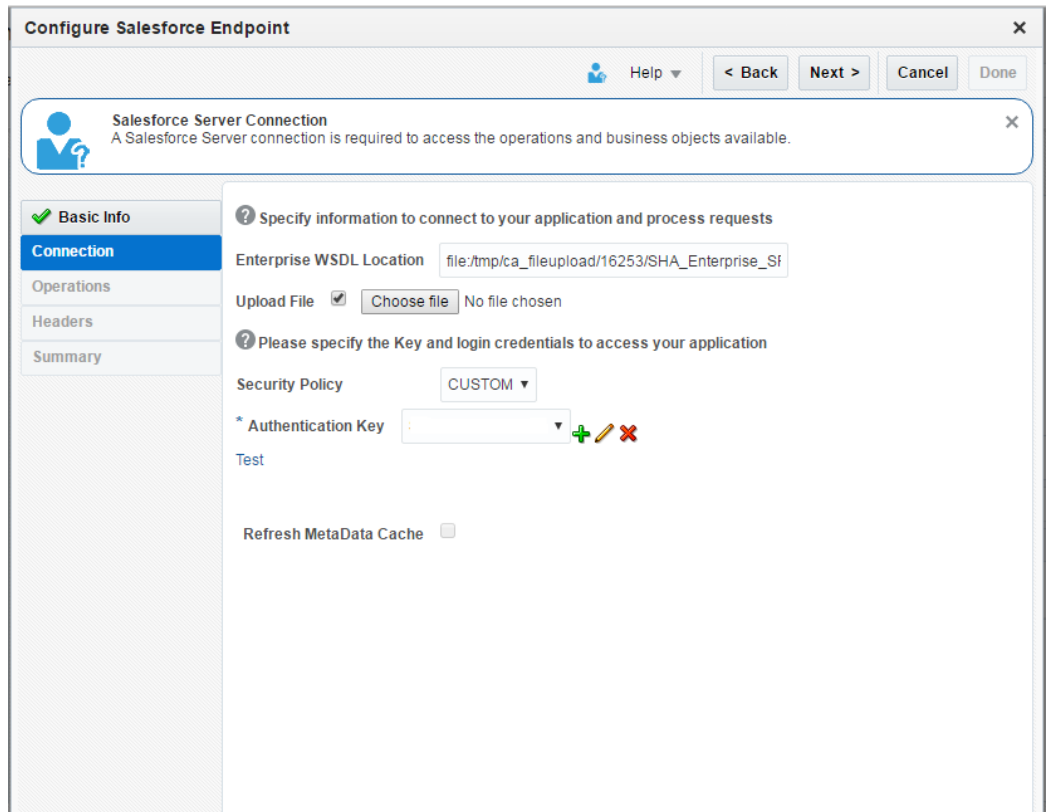

7. Select **Salesforce** adapter and click **Ok** to go to the Adapter Configuration Wizard or **Cancel** to discard the changes.
8. In the **Basic Info** page, provide a suitable name and description of the endpoint, and click **Next** to go to the **Connection** page or **Cancel** to go back to the OSB window.

Figure 6- 54 Basic Info Page

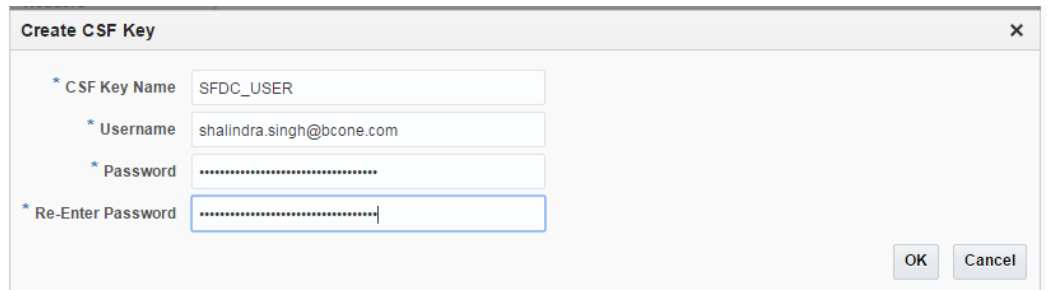

9. On the **Connection** Page, upload Salesforce Enterprise WSDL, and select the Security Policy.
Provide Authentication Key and click **Next** to go to the **Operation** page, **Back** to go to the **Basic Info** Page or **Cancel** to cancel the operation.

Figure 6-55 Connection Page

- a. Create a new **Authentication Key** by clicking on the '+' icon, and provide the required parameters as shown below.

Figure 6-56 Create CSF Key popup

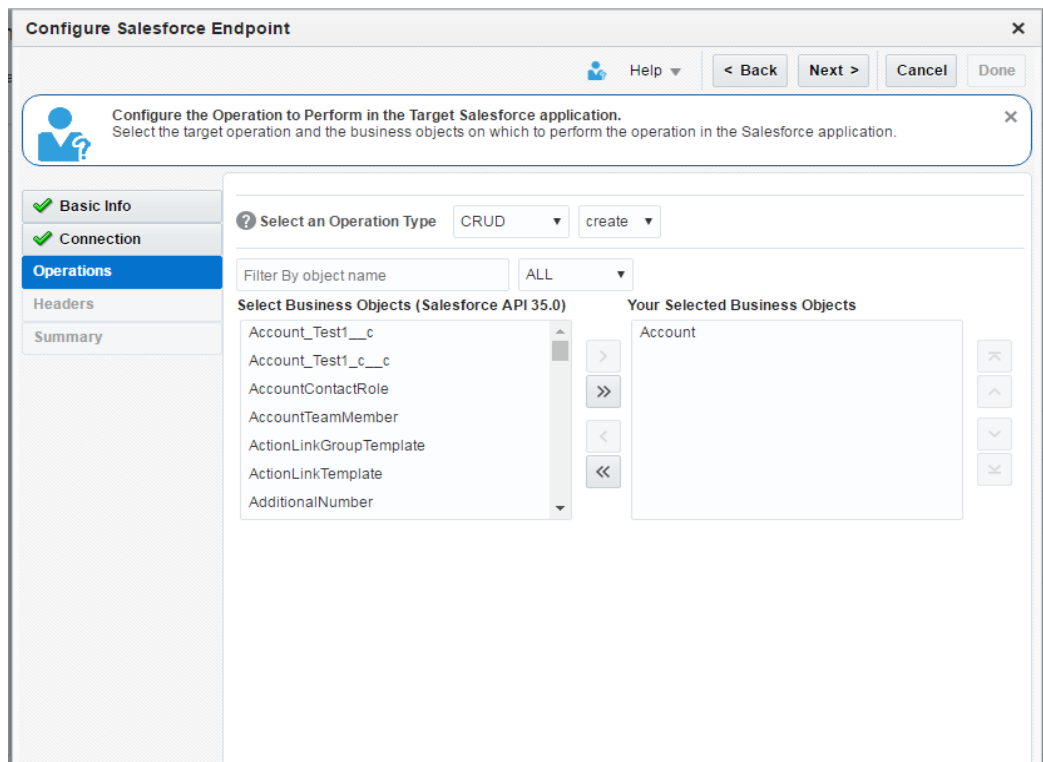

- b. Click **Test** to test the connection as shown in the Figure below.

Figure 6- 57 Test Connection link

10. On the **Operations** page, select the Operation, and Object (s) as shown in the Figure below.

Figure 6- 58 Operations Page

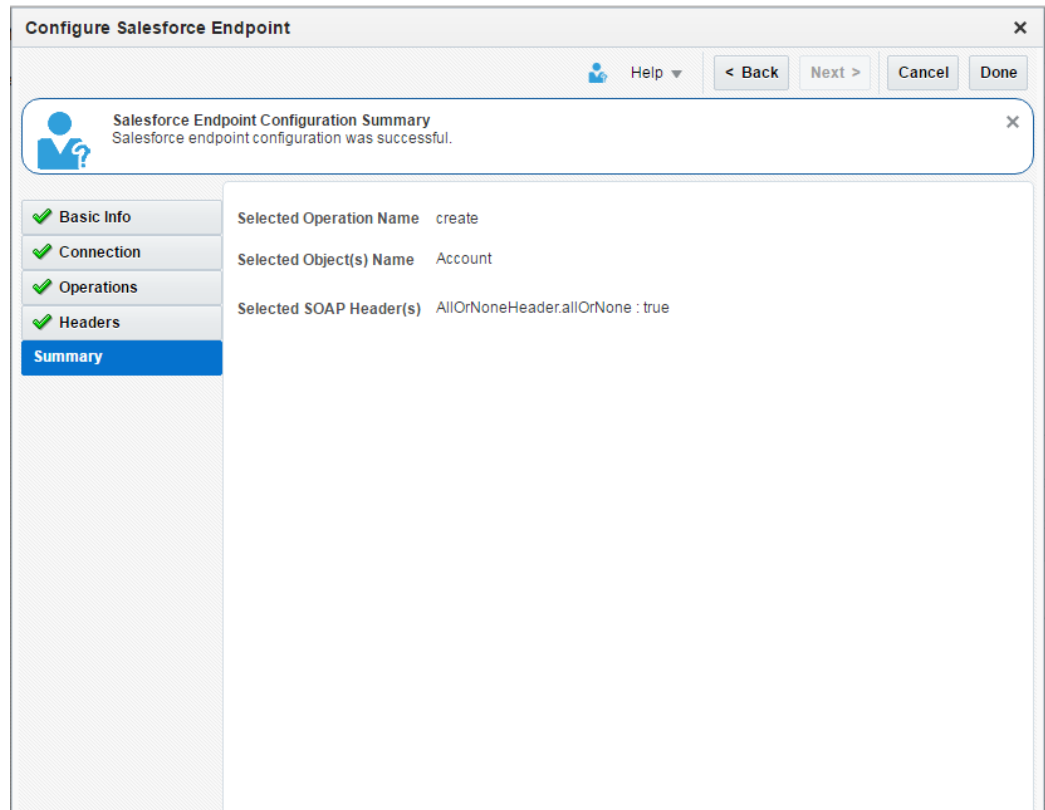

11. Click **Next** to go to the **Headers** page, **Back** to go to the **Operations** Page or **Cancel** to cancel the operation.

Figure 6-59 Headers Page

11. Select the required Header (s) and provide its value.
12. Click **Next** to go to the **Summary** page, **Back** to go to the **Headers** page or **Cancel** to cancel the operation.
13. **Summary** page opens. Review the Salesforce Endpoint Configuration, and Click **Done** to confirm and save the settings, **Back** to go to the **Headers** Page or **Cancel** to cancel the operation.

Figure 6- 60 Summary Page

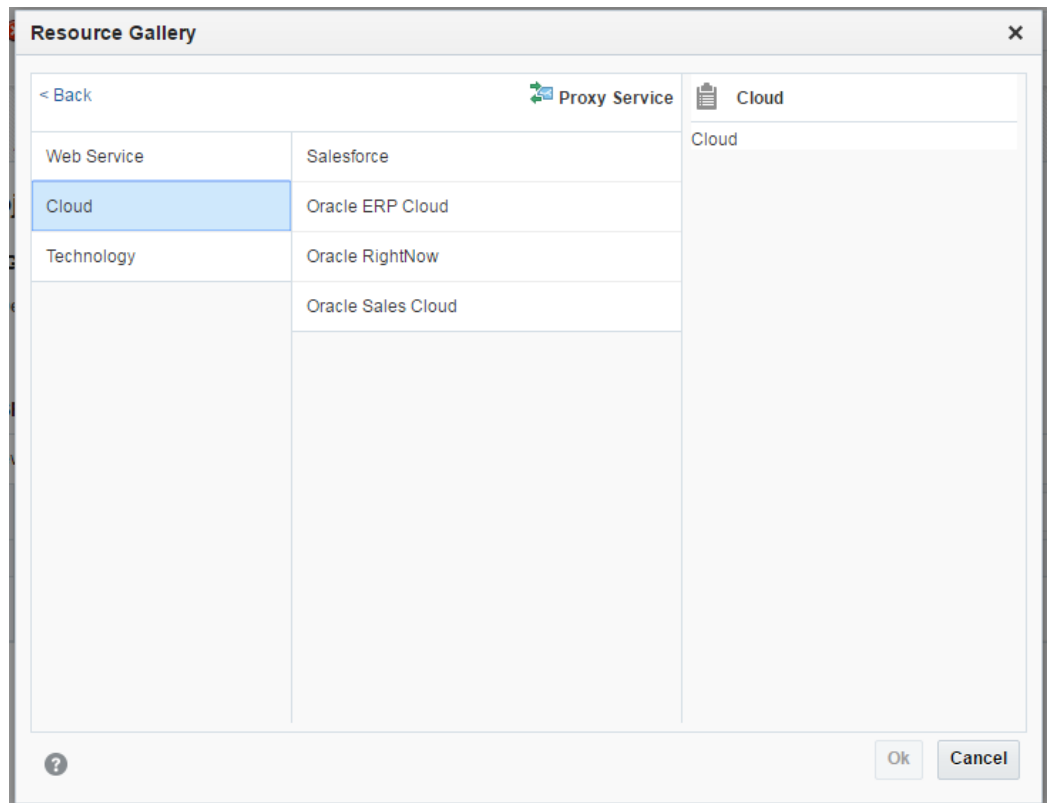

6.4.2 Configuring Inbound Process (Proxy Service)

Follow the below steps to create OSB projects (Inbound), and services using the OSB Modelling Console.

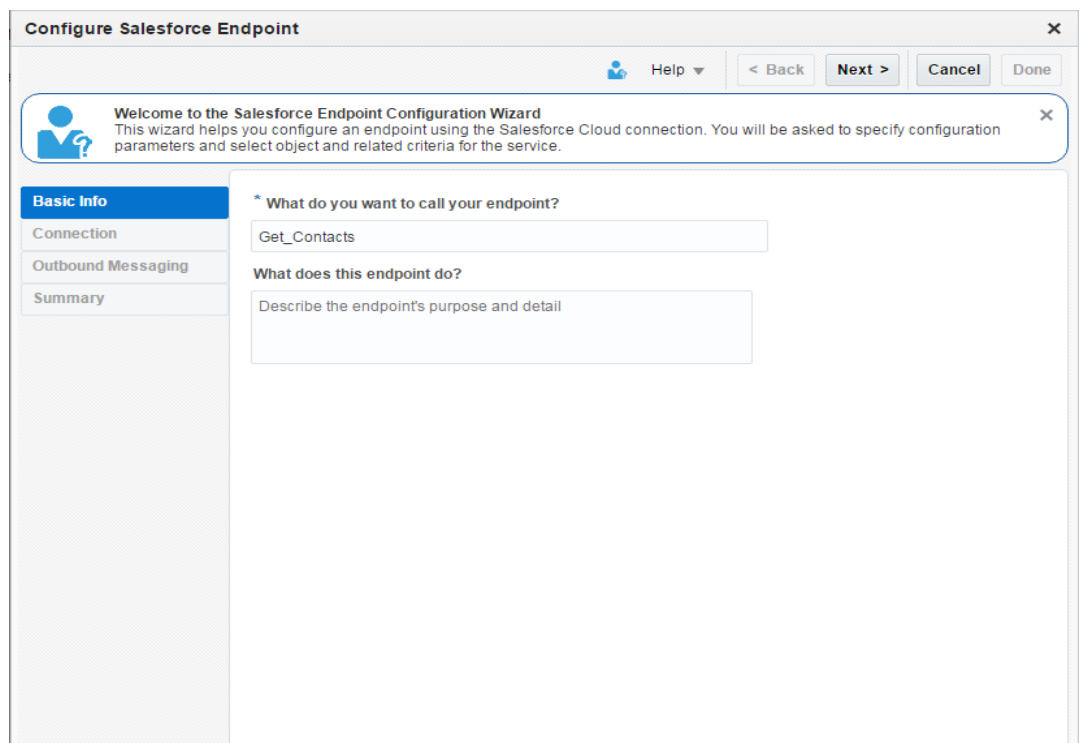

1. Follow Steps 1-5 of section 6.4.1, “[Configuring Outbound Process \(Business Service\)](#)”.
2. Select **Proxy Service** (Inbound) and then select **Cloud** as shown in the Figure below.

Figure 6-61 Resource Gallery Page

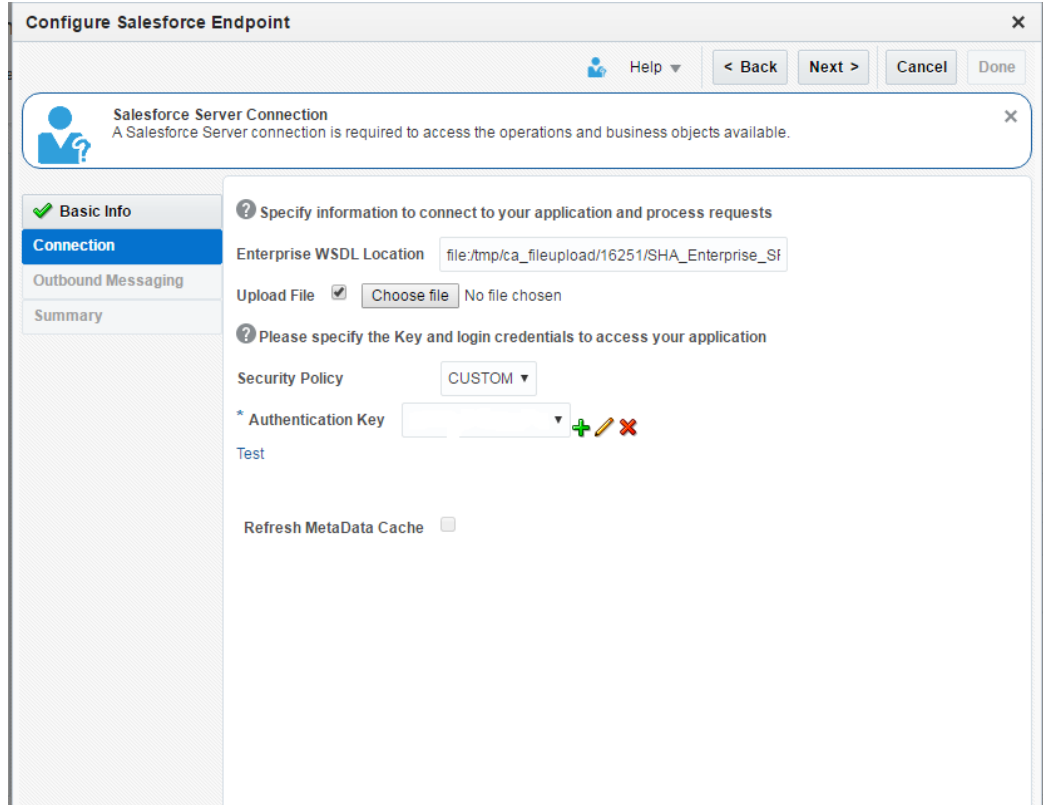

3. Select **Salesforce** adapter and click **Ok** to go to the Adapter Configuration Wizard or **Cancel** to discard the changes.
4. In the **Basic Info** page, provide a suitable name and description of the endpoint, and click **Next** to go to the **Connection** page or **Cancel** to go back to the OSB window.

Figure 6-62 Basic Info Page

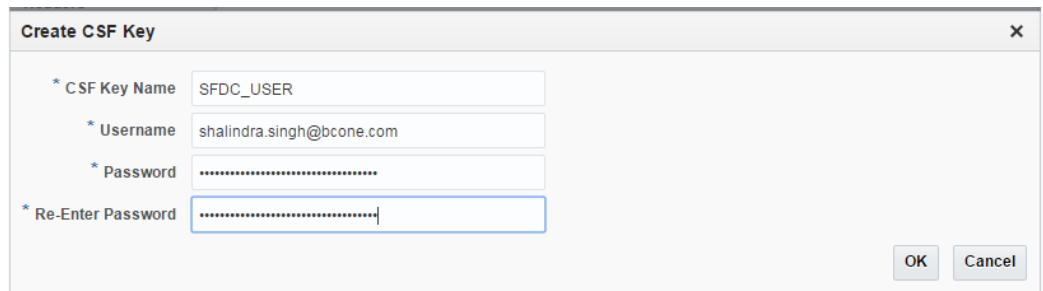

5. On the **Connection** Page, upload Salesforce Enterprise WSDL, and select the Security Policy.
Provide Authentication Key and click **Next** to go to the **Operation** page, **Back** to go to the **Basic Info** Page or **Cancel** to cancel the operation.

Figure 6- 63 Connection Page

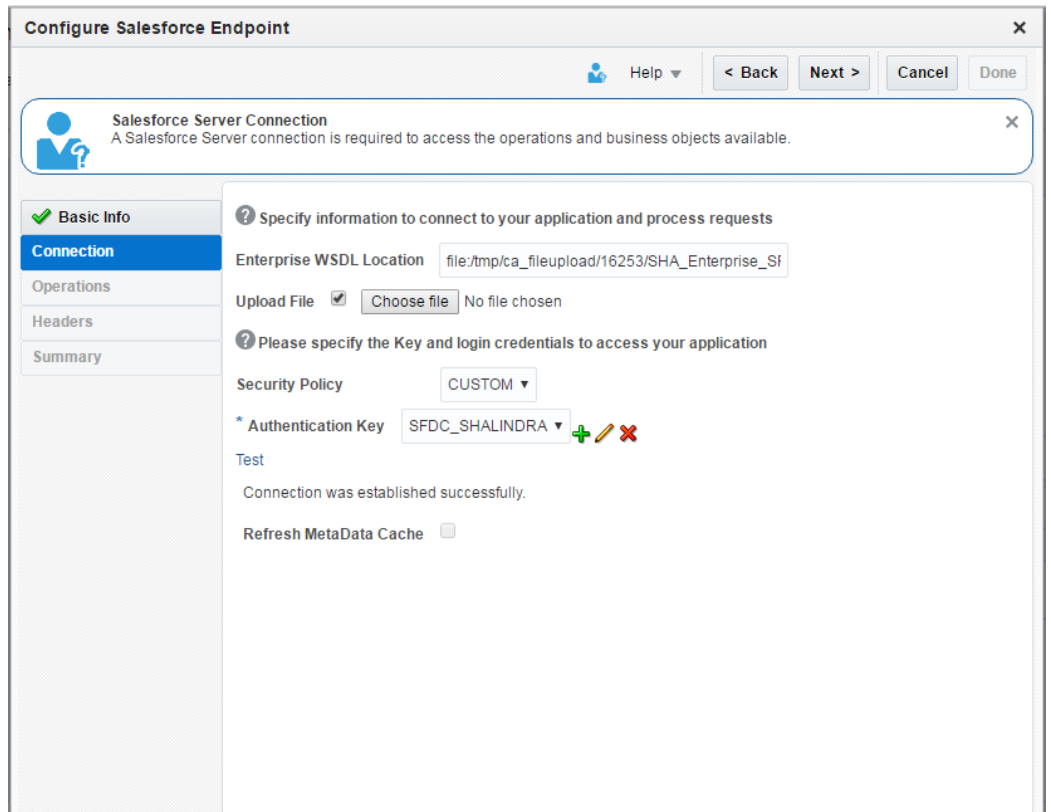

- a. Create a new **Authentication Key** by clicking on the '+' icon, and provide the required parameters as shown below.

Figure 6- 64 Create CSF Key Popup Window

- b. Click **Test** to test the connection as shown in the Figure below.

Figure 6- 65 Test Connection Link

6. On the **Outbound Messaging** page, upload Outbound Messaging WSDL. For steps to download the Outbound Messaging WSDL, refer section 4.2.2.3, “[Outbound Messaging](#)”

Figure 6- 66 Outbound Messaging Page

7. Click **Next** to go to the **Summary** page, **Back** to go to the **Outbound Messaging** page or **Cancel** to cancel the operation.
8. **Summary** page opens. Review the Salesforce Endpoint Configuration, and Click **Done** to confirm and save the settings, **Back** to go to the **Headers** Page or **Cancel** to cancel the operation.

Figure 6- 67 Summary Page

Configuring the Oracle Cloud Adapter for Salesforce.com on Oracle WebLogic Server

This chapter gives an overview of the design-time and run-time configuration properties. This chapter contains the following topics:

- [Section 7.1, "Oracle Cloud Adapter for Salesforce.com Run-Time Properties"](#)

7.1 Oracle Cloud Adapter for Salesforce.com Run-Time Properties

The section describes different run-time properties. This section is subdivided into multiple sections that includes:

- [Section 7.1.1, "Generic Properties"](#)
- [Section 7.1.2, "Properties available in the response"](#)
- [Section 7.1.3, "Retry Properties"](#)
- [Section 7.1.4, "Precedence of Salesforce.com Property Values"](#)

7.1.1 Generic Properties

[Table 7-1](#) shows the Run-time properties supported by Oracle Cloud Adapter for Salesforce.com. You can provide the values for these properties while creating the BPEL process inside the invoke activity or using the Enterprise Manager console, as desired.

Some of these properties are also available in **Salesforce Cloud Adapter Configuration Wizard** for some particular operations.

Table 7-1 Run-time Properties

Property Name	Type	Default Value	Description	Configurable At
jca.salesforce.AllOrNoneHeader.allOrNone	Boolean	True	The AllOrNoneHeader header property allows a call to roll back all changes unless all records are processed successfully.	Oracle Cloud Adapter for Salesforce Configuration Wizard/ BPEL invoke activity
jca.salesforce.LocaleOptions.language	String	en_US	Specifies the language of the labels returned. The value must be a valid user locale (language or country), such as en_US.	BPEL invoke activity

Table 7-1 Run-time Properties (Continued)

Property Name	Type	Default Value	Description	Configurable At
jca.salesforce.QueryOptions.batchSize	integer	500	Specifies the batch size for queries. The default is 500; the minimum is 200, and the maximum is 2,000.	Oracle Cloud Adapter for Salesforce Configuration Wizard/ BPEL invoke activity
jca.salesforce.HttpTimeout	Integer	10 sec	Maximum value 120 sec. It specifies the timeout value for the transactions.	BPEL invoke activity
jca.salesforce.queryLocator	String	NA	The queryLocator value is returned in case of query and queryAll calls from Salesforce.com. If queryLocator value is not empty, it means there are more records to fetch for the same query. You can assign the queryLocator value to this property (jca.salesforce.queryLocator) in your BPEL process and invoke query or queryAll again. It will fetch the next set of records for the same query string. It is similar to calling queryMore operation to fetch the next set of records.	BPEL invoke activity

7.1.2 Properties available in the response

Table 7-2 shows the properties available in the response.

Table 7-2 Properties Available in the Response

Property Name	Type	Default Value	Description	Configurable At
jca.salesforce.response.debugLog	String	NA	debugLog is returned as part of Header response, if you provide a value for debug header in the configuration wizard of the Salesforce.com adapter. To access this value you need to create a variable of type 'string' and extract the value of debug log into this variable in the properties section of your Invoke activity.	BPEL invoke activity

Table 7-2 Properties Available in the Response (Continued)

Property Name	Type	Default	Description	Configurable
---------------	------	---------	-------------	--------------

		Value		At
jca.salesforce.response.limitInfo.current	String	NA	<p>This value is returned as part of Header response, specifying the number of calls that have already been used in the organization. (Supported in Salesforce.com 29.0 version or higher)</p> <p>To access this value you need to create a variable of type 'string' and extract the value of this property into that variable in the properties section of your Invoke activity.</p>	BPEL invoke activity
jca.salesforce.response.limitInfo.limit	String	NA	<p>This value is returned as part of Header response, specifying the organization's limit for the number of calls it can make. (Supported in Salesforce.com 29.0 version or higher).</p> <p>To access this value you need to create a variable of type 'string' and extract the value of this property into that variable in the properties section of your Invoke activity.</p>	BPEL invoke activity

Providing the Property Values in BPEL Invoke Activity

Figure 7-1 depicts the properties available in the Invoke activity of BPEL Process. The prefix **jca.salesforce** determines that these properties are pertaining to the Salesforce.com adapter. In the value section, you can assign values to these properties using a variable or an expression if the type of property is "input". On the other hand, if the type of property is "output", its value can be extracted into a variable.

Figure 7-1 Properties Available in the Invoke Activity of BPEL Process

7.1.3 Retry Properties

Table 7-3 shows the configurable properties related to Oracle Cloud Adapter for Salesforce.com. These properties can be modified in the composite file or at the Enterprise Manager console.

Table 7-3 Oracle Cloud Adapter for Salesforce.com Configurable Properties

Property Name	Type	Default Value	Description	Available at
jca.retry.count	integer	4	Specifies the number of retries to post the message.	Composite.xml, EM console
jca.retry.backoff	integer	2	Specifies the retry interval growth factor.	Composite.xml, EM console
jca.retry.interval	integer	1	Specifies the time interval between two retries.	Composite.xml, EM console
jca.retry.maxInterval	integer	120	Specifies the maximum interval between two retries.	Composite.xml, EM console

7.1.3.1 Providing the Property Values in the Composite

Figure 7-2 shows the properties available in the composite.xml file.

Figure 7-2 Composite.xml File Properties

```
</componentType>
<property name="bpel.config.oneWayDeliveryPolicy" type="xs:string" many="false">async.persist</propert
</component>
<reference name="salesforceReference" ui:wSDLLocation="WSDLs/salesforceReference.wsdl">
  <interface.wSDL interface="http://xmlns.oracle.com/pcbpel/adapter/salesforce/Application6/Project1/s
  <binding.jca config="Adapters/salesforceReference.salesforce.jca"/>
  <property name="jca.retry.count" type="xs:integer" many="false" override="may">4</property>
  <property name="jca.retry.interval" type="xs:integer" many="false" override="may">1</property>
  <property name="jca.retry.backoff" type="xs:integer" many="false" override="may">2</property>
  <property name="jca.retry.maxInterval" type="xs:integer" many="false" override="may">120</property>
</reference>
<wire>
  <source.uri>bpelprocess1_client_ep</source.uri>
  <target.uri>BPelProcess1/bpelprocess1_client</target.uri>
</wire>
<wire>
  <source.uri>BPelProcess1/salesforceReference</source.uri>
  <target.uri>salesforceReference</target.uri>
</wire>
```

You can also edit the value of these properties in the **Properties** section of Salesforce.com Adapter. The properties section appears if you click on the Salesforce.com Adapter in the **External References** section as shown in Figure 7-3.

Figure 7-3 Salesforce Adapter Properties

Name	Value
jca.retry.count	4
jca.retry.interval	1
jca.retry.backoff	2
jca.retry.maxInterval	120

7.1.3.2 Providing the Property Values at Enterprise Manager Console

To provide the property values at the Enterprise Manager Console, follow the steps given below:

1. Proceed to **Services & References** section of your project, as shown in [Figure 7-4](#).

Figure 7-4 Services & References Section

Name	Type
bpelprocess1_client_ep	Web Service
getUpdatedDemo	JCA Adapter

2. Select the service name of your Salesforce.com Adapter from this section, and click on the **Properties** tab on the subsequent page, as shown in [Figure 7-5](#).

Figure 7-5 Salesforce Adapter Properties

getUpdatedDemo (Custom Adapter)

Dashboard Policies **Properties** Adapter Reports

You can edit or delete the following binding properties. Click Add to add additional properties.

Name (Operation or Port Type)	Value
jca.retry.count	4
jca.retry.backoff	2
jca.retry.interval	1
jca.retry.maxInterval	120

7.1.4 Precedence of Salesforce.com Property Values

If there is provision to set a particular property at multiple positions, the highest priority would be given to the value provided at the Enterprise Manager Console, next priority would be given to the value provided while creating the composite, while the lowest priority would be given to the value provided at Salesforce Cloud Adapter Configuration Wizard.

Troubleshooting and Error Messages

This chapter explains the troubleshooting information and error messages that you can come across while configuring the Oracle Cloud Adapter for Salesforce.com. It contains the following topics:

- [Section 8.1, "Troubleshooting and Error Messages"](#)
- [Section 8.2, "API Fault"](#)
- [Section 8.3, "Status Code"](#)
- [Section 8.4, "Known Issues"](#)

8.1 Troubleshooting and Error Messages

The Oracle Cloud Adapter for Salesforce.com supports the adapter diagnostic framework for reporting and alerting. This provides run-time adapter diagnostic information as read-only reports in EM console.

The troubleshooting information is categorized as follows:

- Oracle Cloud Adapter for Salesforce.com Design-Time JDeveloper
- Oracle Cloud Adapter for Salesforce.com Run-Time

Log file information that can be relevant in troubleshooting can be found in the following locations based on the adapter installation.

The Oracle Cloud Adapter for Salesforce.com trace information can be found under the following directory:

For Oracle SOA Suite:

```
<ORACLE_HOME>\soa\user_projects\domains\${soa_server
domain}\servers\${soa_server name}\logs\soa-server_diagnostic.log
```

8.1.1 Oracle SFDC Cloud Adapter Design-Time JDeveloper

[Table 8-1](#) shows the common errors faced while using Oracle Cloud Adapter for Salesforce.com in JDeveloper and their possible solutions.

Table 8-1 Oracle Cloud Adapter for Salesforce.com in JDeveloper

Error	Solution
The login credentials are not valid, or the maximum number of logins has been exceeded. Contact your administrator for more information.	Provide the valid Salesforce.com credentials. Delete the CSF key and add it again providing the correct credentials.

Table 8-1 Oracle Cloud Adapter for Salesforce.com in JDeveloper (Continued)

Error	Solution
Unable to connect to Salesforce.com server.	Ensure that you are connected to the internet and not blocked by or behind the firewall of your organization.
Error deploying the composite on soa_server: Composite with same revision ID already exists.	Check whether the project is already deployed on the server. Check the overwrite composites with the same revision box or change the revision number.
java.net.ConnectException: Connection refused: connect; No available router to destination.	Check whether the SOA server is up and running.

8.1.2 Oracle SFDC Cloud Adapter Run-time

Table 8-2 shows the common errors faced in the SOA server run-time.

Table 8-2 Error in SOA server Run-time

Error	Solution
Unable to find username in credential store.	Make sure that CSF key being used in the adapter during the design-time is available in the credential store in the WebLogic server.
Invalid ID. ID does not belong to the selected object.	Ensure that you are providing only the ID's corresponding to the objects selected at the design-time for the operation.
Bind Parameter's values are missing.	Ensure that you have provided the values of all the bind parameters defined in the query or search string at design-time.
Bind Parameter's value is empty.	Ensure that the value of bind variable is not empty.
FileNotFoundException.	Ensure that the Enterprise WSDL file you have provided is localized into your composite, or, in case you are using MDS, make sure that it is available in the MDS.
Unknown exception while transforming request message.	Please make sure that parameter Hostname Verification field (Under the tab SSL) is set to NONE on the server side as this is the most common reason.

Set Hostname Verification to None

You might come across the Exception: *javax.net.ssl.SSLKeyException* due to failed hostname verification check on the server side when you test your composite. This error comes when Hostname Verification parameter on the server side is set to a value other than "None". To overcome this you can follow the below mentioned steps:

1. Login into WebLogic console.

2. Browse to the servers and select manage server on which Salesforce adapter is running (e.g., soa_server1).
3. Go to Configuration →SSL.
4. Expand **Advanced** section. You will see ‘Hostname Verification’.
5. Select the “None” value from the dropdown and save the changes.

8.2 API Fault

You can refer the link below to get more information about the API Fault.

http://www.salesforce.com/us/developer/docs/api/Content/sforce_api_calls_concepts_core_data_objects.htm#i1421192

8.3 Status Code

You can refer the link below to get more information about the Status Code.

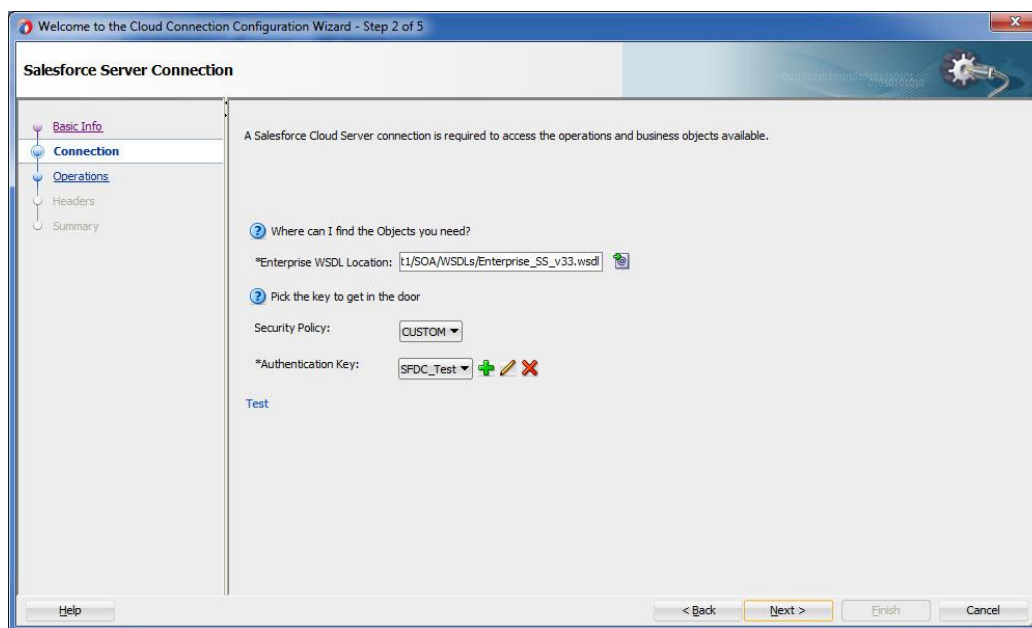

http://www.salesforce.com/us/developer/docs/api/Content/sforce_api_calls_concepts_core_data_objects.htm#i1421521

8.4 Known Issues

1. **Run-Time execution failure due to absence of the local copy of Enterprise WSDL in JDeveloper SOA Project:** While configuring Oracle Cloud Adapter for Salesforce.com, you will need to browse for the Enterprise WSDL of your Salesforce.com organization. When you point to the location of the WSDL, JDeveloper creates a copy of the WSDL in the JDeveloper SOA Project (say Project1). This copy of the WSDL is needed by the Oracle Cloud Adapter for Salesforce.com during Run-Time execution.

The next time you create the adapter in a different project (say Project2), the adapter (by default) picks the location of the Enterprise WSDL localized in the previous project (Project1) and the previously CSF key from the cache, as shown in [Figure 8-1](#).

Figure 8- 1 WSDL Location

You can click on **Next** button without browsing for the WSDL again and the adapter will be configured, but the execution will fail during Run-Time as the Enterprise WSDL has not been localized in the folder of Project2.

Temporary Fix: To avoid this, always browse to the location of the Enterprise WSDL (either in the file system or MDS) to localize it in the project folder.

2. **Package Version Header does not support multiple package versions:** Salesforce.com supports multiple package versions per operation in its SOAP calls. In Cloud Adapter for Salesforce.com, currently only one Package Version can be configured per operation, using the Header page of the Adapter Configuration Wizard.
3. **Double-click does not select WSDL in WSDL Chooser dialog:** You cannot select the Enterprise WSDL of your Salesforce organization in the WSDL chooser dialog of connection page, by double-clicking on it. You need to select the WSDL at the appropriate location, and then click **OK**.
4. Binding parameters textbox is getting generated when user click WSDL operation textbox: When user provides a bind query in query statement text area and click WSDL operation textbox, it generates Binding parameters text box.
5. User is allowed to change the Reference name in Edit mode.
6. In the current version, Suppress Response, Clear Cache, and Offline Configuration functionality is not supported.
7. Refresh Metadata is not working in the current release.
8. BPM is not supported in the current 12.2.1.1.0 release.
9. For migration of projects, user needs to create CSF key and Map manually.
10. Not able to access endpoint URL in EM console for SFDC inbound adapter: The endpoint URL that need to be replaced in the Outbound Message is not accessible from the EM console.

Temporary Fix: After completing the development of SOA/OSB project, follow the steps provided below:

- a) Deploy the SOA/OSB project.
- b) Open the SOA/OSB diagnostic logs from the following path:

```
{$Oracle_Home}/user_projects/domains/{your_domain}/servers/{server_name}/logs/{server_name}-diagnostic.log
```

- c) Search and Copy the endpoint URL from the diagnostic logs. It would look something like this:

For SOA:

`https://{host}:{port}/integration/flowsvc/salesforce/{partition_name}/{project_name}/{service_name}/v1.0`

For OSB:

`https://{host}:{port}/integration/flowsvc/salesforce/{project_name}/{service_name}/v1.0/`

- d) Go to the Outbound Messaging section at Salesforce.com and replace the dummy URL you entered with the SOA/OSB endpoint URL fetched in the previous step.
- 11 User is not able to edit Oracle Cloud Adapter for Salesforce.com whether it is Inbound or Outbound once configured in OSB Console.
- 12 User is not able to invoke Oracle Cloud Adapter for Salesforce.com when operation (s) is changed in EDIT Mode.
Temporary Fix: After Editing and changing the operation in EDIT mode, delete the wire between BPEL and SFDC Adapter from Composite.xml and rewire in order to invoke the Adapter with the new operation.
- 13 Although user is able to configure two Oracle Cloud Adapter for Salesforce.com with the same name, this will create one common jca file for the two adapter and hence causing issue during deployment.
- 14 When configuring the Salesforce Inbound Adapter, data is displayed with HTML tags in Summary Page in the OSB Console.

8.5 Limitations

It is important to note that Salesforce API either supports Unicode characters or ISO-8859-1 character. The character set for a user depends on the Salesforce instance it uses. For the instance SSL, the encoding is ISO-8859-1 and for the rest, it is UTF-8. Moreover, if ISO characters are used in Salesforce organization in an instance which is non-SSL instance, can result in an error.

The Adapter for Salesforce.com is built to work on a single character encoding at a time that could either be ISO-8859-1 or UTF-8. Hence, if the organization use a character encoding different than the encoding assigned as per the Instance, the adapter may not recognize it and return an error. To learn more about the supported character sets by Salesforce, check 'Internationalization and Character Sets' section [here](#).

Note: The instance of an organization is indicated as a prefix in the URL of the Salesforce login. For example, `https://na2.salesforce.com`, here NA2 is the instance. For more information on list of available Salesforce Instance, Click [here](#).

Migration Support

This chapter provides information about the migration support in 12c version of Oracle Cloud Adapter for Salesforce.com for the 11g version of Oracle Cloud Adapter for Salesforce.com. This can be used as a reference by the organizations currently using the Oracle Cloud Adapter for Salesforce.com on Oracle SOA Suite 11g and migrating to the Oracle SOA Suite 12c.

This chapter contains the following topics:

- [Section 9.1, "Complete Backward Compatibility"](#)
- [Section 9.2, "Migrating 11g Application and Projects to 12c"](#)
- [Section 9.3, "Points to Remember"](#)

9.1 Complete Backward Compatibility

The Oracle Cloud Adapter for Salesforce.com is completely compatible with the previous release for Oracle SOA Suite 11g. All your composites containing the Oracle Cloud Adapter for Salesforce.com created in Oracle SOA Suite 11g can be ported to Oracle SOA Suite 12c by a simple process outlined in the next section of this chapter.

This will allow you to seamlessly upgrade to the latest version of Oracle SOA Suite and enjoy a host of new features. Once the migration of projects and application is done in the JDeveloper of 12c, you can upgrade your existing Oracle Cloud Adapter for Salesforce.com to the latest version by either double-clicking the adapter in External References swim lane or by right-clicking on it and selecting "Edit" as shown in the following section.

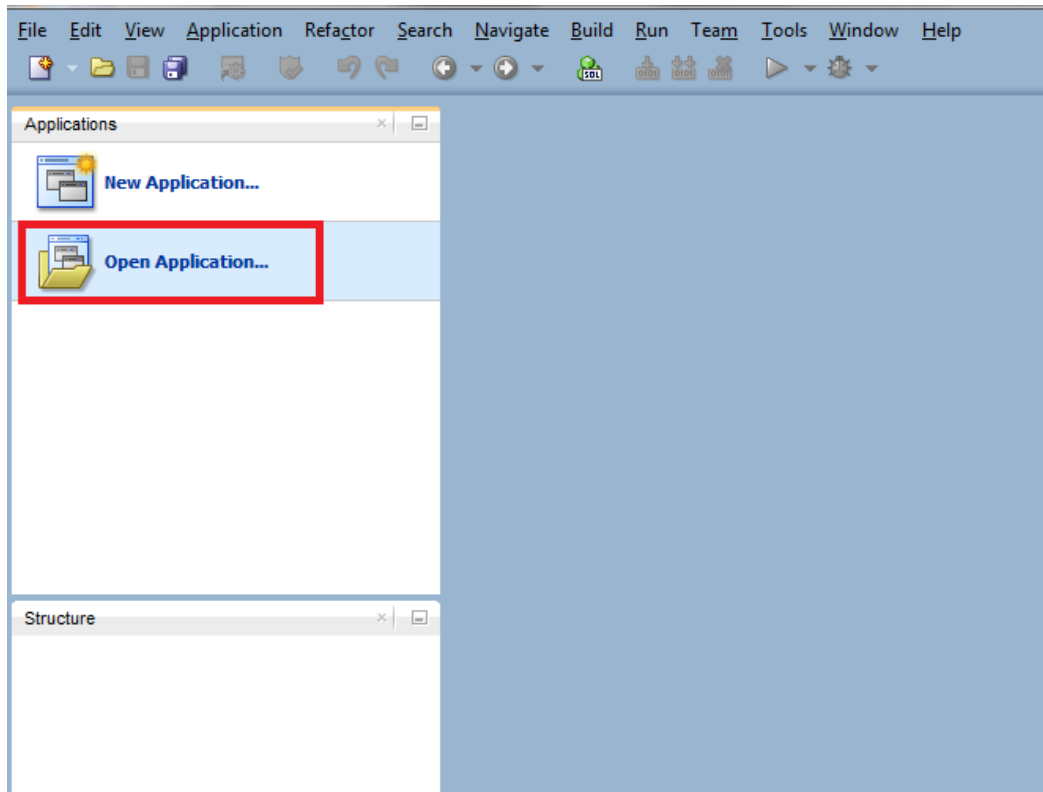

9.2 Migrating 11g Application and Projects to 12c

This section will outline the steps to migrate your applications and projects created in Oracle SOA Suite 11g to the latest version of Oracle SOA Suite 12c.

Follow the steps as shown:

1. Create a copy of your existing 11g applications in a new directory inside your "mywork" folder, for example – C:\JDeveloper\mywork\11g-12c\
2. Open JDeveloper 12c.
3. Click on Open Application

Figure 9- 1 Open Existing Application

4. Select the .jws file of the 11g application you had copied into the location mentioned in step 1. If you only wish to migrate a single project, you can select the .jpr file of that project.

Figure 9- 2 Choose .jws of 11g application

5. You will see a prompt warning stating that you are about to migrate your 11g files to the 12c format. Click “Yes” to continue.

Figure 9- 3 Confirm Migration to 12c

6. Wait for a few minutes while JDeveloper migrates your application to 12c format. This process can take a few minutes depending upon the size of your application. During this time you will see the following dialog.

Figure 9- 4 Wait while migration completes

7. After a few minutes, you will see the following dialog stating that successful migration for all your project files in the application.

Figure 9- 5 Migration successfully completed

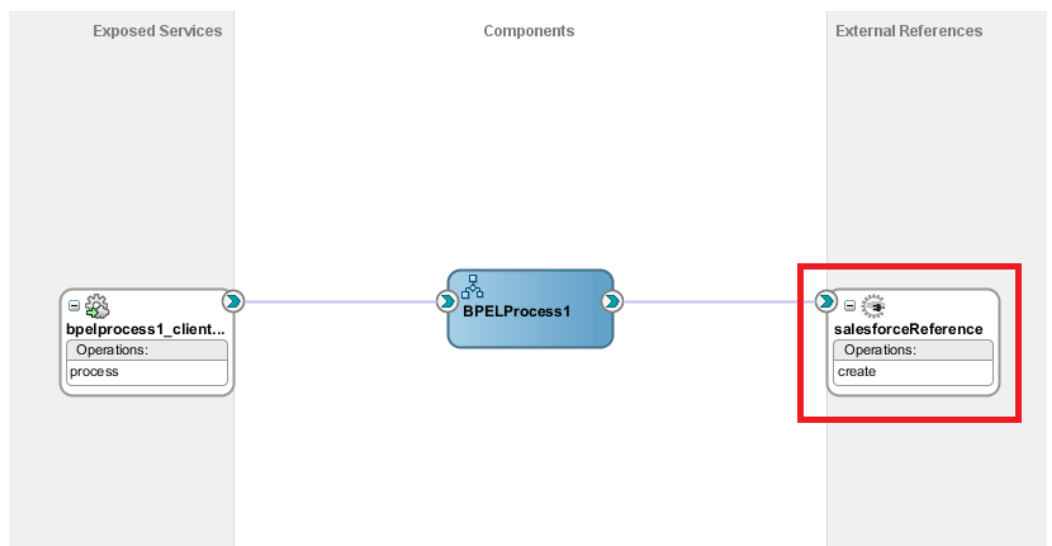

8. Click **OK** and you will see all your projects in the Projects Tab in Application. If you expand one of your projects, you will see the inner directory structure to be different than it was in 11g (this is expected behavior and will not affect the functioning of your projects).

Figure 9- 6 Migrated Project Structure

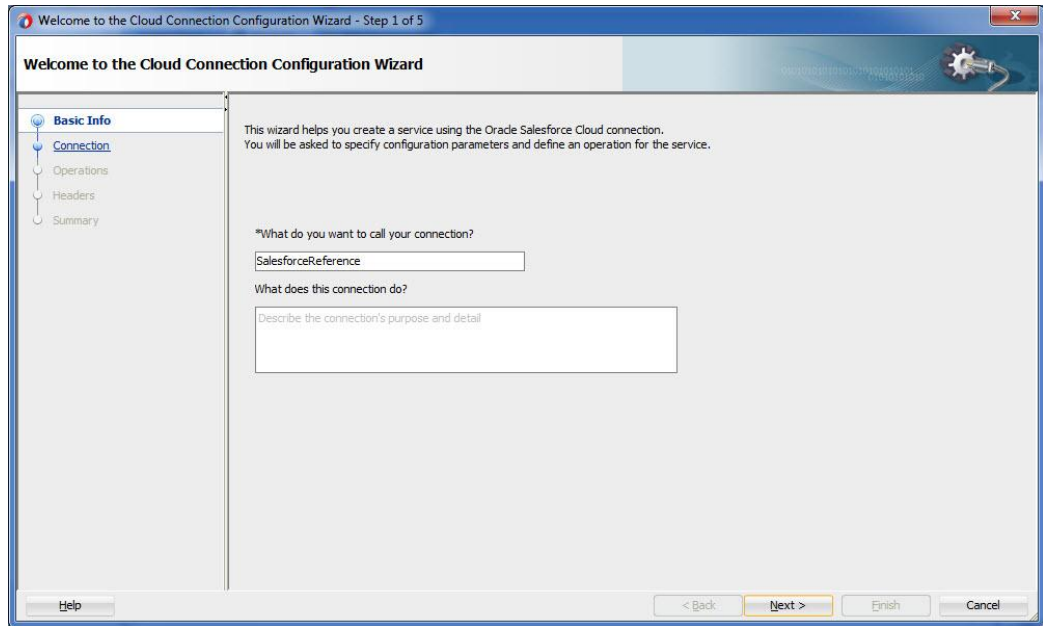

9. This completes the migration of your 11g application/projects to 12c. You can now proceed to update your Oracle Cloud Adapter for Salesforce.com to the latest version.
10. Open the composite.xml of the project you wish to update the adapter in, and edit the Oracle Cloud Adapter for Salesforce.com in External References swim-lane. (This project shown contains only one instance of the adapter, your projects may contain more and each instance will require the Steps 10.)

Figure 9- 7 Edit Oracle Cloud Adapter for Salesforce.com

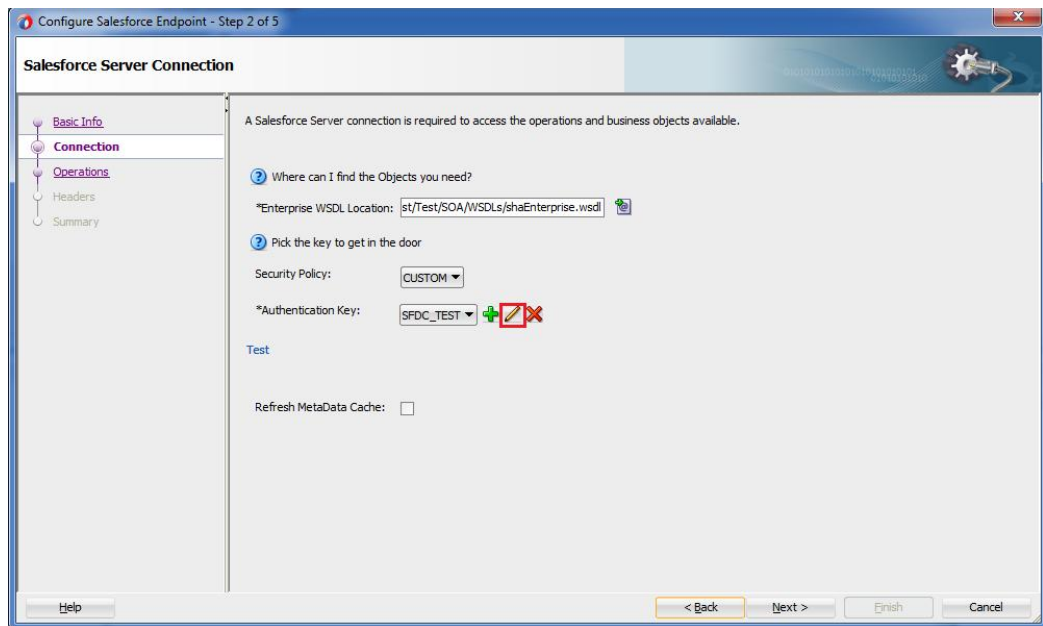

11. On editing the adapter, you will see the Adapter Configuration Wizard – Page 1, you cannot make any changes here to maintain the sanctity of your mappings in the BPEL process. Click “Next”.

Figure 9- 8 Oracle Cloud Adapter for Salesforce.com Welcome Screen

12. On the page that follows, you will see the Authentication Key field already populated with the key you had created during 11g project creation for the adapter. You will need to enter the username and password for this key again by clicking on the Edit button. (Please note that this step has to be followed only the first time you edit the adapter in a newly migrated application. Once you have configured the same key again in this application, it will show up in all future adapter edits within this application and you can skip the steps 13-14)

Figure 9- 9 Oracle Cloud Adapter for Salesforce.com Connection Page - Edit CSF Key

13. Configure the Authentication key as shown in section “4.2.2.2 Authentic Key”.
14. Click “Next” on all the subsequent screens without making any changes and Finish the configuration of the adapter on the Finish page.
15. This completes the migration of your Oracle Cloud Adapter for Salesforce.com from 11g version to the latest 12c version.

16. You can now proceed with deploying the composites to the WebLogic Server.

9.3 Points to Remember

There are certain points you must remember while migrating your projects from 11g to 12c.

1. Take a backup of your 11g applications/projects in a separate location before you migrate.
2. Once an application has been migrated, it will no longer be usable in Oracle SOA Suite 11g. This will not affect your already deployed composites, but you will not be able to make any changes to them after migration.
3. It is better to make a copy of your 11g applications and then open it in 12c, this way if you face any issues during your migration, your original composites will still remain usable and editable.
4. Create new CSF Map and key in EM console. Refer Section A.2, "[CSF Key in Enterprise Manager](#)".

Oracle Cloud Adapter for Salesforce.com- BPEL Use Cases

This section provides details of a few Use Cases to illustrate the end-to-end use of Oracle Cloud Adapter for Salesforce.com. These can be used as a reference by an organization planning to integrate with Salesforce.com using the Oracle Cloud Adapter for Salesforce.com on Oracle Fusion Middleware.

This chapter aims to introduce the user to different integration scenarios to Salesforce.com using various components of Oracle SOA Suite. The chapter focuses on guiding the user on various functionalities of the Oracle Cloud adapter for Salesforce.com – queryMore operation , MDS, Salesforce headers, etc. by means of few examples. These examples would be beneficial in resolving any complexities associated with the integration to Salesforce.

10.1. BPEL Use Cases

This section provides details of a few BPEL Use Cases to illustrate the end-to-end use of Oracle Cloud Adapter for Salesforce.com. These can be used as a reference by an organization planning to integrate with Salesforce.com using the Oracle Cloud Adapter for Salesforce.com on Oracle Fusion Middleware.

This chapter contains the following topics:

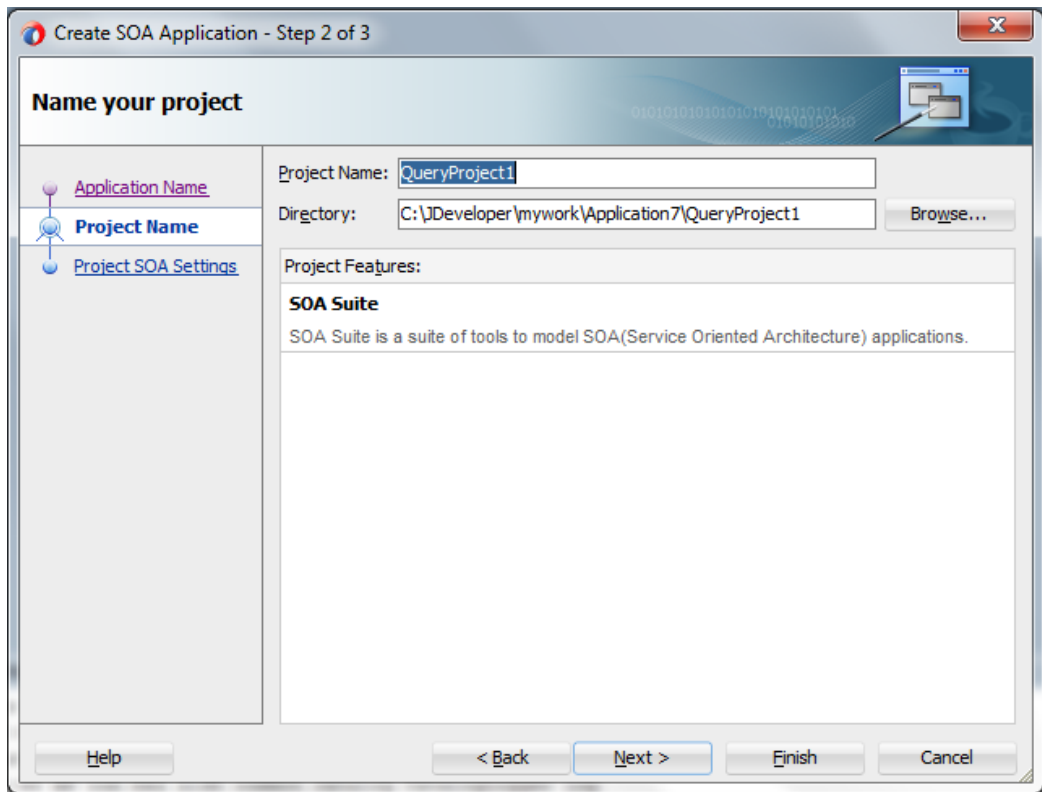

- [Section 10.1.1, "How to use query and queryMore Operations?"](#)
- [Section 10.2.1, "How to use MDS for importing WSDL into JDeveloper"](#)
- [Section 10.3.1, "How to use Debug Header \(Response Header\)"](#)

10.1.1. How to use query and queryMore Operations?

Perform the following steps to use query and queryMore Operations.

1. Create a New project in an existing application or in a new application.
2. Provide a suitable name to your project as shown in [Figure 10-1](#).

Figure 10 - 1 Name your project

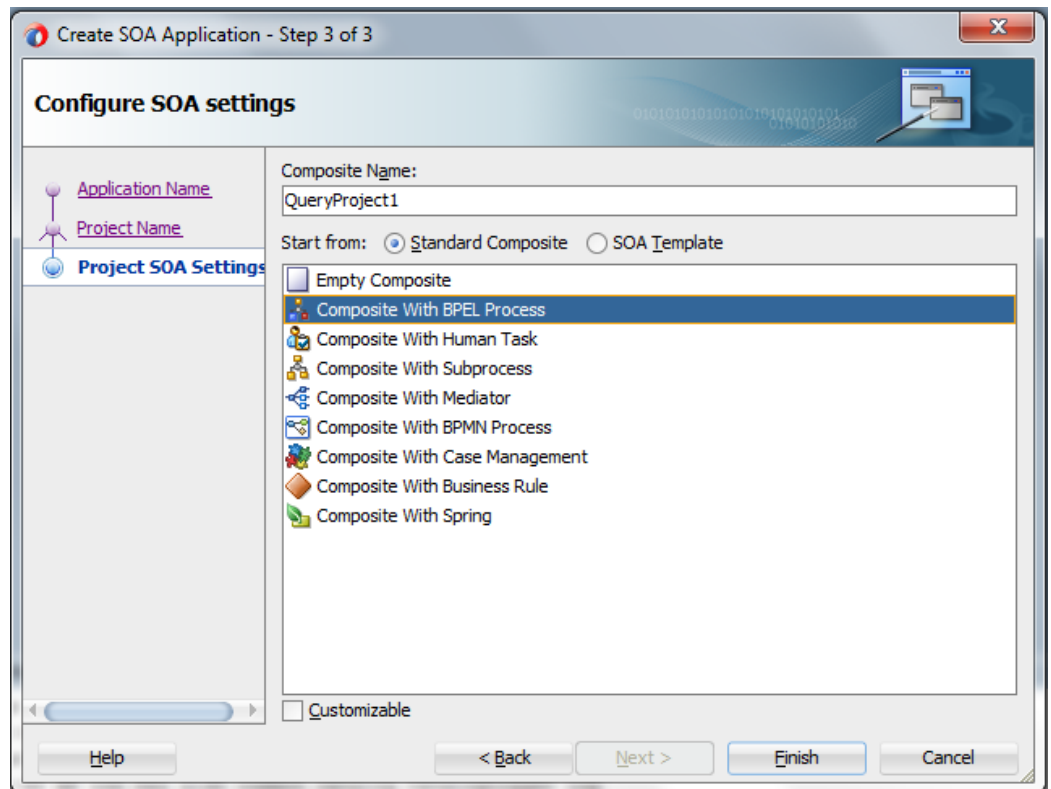

Create BPEL Process

Perform the following steps to create BPEL Process.

1. Click **Next** and select **Composite with BPEL Process** from **Standard Composite** list, as shown in [Figure 10-2](#).

Figure 10 - 2 Configure SOA Setting

2. Click **Finish**.
3. Select the BPEL 1.1 radio button and **Synchronous BPEL Process** from **Template** drop-down and click **OK**, as shown in [Figure 10-3](#).

Figure 10 - 3 Create BPEL Process

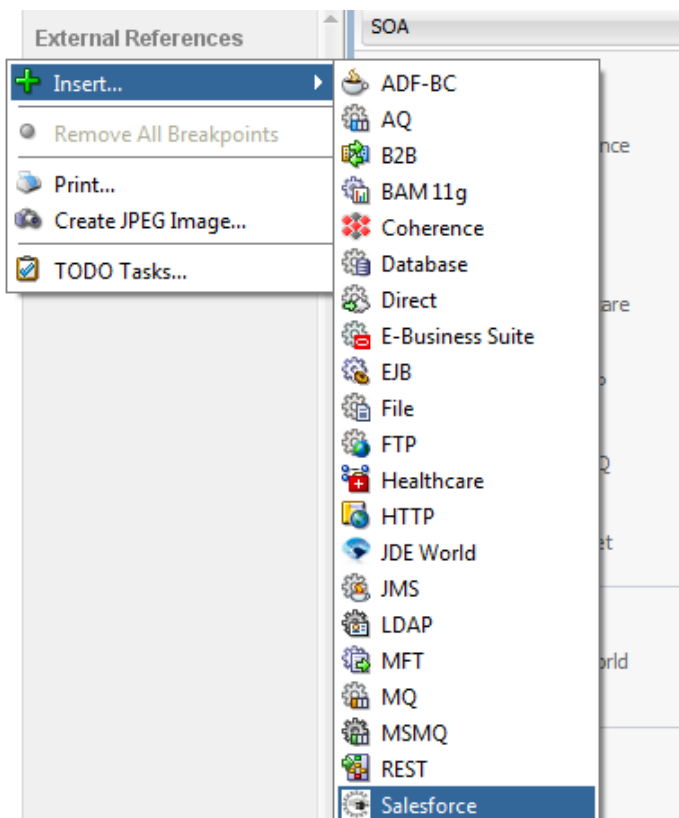

The composite.xml looks like [Figure 10-4](#).

Figure 10 - 4 Composite.xml

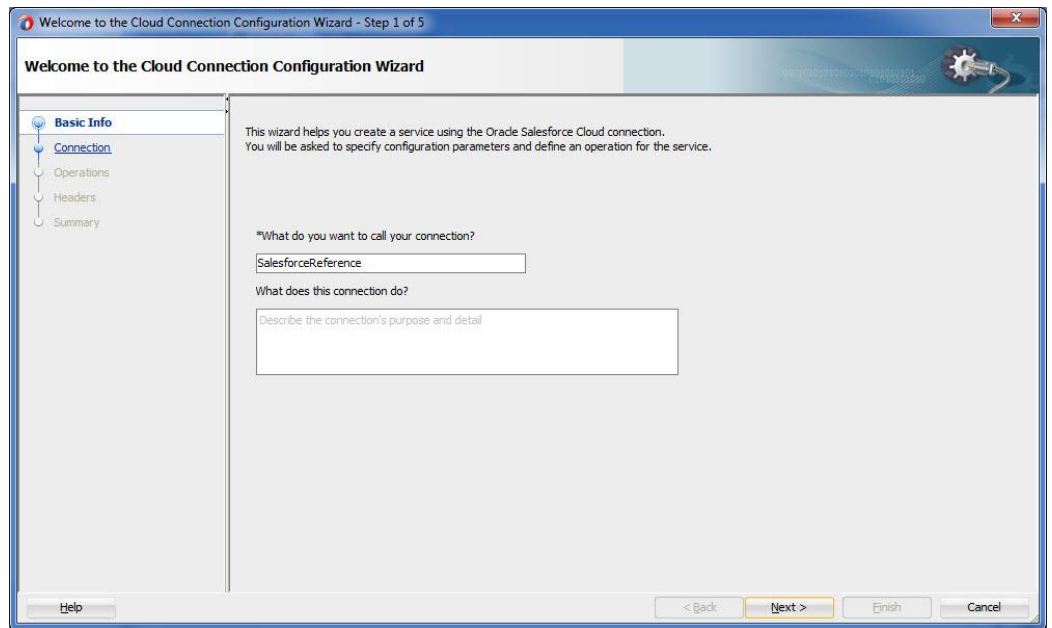

4. In **External References** swim-lane of the composite.xml file, right-click and select **Salesforce** adapter, as shown in [Figure 10-5](#).

Figure 10 - 5 Salesforce adapter

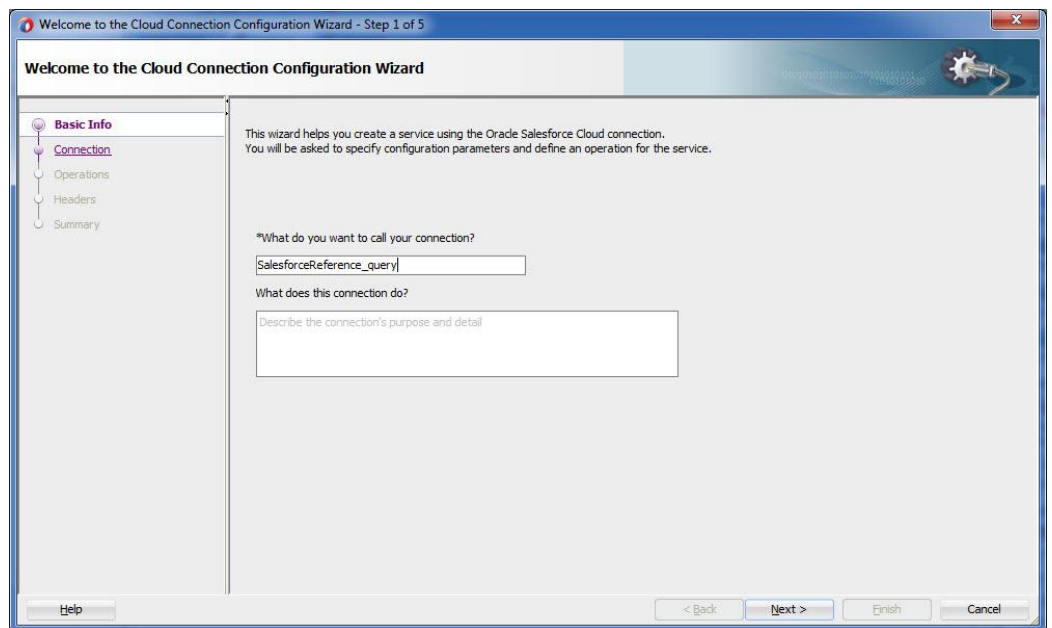

5. The Salesforce Cloud Adapter Configuration Wizard -Welcome page is displayed, as shown in [Figure 10-6](#).

Figure 10 - 6 Welcome Page

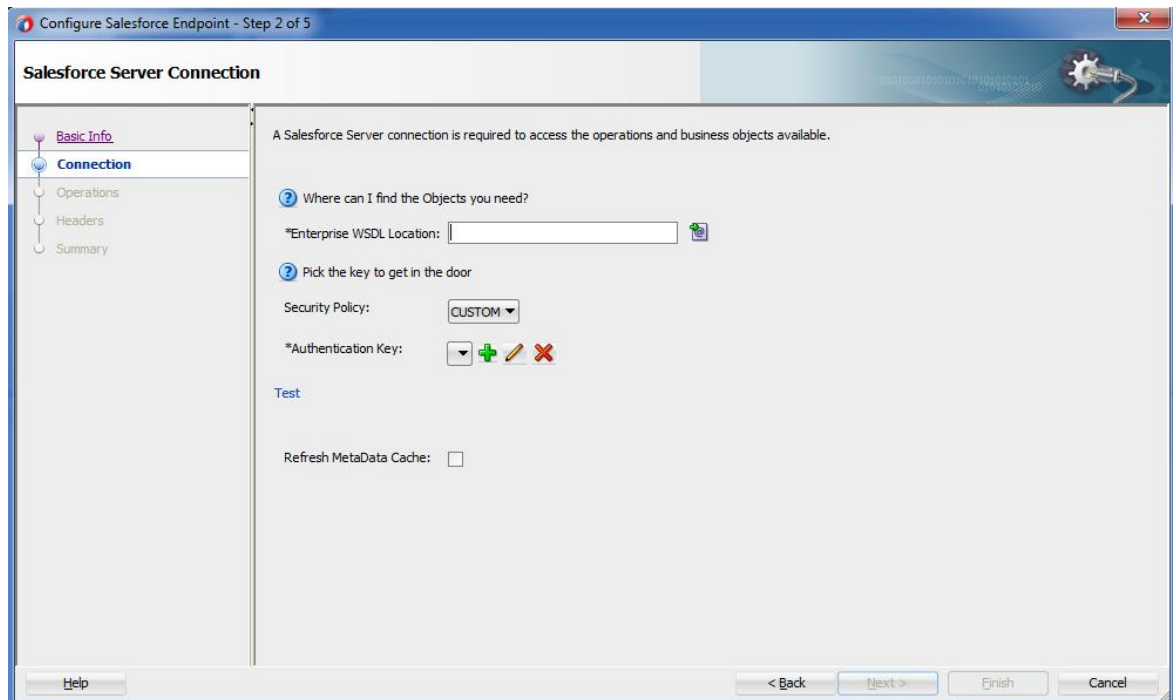

6. In the **Welcome** page, Enter a Reference Name in the **Name** field, as shown in [Figure 10-7](#)

Figure 10 - 7 Name your Service

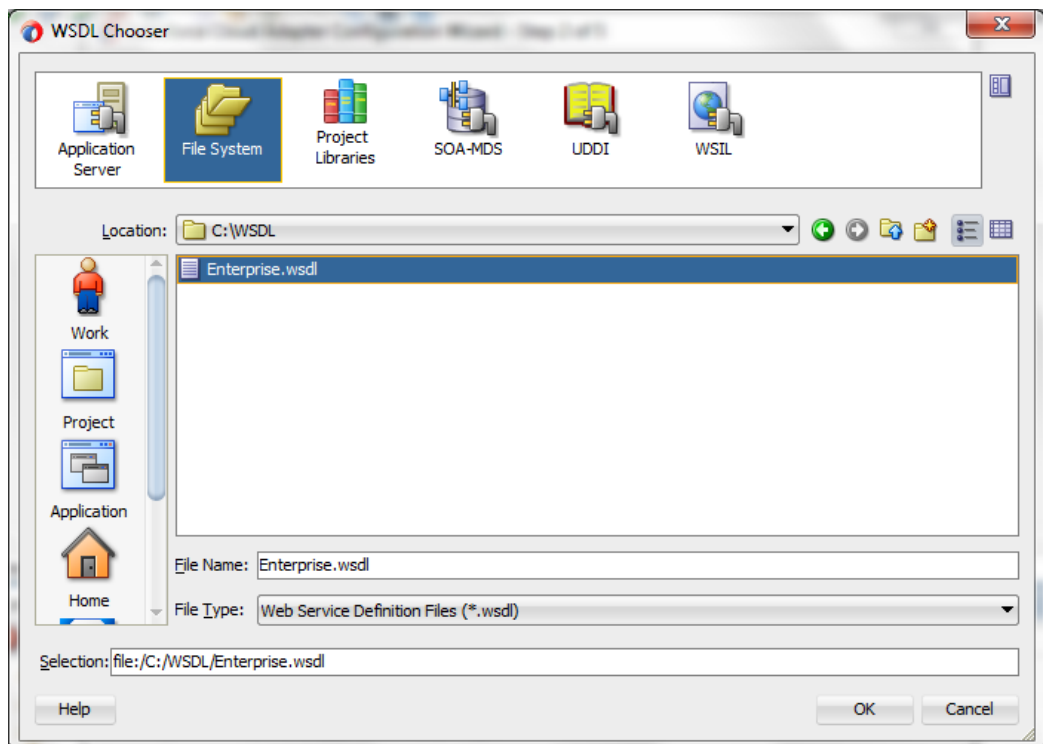

7. Click **Next**.
8. The **Salesforce Cloud Server Connection** page is displayed. The **WSDL Location** and **Authentication Key** text boxes are already populated. It picks up these values from the cache. You can re-enter these values. If you want to use a different value, click the **Find existing WSDLs** icon, which is located to the right of the **WSDL Location** field, as shown in [Figure 10-8](#).

Figure 10 - 8 Salesforce Cloud Server Connection Page

9. The **WSDL Chooser** dialog is displayed, browse and select the downloaded Enterprise WSDL and click **OK**, as shown in [Figure 10-9](#).

Figure 10 - 9 SOA Resource Browser

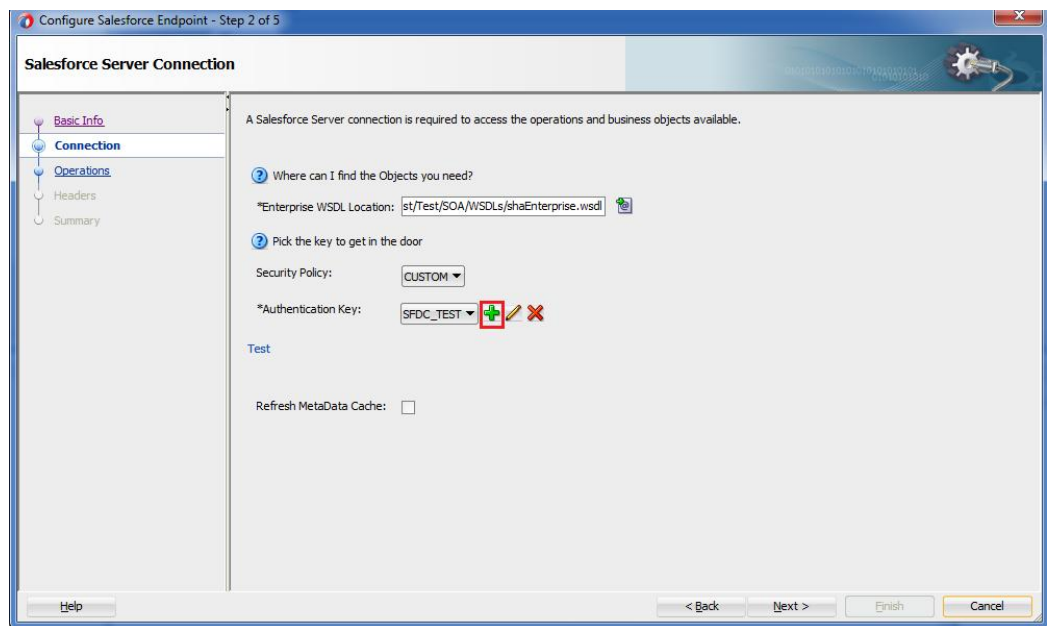

Note: Alternatively, you can store WSDL at an MDS location and access it, as shown in [Figure 10-10](#).

Figure 10 - 10 SOA Resource Browser

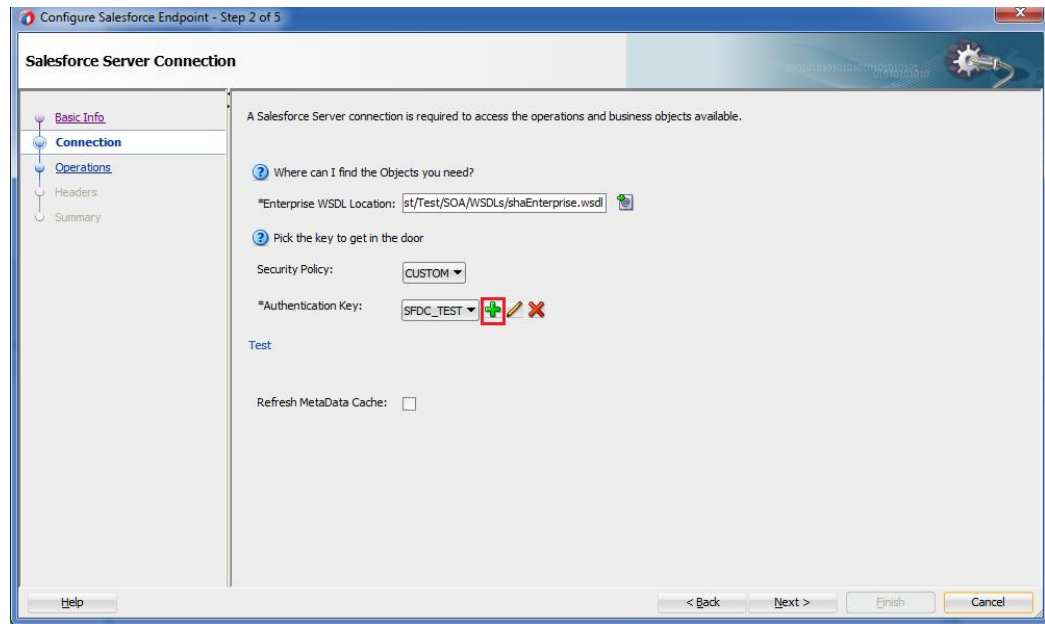

10. Click **OK**.
11. Traverse to IDE Connections → SOA-MDS. Select the appropriate SOA-MDS connection where you placed the Enterprise WSDL. Select the WSDL file to be used in the adapter configuration and click **OK**.
12. The WSDL location should be of the form 'oramds:/apps/SOA/WSDLs/Integratn/WSDLNAME.wsdl', as shown in [Figure 10-11](#).

Figure 10 - 11 WSDL location

13. Click **OK**.
14. Click + button to create a new **Authentication Key**, as shown in [Figure 10-12](#).

Figure 10 - 12 Create a New Authentication Key

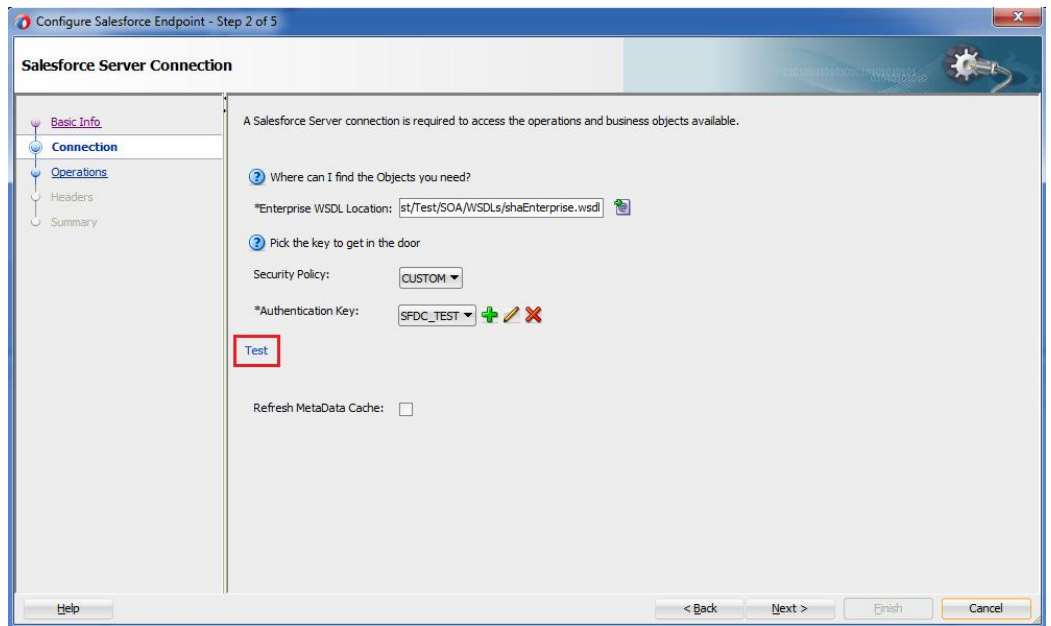

15. The **Add Credential** page is displayed, as shown in [Figure 10-13](#). Provide a suitable name and the Salesforce.com credentials. The password should be a combination of Salesforce.com password and Salesforce.com Security Token.

Figure 10 - 13 Add Credential

16. Click **Test Connection** button to validate the Authentication Key, as shown in [Figure 10-14](#).

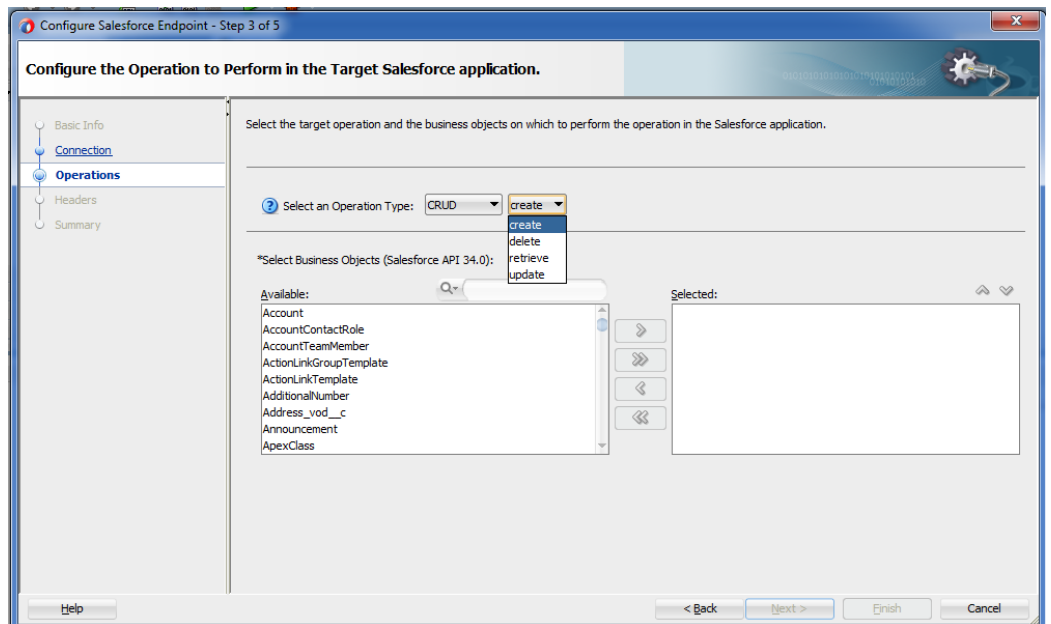

Figure 10 - 14 Test Connection

17. Click Next.

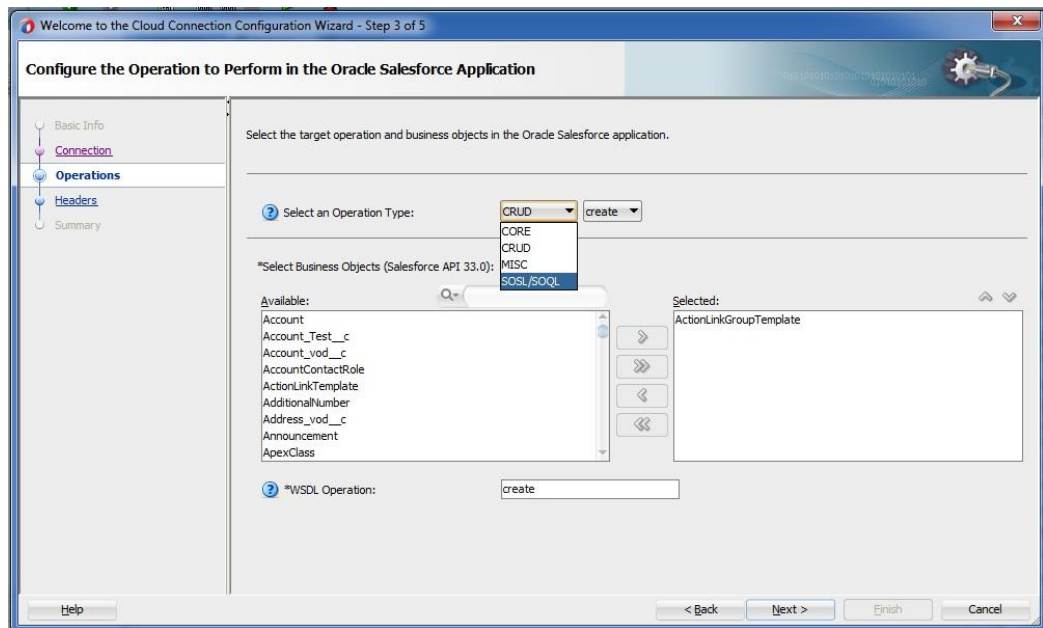

18. The Cloud Operation Configuration page is displayed, as shown in Figure 10-15.

Figure 10 - 15 Cloud Operation Configuration Page

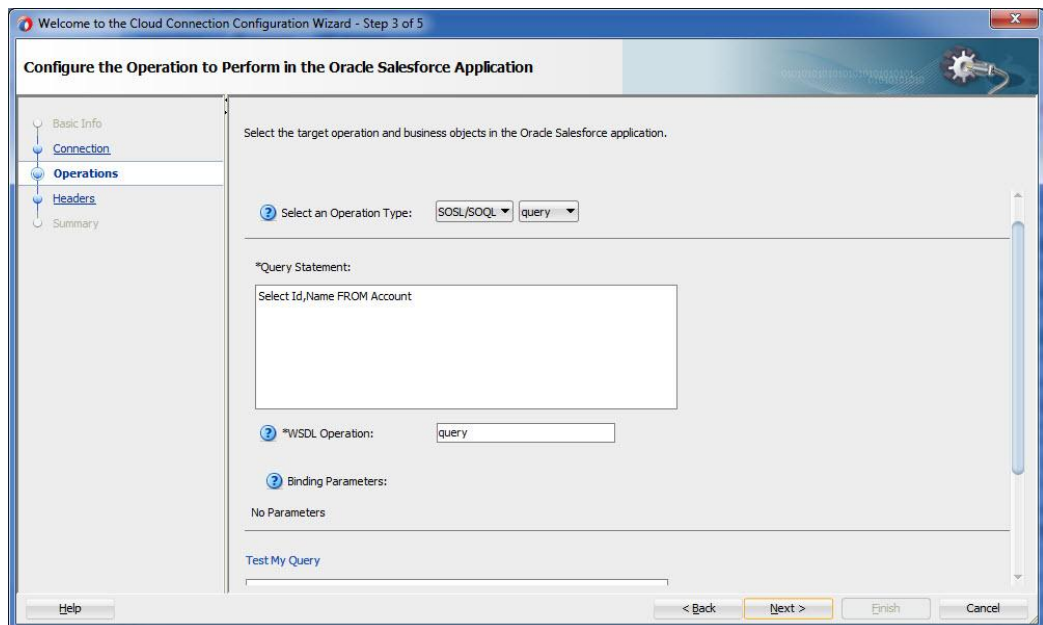

19. From the list of Operation Category, select SOSL/SOQL, as shown in the Figure 10-16.

Figure 10 - 16 Select SOSL/SOQL

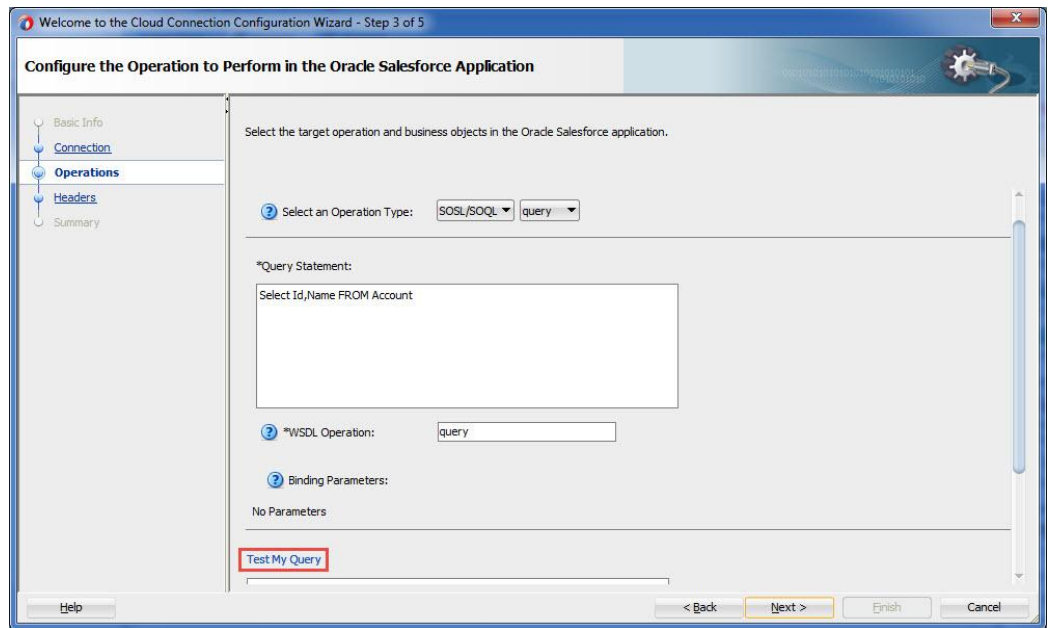

20. Now, the query operation will automatically be selected. Provide the query string in the text box, as shown in the [Figure 10-17](#).

Figure 10 - 17 Provide the query String

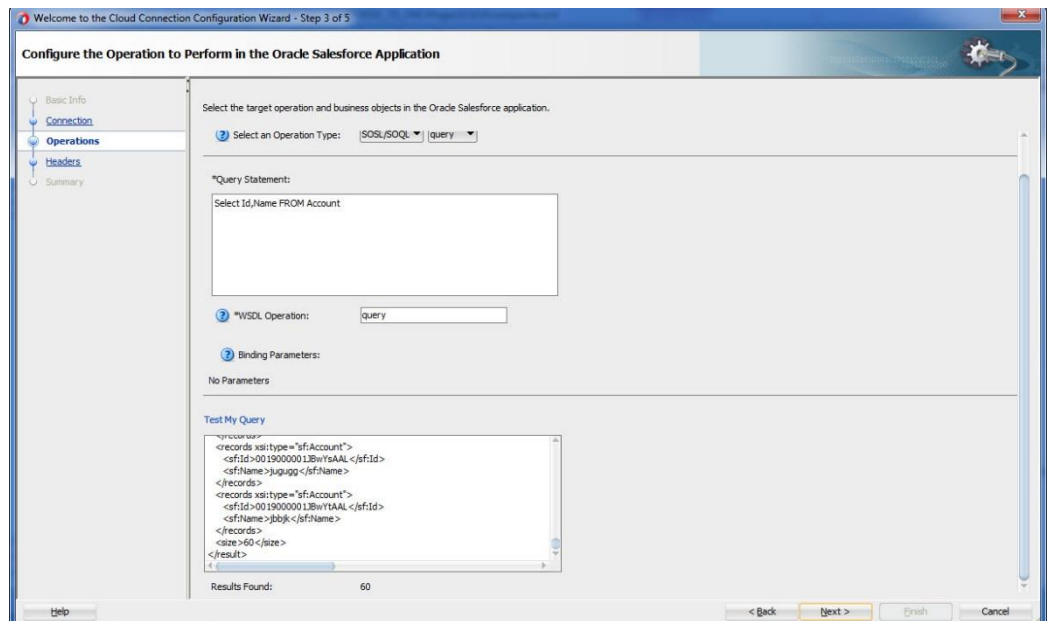

21. You can also test the query string after clicking on the **Query Test** button. As shown in [Figure 10-18](#).

Figure 10 - 18 Query Test button

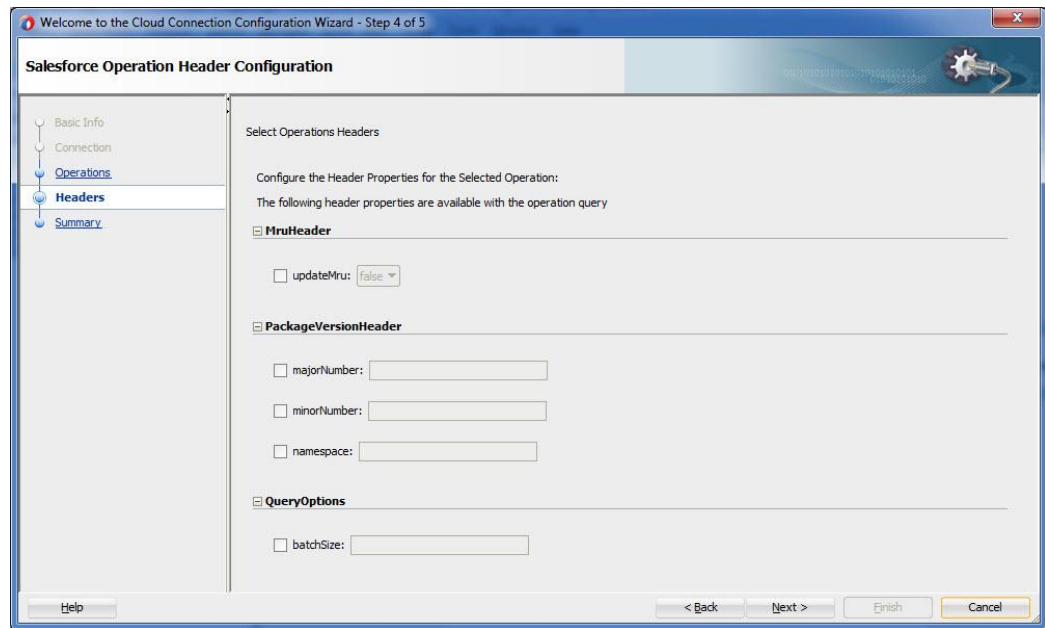

22. After clicking on query test button, a **Query Test** dialog appears, as shown in [Figure 10-19](#).

Figure 10 - 19 Query Test

23. Click on **Next**. The **Header and Properties** page is displayed. Provide the value of headers as per your business requirement, as shown in [Figure 10-20](#).

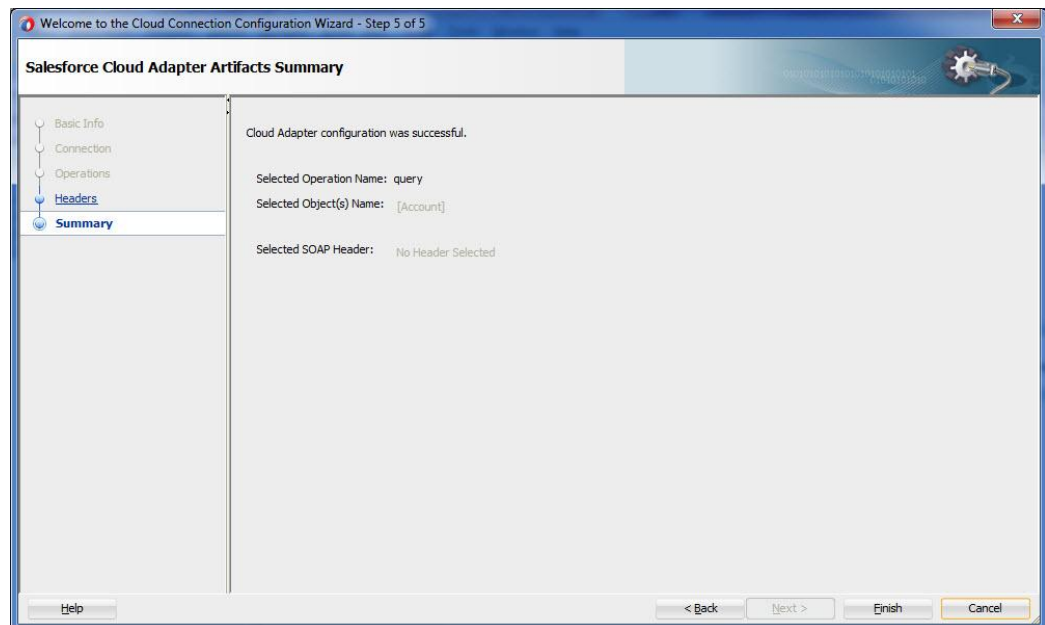

Figure 10 - 20 Provide the Value of Headers

24. Click **Next**.

25. The finish page is displayed. It provides a complete summary of the operation selected, object on which the operation would operate and the headers selected for that operation, as shown in [Figure 10-21](#).

Figure 10 - 21 Finish Page

26. Click the **Finish** button to complete adapter configuration.

27. After clicking on **Finish** button, the following screen appears, as shown in [Figure 10-22](#).

Figure 10 - 22 Composite Screen

Understanding query Response

The response returned by query operation has the following structure:

1. **done:** It is a Boolean element that contains the following values:
 - **True:** If all records are returned in a single invoke to query operation.
 - **False:** If all records are not returned in a single invoke to query operation, i.e., there are more records to fetch.
2. **queryLocator:** If the value of the element **done** is false, then query operation returns a queryLocator value that is used to make queryMore call to Salesforce.com.
3. **Records:** The set of records queried by the user.
4. **Size:** The number of records for that particular query.

Figure 10-23 shows all the above mentioned values.

Figure 10 - 23 Query Operation Structure

```

<complexType name="QueryResult">
  <sequence>
    <element name="done" type="xsd:boolean"/>
    <element name="queryLocator" type="tns:QueryLocator" nillable="true"/>
    <element name="records" type="ens:sObject" nillable="true" minOccurs="0" maxOccurs="1"/>
    <element name="size" type="xsd:int"/>
  </sequence>
</complexType>

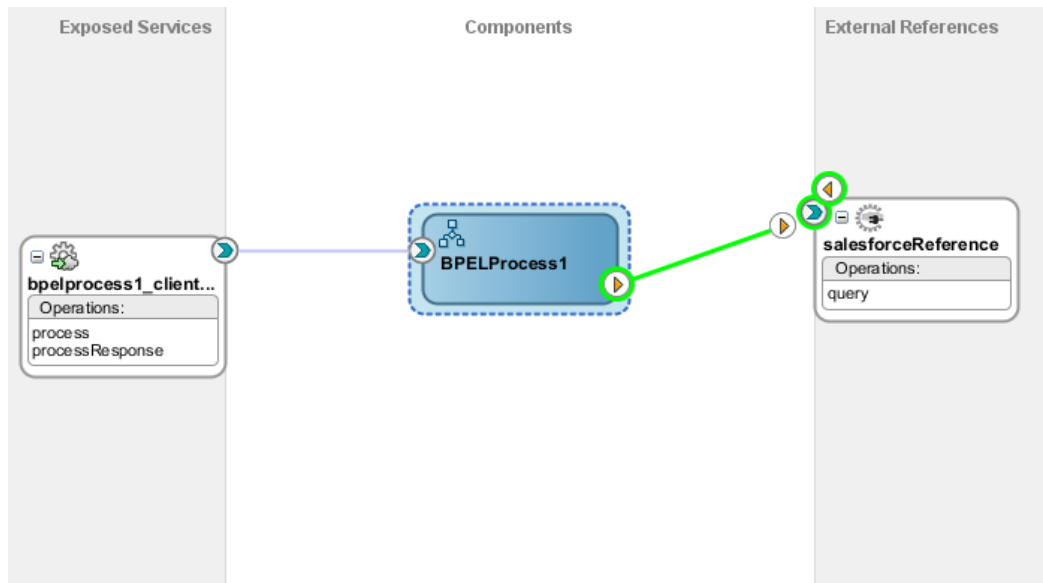

```

Integration with BPEL

Perform the following steps for integration with BPEL:

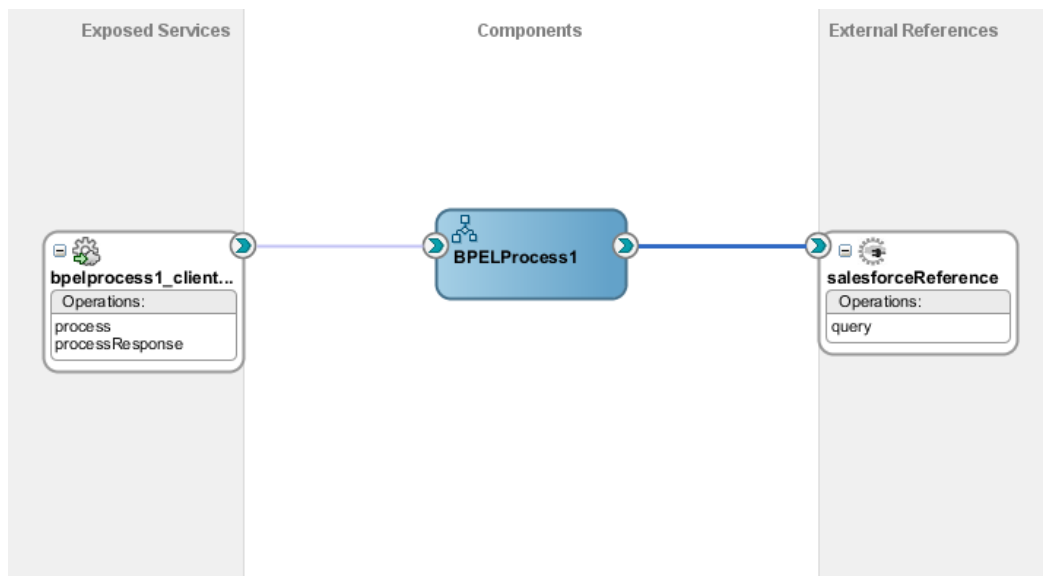

1. Connect **BPELProcess1** and **query** via a wire, as shown in Figure 10-24.

Figure 10 - 24 Wiring BPELProcess1 and query

2. After wiring, your composite will look, as shown in Figure 10-25.

Figure 10 - 25 Wiring BPELProcess1 and query

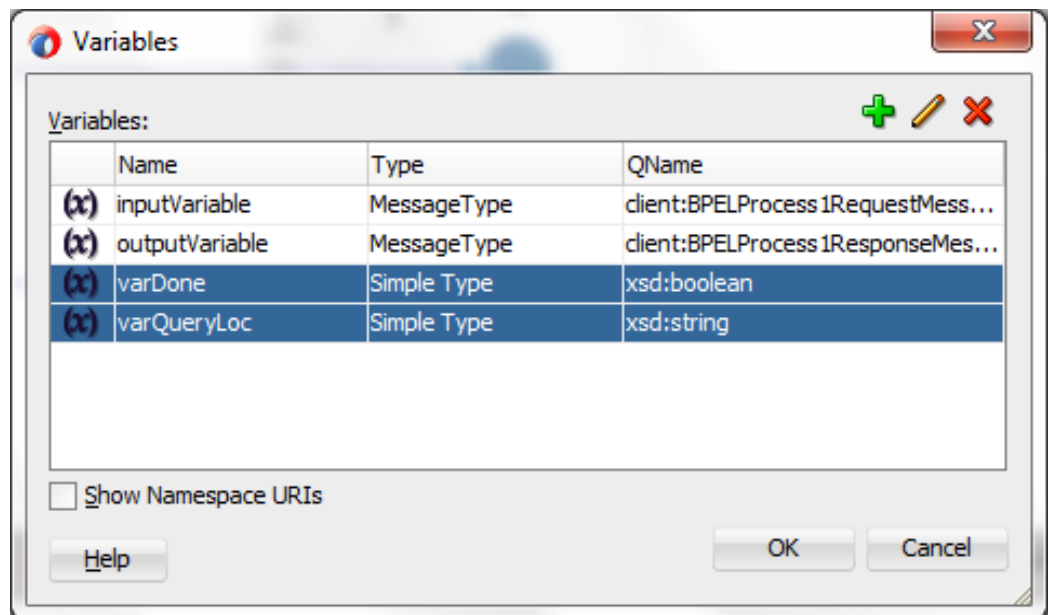

3. Double-click and open **BPELProcess1**. The **query** adapter should be present as part of Partner Links, as shown in Figure 10-26.

Figure 10 - 26 Open BPELProcess1

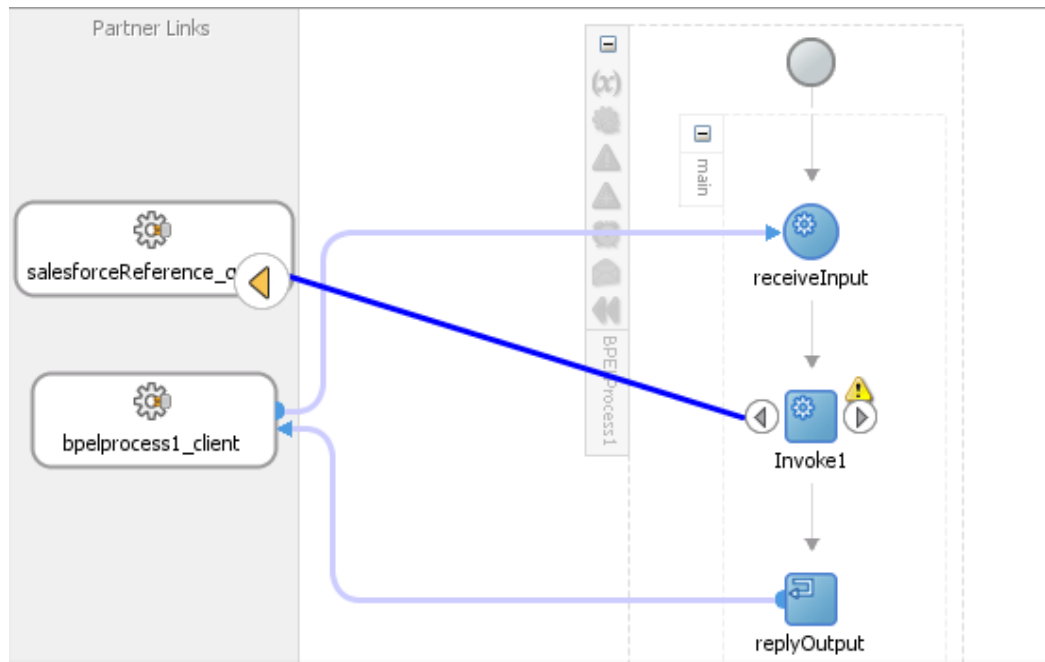

4. Create two variables **varDone** and **varQueryLoc** to track the values of “queryLocator” and “done” returned in query response from Salesforce.com, as shown in [Figure 10-27](#).

Figure 10 - 27 Variables Screen

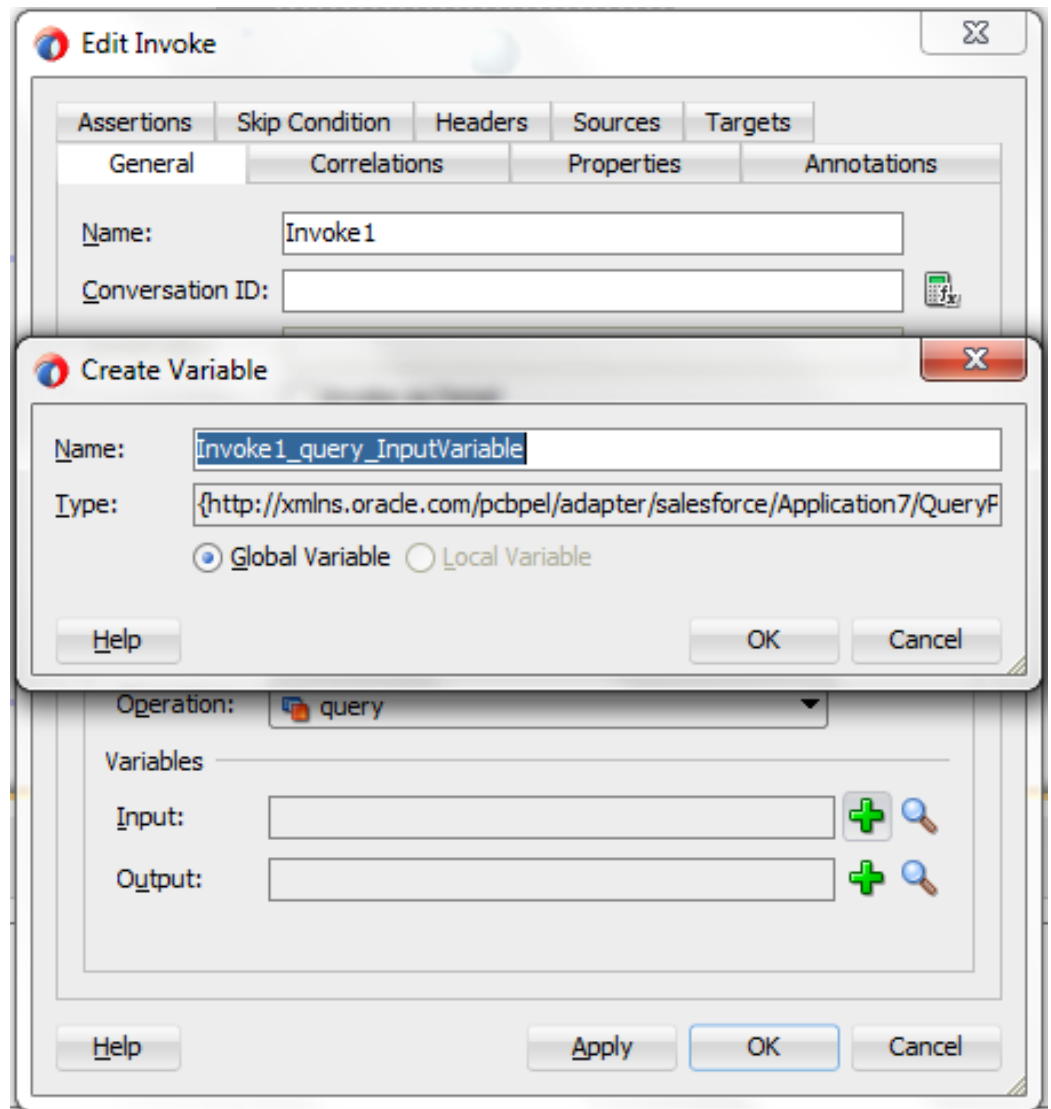

5. Add an **invoke activity** to invoke the query Partner Links, as shown in [Figure 10-28](#).

Figure 10 - 28 Invoke activity

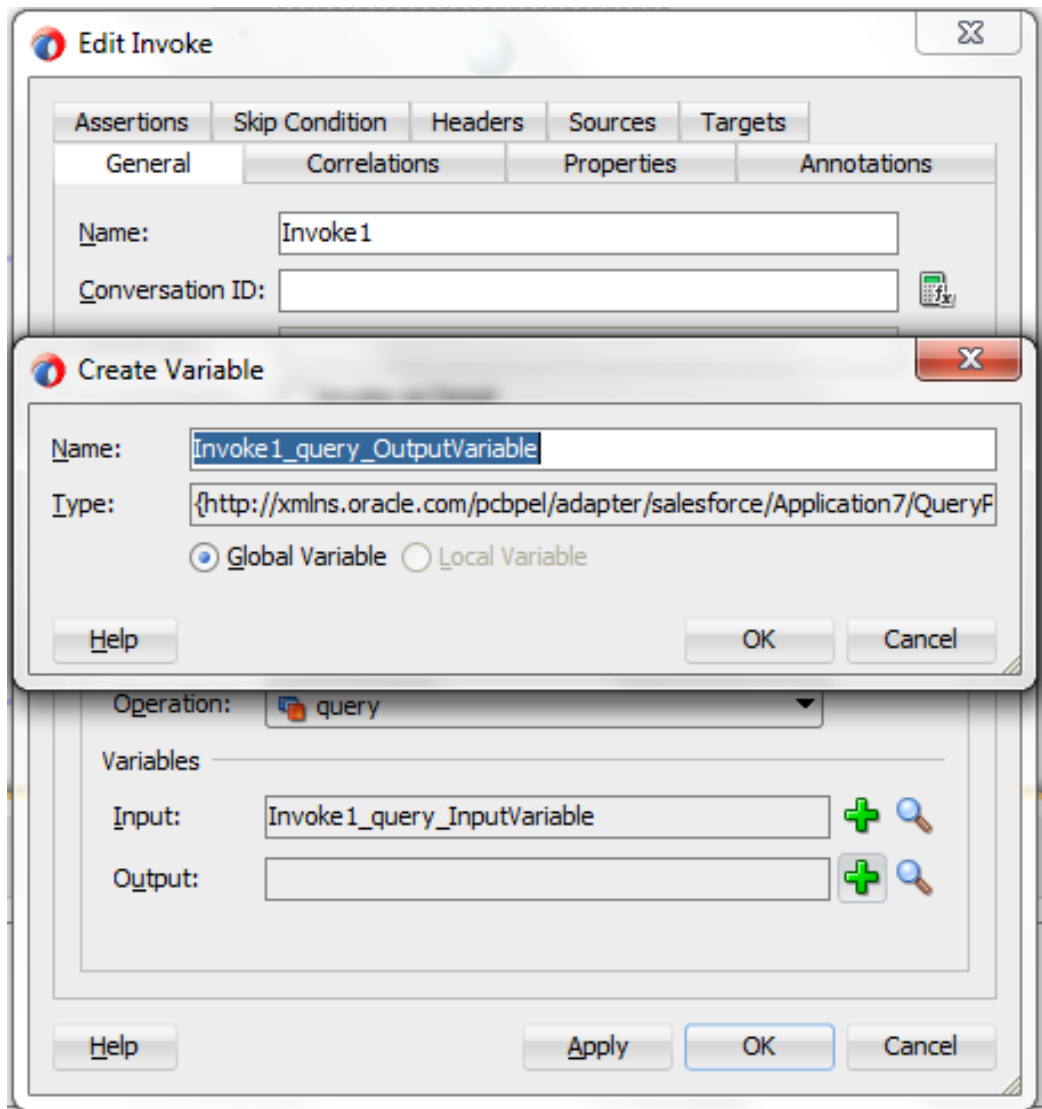

6. Create an input variable to the partner link by clicking the '+' button adjacent to **Input** text box in the **Variables** section. The **Create Variable** dialog is displayed, as shown in [Figure 10-29](#).

Figure 10 - 29 Create Variable

7. Create an output variable from the partner link by clicking the '+' button adjacent to **Output** text box in the **Variables** section. The **Create Variable** dialog is displayed, as shown in [Figure 10-30](#).

Figure 10 - 30 Create Variable

8. Introduce Assign activity right after the invoke activity, as shown in [Figure 10-31](#).

Figure 10 - 31 Introduce Assign activity

9. Inside the Assign activity, assign the value of “Invoke1_query_OutputVariable/done” variable to “varDone” variable, as shown in Figure 10-32.

Figure 10 - 32 Wire the Assign activity

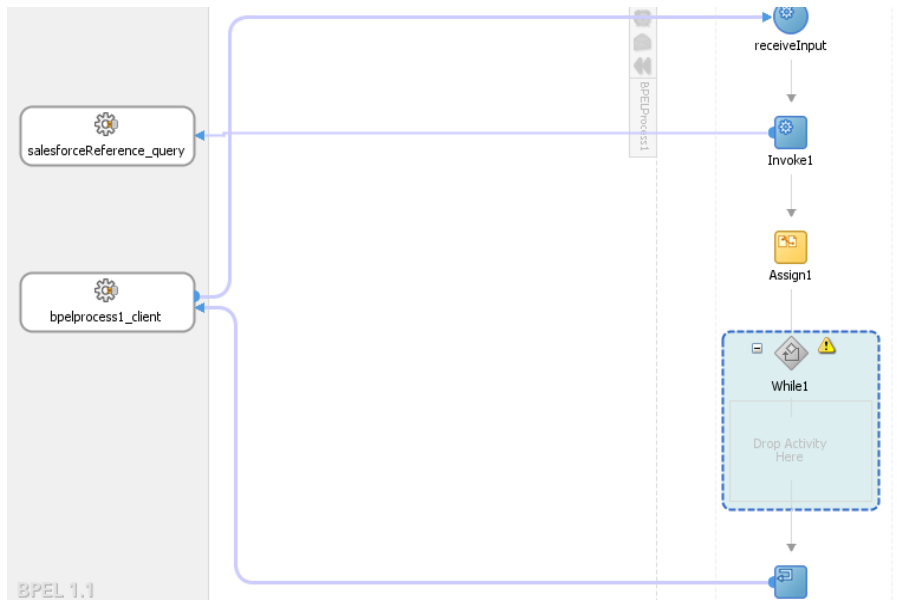

10. Next, assign the value of “Invoke1_query_OutputVariable/queryLocator” variable to “varQueryLoc” variable in the same Assign activity, as shown in Figure 11-33.
11. Click on **Apply** and then **OK**.

Figure 10 - 33 Wire the Assign activity

12. Add a While activity after the Assign activity, as shown in Figure 10-34. While activity is used to introduce iterations in the BPEL flow.

Figure 10 - 34 Add a While activity

13. Double-click on the While Activity, a dialog box appears where you can specify condition for the while loop. Here, provide the condition, as shown in [Figure 10-35](#).

Figure 10 - 35 Edit While activity

14. Click on **Apply** and then **OK**.
15. Drag and drop a **Sequence** Activity inside the **While**, as shown in [Figure 10-36](#).

Figure 10 - 36 Add Sequence Activity

The While Activity will look like [Figure 10-37](#).

Figure 10 - 37 While Activity

16. Drag and drop Invoke activity in the **Sequence**, as shown in [Figure 10-38](#).

Figure 10 - 38 Add Invoke activity in the Sequence

17. Wire this invoke activity to the partner link named “query”, as shown in [Figure 10-39](#).

Figure 10 - 39 Wire the invoke activity

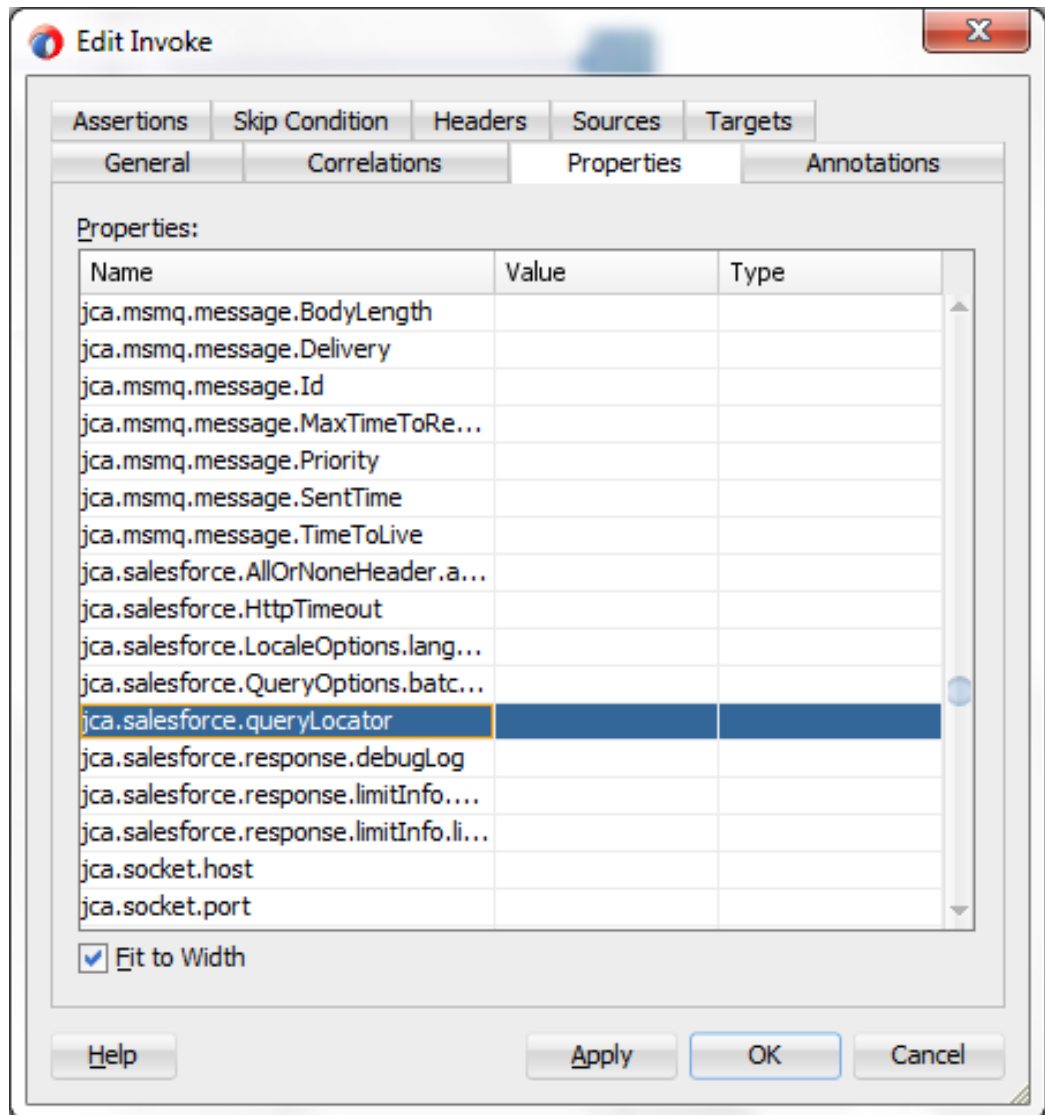

18. An “Edit Invoke” dialog will appear. Create input and output variables for this invoke activity by clicking on “+” sign, as shown in [Figure 10-40](#).

Figure 10 - 40 Edit Invoke

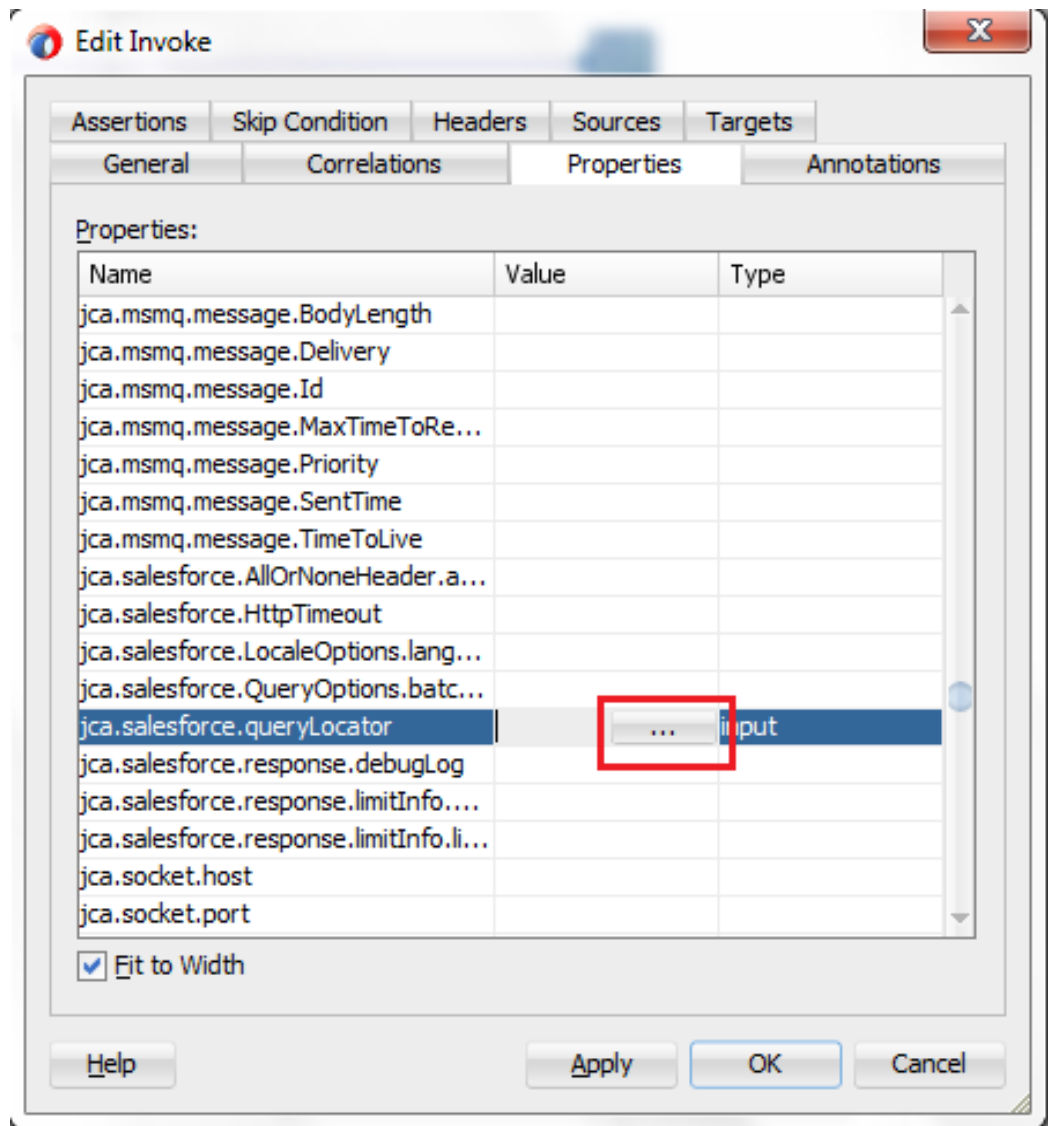

19. Click on **Properties** tab in the same dialog. Search for the property named “jca.salesforce.queryLocator”, as shown in [Figure 10-41](#).

Figure 10 - 41 Properties Tab

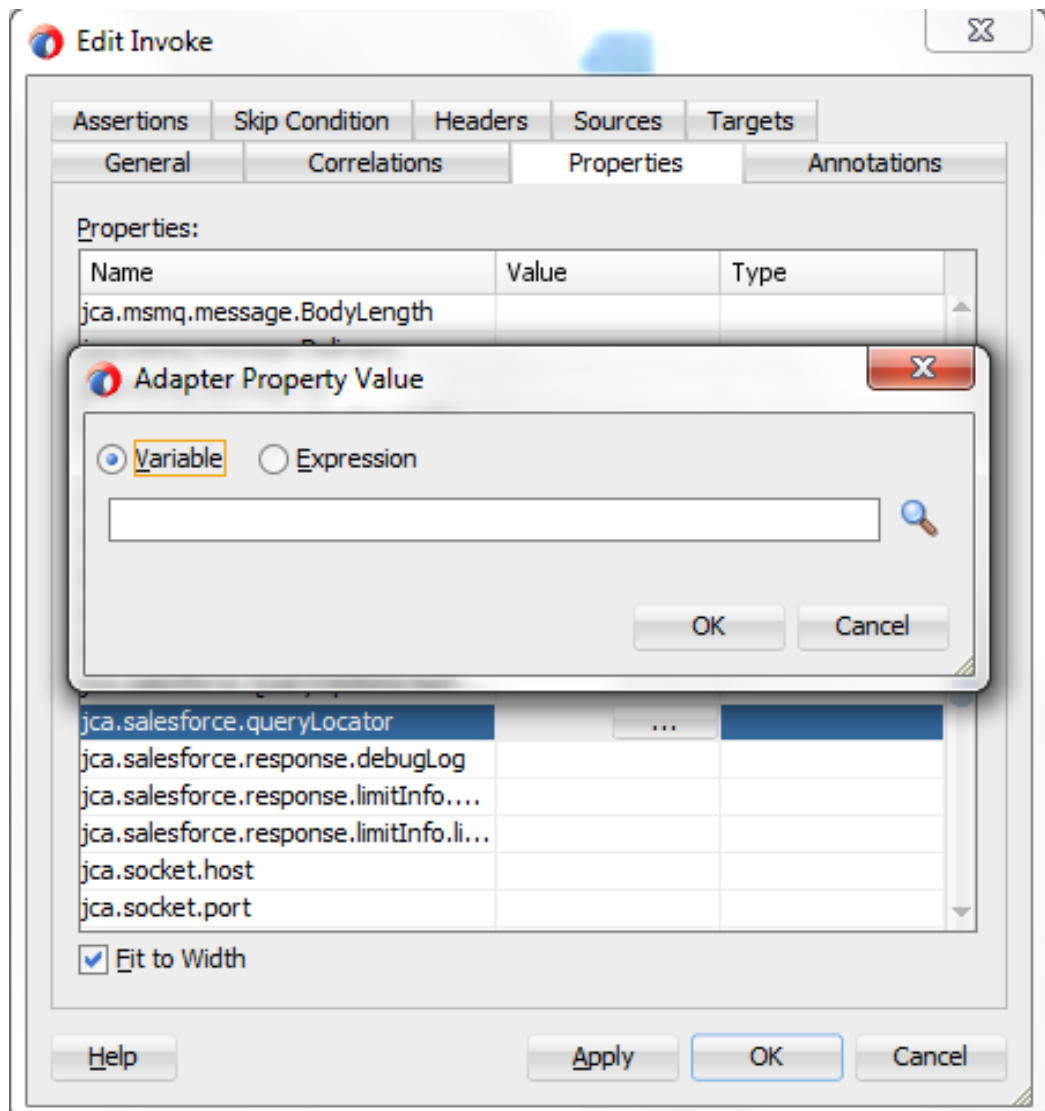

20. Browse for the variable by double-clicking on the button shown in [Figure 10-42](#).

Figure 10 - 42 Browse for the variable

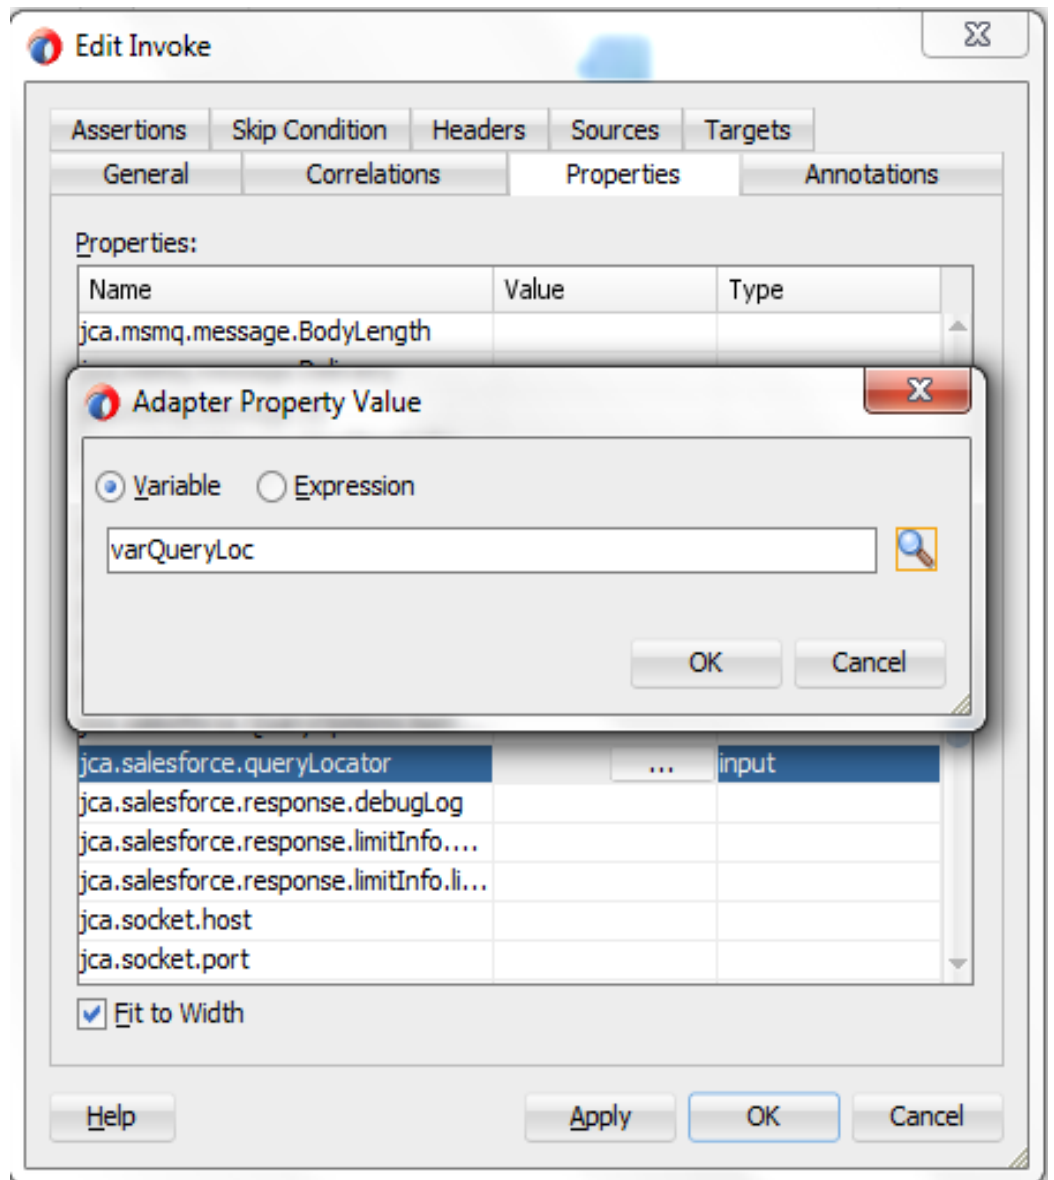

21. Adapter Property Value dialog box is displayed. Click on the **Search**, as shown in Figure 10-43.

Figure 10 - 43 Search Property Value

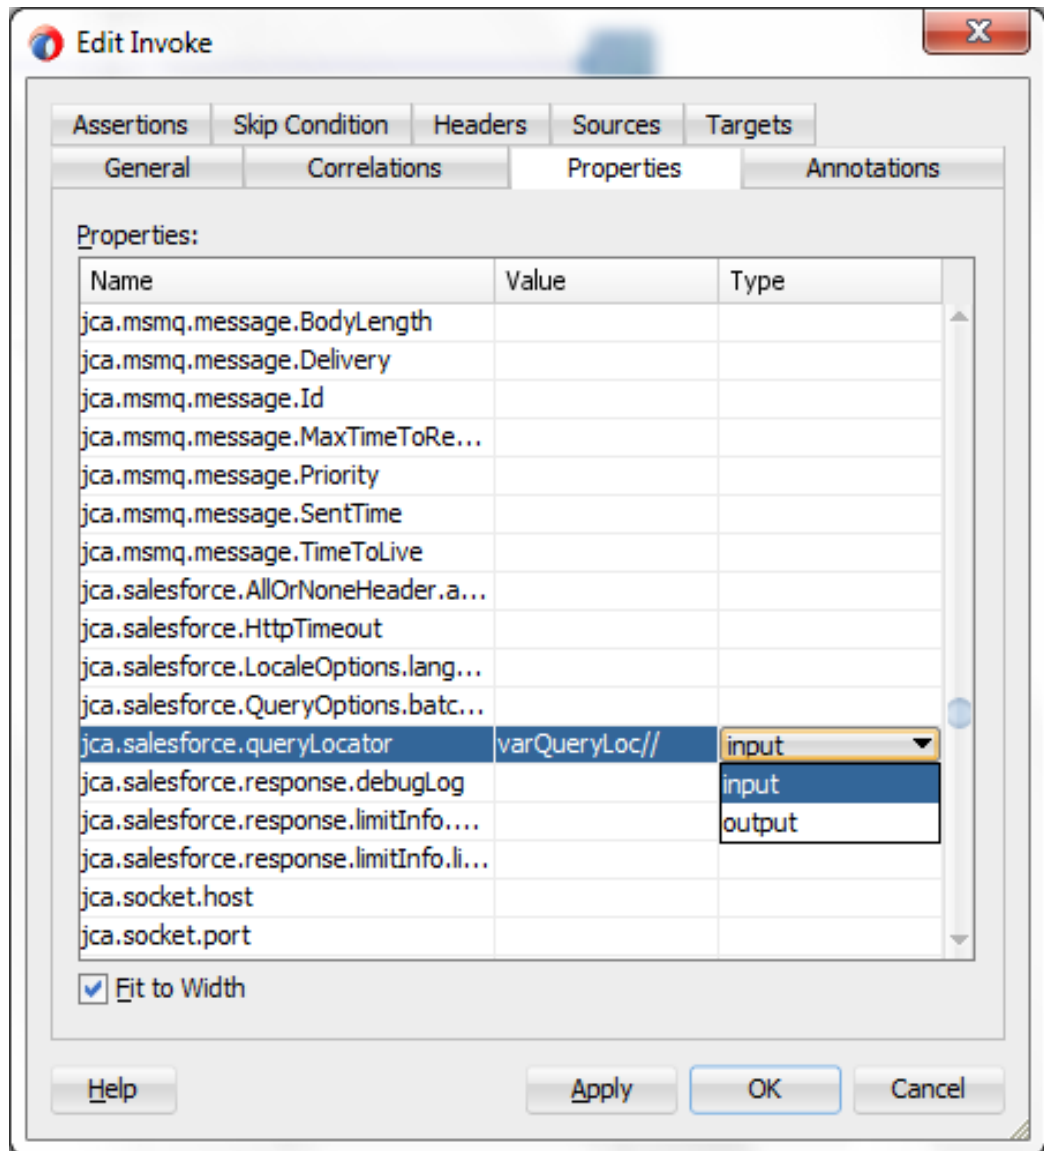

22. Select the variable **varQueryLoc** and click **OK**, as shown in [Figure 10-44](#).

Figure 10 - 44 Select the variable varQueryLoc

23. Click on **OK** and select the **Type** as **input**, as shown in [Figure 10-45](#).

Figure 10 - 45 Select the Type as input

24. Click on **Apply** and then **OK**.

25. Drag and drop the **Assign** activity in the While Sequence, as shown in [Figure 10-46](#).

Figure 10 - 46 Drag and drop Assign activity

26. Double-click on **Assign activity**, and assign the value of “Invoke2_query_OutputVariable/done” variable to “varDone” variable, as shown in [Figure 10-47](#).

Figure 10 - 47 Assign the Value

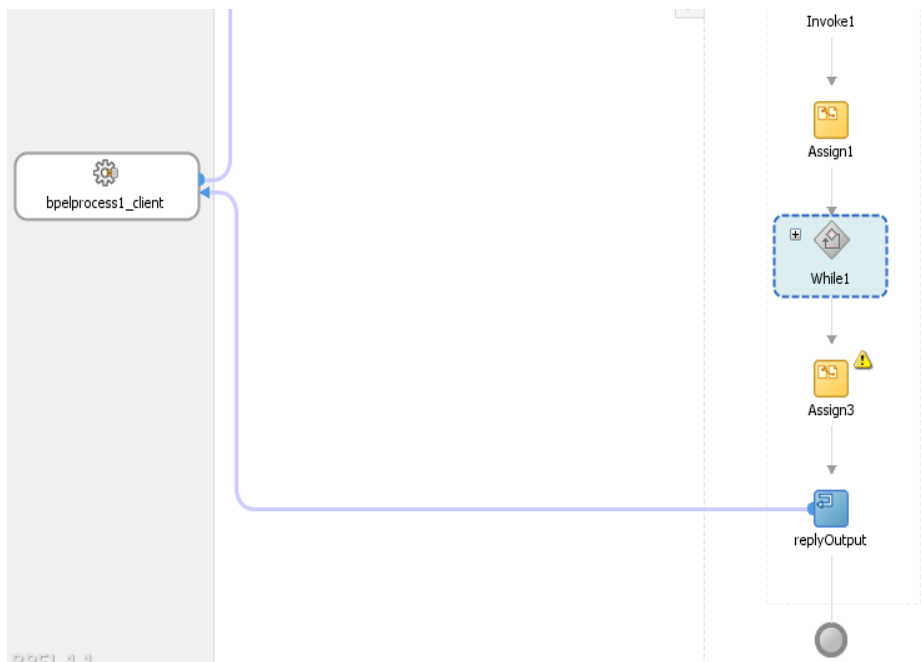

27. Assign the value of “Invoke2_query_OutputVariable/queryLocator” variable to “varQueryLoc” variable, as shown in [Figure 10-48](#).

Figure 10 - 48 Assign the Value

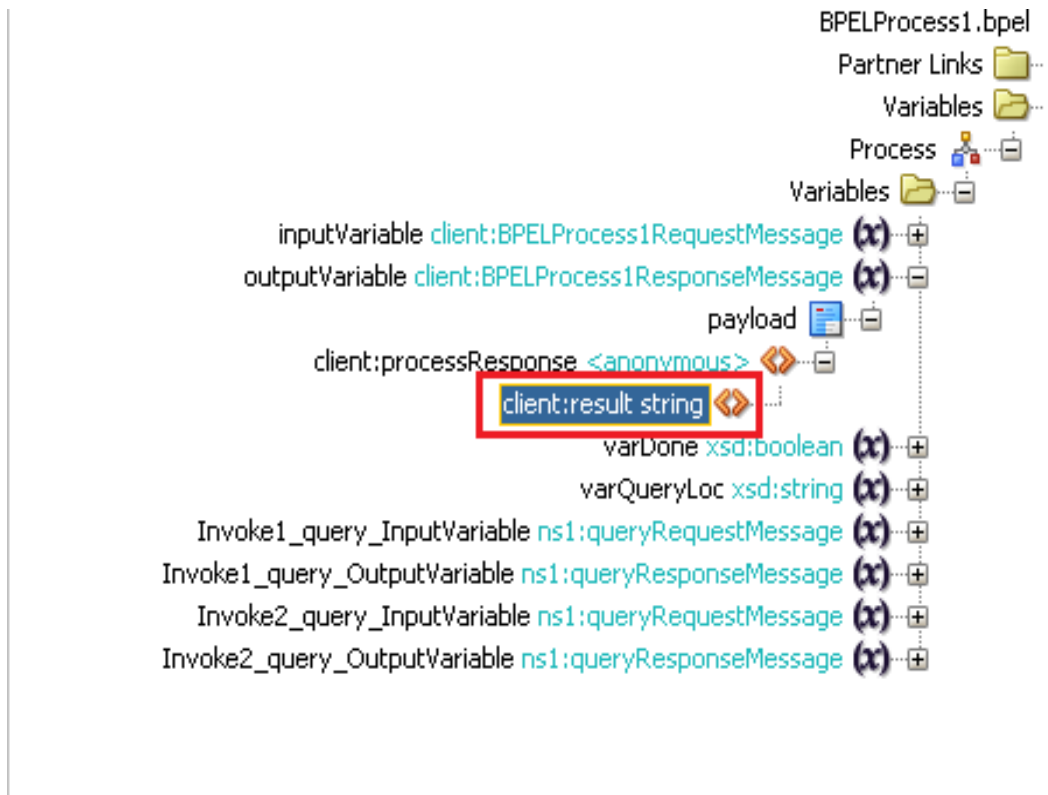

28. Click on **Apply** and then **OK**.
29. Drag and drop **Assign** activity right after the **While** activity, as shown in [Figure 10-49](#).

Figure 10 - 49 Drag and drop Assign activity

30. Double click on **Assign** activity and look for the variable **processresponse/result**, as shown in [Figure 10-50](#).

Figure 10 - 50 Double click on Assign activity

31. Drag and drop the Expression over to this variable, as shown in [Figure 10-51](#).

Figure 10 - 51 Drag and drop the Expression over to this variable

32. **Expression Builder** dialog box is displayed. Provide an expression value, as shown in Figure 10-52.

Figure 10 - 52 Expression Builder Dialog

33. Click **OK**.
34. In the Assign activity, click on **Apply** and then **OK**.

Deploy the Composite

Perform the following steps to deploy the composite.

1. In the **Application Navigator** pane, right-click **Project1** and select **Deploy -> Project1**, as shown in [Figure 10-53](#).

Figure 10 - 53 Navigator Screen

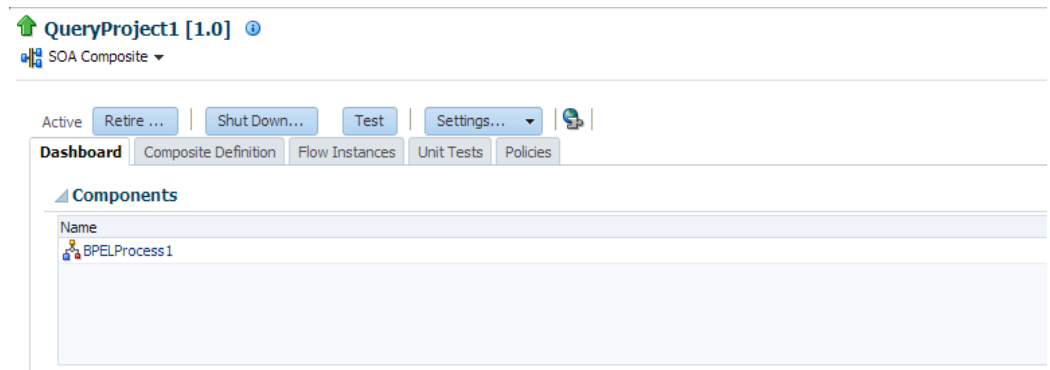

2. Select the **Deploy to Application Server** option and follow the instructions displayed on the screen. Using this option you can deploy the composite on the Application server after providing the details of the server.

Test the Composite

Perform the following process to test the composite.

1. Login to Enterprise Manager Console for the server you deployed your project on.
2. Open **QueryProject1**
3. Click the **Test** button to test the Web service, as shown in [Figure 10-54](#).

Figure 10 - 54 Test Tab

Since we are not mapping the input variable anywhere, you can provide any random input here.

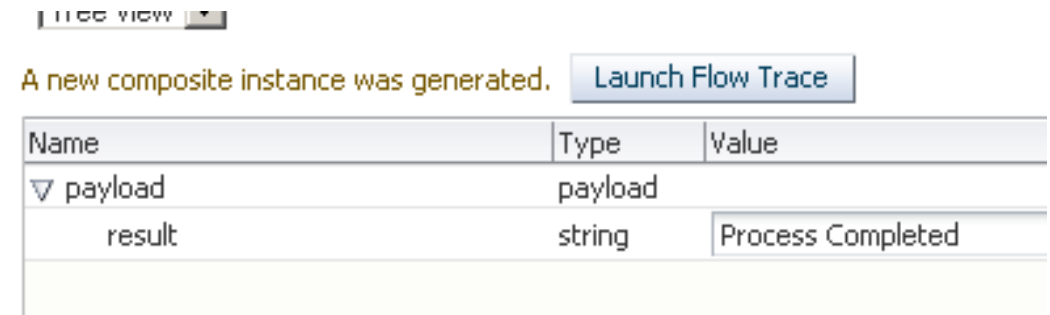

4. Click on **Test Web Service** button, as shown in [Figure 10-55](#).

Figure 10 - 55 Test Web Service

5. After successful execution the response contains the expression that you provided in the last assign activity, as shown in [Figure 10-56](#).

Figure 10 - 56 Execution Window

6. Click the **Launch Flow Trace** button to view the **Audit Trail**, as shown in [Figure 10-57](#).

Figure 10 - 57 Launch Flow Trace

10.1.2. How to use MDS for importing WSDL into JDeveloper?

Oracle Metadata Services (MDS) provides a unified store for Metadata and ensures reliable access to metadata for fusion middleware artifacts like XSD, WSDL, etc. This Use Case intends to make you familiar with how Enterprise WSDL placed in MDS can be used in Oracle cloud adapter for Salesforce.com. It first provides a brief introduction about placing the Enterprise WSDL in MDS and then explains you how this file can be used in the Oracle Cloud Adapter for Salesforce.com.

Steps to Place Enterprise WSDL in MDS:

1. Create SOA Application.
2. Create an MDS connection.
3. Transfer artifacts to MDS.

Create SOA Application

Follow the steps from 1-32 of section [10.1.1 Creating the BPEL Process](#).

Create an MDS connection.

Now you need to create a new MDS connection for your application.

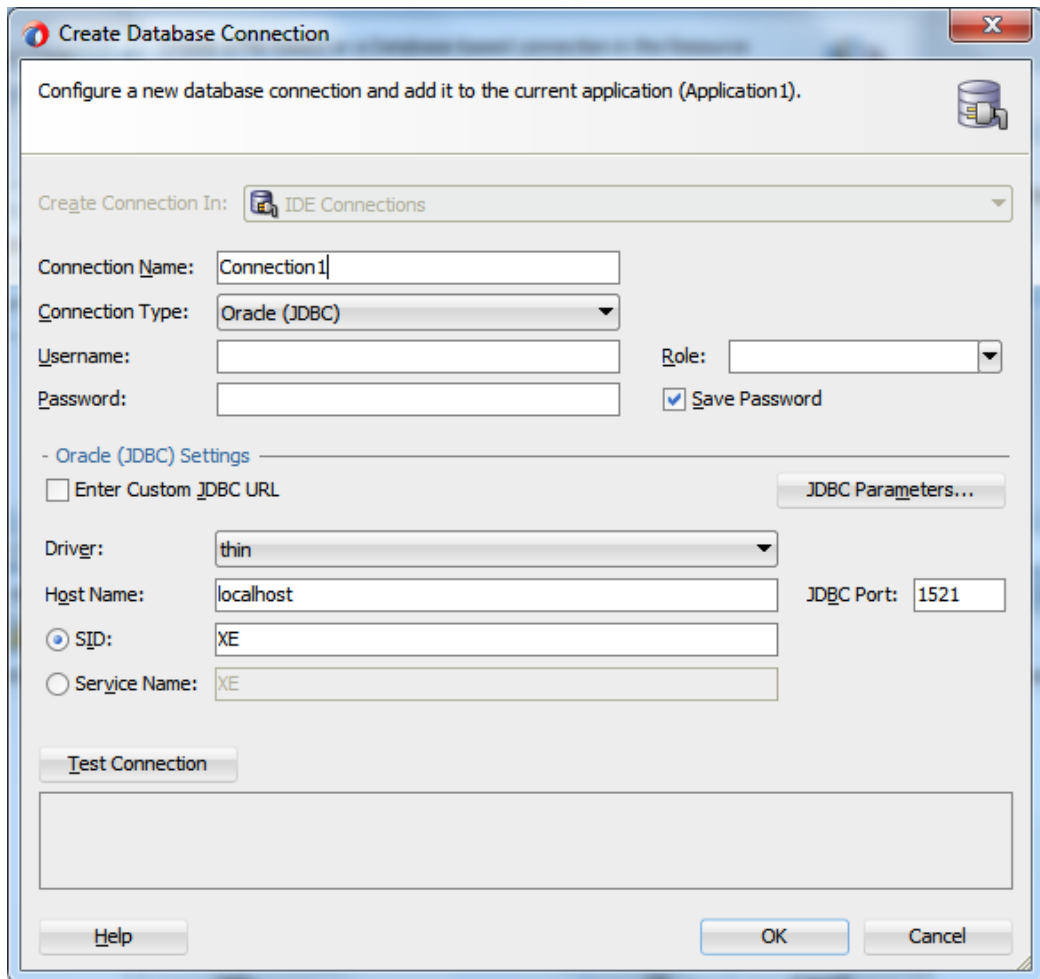

1. For this, press Ctrl+N and search for SOA-MDS Connection option and select it, a new window will pop up asking for MDS connection details Popup window has been shown in [Figure 10-61](#).

Figure 10 - 61 Create SOA-MDS Connection

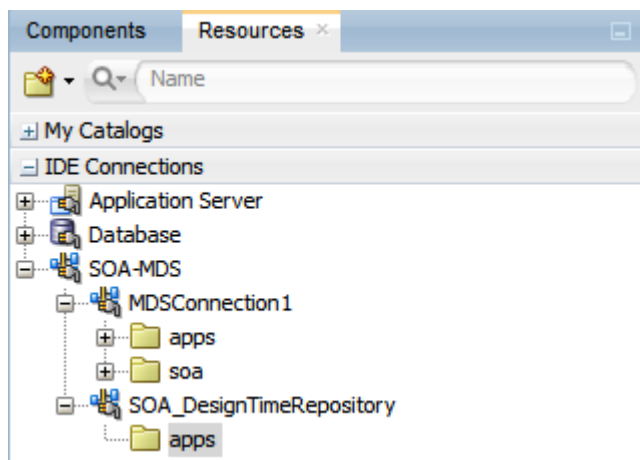

2. For this Use Case we will be using the connection type as DB Based MDS. To enter DB connection details, please click on “+”. You will see the Create database connection pop-up as shown in [Figure 10-62](#). Please enter the connection details as per your installation and DB configuration of the SOA SUITE.

Figure 10-62 Create Database Connection

3. Once the connection has been established with MDS, under the Resources tab, in IDE Connections, you will see the SOA-MDS connection as shown in the [Figure 10-63](#).

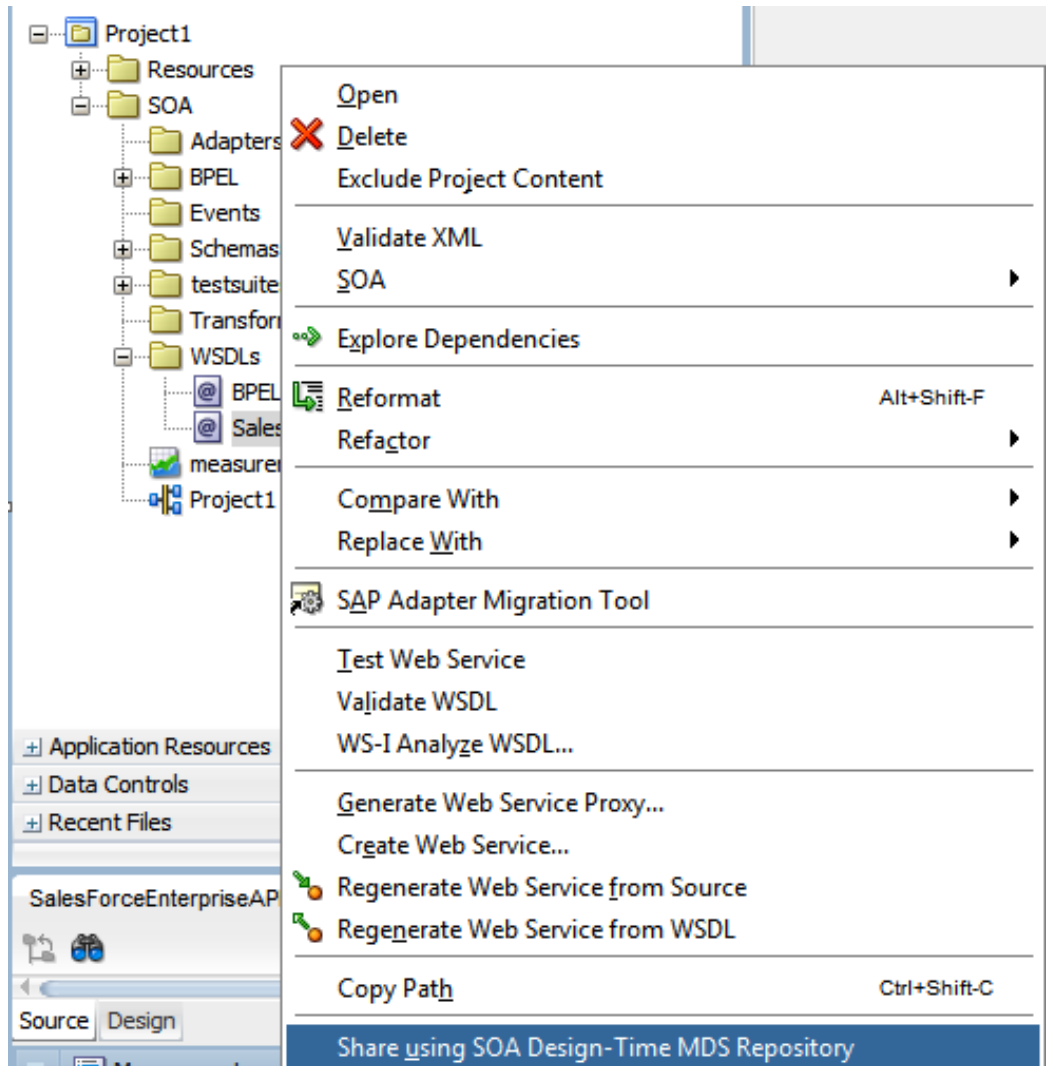

Figure 10-63 Create Database Connection

Transfer Enterprise WSDL to MDS

1. In your project, Under WSDL's directory, right-click on the **Enterprise WSDL** and select the Share using SOA Design-Time MDS Repository as shown in the [Figure 10-64](#).

Figure 10-64 SOA Design-Time MDS Repository

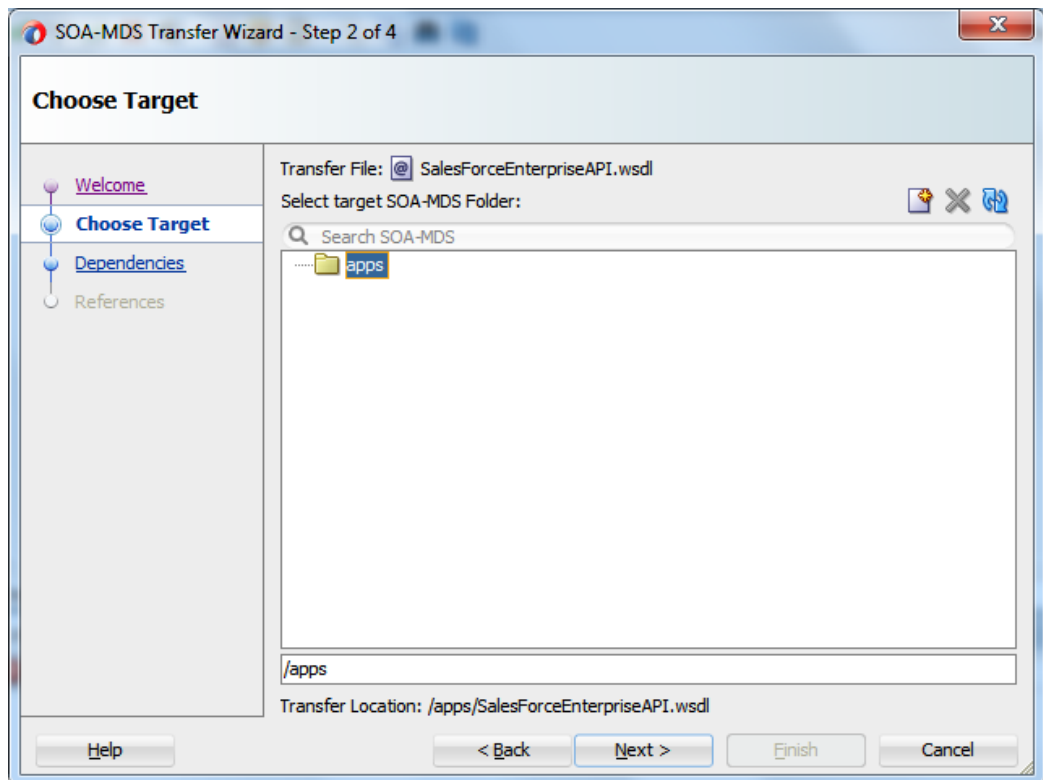

2. Now you will see a SOA-MDS Transfer Wizard as shown in the [Figure 10-65](#).

Figure 10-65 SOA-MDS Transfer Wizard

3. Click on the **Next** button and you will see 'apps' folder as shown in the [Figure 10-66](#). You can also notice the Transfer Location.

Figure 10 - 66 SOA-MDS Transfer Wizard

4. Click **Next**, You will see what all files are being transferred and you can also note MDS URL of the WSDL File as shown in [Figure 10-67](#).

Figure 10 - 67 SOA-MDS Transfer Wizard

5. Click **Next**, You can see what all files would be updated with the oramds URLs [Figure 10-68](#).

Figure 10 -68 SOA-MDS Transfer Wizard

6. Click **Finish** to transfer the WSDL to SOA_DesignTimeRepository. Please note that once the file is transferred then it is no more part of your SOA project. Check your

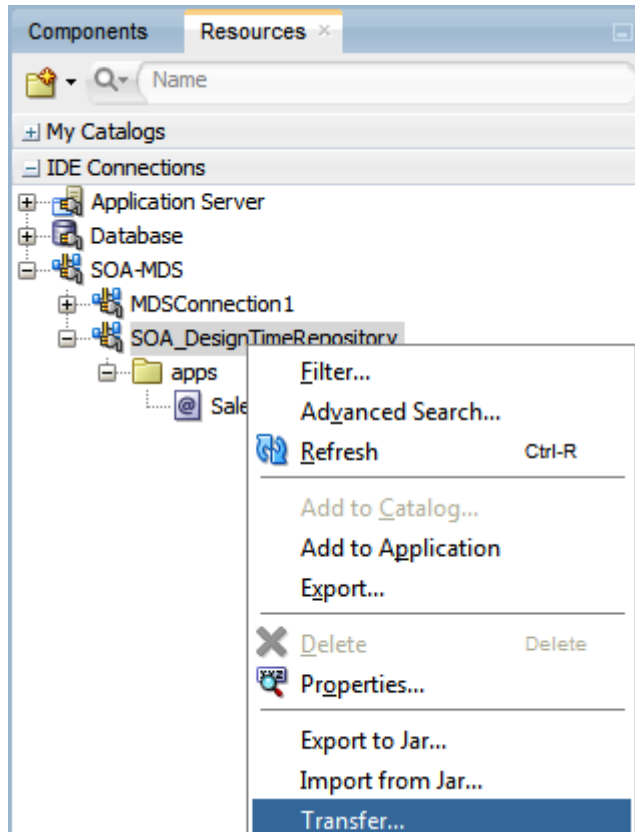

resources palette now. Expand SOA-MDS connection to see the transferred file as shown in the [Figure 10-69](#).

Figure 10 -69 After Transferring WSDL to SOA_DesignTimeRepository

7. Now to transfer WSDL File from SOA_DesignTimeRepository to Target MDS Connection, Right-Click on the SOA_DesignTimeRepository and select the **Transfer** option as shown in the [Figure 10-70](#).

Figure 10 - 70 Transfer from SOA_DesignTimeRepository

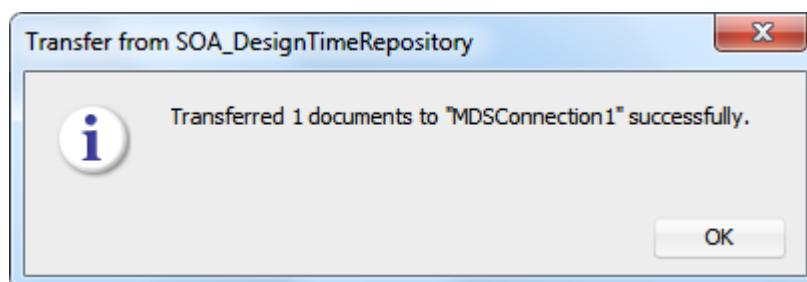

8. In the pop-window, select the Enterprise WSDL and click on **Transfer** as shown in the [Figure 10-71](#).

Figure 10 -71 Transfer from SOA_DesignTimeRepository

10. You will get a confirmation message after file has been transferred to target MDS connection as shown in the [Figure 10-72](#).

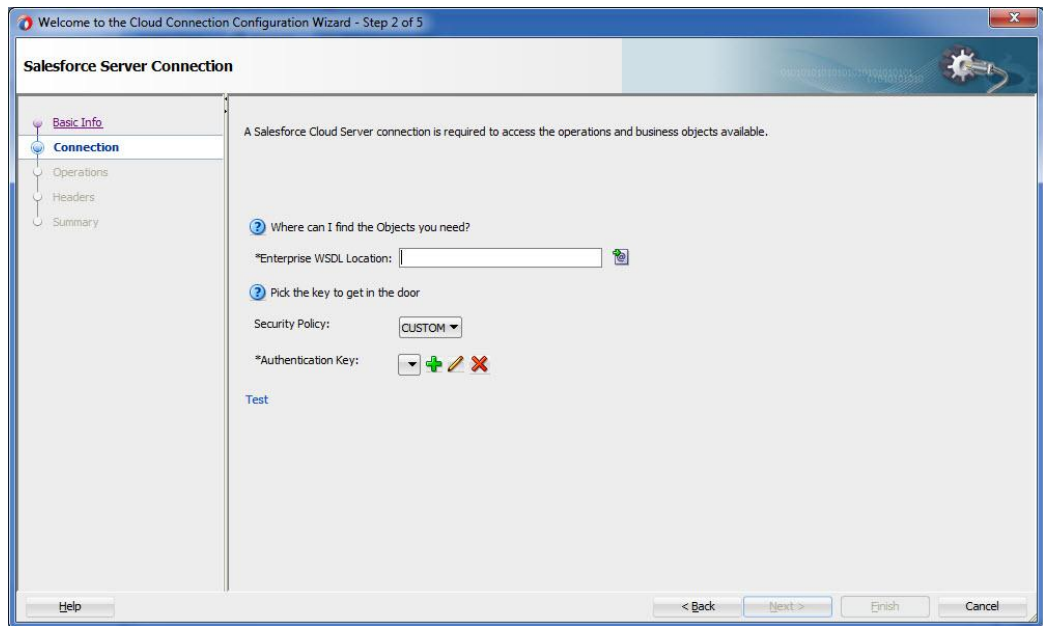

Figure 10 - 72 Confirmation for Transfer of WSDL File to MDS Connection

Using Enterprise WSDL placed at MDS in Oracle Cloud Adapter for Salesforce.com.

1. To make use of the WSDL file that is placed in MDS, Open the Adapter in Edit mode and navigate to the connection page as shown in [Figure 10-73](#).

Figure 10 - 73 Connection Page in Edit Mode

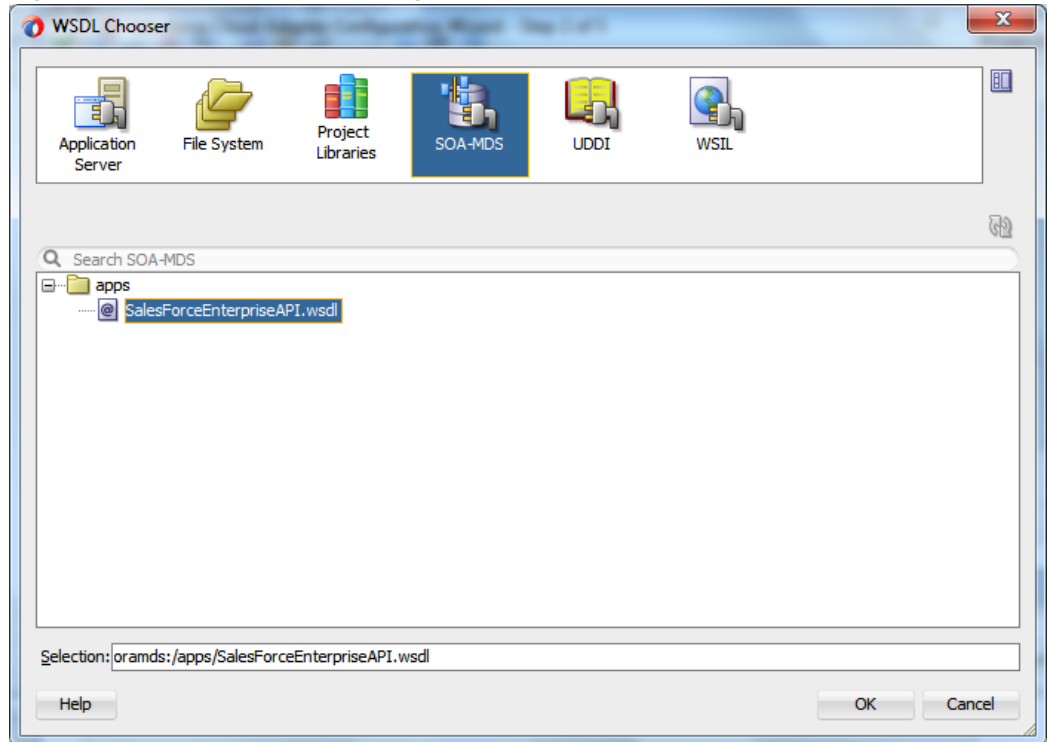

2. Click on the **WSDL Chooser** button and select SOA-MDS tab as shown in [Figure 10-74](#).

Figure 10 - 74 Connection page in edit mode

3. Expand apps folder and select the **Enterprise WSDL** as shown in [Figure 10-75](#). This is the WSDL that was transferred to MDS in the previous steps.

Figure 10 - 75 WSDL Chooser Page

4. Subsequent steps for configuration would remain the same as in section 10.1.1 [Creating the BPEL Process](#)
5. In your JCA file, you can notice that the targetWSDLURL property has been updated with MDS file location see as shown in [Figure 10-76](#).

Figure 10 - 76 Connection page in edit mode

```
<adapter-config name="salesforceReferencePortType" adapter="salesforce" wsdlLocation="..
<connection-factory location="cloud/CloudAdapter">
  <non-managed-connection managedConnectionFactoryClassName="oracle.cloud.connector.sa
    <property name="targetWSDLURL" value="orams:/apps/SalesForceEnterpriseAPI.wsdl"/>
    <property name="csfkey" value="SFDC_USER"/>
    <property name="csfMap" value="SOA"/>
    <property name="applicationVersion" value="29.0"/>
  </non-managed-connection>
</connection-factory>
```

10.1.3. How to use Debug Header (Response Header)?

Perform the following steps to use debug header and response headers.

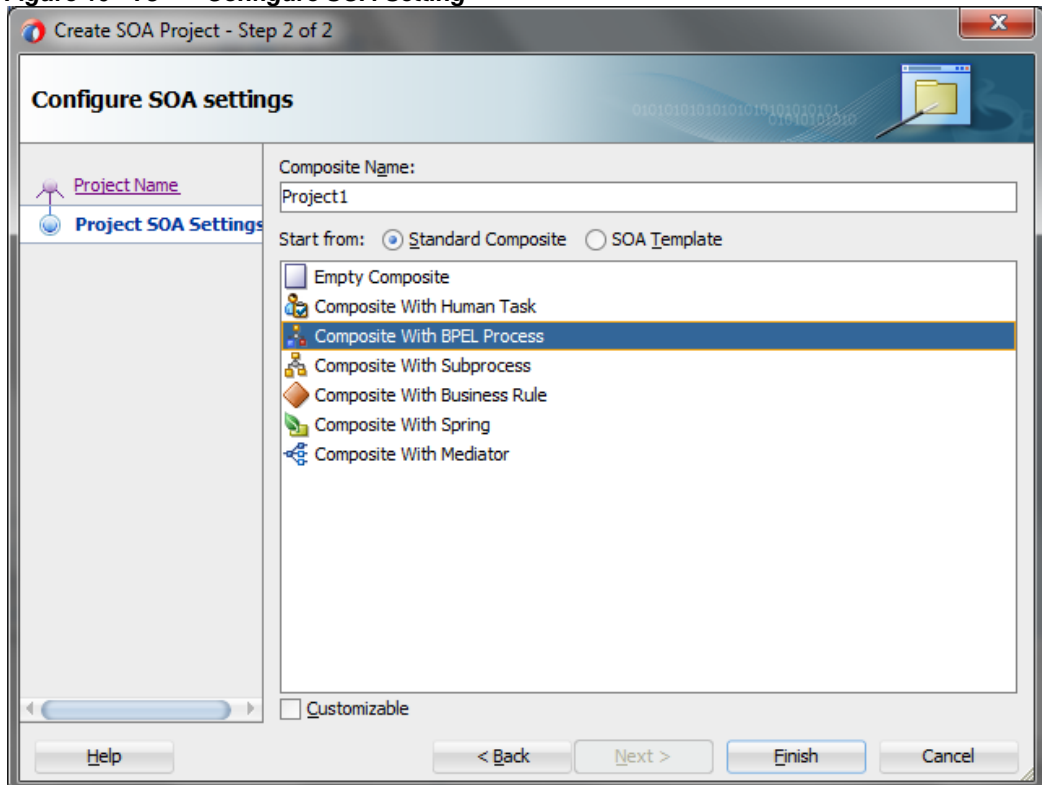

1. Create a New project in an existing application or in a new application.
2. Provide a suitable name to your project, as shown in [Figure 10- 77](#).

Figure 10 - 77 Name your project

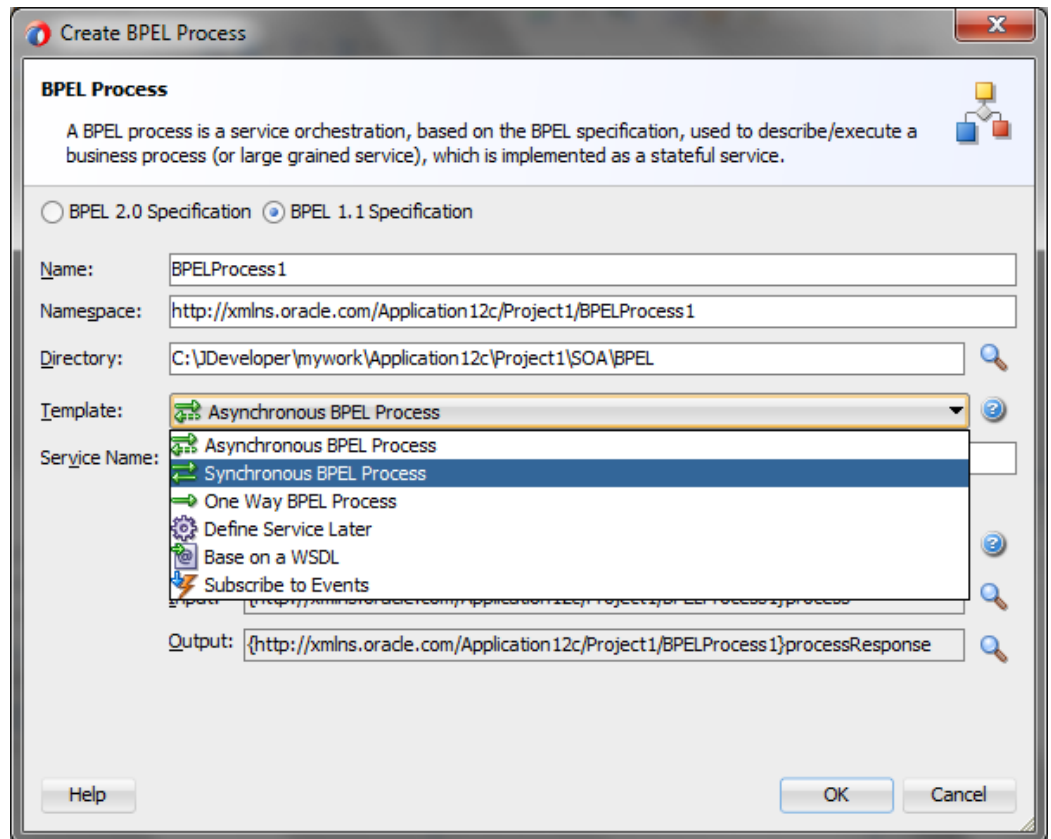

3. Click **Next** and select **Composite with BPEL Process** from Standard Composite list, as shown in Figure 10- 78.

Figure 10 - 78 Configure SOA Setting

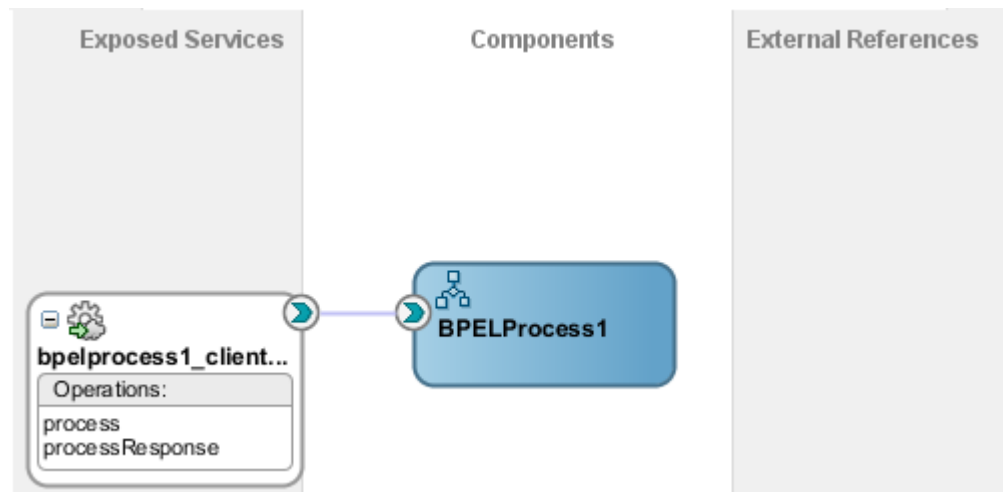

4. Click **Finish**.
5. Select the **Synchronous BPEL Process** from **Template** drop-down and click **OK**, as shown in Figure 10- 79.

Figure 10 - 79 Create BPEL Process

The composite.xml shown in Figure 10- 80.

Figure 10 - 80 Composite.xml

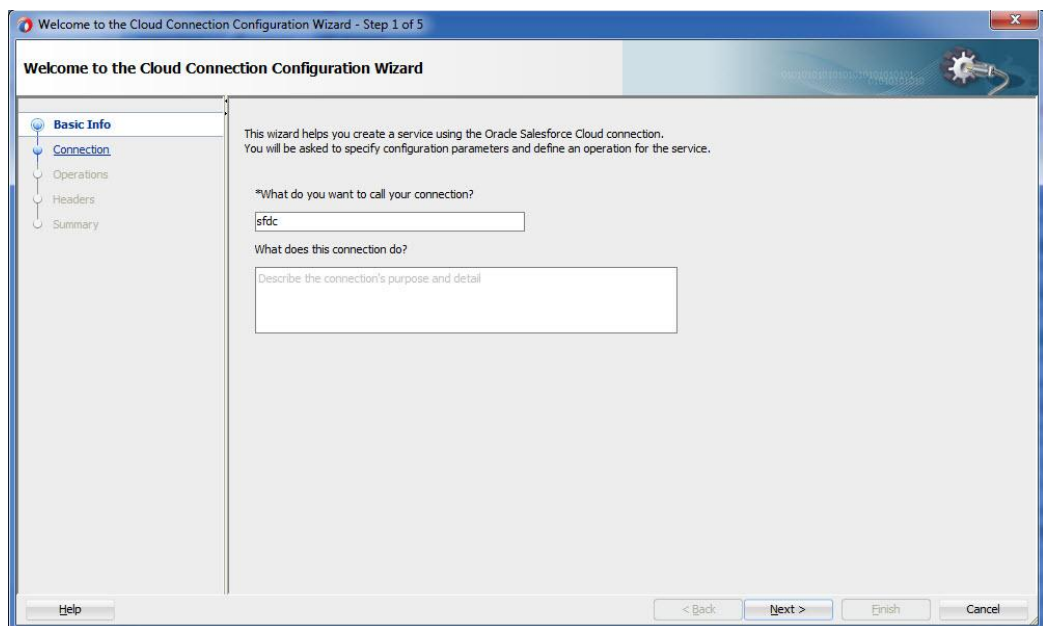

6. In **External References** swim-lane of the composite.xml file, right-click and select **Salesforce** adapter, as shown in Figure 10- 81.

Figure 10 - 81 **Salesforce adapter**

7. The Salesforce Cloud Adapter Configuration Wizard - Welcome page is displayed, as shown in [Figure 10- 82](#).

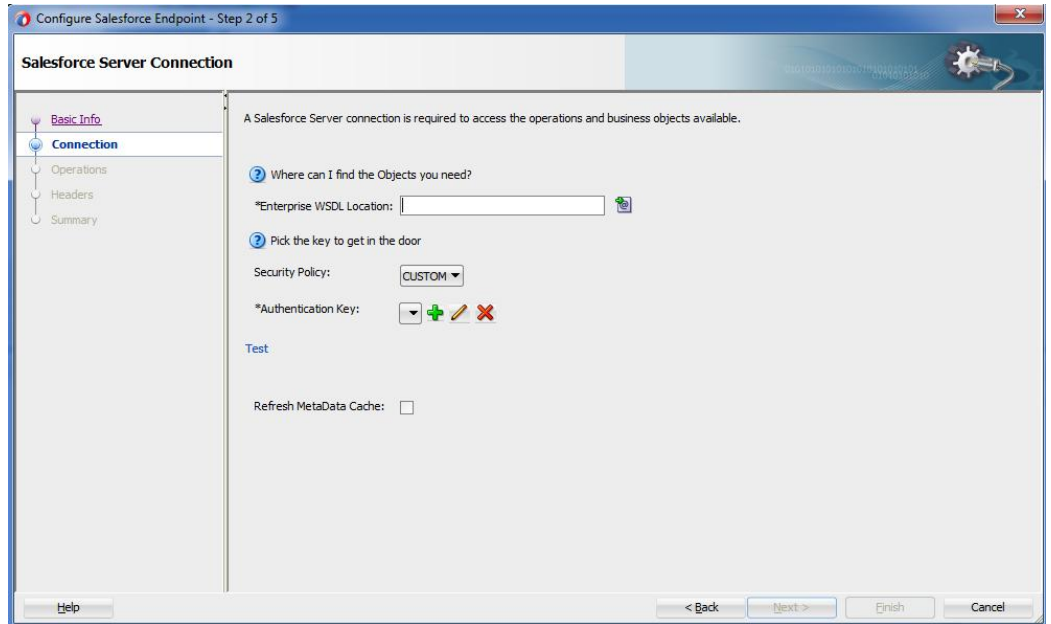

Figure 10 - 82 **Welcome Page**

8. Click **Next**.
9. The **Salesforce Cloud Server Connection** page is displayed. The **WSDL Location** and **Authentication Key** textboxes are already populated. It picks up these values

from the cache. You can re-enter these values. If you want to use a different value, click the **Find existing WSDLs** icon, which is located to the right of the **WSDL Location** field, as shown in [Figure 10- 83](#).

Figure 10 - 83 *Salesforce Cloud Server Connection Page*

10. The **WSDL Chooser** dialog is displayed, browse and select the downloaded Enterprise WSDL and click **OK**, as shown in [Figure 10- 84](#).

Figure 10 - 84 *SOA Resource Browser*

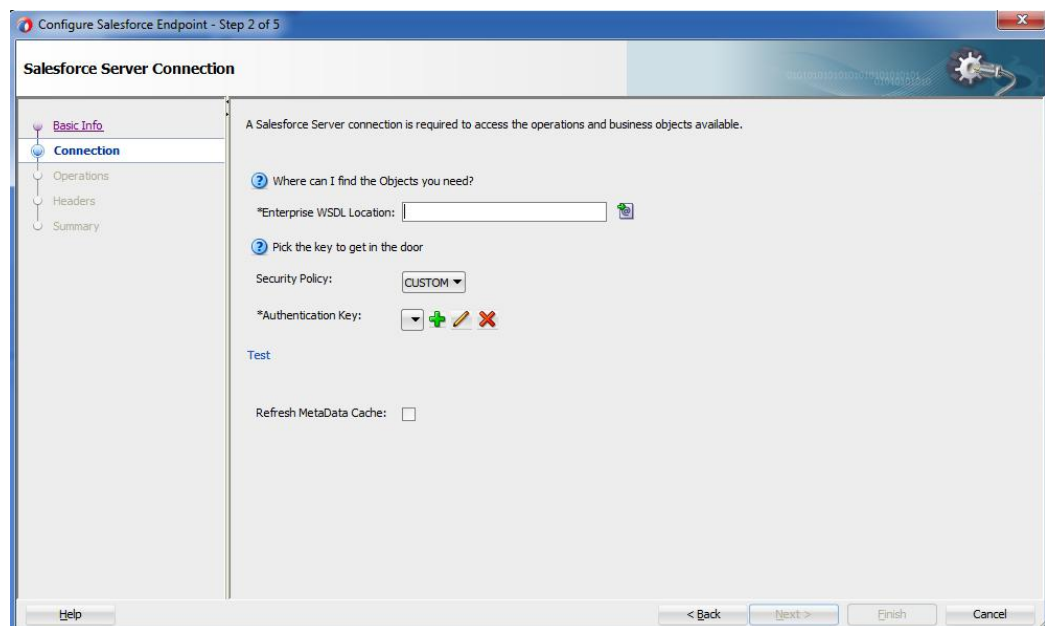

Note that as an alternative, you can store WSDL at an MDS location and access it, as shown in [Figure 10- 85](#).

Figure 10 - 85 SOA Resource Browser

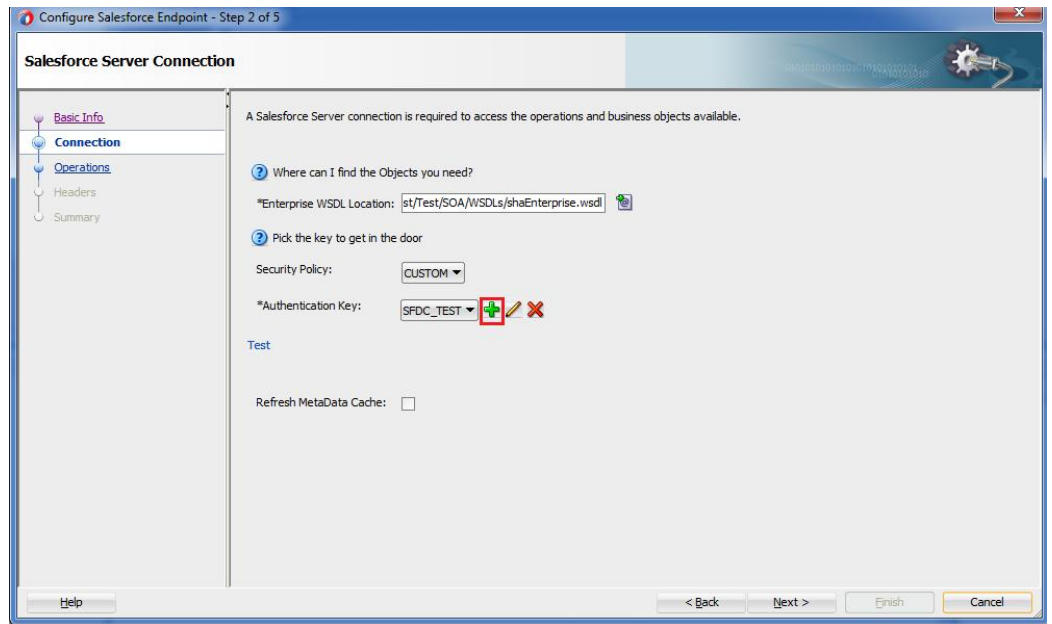

11. Copy WSDL to Your Project Folder.
12. Traverse to IDE Connections → SOA-MDS. Select the appropriate SOA-MDS connection where you placed the Enterprise WSDL. Select the WSDL file to be used in the adapter configuration and click **OK**.
13. The WSDL location should be of the form ‘oramds:/apps/SalesforceEnterpriseAPI.wsdl’, as shown in [Figure 10- 86](#).

Figure 10 - 86 WSDL location

14. Click **OK**.
15. Click “+” button to create a new **Authentication Key**, as shown in [Figure 10- 87](#).

Figure 10 - 87 Create a New Authentication Key

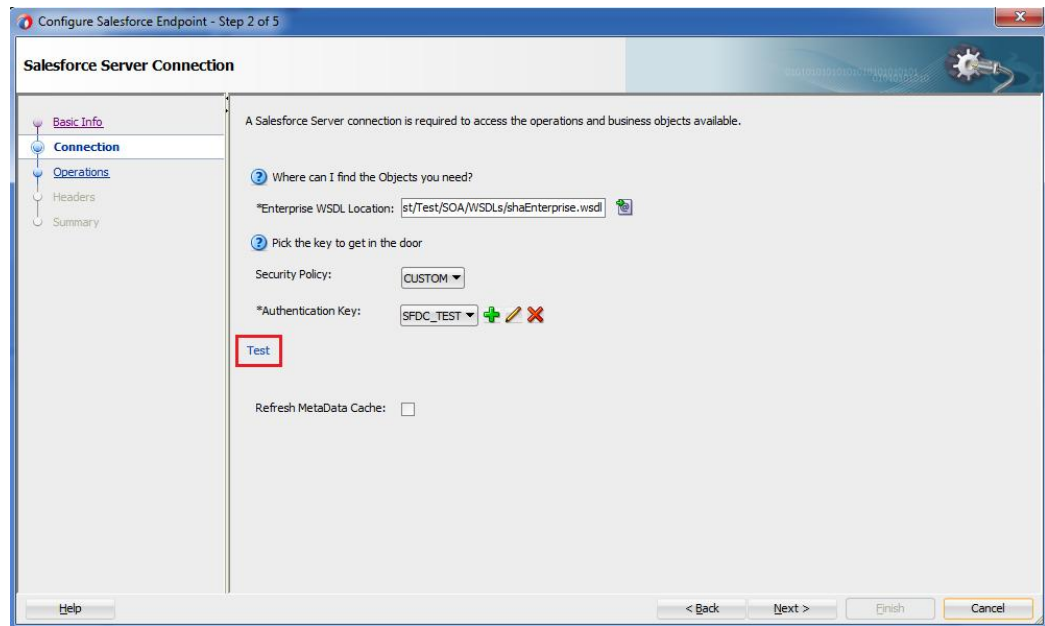

16. The **Add Credential** page is displayed, as shown in [Figure 10- 88](#). Provide a suitable name and the Salesforce.com credentials. The password should be a combination of Salesforce.com password and Salesforce.com Security Token.

Figure 10 - 88 Add Credential

17. Click **Test Connection** button to validate the Authentication Key, as shown in [Figure 10- 89](#).

Figure 10 - 89 Test Connection

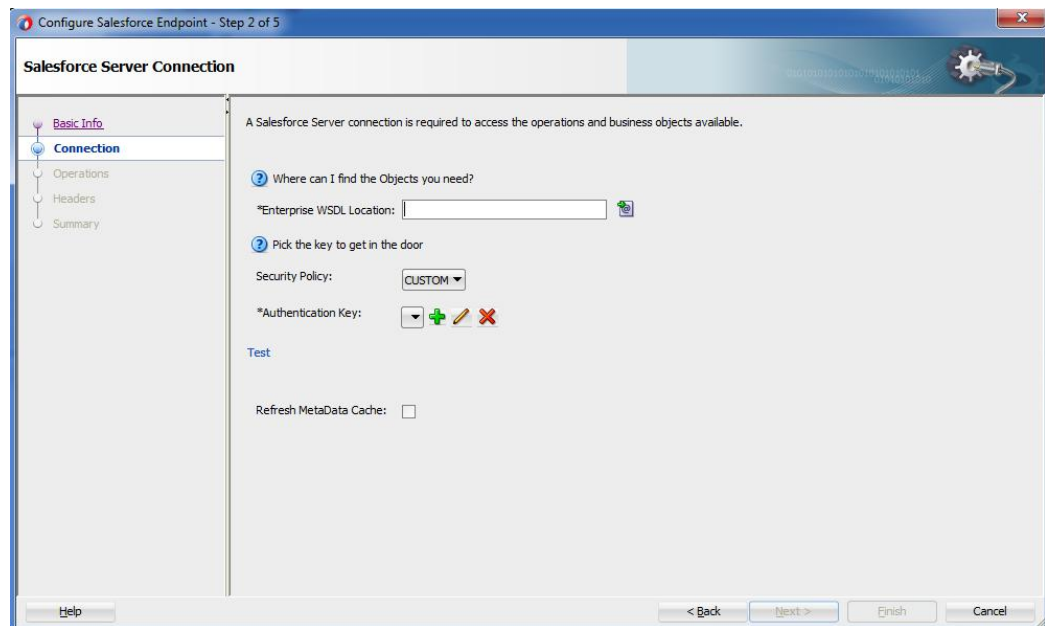

18. Click **Next**.

19. Click **OK** in the next screen.

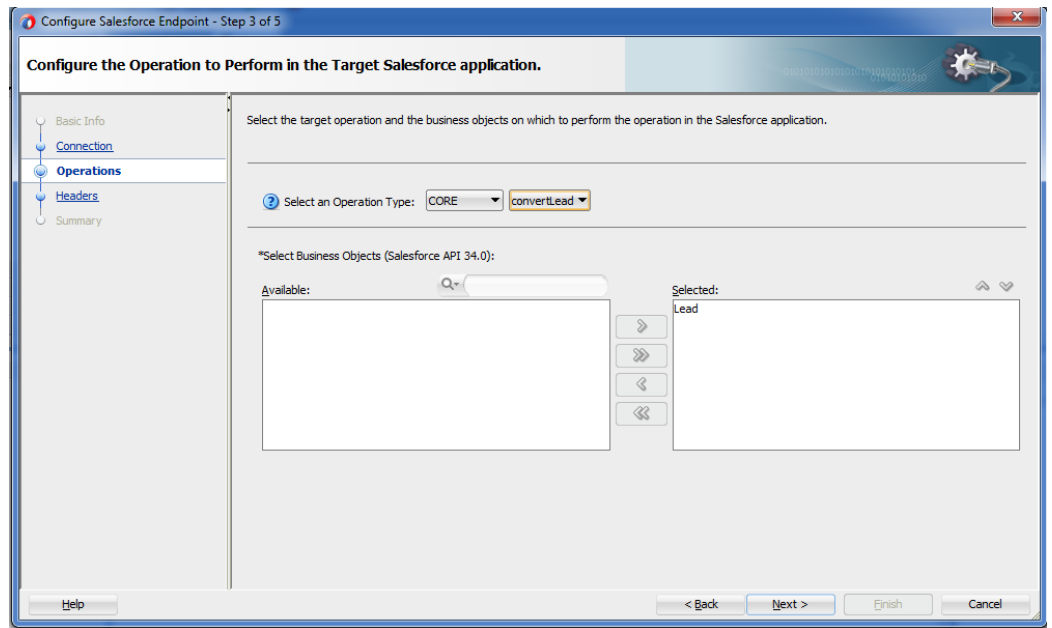

20. The **Cloud Operation Configuration** page is displayed, as shown in [Figure 10- 90](#).

Figure 10 - 90 Cloud Operation Configuration Page

21. From the list of **Operation Category**, select **CORE**, as shown in the [Figure 10- 91](#).

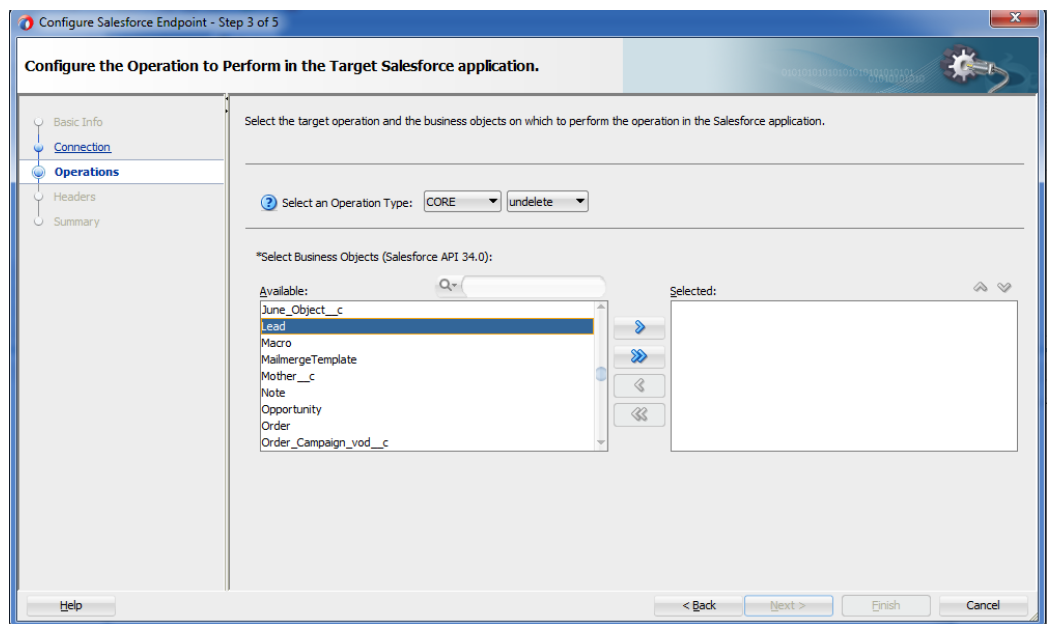

Figure 10 - 91 Select CORE

22. For SFDC Operation, the convertlead operation will automatically be selected. Select SFDC Operation as undelete.

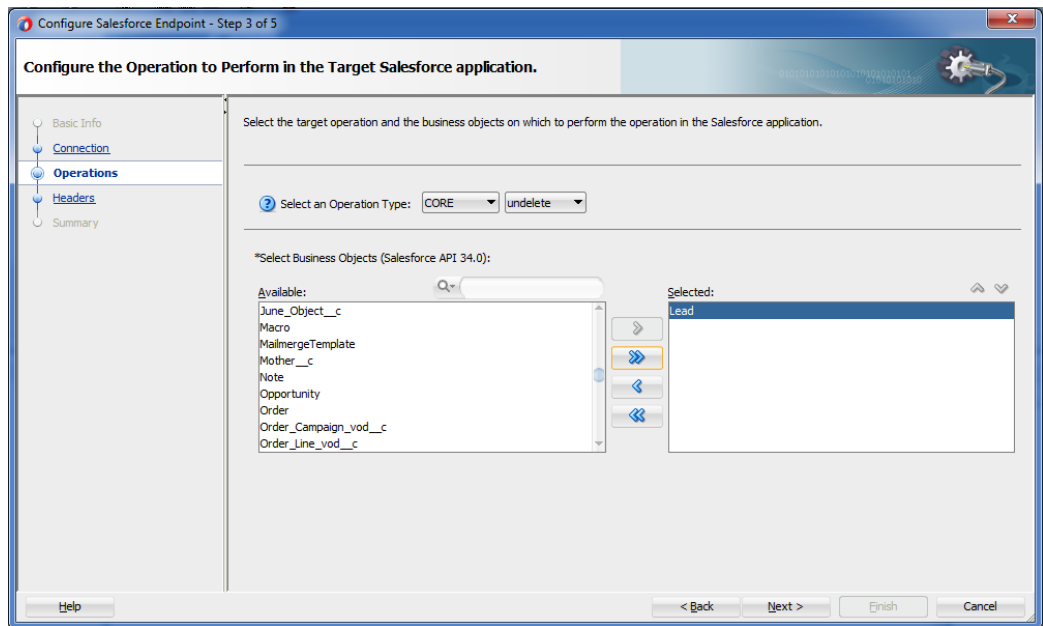

23. Select Lead from Available object, as shown in the [Figure 10- 92](#).

Figure 10 - 92 Select Lead object

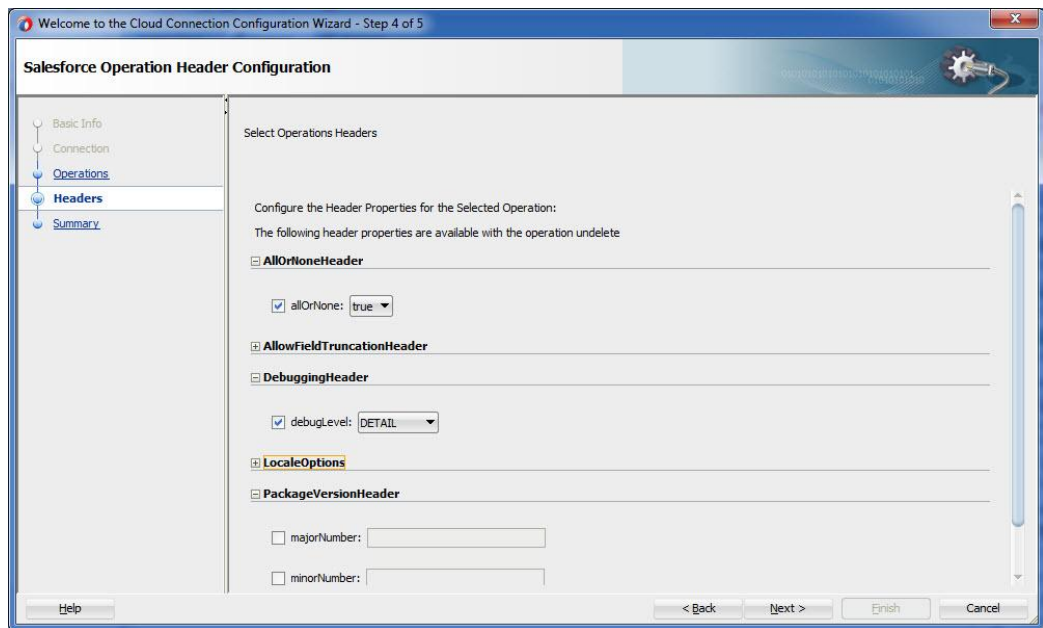

24. After selecting Lead object, move it to the Selected object area, as shown in [Figure 10- 93](#).

Figure 10 - 93 **Select Lead object**

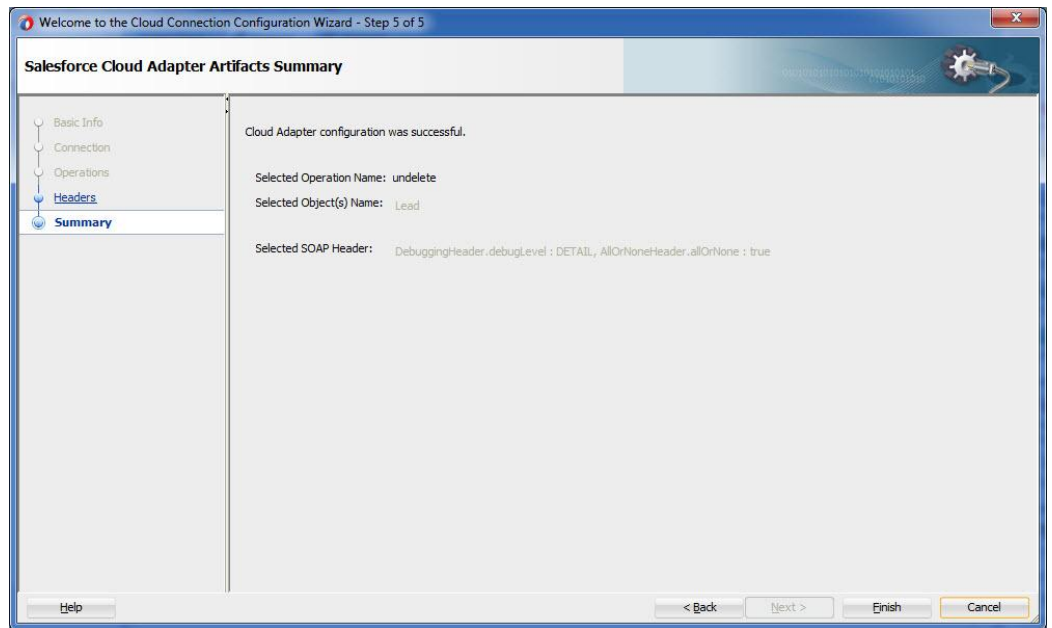

- 25. Click **Next**. The Headers and Properties page is displayed.
- 26. On the Headers and Properties, enter the value of DebuggingHeader – debugLevel as **DETAIL**. As shown in [Figure 10- 94](#).

Figure 10 - 94 **Header and Properties page, set value of DebuggingHeader**

- 27. Click **Next**.
- 28. The finish page is displayed. It provides a complete summary of the operation selected, object on which the operation would operate and the headers selected for that operation, as shown in [Figure 10- 95](#).

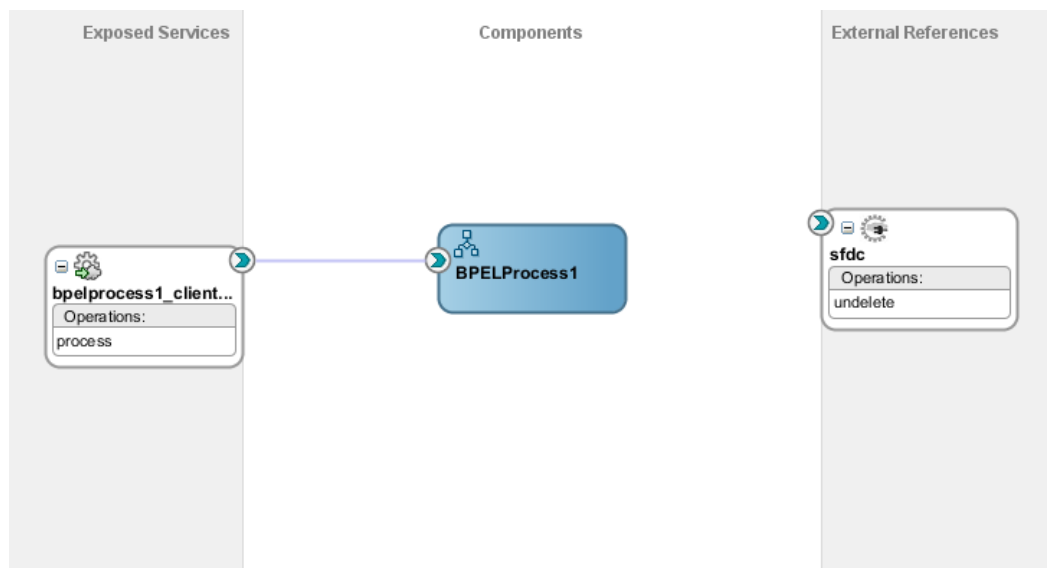

Figure 10 - 95 *Finish Page*

29. Click the **Finish** button to complete adapter configuration.

30. After clicking on **Finish** button, the following screen appears, as shown in [Figure 10-96](#).

Figure 10 - 96 *Composite Screen*

Integration with BPEL

Perform the following steps for integration with BPEL:

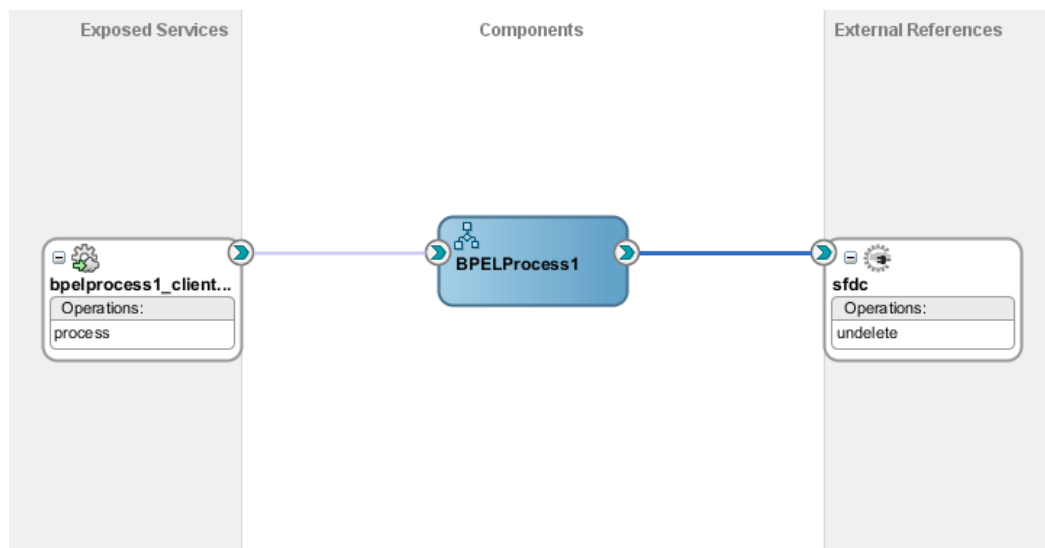

1. Connect **BPELProcess1** and **SFDC** via a wire, as shown in [Figure 10-97](#).

Figure 10 - 97 Wiring BPELProcess1 and adapter

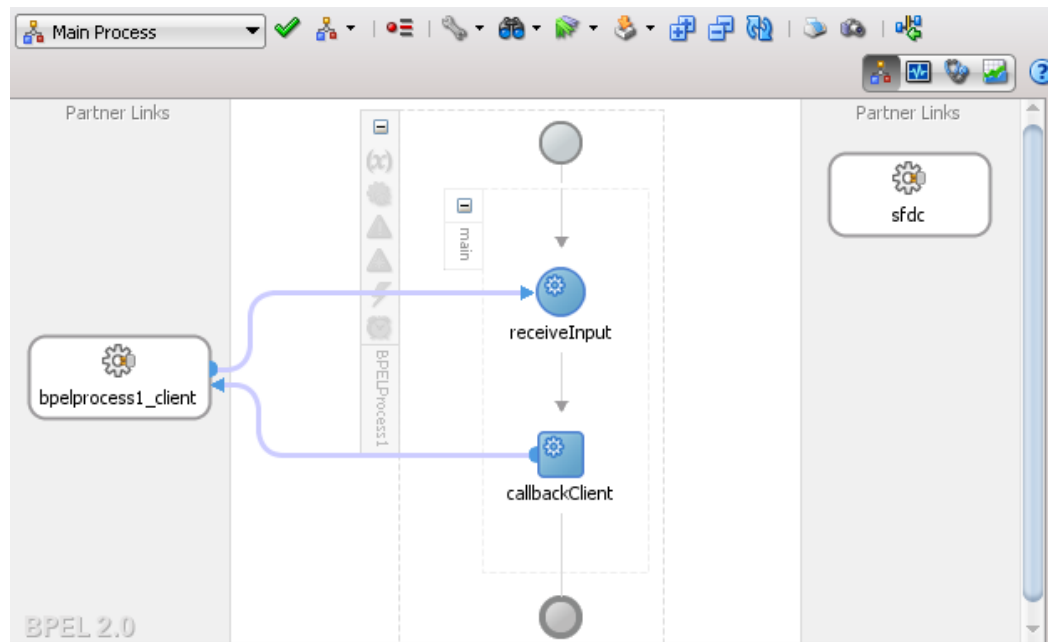

2. After wiring, your composite will look like [Figure 10- 98](#).

Figure 10 - 98 Wiring BPELProcess1 and undelete

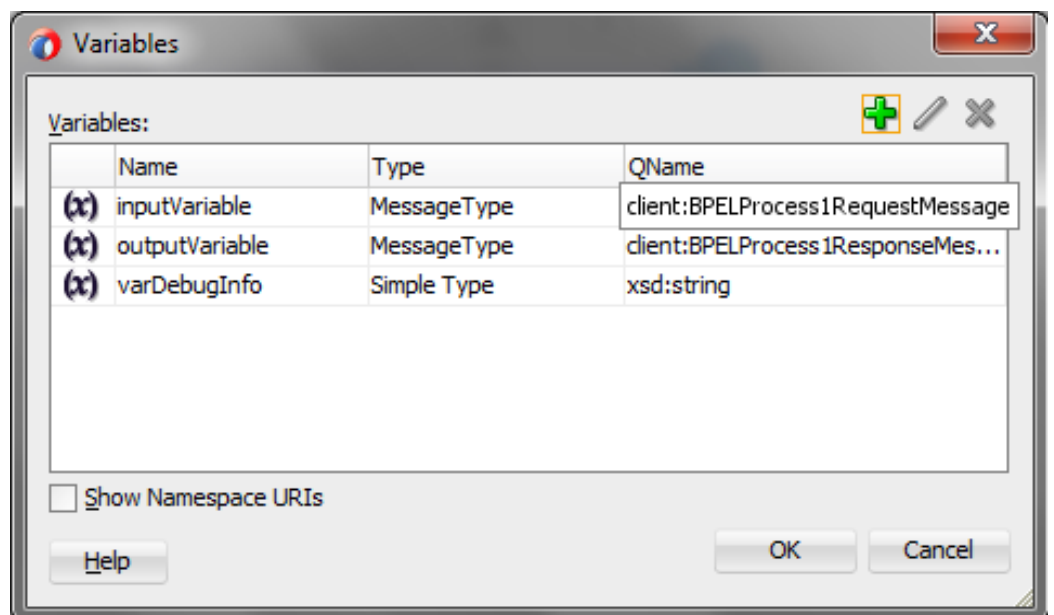

3. Double-click and open **BPELProcess1**. The adapter should be present as part of the Partner Link, as shown in [Figure 10- 99](#).

Figure 10 - 99 Open BPELProcess1

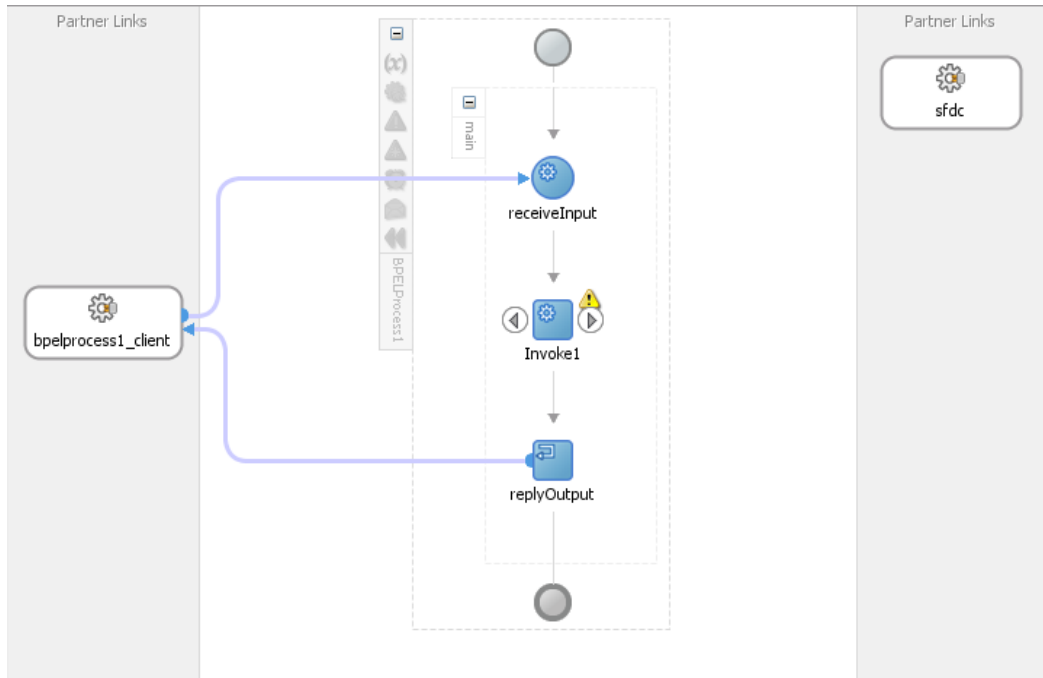

4. Create a variable **varDebugInfo** to track the debugLog returned in debuggingHeader from Salesforce.com, as shown in Figure 10- 100.

Figure 10 - 100 Variables Screen

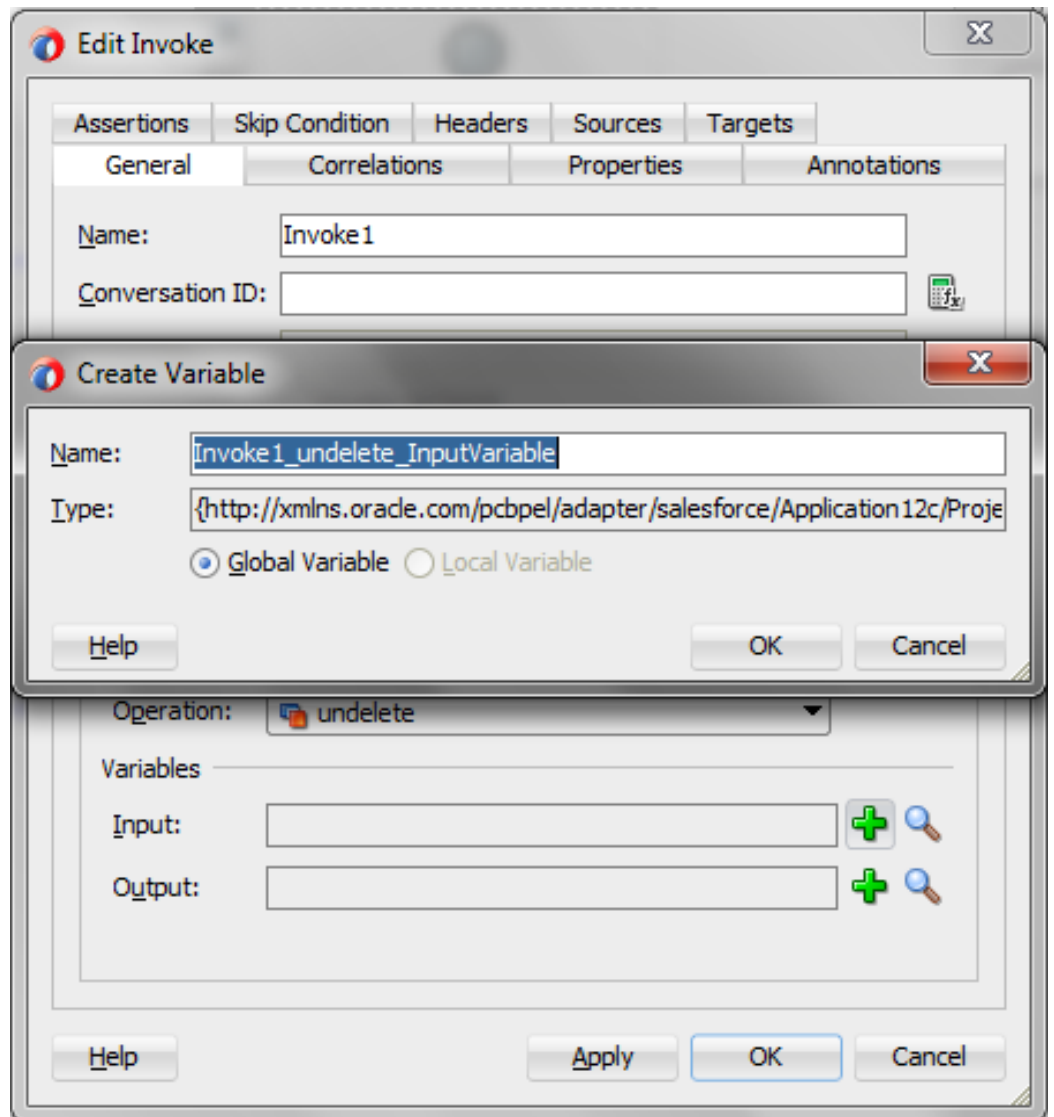

5. Add an **invoke activity** to invoke the query Partner Link, as shown in Figure 10-101.

Figure 10 - 101 Invoke Activity

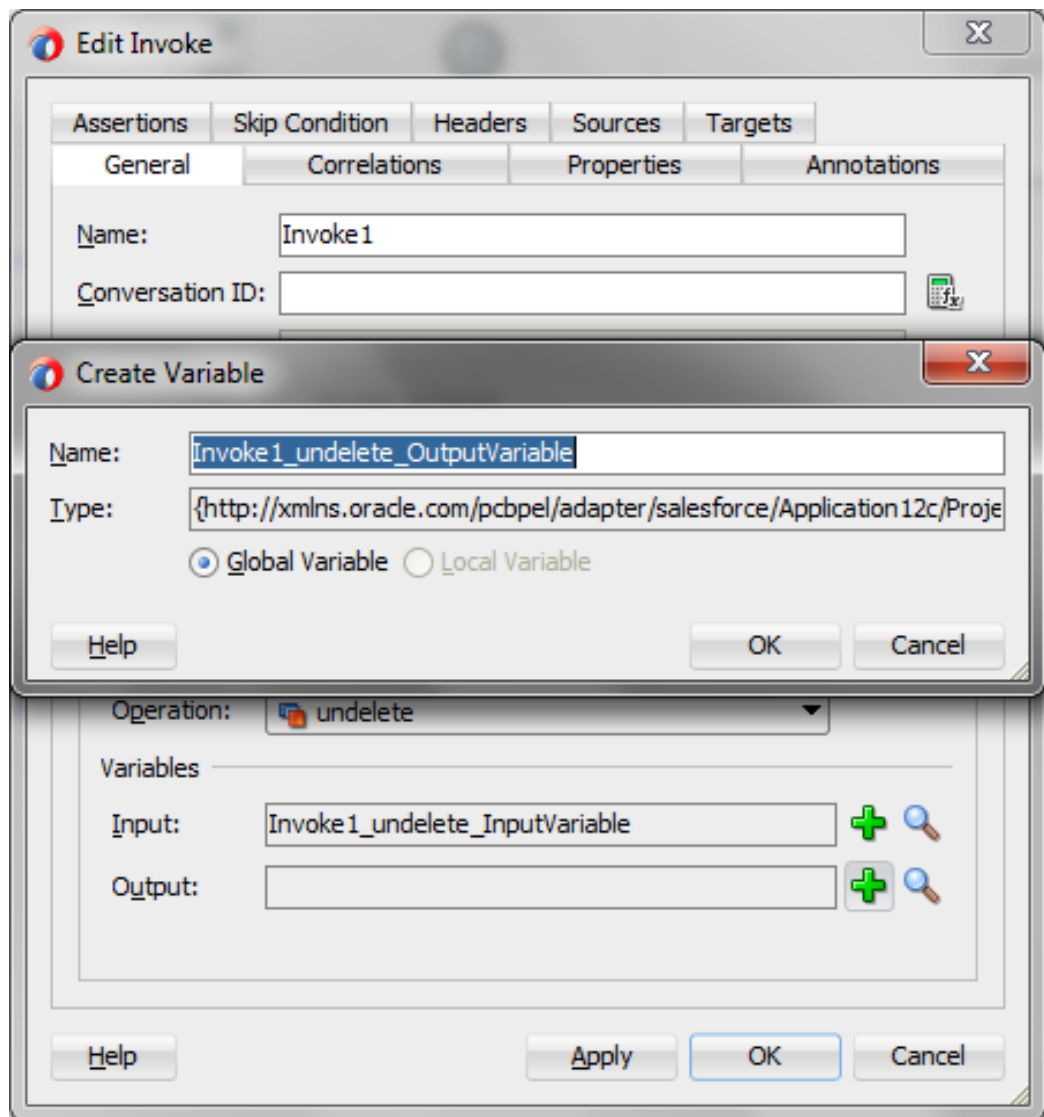

6. Edit Invoke dialog is displayed. Create an input variable to the partner link by clicking the '+' button adjacent to **Input** textbox in the **Variables** section. The **Create Variable** dialog is displayed, as shown in [Figure 10- 102](#).

Figure 10 - 102 Create Variable

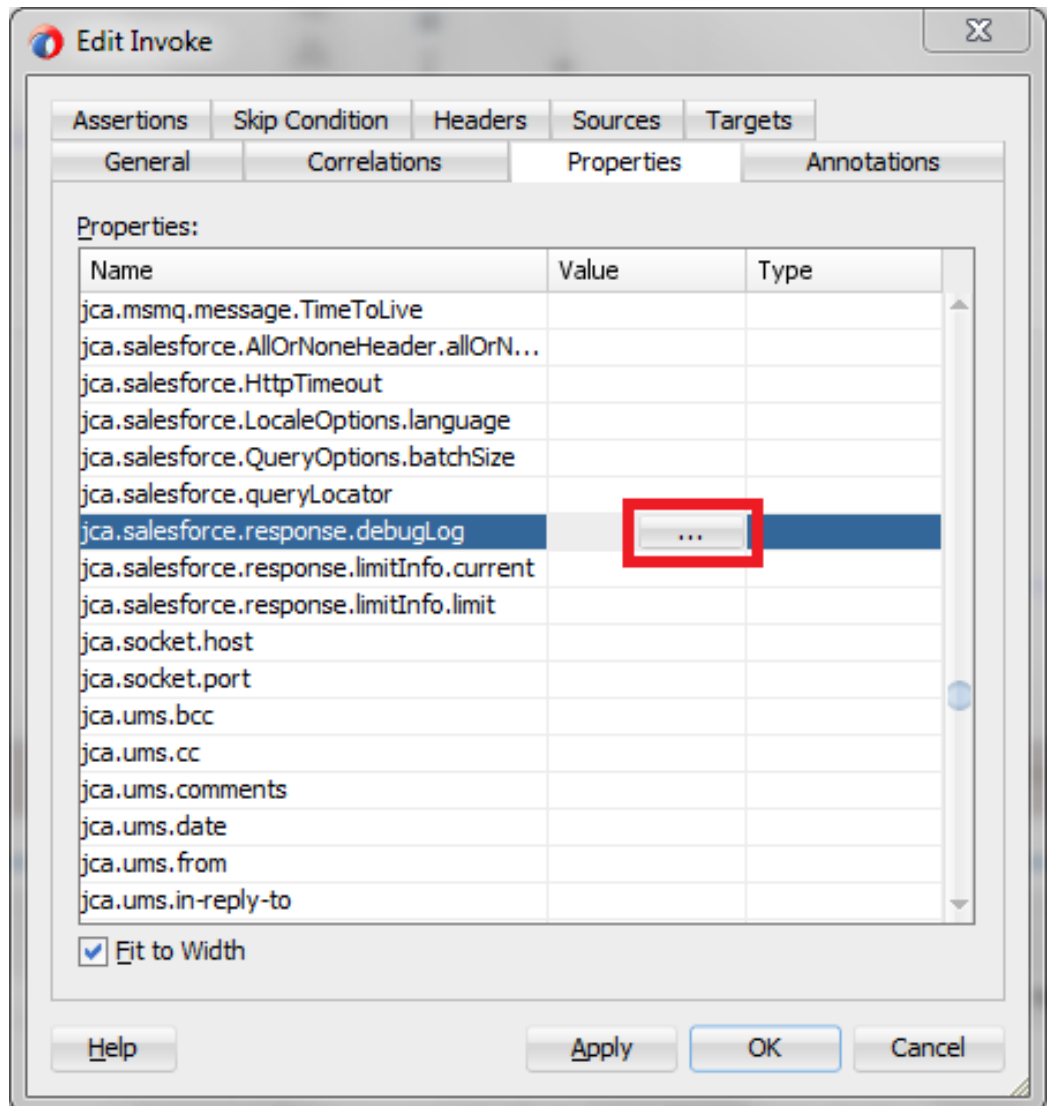

7. Create an output variable from the partner link by clicking the '+' button adjacent to **Output** textbox in the **Variables** section. The **Create Variable** dialog is displayed, as shown in [Figure 10- 103](#).

Figure 10 - 103 Create Variable

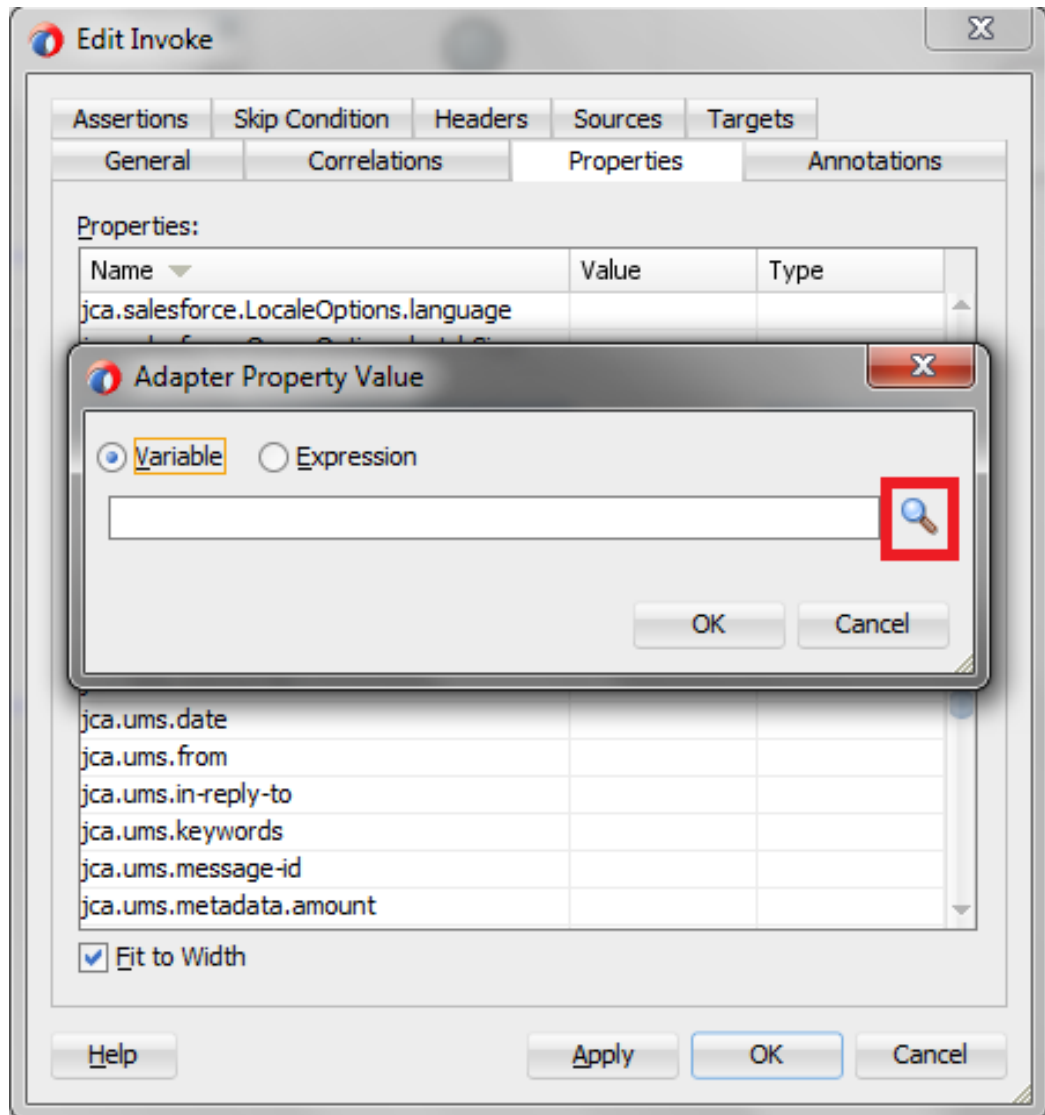

8. Go to the properties tab and locate `jca.salesforce.response.debugLog` and double click on the "...” button under values as shown in [Figure 10- 104](#).

Figure 10 - 104 Properties Tab

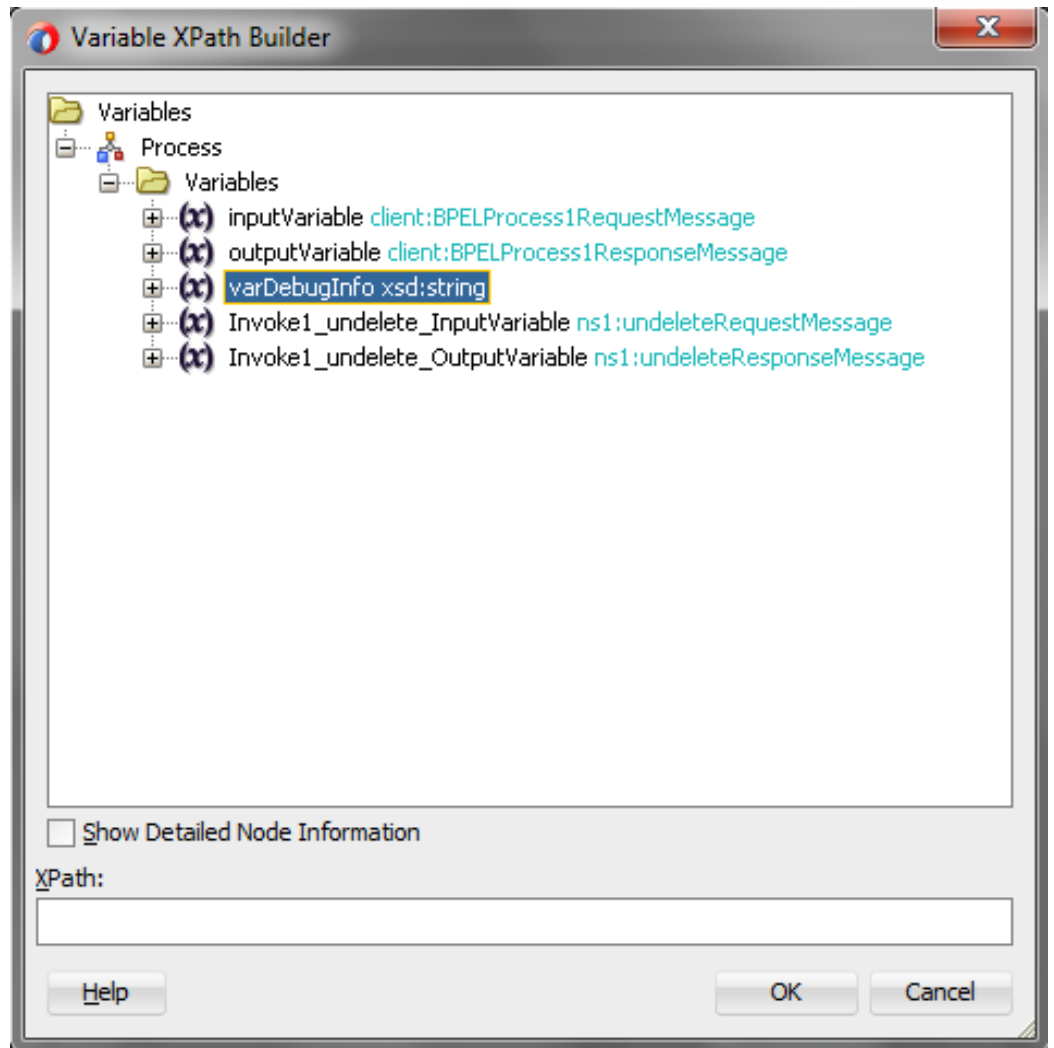

9. In the AdapterPropertyValue dialog, click on search for the variable as shown in [Figure 10- 105](#).

Figure 10 - 105 Search Property Value

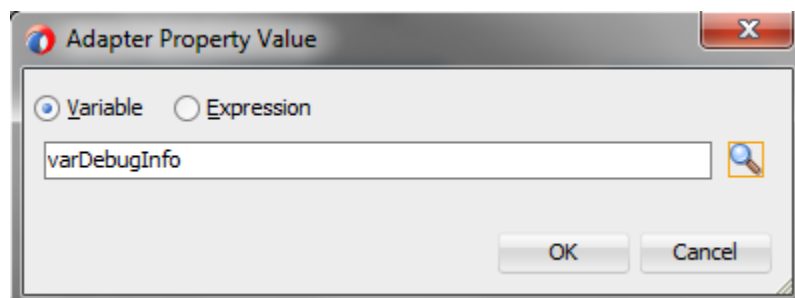

10. In the next dialog, click **varDebugEnabled** variable and click **OK** as shown in [Figure 10-106](#).

Figure 10 - 106 Variable XPath Builder

11. After the variable is selected, click **OK** as shown in [Figure 10- 107](#).

Figure 10 - 107 Select variable

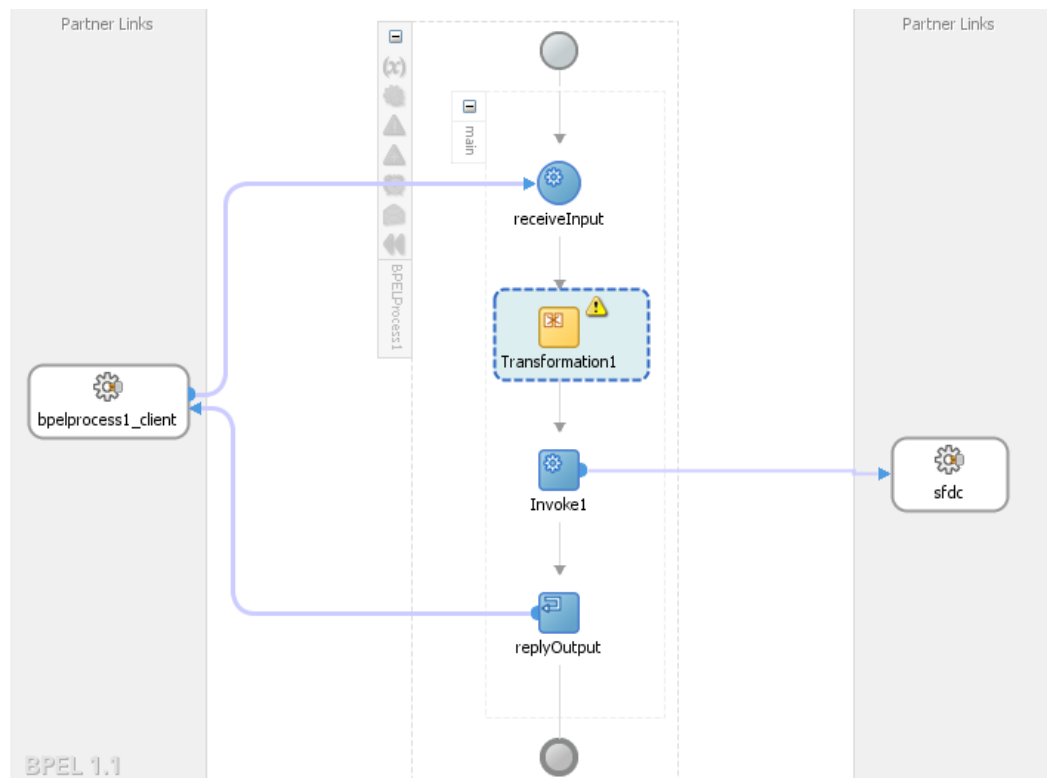

12. Change the type to **Output** and click **OK**, as shown in [Figure 10- 108](#).

Figure 10 - 108 Select Output

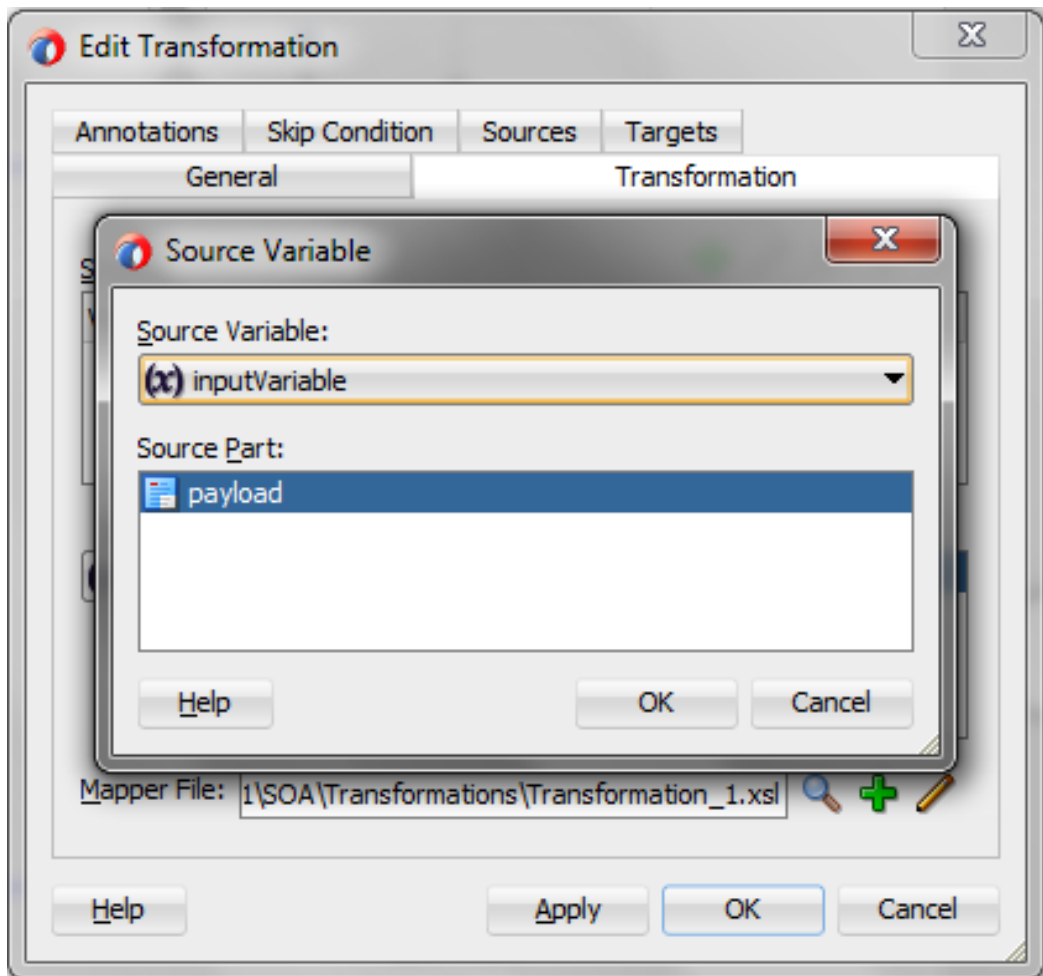

13. Introduce Transform activity right before invoke activity, as show in [Figure 10- 109](#)

Figure 10 - 109 Introduce transform activity

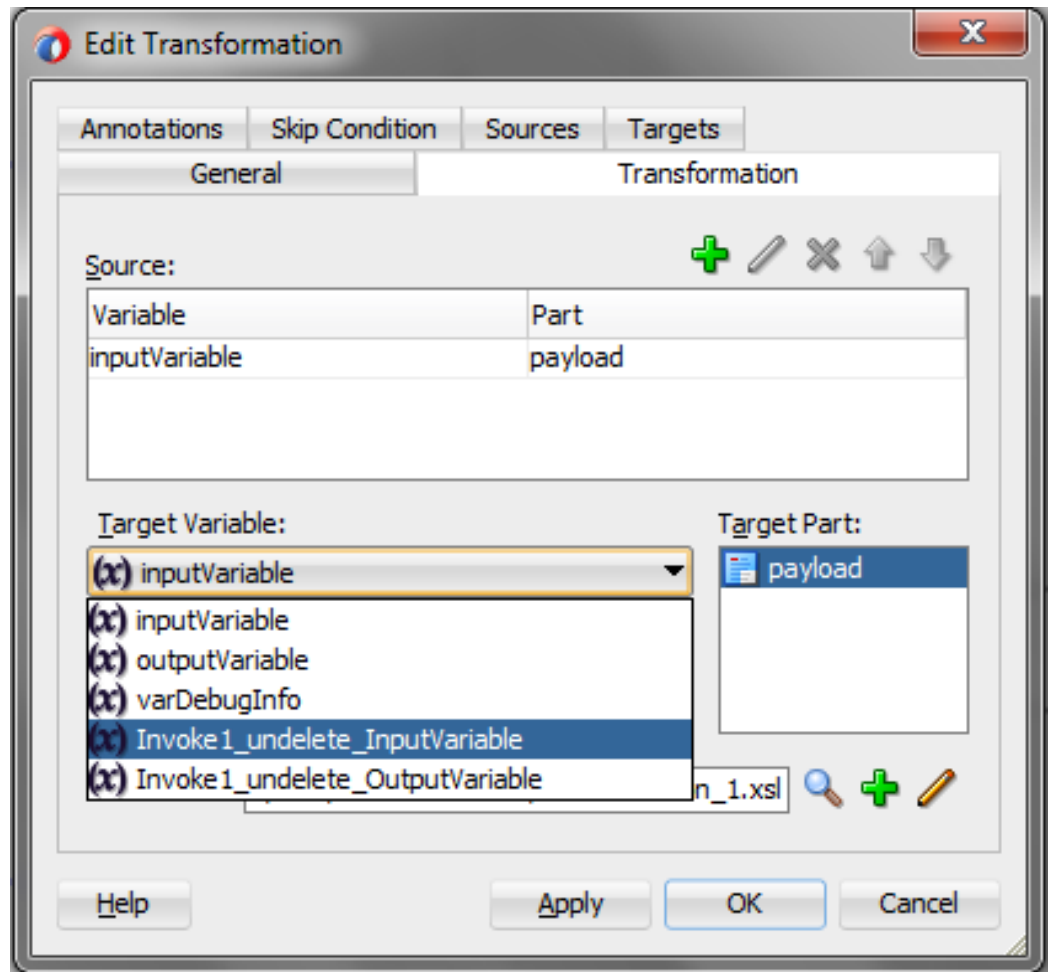

14. Double-click on **Transform1** and add the source variable as inputVariable, as shown in [Figure 10- 110](#).

Figure 10 - 110 Transformation Tab

15. Add the target variable “Invoke1_undelete_InputVariable” as shown in [Figure 10-111](#), and click **OK**.

Figure 10 - 111 Add target variable

16. Map the input to the source variable in the mapper file, as shown in Figure 10- 112.

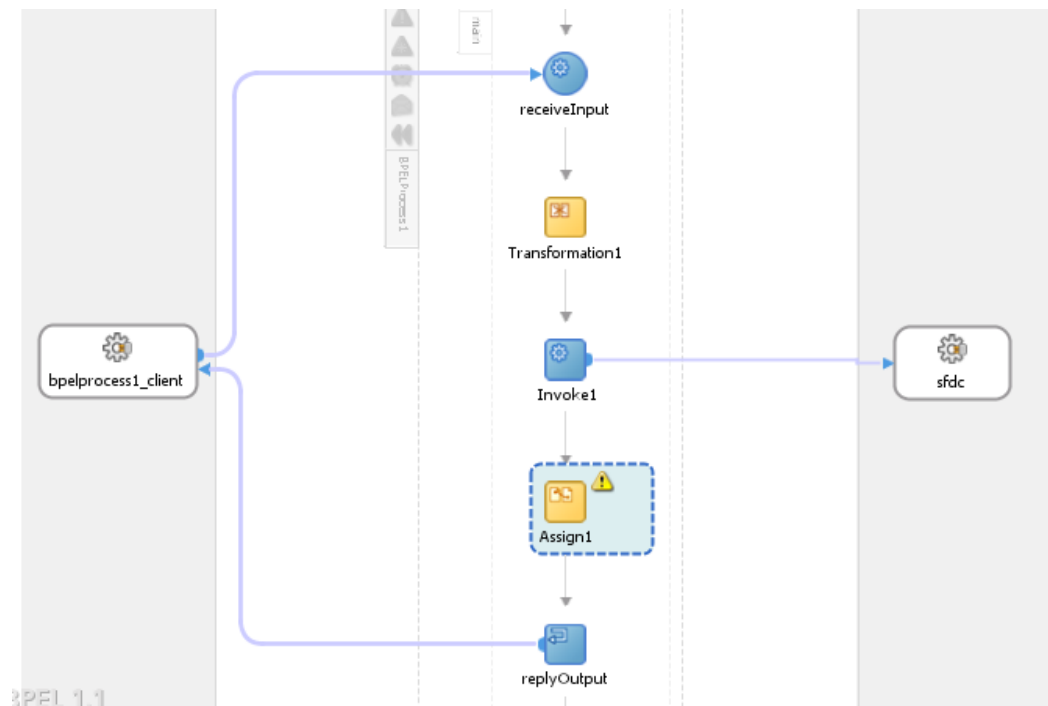

Figure 10 - 112 Map the input

17. Save all and move back to BPELProcess1.

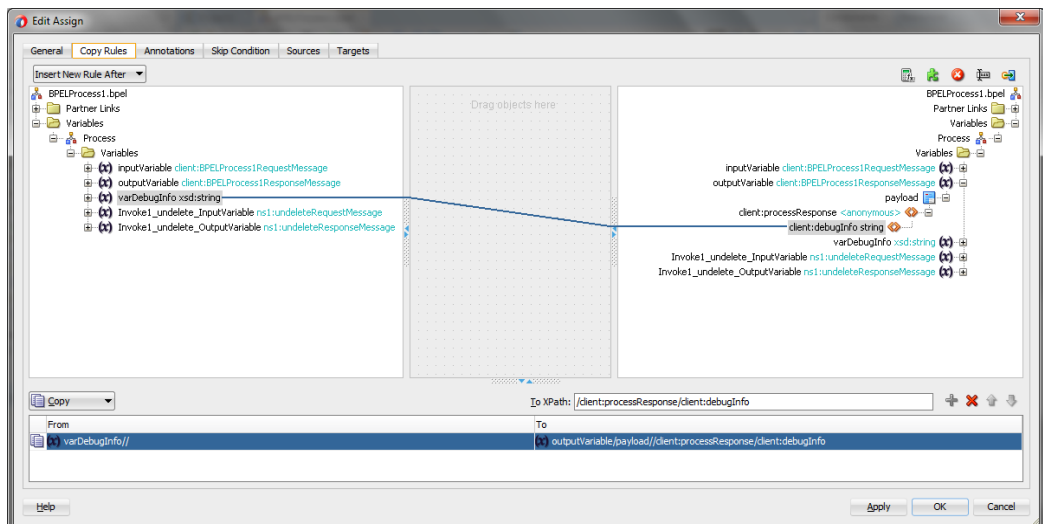

18. Introduce **Assign** activity right after the invoke activity, as shown in Figure 10- 113.

Figure 10 - 113 Introduce Assign activity

19. Inside the Assign activity, assign the value of “OutputVariable/payload/client:processResponse/client:debugInfo” variable to “varDebugInfo” variable, as shown in [Figure 10- 114](#).

Figure 10 - 114 Wire the Assign activity

20. In the Assign activity, click on **Apply** and then **OK**.

Deploy the Composite

Perform the following steps to deploy the composite.

1. In the **Application Navigator** pane, right-click **Project1** and select **Deploy -> Project1**, as shown in [Figure 10- 115](#).

Figure 10 - 115 Navigator Screen

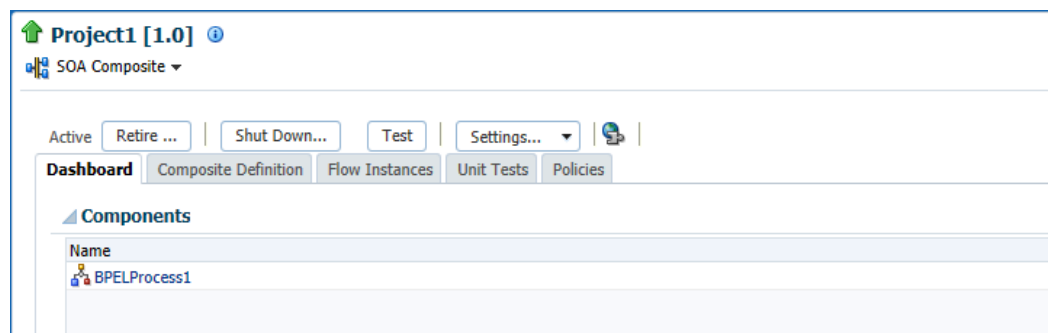

2. Select the **Deploy to Application Server** option and follow the instructions on the screen. Using this option you can deploy the composite on the Application server after providing the details of the server.

Test the Composite

Perform the following steps to test the composite.

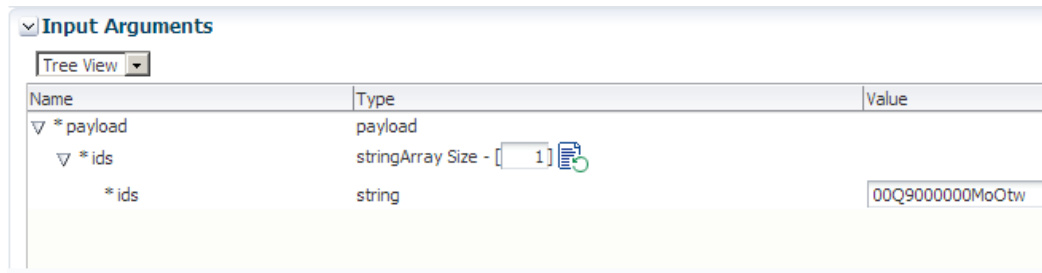

1. Login to Enterprise Manager Console for the server on which you deployed your project.
2. Open **Project1**.
3. Click the **Test** button to test the Web service, as shown in [Figure 10- 116](#).

Figure 10 - 116 Test Tab

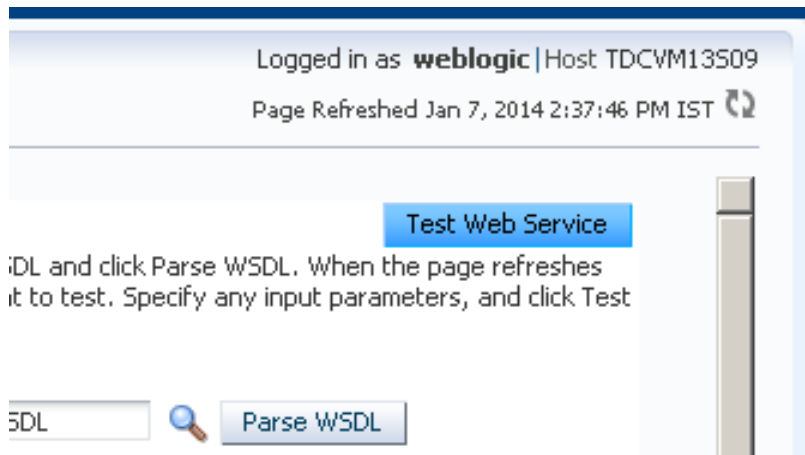

4. Enter the ID of the objects you wish to undelete, as shown in [Figure 10- 117](#).

Figure 10 - 117 Enter ID

5. Click on **Test Web Service** button, as shown in [Figure 10-118](#).

Figure 10 - 118 Test Web Service

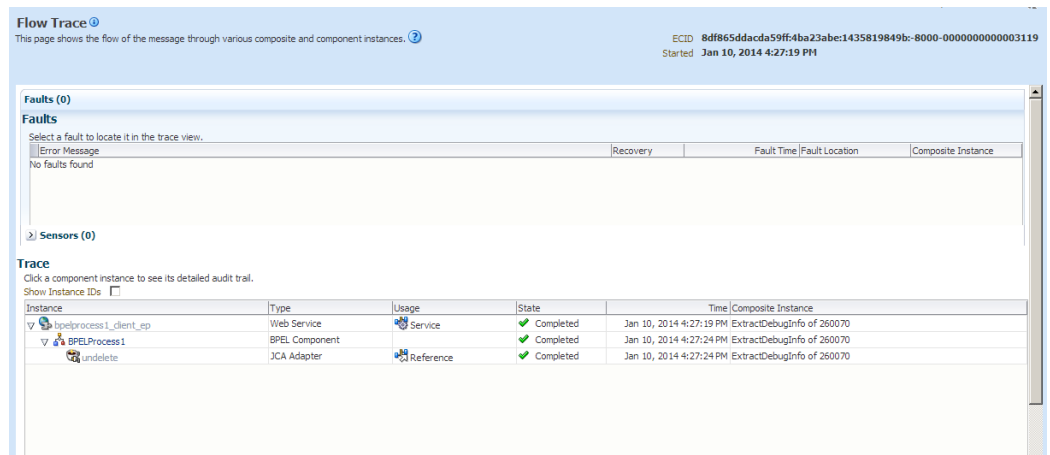

6. After successful execution, the response contains the expression that you provided in the last assign activity, as shown in [Figure 10-119](#).

Figure 10 - 119 Execution Window

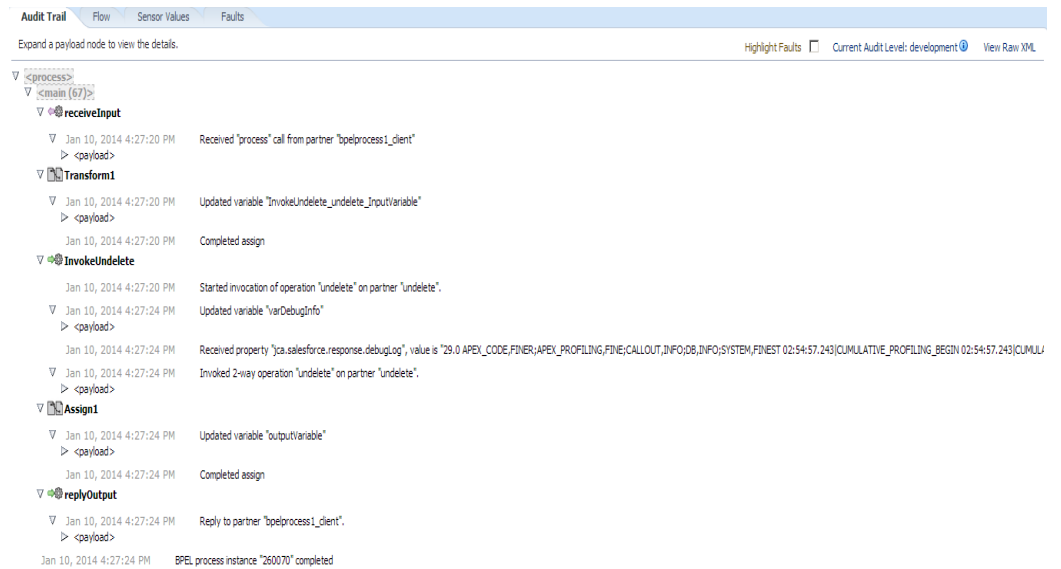

7. Click the **Launch Flow Trace** button to view the **Audit Trail**, as shown in [Figure 10-120](#).

Figure 10 - 120 Launch Flow Trace

8. The Audit Trail will look like Figure 10-121.

Figure 10 - 121 Audit Trail

9. Click on Flow tab, the Flow tab will look like Figure 10-122.

Figure 10 - 122 Flow Tab

10. Click on invoke activity, here you can see how the value of “debugLog” property being returned, as shown in [Figure 10-123](#).

Figure 10 - 123 Invoke Received Property

```
[2014/01/10 16:27:24]
Received property "jca.salesforce.response.debugLog", value is "29.0 APEX_CODE;FINER;APEX_PROFILING;FINE;CALLOUT;INFO;DB;INFO;SYSTEM;FINEST 02:54:57.243|CUMULATIVE_PROFILING_BEGIN
02:54:57.243|CUMULATIVE_PROFILING|No profiling information for SOQL operations 02:54:57.243|CUMULATIVE_PROFILING|No profiling information for SOSL operations
02:54:57.243|CUMULATIVE_PROFILING|No profiling information for DML operations 02:54:57.243|CUMULATIVE_PROFILING|No profiling information for method invocations
02:54:57.243|CUMULATIVE_PROFILING_END "
```

11. You can also see how the value of “debugLog” property is written to varDebugEnabled value, as shown in [Figure 10-124](#).

Figure 10 - 124 Invoke updated variable

```
[2014/01/10 16:27:24]
Updated variable "varDebugInfo"
- <varDebugInfo>

    02:54:57.243|CUMULATIVE_PROFILING|No profiling information for method invocations
    02:54:57.243|CUMULATIVE_PROFILING_END
  </varDebugInfo>
</varDebugInfo>
Copy details to clipboard
```

This appendix outlines the steps for generating enterprise WSDL for your Salesforce.com organization and how to configure the Credential Store Key in your Enterprise Manager. These steps are pre-requisites for proper adapter functioning and need to be performed only once, provided you do not make any object level changes in your organization. These sections have been referenced several times in the document and need to be followed exactly as described.

This appendix contains the following topics:

- [Section A.1, "Generating the Enterprise WSDL"](#)
- [Section A.2, "CSF Key in Enterprise Manager"](#)

A.1 Generating the Enterprise WSDL

To download the Web Services Description Language (WSDL) file, required by the adapter to integrate different applications with Salesforce.com, you must have “Modify All Data” permission. (The System Administrator profile has this permission.)

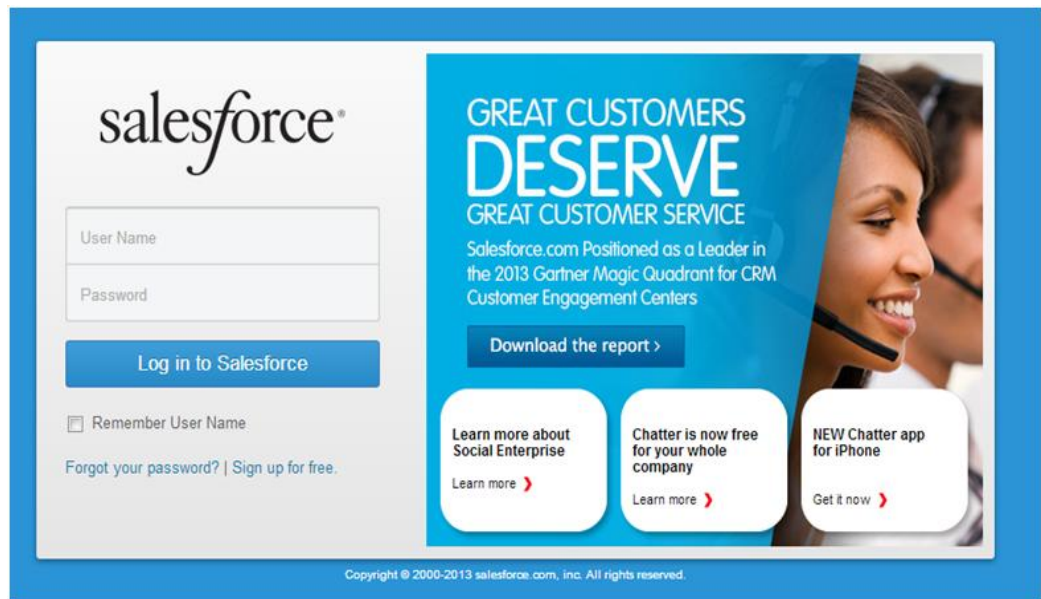

The generated WSDL defines all of the API calls, objects (including standard and custom objects), and fields that are available for API access for the organization.

Perform the following steps to generate the WSDL file for the organization:

1. Log in to your Enterprise, Unlimited, or Developer Edition Salesforce.com account. Open the Web browser and enter the following URL: www.salesforce.com

The login window is displayed, as shown in [Figure A-1](#).

Figure A-1 Login Window

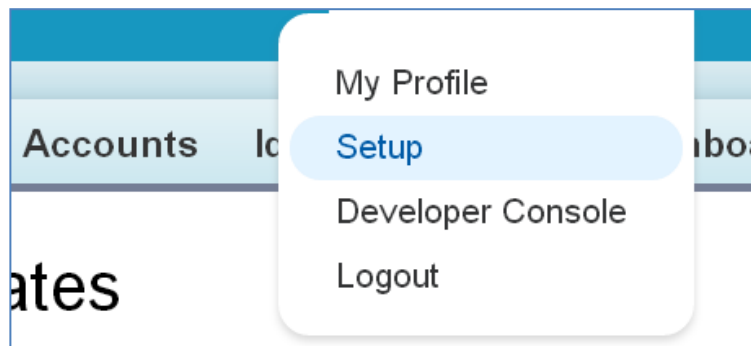

2. Log in to the **Salesforce.com** using a valid user name and password.

Note that you must login as an administrator or as a user who has the **Modify All Data** permission. Logins are checked to ensure they are from a known IP address.

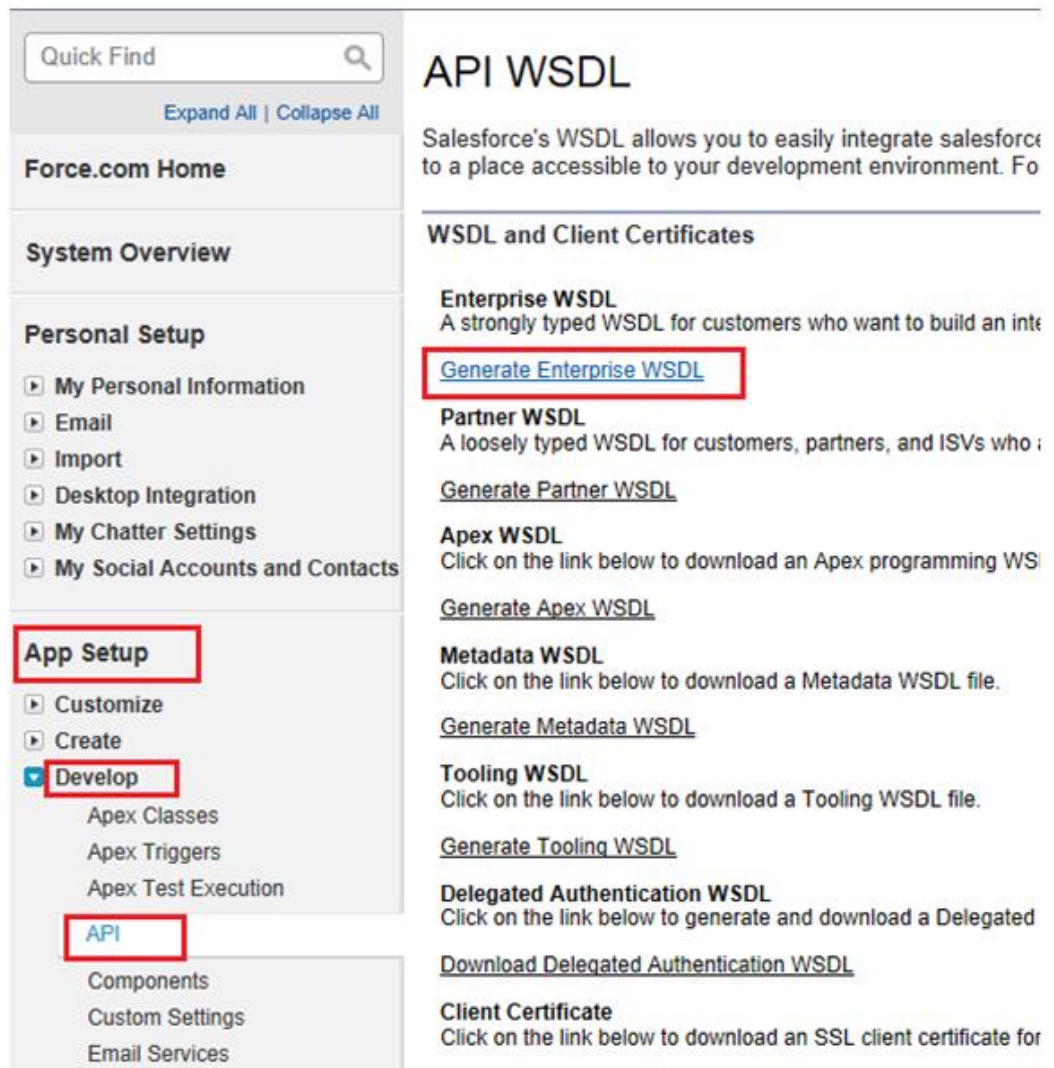

3. Click on **User menu** for user name, and select **Setup**, as shown in [Figure A-2](#).

Figure A-2 Setup Window

4. Under **App Setup**, Expend **Develop** and click on **API** to display the WSDL download page, as shown in [Figure A-3](#).

Figure A-3 WSDL Download Page

5. If the organization has managed packages installed in the organization, click **Generate Enterprise WSDL**, Salesforce.com will prompt you to select the version of each installed package to include in the generated WSDL.

OR

Right-click on **Generate Enterprise WSDL** and save it to a local directory.

Note that in the Right-click menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As** to save it to the local directory.

6. The **Save** dialog is displayed, as shown in [Figure A – 4](#).

Figure A- 4 Save Dialog Box

7. Provide a name for the WSDL file and a location to save the WSDL file on your file system.
8. Click **Save**.

A.2 CSF Key in Enterprise Manager

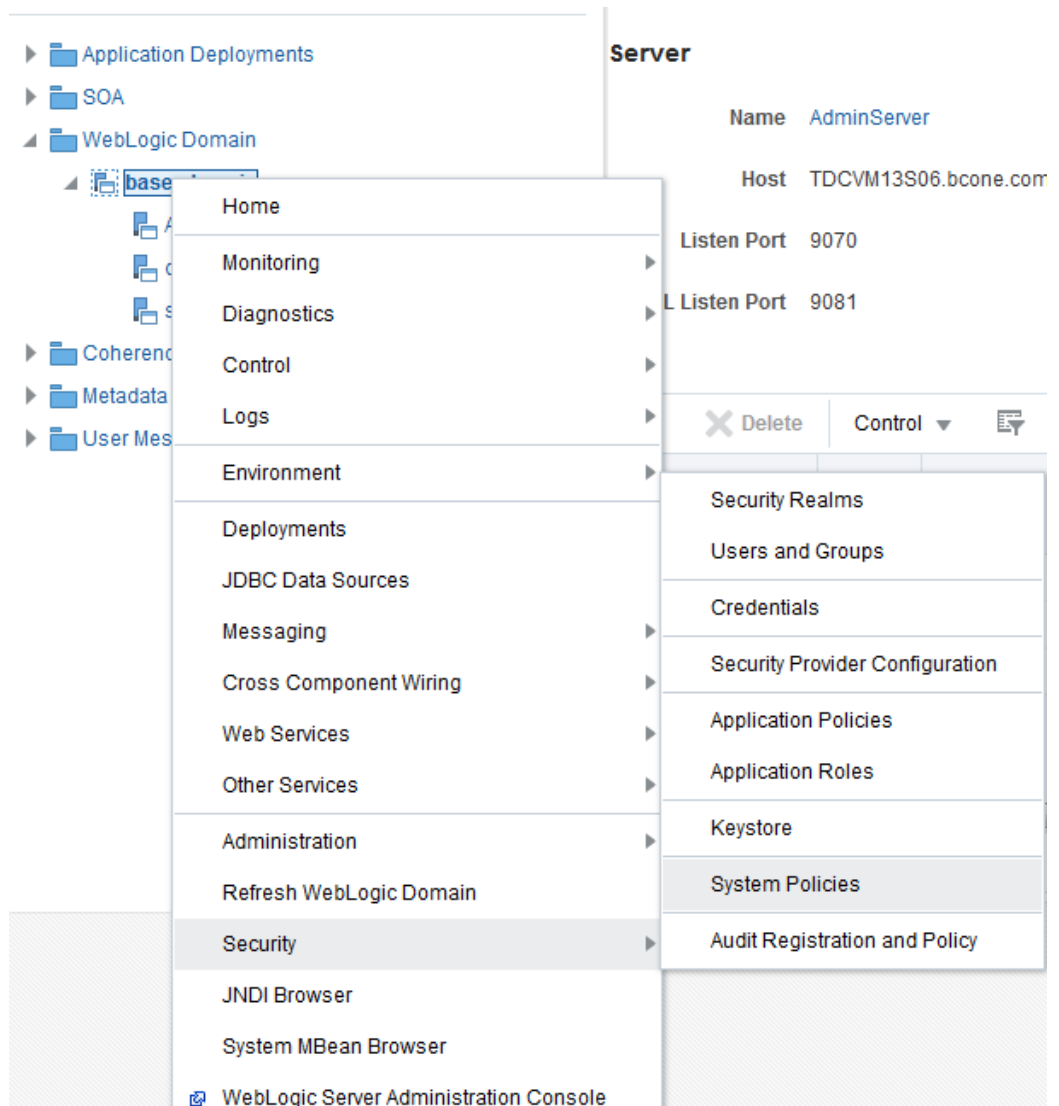

The Oracle Cloud Adapter for Salesforce.com provides enhanced security through the Credential Store Framework (CSF) Key. This key needs to be presented on the WebLogic server where the adapter is being deployed, and has to be configured in the Enterprise Manager for the Cloud Adapter for Salesforce.com to be successfully able to retrieve the salesforce.com login credentials.

Follow the steps below to configure the CSF key in the Enterprise Manager:

Create "SOA" map in EM console (One-time setup)

- 1 Log in to Fusion Middleware Control Enterprise Manager
- 2 Expand 'Weblogic Domain' in the left panel
- 3 Right-click on the domain and select Security → Credentials, to display the page Credential store.

Figure A-5 Navigation Page

- 4 In the Credential store, click **‘Create Map’** to create a new map
- 5 In the Create Map page, enter the ‘Map Name’ as SOA and click ‘OK’.

Figure A-6 Create Map

Create <CSF-KEY> under "SOA" map in EM console

At the time of adapter reference creation in JDeveloper, user has provide the <CSF-KEY> details in connection page. The same <CSF-KEY> information should also be available in the run-time. User needs to create it manually for the EM console.

1. Log in to Fusion Middleware Control Enterprise Manager
2. Expand ‘Weblogic Domain’ in the left panel
3. Right-click on the domain and select Security → Credentials, to display the page Credential Store.
4. In the Credential store, click **‘Create Key’** to create a new key.

5. In the Create Key page, select '**Select Map as SOA**
6. Enter key as <CSF-KEY>
7. Select type as 'Password'
8. Enter User Name, Password, Confirm Password and Description (optional) details and click '**OK**'

Adapter

An adapter is a software that an application client or an application server uses to connect to a specific Enterprise Information System (EIS).

Business Service

Also known as a Web service. A Web service is a self-contained, modularized function that can be published and accessed across a network using open standards. It is the implementation of an interface by a component and is an executable entity.

Integration WSDL

The non-polymorphic WSDL generated by the Oracle Cloud Adapter for Salesforce.com during design-time; contains the request and response structures for the selected operation and objects.

Enterprise WSDL

The enterprise WSDL file is a strongly typed representation of your organization's data. It provides information about your schema, data types, and fields to your development environment, allowing for a tighter integration between it and the Force.com Web service. This WSDL changes if custom fields or custom objects are added to, renamed, or removed from, your organization's Salesforce.com configuration directly from Salesforce.com -

http://www.salesforce.com/us/developer/docs/api/Content/sforce_api_quickstart_intro.htm

MDS

An application server and Oracle relational database that keep metadata in these areas: a file-based repository data, dictionary tables (accessed by built-in functions) and a metadata registry. One of the primary uses of MDS is to store customizations and persisted personalization for Oracle applications.

CSF

Credential Store Framework (CSF) stores the login information of the user matched to a unique key called the CSF Key.

CSF Key

Credential Store Framework Key; used to externalize the login credentials of the user from design-time and run-time of the Oracle Cloud Adapter for Salesforce.com. The Oracle Cloud Adapter for Salesforce.com uses this key to retrieve the login information of the Salesforce.com user from the Credential Store.

OPatch

OPatch is the Oracle database's Interim (one-off) Patch Installer. If OPatch is not installed into your Oracle Home (\$ORACLE_HOME/OPatch), you may need to download it from Metalink and install it yourself. All patches that are installed with Oracle's OPatch Utility can be listed by invoking the **opatch** command with the **lsinventory** option.

Cloud SDK

Cloud Software Development Kit is a set of development tools that allows for the creation of the design-time and run-time of cloud adapters for Oracle SOA Suite.

Terms and Acronyms

CSF- Credential Store Framework

DT- Design-time

OSB – Oracle Service Bus

RT – Run-time

SFDC – Salesforce.com

SOA –Service-Oriented Architectures

SOSL – Salesforce Object Search Language

SOQL – Salesforce Object Query Language

WSDL –Web Services Description Language
