rtrv-lg-card

Use this command to retrieve and display LG card provisioning.

The command class is TKLC_INTERNAL inheriting properties of DEBUG class.

The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

Example

```
rtrv-lg-card:loc=1302
```

Dependencies

The card location must not be 1113-1118, or xy09 and xy10 where x is the frame and y is the shelf.

The LG Card table is corrupt or cannot be found.

Loc is mandatory

The card location specified in the loc parameter must be of a provisioned LG card.

Output

```
rtrv-lg-card:loc=1302
```

```
tekelecstp 09-04-29 18:15:20 EST xx.x.x-xx.x.x
LG Card Configuration

rtrv-lg-engine

Use this command to retrieve and display LG engine provisioning, as well as the total number of engines configured. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

Parameters

engine (optional)

LG Engine name

Range:

aaaaaaaa

Up to 10 alphanumeric characters; the first character must be a letter.

Example

```
rtrv-lg-engine
```

```
rtrv-lg-engine:engine=rxengine1
```

Dependencies

The value specified for the `engine` parameter must already exist in the LG Engine table.

The LG Engine table is corrupt or cannot be found.

Output

```
rtrv-lg-engine
```

```

tekelecstp 09-04-29 18:15:20 EST xx.x.x-xx.x.x
LG Engine Configuration
TX Engine(s)

rtrv-lg-event

Use this command to display an LG event provisioning. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSP, IPLHC, IPGHC and SS7HC GPLs.

Parameters

dir (optional)

Direction of Event generation or reception.

Range:

Tx
Transmit Event

Rx
Receive Event

event (optional)

The name of the LG event.

Range:

ayyyyyyyy

Up to 10 alphanumeric characters; the first character must be a letter

Example

```
rtrv-lg-event
rtrv-lg-event:event=txisup1
rtrv-lg-event:event=txsnm1
rtrv-lg-event:dir=rx
```

Dependencies

When failed to read LG Event table.

The value specified for the `event` parameter must already exist in the table.

The `dir` or `event` parameter must be specified.

The value specified for the `event` parameter cannot be an Eagle reserved name

Output

```
rtrv-lg-event
```

rtrv-lnp-serv

Use this command to retrieve all LNP services. This command displays the assigned translation type, translation type name, service type, LNP digit validity indication, and TT aliases.

Parameters

This command has no parameters.

Example

```
rtrv-lnp-serv
```

Dependencies

The LNP TT SERV table is corrupt or cannot be found.

The LNP feature must be turned on before this command can be entered.

The LNP database is corrupt or cannot be found.

The GTT Action table is corrupt or cannot be found.

Notes

None

Output

This example shows output when EGTT is ON.

rtrv-lnpopts

Use this command to display all the LNP-specific system options from the database.

Parameters

This command has no parameters.

Example

```
rtrv-lnpopts
```

Dependencies

The LNP feature or AINPQ feature must be turned on before this command can be entered.

The LNP Options table must be accessible.

The LNP database must be accessible.

Notes

None

Output

The JIPPROV and JIPDIGITS fields appear in the output only when the Triggerless LNP feature is turned on.

```
rtrv-lnpopts

      AMASLPID      = 123456789
      INCSLP        = yes
      AMACTYPE       = 003
      AMAFEATID     = 010
      CIC           = 1369
      AUD           = on
      SP            = a123
      ADMHIPRI      = yes
      GTWYSTP       = yes
      JIPPROV       = yes
      JIPDIGITS     = 919460
      CCP           = no
      SERVPORT      = no
      WQREDRCT      = off
      WSMSC10DIG    = yes
;
```

Legend

- **AMASLPID**—AMA slip ID
- **INCSLP**—Whether the AMA slip ID included in the response
- **AMACTYPE**—AMA call type

- **AMAFEATID**—AMA feature ID
- **CIC**—Carrier identification code
- **AUD**—Audit indicator
- **SP**—Service provider ID
- **FRCSMPLX**—Allow simplex database updates indicator
- **ADMHIPRI**—LNP database administration has the highest priority of all administration
- **GTWYSTP**—LNP system is configured as a Gateway STP
- **JIPPROV**—Add a Jurisdictional Information Parameter value to the IAM
- **JIPDIGITS**—Jurisdictional Information Parameter value
- **CCP**—Copy Charge Parameters

rtrv-log

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

Parameters

dir (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

Range:

fwd

Display entries from nearer the beginning of the log toward entries at the end of the log

bkwd

Display entries from nearer the end of the log toward entries at the beginning of the log

Default:

fwd

edate (optional)

End date. Report only log entries that were created on or before the specified date (*dir=fwd*), or only log entries that were created on or after the specified date (*dir=bkwd*). See the Notes section for usage information.

Range:

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)**Default:**

Report log entries regardless of their creation date

enum (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

Range:

1 - 1999

1-999 —Alarms (UAMs)

1000-1999 —UIMs

Default:If *enum* is not specified and:If *snum* is specified, the default *enum* value is the same as the specified *snum* value.If *snum* is not specified and *type* is *alarm* or not specified, the default *enum* value is 999.If *snum* is not specified and *type* is *all* or *uim*, the default *enum* value is 1999.**etime (optional)**End time. Report only log entries that were created on or before the specified time (*dir=fwd*), or only log entries that were created on or after the specified time (*dir=bkwd*). See the Notes section for usage information.**Range:**

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59)) *y*)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503.

Default:

Report log entries regardless of their creation time

mode (optional)

Log display mode; display all information or just summary information from each log entry.

 **Note:**

If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.

Range:***brief***

Display only the first “Summary” line of the log entry

full

Display all information available in the log entry

Default:

full

next (optional)

Number of additional records to display using the same direction (*dir*) and filtering criteria of *outgrp*, *type*, *slog*, and *mode* that were used for the previous successful *rtrv-log* command at the same terminal.

Range:

1 - 65500

num (optional)

Number of records that can be displayed before the report is stopped.

Range:

1 - 65500

Default:

15

outgrp (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on.

Range:

all

Retrieve information for all Output Groups

appserv

Application Server

appss

Application Subsystem

card

Card

Default:

If the `next` parameter is not specified, the default is *all*.

If the `next` parameter is specified, the output is the same as the immediately previous successful `rtrv-log` command that was entered at the same terminal (and no `rtrv-log` command was entered at another terminal).

sdate (optional)

Start date. Report only log entries that were created on or after the specified date (`dir=fwd`), or only log entries that were created on or before the specified date (`dir=bkwd`). See the Notes section for usage information.

Range:

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

Default:

Report log entries regardless of their creation date

slog (optional)

Source of log. The OAM Maintenance log to access.

Range:

act
Active OAM

stb
Standby OAM

Default:*act***snum (optional)**

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the *outgrp* parameter is specified.

Range:*1 - 1999**1-999* —Alarms (UAMs)*1000-1999* —UIMs**Default:**

All entries for the specified *type* are displayed.

If *type=all*, *alarm*, or not specified, the default value is *1*.

If *type=uim*, the default value is *1000*.

stime (optional)

Start time. Report only log entries that were created on or after the specified time (*dir=fwd*), or only log entries that were created on or before the specified time (*dir=bkwd*). See the Notes section for usage information.

Range:*000000 - 235959*

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as *130503*.

Default:

Report log entries regardless of their creation time

type (optional)

Type of Maintenance log to access for the report.

Range:*all*

UAMs and UIMs

alarm

UAMs

uim

UIMs

Default:*alarm***Example**

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all  
rtrv-log:next=100
```

Dependencies

No other `rtrv-log` command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the `rtrv-log` command can be entered.

If the `sdate` and `edate` parameters are specified:

- In the forward direction, the `sdate` value must be less than or equal to the `edate` value.
- In the backward direction, the `sdate` value must be greater than or equal to the `edate` value.

The month component of the `sdate` and `edate` parameters must be in the range 1–12.

The day component of the `sdate` and `edate` parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the `stime` and `etime` parameters must be in the range 00–59.

The minutes component of the `stime` and `etime` parameters must be in the range 00–59.

If the `sdate` parameter value is equal to the `edate` parameter value,

- In the forward direction, the `stime` value must be less than or equal to the `etime` value.
- In the backward direction, the `stime` value must be greater than or equal to the `etime` value.

The `sdate` parameter value plus the `stime` parameter value must be less than the current time and date combination.

If `dir=bkwd` is specified with a date and time range, `sdate/stime` must be greater than `edate/etime`.

When the `enum` parameter is specified, the `snum` parameter must be specified with a value less than or equal to the specified `enum` value.

The specified `enum` parameter value and the specified `snum` value must be within the same range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

The `type` parameter and the `snum/enum` parameters cannot be specified together in the command.

The `rtrv-log:next=` command must be entered on the same terminal where the previous successful `rtrv-log` command was entered in the system. No other parameters can be entered with the `next` parameter in the command.

The `rtrv-log:next=` command cannot be entered following a `rtrv-log` command that contained the `type=all` parameter. A `rtrv-log` command without the `type=all` parameter must be entered before the `rtrv-log:next=` command can be entered.

Because entries can be overwritten between the entry of a `rtrv-log` command without the `next` parameter and the entry of a `rtrv-log:next=` command, the `rtrv-log:next:`

command might not execute successfully. Another `rtrv-log` command without the `next` parameter must be entered before the `rtrv-log:next:` command can be entered again,

The values specified for the `edate` with the `stime` parameter combination must be valid.

The values specified for the `edate` with `stime` and `etime` parameter combination must be valid.

When an `enum` parameter is specified, it requires an `snum` as its mated parameter.

No other parameters can be entered with the `next` parameter in the command.

The selected log must be accessible and free of errors.

The standby OAM is corrupt or cannot be found.

When the `snum` parameter is specified, it must be within the valid range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

When the `enum` parameter is specified, it must be within the valid range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

- years 95–99 = 1995 through 1999
- years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any `sdate/edate` value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of the `num` and `dir` parameters. The `num` parameter determines the maximum number of entries to display, and the `dir` parameter determines whether entries are displayed from the oldest end (`dir=fwd` or not specified) or the newest end (`dir=bkwd`).

When `sdate` is specified and `edate` is not specified in the forward direction, `edate` is defaulted to be the end of the log.

When `edate` is specified and `sdate` is not specified in the forward direction, `sdate` is defaulted to be the beginning of the log.

When `sdate` is specified and `edate` is not specified in the backward direction, `edate` is defaulted to be the beginning of the log.

When `edate` is specified and `sdate` is not specified in the backward direction, `sdate` is defaulted to be the end of the log.

When `stime` is specified and `etime` is not specified in the forward direction, `etime` is defaulted to 235959.

When `etime` is specified and `stime` is not specified in the forward direction, `stime` is defaulted to 000000.

When `stime` is specified and `etime` is not specified in the backward direction, `rtime` is defaulted to 000000.

When `etime` is specified and `stime` is not specified in the backward direction, `stime` is defaulted to 235959.

When `stime` or `etime` is specified but neither the `sdate` or `edate` parameters are specified, `sdate` and `edate` are each defaulted to the value *today*.

The `num` parameter is used to control the maximum number of entries to be displayed by one command.

The `dir` parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the `dir` parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (`outgrp`) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When `outgrp=all` is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The `next` parameter is used to display a specified number of additional log records after the previous `rtrv-log` entry at the terminal. New records that are logged after the previous `rtrv-log` command was entered will not be displayed when the `rtrv-log:next=` command is entered. The `next` parameter is valid only under the following conditions:

- The `rtrv-log:next=` command is entered at the same terminal from which the previous `rtrv-log` command was entered. The previous `rtrv-log` command must not include the `type=all` parameter.
- No other terminal has issued a `rtrv-log` command after the `rtrv-log` command entered at the terminal from which the `rtrv-log:next=` command is entered.
- The `next` parameter is the only parameter specified in the `rtrv-log` command.
- There are still logs present that match the conditions (except `time/date/num`) specified in the previous `rtrv-log` command.

When either a single `snum` or range of `snum/enum` is specified, only those Alarms or UIMs within the specified range are displayed.

When `snum` is specified and `enum` is not specified, the `enum` value defaults to the specified `snum` value.

When `enum` is specified, an `snum` value must be specified that is less than or equal to the specified `enum` value.

If an `snum` is specified within the range 1-999, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1-999.

If an `snum` is specified within the range 1000-1999, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1000-1999.

When `enum` is not specified and the specified `snum` Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the `snum` value is out of range.

If `snum` and `enum` are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

The Alarm log only stores minimal information about each alarm. Only a few alarms support multiple-line formats that would be displayed when `mode=full` is used. The majority of alarms display the same information when either `mode=full` or `mode=brief` is used.

Output

In this example, the sequence numbers that are replaced by the dashes (- - -) represent the UIMs that were discarded due to the UIM thresholding feature:

```
rtrv-log:type=uim:sdate=960715:stime=220000:num=50
```

rtrv-loopset

Use this command to retrieve loopset data from the database.

Parameters

disp (optional)

Display method. The manner in which the retrieved data is displayed.

Range:

detail

Provides detailed information for a loopset entry.

list

Provides a list of loopset entries.

Default:

detail

force (optional)

Range:

yes

mode (optional)

Mode of operation. Retrieves loopset entries that have been assigned the specified mode.

Range:

notify

Generates a UIM without discarding the message.

discard

Generates a UIM and discards the message.

name (optional)

Loopset name.

Range:

ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters.

num (optional)

The number of entries to be retrieved.

Range:

1 - 1000

Default:

50

Example

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

```
rtrv-loopset
```

This example provides detailed information for the loopset entry RTP1.

```
rtrv-loopset:name=rtp1
```

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:num=100:force=yes
```

This example provides a list of the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:force=yes:num=100:disp=list
```

This example provides detailed information for the first 100 valid loopset entries set to *discard* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=discard
```

This example provides a list of the first 100 valid loopset entries set to *notify* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=notify:disp=list
```

Dependencies

If the value of the `num` parameter is greater than 50, then the `force=yes` parameter must be specified.

The value of the `name` parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The Loopset table must be accessible.

The `name=none` parameter cannot be specified.

If the `name` parameter is specified, then the `disp=list` parameter cannot be specified.

Output

This example displays loopset entry details for loopset RTP1:

```
rtrv-loopset:name=rtp1
```

```
rlghncxa03w 07-02-10 08:52:38 EST EAGLE Rel 35.6.0

rtrv-ls

Use this command to show the linkset information.

Parameters

apc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

apc/apca/apci/apcn/apcn24/apcn16 (optional)

Adjacent point code.

apci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7
 area—000-255
 id—0-7

The point code 0-000-0 is not a valid point code.

apcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

apcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The prefix indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

apcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

cggtmod (optional)

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

Range:

yes

no

islrsrb (optional)

Incoming rotated signaling link selection (SLS) bit. This parameter displays the linksets with the specified rotated bit.

Range:

1 - 8

ITU linksets— *1-4*

ANSI linksets— *1-8*

Default:

Display all link sets

itutfr (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the *itutfr* parameter.

This parameter is valid for ITU national linksets only.

Range:

on

off

Default:

Display all link sets

lsn (optional)

Linkset name

Range:

ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all link sets

lst (optional)

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

Range:

prx

Display proxy links.

mtpmse (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range:

yes
equipped

no
not equipped

Default:

Display all link sets

pct (optional)

This parameter displays the linksets where the Point Code and CIC Translation has the specified status.

Range:

on

off

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

The proxy point code must be a full point code.

Synonym:

ppca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code.

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7
 area—000-255
 id—0-7

The point code 0-000-0 is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*
nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ppcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

ppcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

rands1s (optional)

Random SLS (signaling link selection). This parameter displays linksets that have the specified value of the `rands1s` parameter.

Range:**off**

Displays all linksets where random SLS is disabled.

class0

Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

all

Displays ITU linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled and ANSI linksets where random SLS generation for Class0 and ISUP traffic is enabled.

Default:

off

s1socbit (optional)

Other CIC (Circuit Identification Code) Bit. This parameter displays the linksets that have the `s1socbit` parameter set to a value from 5 - 16.

Range:*

*

Specifies all possible values (5-16)

Default:

Display all link sets

s1srsb (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

Range:

1 - 4

Default:

Display all link sets

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

```
sna---000---15
```

```
mna---000---31
```

Example

Display all linksets having the parameter `pct=on`:

```
rtrv-ls:pct=on
```

Display the attributes of all link sets:

```
rtrv-ls
```

Retrieve linkset LS1:

```
rtrv-ls:lsn=ls1
```

Retrieve all link sets with the `mtprse=yes` parameter:

```
rtrv-ls:mtprse=yes
```

Retrieve all link sets that use the `slsocbit` parameter with a value from 5 - 16:

```
rtrv-ls:slsocbit=*
```

Display an ITU linkset to view the settings for the `slsrsb` or `slsocbit` parameters:

```
rtrv-ls:lsn=lsitu
```

Retrieve all ITU national linksets that have the `itutfr` parameter set to `on`:

```
rtrv-ls:itutfr=on
```

Retrieve the specified ITU national linkset and display its setting for the `itutfr` parameter:

```
rtrv-ls:lsn=lsitun
```

Retrieve all linksets where random SLS generation is enabled for SCCP ITU traffic and Class0 ANSI traffic:

```
rtrv-ls:randsls=class0
```

Display all proxy linksets:

```
rtrv-ls:lst=prx
```

Display all linksets using a specified proxy point code:

```
rtrv-ls:ppc=11-11-11
```

Display all linksets using a specified secondary point code:

```
rtrv-ls:spc=2-2-2
```

Display all linksets using a specified adjacent point code:

```
rtrv-ls:apc=1-1-2
```

Retrieves all linksets where calling party global title modification is requested:

```
rtrv-ls:cggtmod=yes
```

Retrieves all link sets with the ISLSRSB value 6:

```
rtrv-ls:islsrsb=6
```

Display all linksets using a specified adjacent point code:

```
rtrv-ls:apcn16=121-10-15
```

Dependencies

A PCT quantity feature must be enabled before the `pct` parameter can be specified.

The specified linkset must be in the database.

The Linkset table is corrupt or cannot be found.

All optional parameters, except for the combination of the `slsocbit` and `slsrsb` parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the `apcn` parameter is specified as the Adjacent Point Code, then the format of the `apcn` parameter must match the format dictated by the `chg-stpopts:npcfmti` parameter.

The SLSOCB feature must be enabled before the `slsocbit` parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the `apc` and `spc` parameters can be specified.

A NULL pointer was sent into a function. An ATH will also be issued.

The Signaling Link table is corrupt or cannot be found.

The extended link table is corrupt or cannot be found.

The STPOPTS table is corrupt or cannot be found.

At least one linkset must be associated with the value of the `apc` parameter.

The Proxy Point Code feature must be enabled before the `lst=prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The value specified for the `ppc` parameter must be a full point code.

The value specified for the `ppc` parameter must already exist in the Destination table, and the `prx=yes` parameter must have been specified.

The value specified for the `apc` parameter must be a full point code.

The value specified for the `spc` parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggtmod` parameter can be specified.

The ISLSRSB feature must be enabled before the `islsbr` parameter can be specified.

The PPC specified must not be a private point code.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The CLLI, TFATCABMLQ, MTPRSE, and ASL8 fields are displayed only when a specific linkset is specified. The SLSOCBIT and SLSRSB fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the `tfatcabmlq` parameter database value is 0 for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or 1 if there are 2 or fewer links in the linkset).

If the `tfatcabmlq` parameter database value is 0, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE to be a minimum of 1 for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the `rtrv-ls` command output.

If the `tfatcabmlq` parameter value is set to a specific value greater than 0, then the EAGLE does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the `rtrv-ls` command output.

The EAGLE `ent-ls` command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS `vfy-ls` command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS `vfy-ls` output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The value specified for the `ppc` parameter must be a full point code. Cluster point codes and private point codes are not supported.

The ICNIMAP and OGNIMAP fields are displayed only if the linkset name is specified in the command, the ITU Spare Point Code feature is enabled, and an ITUN or ITUI point code is associated with the linkset.

IPSG linksets have SLKTPS configured. SLKTPS configures the transactions per second for each link assigned to the IPSG linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSG-M2PA links, then the command does not report any data below the TPS header or raise alarms.

Output

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

If information is requested for a linkset, then the secondary point code field is displayed in the output. If the MLS feature is not enabled, or if the linkset was not created with a secondary point code, the field contains dashes.

Headings for unequipped cards are not displayed.

This example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic for ITU linksets and Class0 and ISUP traffic for ANSI linksets:

```
rtrv-ls:randsls=all
```

Legend

- **LSN**—Name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the `apctype=itunchina` parameter specified.
- **APC/APCII/APCN/APCN24/APCN16**—Adjacent DPC of the linkset
- **SPC/SPCII/SPCN/SPCN24/SPCN16**—Secondary PC of the linkset
- **SCRN**—Screen set assigned to the linkset
- **L3TSET**—Level 3 timer set value assigned to the linkset
- **SLTSET**—SLTM record associated with the linkset
- **BEI**—Broadcast exception indicator. Indicates whether TFP (transfer prohibited) messages can be broadcast on the linkset.
- **LST**—Type of links in the linkset (access links, bridge links, etc.)
- **LNKS**—Number of links in the linkset
- **GWSA**—Shows whether gateway screening is used on the specified linkset
- **GWSM**—Shows whether the display of messages generated for each screened message is turned on or off
- **GWSD**—Shows whether the gateway screening message discard function is turned on or off
- **SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset
- **NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset
- **CLLI**—The far end Common Language Location Identifier (CLLI)
- **TFATCABMLQ**—the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted
- **MTPRSE**—Shows whether the adjacent node is equipped with MTP restart
- **ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs
- **MULTGC**—Shows whether multiple group codes are allowed
- **MATELSN**—Name of the mate IP Gateway linkset
- **LSUSEALM**—Percent of the linkset TPS (IPTPS) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured IPTPS value for the linkset
- **SLKUSEALM**—Percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured IPTPS. The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.
- **LOC**—Location of the card containing the signaling links that make up the linkset
- **PORT**—Port on the card containing the signaling link
- **SLSOCBIT**—Setting of the Other CIC (Circuit Identification Code) Bit

- **SLRSRB**—Setting of the Rotated SLS (Signaling Link Selection) Bit
- **ISLRSRB**—setting of the Incoming Rotated SLS (Signaling Link Selection) Bit
- **GSMSCRN**—Shows whether the GSM MAP screening indicator is turned on or off
- **ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off
- **L2TSET**—Level 2 timer set value associated with the signaling link
- **SLC**—Signaling link code of the signaling link
- **TYPE**—Type of card
- **BPS**—Transmission rate for the link in bits per second
- **E1PORT**—E1 port with the E1 interface that services the link
- **E1LOC**—Card location of the E1 card with the E1 interface that services the link
- **T1PORT**—T1 port with the T1 interface that services the link
- **T1LOC**—Card location of the T1 card with the T1 interface that services the link
- **TS**—Timeslot assigned to the link that is serviced by the E1 or T1 interface
- **E1ATMCRC4**—Indicator of whether CRC4 multi-frame structure is enabled or disabled
- **E1ATMSI**—Value of two Spare International bits of NFAS data
- **E1ATMSN**—Value of five Spare National bits of NFAS data
- **RANDSLS**—The setting of linkset for Random SLS generation
- **ADAPTER**—Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset
- **RSVDSLKTPS**—Guaranteed SLKTPS for an IPSP linkset
- **MAXSLKTPS**—Maximum SLKTPS for an IPSP linkset
- **RCONTEXT**—Routing context ID of IPSP M3UA linkset
- **ASNOTIF**—Shows whether AS notifications will be generated for IPSP M3UA linkset
- **ANAME**—Association name configured for signaling link of IPSP linkset
- **SLKTPS**—Provisioned TPS for concerned signaling link of the specified IPSP linkset
- **CGGTMOD**—Shows whether calling party global title modification indicator is yes or no for the linkset
- **PPC/PPCI/PPCN/PPCN24/PPCN16**—The proxy point code of the linkset
- **NUMSLKALW**—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state
- **NUMSLKRSTR**—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state
- **NUMSLKPROH**—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state
- **ICNIMAP**—Incoming NI Map
- **OGNIMAP**—Outgoing NI Map
- **RSL8**—Shows whether the incoming SLS is rotated by 8 bits
- **PCT**—Shows whether the Point Code & CIC Translation (PCT) feature is applied to messages coming in or going out on links of a particular link set
- **RFT**—Shows whether the linkset is in SLT Reflect mode

- **J1PORT**—J1 port with the J1 interface that services the link
- **CHGMTP3OPC**—Shows whether OPC is going to be replaced by SPC.
- **GNAMESET**—Shows the Generic name Set.
- **CGPNBLSET**—Shows the Calling Party Blacklist Set.
- **VISUALIZEDATA**—Linkset based visualization options.

rtrv-m2pa-tset

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

Parameters

tset (optional)

The name of the M2PA timer set to be retrieved.

Range:

1 - 20

ver (optional)

The M2PA version supported by the association.

Range:

d6

rfc

Example

```
rtrv-m2pa-tset
```

```
rtrv-m2pa-tset:tset=1
```

Dependencies

None

Notes

If a timer set is not specified in the command, all timer sets are retrieved.

Output

```
rtrv-m2pa-tset:tset=1:ver=d6
```

```

rtrv-map

Use this command to show the mated application relationship information and Alternate RI Mate information maintained by the system. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to view Alternate RI Mate information. This information is used to support the routing of SCCP management SSP/SSA messages.

Parameters**Note:**

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

**Note:**

Definitions for the feature options specified by the `on` parameter are located in the Notes section.

mapset (optional)

MAP set ID.

Range:

1 - 36000, *dflt*
dflt —Default MAP set

Default:

dflt

The default value is *dflt* only when the Flexible GTT Load Sharing feature is not enabled.

on (optional)

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

Range:

refcnt

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

Point code.

pci (optional)

ITU international point code in the form of *zone-area-id*.

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

pcn16 (optional)

16-bit ITU national point code in the form of *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

ssn (optional)

Subsystem number

Range:

2 - 255

Default:

All subsystem numbers and their mates are shown for the given point code.

Example

```
rtrv-map
rtrv-map:pc=2-2-2
rtrv-map:pca=1-1-4:ssn=15
rtrv-map:mapset=2
rtrv-map:mapset=df1t:pcn=s-10155-ab
rtrv-map:pcn=1001:on=refcnt
rtrv-map:pcn16=1-2-3
```

Dependencies

The value of the `pc/pca/pci/pcn/pcn24/pcn16` parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Site Identification table is corrupt or cannot be found.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

The MAP table is corrupt or cannot be found.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See the `canc-cmd` command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If the Flexible GTT Load Sharing feature is enabled, then the retrieved MAP examples contain the MAPSET ID for each MAP set. MAP sets that were configured before the Flexible GTT Load Sharing feature was enabled are shown as MAPSET ID=DFLT after the Flexible GTT Load Sharing feature is enabled.

The `pc/pca/pci/pcn/pcn24/pcn16`, `ssn`, and `mapset` parameters can be used to screen the output of all MAP sets. These parameters allow retrieval of only those MAP sets that contain the desired parameters.

A MAP set can contain one primary entry and up to 31 mated entries.

If no parameters are entered, all defined mated point codes (up to 36,000) are shown.

If the Flexible Final GTT Loadsharing feature is not enabled, then the number of entries in the MAP table is based on unique point codes. Point codes that are duplicated in MRN sets using different SSNs are counted only once in the number of entries.

If the Flexible Final GTT Loadsharing feature is enabled, then the number of entries in the MAP table is based on unique point code and SSN combinations. Point codes that are duplicated in MRN sets are counted in the number of entries).

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MRNSET and MRNPC fields, is displayed for all MAP Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

on option

`refcnt`—displays the MAPSET, MAPSET/PC, and MAPSET/PC/SSN reference counts

Output

All subsystem numbers for the specified point code and its mates are shown.

The NET column is shown only when a MAP set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

If an MRC value is preceded with an "*", then the MRC value is not applicable for the current multiplicity mode (MULT field). The MRC value is only valid when MULT is *DOM*.

If an SRM value is preceded with an "*", then the SRM value is not applicable for the current multiplicity mode (MULT field). The SRM value is only valid when MULT is *DOM* or *COM*.

If an SSN REFCNT value is preceded with an "*", then the entry can be deleted if any other entry with the same point code exists in that MAP set.

This example retrieves an ANSI MAP set for a specified point code:

```
rtrv-map:pc=2-2-2
```

Legend

- **MAPSET ID**—MAP set number or DFLT when numbered MAP sets are allowed
- **PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the primary application resides
- **NET**—Mate network type of the point code when an ITU MAP set contains both ITU-I and ITU-N point codes. The field can show I if the MATE PC is an ITU-I point code or N if the MATE PC is an ITU-N point code.
- **MATE PC/PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the mate application resides
- **SSN**—Applications subsystem number
- **RC**—Relative cost of the point code/subsystem
- **MULT**—Multiplicity mode SOL (Solitary), DOM (Dominant), SHR (Shared), or COM (Combined - Shared and Dominant) Load sharing. See the "Notes" section in the `ent-map` command description for an explanation of multiplicity modes.
- **SRM**—Specifies whether subsystem routing messages are transmitted is on (YES), off (NO), not applicable (*Y) but would be YES if applicable, or not applicable (*N) but would be NO if applicable. See the "Notes" section in the command description for SRM non applicable Load sharing modes.
- **MRC**—Specifies whether message routing under congestion is on (YES), off (NO), not applicable (*Y) but would be YES if applicable, or not applicable (*N) but would be NO if applicable. See the "Notes" section in the `rtrv-map` command for MRC non applicable Load sharing modes.
- **GRP NAME**—Name of a group of point codes (broadcast list group name) to be notified of the subsystem status
- **SSO**—Subsystem Status Option. Subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.
- **WT**—Weight assigned to the PC
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group

- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.
- **MRNSET**—Alternate RI Mate MRN Set ID
- **MRNPC**—Alternate RI Mate point code
- **MAPSET REFCNT**—Count of GTT Translation table entries with XLAT=NONE that refer to the corresponding MAP set
- **MAPSETPCSSN REFCNT**—Count of entries from MRN, GSM MAP Screening, GSM MAP Opcode, GTT Translation and GTT Action tables that refer a MAP entry with a MAPSET/PC/SSN combination
- **MAPSETPC REFCNT**—Count of entries from MRN, GTT Translation, GSM MAP Screening, GSM MAP Opcode and Prepaid SMS Options tables that refer a MAP entry with a MAPSET/PC combination

rtrv-meas-sched

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for OAM based measurements.

This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see `rtrv-measopts`).

Refer to the *Measurements Manual* for specific details on measurement reports.

Parameters

This command has no parameters.

Example

```
rtrv-meas-sched
```

Dependencies

None

Notes

None

Output

Output with measurement collection on.

```
rtrv-meas-sched
```

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0  
COLLECT          = on  
GTWYLSFLTR      = both  
-----  
SYSTOT-STP      = on  
SYSTOT-TT       = off  
SYSTOT-STPLAN   = off  
COMP-LNKSET     = on  
COMP-LINK       = on  
GTWY-STP        = on  
GTWY-LNKSET     = on  
MTCD-STP        = on  
MTCD-LINK       = on  
MTCD-STPLAN     = on
```

```

    MTC-D-LNKSET      = on
;

```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

```
rtrv-meas-sched
```

```

rlghncxa03w 04-02-27 07:19:51 EST  EAGLE 31.3.0
COLLECT          = off

MTC-D-STPLAN    = (on)
MTC-D-LNKSET    = (on)
;

```

Legend

- **COLLECT**—Shows whether measurement collection is on or off.
- **GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:
 - *both*—Only gateway linksets are included in the report to the terminal and SEAS.
 - *stp*—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.
 - *seas*—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.
 - *none*—All defined linksets are included in the report to the terminal and SEAS.
- **SYSTOT-STP**—System total–STP measurement collection is on or off.
- **SYSTOT-TT**—System total–translation type measurement collection is on or off.
- **SYSTOT-STPLAN**—System total–STP LAN measurement collection is on or off.
- **COMP-LNKSET**—Component–linkset measurement collection is on or off.
- **COMP-LINK**—Component–link measurement collection is on or off.
- **GTWY-STP**—Gateway administration–STP measurement report is on or off.
- **GTWY-LNKSET**—Gateway administration–LNKSET measurement report is on or off.
- **MTC-D-STP**—Maintenance daily–STP measurement collection is on or off.
- **MTC-D-LINK**—Maintenance daily–link measurement collection is on or off.

- **MTCD-STPLAN**—Maintenance daily—STP LAN measurement collection is on or off.
- **MTCD-LNKSET**—Maintenance daily—LNKSET measurement report is on or off.

rtrv-mrn

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing feature is on and the Flexible GTT Load-Sharing feature is enabled, then use this command to retrieve MRN set information.

If the GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature is enabled, then use this command to display Alternate RI Mate information.

Parameters

**Note:**

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

**Note:**

Definitions for the feature options specified by the `on` parameter are located in the Notes section.

mrnset (optional)

MRN set ID.

Range:

1 - 3000, *dflt*
dflt —Default MRN set

on (optional)

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

Range:

refcnt

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

Post-GTT-translated point code.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa*-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-*nnnnn*—0-16383*gc*—*aa*-zz*m1*-*m2*-*m3*-*m4*—0-14 for each member; values must sum to 14**pcn24 (optional)**24-bit ITU national point code with subfields *main signaling area*-*sub signaling area*-*signaling point* (*msa*-*ssa*-*sp*).**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255*ssa*—000–255*sp*—000–255**pcn16 (optional)**16-bit ITU national point code with subfields *unit number*-*sub number* *area*-*main number* *area* (*un*-*sna*-*mna*).**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127*sna*---000---15*mna*---000---31**Example**

rtrv-mrn

rtrv-mrn:pc=1-1-2

rtrv-mrn:pcn=s-1-1-1-123-aa

rtrv-mrn:pci=1-55-1:mrnset=2

rtrv-mrn:pcn=1001:mrnset=dflt:on=refcnt

rtrv-mrn:pcn16=1-2-3:mrnset=dflt

Dependencies

A point code that is specified in the command must already exist in the MRN table.

The `mrnset` parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If any entries are provisioned in the SCCP-SERV table, then the maximum number of entries shown for the MRN table are reduced by that amount.

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MAPSET, MAPPC, and MAPSSN fields, is displayed for all MRN Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

on options

refcnt —displays the MRNSET and MRNSET/PC reference counts

Output

The NET column is shown only when an MRN set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

Legend

- **MRNSET**—MRN set ID
- **NET**—Mmated network type of the point code when an ITU MRN set contains both ITU-I and ITU-N point codes. The field can show I if the PC is an ITU-I point code or N if the PC is an ITU-N point code.
- **PC/PCI/PCN/PCN24/PCN16**—Point Code
- **RC**—Relative Cost
- **WT**—PC Weight
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within a RC group falls below the in-service threshold, that RC group is considered out-of-service, and traffic is routed to the next lowest RC group.
- **MAPSET**—Secondary mate MAP Set
- **MAPPCN**—Alternate RI Mate point code
- **MAPSSN**—Alternate RI Mate subsystem number
- **MRNSET REFCNT**—Count of GTA table entries with XLAT=NONE that refer to the corresponding MRN set
- **MRNSETPC REFCNT**—Count of entries from the MAP, GTT Translation, GTT Action, and Prepaid SMS Options tables that refer to the corresponding MRN entry with an MRNSET/PC combination

rtrv-npp-as

Use this command to display a Numbering Plan Processor (NPP) Action Set (AS) entry.

Parameters

asn (optional)

Action set name. The name of the AS.

Range:

ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

mode (optional)

This parameter allows the command to display Service Action optional numerical and digit string data values.

Range:

full

Example

```
rtrv-npp-as
rtrv-npp-as:asn=asn6
rtrv-npp-as:mode=full
```

Dependencies

None

Output

Note:

The `asn` or `mode=full` parameter must be specified before FA list information is displayed in the `rtrv-npp-as` output.

This example displays all AS entries:

```
rtrv-npp-as

rtrv-npp-srs

Use this command to display a Numbering Plan Processor (NPP) Service Rule Set entry.

Parameters

asn (optional)

Action set name.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

fdl (optional)

Filter digit length. The number of digits on the incoming digit string that is filtered by the NPP.

Range:

*1 - 32, **

*—multiple lengths of digit strings can be filtered

fnaI (optional)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

Range:

intl, natl, nai1, nai2, nai3, unkn

intl—filter messages with NAI=INTL

natl—filter messages with NAI=NATL

nai1—filter messages with NAI=NAI1

nai2—filter messages with NAI=NAI2

nai3—filter messages with NAI=NAI3

unkn—filter messages with NAI=UNKN

The `chg-npp-serv` command is used to assign values to the various FNAI classes.

fpfx (optional)

Filter prefix. The prefix used to filter incoming digit strings.

Range:

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; Valid digits are ?, *, 0-9, a-f, A-F.

srvn (optional)

Service name.

Range:

nppt

Example

Display all NPP Service Rule Set table entries for a given service.

```
rtrv-npp-srs
```

Display NPP Service Rule Set table entries for a specified digit length.

```
rtrv-npp-srs:fdl=*
```

Display NPP Service Rule Set table entries for a specified filter prefix and filter digit length.

```
rtrv-npp-srs:fpfx=91:fdl=16
```

Dependencies

The value specified for the `fpfx` parameter cannot have a `?` as the final character.

Output

```
rtrv-npp-srs
```

```
tekelecstp 11-02-28 16:41:44 EST EAGLE 44.0.0
```

rtrv-obit

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

Parameters

loc (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

Range:

1113, 1115

mode (optional)

Display mode

Range:

c

Continuous mode; shows obituaries already logged and new obituaries as they occur.

m

Manual mode; shows obituaries on demand only, when this command is entered.

Default:

c

num (optional)

The number of obituaries to display.

Range:

1 - 512

Default:

150

Example

```
rtrv-obit:loc=1115:num=2
```

Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the `mode` parameter is specified without the `num` parameter, the entire log is displayed.

Only one `rtrv-obit` or `rtrv-trbl` command at a time can be in progress throughout the entire system.

The card location specified by the `loc` parameter must be either 1113 or 1115.

If the `loc` parameter specifies the card that is running the standby OAM, that card must be available.

The `num` parameter value must be between 1 - 512.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command when the command is entered for the active OAM. See `canc-cmd` for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the `mode=m` parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which includes MUX card) contains significantly more information than an obituary from an X86-based processor card. The data in an IXP obituary is spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

Output

This example shows output for two obituaries from an x86-based card:

```
rtrv-obit:loc=1115:num=2
```

```

rtrv-pct

Use this command to display Point Code and CIC Translations.

Parameters

ecice (optional)

The end of the Emulated Circuit Identification Code range.

Range:

0 - 4294967295, *

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

Default:

*

ecics (optional)

The start of the Emulated Circuit Identification Code range.

Range:

0 - 4294967295, *

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

Default:

*

epc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

epca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

epci (optional)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0–7

area—000–255

id—0–7

The point code *0-000-0* is not a valid point code.

epcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:*0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**filtpc (optional)**ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.**Synonym:***filtpca***Range:***0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.When *chg-sid:pctype=ansi* is specified, *ni-*. ** is valid if *ni =006–255*.The point code *000-000-000* is not a valid point code.**filtpci (optional)**ITU international destination point code with subfields *zone-area-id*.**Range:***0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

Example

`rtrv-pct:epc=1-1-1`

```
rtrv-pct:realpc=2-2-2
```

Dependencies

If the `ssn` or `ecics` parameter is specified, then the `si` parameter must be specified.

A full point code must be specified as the value for the `realpc/realpca/realpci/realpcn` and `epc/epca/epci/epcn` parameters.

The value specified for the `ecice/rcice` parameter must be equal to or greater than the value specified for the `ecics/rcics` parameter, respectively.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters must have the same domain.

The PCT table is corrupt or cannot be found.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must have at least one route for each value defined in the Route table.

If a groupcode is specified then the values specified for the `realpc`, `filtpc`, and `epc` parameters must have the same group code.

A spare point code cannot be specified as a value for the `epci/epcn`, `filtpci/filtpcn`, and `realpci/realpcn` parameters.

The `ecics` or `rcics` parameter must be specified before the `relcause` parameter can be specified.

The `si=3` parameter must be specified before the `ssn` parameter can be specified.

If the `ecice` or `rcice` parameter is specified, then the `ecics` or `rcics` parameter must be specified, respectively.

If the `ecics`, `ecice`, and `rcics` parameters are specified, then the `rcice` parameter must be specified.

A value of 4, 5, or 13 must be specified for the `si` parameter before the `ecice/ecics` and `rcice/rcics` parameters can be specified.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP point code.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP capability point code.

The `epc/epca/epci/epcn` or `realpc/realpca/realpci/realpcn` parameter must be specified if any other optional parameter is specified.

The values specified for the `ecics/ecice` and `rcics/rcice` parameters must be within the range specified by the parameter definition.

The difference between the values specified for the `ecice` and `ecics` parameters must be equal to the difference between the values specified for the `rcice` and `rcics` parameters.

A value of 5 or 13 must be specified for the `si` parameter before the `relcause` parameters can be specified.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must already exist in the Route table.

The `ssn` and `cic` parameters cannot be specified together in the command.

If the `ecics`, `rcics`, and `rcice` parameters are specified, then the `ecice` parameter must be specified.

If the same value is specified for the `epc` and `realpc` parameters, then the values specified for the `ecics/ecice` and `rcics/rcice` parameters cannot indicate the same range.

Only one of the `filtpc/filtpca/filtpci/filtpcn` parameters can be specified in the command.

The value specified for the `epc/epci/epcn` parameter cannot be the same as a secondary point code.

Output

```
rtrv-pct

rtrv-ppsopts

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

Parameters

ppt (optional)

Prepaid portability type. An IN platform.

Range:

1 - 32

Example

```
rtrv-ppsopts
rtrv-ppsopts:ppt=2
```

Dependencies

The Prepaid SMS Intercept Ph1, IDP A-Party Routing, or IDP Service Key Routing feature must be enabled and turned on before this command can be entered.

The Prepaid SMS Options Table must be available.

Output

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.

This example displays Prepaid SMS options for a specific Prepaid Type:

```
rtrv-ppsopts:ppt=1

tekelecstp 08-12-17 15:07:01 EST  EAGLE 40.1.0

Prepaid SMS Options
-----
BPARTYCHK          = OFF

- GSM MAP SRI Redirect
- ISUP NP for EPAP

Example

Retrieve provisioned prefix information for all supported features.

```
rtrv-prefix
```

Retrieve prefix information for the GSM MAP SRI Redirect feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

Dependencies

The feature name must be the name of an enabled controlled feature as it is displayed in the `rtrv-ctrl-feat` command output. The following controlled features are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

The FEATPFX table is corrupt or cannot be found by the system.

Notes

None

Output

This example retrieves the provisioned prefix information for all features. Additional information is displayed in the function column for prefix numbers 6 and 7 of the “ISUP NP with EPAP” feature.

```
rtrv-prefix
```

```
rlghncxa03w 14-09-20 09:04:14 EST EAGLE 46.1.0
```

Feature	NUM	Prefix	Function
GSM MAP SRI Redirect	1	1a1a	
GSM MAP SRI Redirect	2	ffff	
GSM MAP SRI Redirect	3	1234	
GSM MAP SRI Redirect	26	1224	
ISUP NP with EPAP	1	3b4c	
ISUP NP with EPAP	6	886	Insertion Country Code
ISUP NP with EPAP	7	0	Deletion Condition

```
FEATPFX table is (7 of 256) 2% full
```

```
;
```

This example retrieves provisioned prefix information for the “GSM MAP SRI Redirect” feature. The table capacity for the total number of entries in use is reported, not just the number of entries displayed. No additional information is displayed in the Function column for this feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

```
rlghncxa03w 14-09-20 09:04:14 EST EAGLE 46.1.0

rtrv-rte

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

Parameters

Note:

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

c11i (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default:

No value given

dpc (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, `ni=000` is not valid.
 When `chg-sid:pctype=ansi` is specified, `nc=000` is not valid if `ni=001-005`.
 When `chg-sid:pctype=ansi` is specified, `nc=000` is valid if `ni=006-255`.
 When `chg-sid:pctype=ansi` is specified, `ni-*.*` is valid if `ni= 006-255`.
 The point code `000-000-000` is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

*s-, p-, ps-, 0-16383, aa-zz, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—s-, p-, ps-

*nnnnn—0-16383, **

*gc—aa-zz, **

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or **-*-*-** when the point code includes a group code.

dpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000–255
sp—000–255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---*000---127

*sna---*000---15

*mna---*000---31

lsn (optional)

Linkset name

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all

mode (optional)

The method used to display the output report.

Range:

full

pcst (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

Range:

none

Display all point codes that do not have subtype prefixes

s

Display only spare point codes

p

Display only private point codes

ps

Display only private and spare point codes

pctype (optional)

Point code domain. This parameter displays the point codes of the specified domain type.

Dependencies

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must exist in the Destination Point Code table.

The value specified for the `lsn` parameter must exist in the routeset of the destination if the `dpc` parameter is specified.

If the `dpcn` parameter is specified, its format must match the format that was assigned with the `chg-stpopts` command `npcfmti` parameter.

If the `pctype` parameter has a value of `ansi` or `itun24`, then the `pcst` parameter cannot have a value of `s` or `ps`.

The `pctype` and `pcst` parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, `clli`, `msar=only`, and `ncai` parameters.

When using network routing, if the destination point code has a value of `*` in the `nc` field, the `ncm` field must also be `*` (for example, `dpc=21--*`).

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be a valid point code.

If the `clli` parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Site ID table is corrupt or cannot be found.

The database must be consistent.

The value specified for the `lsn` parameter must already be assigned to the specified routeset.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (`s-`) and the private and spare point code subtype prefix (`ps-`). All of the point code types support the private (internal) point code subtype prefix (`p-`).

Asterisks in ANSI Point Codes

Two asterisks in the `ncm` subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, `20-2-**`). This does not include the specified cluster point code (for example, `20-2-*`).

Three asterisks in the `ncm` subfield of a cluster point code (for example, `20-2-***`) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified and the `dpc/dpca` parameter `ncm` subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified `dpc/dpca` parameter subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, `10101-*`).
- An asterisk (*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, `*-ab`).

When the ITUDUPPC feature is on and the STP flexible point code option (`npcfmt1`) is used to change the ITU-N point format to four members (`m1-m2-m3-m4-gc`),

- An asterisk (*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, `15`).
- An asterisk (*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, `*`, `*-15-*-*-*ab` is not valid).

Output

In these command output examples, the point code prefixes `s-`, `p-`, and `ps-` indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

Abbreviated output is indicated by 3 vertical dots as shown:

```
.
.
.
```

This example displays output when the Route table is provisioned. The example displays abbreviated output.

```
rtrv-rte
```

;

This example displays the output when the Route table is empty:

```
rtrv-rte
```

```
tekelecstp 08-01-01 12:31:35 EST EAGLE 38.0.0
```

```
rtrv-rte
```

```
Command entered at terminal #4.
```

```
No routes meeting the requested criteria were found
```

;

This example retrieves a route by linkset name:

```
rtrv-rte:lsn=e2e1
```

```
eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
```

```
rtrv-rte:lsn=e2e1
```

```
Command entered at terminal #4.
```

```
Extended Processing Time may be Required
```

LSN	DPCA	RC
e2e1	001-001-000	10
	001-101-001	10
	004-101-001	20
	100-100-*	10
	100-100-001	10

;

This example retrieves a route by linkset name and destination point code:

```
rtrv-rte:dpc=4-101-1:lsn=e2e1
```

```
eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0
```

```
LSN DPCA RC
```

```
e2e1 004-101-001 20
```

;

In this example, the `chg-stpopts:npcfmti` value is set to 7-4-3:

```
rtrv-rte:dpcn=127-15-7
```

```
eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0

This example contains a route with 16-bit ITU-N point codes:

```

rtrv-rte:lsn=lsn66

tekelecstp 10-10-09 10:00:37 EST EAGLE 45.1.0
rtrv-rte:lsn=lsn66
Command entered at terminal #4.
Extended Processing Time may be Required

LSN          DPCN16      RC
lsn66        006-005-004 10
              006-004-002 10

;

```

Legend

- **DPC, DPCA, DPCI, DPCN, DPCN24, DPCN16**—Destination point code to be reached through this route
- **ALIAS, ALIASA, ALIASI, ALIASN/N24, ALIASN16**—Alias associated with the route
- **CLLI**—CLLI associated with the route
- **LSN**—Name of the linkset assigned to this route
- **RC**—Relative cost (priority) assigned to the route
- **APC, APCA, APCI, APCN, APCN24, APCN16**—Point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

rtrv-rtx

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the `cic` and `ecic` parameters are displayed.

Parameters

cic (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the `ecic` parameter as exception routing criteria for the specified exception route.

Range:

0 - 16383

class (optional)

Exception routing class. This parameter displays all exception route sets provisioned for the specified class.

Range:

opc

ilsn

cic

si

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc=000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpci (optional)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps*, 0-16383, *aa-zz*, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—*s-*, *p-*, *ps-*

nnnnn—0-16383, *

gc—*aa-zz*, *

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or **-*-** when the point code includes a group code.

dpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

un---000---127

sna---000---15

mna---000---31

ecic (optional)

Ending Circuit Identification Code. This parameter, together with the `cic` parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

ilsn (optional)

Incoming Link Set Name. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters.

lsn (optional)

Link Set Name. The linkset associated with the specified exception route.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters.

opc (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

*p-, 000-255, *, **, ****

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values ***, ****, and ***** are not valid for the *ni* subfield.

If **** or ***** is specified for the *nc* subfield, either ***, ****, or ***** must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc=000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-*-** is valid if *ni= 006-255*.

The point code *000-000-000* is not a valid point code.

opci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

opc_n (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*, 0-16383, *aa-zz*, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—*s*-, *p*-, *ps*-
nnnnn—0-16383, *
gc—*aa-zz*, *

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or **-*-** when the point code includes a group code.

opc_{n24} (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*
msa—000-255
ssa—000-255
sp—000-255

opc_{n16} (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

si (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range:

3 - 15

Example

```
rtrv-rtx:dpc=1-1-1
```

```
rtrv-rtx:opca=6-**-*
```

```
rtrv-rtx:ilsn=1set4
```

```
rtrv-rtx:si=5
```

```
rtrv-rtx:cic=0:ecic=16383
```

```
rtrv-rtx:dpcn16=121-10-25
```

Dependencies

Only one of the `opc`, `ilsn`, `cic`, `si`, or `class` parameters can be specified.

If the `ecic` parameter is specified, the `cic` parameter must also be specified.

The `ecic` parameter value cannot be less than the `cic` parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the `ilsn` or `lsn` parameter, must exist.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Route Exception table is corrupt or cannot be found.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

Notes

** can be used in the network cluster member (*ncm*) subfield of `dpc/dpca` and `opc/opca` parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

** can be used in the network cluster (*nc*) subfield of `dpc/dpca` and `opc/opca` parameters to retrieve all point codes residing in (members of) a given network (*ni*).

*** can be used in the network cluster member (*ncm*) subfield of *dpc/dpca/opc/opca* parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*), and the network cluster address (if any).

*** can be used in the network cluster (*nc*) subfield of *dpc/dpca* and *opc/opca* parameters to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

* is allowed only for retrieves (for example, *rtrv-rtx:dpcn=-aa* or *rtrv-rtx:opc=-xy*) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on. ** and *** are not allowed for ITU-N DPCs and OPCs (for example, *dpcn=-xy* is rejected). The node and group code cannot both be * (*dpcn=-** is rejected).

Output

This example retrieves all provisioned exception routes:

```
rtrv-rtx
```

```
eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0
```

rtrv-sccp-msg

Use this command to display the configured SCCP message parameter values.

Parameters

msgn (optional)

Message number. The number of the SCCP message.

Range:
1 - 10

Example

```
rtrv-sccp-msg:msgn=1
```

Dependencies

The TSTMSG table is corrupt or could not be found.

The GTT feature must be turned on before this command can be entered.

Notes

None

Output

rtrv-sccp-msg:msgn=1

tekelecstp 16-10-03 14:18:10 MST EAGLE 46.5.0.0.0

```

rtrv-sccp-serv

Use this command to display the SCCP Service application relationship information maintained by the EAGLE.

Parameters

serv (optional)

Name of the service to be retrieved.

Range:

gflex

G-Flex (GSM Flexible Numbering)

gport

G-Port (GSM Mobile Number Portability)

mnport

Mobile Number Portability

Dependencies

The A-Port or IGM feature must be enabled before the `serv=mnport` parameter can be specified.

The G-Flex feature must be enabled before the `serv=gflex` parameter can be specified.

The G-Port feature must be enabled before the `serv=gport` parameter can be specified.

Failed reading the MRN table.

Failed reading the SCCP Service table.

Notes

The `rtrv-sccp-serv` command is cancelable using the **F9** key or the `canc-cmd` command. Please refer to [8] for details and an example of a command abort in KSR mode. The `canc-cmd` command and F9 are not applicable for pure SEAS commands.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Point codes are grouped by service in the output.

Output

The number of entries reported in use for the SCCPSRV table includes an entry for each point code network type. This entry is not displayed with the point code entries in the output. For example, if 3 ANSI point codes are used, the reported number of ANSI entries is 4.

This example displays output when no supporting features are turned on, and the SCCP Service table is empty:

```
rtrv-sccp-serv

- [chg-sccpopts](#)

rtrv-scr-aftpc

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all AFTPC screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*000 - 255, **

*the full range of values from 000–255

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

* —the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0 -- 31, *

* —the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

Range:

000 - 255, *

* —the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 000-255

Default:

Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 000-255

Default:

Display all

ni (optional)

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 000-255

Default:

Display all

npc (optional)

ITU national point code.

 **Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:

00000 - 16383, *

* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

stop—The gateway screening process ends and the message proceeds through normal routing.

Default:

Display all

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0 -- 15, *

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

000 - 255, *

* —the full range of values from 000-255

sr (optional)

The AFTPC screening reference name

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

ssa (optional)

24-bit ITU national sub signaling area. The ssa specified in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

* —the full range of values from 000-255

ssn (optional)

Subsystem number.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all.

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0 -- 127, *

* —the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range:

0 - 7, *

* —the full range of values from 0–7

Example

```
rtrv-scr-aftpc
```

```
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012
```

```
rtrv-scr-aftpc:sr=iec
```

```
rtrv-scr-aftpc:all=yes  
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy  
rtrv-scr-aftpc:sr=aft1  
rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s  
rtrv-scr-aftpc:sr=aft2:un=1:sna=2:mna=3
```

Dependencies

If the `nsfi` parameter is specified, the parameter value must be `stop`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If `nc=*` is specified, `ncm=*` must be specified.

If `ni=*` is specified, `nc=*` and `ncm=*` must be specified.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

The character `c` is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

The `nsr` parameter cannot be specified if the `nsfi=stop` parameter is specified.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the `sr` parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

If specified, the `sr` parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16, and ITU-N24 point codes.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, `ncp`, `nsfi`, and `nsr` parameters must already exist in the AFTPC entity for the screening reference.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (&&) for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

If no parameters are specified, a list of allowed AFTPC references is produced indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed AFTPC screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-blkdpq:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED AFTPC**—Screen type
- **SR**—Identifies the various screen sets being used. It can be up to four characters in length
- **NI-NC-NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.

- **SSN**—Subsystem number associated with the point code identified by *ni-nc-ncm*
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR –up to four characters) or action to be taken (ACT –up to six characters), if the message passes this screen

rtrv-scr-blkdpc

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all blocked DPC screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The area in the point code specified by *zone-area-id*.

Range:

*000 - 255, **

* —the full range of values from 000–255

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

* —the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0 -- 31, *

* —the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

Range:

000 - 255, *

* —the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing the specific cluster member of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all

ni (optional)

Network identifier value. This parameter displays entries containing the specific network of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 0–255.

Default:

Display all

npc (optional)

ITU national point code.

 **Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:

00000 - 16383, *

* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:***cgpa***

Allowed calling party address is the next screening category

destfld

Allowed destination field (DESTFLD) is the next screening category

fail

The received message should be discarded.

isup

ISUP message type (ISUP) is the next screening category

stop

The gateway screening process ends and the message proceeds through normal routing

Default:

Display all

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail* and cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:

ayyy 1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (S-).

Range:*none**s***Default:***none***sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:*0 -- 15, **

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. This parameter specifies the signaling point in the point code represented by *msa-ssa-sp*.

Range:*000 - 255, **

* —the full range of values from 000-255

sr (optional)

The BLKDPC screening reference name

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area specified in the point code represented by *msa-ssa-sp*.

Range:*0 - 255, **

* —the full range of values from 000-255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:*0 -- 127, **

* —the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range:*0 - 7, **

* —the full range of values from 0–7

Example

```
rtrv-scr-blkdpc  
  
rtrv-scr-  
blkdpc:sr=iec:ni=240:nc=001:ncm=010&&018:nsfi=stop:actname=rdct  
  
rtrv-scr-blkdpc:sr=iec  
  
rtrv-scr-blkdpc:all=yes  
  
rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s  
  
rtrv-scr-blkdpc:sr=bl01:un=1:sna=2:mna=3
```

Dependencies

A complete point code must be specified, and must be one and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna`, or `npc`, except in the special case of entering `c` for "continue."

If the `ni=c` parameter is specified, then the `nc` and the `ncm` parameters must have a value of `c` or must not be specified. If the `ni=c` parameter is specified, and the `nc` and the `ncm` parameters are not specified, then the `nc` and `ncm` parameters default to a value of `c`.

If the `zone=c` parameter is specified, then the `area` and `id` parameters must have a value of `c` or must not be specified. If the `zone=c` parameter is specified, and the `area` and the `id` parameters are not specified, then the `area` and `id` parameters default to a value of `c`.

If the `msa=c` parameter is specified, then the `ssa` and `sp` parameters must have a value of `c` or must not be specified. If the `msa=c` parameter is specified, and the `ssa` and the `sp` parameters are not specified, then the `ssa` and `sp` parameters default to a value of `c`.

If the `un=c` parameter is specified, then the `sna` and `mna` parameters must have a value of `c` or must not be specified. If the `un=c` parameter is specified, and the `sna` and the `mna` parameters are not specified, then the `sna` and `mna` parameters default to a value of `c`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the value of the `nsfi` parameter is `stop` or `fail`, then the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

If the `actname` parameter is specified with the `sr` parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `ni` parameter is specified as an asterisk (`ni=*`) or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and the `nc` parameters must be specified with a single value.

The value of the `sr` parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

Any specified `id`, `mna` or `sp` parameter must already exist in the database.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

Any specified `nc` parameter must already exist in the database

Any specified `ncm` parameter must already exist in the database

Any specified `zone`, `un` or `msa` parameter must already exist in the database.

Any specified `ni` parameter must already exist in the database

Any specified `nsr` parameter must already exist in the database

Any specified `nsfi` parameter must already exist in the database

Any specified `npc` parameter must already exist in the database

Any specified `area`, `sna`, or `ssa` parameter must already exist in the database.

Any specified `pcst` parameter must already exist in the database

The Gateway Screening Stop Action table must be accessible.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The character `c` is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code has the value `c`.

If the character `c` is specified for any subfield of a three-subfield point code, all three subfields must have the value `c`. No other values can be used. For example, a point code `c` is not allowed. The point code must be `c`. The asterisk (*) value cannot be used with the character `c` (for example, a point code `c` is not allowed).

In all cases, if `c` for "continue" is entered for the first subfield in the point code, the other subfields default to `c` in the database.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code `c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-blkopc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = BLOCKED DPC**—Screen type
- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, columns are ZONE - AREA - ID. For 24-bit ITU national point codes, columns are MSA-SSA-SP. For 16-bit ITU national point codes, columns are UN-SNA-MNA. For national point codes, columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-blkopc

Use this command to show the blocked originating point code (BLKOPC) screening references in the BLKOPC entity set.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all blocked OPC screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The area in the point code represented by *zone-area-id*.

Range:

*000 - 255, **

*— the full range of values from 000–255

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 31, **

*—the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

*—the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

Range:

0 - 255

*—the full range of values from 0–255

Default:

Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

Range:*0 - 255, **

* —the full range of values from 0–255

Default:

Display all

ni (optional)

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

Range:*0 - 255, **

* —the full range of values from 0–255

Default:

Display all

npc (optional)

ITU national point code.

 **Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:*00000 - 16383, **

* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:***cgpa***

Allowed calling party address is the next screening category

stop

The gateway screening process ends and the message proceeds through normal routing.

fail

The received message should be discarded.

sio

Allowed SIO is the next screening category.

dpc

Allowed DPC is the next screening category.

blkdpc

Blocked DPC is the next screening category.

Default:

Display all

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. The *nsr* parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 15, **

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

* —the full range of values from 000-255

sr (optional)

The BLKOPC screening reference name

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:
Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area is specified in the point code represented by *msa-ssa-sp*.

Range:
0 - 255, *
*—the full range of values from 000-255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:
0 -- 127, *
*—the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range:
0 - 7, *
*—the full range of values from 0–7

Example

```
rtrv-scr-blkopc
rtrv-scr-blkopc:sr=iec:ni=240:nc=001:ncm=010&&018:actname=copy
rtrv-scr-blkopc:sr=iec
rtrv-scr-blkopc:all=yes
rtrv-scr-blkopc:sr=bop1:npc=128:nsfi=fail
rtrv-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s
rtrv-scr-blkopc:sr=bop1:un=121:sna=10:mna=17:nsfi=fail:pcst=s
```

Dependencies

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

Any specified *ni*, *nc*, *ncm*, *zone*, *area*, *id*, *msa*, *ssa*, *sp*, *ncp*, *nsfi*, *un*, *sna*, *mna*, and *nsr* parameters must already exist in the database.

If the *pcst* parameter is specified, point codes with the specified subtype prefix (no prefix or *s-*) must exist in the database.

If the *area=** parameter is specified, then the *id=** parameter must be specified.

If the *nsr* parameter is specified, then the *actname* parameter cannot be specified.

If the value of the *nsfi* parameter is *stop* or *fail*, then the *nsr* parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the value `c` is specified for any subfield of a three-subfield point code, then all three subfields must have a value of `c` (`c-c-c`). No other values, including asterisks can be used.

If the value of the first subfield is `c`, then the other subfields default to `c` in the database.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nc=*` parameter is specified, then the `ncm=*` parameter must be specified.

The Gateway Screening Stop Action table must be accessible.

If the `ni=*` parameter is specified, then the `nc=*` and `ncm=*` parameters must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and `mna=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of blocked OPC references is displayed indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every blocked OPC screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

For point codes with three subfields, the value `c` (continue) is used as a place holder. If the point code is not found in this screen set, the continue value points to the `nsfi` and `nsr` to be applied next.

The character `c` is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code `c`.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code `c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

rtrv-scr-cdpa

Use this command to show the allowed called party address (CDPA) screening references in the CDPA entity set.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display gateway screening rules that do not have an assigned gateway screening stop action set**a11 (optional)**

Displays all allowed CDPA screening references.

Range:*yes**no***Default:***no***area (optional)**ITU international area. The area in the point code represented by *zone-area-id*.**Range:***000 - 255, *****—the full range of values from 000–255**id (optional)**ITU international ID. The ID in the point code represented by *zone-area-id*.**Range:***0 - 7, ***** —the full range of values from 0–7**mna (optional)**16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.**Range:***0 -- 31, ***** —the full range of values from 0–31**msa (optional)**24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.**Range:***000 - 255, ***** — the full range of values from 000-255**nc (optional)**Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.**Range:***0 - 255, ***** —the full range of values from 0–255

Default:
Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

Range:
0 - 255, *
* —the full range of values from 0–255

Default:
Display all

ni (optional)

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

Range:
0 - 255, *
* —the full range of values from 0–255

Default:
Display all

npc (optional)

ITU national point code.

Note:

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:
00000 - 16383, *
* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

aftpc

Allowed affected point code is the next screening category

stop

The gateway screening process ends and the message proceeds through normal routing

Default:
Display all

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. This parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

Range:

none

No spare point code prefix required

s

Spare point code prefix required

Default:

none

scmgfid (optional)

SCCP management (SCMG) format ID, which consists of a 1-octet field and uniquely defines the function and format of each SCMG message. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUUDT, XUUDTS

Range:

*1 - 255, **

*—the full range of values from 1-255

Default:

All SCMG format IDs are shown.

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 15, **

*—the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

*—the full range of values from 000-255

sr (optional)

Displays all allowed CDPA screening references.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area specified in the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

*—the full range of values from 000-255

ssn (optional)

Subsystem number.

Range:

*0 - 255, **

* — the full range of values from 0–255

Default:

Display all.

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

*0 -- 127, **

*—the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

*—the full range of values from 0–7

Example

```

```
rtrv-scr-cdpa:sr=cdp1
```

```
rtrv-scr-cdpa:sr=cdp2:un=1:sna=2:mna=3
```

Dependencies

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The `nsr` parameter cannot be specified when `nsfi=stop`.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area` is specified or respecified as an asterisk, `id` must also be an asterisk.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and the `nc` parameters must be specified with a single value.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, `nep`, `nsfi`, `ri`, `ssn`, and `nsr` parameters must already exist in the CGPA entity for the screening reference.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or `s-`) must exist in the database.

The specified screening function identifier (`nsfi`) must be in the allowed CDPA entity set.

The Gateway Screening Stop Action table must be accessible.

If specified, the `sr` parameter value must exist in the AFTPC screen entity set.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, the system displays a summary output.

If only the `all=yes` parameter is specified, the system displays a detailed output.

If the `all` parameter and any point code parameter are specified, the `all` parameter is ignored.

The REF column of the output of this command displays *YES* when the screen is referenced by another screen; otherwise, it displays *NO*.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix (`s-`) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-cdpa:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED CDPA**—Screen type
- **SR**—Screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID . For 24-bit national point codes, these columns are MSA - SSA - SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.
- **SSN**—Subsystem number associated with the point code identified by the *ni-nc-ncm*.
- **SCMGFID**—SCMGFID format ID
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-cgpa

Use this command to show the allowed calling party address (CGPA) screening references in the CGPA entity set.

Parameters

Note:

The `nc`, `ncm`, and `ni` parameters can be specified as a single value, range of values, or an asterisk (*). An * value indicates the full range of values. The `area`, `id`, `msa`, `ni`, `nsr`, `ri`, `sp`, `ssa`, `ssn`, `un`, `sna`, `mna`, and `zone` parameters can be specified as a single value or as an *.

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed CGPA screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The area in the point code represented by *zone-area-id*.

Range:

*000 - 255, **

* —the full range of values from 000–255

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

* —the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 31, **

* —the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.

Range:

000 - 255, *

* —the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* — the full range of values from 0–255

Default:

Display all

ncm (optional)

Network cluster member identifier value. This parameter display entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all

ni (optional)

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* — the full range of values from 0–255

Default:

Display all

npc (optional)

ITU national point code.

**Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:

00000 - 16383, *

* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: *cdpa, stop, tt*

cdpa —Allowed called party address point code is the next screening category.

stop —The gateway screening process ends and the message proceeds through normal routing.

tt —Allowed translation type point code is the next screening category.

Default:

Display all

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. This parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

Range:

none

No spare point code prefix required.

s

Spare point code prefix required.

Default:

none

ri (optional)

Routing indicator. Routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range:

gt

Allow a called party address with a routing indicator value of "global title."

dpc

Allow a called party address with a routing indicator value of "DPC/SSN."

Allow both routing indicator values.

Default:
Display all

sccpmt (optional)
SCCP message type.

Range:

9
UDT

10
UDTS

17
XUDT

18
XUDTS

All possible allowed values (9, 10, 17, 18)

Default:
Display all SCCP message types

sna (optional)
16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:
0 -- 15, *
* —the full range of values from 0–15

sp (optional)
24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:
000 - 255, *
* —the full range of values from 000-255

sr (optional)
The CGPA screening reference name

Range:
ayyy
1 alphabetic character followed by up to 3 alphanumeric characters

Default:
Display all.

ssa (optional)
24-bit ITU national sub signaling area. The sub signaling area specified in the point code. represented by *msa-ssa-sp*.

Range:

0 - 255, *

* — the full range of values from 000-255

ssn (optional)

Subsystem number.

Range:

0 - 255, *

* — the full range of values from 0–255

Default:

Display all.

un (optional)16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:**

0 -- 127, *

* — the full range of values from 0–127

zone (optional)ITU international zone. The zone in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

* — the full range of values from 0–7

Example

```
rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:ssn=012
```

```

```
rtrv-scr-cgpa:sr=cgp1
```

```
rtrv-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

```
rtrv-scr-cgpa:sr=cgp1:un=1:sna=2:mna=1:ssn=1:sccpmt=9:nsfi=stop:ri=*
```

Dependencies

If the *ni* parameter is specified as an asterisk or as a range, the *nc* and *ncm* parameters must be specified as an asterisk or as the full range 000 – 255.

If the *nc* parameter is specified as an asterisk, the *ncm* parameter must be specified as an asterisk or as the full range 000 – 255.

If the *nc* parameter is specified as a single value or a range, a single value must be specified for the *ni* parameter.

If the *nc* parameter is specified as a range, the *ncm* parameter must be specified as an asterisk or as the full range 000 – 255.

If the *ncm* parameter is specified as a single value, or a range other than the full range of 000 – 255, the *ni* and the *nc* parameters must be specified with a single value.

If the *actname* parameter is specified, the *nsr* parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified or re-specified, `sp=*` must also be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, `ncp`, `nsfi`, `ri`, `ssn`, and `nsr` parameters must already exist in the CGPA entity for the screening reference.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

The specified screening reference (`sr`) must be in the allowed CGPA entity set.

If the `nsfi=stop` parameter is specified, the `nsr` parameter cannot be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` and `npcst` parameters cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the *ACT NAME* field of the `rtrv-gws-actset` command output.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, the system displays a summary output.

If only the `all=yes` parameter is specified, the system displays a detailed output.

If the `all` parameter and any point code parameter are specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-cgpa:all=yes` command, or specify the specific screening reference.
- **RULES**—The number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED CGPA**—Screen type

- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.
- **SSN**—Subsystem number associated with the point code identified by the *ni-nc-ncm*
- **RI**—Routing indicator in the called party address
- **SCCPMT**—SCCP message type
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

Related Topics

- [chg-scr-cgpa](#)

- [ent-scr-cgpa](#)

rtrv-scr-destfld

Use this command to show the attributes of one or more allowed affected destination field (DESTFLD) screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see [chg-gws-actset](#) and [rtrv-gws-actset](#)).

Range:

ayyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed DPC screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The area in the point code represented by *zone-area-id*.

Range:

000 - 255, *

* —the full range of values from 000–255

Default:

Display all

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:

0 - 7, *

* —the full range of values from 0–7

Default:

Display all

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0 -- 31, *

* —the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

Range:

000 - 255, *

* —the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing the specific cluster member of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

* — the full range of values from 0–255

Default:
Display all

ni (optional)

Network identifier value. This parameter displays entries containing the specific network of the point code represented by *ni-nc-ncm*.

Range:
0 - 255, *
* —the full range of values from 0–255

Default:
Display all

npc (optional)

ITU national point code.

 **Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:
00000 - 16383
* —the full range of values from 00000–16383

nsfi (optional)

This parameter indicates that the gateway screening process should stop.

Range:

stop
the gateway screening process ends and the message proceeds through normal routing

Default:
Display all screening references

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:
ayyy
1 alphabetic character followed by up to 3 alphanumeric characters

Default:
Display all

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 15, **

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

* —the full range of values from 000-255

sr (optional)

The name of the individual DESTFLD screen to be displayed.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area in the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

* —the full range of values from 000-255.

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

*0 -- 127, **

* —the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range: 0 - 7, *

*0 - 255, **

* — the full range of values from 0–7

Example

```
rtrv-scr-destfld
rtrv-scr-destfld:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-destfld:sr=iec:id=4:actname=cncf
rtrv-scr-destfld:all=yes
rtrv-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s
rtrv-scr-destfld:sr=dst1
rtrv-scr-destfld:sr=iec:un=125:sna=1:mna=10
```

Dependencies

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The `nsfi=stop` parameter must be specified.

The `nsr` parameter cannot be specified in the command if the `nsfi` parameter has a value of *stop* or *fail*.

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and `nc` parameters must be specified with a single value.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

The specified screening reference (`sr`) must be in the allowed DESTFLD entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `na`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

Any specified `area`, `sna` or `ssa` parameter must already exist in the database.

Any specified `id`, `sp` or `mna` parameter must already exist in the database.

Any specified `zone`, `un` or `msa` parameter must already exist in the database.

Any specified `nc` parameter must already exist in the database.

Any specified `ncm` parameter must already exist in the database.

Any specified `ni` parameter must already exist in the database.

Any specified `npc` parameter must already exist in the database.

Any specified `nsfi` parameter must already exist in the database.

Any specified `nsr` parameter must already exist in the database.

Any specified `pcst` parameter must already exist in the database.

If the `nsfi=fail` parameter is specified, then the `nni`, `nc`, `ncm`, `narea`, `nzone`, `nid`, `nmsa`, `nssa`, `nsp`, `nun`, `nsna`, `nmna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, the system displays a summary output.

If only the `all=yes` parameter is specified, the system displays a detailed output.

If the `all` parameter and any point code parameter are specified, the `all` parameter is ignored.

The REF column of the output of this command displays *YES* when the screen is referenced by another screen; otherwise, it displays *NO*.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-destfld:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED DESTFLD**—Screen type

- **SR**—Identifies the various screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-dpc

Use this command to show the attributes of one or more allowed DPC screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see [chg-gws-actset](#) and [rtrv-gws-actset](#)).

Range:

ayyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed DPC screening references.

Range:

yes

no

Default:

no

area (optional)

ITU international area. The area in the point code represented by *zone-area-id*.

Range:

000 - 255, *

*—the full range of values from 000–255

id (optional)ITU international ID. The ID in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

*—the full range of values from 0–7

mna (optional)16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.**Range:**

0 -- 31, *

*—the full range of values from 0–31

msa (optional)24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.**Range:**

000 - 255

* — the full range of values from 000-255

nc (optional)Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

Default:

Display all

ncm (optional)Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

Default:

Display all

ni (optional)Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

Default:
Display all

npc (optional)
ITU national point code.

Note:

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#).

Range:
00000 - 16383, *
*—the full range of values from 00000–16383

nsfi (optional)
This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category

cgpa

Allowed calling party address is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

Default:
Display all screening references

nsr (optional)
Next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. The *nsr* parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:
ayyy
1 alphabetic character followed by up to 3 alphanumeric characters

Default:
Display all

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (S-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 15, **

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

* —the full range of values from 000-255

sr (optional)

The allowed DPC screening reference name

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area in the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

* — the full range of values from 000-255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

*0 -- 127, **

* —the full range of values from 0–127

zone (optional)

ITU international zone. The zone in the point code represented by *zone-area-id*.

Range:

0 - 7, *

* — the full range of values from 0–7

Example

```
rtrv-scr-dpc
rtrv-scr-dpc:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-dpc:sr=iec:id=4
rtrv-scr-dpc:all=yes
rtrv-scr-dpc:all=yes:actname=cncf
rtrv-scr-dpc:sr=dpc1:npc=128:nsfi=stop:pcst=s
rtrv-scr-dpc:sr=dpc2:un=1:sna=2:mna=3
```

Dependencies

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The specified screening reference (*sr*) must be in the allowed DPC entity set.

Any specified *ni* parameter must already exist in the allowed DPC entity for the screening reference.

The Spare Point Code Support feature must be enabled before the *pcst* parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters *ni*, *nc*, *ncm*) or for 24-bit ITU national point codes (parameters *msa*, *ssa*, *sp*) or for 16-bit ITU national point codes (parameters *un*, *sna*, *mna*). The *pcst* parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the *pcst* parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

If the *ni=** parameter is specified, then the *nc=** and *ncm=** parameters must be specified.

If the *nc=** parameter is specified, then the *ncm=** parameter must be specified.

If the *zone=** parameter is specified, then the *area=** and the *id=** parameters must be specified.

If the *area=** parameter is specified, then the *id=** parameter must be specified.

If the *msa=** parameter is specified, then the *ssa=** and the *sp=** parameters must be specified.

If the *un=** parameter is specified, then the *sna=** and the *mna=** parameters must be specified.

If the *ssa=** parameter is specified, then the *sp=** parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the value of the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

Any specified `npc` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `ncm` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nc` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nsfi` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nsr` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `pcst` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `area`, `sna` or `ssa` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `id`, `mna` or `sp` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `zone`, `un` or `msa` parameter must already exist in the allowed DPC entity for the screening reference.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `nid`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, a list of allowed DPC references is displayed indicating whether they are referenced or not.

If a single allowed DPC screening reference is specified, the specified entity set requested is shown.

If `all=yes` and no other parameter is specified, detailed information for all of the screening reference entities in the allowed DPC entity set are shown.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100 .

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtv-scr-dpc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED DPC**—Screen type
- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI-NC-NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE-AREA-ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtv-scr-isup

Use this command to display one allowed ISUP screening reference or all allowed ISUP screening references in the Allowed ISUP entity set.

Parameters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtv-gws-actset`).

Range:*ayyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

a11 (optional)

This parameter displays all allowed ISUP screening references in the Allowed ISUP entity set.

Range:*yes**no***Default:***no***isupmt/tupmt (optional)**ISUP message type or TUP message type in the specified entry. The *tupmt* parameter is not valid for SEAS. A single value or range of values can be entered.**Range:***000 - 255, **

*—the entire range of 0-255

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process.

Range: stop ,*stop* —The gateway screening process ends and the message proceeds through normal routing.**nsr (optional)**

Next screening reference.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

sr (optional)

The individual ISUP screen to be displayed.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
rtrv-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2
```

```
rtrv-scr-isup:sr=tu01:tupmt=0&&255
```

Dependencies

If the `nsfi` parameter is specified, the value must be `stop`.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

The `nsr` parameter cannot be specified if the `nsfi=stop` parameter is specified.

If `sr` is specified, the value must exist in the database.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

A range of values for the `isupmt` or `tupmt` parameter can be specified by separating the values that define the range by two ampersands (&&); for example, `isupmt=025&&100` specifies all ISUP message types from 25 - 100. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk can be used for a parameter value in the `chg/dlt/rtrv-scr-isup` commands only if that parameter value was specified as an asterisk in the `ent-scr-isup` command to define the parameter value.

If no parameters are specified, a list of allowed ISUP references is produced indicating whether they are referenced or not.

Output

rtrv-scr-opc

Use this command to show an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference).

Parameters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed OPC screening references.

Range:

yes

no

Default:
Display all

area (optional)

ITU international area. The area in the point code represented by *zone-area-id*.

Range:
*000 - 255, **
* —the full range of values from 000–255

id (optional)

ITU international ID. The ID in the point code represented by *zone-area-id*.

Range:
*0 - 7, **
* —the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:
*0 -- 31, **
* —the full range of values from 0–31

msa (optional)

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

Range:
*000 - 255, **
* —the full range of values from 000-255

nc (optional)

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

Range:
*0 - 255, **
* —the full range of values from 0–255

Default:
Display all

ncm (optional)

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

Range:
*0 - 255, **
* —the full range of values from 0–255

Default:
Display all

ni (optional)

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

Range:

0 - 255

* —the full range of values from 0–255

Default:

Display all

npc (optional)

ITU national point code.

 **Note:**

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

Range:

00000 - 16383, *

* —the full range of values from 00000–16383

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:***blkopc***

Blocked OPC is the next screening category.

sio

Allowed SIO is the next screening category

dpc

Allowed DPC is the next screening category.

blkdpc

Blocked DPC is the next screening category

cgpa

Allowed calling party address is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

Default:

Display all screening references

nsr (optional)

Next Screening Reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. This parameter cannot be specified if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (S-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

*0 -- 15, **

* —the full range of values from 0–15

sp (optional)

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

Range:

*000 - 255, **

* —the full range of values from 000-255

sr (optional)

The allowed OPC screening reference name

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all.

ssa (optional)

24-bit ITU national sub signaling area. The sub signaling area *i* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

* — the full range of values from 000-255

un (optional)16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:**

0 -- 127, *

* —the full range of values from 0–127

zone (optional)ITU international zone. The zone in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

* —the full range of values from 0–7

Example

```

rtrv-scr-opc
rtrv-scr-opc:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-opc:sr=iec:id=4
rtrv-scr-opc:all=yes
rtrv-scr-opc:sr=opc1:actname=cr
rtrv-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
rtrv-scr-opc:sr=opc2:un=1:sna=2:mna=3

```

Dependencies

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the *ni=** parameter is specified, the *nc=** and *ncm=** parameters must be specified.

If the *nc=** parameter is specified, then the *ncm=** parameter must be specified.

If the *zone=** parameter is specified, then the *area=** and *id=** parameters must be specified.

If the *area=** parameter is specified, then the *id=** parameter must be specified.

If the *msa=** parameter is specified, then the *ssa=** and *sp=** parameters must be specified.

If the *ssa=** parameter is specified, then the *sp=** parameter must be specified.

If the *un=** parameter is specified, then the *sna=** and the *mna=** must be specified.

If the *sna=** parameter is specified, then the *mna=** parameter must be specified.

If the *ni* parameter is specified as an asterisk or as a range, the *nc* and *ncm* parameters must be specified as an asterisk or as the full range 000 – 255.

If the *nc* parameter is specified as an asterisk, the *ncm* parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and `nc` parameters must be specified with a single value.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The specified screening reference must be in the allowed OPC entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

Any specified `ni` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nc` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `ncm` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `npc` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nsfi` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nsr` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `pcst` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `area`, `sna` or `ssa` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `id`, `mna` or `sp` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `zone`, `un` or `msa` parameter must already exist in the allowed OPC entity for the screening reference.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, a list of allowed OPC references is produced indicating whether they are referenced or not.

If a single allowed OPC screening reference is specified, the specified entity set requested is shown.

If `all=yes` and no other parameter is specified, detailed information for all of the screening reference entities in the allowed OPC entity set are shown.

If `all` is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk specified as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-opc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED OPC**—Screen type
- **SR**—Identifies the various screen sets being used. It can be up to four characters in length
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE-AREA-ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-sio

Use this command to show the attributes of one or more `nic/si/h0/h1` combinations that are allowed for SS7 messages from another network.

Parameters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed SIO screening references.

Range:

yes

no

Default:

no

h0 (optional)

H0 heading code. A single value or a range of values can be specified.

Range:

*0 - 15, **

*** — all possible values from 0–15

Default:

Display all

h1 (optional)

H1 heading code. A single value or a range of values can be specified.

Range:

*0 - 15, **

*** —all possible values from 0–15

Default:

Display all

nic (optional)

Network indicator code.

Range:

0 - 3, *

* — all possible values from 0–3

Default:

Display all

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:***blkdpc***

Blocked DPC is the next screening category.

cgpa

Allowed calling party address is the next screening category.

cdpa

Allowed called party address is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

dpc

Allowed DPC is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

Default:

Display all screening references

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

This parameter is mandatory if *nsfi* is other than *stop*; cannot be entered if *nsfi=stop*.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

pri (optional)

Message priority. A single value or a range of values can be specified.

Range:

0 - 3

* —all possible values from 0–3

Default:
Display all

si (optional)
Service indicator.

Range:
0 - 15, *
*—all possible values from 0–15

Default:
Display all

sr (optional)
Allowed SIO screening reference name

Range:
ayyy
1 alphabetic character followed by up to 3 alphanumeric characters

Default:
Display all

Example

```
rtrv-scr-sio
rtrv-scr-sio:sr=iec:nic=1:si=3:pri=2&&3
rtrv-scr-sio:sr=sio1:nic=1:si=1
rtrv-scr-sio:sr=sio1:nic=1:si=1:h0=1:h1=*
rtrv-scr-sio:sr=sio1:si=1:h0=1:h1=1
rtrv-scr-sio:all=yes
rtrv-scr-sio:sr=iec:nic=1:si=1:actname=crncf
```

Dependencies

If the `si` parameter is not equal to 00, 01, or 02, the `h0` and `h1` parameters cannot be specified.

If the `nic`, `si`, and `h0/h1` parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The `nic` parameter must be specified if the `si` parameter is specified.

The `nic` and `si` parameters must be specified if the `h0` and `h1` parameters are specified.

If an asterisk value is specified for the `h0` parameter, the `h1` parameter cannot be specified.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `sr` parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The Gateway Screening Stop Action table must be accessible.

Valid `nsfi` parameter combinations must be specified.

The GWSOA parameter combination should be known and valid.

For SEAS commands, the `pri` parameter specified must be in the range 0-3, *.

For SEAS commands, the `h0` parameter specified must be in the range 0-15, *.

For SEAS commands, the `h1` parameter specified must be in the range 0-15, *.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed SIO references is output indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed SIO screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

Legend

For a summary report:

- **SR**—The screen sets being used
- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-sio:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED SIO**—Screen type
- **SR**—The screen sets being used
- **NIC**—Network indicator code in the service information octet
- **PRI**—Priority of a single message or the beginning message priority in a range of priorities in the service information octet
- **SI**—Service indicator for the service information octet, which are the last two bits of the subservice field
- **H0**—H0 heading code
- **H1**—H1 heading code
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

rtrv-scr-tt

Use this command to show the allowed translation type (TT) screening reference in the TT entity set.

Parameters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Displaygateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all allowed TT screening references.

Range:

yes

no

Default:

no

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: *cdpa, stop*

cdpa

Allowed called party address is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

Default:

Display all screening references

nsr (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop*. The *nsr* parameter cannot be entered if *nsfi* is *stop*, or the `copy=yes` parameter is specified.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

sr (optional)

The TT screening reference name

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

type (optional)

Translation type. The global title translation type value in the called party address. This value is the decimal representation of the 1-byte field used in SS7.

Range:

0 - 255, *

* —the full range of values from 0–255

Default:

Display all.

Example

```
rtrv-scr-tt
```

```
rtrv-scr-tt:sr=iec
```

```
rtrv-scr-tt:all=yes
```

Dependencies

If the `nsr` parameter is specified, `nsfi=stop` cannot be specified.

If the `actname` parameter is specified, the value specified for `nsfi` must be `stop`.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

Stop actions must be administered using the `actname` parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

The specified value for the `nsfi` parameter is not valid for TT screen.

The `actname` parameter value must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The Gateway Screening Stop Action table must be accessible.

The screening reference and translation type for which the attributes are to be retrieved must exist.

The value specified for the `type` parameter must be within the allowed range.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed TT references is produced indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed TT screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

rtrv-scrset

Use this command to show the attributes of one or more screen sets in the screen set entity set.

Parameters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none —Display gateway screening rules that do not have an assigned gateway screening stop action set

a11 (optional)

Displays all screen sets (except “placeholder” screen sets that contain only one rule with `nsfi=stop` specified in the rule).

Range:

yes

no

Default:

no

destfld (optional)

This parameter displays the indicator that specifies whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on in the screen set rule, the automatic screening is applied at the end of the provisioned screen set.

Range:

yes

no

Default:

Display all

nsfi (optional)

This parameter indicates the next screening category that is used in the gateway screening process, or that the gateway screening process should stop. In this command, information is displayed for one or more screen sets containing rules with the specified `nsfi` parameter value.

 **Note:**

When `nsfi=stop` is specified, the command displays only the “placeholder” screen sets that have only one rule, with `nsfi=stop` specified in the rule. This is a way to locate those “placeholder” screen sets, so that you can add or change the rules to accomplish appropriate screening.

Range:***opc***

Display rules with Allowed OPC as the next screening category.

blkopc

Display rules with Blocked OPC as the next screening category.

sio

Display rules with Allowed SIO as the next screening category.

dpc

Display rules with Allowed DPC as the next screening category.

blkdpc

Display rules with Blocked DPC as the next screening category.

stop

Display only “placeholder” screen sets that have only one rule in the screen set, with `nsfi=stop` specified as the next screening category.

Default:

Display all

***nsr* (optional)**

Next screening reference. This parameter indicates which screening reference in the specified screening category (`nsfi`) is to be used in the screening process. This parameter is used to display information for one or more screen sets with rules that have the specified `nsr` parameter value.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

***scrn* (optional)**

Screen set name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

Display all

Example

```
rtrv-scrset  
rtrv-scrset:scrn=scr1  
rtrv-scrset:nsr=opc4  
rtrv-scrset:nsfi=dpc  
rtrv-scrset:actname=copy
```

Dependencies

The screen set name must already exist.

The `nsfi=stop` parameter must be specified before the `actname` parameter can be specified.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

If the `actname` parameter is specified with the screen set name parameter, the specified value for the `actname` parameter must be assigned to that screen set name.

The `nsfi` parameter must be valid for the SCRSET entity.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

The `nsr` parameter cannot be entered if the `nsfi` parameter value equals `stop`.

The GWSOA parameter combination should be known and valid.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified for the `rtrv-scrset` command, the output shows all the screen sets, the screening function identifier of the root screening table, the screening reference of the root screening table, the memory usage (percentage), the number of entries in the screen set and the overall gateway screening statistics, followed by a summary of statistics for each screen set.

For the `rtrv-scrset:all=yes` command, the output consists of every screen set and every screening reference in each screen set (except "placeholder" screen sets that have only one rule with `nsfi=stop` specified in the rule). The `all=yes` and `nsfi=stop` parameters cannot be specified in the same command.

If the `scrn`, `nsfi`, or `nsr` parameter is entered, summary information for all screens that match the specified parameters is shown.

When the % FULL is over 100%, the screen is inaccessible. A screenset over 100% capacity size will not bind correctly. A screenset can become provisioned over capacity when linking one screen reference to another causes the size to become too large. To reduce a screenset that is over 100% capacity, screen rules must be deleted (see the `dlt-scr-xxx` commands)

Output

;

```

Legend

- **PAGE**—Default password aging interval for newly created user IDs
- **UOUT**—number of successive days a user ID can go unused (no successful login) before the system denies login
- **MULTLOG**—Indicates whether users can users be logged on to multiple terminals at the same time
- **MINLEN**—Minimum password length
- **ALPHA**—Minimum number of alphabetic characters (a–z) required in a new password

- **NUM**—Minimum number of numeric characters (0–9) required in a new password
- **PUNC**—Minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character.
- **MININTRVL**—Minimum number of days before a password can be changed again
- **PNOTIFY**—Number of days prior to password expiration in which the user will be notified about upcoming expiration
- **PGRACE**—Number of days after password expiration in which the user is allowed to login without requiring a password change
- **PREUSE**—Number of passwords in the password history that must be unique
- **PCHREUSE**—Number of characters that cannot be reused from the existing password when setting a new password
- **WARNING MESSAGE**—Message displayed when a user has successfully logged in
- **SSH**— Together with OAM IP security feature it indicates whether the telnet connections are secure or not

rtrv-secu-trm

Use this command to display the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system.

Parameters

trm (optional)

Specifies the port about which information will be displayed.

Range:

1 - 16

Default:

Display all

Example

```
rtrv-secu-trm
```

```
rtrv-secu-trm:trm=9
```

Dependencies

The CCCNAMES table is corrupt or cannot be found.

The Terminal table is corrupt or cannot be found.

None

Notes

None

Output

This example shows attributes of all terminals when the Command Class Management feature is off:

```
rtrv-secu-trm
```

```

rtrv-secu-user

Use this command to show the security information for all users in the system.

Parameters

uid (optional)

User ID

Range:

azzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Default:

Display all

Example

```
rtrv-secu-user:uid=rogers
```

Dependencies

The CCCNAMES table is corrupt or cannot be found.

If a user ID is specified, the user ID must exist in the UserID table.

Notes

Only the system administrator should have access to this command.

Passwords cannot be shown.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This example shows a display when the Command Class Management feature is not enabled:

Legend

- **USER-ID**—Name of the user
- **AGE**—Current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value 999 is displayed.
- **PAGE**—Maximum password age established for the user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (*) displayed after the value indicates that the system-wide default page parameter value, as configured on the `chg-secu-dflt` command, is in effect for the user ID.

- **UOUT**—User ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (*) displayed after the value indicates that the system-wide default, `uout` parameter value, as configured on the `chg-secu-dflt` command, is in effect for the user ID.
- **REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.
- **LINK**—Shows whether the user has access to all commands in the Link Maintenance command class
- **SA**—Shows whether the user has access to all commands in the Security Administration command class
- **SYS**—Shows whether the user has access to all commands in the System Maintenance command class
- **PU**—Shows whether the user has access to all commands in the Program Update command class
- **DB**—Shows whether the user has access to all commands in the Database Administration command class
- **DBG**—Shows whether the user has access to all commands in the Debug command class

If the Command Class Management feature is enabled, the following fields appear:

- **U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

rtrv-seculog

Use this command to retrieve the contents of a security log and display it to the user in the scroll area. Various reports can be produced by varying the values of the command parameters. By default, the report is generated from the log on the active fixed disk, although the `slog` parameter can be used to generate the report from the log on the standby fixed disk.

Parameters

edate (optional)

End date. This parameter displays log entries that were created on or before the specified date. If the `sdate` parameter is specified, log entries created for the period specified by the `sdate` and `edate` combination are displayed.

Range:

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as 960101.

Default:

Report log entries regardless of their creation date

etime (optional)

End time. This parameter displays log entries created between midnight (00:00:00) and the time specified by this parameter. If the `stime` parameter is specified, log entries created in the time period specified by the `stime` and `etime` combination are displayed.

Range:

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503.

Default:

Report log entries regardless of their creation time

mode (optional)

Use this parameter to produce a either full log report or an abbreviated log report.

Range:

brief

Causes only one line of output to be generated for each log entry reported. Some information in each reported log entry is not shown.

full

Produces a report showing multiple lines of output for each log record that is reported. This report displays more information from each log record (including the entire command) than the `mode=brief` report.

Default:

brief

num (optional)

Number of records to be displayed before the report is terminated.

Range:

1 - 50000

Default:

500 —if `mode=brief` is specified
250 —if `mode=full` is not specified

rectype (optional)

This parameter specifies whether to consider all records in the log for reporting or only new (un-uploaded) records.

Range: *new, both****new***

The report generator scans un-uploaded records when generating the report. Old records are not considered for reporting, even if they match the reporting criteria.

both

All records in the log are considered for reporting.

Default:

new

sdate (optional)

Start date. This parameter displays log entries created on or after the specified date. If the `edate` parameter is also specified, log entries created for the period specified by the `sdate/edate` combination are displayed.

Range:

000101 - 991231

(in the form *yymdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as 960101.

Default:

Report log entries regardless of their creation date

slog (optional)

Source log indicator. The log to be copied to the FTA.

Range:***act***

produces the report from the log on the active MASP

stb

produces the report from the log on the standby MASP

Default:

act

stime (optional)

Start time. This parameter displays log entries created between the time specified by this parameter and the end of the day (23:59:59) inclusive. If the `etime` parameter is specified, log entries created in the time period specified by the `stime/etime` combination are displayed.

Range:

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format (*hhmmss*). For example, enter 1:05:03 p.m. as *130503*.

Default:

Report log entries regardless of their creation time

trm (optional)

Terminal ID. Use this parameter to report only those log entries created by the specified terminal.

Range:

1 - 16

Default:

Report log entries regardless of the associated terminal

uid (optional)

User ID. This parameter displays log entries created by the specified user ID. Specify `uid=seas` to display commands received on a SEAS terminal. Specify `uid=none` to display commands not associated with a user ID (for example, commands issued prior to login).

Range:

azzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Default:

Display all

Example

```
rtrv-seculog:sdate=960214:edate=960215:num=7
```

```
rtrv-seculog:mode=full:sdate=960214:edate=960214:stime=062900:etime=063200
```

Dependencies

If the `sdate` and `edate` parameters are specified, the date specified for the `sdate` parameter must be earlier than or equal to the date specified for the `edate` parameter.

If the `stime` and `etime` parameters are specified, the time specified for the `stime` parameter must be earlier than or equal to the time specified for the `etime` parameter.

The month component of the `sdate` and `edate` parameter combination must be specified in the range 1–12.

The day component of `sdate` and `edate` parameter combination must be specified in the range 1–31. This value must accurately reflect the number of days in the month and year indicated. For example, `sdate=960631` is not a valid parameter value because June has only 30 days.

The second component of the `stime` and `etime` parameter combination must be specified in the range 00–59.

The minute component of the `stime` and `etime` parameter combination must be specified in the range 00–59.

No other security log command can be in progress when this command is entered.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

Notes

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

- years 95–99 = 1995 through 1999
- years 00–36 = 2000 through 2036

A consequence of this is that date 000101 (Jan 1, 2000) is greater than 991231 (December 31, 1999).

If the `mode=brief` parameter is specified and the output report has a plus (+) symbol appearing at the end of the command, the plus symbol indicates that more command characters are available to be displayed. Specify the `mode=full` parameter to see these additional characters.

In the `mode=full` output report, a plus (+) symbol appearing at the end of the command indicates the command is longer than 150 characters. Note that even in the uploaded log, each record in the log has room to record only 150 characters of the entered command. If the command is longer than 150 characters, then only the first 149 characters of the command and the plus symbol (to indicate that truncation has occurred) are recorded.

Security log size is limited to 50,000 records. Data from a query that exceeds the size limit of the security log cannot be displayed.

The system checks to ensure that the day portion of any `sdate/edate` value entered is in agreement with the month and year. It issues error message E2252 if the day is found to be invalid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries.

The system uses the `sdate/edate` and `stime/etime` parameters to select log records for reporting as follows:

- If the date on which the log record was created is not in the date range specified by the `sdate/edate` parameters, the record is not reported. The default `sdate` is the date of the oldest record in the log, and the default `edate` is the current date.
- If the time of day at which the log record was created is not in the time range specified by the `stime/etime` parameters, the record is not reported. The default `stime` is 00:00:00 (midnight), and the default `etime` is 23:59:59.
- Otherwise, the log record is reported, unless it is disqualified by other parameters such as `uid` or `trm`.

As an example, if the following command is entered, records are displayed for October 10, 1996 from 2:00 p.m. until 4:00 p.m., for October 11, 1996, from 2:00 p.m. until 4:00 p.m., and for October 12, 1996, from 2:00 p.m. until 4:00 p.m.

```
rtrv-  
seculog:sdate=961010:edate=961012:stime=140000:etime=160000
```

It takes the system approximately one minute to display 500 lines of data in the scroll area. To output a complete `mode=full` report (150,000 lines maximum) takes approximately 300 minutes. For this reason, the `num` parameter defaults to 125 (`mode=full`) or 500 (`mode=brief`) to prevent an excessively long process time, unless you deliberately choose a longer report.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The following message appears in the scroll area if the `slog=stb` parameter is specified (either explicitly or by default) and the standby fixed disk is not available (for example, simplex mode).

```
Command Failed - unable to read security log
```

When the `rtrv-seculog` command is entered, one of the first things that the reporting function does is to examine the log overflow and logging failure flags in the header of the specified log. Depending on the nature of the information found, one of the following notices is displayed in the output:

```
Notice: Log overflow has occurred -- report may be incomplete.
```

```
Notice: Logging failure -- report may be incomplete.
```

Output

This example shows output for records in the log created between 2/14/96 and 2/15/96 are displayed, up to a maximum of 9 records:

```
rtrv-seculog:sdate=960214:edate=960215:num=9
```

```
rlghncxa03w 96-02-14 06:32:20 EST EAGLE Release 34.0
Notice: Log overflow has occurred -- report may be incomplete.
```

```
Reporting parameters:
```

```

10 records reported of 240 records scanned.
END OF SECURITY LOG REPORT.

Legend

- **uid**—User ID that issued the command. The value SEAS appears if the command was received on a SEAS port. The value NONE appears if no user ID was associated with the port at the time the command was logged.
- **trm**—Terminal ID of the terminal where the command was received
- **date**—Date the log entry was made; that is, the date on which the command was received for execution
- **time**—Time the log entry was made; that is, the time the command was received for execution. A 24-hour time format is used (for example, 1:00 p.m. = 130000).
- **st**—Two-letter shorthand notation of the command's status. The complete status can be obtained by re-entering the `rtrv-seculog` command and specifying the `mode=full` parameter. The status abbreviations are:
 - **AB**—Command aborted. Displayed when the `canc-cmd:trm` command is issued to abort the following commands: `rept-stat-card`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-slk`, `rtrv-dstn`, `rtrv-gta`, `rtrv-gtt`, `rtrv-ls`, `rtrv-map`, `rtrv-rte`, `rtrv-seculog`, and `rtrv-slk`. An AB status indicates that processing and output of the command have been halted. This status is also displayed for SEAS flow-thru commands that are canceled with the `canc-cmd` (without the `trm` parameter).
 - **RJ**—Command rejected. Displayed whenever the results value that would be displayed in the `mode=full` report would be one of the following:
 - * Edddd

- * FAILED
- * rrrrrr/mmmm
- **RL**—Retry later. The system is busy.
- **IP**—In Progress
- **OK**—Command successfully executed
- **TO**—Timed out.
- **cmd**—Command that was recorded. In the `mode=brief` report, if the length of the recorded command is greater than or equal to 35 characters (as this much as can be displayed on a single line of the output report), then only the first 34 characters of the command are displayed, and the 35th character is displayed as a plus symbol (+) to indicate that more information is available in the log. Re-enter the `rtrv-seculog` command with the `mode=full` parameter to see the additional information. In the `mode=full` report, a plus symbol at the end of a command indicates that the command is longer than 150 characters.

rtrv-serial-num

Use this command to retrieve the NT serial number for the system.

Parameters

This command has no parameters.

Example

```
rtrv-serial-num
```

Dependencies

None

Notes

None

Output

Dashes appear if the serial number has not yet been entered into the database.

```
rtrv-serial-num
```

```
rlghncxa03w 03-03-29 16:40:40 EST EAGLE 31.3.0  
System serial number = nt00001231
```

```
System serial number is locked.

rtrv-sfappopts

Use this command to retrieve the parameters from the SFAPPOPTS table.

Parameters

This command has no input parameters.

Example

```
rtrv-sfappopts
```

Dependencies

The SFAPP table should be accessible.

Output

This example shows output with default SFAPP options in Eagle Rel 46.7.0:

```
rtrv-sfappopts
```

```
tekelecstp 18-09-13 01:26:30 EST EAGLE 46.7.0.0.0-75.10.0
rtrv-sfappopts
Command entered at terminal #17.
;
```

```
Command Accepted - Processing
```

```
tekelecstp 18-09-13 01:26:30 EST EAGLE 46.7.0.0.0-75.10.0
SFAPP OPTIONS TABLE
-----
VLRIMEICHALLENGE = no
MODE              = active
SUCCTH           = none
FAILTH           = none
VELTH            = none
AGETIME          = none
```

Legend

- **VLRIMEICHALLENGE** - Enables/Disables the VLR IMEI challenge for CAT3.2 messages
- **MODE**- Provides option to turn off dynamic learning, test the learning algorithm, and move the system in operation using various modes
 - **OFF**- Turn off the dynamic learning. Delete all the dynamic entries

- *LEARN* - Only learn about new VLRs, no challenges are performed (newly learned VLRs are considered as Whitelisted). Delete dynamic entries without parent in static when switch from ACTIVE or TEST mode
- *ACTIVE* - Challenges are performed. Status of dynamically learned VLRs are changed to Whitelisted or Blacklisted if they meet criteria
- *TEST* - Challenges are performed. However, learned VLRs remain Grey listed
- **SUCCTH** If system-wide success threshold is 0 i.e., None, then do not transition any VLR to whitelist
- **VELTH** - In case VELTH is set to None, all dynamic VLR roaming entries will always be in LEARNING phase and will never be used for VLR validation
- **AGETIME** - In case agetime is set to None, ageing will not perform

rtrv-sg-opts

Use this command to retrieve information about the currently chosen IP⁷ Secure Gateway protocol options.

Parameters

This command has no parameters.

Example

```
rtrv-sg-opts
```

Dependencies

None

Notes

None

Output

```
rtrv-sg-opts
```

```
rlghncxa03w 13-09-24 09:50:17 EST EAGLE 46.0.0
SRKQ:                250

UAMEASUSEDFTAS:     YES
DSCP                  20
```

```
;
```

Legend

- **SRKQ**—Static routing key quantity. Maximum number of routing key entries in the Static Routing Key table.
- **SNMPCONT**—System contact information for each E5-ENET-B SNMP agent
- **GETCOMM**—Community name used for messages sent by SS7IPGW cards (SNMP Get and GetNext request validations)
- **SETCOMM**—Community name used for SNMP set request validation. This value applies for each E5-ENET-B SNMP agent in the system.
- **TRAPCOMM**—Community name used when SNMP traps are generated. This value applies for each E5-ENET-B SNMP agent in the system.
- **SCTPCSUM**—SCTP checksum algorithm type
- **IPGWABATE**—IPGWx SS7 congestion abatement procedures
- **UAMEASUSEDFTAS**—UA measurements are generated
- **DSCP**--- Subfield in IP header. Applicable to SIGTRAN based cards only.

rtrv-shlf

Use this command to display the frames and shelves that are currently provisioned in the system. The type of shelf is also shown.

Parameters

loc (optional)

The shelf location.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100, 6200, 6300

Default:

Display all configured locations

Example

```
rtrv-shlf
rtrv-shlf:loc=1300
rtrv-shlf:loc=6200
```

Dependencies

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (*xyzz*, where *x*=frame and *y*=shelf; *zz* is always 00 for this command).

The Shelf table is corrupt or cannot be found by the system.

Notes

None

Output

This example displays all configured STP equipment shelves:

rtrv-shlf

```
tekelecstp 09-03-12 12:24:48 EST 45.0.0
SHELF DISPLAY
FRAME SHELF      TYPE

rtrv-sid

Use this command to retrieve site identification characteristics of the system. It shows the point code assigned to this system, the CLLI code of the system, the capability code of the STP, and the type of point codes supported by the system.

Parameters

Note:

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cpc (optional)

ANSI capability point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

cpc

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

Default:

Display all

cpc/cpca/cpci/cpcn/cpcn24/cpcn16 (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

cpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

Default:

Display all

cpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:
Display all

cpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:
000-255
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
msa—000–255
ssa—000–255
sp—000–255

Default:
Display all

cpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*.

Range:
000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Default:
Display all

cpctype (optional)

Capability point code type. This parameter displays the CPCs that are provisioned for the specified service.

Range:

stp

lnp

inp

eir

gport

gflex

mnp

atinpq

vflex

aiq

Default:

stp

Example

```
rtrv-sid
rtrv-sid:cpc=3-3-3
rtrv-sid:cyctype=inp
rtrv-sid:cpcn=s-00456
rtrv-sid:cpcn16=1-2-3
```

Dependencies

The STP destination point codes and capability point codes can be specified only as full point codes.

The ANSI point code 0-0-0 and the ITU-I point code 0-000-0 are invalid for STP capability point codes.

The LNP feature must be turned on before the `cpctype=lnp` parameter can be specified.

The INP feature must be turned on before the `cpctype=inp` parameter can be specified.

The EIR feature must be turned on before the `cpctype=eir` parameter can be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be retrieved.

The STP MAS Configuration table is corrupt or cannot be found.

If the `cpcn` parameter is specified, the format of the specified point code must match the format that was assigned with the `chg-stpopts:npcfmit` command.

The STP Site Identification table is corrupt or cannot be found.

The ATINP feature must be enabled before the `cpctype=atinpq` parameter can be specified.

The V-Flex feature must be turned on before the `cpctype=vflex` parameter can be specified.

The A-Port or the IS41 GSM Migration (IGM) feature must be enabled, before the `cpctype=mnp` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `cpctype=aiq` parameter can be specified.

Notes

If the `cpc/cpca/cpci/cpcn/cpcn24/cpcn16` parameter is not specified, all site identification characteristics are displayed.

If the STP capability point code is specified and not provisioned, the report contains only the PCA, PCI, PCN, PCN16, PCN24, CLLI, and PCTYPE fields, with the message:

```
Capability Point Code specified is not provisioned.
```

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

The `rtrv-sid` command CPC output is sorted using three sort keys.

- The first sort key is by the `cpctype` service, ordered by: `aiq`, `eir`, `gflex`, `inp`, `stp` (own STP, unlabeled), and `gport` or `mnp` depending on whether A-Port, ATINP, G-Port or V-Flex is enabled.
- The second sort key is by network type, ordered by: ANSI, ITU-I, ITU-N, then ITU-N24.
- The third sort key is by point code value, ordered low to high.

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The s- point code prefix indicates an ITU national or international spare point code or spare capability point code.
- ANSI41 AIQ, EIR, G-Flex, G-Port, INP, LNP and V-Flex capability point codes are indicated in parentheses after the capability point code header.
- STP capability point codes have no parentheses after the header.

This example shows all site identification characteristics provisioned in the system at the time the command was entered. The output includes spare point codes.

Legend

- **PCA**—ANSI point code of the STP.
- **PCI**—ITU-TSS international point code of the STP.
- **PCN**—ITU-TSS national point code of the STP.
- **PCN16**—16-bit ITU national point code of the STP.
- **PCN24**—24-bit ITU national point code of the STP.
- **CPCA**—ANSI capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network
- **CPCN**—ITU-TSS national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCI**—ITU-TSS international capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCN24**—ITU-TSS 24-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCN16**—ITU-TSS 16-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **(EIR)**—Equipment Identity Register (EIR) point code.
- **(INP)**—INAP Number Portability (INP) point code.
- **(LNP)**—Local number portability (LNP) point code.
- **(GFLEX)**—G-Flex (GFLEX) point code.
- **(GPORT)**—G-Port (GPORT) point code.
- **(MNP)**—MNP point code.
- **(VFLEX)**—V-Flex (VFLEX) point code.
- **(ATINP)**—ATINP feature (ATINPQ) point code.
- **(AIQ)**—ANSI41 AIQ feature (AIQ) point code.
- **CLLI**—Common language location identifier of the STP
- **PCTYPE**—Type of point code used by the STP. There are two types of point codes that the EAGLE STP can use, ANSI and OTHER. The value ANSI means the EAGLE STP supports point codes that meet the ANSI standard. The value OTHER means that the EAGLE STP supports point codes that do not meet the ANSI standard.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no other parameter is specified:

rtrv-sipopts

Use this command to retrieve SIP-configuration options.

Parameters

This command has no input parameters.

Example

```
rtrv-sipopts
```

Dependencies

SIPNP Feature must be enabled before retrieving SIP configuration-options.

SIPOPTS table should be accessible.

Output

This example shows output with default SIP options.

```
rtrv-sipopts
```

```
tekelecstp 12-06-25 11:43:52 EST EAGLE 45.0.0
```

```
rtrv-sipopts
```

```
Command entered at terminal #4.
```

```
NPRSPFMT      = RNDN
```

```
INCLUDENPDI   = on
```

```
INCLUDERN     = on
```

```
RNFMT         = RN
```

```
NPLKUPFAIL    = 404
```

```
RNCONTEXT     = null
```

```
;
```

This example shows output with SIP options provisioned.

```
rtrv-sipopts
```

```
tekelecstp 12-06-25 11:54:02 EST EAGLE 45.0.0
```

```
rtrv-sipopts
```

```
Command entered at terminal #4.
```

```
NPRSPFMT      = RN
```

```
INCLUDENPDI   = off
```

```
INCLUDERN     = off
```

```
RNFMT         = RNASD
```

```
NPLKUPFAIL    = 302
```

```
RNCONTEXT     = xyz
```

```
;
```

Legend

- NPRSPFMT— Defines format of URI in Contact header, when INCLUDERN is OFF.
- INCLUDENPDI— Indicates whether to include "npdi" parameter in the response in cases where the RTDB dip is successfully performed.
- INCLUDERN— Indicates whether to include "rn" parameter in the response in cases where the RTDB dip is successfully performed.
- RNFMT— Defines format of Routing Number in the 302 response.

- NPLKUPFAIL— Indicates whether 302 or 404 response is sent, when DN is not found in RTDB lookup.
- RNCONTEXT— Describes how the "rn" parameter value should be interpreted (global or local).

rtrv-slk

Use this command to show the parameters for low-speed signaling links, ATM high-speed signaling links, or both.

Parameters

aname (optional)

Association name. The name of the association assigned to the links to be displayed.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

link (optional)

The signaling link on the card specified in the `loc` parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid `link` parameter range values for each type of card that can have assigned signaling links.

Default:

Display all

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All signaling links are shown.

type (optional)

Link type. This parameter specifies to display a sub-set of links.

Range:***e1***

Display signaling links for E1 cards. Includes low speed E1 and SE-HSL links.

ipgw

Display signaling links configured for IPGW linksets

ipsg

Display signaling links configured for IPSG linksets

j1

Display signaling links for J1 cards. Includes low speed J1 links.

mtp2

Display low-speed signaling links

saal

Display ATM high-speed signaling links

t1

Display signaling links for T1 cards. Includes low speed T1 and ST-HSL-A links.

Default:

Display all signaling links

Example

```
rtrv-slk:loc=1302:link=a
rtrv-slk:loc=1302:link=b2
rtrv-slk:loc=1303:link=a31
rtrv-slk:aname=asocm2pa
rtrv-slk:loc=1305
rtrv-slk:type=j1
```

Dependencies

If the `link` parameter is specified, the `loc` parameter must be specified. The `loc` parameter can be specified without the `link` parameter.

The `loc` parameter or the `class` parameter, but not both, can be specified in the command.

The slot portion of the specified `loc` parameter must be 01 - 18, except 09 and 10 cannot be specified (`loc=xyss`, where `x` is the frame, `y` is the shelf, and `ss` is the slot).

Card locations 1113 - 1118 cannot be specified for the `loc` parameter.

The LIMATM, LIME1ATM, LIME1, LIMT1, DCM, and ENET/ENETB card types are the only valid card types for this command.

The card must be an E5-ATM-B, E5-E1T1-B, E5-ENET-B.

The specified card location must be equipped.

The IMT (Card) table must be accessible.

The Link table must be accessible.

The Linkset table must be accessible.

If an E5-ATM-B card is used, then a value of A, B, or A1 must be specified for the `link` parameter. A 3 Links per Card feature quantity must be enabled before the `link=a1` parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Guide* provides an illustration of the card locations.

```

IPTPS for LOC = 1301 is (3400 of 9500) 35%

;

Legend

- **LOC**—Location of the card containing the signaling link
- **LINK**—Signaling link assigned to the card
- **LSN**—Name of the linkset containing the signaling link
- **SLC**—Signaling link code of the signaling link
- **TYPE**—Type of card
- **ANAME**—Association name
- **SLKTPS/RSVDSLKTPS**—SLKTPS guaranteed for an IPSP link
- **MAXSLKTPS**—Maximum SLKTPS allowed for an IPSP link
- **L2TSET**—Number of the level 2 timer set associated with the signaling link
- **BPS**—Transmission rate of the signaling link in bits per second
- **ECM**—Basic of PC for transmission
- **PCRN1**—MSU number
- **PCRN2**—Octet number
- **LPSET**—ATM link parameter set identifier
- **ATMTSEL**—ATM timing selector. Possible values are as follows:
 - **Internal**—Derived from an internal clock source operating at 1.544 MHz \pm 200 Hz (ANSI) or 2.048 MHz \pm 103 Hz (ITU).
 - **External**—Derived from the High-Speed Master Clock (T1 or E1)
 - **Line**—Derived from its received data stream, if present
- **VCI**—ATM virtual channel identifier
- **VPI**—ATM virtual path identifier
- **LL**—ATM line length
- **E1PORT**—E1 card port that has an E1 interface assigned to it.
- **T1PORT**—T1 card port that has a T1 interface assigned to it
- **TS**—Timeslot associated with the signaling link that is serviced by the E1 or T1 interface
- **E1ATMCRC4**—E1 ATM card CRC4 multi-frame structure enable/disable indicator
- **E1ATMSI**—Value of two Spare International bits of NFAS data for the E1 ATM card
- **E1ATMSN**—Value of five Spare National bits of NFAS data for the E1 ATM card
- **J1PORT**— J1 card port that has a J1 interface assigned to it.

rtrv-slt

Use this command to display the fields of an SLTM (signaling link test message) record in the SLTM table.

Parameters

enabled (optional)

Displays the SLTM records that are either enabled or disabled (*off*).

Range:

on
display enabled records

off
display disabled records

Default:

All SLTM records with the specified value for the enabled parameter are shown.

sltset (optional)

The signaling link test message (SLTM) record number in the SLTM table.

Range:

1 - 20

Default:

Display all

Example

```
rtrv-slt  
rtrv-slt:sltset=1  
rtrv-slt:enabled=off
```

Dependencies

None

Notes

None

Output

```
rtrv-slt
```

```

Legend

- **SLTSET**—Signaling link test message record number in the SLTM table
- **T1**—T1 timer value for the SLTM record. The amount of time, in seconds, to wait before running the SLTM test again after an SLTM test fails.
- **T2**—T2 timer value for the SLTM record. The amount of time, in seconds, to wait between running SLTM tests for a normally functioning signaling link.
- **MODE**—SLTM mode to be used when sending test messages
- **ENABLED**—Indicates whether the signaling link test message is enabled.
- **PATTERN**—Test pattern to be sent with a signaling link test message

rtrv-spc

Use this command to retrieve an SPC (secondary point code) from the active database.

Parameters**Note:**

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

spc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

spca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

The secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

spcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt1` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Example

```
rtrv-spc
```

```
rtrv-spc:spc=5-3-3
```

```
rtrv-spc:spcn24=98-98-98
```

```
rtrv-spc:spcn=s-00345
rtrv-spc:spcn16:121-10-30
```

Dependencies

The MPC feature must be turned on before this command can be entered.

The SPC table must be accessible.

The value of the `spc` parameter must be a full point code.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

This example shows output for all provisioned secondary point codes. SPC-N is a flexible point code format as defined with the `chg-stpopts:npcfmti` parameter.

rtrv-srvsel

Use this command to display a list of administered service selector combinations. The list can be filtered using various parameter combinations.

Note:

The `rtrv-srvsel` operation may be lengthy because the service selector table can contain over 1,000 entries.

Parameters

Note:

Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

df1tact (optional)

The default action ID associated with the service selector entry.

Range:

`ayyyyyyy`

1 alphabetic character followed by up to 8 alphanumeric characters

This parameter can take one of the following values:

- a valid GTT Action ID of type **disc/udts/tcaperr** that must already exist in the GTT Action table

- *fallback* —Fallback to the Relay data. The Relayed MSU is routed as per routing data provided by the service.
- *falltogtt* —Fallback to GTT. If the *gttselid* parameter has a value other than *none*, and the GTT selector search fails, then the GTT selector search is performed again using *gttselid=none*.

force (optional)

The *force=yes* parameter must be specified when a *num* parameter value greater than 50 is specified to display more than 50 entries.

Range:

yes

no

Default:

no

gti/gtia/gtii/gtin/gtin24 (optional)

Global title indicator. For all service selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national) and GTIN24 (24-bit ITU national). For the service selector commands, GTI and GTIA are equivalent.

Range:

Supported value for ANSI: *gti/gtia=2*

Supported values for ITU: *gtii/gtin/gtin24=0, 2, 4*

Default:

Display all

nai (optional)

Nature of Address indicator.

Range:

Example

```
rtrv-srvsel
rtrv-srvsel:gtii=2
rtrv-srvsel:tt=0:np=e164
rtrv-srvsel:serv=vflex
rtrv-srvsel:serv=aiq
rtrv-srvsel:on=gttrqd
rtrv-srvsel:gtii=0:serv=idpr
```

Dependencies

The INP or AINPQ feature must be turned on before the `serv=inpmr` or `serv=inpq` parameter can be specified.

The G-Flex feature must be turned on before the `serv=gflex` parameter can be specified.

The G-Port feature must be turned on before the `serv=gport` parameter can be specified.

The `np` and `npv` parameters cannot be specified together in the command.

The `nai` and `nai v` parameters cannot be specified together in the command.

The values 1 and 3 are not valid for the `gti/gtia/gtii/gtin/gtin24` parameters.

The value 0, 4 is not valid for the `gti/gtia` parameters.

If the `gti/gtia/gtii/gtin/gtin24=0, 2` parameter is specified, then no `np(v)` and `nai(v)` parameter combinations can be specified.

If the `serv` parameter has a value of `inpmr`, `inpq`, `gport`, or `eir`, then the `gtia` and `gti` parameters cannot be specified.

If the `serv=inpmr` parameter is specified, then the value of the `snp` parameter must be `e164` if specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the value of the `serv` parameter must be `inpmr`, `gport`, or `smsmr` if it is specified.

If the `serv=inpq` parameter is specified, then the `gtii` parameter cannot be specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the `serv=gflex` parameter cannot be specified.

If a value of `aiq`, `eir`, `inpq`, or `vflex` is specified for the `serv` parameter then the `snp` and `snai` parameters cannot be specified.

If the `snai=ccrndn` parameter is specified, then the value specified for the `serv` parameter must be `gport` or `smsmr`.

If the value specified for the `num` parameter is greater than 50, then the `force=yes` parameter must be specified.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the `serv=ttr` parameter can be specified.

If a value of `idpr` or `ttr` is specified for the `serv` parameter, then the parameters `NAIV`, `NPV`, `SNP`, or `SNAI` must not be specified.

The IDP Screening for Prepaid feature must be turned on before the `serv=idps` parameter can be specified.

The V-flex feature must be turned on before the `serv=vflex` parameter can be specified.

The Portability Check for Mobile Originated SMS or the PPSMS feature must be turned on, or the MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the `serv=smsmr` parameter can be specified.

The ATINP feature must be enabled before the `serv=atinp` parameter can be specified.

If a value of `aiq`, `atinp`, or `eir` is specified for the `serv` parameter, then the `gtin24` parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the `serv=idpr` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `serv=aiq` parameter can be specified.

If a DSM4G card is active in the system, then the `on=gttrqd` parameter cannot be specified.

The GTT Action table is corrupt or cannot be found.

If a GTT Action ID is specified as the value for the `dfltact` parameter, then the Action ID must already exist in the GTT Action table.

The same values cannot be specified for the `on` and `off` parameters.

The `dfltact=none` parameter cannot be specified.

The EGTT feature must be turned on before the `dfltact` parameter can be specified.

The GSM DBMM table must be accessible.

The `defactid=none` parameter cannot be specified.

Only for IDP Relay feature, `gtii/gtin/gtin24=0` can be specified.

Notes

on/off options

- `gttrqd` —GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.

- *force* —Must be specified to display more than 50 entries

Output

This example shows all service selectors containing the specified GTI value:

```
rtrv-srvsel:gtii=2
```

```

rtrv-ss-appl

Use this command to retrieve information for all provisioned subsystem applications from the database. The command displays the application type, subsystem number, and application status.

Parameters

This command has no parameters.

Example

```
rtrv-ss-appl
```

Dependencies

The ANSI41 AIQ, EIR, LNP, or V-Flex feature must be enabled, or the AINPQ or INP feature must be turned on before this command can be entered.

The SS-APPL table is corrupt or cannot be found.

The LNP feature must be turned on before the WNP or PLNP feature can be turned on and before LNP information or measurements can be reported on.

A severe system fault has occurred and the command was rejected.

The LNP TT SS-APPL table is corrupt or cannot be found.

Notes

None

Output

```
rtrv-ss-appl
```

```
tekelecstp 09-12-03 14:42:38 EST EAGLE 42.0.0
APPL  SSN  STAT
AIQ   12   online

rtrv-stp

Use this command to retrieve information related to the STP at which the command is entered.

The command can retrieve frame and card power consumption and threshold values (in Amps or milliamps and Watts) for all provisioned frames or for a specified frame. (See the `ent-frm-pwr` command.)

The command can retrieve hardware configuration information (card location, board part number, revision, serial number, card type, card memory, APPL, and GPL version):

- For all provisioned STP frames and shelves
- For a specific provisioned frame
- For a specific provisioned shelf
- For a specific equipped card
- For all cards of the specified card type
- For all cards that contain the specified Board Part Number
- For all cards that are running the specified GPL or GPL version.

Parameters

display (optional)

Display the power consumption and power threshold value for all provisioned frames or for one specific provisioned frame.

This parameter must be specified when the `frm` parameter is specified, to display the power information for one frame.

Range:

power

Display frame power information in the command output.

frm (optional)

Frame ID. Displays information for the specified provisioned frame.

Range:

cf00

Control Frame identifier

ef00

Identifier for the first Extension Frame

ef01

Identifier for the second Extension Frame

ef02

Identifier for the third Extension Frame

ef03

Identifier for the fourth Extension Frame

ef04

Identifier for the fifth Extension Frame

gp1 (optional)

Generic program load. Displays hardware configuration information for all card locations equipped with cards that are running the specified GPL.

Note:

This parameter must be specified with the `ver` parameter to display information for a specific version of the GPL.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc—Used by E5-ATM-B cards to allow the card to support up to 3 signaling links

blxp—Flash GPL containing a tar image with all code required on E5-IPSM, E5-TSM, and E5-SM4G cards

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

deirhc— Used by E5-SM8G-B cards to support the S13/S13' EIR feature

enumhc— Used by E5-SM8G-B cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application

erthc—Used by E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

glshc—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

ipghc—Used by E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

iplhc—Used by E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

ipsg—Used by E5-ENET-B and SLIC cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

ipsg32—Used by SLIC cards to support IPSEG application with 64-bit addressing either with GTT functionality or without it.

ipshc—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

mcphc—Used by E5-MCPM-B cards for the Measurements Platform feature

oamhc—Used by E5-MCAP cards for enhanced OAM functions

sccphc—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM4G or E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

siphc— Used by E5-SM8G-B Cards to support the SIP application

slanhc—Used by E5-ENET-B cards to support the STPLAN application

ss7hc—Used by , and E5-E1T1-B cards. Allows the card to support up to 64 (E5-E1T1-B) signaling links for E1 and T1 functions.

partnum (optional)

Display the hardware configuration for all card locations that contain a card with the specified Board Part Number.

Range:

zzz-zzzz-zz or *zzzzzzz*

Specify the Board Part Number in the format *xxx-xxxx-xx*. See the Hardware Baseline in *Release Notes* for a list of Board Part Numbers that are supported for the release.

shelf (optional)

Display the hardware configuration information for all card locations in the specified EAGLE shelf.

Range:

1100

1200

1300

2100

2200

2300

3100

3200

3300

4100

4200

4300

5100

5200

5300

6100

6200

6300

type (optional)

Display the hardware configuration information for all card locations that contain cards of the specified card type.

Range:

dcm

dsm

e5appb

enet

enetb

ipsm

limatm

lime1

lime1atm

limt1

mcpm

slic

stc

telco

tsm**ver (optional)**

Display the hardware configuration information for all the card locations that have cards with the specified GPL Type and the specified GPL Version. The version format is *major-minor-fix*.

Range:

major-minor-fix

major—Range 0-255

minor—Range 0-255

fix—Range 0-255

Example

Retrieve the frame power information for all provisioned frames of the STP.

```
rtrv-stp:display=power
```

Retrieve the card level power information for the control frame in the STP.

```
rtrv-stp:display=power:frm=cf00
```

Retrieve the hardware configuration information for the STP control shelf (shelf 1100).

```
rtrv-stp:shelf=1100
```

Retrieve the hardware configuration information for all cards equipped in the STP that have the specified Board Part Number.

```
rtrv-stp:partnum=870-1275-01
```

Retrieve the hardware configuration information for all provisioned E5-TSM cards in the STP.

```
rtrv-stp:type=tsm
```

Retrieve the hardware configuration information for all cards in the STP that are running the IMT communication GPL with GPL version 126-039-043.

```
rtrv-stp:gpl=imt:ver=126-039-043
```

Retrieve the hardware configuration information for all provisioned frames in the STP.

```
rtrv-stp
```

Retrieve the hardware configuration information for all cards in the STP that are running the ATMHC GPL.

```
rtrv-stp:gpl=atmhc
```

Retrieve the hardware configuration information for all provisioned E5-APP-B cards in the STP.

```
rtrv-stp:type=e5appb
```

Retrieve the hardware configuration information for all provisioned Telco Switches in the STP.

```
rtrv-stp:type=telco
```

Retrieve the hardware configuration information for all cards in the STP that are running the SIPHC GPL.

```
rtrv-stp:gpl=siphc
```

Retrieve the hardware configuration information for all cards in the STP that are running the DEIRHC GPL.

```
rtrv-stp:gpl=deirhc
```

Dependencies

A valid value must be specified for the `display` parameter.

A valid value must be specified for the `frm` parameter.

A valid value must be specified for the `shelf` parameter.

The `partnum` parameter value must contain no more than 12 characters.

A valid value must be specified for the `type` parameter.

The `gpl` parameter value must contain no more than 8 characters.

Valid values must be specified for the `ver` parameter subfields (format *major-minor-fix*).

The `display` parameter must be specified when the `frm` parameter is specified.

The `gpl` parameter must be specified when the `ver` parameter is specified.

Only one optional parameter can be specified in the command, except for the following parameter combinations:

- The `display` parameter must be specified when the `frm` parameter is specified.
- The `gpl` parameter must be specified when the `ver` parameter is specified.

The `frm` parameter value must specify a provisioned frame.

The Assembly Power table must be available.

The value specified for the `gpl` parameter must be supported. See the `gpl` definition for a list of supported GPLs.

Notes

When the power threshold value has not been provisioned for a provisioned frame, the default frame power threshold value is displayed and prefixed with a plus sign (+).

For an un-provisioned card that is present in the frame, the card power consumption value is displayed prefixed with a plus sign (+).

For the E5-TDM and E5-MDAL cards in the Control Frame, "E5-TDM" and "E5-MDAL" are displayed as the Part Number of the card.

If a MUX card is not present, then "Empty" is displayed.

If the Board Part Number received in the BIP response from a card is not present in the Assembly Power table, then the Part Number for the card is displayed with a prefix of a plus sign (+).

If the Card power value is not present in the BIP data and the Assembly Power table, then the default card power value of *1563 milliamps* is displayed for the card.

If board information is not available from a card,

- *BIP Data inv* is displayed as the Part number for the card.
- The default card power value of 1563 milliamps is displayed for the card.

If a card location is empty (no card is present in that slot),

- *Empty* is displayed as the Part Number for the card
- A card power value of 0 is assumed and displayed.

For Standby E5-MASP cards, “Unavailable” is displayed as the Part Number if the card is absent. In this case, the card power of the Active E5-MASP card is shown for the card power of the standby card.

If a flash or communication GPL is specified with the `rtrv-stp` command, then the GPL output displays the version of the application GPL that is running on the card and not the version of the specified flash or communication GPL.

An unequipped MUX location does not have any type of MUX card in the slot. If a MUX card is present in the slot, then the location is equipped. When a location is unequipped, “EMPTY” is displayed for the slots, and an error message is generated. Locations 1109 and 1110, which support the control shelf, must contain MUX cards before the EAGLE is considered to be fully operational.

This command can be used to display the power consumption of MUX cards within a frame. The power consumption displays 0 for an unequipped MUX location. The Part Number, Revision, and Power Consumption obtained from the BIP data associated with the MUX card are displayed.

Because E5-APP-B cards provisioned using the `ent-card` command (`type=e5appb`) do not connect to the IMT bus and do not have a BIP record, the part number for these cards will be displayed as "870-3096-XX".

Output

If a flash or communication GPL is specified, then the output displays the GPL version of the application GPL running on the card instead of the GPL version of the specified flash or communication GPL.

The power consumption values that are displayed in the `rtrv-stp:display=power` or the `rtrv-stp:display=power:frm=` commands indicate the maximum calculated power for the frame. The calculation is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE.

Abbreviated output is indicated by 3 vertical dots:

```
.
.
.
```

This example shows the output for a specific shelf containing a HIPR2 card at location 1109:

```
rtrv-stp:shelf=1100
```

Legend

- **Frame**—Frame ID for the control shelf or an extension shelf
- **Power Threshold**—Power threshold (in Amps or Milliamps and Watts) at which an alarm is generated to indicate that power consumption is approaching a maximum allowed level. (See the `ent-frm-pwr` command.)
- **Power Consumption**—Current calculated power consumption (Amps or Milliamps and Watts) of the frame or card
- **Card**—Card Location
- **Part Number**—Board Part Number
- **Rev**—Board Part Number revision
- **Serial Number**—Card serial number
- **Type**—Card type
- **DB**—Daughterboard memory
- **APPL**—Application that has been provisioned on the card
- **GPL Version**—GPL version of the Application GPL being used by the card

rtrv-stpopts

Use this command to retrieve the current value of the system's node-level processing option indicators maintained in the system's options table.

Parameters

This command has no parameters.

Example

```
rtrv-stpopts
```

Dependencies

The MAS Configuration table must be available.

The STP Options table must be available.

None

Notes

The timer output for this command is in milliseconds, even though the timer could have been entered in seconds on the `chg-stpopts` command.

Output

The following example displays MTP STP options with no affecting features on. Certain features that are shown in other examples control changes and additional options in this option list:

```
rtrv-stpopts
```

```
Command Accepted - Processing
```

```

The following example displays all MTP STP options. The following list indicates which options appear in the output when the associated features are on:

 **Note:**

All options will not appear in actual output, because all features that cause these options to appear cannot be on in the system at the same time.

- Cluster Routing and Management Diversity (CRMD) feature—MTPXLQ, MTPXLET, MTPXLOT
- MTP Restart (MTPRS or ITUMTPRS) feature—MTPRSI, MTPRSIT
- 6000, 7000, or 8000 Routesets feature—MTPDPCQ=6000 or 7000 or 8000
- GSM MAP Screening (GSMSCRN) feature—GSMDFLT, GSMDECERR
- GSM Mobile Number Portability (G-Port), IS41 to GSM Migration (IGM), Prepaid SMS Intercept (PPSMS) Ph1, Voice Mail Router (V-Flex), Prepaid IDP Query Relay (IDPR), ANSI-41 Mobile Number Portability (A-Port), or any TIF feature is enabled **OR** INAP Number Portability (INP) or GSM Flexible Numbering (G-Flex) feature is ON—DEFCC, DEFNDC
- ATINP feature is enabled—DEFCC
- EPAP-based features or LNP ELAP Configuration feature—DSMAUD
- GSM Flexible Numbering (G-Flex) feature—ANSIGFLEX
- Network Security (NSE) feature—SECMTPMATE, SECMTPSID, SECMTPSNM, SECSCCPSCMG
- ANSI-ITU-China SCCP Conversion (SCCP Conversion) feature is enabled—CNVCGDA, CNVCGDI, CNVCGDN, CNVCGDN24, GTCNVDFLT
- PC & CIC Translation feature—PCT
- VISUALIZATION—MSG

Legend

- **MTPT31CTL**—MTP T31 congestion trigger level. The signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.
- **MTPLTI**—MTP loop test indicator. Specifies whether the MTP loop detection procedures are enabled or disabled at the system.
- **MTPLTCTDPCQ**—MTP loop test congestion trigger DPC quantity. The number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.
- **MTPLTST**—MTP loop test supervision timer. The amount of time, in milliseconds, that the MTP loop test detection procedures run when started.
- **MTPXLQ**—MTP x-list quantity. The number of dynamic status exception list (x-list) entries the system maintains.
- **MTPXLET**—MTP x-list expiration time. The maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.
- **MTPXLOT**—MTP x-list occupancy threshold. The dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

- **MTPDPCQ**—MTP destination point code quantity. The maximum number of DPCs that can be provisioned in the system.
- **TFATFRPR**—TFA/TFR pacing rate. The amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly-recovered linksets.
- **MTPRSIT**—MTP Restart isolation timer. The minimum duration of node isolation, in milliseconds, before the MTP Restart procedure is deemed necessary.
- **MTPRSI**—MTP Restart indicator. Specifies whether ANSI or ITU MTP Restart procedures are enabled or disabled at the STP.
- **MTPLPRST**—MTP low priority route set test. Specifies whether low priority route set polling is enabled or disabled at the STP.
- **MTPT10ALT**—MTP T10 alternate timer. Specifies the interval at which the STP performs a route set test on low priority routes.
- **SLSCNV**—Per node SLS conversion indicator. Specifies whether SLS conversion is on, off, or performed per linkset (perls).
- **UIMRD**—Unsolicited Information Message (UIM) redirect. Specifies whether specific UIMs are redirected to this output group.
- **CRITALMINH**—Indicates whether the option that allows the inhibiting of critical alarms is enabled (yes) or disabled (no).
- **DISPACTALMS**—Indicates whether to display active or total alarms in the alarm status area of the VT320 screen.
- **NPCFMTI**—Defines how the ITU national point code is entered into the database and how it is displayed in any outputs from the system.
- **GSMDFLT**—Indicates whether the GSM MAP screening default action is set to pass or discard.
- **GSMDECERR**—Indicates whether the GSM MAP screening decode error action is set to pass or discard.
- **DEFCC**—Defines the default country code.
- **DEFNDC**—Defines the default network destination code.
- **DSMAUD**—Indicates whether the DSM audit is running (on) or disabled (off).
- **RANDSLS**—Displays the Random SLS setting.
- **RTPLNPMRSS**—Displays the setting for reporting or suppressing UIM 1049 for LNP MR with missing subsystems.
- **RSTRDEV**—Allow or disable restoration of device states when an `init-sys` command is executed, an OAM role changes, or a card reload occurs.
- **SECMTPMATE**—Indicates Network Security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.
- **SECMTPSID**—Indicates Network Security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the `chg-sid` command) that is not a route-set-congestion-message. The EAGLE should not receive a message with its own OPC

unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked).

- **SECMTPSNM**—Indicates Network Security screening for MTP SNM messages. The EAGLE should not receive an MTP network management message unless:
 - The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)
 - The EAGLE has a route to the OPC of the MTP network management message on the linkset which the message was received.
 - The EAGLE has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule is not applicable to RST messages.)
- **SECSCCPSCMG**—Indicates Network Security screening for SCCP SCMG messages. This value applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected. The EAGLE should not receive an SCCP network management message unless:
 - The EAGLE has a route to the OPC of the SCMG message on the linkset on which the message was received.
 - The EAGLE has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE) in the message on the linkset on which the message was received.
- **CNVCGDA**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ANSI, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDI**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-I, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDN**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-N, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDN24**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is 24-bit ITU-N, and the PC or ALIAS PC of the destination network type is not defined.
- **ANSIGFLEX**—Indicates enable or disable of ANSI G-Flex to execute at 1700 TPS per DSM card
- **GTCNVDFLT**—Indicates enable or disable of routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion table.
- **HSCLKLL**—High speed master clock line length option (SHORTHAUL, LONGHAUL)
- **HSCLKSRC**—High speed master clock source
- **ARCHBLDID**—Archive build ID
- **MFC**—Indicates that the system is using Message Flow Control (MFC).
- **PCT**—Indicates whether PCT is applied to MSUs
- **GDPC**—MSU duplicated by GWS DUP Stop Action will be routed to the point code configured in GDPC.

- **UITHROTTLE**—Indicates the speed at which output is sent to the terminal. Zero represents the most throttling, or the slowest output. Nine represents the least throttling, or the fastest output.
- **EPAP240M**—Indicates that the E5-SM8G-B card can download the maximum 240M DN/IMSI RTDB data from EPAP.
- **EPAPX**— Indicates that the SLIC cards running 64-bits flash SCCP gpls can download 480M individual DN entries, 600M individual IMSI entries or 600M individual IMEI entries from EPAP.
- **VISUALIZATION**— Indicates that whether system wide visualization feature is disable or specific visualization (UIM/MSG/BOTH) is enable.

rtrv-subnetid

Use this command to retrieve a list of Subnet ID entries from the SUBNETID table, for the ISUP NP with EPAP feature.

Parameters

subnetnum (optional)

Subnet Number

Range:

1 - 5

Example

```
rtrv-subnetid
rtrv-subnetid:subnetnum=1
```

Dependencies

The SUBNETID table is corrupt or cannot be found by the system.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

Notes

None.

Output

This example shows output when the command is entered with no parameter. Subnet IDs for Subnet number 1 are listed in numerical order, followed by the Subnet IDs for Subnet number 2 in numerical order, etc.

```
rtrv-subnetid

rtrv-t1

Use this command to retrieve information for a specified T1 interface or for all T1 interfaces that have been defined by the `ent-t1` command for an E5-E1T1-B card that is used as a T1 or ST-HSL-A card.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

all T1 card locations are listed

t1port (optional)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified T1 card (`loc` parameter).

Range:

1 - 8

Default:

If not specified, all T1 ports are listed.

Example

```
rtrv-t1
rtrv-t1:loc=1307:t1port=2
rtrv-t1:loc=1311:t1port=1
```

Dependencies

The `loc` and `t1port` parameters must be specified together, if any parameters are specified for the command.

The T1 interface of the T1 card specified by the `loc` parameter must already be defined before this command can be entered.

The card specified by the `loc` parameter must be a LIMT1 card type.

The Card (IMT) table must be accessible.

The E1/T1 table must be accessible.

The port specified by the `t1port` parameter on the card specified by the `loc` parameter must be already equipped with a T1 interface.

The following card locations (`loc` parameter) are not valid for this command: 1113 - 1118 and all xy09 and xy10 locations (where x is the frame and y is the shelf).

Notes

None.

Output**Legend**

- **LOC**—T1card location in the shelf
- **T1PORT**—T1 port number on a T1 card

- **ENCODE**—Indicator for use of B8ZS or AMI encoding/decoding
- **FRAMING**—Framing format (SF or ESF)
- **LL**—Line length; T1 cable length in feet between the EAGLE and the connecting node
- **MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.
- **TSx**—Timeslot

rtrv-tatr-msg

Use this command to display the configured Triggerless ANSI TCAP Relay message parameter values.

Parameters

msgn (optional)

Message number. The number of the TATR message.

Range:

1 - 10

Example

```
rtrv-tatr-msg:msgn=1
```

Dependencies

The TSTMSG table is corrupt or could not be found.

None.

Notes

None.

Output

rtrv-tbl-capacity

Use this command to retrieve table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value.

Parameters

This command has no parameters.

Example

```
rtrv-tbl-capacity
```

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

XLIST table information is shown only if the CRMD feature is ON.

Secondary Point Code (SPC) table information is shown only if the MPC feature is ON.

If the EGTT feature is ON then table name is GTA instead of GTT.

Additional information for each listed table can be displayed using the commands listed in [Retrieve Commands for Additional Table Information](#).

Though the ASP table entries are now part of the IPAPSOCK table, command entry and output still appear as though they are separate tables. The `rtrv-tbl-capacity` command shows the number of ASPs in the 4000-entry IPAPSOCK table.

Table 4-55 Retrieve Commands for Additional Table Information

Command	Table name	Description of table
<code>rept-stat-xlist</code>	XLIST	Destination - Routeset Extension
<code>rtrv-appl-rtkey</code>	IPRTKEY	IP Routing Key
<code>rtrv-as</code>	AS	Application Server
<code>rtrv-assoc</code>	IPAPSOCK	IP Socket/Association
<code>rtrv-dstn</code>	DSTN	Destination Routeset, Exception Routeset
<code>rtrv-gta</code>	GTA	Global Title Address

Table 4-55 (Cont.) Retrieve Commands for Additional Table Information

Command	Table name	Description of table
rtrv-gtt	GTT	Global Title Translation
rtrv-ip-host	IP-HOST	IP Host
rtrv-ip-lnk	IP-LNK	Internet Process Link
rtrv-ls	LS	Link Set
rtrv-map	MAP	Mated Application
rtrv-mrn	MRN	Mated Relay Node
rtrv-npp-as	NPP-AS	Numbering Plan Processor
rtrv-npp-srs	NPP-SRS	Numbering Plan Processor
rtrv-scrset	SCRSET	Gateway Screening Screen Set
rtrv-slk	SLK	Signal Link
rtrv-spc	SPC	Secondary Point Code
rtrv-vflx-cd	VFLXCD	V-Flex Call Decision
rtrv-vflx-rn	VFLXRN	V-Flex Routing Number
rtrv-vflx-vmsid	VFLXVID	V-Flex VMSID
rtrv-gttact	GTT-ACT	GTT Action
rtrv-gttaset	GTT-ASET	GTT Action Set
rtrv-gttapath	GTT-PATH	GTT Action Path
rtrv-gtmod	GTMOD	GT Modification

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service.

V-Flex Call Decision (VFLXCD), Routing Number (VFLXRN) and VMSID (VFLXVID) table information is shown only if the V-Flex feature is enabled.

Output

This example shows the output for the minimum table sizes in the system when CRMD, MPC, EGTT and VFLEX features are off:

```
rtrv-tbl-capacity
```

```

rtrv-tps

Use this command to display the total provisioned system TPS for IPSG and E5-ATM-B cards. The total of these four values, and the maximum allowed system TPS value, are also displayed.

Parameters

This command has no parameters.

Example

```
rtrv-tps
```

Dependencies

The Linkset table is corrupt or cannot be found.

The Signaling Link table is corrupt or cannot be found.

None

Notes

The maximum total provisioned System TPS is based on whether the HIPR2 High Rate Mode feature is turned on. The maximum total provisioned System TPS is 500,000 if the HIPR2 High Rate Mode feature is turned off, 750,000 if the HIPR2 High Rate Mode feature is turned on, and 1,000,000 if both the HIPR2 High Rate Mode and 1M System TPS features are turned on.

MAX TPS calculations

The provisioned (max) system TPS calculation is calculated by summing the SIGTRAN TPS values (values for the IPSG linksets TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPSG linksets using the (num_ipsg_links * the value of the maxslktps parameter (see the ent/chg-ls commands)).
- Sum all ATM over T1 links ((ATM ANSI links) * per ATM ANSI links TPS (1630))
- Sum all ATM over E1 links ((ATM ITU links) * per ATM ITU links TPS (2038))

RSVD TPS Calculations

The reserved TPS calculation is calculated by summing the SIGTRAN TPS values (values for the and IPSG linksets TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPSG linksets using the (num_ipsg_links * the value of the slktps or rsvdslktps parameter (see the ent/chg-ls commands)).
- Sum all ATM over T1 links ((ATM ANSI links) * per ATM ANSI links TPS (1630))
- Sum all ATM over E1 links ((ATM ITU links) * per ATM ITU links TPS (2038))

Output

This example shows the output when the HIPR2 High Rate Mode feature is turned off:

```
rtrv-tps
```

```
rlghncxa03w 10-02-10 16:20:46 EST EAGLE 42.0.0
```

CARD TYPE	NUM CARDS	NUM LINKS	RSVD TPS	MAX TPS

rtrv-trbl

Use this command to display detailed information for one or more troubles that are currently logged into the system.

Parameters

loc (mandatory)

The address of the card that is running the OAM from which logged trouble reports are to be displayed.

Range:

1113, 1115

mode (optional)

Display mode

Range:

c

Continuous mode; shows troubles already logged and new troubles as they occur.

m

Manual mode; shows troubles on demand only

Default:

c

num (optional)

Indicates how many troubles to display.

Range:

1 - 1023

Default:

99

Example

```
rtrv-trbl:loc=1113:num=2
```

Dependencies

At least one trouble must be in the trouble log, or the command is rejected.

Only one `rtrv-trbl` or `rtrv-obit` command can be in progress at a time.

If the `mode` parameter is specified without the `num` parameter, the entire log is displayed.

The card specified by the `loc` parameter must be 1113 or 1115.

If the `loc` parameter specifies the card that is running the standby OAM, that card must be available.

The `num` parameter must be between 1 - 1023.

Notes

When a trouble is generated in the system, it is logged into the RAM storage area of the active OAM. Each OAM can store up to 1023 troubles in a queue. If the OAM resets, logged troubles are lost.

Output

The output from this command should be reviewed with a member of the Customer Care Center. See the "My Oracle Support (MOS)" section in Chapter 1 of this reference guide.

rtrv-trbltx

Use this command to retrieve Alarm and UIM message information including MRN (message reference number), level (for Alarms), Output Group, and text.

The default report displays all Alarms (in numerical order) and then all UIMs.

The optional parameters can be used to:

- Display a range of Alarms or UIMs (ranges spanning both Alarms and UIMs are not supported)
- Search for Alarms, UIMs, or both message types matching a specific Output Group
- Sort all entries by Output Group

Parameters

enum (optional)

The ending Message Reference Number (MRN) when specifying a range.

Range:

1 - 1999

1-999-UAMs

1000-1999 -UIMs

Default:

If *snum* is specified, the *enum* value defaults to the specified *snum* value.

If *snum* is not specified and *type=all*, *type=uim*, or *type* is not specified, the *enum* value defaults to 1999

If *snum* is not specified and *type=alarm*, the *enum* value defaults to 999.

outgrp (optional)

The Output Group to sort or filter the Alarm/UIMs on.

Range:

appserv

Application Server

appss

Application Subsystem

card

Card

clk

Clock

db

Database

dbg

Debug

gtt

GTT Maintenance

gws

GWS Maintenance

link

Link Maintenance

sys

System Maintenance

traf

Traffic

all

Retrieve information for all Output Groups

Default:

No sorting or filtering is done on Output Groups.

snum (optional)

A single Message Reference Number (MRN), or the starting MRN when specifying a range.

Range:

1 - 1999

1-999 —UAMs

1000-1999—UIMs

Default:

All message entries for the specified type are displayed.

For `type=all`, `type=alarm`, or type not specified the `snum` value defaults to 1.For `type=uim`, the `snum` value defaults to 1000.**type (optional)**

The type of trouble text entry to display.

Range:**all**

Both types are displayed

alarm

Only Alarm entries are displayed

uim

Only UIM entries are displayed

Default:

all

Example

```
rtrv-trbltx
rtrv-trbltx:type=alarm
rtrv-trbltx:outgrp=sys
rtrv-trbltx:type=alarm:outgrp=all
rtrv-trbltx:snum=1002
```

Dependencies

If the `enum` parameter is specified, then the `snum` parameter must be specified.

The value specified for the `enum` parameter must be greater than or equal to the value specified for the `snum` parameter.

The specified `enum` value must be in the same range as the specified `snum` value (1-999 for Alarms and 1000-1999 for UIMs). The range cannot span both types.

The values specified for the `snum` and `enum` parameters must be in the range of the specified `type` (1-999 for Alarms and 1000-1999 for UIMs).

If the `outgrp` parameter is specified, then the `snum` and `enum` parameters cannot be specified.

If the `snum` parameter is specified, the `snum` parameter specified is out of range.

If the `enum` parameter is specified, the `enum` parameter specified is out of range.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

To display a single Alarm or UIM, enter the Alarm or UIM MRN as the value of the `snum` parameter. Either do not specify the `enum` parameter or specify the `enum` parameter with the same value as the `snum` value.

If an unused MRN is specified as an `snum` parameter value, the header information is displayed without any Output Group header or MRN information.

If an `snum/enum` range is specified, and there are unused MRNs within that range, only the used MRNs are displayed.

Output

This example shows the output when the command has no parameters. All entries are not shown; the list is long.

rtrv-trm

Use this command to show the port configuration for all TDM terminals or a specified terminal. These ports are used to connect modems, printers, and terminals to the system. This command displays the following information: device type, data transmission rate, parity, type of flow control used, number of stop bits, number of data bits, and the type of unsolicited messages to be received.

Parameters

trm (optional)

The ID number of the terminal whose characteristics are to be retrieved and displayed.

Range:

1 - 40

Default:

Display all

Example

```
rtrv-trm
rtrv-trm:trm=17
```

Dependencies

The IP User Interface feature must be enabled and turned on, and at least one IPSM card must be equipped, before `telnet` or `emsalm` type terminals with IDs 17 - 40 can be specified.

The specified terminal must be equipped.

If a value of `telnet`, `seas`, or `emsalm` was specified for the `type` parameter (see the `chg-trm` command) and a Telnet terminal is specified by the `trm` parameter (IDs 17-40), then an IPSM card must be equipped in the system.

Notes

None

Output

This example shows the output for 16 terminal ports (no IPSM cards are equipped):

```

This example shows the output with the IP User Interface feature enabled, one IPSM card equipped, and the OA&M IP Security Enhancements feature and the parameter SSH in SECUDFLT table are turned on.

- Terminals 17,18 and 19 are of type TELNET.
- Terminals 20,21 and 22 are of type EMSALM.
- Terminal 23 is of type NONE.
- Terminal 24 is of type SEAS.

The *LOGIN*TMR and *LOGOUT*TMR fields apply to terminals 17 - 19. The *PNG*TIMEINT and *PNG*FAILCNT fields apply to terminals 17 - 22. None of the fields apply to terminals 23 and 24.

Legend

Part one of the report contains these fields:

- **TRM**—TDM terminal port number associated with the output device
- **TYPE**—Type of output device that is connected

- **COMM**—This field consists of four communication attributes in the format *baud-dbts-prty-sb*. The parts are:
 - **BAUD**—Serial port baud rate of the output device
 - **DBTS**—Number of data bits used by the output device
 - **PRTY**—Parity of the output device
 - **SB**—Number of stop bits used in communications with the output device
- **FC**—Type of protocol used between the system and the output devices
- **TMOUT**—Maximum amount of time (in minutes) that a login session can remain idle
- **MXINV**—Login/unlock failure threshold
- **DURAL**—Length of time (in seconds, minutes, and hours) the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured with the `mxinv` parameter
- **SECURE**—Shows whether the OA&M IP Security Enhancements feature and the parameter `SSH` in the `SECUDFLT` table are turned on or off for Telnet terminals

Part two of the report contains these fields:

- **LOGINTMR**—Maximum time for logging on to the telnet terminal after selecting the terminal
- **LOGOUTTMR**—Maximum time the telnet session remains open after the user manually or automatically logs out
- **PNGTIMEINT**—Time period after which IPSM card initiates new ping cycle
- **PNGFAILCNT**—Number of consecutive ping fails waited before dropping the telnet connection

Part three of the `rtrv-trm` report contains these fields:

- **TRM**—TDM terminal associated with the output device
- **TRAF**—Shows whether traffic-related unsolicited messages are received by the output device
- **LINK**—Shows whether link-related unsolicited messages are received by the output device
- **SA**—Shows whether security administration-related unsolicited messages are received by the output device
- **SYS**—Shows whether system maintenance-related unsolicited messages are received by the output device
- **PU**—Shows whether program update-related unsolicited messages are received by the output device
- **DB**—Shows whether database-related unsolicited messages are received by the output device
- **UIMRD**—Shows whether Unsolicited Information Messages (UIMs) specific to the group are received by the output device

Part four of the `rtrv-trm` report contains these fields:

- **APP SERV**—Shows whether Application Server unsolicited messages are received by the output device

- **APP SS**—Shows whether Application Subsystem unsolicited messages are received by the output device
- **CARD**—Shows whether Card unsolicited messages are received by the output device
- **CLK**—Shows whether Clock unsolicited messages are received by the output device
- **DBG**—Shows whether Debug unsolicited messages are received by the output device

rtrv-tt

Use this command to show the translation types that are currently defined in the system database for global title translations.

 **Note:**

If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrvgttssel`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrvgta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. It is not recommended to run `ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt` commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters**alias (optional)**

The alias of the global title translation type

Range:

0 - 255

Default:

Display all

ovr1apd (optional)

Overlapped GTT Selectors.

Range:

yes

Default:

none

ttn (optional)

Translation type name.

Range:

ayyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

Display all

type/typeea/typeei/typen/typen24/typeeis/typens (optional)

Translation type. The translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The `type` and `typeea` parameters specify an ANSI network.

The `typei` parameter specifies an ITU-international network.

The `typen` parameter specifies an ITU-national network.

The `typen24` parameter specifies a 24-bit ITU-national network.

The `typeis` parameter specifies an ITU-international spare network.

The `typens` parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as an ANSI type (`type` or `typeea`) and as an ITU type (`typei/typen/typen24/typeis/typens`). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as ANSI or ITU. ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

0 - 255

Default:

No translation type is specified

Example

```
rtrv-tt
rtrv-tt:type=230
rtrv-tt:ttn=lidb
rtrv-tt:type=230:ttn=lidb
rtrv-tt:type=230:ttn=lidb:alias=012
rtrv-tt:typeis=2
rtrv-tt:ovrlapd=yes
```

Dependencies

If a translation type is specified, it must already exist in the database for the network type and cannot be an alias.

If both translation type and translation type name are specified, the translation type name must correspond to the specified translation type.

If an alias is specified with a translation type and/or translation type name, the alias must exist in the database for the specified network type, and it cannot be a translation type.

If an alias is specified without a translation type or translation type name, the alias must exist in the database for at least one of the network types. If it exists, the entries and the mapped translation type entries that exist in the database for all network types are displayed.

The value specified for the `alias` parameter must be associated with the value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter and cannot be the value of an existing translation type.

The value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter cannot be an alias value.

The value specified for the `ttn` parameter must already exist in the database.

The value specified for the `ttn` parameter must correspond to the value specified for the `alias` parameter.

The GTTSET associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The `ttn=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command).

The Overlapped TT must exist with the specified filter criteria.

Notes

If a translation type, translation type name, or both, are specified, the translation type entry and all aliases mapped to that translation type are displayed.

This command retrieves only selector entries that were provisioned by GTT Selector commands, have a GTI value of 2, and a set type of CdGTA.

If the EGTT feature is turned on, the following occurs for the `rtrv-tt` command:

- For ANSI, if any selector for an entry made by TT commands is deleted using the `dlt-gttset` command, that entry cannot be retrieved.
- For ITU, if the GTT set name of a true selector (GTI=2 or GTI=4) is deleted using the `dlt-gttset` command, then that entry cannot be retrieved.
- If the GTT set name of a true selector is changed using the `chg-gttset` command or if a selector is deleted using the `dlt-gttset` command, none of the selector aliases can be retrieved.
- Any entry where the `selid`, `lsn`, `cgssn`, or `eaglegen` is provisioned for the GTT selector cannot be retrieved.

Output

```
rtrv-tt
```

```

rtrv-ttmap

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. This command can be used to display the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping, see which linkset the mapping applies to, and see whether the mapping applies to incoming or outgoing messages.

Parameters

ett (optional)

Translation type before mapping. The identification of the type of allowed global title translation in the SS7 message *prior to* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range:

0 - 255

Default:

Display all types allowed

io (optional)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range:*i*
incoming*o*
outgoing**Default:**

Both incoming and outgoing

lsn (optional)

Linkset name

Range:*ayyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all

Example

```
rtrv-ttmap
rtrv-ttmap:lsn=nc001
rtrv-ttmap:lsn=nc001:io=i:ett=128
rtrv-ttmap:io=i:ett=128
rtrv-ttmap:ett=128
rtrv-ttmap:ett=40
```

Dependencies

The linkset must be defined.

The Linkset table must be accessible.

The Translation Type Mapping table must be accessible.

The memory space accounting report (MSAR) is not produced if the *io* or *ett* parameter is specified, because the statistics presented may be misleading.**Notes**

The order of display is by linkset index + I/O + ETT.

Output

```

rtrv-ttr-msg

Use this command to display the configured Triggerless TCAP Relay message parameter values.

Parameters

msgn (mandatory)

Message number. This parameter specifies the number of the TTR message.

Range:

1 - 10

Default:

The values for all TTR messages are displayed.

Example

```
rtrv-ttr-msg:msgn=1
```

Dependencies

The Prepaid IDP Query Relay feature must be enabled before this command is entered.

The TSTMSG table is corrupt or could not be found.

Output

```

6=Broadcast Congestion Status Change	0=Disabled, 1=Enabled
7-31=Reserved	

PARM 2: ASP/AS Notification options. Each bit is used as an enabled/disabled flag for a particular ASP/AS Notification option. Not supported on IPSP application.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=ASP Active Notifications	0=Disabled, 1=Enabled

1=ASP Inactive Notifications	0=Disabled, 1=Enabled
2=ASP AS State Query	0=Disabled, 1=Enabled
3-31=Reserved	

PARM 3: UA Serviceability Options. Each bit is used as an enabled/disabled flag for a particular UA Serviceability option. Supported on IPSP, SS7IPGW, and IPGWI applications. UA Graceful Shutdown supported on IPSP for M3UA only.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=UA Heartbeats	0=Disabled, 1=Enabled
1=UA Graceful Shutdown	0=Disabled, 1=Enabled
2-31=Reserved	

PARM 4: SCTP Payload Protocol Indicator byte order option. Bit indicates

PPI value is RCV/TX in Big Endian or Little Endian byte format.

Supported on IPSP-M2PA associations only.

PVALUE : Valid range = 32-bits

BIT	BIT VALUE
0=Payload Protocol Indicator	0=Big Endian, 1=Little Endian
1-31=Reserved

rtrv-uim-acthresh

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

Parameters

uimn (optional)

The UIM number.

Range:

1000 - 1999

Default:

Display all

Example

Display UIM number 1333 threshold:

```
rtrv-uim-acthresh:uimn=1333
```

Display the threshold for all UIMs that have been set:

```
rtrv-uim-acthresh
```

Dependencies

A valid value must be specified for the `uimn` parameter.

The value specified for the `uimn` parameter must already exist in the system Trouble Text Table.

Notes

None

Output

```
rtrv-uim-acthresh:uimn=1333
```

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100         5
The UIM Threshold Table is (1 of 499) 1% full.
```

```
rtrv-uim-acthresh
```

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100         5
1444      200         15
1155      50          30
The UIM Threshold Table is (3 of 499) 1% full.
```

rtrv-user

Use this command to show the information about the user currently logged on to the terminal from which this command was entered.

Parameters

This command has no parameters.

Example

```
rtrv-user
```

Dependencies

The CCCNAMES table must be accessible.

None

Notes

The password is not shown.

This command shows the command class privileges for the user logged onto the system. No other users are shown.

All users have access to this command.

Output

This example shows the output when the Command Class Management feature is turned on:

```
rtrv-user

rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
user id      age page uout rev link sa  sys pu  db  dbg
manny       36  60   60  NO  YES YES YES YES YES YES YES
           u01 u02 u03 u04 u05 u06 u07 u08 u09 u10 u11 u12 u13 u14 u15 u16
           NO NO NO NO YES YES YES YES YES YES YES YES YES YES YES YES YES
           u17 u18 u19 u20 u21 u22 u23 u24 u25 u26 u27 u28 u29 u30 u31 u32
           YES YES YES YES YES YES YES YES YES YES YES YES NO NO NO NO YES
;
```

This example shows the output when the Command Class Management feature is not turned on:

```
rtrv-user

rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
USER ID      LINK SA SYS  PU  DB DBG
eagle       YES YES YES YES YES YES

USER ID      AGE PAGE UOUT REV
eagle       750 0   0   NO
;
```

Legend

- **USER ID**—Name of the user
- **AGE**—Current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, then 999 is displayed.
- **PAGE**—Maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (*) displayed after the value indicates that the system-wide default page parameter value, (see the `chg-secu-dflt` command), is in effect for the user ID.
- **UOUT**—User ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (*)

displayed after the value indicates that the system-wide default `uout` parameter value, (see the `chg-secu-dflt` command), is in effect for the user ID.

- **REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.
- **LINK**—Shows whether the user has access to all commands in the Link Maintenance command class
- **SA**—Shows whether the user has access to all commands in the Security Administration command class
- **SYS**—Shows whether the user has access to all commands in the System Maintenance command class
- **PU**—Shows whether the user has access to all commands in the Program Update command class
- **DB**—Shows whether the user has access to all commands in the Database Administration command class
- **DBG**—Shows whether the user has access to all commands in the Debug command class

If the Command Class Management feature is enabled and turned on, the following fields are displayed:

- **U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

rtrv-vendid

Use this command to retrieve a list of Vendor ID entries from the VENDID table, for the GSM MAP SRI Redirect to Serving HLR feature.

Parameters

num (optional)

Number of Vendor ID entries to be retrieved.

Range:
1 - 500

Default:
500

vendnum (optional)

Vendor Number

Range:
1 - 128

Example

```
rtrv-vendid
rtrv-vendid:vendnum=15
rtrv-vendid:num=100
```

Dependencies

The VENDID table is corrupt or cannot be found by the system.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

Notes

None.

Output

This example shows output when the command is entered with no parameter. Vendor Types are listed in numerical order. Vendor Numbers for each Vendor Type are listed in numerical order, followed by the Vendor ID for each Vendor Number.

```
rtrv-vendid

rtrv-vflx-cd

Use this command to retrieve call decision information.

Parameters

cdn (optional)

Call decision name. The name of the call decision entry.

Range:

ayyy

1 alphabetic character followed by 3 alphanumeric characters

vmdig (optional)

Voice mail number or voice mail prefix digits. The voice mail number or voice mail digits associated with the call decision entry.

Range:

1 - 15 digits

Valid digits are 0-9, A-F, a-f

Example

This command retrieves all entries from the Call Decision table.

```
rtrv-vflx-cd
```

This command retrieves a specific Call Decision entry.

```
rtrv-vflx-cd:cdn=cdn1
```

This command retrieves all call decision entries with a specified voice mail number or voice mail prefix digits.

```
rtrv-vflx-cd:vmdig=123456789abcd2
```

Dependencies

The `cdn` and `vmdig` parameters cannot be specified together in the command.

The value specified for the `cdn` parameter cannot be a reserved word, such as *none*.

The Call Decision table is corrupt or cannot be found by the system.

The value specified for the `cdn` parameter must already exist in the Call Decision table.

The V-Flex feature must be enabled before this command can be entered.

Notes

This command can be cancelled using the **F9** function key or the `canc-cmd` command.

Output

```
rtrv-vflx-cd
```

```
tekelecstp 08-05-01 09:36:55 EST EAGLE 39.0.0
```

rtrv-vflx-opts

Use this command to retrieve the data that is used for number conditioning.

Parameters

This command has no parameters.

Example

This command displays V-Flex Options Table data.

```
rtrv-vflx-opts
```

Dependencies

The V-Flex feature must be enabled before this command can be specified.

Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 0.

Output

This example shows the output with default V-Flex Options:

```
rtrv-vflx-opts
```

```
tekelecstp 08-05-04 07:53:46 EST EAGLE 39.0.0
```

```
VFLEX OPTIONS
```

```
-----
```

```
DRANPV      = 0  
DRANAIV     = 0  
DRA         = RN  
NEQUERYONLY = OFF  
NETYPE      = VMSID
```

```
;
```

This example shows the output with some V-Flex Options provisioned:

```
rtrv-vflx-opts
```

```
tekelecstp 08-05-04 07:55:30 EST EAGLE 39.0.0
```

```
VFLEX OPTIONS
```

```
-----

rtrv-vflx-rn

Use this command to retrieve voice mail routing numbers and routing number names and to view the associated reference count. The V-Flex feature must be enabled before this command can be entered.

Parameters

refcnt (optional)

Reference count. This parameter specifies whether to display the reference count.

Range:

yes
display the reference count

rn (optional)

Routing number. A voice mail routing number.

Range:

1-15 digits
Valid digits are 0-9, A-F, a-f.

rnname (optional)

Routing number name. The name associated with a voice mail routing number.

Range:

ayyyyyyy

1 alphabetic character followed by 7 alphanumeric characters.

Example

```
rtrv-vflx-rn:rnname=rn01
rtrv-vflx-rn:rn=123456789ABC
rtrv-vflx-rn
rtrv-vflx-rn:rnname=rn01:refcnt=yes
rtrv-vflx-rn:rn=123456789ABC:refcnt=yes
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The Routing Number table is corrupt or cannot be found by the system.

The value specified for the `rnname` parameter must already exist in the Routing Number table.

The `rn` and `rnname` parameters cannot be specified together in the command.

The value specified for the `rnname` parameter cannot be a reserved word, such as `none`.

The value specified for the `rn` parameter must already exist in the Routing Number table.

Notes

This command can be cancelled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This command shows the output for a routing number name:

```
rtrv-vflx-rn:rnname=rn01

tekelecstp 08-05-29 15:07:01 EST  EAGLE 39.0.0

rtrv-vflx-vmsid

Use this command to retrieve information for voice mail server IDs.

Parameters

id (optional)

The voice mail server ID.

Range:

1-15 digits, *dflt*

Valid digits are *0-9, A-F, a-f*.

dflt —a default set of routing numbers used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB

rname (optional)

A routing number name associated with the voice mail server ID.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters.

Example

```
rtrv-vflx-vmsid
```

```
rtrv-vflx-vmsid:id=123456789012345
```

```
rtrv-vflx-vmsid:rname=rn90
```

Dependencies

The value specified for the `rname` parameter cannot be a reserved word, such as *none*.

The V-Flex feature must be enabled before this command can be entered.

The value specified for the `rname` parameter must already exist in the Routing Number table.

The value specified for the `id` parameter must already exist in the VMSID table.

The GTT DBMM table is corrupt or cannot be found by the system.

The VMSID table is corrupt or cannot be found by the system.

The `rname` and `id` parameters cannot be specified together in the command.

The Routing Number table is corrupt or cannot be found by the system.

Notes

This command can be cancelled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This command shows the output for all the entries from the VMSID table:

```
rtrv-vflx-vmsid
```

```

rtrv-vlr-prof

Use this command to display entries from the Visitor Location Register (VLR) Profile table.

Parameters

v1r (mandatory)

VLR Number: Hexadecimal digit GT Number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

filter (optional)

Determines the category in which the number falls into.

Range:

whitelist

blacklist

graylist

Default:

graylist

num (optional)

Number of entries in the VLR table which user wants to view.

Range:

1-50000

vlrtbl (optional)

Selects either the static or dynamic table the user wants to view.

Range:

static

dynamic

Default:

static

Example

```
rtrv-vlr-prof
rtrv-vlr-prof:num=2
rtrv-vlr-prof:filter=blacklist
rtrv-vlr-prof:vlrtbl=static
```

Dependencies

VLR_PROF table must be accessible.

VLR parameter length must be in the range 1 to 5 digits as per current restriction.

VLR parameter and NUM parameter both cannot be specified together.

Output

```
rtrv-vlr-prof

tekelecstp 17-11-23 14:21:51 MST EAGLE 46.5.1.5.0-73.2.0

rtrv-vlr-roaming

Use this command to display entries from the Visitor Location Register (VLR) Profile table.

Parameters

oldv1r (optional)

VLR Number from which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

newv1r (optional)

VLR Number to which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

num (optional)

Number of entries in the VLR table which user wants to view.

Range:

1-50000

vlrtbl (optional)

Selects either the static or dynamic table the user wants to view.

Range:

static

dynamic

Default:

static

Example

```
rtrv-vlr-roaming
rtrv-vlr-roaming:num=2
rtrv-vlr-roaming: newv1r=12345:oldv1r=56780
rtrv-vlr-roaming:vlrtbl=static
```

Dependencies

VLR_ROAM table must be accessible.

Both OLDVLR and NEWVLR must be specified

OLDVLR or NEWVLR parameter must be existing in VLR-PROF table

The entry should be existing in VLR_ROAM table

OLDVLR and NEWVLR parameter length must be in the range 1 to 5 digits as per current restriction.

Output

```

set-date

Use this command to set the date in the system.

Parameters

date (mandatory)

The system date, to be reflected on all reports and output messages.

Range:

000101 - 991231

(in the form *yymmdd*, where *yy*=year, *mm*=month, *dd*=day)**Example**

```
set-date:date = 010307
```

Dependencies

The system date day value (the *dd* in the *yymmdd* format) must accurately reflect the number of days in the specified month and year. For example, February never has 30 days. The value *050230* is not valid (February 30, 2005).

None

The system date month value (the *mm* in the *yymmdd* format) must be in the range 01-12.

Notes

None

Output

```
set-date:date = 010307
```

```
rlghncxa03w 03-11-07 11:11:28 EST EAGLE 31.3.0
Date set complete.

set-gtwy-acthresh

Use this command to set or change the level of activity thresholds to be used when reporting gateway screening activity. The STP reports screening activity only if the threshold is set and only if the threshold is reached. The thresholds are set on a linkset basis.

Parameters**intrvl (mandatory)**

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

Range:

5, 10, 15, 20, 30

System Default:

0 -Indicates that thresholds are not set

lsn (mandatory)

Linkset name

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

recv (optional)

Received message threshold. The threshold for MSUs received on the gateway linkset.

Range:

0 - 999999

Default:

The current value

System Default:

0

rej (optional)

Reject threshold. The threshold for MSUs rejected on the gateway linkset because of screening.

Range:

0 - 999999

Default:

The current value

System Default:

0

Example

This example shows how to set the linkset WY644368 rejection threshold to 100, with a 15 minute interval.

```
set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15
```

This example shows how to set the linkset WY644368 message threshold to 1000 and the rejection threshold to 300, with an interval of 20 minutes.

```
set-gtwy-acthresh:lsn=wy644368:intrv=20:rej=300:recv=1000
```

This example shows how to set the linkset WY644368 so that no activity messages are produced.

```
set-gtwy-acthresh:lsn=wy644368:intrv=5:rej=0:recv=0
```

Dependencies

At least one optional parameter must be specified.

The Linkset table must be accessible.

The linkset specified must exist in the gateway linkset entity set of the requesting system.

The Extended Linkset table must be accessible.

The linkset specified must exist in the active database.

A valid value must be specified for the `intrvl` parameter.

Notes

None

Output

```
set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15
```

```
rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0

```

Related Topics

- [rtv-gtwy-acthresh](#)

set-scrrej-prmtrs

Use this command to change the STP values that limit the display of MSUs rejected because of gateway screening notification messages that could become excessive. The new values overwrite the existing values.

Parameters

intrvl (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

Range:

5, 10, 15, 20, 30

System Default:

5

limit (mandatory)

Threshold not to be exceeded.

Range:

0 - 9999

System Default:

9999

Example

```
set-scrrej-prmtrs:limit=200:intrvl=10
```

Dependencies

The Extended STP Options table must be accessible.

A valid value must be specified for the `intrvl` parameter.

Notes

None

Output

```
set-scrrej-prmtrs:limit=200:intrvl=10

rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-SCRREJ-PRMTRS: MASP A - COMPLTD

set-time

Use this command to set the system clock. The clock is used to determine when measurements collection takes place as well as several other time-driven events.

Parameters**time (mandatory)**

The system time that is to be reflected on all reports and output messages.

Range:

0000 - 2359

hhmm where *hh* = 00-23 (hour) and *mm* =00-59(minute)

tz (optional)

The time zone

Range:

est, edt, cst, cdt, mst, mdt, pst, pdt, hst, hdt, ast, adt, gmt, wet, west, utc, bst, cet, cest, met, mest, fwt, fst, eet, eest, sast, msk, msd, ist, idt, cct, awst, awdt, rok, acst, acdt, aest, aedt, nzst, nzdt, akst, akdt, nst, ndt, bra

The time zones are described in [Table 4-56](#).

Default:

Current value

Abbreviation	Time Zone	Abbreviation	Time Zone
est	Eastern Standard Time	edt	Eastern Daylight Time
cst	Central Standard Time	cdt	Central Daylight Time

Abbreviation	Time Zone	Abbreviation	Time Zone
mst	Mountain Standard Time	mdt	Mountain Daylight Time

nst	Newfoundland Standard Time	ndt	Newfoundland Daylight Time
bra	Brazil Standard Time		

Example

```
set-time:time=1432:tz=est
```

Dependencies

None

The system time minutes value (the *mm* in the *hhmmss* format) must be in the range 00-59.

Notes

None

Output

```
set-time:time=1432:tz=est
```

```
rlghncxa03w 02-11-07 14:32:28 EST EAGLE 30.0.0
Time set complete.
```

```
;
```

Related Topics

- [set-date](#)

set-uim-acthresh

Use this command to set or change the level-of-activity threshold for reporting UIM messages. The system suppresses the generation of UIM messages when message generation exceeds the threshold that was defined for the interval period. The values are set within five seconds after the command was entered. Any previous count is cleared and the new or changed threshold and limit is enforced. Refer to the *Database Administration Manual – System Management* for additional information.

Parameters**intrvl (mandatory)**

The monitor interval in minutes.

Range:

5, 10, 15, 20, 25, 30

Default:

No change to the current value

uimn (mandatory)

The UIM number.

Range:

1000 - 1999

force (optional)

Required to set the `limit` parameter to 0 for a given interval.

 **Caution:**

Setting the limit to 0 turns off all occurrences of the specified UIM. Use this manner of creating thresholds only if you are certain you have specified the correct UIM.

Range:

yes

no

Default:

none

limit (optional)

The message threshold.

 **Caution:**

Setting the `limit` to 0 turns off all occurrences of the specified UIM. This can be dangerous if the wrong UIM number is specified by mistake. It is highly recommended that thresholds for UIMs are not set in this manner, but the ability is provided for certain extreme cases. The `force` parameter must be specified to specify `limit=0`, and an additional scroll area message is issued.

Range:

0 - 9999

Default:

No change to the current value

Example

This example sets UIM number 1333 threshold to 100 in a 5-minute interval:

```
set-uim-acthresh:uimn=1333:limit=100:intrvl=5
```

This example sets UIM number 1444 threshold to 200 in a 15-minute interval:

```
set-uim-acthresh:uimn=1444:limit=200:intrvl=15
```

Dependencies

At least one optional parameter must be specified.

A valid value must be specified for the `uimn` parameter.

A valid value must be specified for the `limit` parameter.

A valid value must be specified for the `intrvl` parameter.

The `force=yes` parameter must be specified before the `limit=0` parameter can be specified for a given interval. Specifying `limit=0` turns off all occurrences of the specified UIM. See the cautions under the `force` and `limit` parameters.

When creating a new UIM threshold, the `limit` and `intrvl` parameters must be specified.

The specified `uimn` parameter value must exist in the system Trouble Text table.

The UIM Threshold table is corrupt or cannot be found by the system.

The system Trouble Text table is corrupt or cannot be found by the system.

Notes

None

Output

```
set-uim-acthresh:uimn=1333:limit=100:intrvl=5
```

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0

tst-bip

Use this command to test each byte of the specified board identification PROM (BIP) by reading and writing to the PROM. The test is performed for the main assembly.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209,
2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210,
4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

Example

```
tst-bip:loc=1211
```

Dependencies

The card location, frame, shelf, or slot must be within the allowed range.

The card location must be valid for the command.

The card specified by the `loc` parameter must be equipped in the database.

The card specified by the `loc` parameter must be in the OOS-MT-DSBLD state prior to BIP testing.

Notes

The specified card must be inhibited.

This command verifies that the PROM is good by writing and reading to the PROM. The `rtrv-bip` command show the level of the BIP, as well as the board part number, the revision number, and the serial number. If the `rtrv-bip` command fails, this indicates that communications to the card has failed, and the card should be replaced.

Output

```
tst-bip:loc=1211
```

```
tekelecstp 10-02-20 17:10:32 CST  EAGLE 42.0.0
Test Board Identification PROM  Location: 1211 - MBD  Packet: 1

tst-disk

Use this command prior to an upgrade, or as a diagnostic tool, to test the integrity of an EAGLE fixed drive or removable media drive, at the specified location. The test is non-intrusive and non-destructive to the disk. A read-only test is executed for all logical blocks (LBAs) used on the specified target disk and a report identifying any bad or questionable LBAs is output.

Parameters

loc (mandatory)

The location of the disk to be tested.

Range:

1114
TDM

1116
TDM

1113
Latched USB port

1115
Latched USB port

disk (optional)

The disk that is being tested

Range:

remove
The removable drive

fixed
The fixed drive

usb
This parameter is to be used by Oracle personnel only.

partition (optional)

Portion of disk to be tested. This parameter specifies the individual physical disk partition (1, 2, 3, or 4) or all defined partitions for a given disk size up to a maximum of 4 partitions.

Range:

1, 2, 3, 4 —Tests the specified existing partition on the disk. Only the number or numbers for the partition or partitions that exist on the disk are valid. (For example, if the disk size allows only 2 partitions, `partition=3` and `partition=4` are invalid for that disk.)

all —Tests all existing partitions on the fixed disk or removable drive

Default:

all

Example

```
tst-disk:loc=1116
```

Dependencies

The card in the specified location (`loc`) must be an E5-TDM or E5-MCAP card.

The disk to be tested must be in service.

If a TDM location is specified, the TDM cannot be reserved (as when a copy-disk command is running).

The target drive must have low level format.

This command can be run simultaneously on both TDMs, if entered from different terminals.

The removable drive can be tested simultaneously with the standby TDM but not with the active TDM.

To test the Removable drive when `loc=1113/1115:disk=remove/usb`, the removable media must be inserted in the corresponding removable drive.

The `partition=3` and `partition=4` values are invalid for a 4GB fixed drive. The only valid value for the 2.3 GB and 4.1 GB removable disks is `partition=1`

An error message will be generated for a disk that has been Formatted (`format-disk` command) but does not yet contain a DOS directory structure (created with the `copy-disk` command) when the `partition=` parameter is specified.

This command cannot be entered when other database commands are running.

If an E5-TDM card is installed, then the `disk=fixed` parameter cannot be specified.

The disk to be tested must be available.

Notes

A physical fixed disk (TDM) or removable drive is formatted and given a DOS directory structure to define the number of physical partitions that the disk size can accommodate. (The logical partitions that contain database, backup, GPL, and measurements files are placed in these physical partitions, with no correlation between the physical numbers and the logical contents.)

For a fixed TDM disk, the `partition` parameter specifies the individual partition (1, 2, 3, or 4) or all existing partitions to be tested.

- One partition = 2 GB.
- The 4 GB drive contains two 2 GB partitions.
- The 9 GB drive and the 18 GB drive each contain four 2 GB partitions.
- The 9 GB drive contains four 2 GB partitions.
- Any disk space beyond the four 2 GB partitions is unused disk space (and always has been due to EAGLE DISK FAT structure used).

The `partition=all` parameter implies that testing starts with the first partition, then second, and so on, until the last existing disk partition is detected without skipping any non-existing or defined partitions.

[Table 4-57](#) outlines execution time estimates based on disk capacity.

Table 4-57 Test Disk Execution Times

Capacity	Nominal Execution Time	Maximum Execution Time for 100% Errors
4.0 GB	40 minutes	27.5 hours
9.0 GB	1 hour 45 minutes	(Not determined)

Table 4-57 (Cont.) Test Disk Execution Times

Capacity	Nominal Execution Time	Maximum Execution Time for 100% Errors
18 GB	30 minutes (partition=1) 5 hours (partition=disk) depending on amount of disk tested and EAGLE provisioning/activity	(Not determined)
507 MB	5 minutes	3.4 hours
2.0 GB	20 minutes	13.5 hours
4.0 GB	40 minutes	27.5 hours
Removable Drive	30 seconds	Less than 1 minute

Nominal times for `tst-disk` command execution depend on the capacity of the disk being tested and assume that few or no errors are found. Maximum execution times are based on disk capacity, retry count, and retry delay. Each read error and retry may cause a delay of up to three seconds. If a TDM has 100% error sectors, the MASP will likely reset, terminating the disk test. A termination and reset will not occur, however, when testing the removable media.

Because of the intense, sustained disk activity created when `tst-disk` is executed, concurrently performing other disk-based activities, such as prolonged LNP command entry or database backups, will result in performance degradation up to twice the usual execution time.

Because of the extended processing time required for large disks, a progress message is displayed every five minutes providing the current LBA and the total LBA count for the partition.

Specific errors are reported for the first 10 error occurrences. Thereafter, only the error count is tracked and summary results are reported upon completion.

tst-dlk

Use this command to test the specified TCP/IP data link. The TCP/IP data link is tested with an ethernet test that is an echo test type called ping.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

type (mandatory)

The type of test to run.

Range:

ping

ipaddr (optional)

The IP address of the remote host. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is *192.126.100.5*, where *192.126.100* is the network number and *5* is the machine's host number.

Range:

1-223, 0-255

4 numbers separated by dots

1-223-first number

0-255-the other 3 numbers

Default:

Host IP

rc (optional)

The number of times the test is repeated.

Range:

1 - 15

Default:

1

Example

```
tst-dlk: loc=1206:type=ping
```

Dependencies

No other action command can be in progress when this command is entered.

The card location must contain an STPLAN card.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If a test repeat count (*rc*) is not entered, the test is not repeated.

If a data link test is in progress, another data link test cannot be started.

The card location, frame, shelf, or slot must be within the allowed range.

A card location that is valid and defined in the database must be specified.

The *ipaddr* parameter must specify a valid IP address.

Notes

None

Output

tst-e1

Use this command to test E1 ports. The command is rejected if a loopback test is not compatible with the port type. This command can be used with E5-E1T1-B cards.

Parameters

e1port (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified card.

Range:

1 - 8

loc (mandatory)

Card location. The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

action (optional)

Indicator of command action to stop or start a test.

Range:

start

stop

Default:*start***loopback (optional)**

Select loopback test type.

Range:*line**lxvr*

local transceiver

*payload***Default:***lxvr***Example**

```
tst-e1:elport=1:loc=1203:loopback=lxvr
```

```
tst-e1:elport=1:loc=1203:action=stop
```

Dependencies

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an E5-E1T1-B card with card type LIME1.

The card in the specified card location (`loc` parameter) must be equipped.

The card in the specified card location (`loc` parameter) must be in service.

The specified E1 port (`elport` parameter) on the card (`loc` parameter) must have a defined E1 interface.

All signaling links that provide timeslots serviced by E1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl`) when this command is entered.

Only one port test can be running on an E1 port (`elport` parameter) at one time.

When the `action=stop` parameter is specified, the `loopback` parameter cannot be specified.

The E1/T1 table must be accessible.

The `action=stop` parameter can be specified only when a port test is running.

Notes

Only one port test can be performed at a time on an E1 port. When a port test is in progress on an E1 port, subsequent test requests are rejected.

Output

```
tst-e1:elport=1:loc=1203:loopback=lxvr

tst-imt

Use this command to:

- Perform a Fault Isolation test to determine the location of faults on a failed or abnormal IMT bus. The Alternate Bus must be in the IS-NR state. The Target Bus must be in the OOS-MT-DSBLD state.
- Perform an Extended Bit Error Rate Test (BERT) on all IMT Buses. The Target Bus must be in the IS-NR or IS-ANR state. The Alternate Bus must be in the IS-NR state.
- Cancel an Extended BERT

Note:

At least one card must be populated in each EAGLE extension shelf provisioned as ent-shlf:type=EXT to allow the command to successfully execute a Fault Isolation Test. See the "Notes" section for this command for more information about executing the command.

 **Note:**

No physical status change can be made to the IMT Bus (e.g., unplugging MUX cards) while an Extended BERT is running.

Parameters

type (mandatory)

The type of test to perform.

Range:

faulttest

perform a Fault Isolation test

extbert

perform an Extended BERT on all MUX cards on an IMT Bus

action (optional)

Indicator of command action to stop or start a test.

Currently, only the cancellation of an Extended BERT is supported by this parameter.

Range:

start

stop

Default:

start

bus (optional)

IMT bus to test.

Range:

a

b

maxerr (optional)

The number of errors allowed for the period during which an Extended BERT is being performed.

 **Note:**

This value is the Bit error threshold.

Range:

0 - 1000

Default:

20

time (optional)

The time, in minutes, for which an Extended BERT runs in order to determine success or failure.

Range:

1 - 60

Example

```
tst-imt:bus=a:type=faultttest
tst-imt:bus=b:type=extbert:time=50
tst-imt:bus=b:type=extbert:time=50:maxerr=30
tst-imt:bus=a:type=extbert:action=stop
```

Dependencies

Valid IMT bus entries are "A" or "B".

A related IMT command cannot be in progress. Only one Fault Isolation Test or Extended BERT can be active at a time.

An Extended BERT cannot be performed if the `init-sys`, `act-upgrade`, `init-flash`, `act-flash`, `init-network`, `flash-card`, or `init-card` (when initializing multiple cards using the `appl` parameter) commands are running.

This command cannot be entered if the alternate bus is other than in-service normal (IS-NR).

The target bus must be in the out of service - maintenance disabled (OOS-MT-DSBLD) state before this command can be entered for a Fault Isolation test.

This command cannot be entered during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The target bus must be in the in-service normal (IS-NR) or in-service abnormal (IS-ANR) state before this command can be entered for an Extended BERT.

If the `type=extbert` parameter is specified, then the `time` parameter must be specified.

If the `type=faultttest` parameter is specified, then the `time`, `maxerr`, and `action` parameters cannot be specified.

If the `action=stop` parameter is specified for an extended BERT, then the `time` and `maxerr` parameters cannot be specified.

This command cannot be entered for an Extended BERT, if the target bus contains HMUX or HIPR cards.

The `action=stop` parameter cannot be specified until an Extended BERT acknowledgment from a MUX card is received.

If an Extended BERT is about to complete, then the `action=stop` parameter cannot be specified.

If an Extended BERT is not in progress, then the `action=stop` parameter cannot be specified.

Notes

Fault Isolation Test

Probable causes are listed in order of most probable to least probable. The listed components should be replaced in order listed by the output of this command.

Multiple, masking points of failure can occur in the same bus segment. Such faults are reported as a single bus segment fault. Because running this command on a system with no IMT bus faults prints an indication that no faults were found, you can iteratively replace components and run this test until all components in the segment are ruled out.

A detection of an IMT address mismatch indicates a faulty backplane or card.

A detection of an inconsistency with a particular card's IMT card list indicates an error of unknown origin, probably due to one or more lost messages.

When this command completes, either through normal termination of the command or because the command was ended for another reason, you must administratively enable the target bus. If all faults have meanwhile been isolated and corrected, the target bus becomes operational.

When a fault is detected, the possible error sources are listed in order from the most likely to the least likely. This ordering is based on operational experience.

At least one card must be populated in each EAGLE extension shelf provisioned as `ent-shlf:type=EXT` to allow this command to execute successfully. The card does not need to be a provisioned card; the card must be in IS-NR state on both IMT busses before this command is entered. If an empty shelf that is provisioned as `ent-shlf:type = EXT` or an un-provisioned shelf that is IMT enabled does exist, the following text is displayed when this command is entered:

Notice: IMT Fault test terminated.

Non-Standard cabling or IMT Bus-X state change detected.

Extended BERT

This command for an Extended BERT allows a BERT to be executed for a longer period of time during installation to verify there are no signal integrity issues. The standard BERT is used as a basic sanity test during bring-up of the ring.

When an Extended BERT is started, the target bus is inhibited. The bus is allowed when the test completes either through normal termination of the command or because the command was ended for another reason.

When the Extended BERT completes, the output is generated as a maintenance report indicating the test passed or failed. An error rate less than or equal to 1 error in 10E12 bits determines whether the test passed.

The `maxerr` parameter allows the Extended BERT to be performed for the longer duration even if the test fails for any of the MUX cards.

An on-going Extended BERT can be cancelled with the `action=stop` parameter.

Hourly report generation is not allowed if the request comes during an Extended BERT. Notification of the hourly boundary is multicast to all IMT processors to age out the least-recent error bucket and advance the current error bucket. The following notice is displayed if the Hourly report is bypassed during Extended BERT:

Extended BERT: Hourly Report is bypassed

One of the following notices is displayed if an Extended BERT terminates prematurely:

- *Extended BERT: Test aborted, Loss of Heartbeat*—Failure observed for the Extended BERT Heartbeat communication maintained between the Active OAM and the Control shelf MUX card.
- *Extended BERT: Test aborted, Alternate IMT Bus [A|B] abnormal*—Alternate IMT Bus becomes abnormal.
- *Extended BERT: Test terminated, Command cancelled*—Test is cancelled using `tst-imt` command with `action=stop`.
- *Extended BERT: Error in results retrieval, HIPR2 card(s) failure*—Extended BERT results are not displayed if an error is encountered during results retrieval from HIPR2 card.
- *Extended BERT: Active MASP failed to disconnect on IMT Bus [A|B]*—Active MASP did not disconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: Active MASP failed to reconnect on IMT Bus [A|B]*—Active MASP did not reconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: ACK for Extended BERT not received from IMT Bus [A|B]*—The acknowledgement for an Extended BERT is not received from MUX card.
- *Extended BERT: Test aborted, Card failure detected at X location*—Failure detected on a card due to both IMT Buses becoming unavailable.

Output

This example shows the output when the Connectivity test fails for the Fault Isolation test:

This example shows the output when the Extended BERT is cancelled for Bus A:

```
tst-imt:bus=a:type=extbert:action=stop

rlghncxa03w 09-12-09 16:02:05 EST  EAGLE5 42.0.0
Extended BERT: Test terminated, Command cancelled
;

```

Legend

- **MAX ERROR**—Bit error threshold. The number of errors allowed for the specific time period during which the BERT is being performed. If this threshold is exceeded in the specified time period, the Extended BERT is prematurely terminated.
- **TIME**—Specified length of time (*hr:min:sec*) to run the test in order to determine success or failure
- **START TIME**—Time at which the test was started (*hr:min:sec*)
- **TEST STATUS**—PASS if the BERT Status is PASS for all the MUX cards, FAIL otherwise
- **CARD**—MUX Card location that contains the BERT being tested

- **TYPE**—MUX Card type
- **SERIAL_NUMBER**—Serial number of the main assembly board of the MUX card obtained from board identification PROM (BIP) data
- **BERT_STATUS**—Extended BERT PASS/FAIL status
- **BIT_ERROR**—Number of bit errors observed during the test
- **ERRORED_SEC**—Number of seconds that contained bit errors during the test. Bit errors are sampled once per second; each sample that contains bit errors adds one second to this count.
- **DURATION**—Length of time (*hr:min:sec*) that the test runs for the BERT. For a successful test, the TIME and DURATION should be the same. If a test runs for less than the specified amount of time, the DURATION is less than the TIME.

tst-j1

Use this command to test J1 ports. The command is rejected if a loopback test is not compatible with the port type.

Note:

This command can be entered for E5-E1T1-B cards.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

Default:

All T1 card locations having J1 interfaces configured are listed.

action (optional)

Indicator of command action to stop or start a test.

Range:*start**stop***Default:***start***loopback (optional)**

Select loopback test type.

Range:*line**lxvr*

local transceiver

*payload**feline*

far end line

far end payload

far end payload

Default:*line***j1port (optional)**

J1 port number. The value must be a J1 port that has already been configured with a J1 interface on the specified card.

Range:*1-8***Example**

```
tst-j1:j1port=1:loc=1102:action=stop
```

Dependencies

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an E5-E1T1-B card with card type LIMT1.The card in the location specified by the `loc` parameter must be equipped.The card in the location specified by the `loc` parameter must be in service.The J1 port specified by the `j1port` parameter must have a defined J1 interface.All signaling links that provide timeslots serviced by J1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl` commands) when this command is entered.Only one port test can be running on the J1 port specified by the `j1port` parameter at one time.

The J1 table must be accessible.

The action=stop parameter can be specified only when a port test is running.

If the action=stop parameter is specified, a value of feline or fepayload must be specified for the loopback parameter.

If the action=stop parameter is specified, and a value of feline or fepayload is specified for the loopback parameter, then there cannot be an active loopback for the T1 span, or the active loopback must be the one specified in the tst-t1:action=stop command.

Notes

Only one port test can be performed at a time on a J1 port. When a port test is in progress on a J1 port, subsequent test requests are rejected.

If a loopback type of feline or fepayload is specified, then the loopback requests are sent to the far end. No response is given from the far end indicate if the request was acted upon or received. The local card which hosts the J1 span in the EAGLE does not instrument the loopback locally but maintains a knowledge of the far end loopback request. If the local card boots, this knowledge is lost by the card.

To maintain the far end loopback states, if the J1 card with an active feline or fepayload test boots, the card loses any knowledge of the Far End loopback request, but the OAM retains that knowledge. If the OAM boots, the J1 card updates the OAM with its last known loopback state. If both the J1 card and the active OAM card boots while a Far End Loopback is active, then there is no way of determining the J1 state; however, a `tst-j1:action=stop:action=(feline or fepayload)` command can still be sent.

Output

```
tst-j1:j1port=1:loc=1102:action=stop
```

```
tekelecstp 13-12-19 19:02:51 EST 46.0.0-65.3.0
Command Accepted: Stop Port test message is sent.
;
tekelecstp 13-12-19 19:02:51 EST 46.0.0-65.3.0
Command Completed.

tst-msg

Use this command to invoke the Test Tool to test the feature call flow for the specified test message from the TESTMSG table.

The command sends the specified message from the TESTMSG table to an EAGLE feature. The test message that is sent does not create a new raw MSU. The test message is used only to modify the internal data structures of the Feature to study the call flow behavior when a message with the specified parameters is injected into the call path. The test message is never sent out to the network.

Parameters

feat (mandatory)

Feature. The Service Feature where the message is processed on the network card.

Range:

ttr

Service Feature for processing Prepaid IDP Query Relay test messages

tif

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF.

tif2

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF2.

tif3

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF3.

mosmsnpp

Service Feature for processing MO SMS NPP test messages

gtt

Service feature for processing GTT test messages.

iar

Service Feature for processing IAR test messages

loc (mandatory)

Card location. The location of the network card where the message is to be sent.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

msgn (mandatory)

Message number. The message number of the test message to be sent for feature service processing.

Range:

1 - 10

prot (mandatory)

Protocol. The protocol of the test message that is sent to the feature for processing.

Range:*ttr**isup**is41**gsm**sccp**tatr***mode (optional)**

Output mode. The mode in which output is shown while processing is performed on the specified test message.

**Note:**

The most complete and accurate test results are obtained when `mode=debug` is used.

Range:*brief*

summary format

full

full format

debug

debug format

Default:*brief***Example**

```
tst-msg:loc=1103:prot=is41:feat=mosmsnpp:msgn=1:mode=full
```

```
tst-msg:loc=1103:prot=ttr:feat=ttr:msgn=1:mode=full
```

```
tst-msg:loc=1103:prot=gsm:feat=mosmsnpp:msgn=1:mode=debug
```

```
tst-msg:msgn=1:prot=isup:loc=1215:feat=tif:mode=debug
```

```
tst-msg:loc=1103:prot=sccp:feat=gtt:msgn=1
```

Dependencies

The Prepaid IDP Query Relay feature must be enabled before the `feat=ttr` parameter can be specified.

The card in the location that is specified in the `loc` parameter must be equipped in the system.

The value specified for the `loc` parameter must indicate a Service Module card running the VSCCP application.

The card in the location specified in the `loc` parameter must be in the Active state.

The values specified for the `prot` and `feat` parameters must be compatible as shown:

- `feat=ttr — prot=ttr`
- `feat=iar — prot=tatr`
- `feat=tif, tif2, tif3 — prot=isup`
- `feat=mosmsnpp — prot=gsm, is41`
- `feat=gtt — prot=sccp`

If the specified test message is defined with `ACTIVE=YES` (see the `chg-isup-msg` command), then the message is sent to the specified network card for test processing. (Test messages are never sent out to the live network.)

The TSTMSG table is corrupt or cannot be found.

The MO SMS ASD, MO SMS GRN, MO SMS IS41-to-GSM Migration, or MO-based IS1 SMS NP feature must be enabled before the `feat=mosmsnpp` and `prot=is41` parameters can be specified.

The MO SMS ASD, MO SMS GRN, Prepaid SMS Intercept Ph1, MO-based GSM SMS NP, or Portability Check for MO SMS feature must be enabled before the `feat=mosmsnpp` and `prot=gsm` parameters can be specified.

At least one TIF feature must be enabled before a value of `tif`, `tif2`, or `tif3` can be specified for the `feat` parameter.

For an ANSI message, the CDPA GTI must be 2 and the CGPA GTI must be 0 or 2 (see the `chg-sccp-msg` command). For an ITU message, the CDPA GTI must be 2 or 4 and the CGPA GTI must be 0, 2, or 4.

The linkset specified by the `lsn` parameter must already exist.

The network domain of the values specified for the OPC, CGPA PC, CDPA PC and DPC must match.

The IAR Base feature must be enabled before the `feat=iar` parameter can be specified.

Notes

The `tst-msg` output for `feat=gtt` with `mode=full` and `debug` will be the same.

Output

When the `mode=full` or `mode=debug` parameter is specified, the `FORMAT` field indicates whether formatting actions are executed. If formatting actions are not executed, then the `OUTG DIGITS` field displays a value of `UNMODIFIED`. If any digit string is blank, then the associated field displays a value of `EMPTY`.

This example shows the output in brief format:

```
tst-msg:feat=ttr:prot=ttr:msgn=1:mode=brief
```

```
tekelecstp 09-08-05 18:20:46 EST EAGLE 41.1.0
tst-msg:feat=ttr:prot=ttr:msgn=1:mode=brief
Command Accepted: Test message is sent.
```

```
;
```

```

tst-npp-msg

Use this command to provision and test the NPP provided service, NPPT. The NPP Test Service allows customers to provision NPP Action Sets and Rules associated with the NPPT Service Rule Set. Customers can inject test messages to a provisioned NPPT Service Rule to verify proper digit string processing.

Parameters

digs (mandatory)

Digits. The incoming digit string for NPP to process.

Range:

1 - 32

loc (mandatory)

The Service Module card to which the test message is issued.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

nai (mandatory)

Incoming digit string Nature of Address Indicator (NAI) mapping value.

Range:

0 - 255

mode (optional)

The output format.

Range:

brief

summary format

full

full format

debug

debug format

Default:

brief

Example

```
tst-npp-msg:loc=1101:mode=full:digs=0ab4041234567:nai=3
```

Dependencies

None.

Output

When the `mode=full` or `mode=debug` parameter is specified, the `FORMAT` field indicates whether formatting actions are executed. If formatting actions are not executed, then the `OUTG DIGITS` field displays a value of `UNMODIFIED`. If any digit string is blank, then the associated field displays a value of `EMPTY`.

The numbers shown to identify Conditioning Actions, Service Actions, and Formatting Actions are the individual parameter numbers or the position of the value in the parameter list when the command was entered. For example, CA2 identifies either the value for the `ca2` parameter or the second CA value in the `ca` parameter list in the command (such as `ac3` in the `ca=cc2, ac3` parameter).

```

```

tst-slk

Use this command for testing signaling links.

- The loopback parameter on the `tst-slk` command provides the ability to select from among the following loopback tests: local transceiver (`lxvr`), `oam`, `line`, `payload`, and either low-speed signaling links or ATM high-speed signaling links (`sltc`).
- The command is not valid on E5-ENET-B cards with SS7IPGW and IPGWI links.
- For low-speed links, `LXVR` and `SLTC` tests are allowed.
- For E5-ATM-B cards, the `LXVR`, `SLTC`, `PAYLOAD`, `LINE`, and `OAM` tests are allowed.
- For E5-ENET-B cards with IPLHC links, the `SLTC` test is allowed.
- For E5-E1T1-B cards, only the `SLTC` test is allowed.
- For E5-ENET-B or SLIC cards running the IPSP application, the command is only supported for IPSP-M2PA signaling links, and the `SLTC` test is allowed.

See [Summary of Loopback Testing Commands and Functions](#) in Appendix A.

Parameters

link (mandatory)

The signaling link on the card specified in the `loc` parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118*

action (optional)

Indicator of command action to stop or start a test.

Range:

start

stop

Default:

start

force (optional)**Range:**

yes

no

Default:

no

loopback (optional)

The type of loopback test to run

Range:***line***

This test is similar to the payload loopback test, but the data transmitted to the remote system is received by the remote system's ATM driver.

lxvr

Loopback at the local transceiver without involving the remote STP. For the ADS0, AINF, AOCU, and AV35 appliques, the MTP-2 protocol stack and ISCC hardware are tested. For AATM applique and DS1 interface, the AATM hardware, ATM level 2 protocol stack, and AAL5CP portion of ATM driver are tested,

oam

Messages are passed between local and remote systems to guarantee that the ATMM portion of ATM driver is functioning.

payload

This test is similar to the local transceiver loopback test. The wire is also tested because the loopback is at the remote's DS1 interface instead of the local's DS1 interface.

sltc

This test can be run on either the low-speed signaling links or the ATM high-speed signaling links. This is the only test that is supported for *m2pa* links on IPLHC cards.

Default:

sltc

time (optional)

The time duration for testing the link.

Range:

1 - 240000

hhmmss

hh=hours (00-24)

mm=minutes (00-59)

ss=seconds (00-59)

For example, `time=1` or `time=000001` is one second; `time=240000` is 24 hours; `time=200` or `time=000200` is 2 minutes.

Default:

1

Example

```
tst-slk:loc=1203:link=a
```

```
tst-slk:loc=1203:link=a:loopback=lxvr
```

```
tst-slk:loc=1205:link=b:time=000200:force=yes:action=start
```

```
tst-slk:loc=1205:link=b:action=stop
```

```
tst-slk:loc=1205:link=b:time=200
```

Dependencies

The card in the location indicated by the `loc` parameter must already be equipped.

A card location that is valid and defined in the database must be specified.

- A card location equipped with an E5-APP-B card cannot be specified.
- A card location equipped with a Telco Switch cannot be specified.

If the signaling link is an ATM HSL signaling link, only the `link=a` parameter can be specified.

This command is not supported for cards running the IPGHC application.

The *payload* and *line* values are not valid for the `loopback` parameter when the card is an E1 ATM.

Only the SLTC test can be run on card types LIME1 and LIMT1.

The card must contain the specified signaling link.

The specified signaling link must be provisioned in the database.

The specified signaling link must be an SS7 signaling link.

The signaling link that is used for LFS (Link Fault Sectionalization) testing cannot be active.

A previously entered command for a link test must be accepted before another link test command can be entered.

This command cannot be entered if the LFS test is running on the specified link.

The specified link cannot be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link. (See the `act/dact-cdl` commands).

The `force=yes` parameter must be specified to start a test when 256 or more tests are already running in the system.

This command cannot be entered if the maximum number of LFS or link tests are already running in the system. At least one active test must complete before the command can be entered again.

Only one link test can be running on a signaling link at one time.

The `action=stop` parameter cannot be specified when there is no active link test running on the specified link.

When the `action=stop` parameter is specified, the `loopback`, `time`, and `force` parameters cannot be specified.

If an IPSPG-M3UA signaling link is used, then this command cannot be entered.

If an IPSPG-M2PA signaling link is used, the `loopback=sltc` parameter must be specified.

The card must be equipped and in service, and must be one of the following cards:

- E5-E1T1-B card running the SS7ANSI or CCS7ITU application
- E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET-B card running the IPLHC or IPSPG application
- SLIC card running the IPSPG application

Notes

The `lxvr` and `sltc` loopback tests can be run on low-speed signaling links. All the loopback tests can be run on the ATM high-speed signaling links.

Output

If the card is inhibited (not in service), this message appears when a link test is attempted:

```
tst-slk:loc=1203:link=a
```

```

;

```

Legend

- **LOC**—Card location that contains the signaling being tested
- **Link**—Signaling link being tested on the card
- **LSN**—Name of the linkset that contains the link being tested
- **Start time**—Time that the test started
- **LOOPBACK**—Type of loopback test being run
- **TIME**—Length of time that the test ran. This value can exceed the value specified in the `time` parameter if the test requires more than the specified time to complete.

- **TEST STATUS**—
 - If the `action=start` (specified or default) is specified, any of the following *TEST STATUS* values can appear:
 - * Loopback success
 - * Loopback failed
 - * Loopback aborted
 - * Loopback in-progress
 - * Loopback prevented
 - * Loopback invalid
 - If the `action=stop` parameter is specified, any of the following *TEST STATUS* values can appear:
 - * Loopback cleared
 - * Loopback could not be cleared

tst-t1

Use this command to test T1 ports. The command is rejected if a loopback test is not compatible with the port type.

Note:

This command can be entered for E5-E1T1-B cards.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

t1port (mandatory)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified card.

Range:

1 - 8

action (optional)

Indicator of command action to stop or start a test.

Range:

start

stop

Default:

start

loopback (optional)

Select loopback test type.

Range:

line

lxvr

local transceiver

payload

feline

far end line

fepayload

far end payload

Default:

lxvr

Example

```
tst-t1:t1port=1:loc=1203:loopback=lxvr
```

```
tst-t1:t1port=1:loc=1203:action=stop
```

Dependencies

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an E5-E1T1-B card with card type LIMT1.

The card in the location specified by the `loc` parameter must be equipped.

The card in the location specified by the `loc` parameter must be in service.

The T1 port specified by the `t1port` parameter must have a defined T1 interface.

All signaling links that provide timeslots serviced by T1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl` commands) when this command is entered.

Only one port test can be running on the T1 port specified by the `t1port` parameter at one time.

The E1/T1 Port table must be accessible.

The `action=stop` parameter can be specified only when a port test is running.

If the `action=stop` parameter is specified, a value of *feline* or *fepayload* must be specified for the `loopback` parameter.

If the `action=stop` parameter is specified, and a value of *feline* or *fepayload* is specified for the `loopback` parameter, then there cannot be an active loopback for the T1 span, or the active loopback must be the one specified in the `tst-t1:action=stop` command.

Notes

Only one port test can be performed at a time on a T1 port. When a port test is in progress on a T1 port, subsequent test requests are rejected.

If a loopback type of *feline* or *fepayload* is specified, then the loopback requests are sent to the far end. No response is given from the far end to indicate if the request was acted upon or received. The local card which hosts the T1 span in the EAGLE does not instrument the loopback locally but maintains knowledge of the far end loopback request. If the local card boots, this knowledge is lost by the card.

To maintain the far end loopback states, if the T1 card with an active *feline* or *fepayload* test boots, the card loses any knowledge of the Far End loopback request, but the OAM retains that knowledge. If the OAM boots, the T1 card updates the OAM with its last known loopback state. If both the T1 card and the active OAM card boot while a Far End Loopback is active, then there is no way of determining the T1 state; however, a `tst-t1:action=stop:action=(feline or fepayload)` command can still be sent.

Output

```
tst-t1:t1port=1:loc=1203:loopback=lxvr

rlghncxa03w 05-01-07 16:19:08 EST  EAGLE5 33.0.0

ublk-slk

Use this command to cancel a local processor outage (LPO) and restore the link to its previous state. Link status signal units (LSSU) with status of processor outage are stopped, and the link begins sending MSUs again. IPSP-M3UA signaling links are allowed to enter service by allowing received AS-ACTIVE messages to be accepted.

Note:

The blocked status of the signaling link is not preserved across a LIM reboot.

Parameters

link (mandatory)

The signaling link on the card specified in the `loc` parameter. The signaling links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,

3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
ublk-slk:loc=2311:link=b
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET-B card running the IPLHC or IPSG application
- E5-E1T1, or E5-E1T1-B card running the SS7ANSI or CCS7ITU application
- SLIC card running the IPSG application

This command is not valid for E5-ENET-B cards with IPGHC or TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The card in the specified card location cannot be an E5-TDM card, an E5-MDAL card, a MUX card, or the cards running the OAM application.

This command is not valid for links belonging to proxy linksets.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- *a-a1, b*—E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

Notes

Unblocking a signaling link removes a Level 2 failure resulting from a `ublk-slk` of an ATM high-speed signaling link.

The function of this command is the same as the `canc-lpo` command.

Installation Guide provides an illustration of card locations.

Output

```
ublk-slk:loc=2311:link=b
```

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
Local processor outage being cleared.
```

```
;
```

```
ublk-slk:loc=1113:link=a
```

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0  
Command Rejected : Location is not valid for command.
```

```
;

unhb-alm

Use this command to restore the reporting of alarms for the given device.

Parameters

Note:

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dev (mandatory)

Device. The device where the reporting of alarms is to be restored.

Range:

applsock

IP gateway application socket

as

IP gateway application. Application Server

card

Cards in the database

cdt

Customer defined troubles

clock

System clock

dlk

IP ports on the VSCCP, EROUTE, SLAN, MCPM, and FC-capable cards

e1port

E1 port on E5-E1T1-B cards

ls
Linksets

lsmconn
Communication link between the LSMS and the EMS

route
Route

slk
Signaling links

t1port
T1 port on E5-E1T1-B cards

trm
Terminals

rtx
Exception Route

enet
Ethernet

tps
TPS subsystem

asname (optional)

Gateway Application Server name. When used with the `dev=as` parameter, this parameter can be used to uninhibit alarms for the named Application Server.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

cic (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the `ecic` parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

Range:

0 - 16383

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpc

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni* = 000 is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is not valid if *ni* = 001–005.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code for inhibiting alarms for routes.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt1` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

e1port (optional)

Port ID. The E1 port on the specified E5-E1T1-B card. This parameter is mandatory if the `dev=e1port` parameter is specified.

Range:

1 - 8

ecic (optional)

Ending Circuit Identification Code. This parameter is used with the `cic` parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

Range:

0 - 16383

id (optional)

Customer Defined Trouble (CDT) ID. Customer Defined Trouble IDs 1 through 4 are generated critical alarms. Because critical alarms cannot be turned off, Customer Defined Trouble IDs 1 through 4 cannot be specified as values for the `id` parameter. This parameter is mandatory if the `dev=cdt` parameter is specified.

Range:

5 - 16

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

link (optional)

Signaling link on the card specified in the `loc` parameter.

Synonym:

port

Range:*a, b, a1 - a31, b1 - b31**a1, a2, b1, b2* — dev=lsmsconn*a, b, a1-a31, b1-b31* — dev=slk for an E5-E1T1-B card*a1, b1* — dev=dlk for an FC-capable card*a, b* — dev=enet for an E5-ENET-B card**loc (optional)**

The card location as stenciled on the shelf of the system.

Range:*1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118***lsn (optional)**

Linkset name. The name of the linkset containing the device where alarm reporting is to be restored.

Range:*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

opc (optional)ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).**Synonym:***opca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.The point code *000-000-000* is not a valid point code.**opc/opca/opci/opcn/opcn24/opcn16 (optional)**

Origination point code

opci (optional)ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).**Range:***s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**zone—0-7*

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opc_n (optional)

ITU national origination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opc_{n24} (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, *000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

opc_{n16} (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, *000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

si (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range:

0 - 15

sname (optional)

Gateway application socket. When used with the `dev=applsock` parameter, this parameter can be used to uninhibit alarms for the named IP7 application socket.

Range:

aaaaaaaaaaaaaaaa

1 to 15 alphanumeric characters

t1port (optional)

Port ID. T1 port on the specified E5-E1T1-B card. This parameter is mandatory if the `dev=t1port` parameter is specified.

Range:

1 - 8

trm (optional)

Terminal ID. The ID number of the terminal whose alarms are to be uninhibited.

Range:

1 - 40

Default:

Report displays on the terminal where the command was issued.

Example

```
unhb-alm:dev=route:dpc=1-1-1
```

```
unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx
```

```
unhb-alm:loc=1102:dev=dlk:port=a1
```

```
unhb-alm:dpcn16=121-10-15:opc16=121-10-15:dev=rtx
```

Dependencies

This command is not allowed in the upgrade mode.

No other action command can be in progress when this command is entered.

When the `dev=card` parameter is specified, the `loc` parameter must be specified.

When the `dev=dlk` parameter is specified, the `loc` parameter must be specified.

When the `dev=slk` parameter is specified, the `loc` and `link` parameters must be specified.

When the `dev=e1port` parameter is specified, the `loc` and `e1port` parameters must be specified.

When the `dev=t1port` parameter is specified, the `loc` and `t1port` parameters must be specified.

When the `dev=ls` parameter is specified, the `lsn` parameter must be specified.

When the `dev=trm` parameter is specified, the `trm` parameter must be specified.

When the `dev=cdt` parameter is specified, the `id` parameter must be specified.

When the `dev=lsmsconn` parameter is specified, the `link` parameter must be specified.

When the `dev=route` parameter is specified, a `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be specified.

When the `dev=applsock` parameter is specified, the `sname` parameter must be specified.

When the `dev=as` parameter is specified, the `asname` parameter must be specified.

The linkset specified by the `lsn` parameter must be equipped in the database.

If the `dev=slk` or `dev=dlk` parameter is specified, the specified `link` must exist in the database.

The STP Options table must be accessible.

The Device Alarm Inhibit table must be accessible.

The parameters that can be specified with the `dev` parameter vary, depending on the value specified for the `dev` parameter as shown:

- `dev= (any value)`— `dur` or `lvl`
- `dev=asname` — `as`
- `dev=dpc/dpca/dpci/dpcn/dpcn24/dpcn16` — `route`
- `dev=id` — `cdt`
- `dev=loc` — `card`, `dlk`, `elport`, `slk`, `tlport`, `enet`
- `dev=lsn` — `ls`
- `dev=elport` — `elport`
- `dev=link (link=a, b)`— `dlk`, `slk`, `enet`
- `dev=link (link=a1, b1)`— `dlk` (For FC-capable cards)
- `dev=link (link=a, b, a1, a2, b1, b2, a3, b3)`— `slk`
- `dev=link (link=a1, a2, b1, b2)`— `lsmsconn`
- `dev=sname` — `applsock`
- `dev=tlport` — `tlport`
- `dev=trm` — `trm`

If the `sname` parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

The card location that is specified in the `loc` parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be turned on before specifying the `dev=rtx` parameter.

The `link` parameter must be valid for the selected device type.

The card specified by the `loc` parameter must have an IPS, MCP, STPLAN, EROUTE, VSCCP, IPSG, IPLIMI, SS7IPGW, or IPGWI application.

The J7 Support feature must be enabled before the `opc16/dpc16` parameters can be specified.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
unhb-alm:dev=route:dpc=1-1-1
```

```

unhb-slk

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

Note:

The inhibited status of the signaling link is not preserved across a LIM reboot.

Parameters

link (mandatory)

The signaling link on the card specified in the `loc` parameter. The signaling links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
unhb-slk:loc=1301:link=a
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-E1T1-B card running the SS7ANSI or CCS7ITU application

- E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET-B card running the IPLIMI, or IPSP application
- SLIC card running the IPSP application

The card must contain signaling links.

The signaling link must be equipped in the database.

The inhibit and uninhibit actions are valid for links on E5-ENET-B cards running the IPLIMx application.

The card in the specified card location cannot be an E5-TDM card, an E5-MDAL card, a MUX card, or the cards running the OAM application.

This command is not valid on E5-ENET-B cards with SS7IPGW, IPGWI, or IPSP-M3UA links. IPLIMI links can be uninhibited.

If an IPSP-M3UA signaling link is used, then this command cannot be entered.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- *a-a1, b*—E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

Notes

The function of this command is the same as the `canc-lpo` command.

Installation Guide provides an illustration of card locations.

Output

```
unhb-slk:loc=1301:link=a
```

```
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Allow Link message sent to card
;
```

unlock

Use this command to unlock a previously locked terminal keyboard. Anyone attempting to use the keyboard is prompted to enter the password of the currently logged-in user.

Parameters

This command has no parameters.

Example

```
unlock
```

Dependencies

You must enter the password of the logged in user to unlock the keyboard.

This command is valid only if the keyboard is locked.

The port must not be in an unlock disabled state because of excessive successive unlock failures.

Notes

None

Output

```
unlock
```

```
Enter LOGIN password to unlock keyboard :
```

Debug Commands

This chapter contains information about debug commands used in troubleshooting and debugging the system. These commands are intended only for [My Oracle Support \(MOS\)](#) personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to personnel who have access to the command class Debug.

CAUTION: These commands are to be used precisely as they are described in this chapter, and only under the direction of Customer Care Center personnel. Any other use of these commands can result in a system failure.

This chapter contains the debug commands in alphabetical order.

act-gedti

Use this command to activate a GEDTI Hub for Eagle Eyes. The state of the GEDTI Hub is changed from DACT(Deactivated) to ACT(Active).

Note:

The GEDTI hub must be Deactivated on the specified card before the command can be executed. If the card boots, then the status of the GEDTI Hub will be reset to DACT.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
act-gedti:loc=1102
```

Dependencies

The value specified for the `loc` parameter must refer to an equipped card location.

The card at the specified location must be configured as GEDTI Hub.

Activating the state of GEDTI Hub that is already activated has no effect.

The card at the specified location must not be a reserved location.

Notes

None.

Output

```
act-gedti:loc=1101
```

```
Command Accepted - Processing
```

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 46.0.0 act-gedti:loc=1101  
Command entered at terminal #1.;
```

```
tekelecstp 11-08-16 18:35:44 MST  
UNKNOWN EAGLE 46.0.0 Activate GEDTI Hub message sent to card.;
```

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 46.0.0  
Command Completed.;
```

Related Topics

- [chg-gedti-card](#)
- [dact-gedti](#)
- [rept-stat-gedti](#)

act-ip-lnk

Use this command to activate an IP link and put the link into service. The state of the link is changed from OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled) to OOS-MT (Out-Of-Service-Maintenance), IS-ANR (In-Service-Abnormal) or IS-NR (In-Service-Normal).

Note:

The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,*

5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

port (mandatory)

Ethernet interface Port ID.

Range:**a**

IP Port A

b

IP Port B

c

IP Port C

d

IP Port D

fca

Fast Copy Port A

fcb

Fast Copy Port B

Example

```
act-ip-lnk:loc=1102:port=a
```

```
act-ip-lnk:loc=1203:port=fca
```

```
act-ip-lnk:loc=1103:port=c
```

```
act-ip-lnk:loc=1202:port=d
```

Dependencies

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG, or STPLAN application
- IPSM card
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B
- SLIC card

A valid value must be specified for the `loc` parameter.

The value specified for the `port` parameter must be supported by the card:

- port A - E5-OAM card running OAMHC application, IPSM card, E5-MCPM-B card, E5-ENET-B card running the STPLAN application
- port A, B - E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application

- port A, B, FCA, FCB - E5-ENET-B card running the IPGWx or IPSG application
- port A, B, C and D are valid for SIP/ENUM/DEIR application running on SLIC card.

The card at the specified location must be configured.

The card in the specified location must be Active before this command can be executed.

Notes

The act-ip-lnk/dact-ip-lnk commands were created as debug means - aids to turn off or disable the IP interface to troubleshoot network problems, specifically to allow the operator to troubleshoot IP network flooding issues that can cause EAGLE cards to boot repeatedly while trying to come up. These commands should NOT be used for general maintenance actions since they have not been rigorously tested and their usage should be limited to situations like described above.

Interface A/D is used for ExAP connectivity and interface B/C is used for the signaling network on the SLIC card running the SIP/ENUM/DEIR application.

Output

```
act-ip-lnk:loc=1101:port=a
```

```

act-upgrade

Use this command to perform a software upgrade from a source release to the target release on an in-service system.

▲ Caution:

It is strongly recommended that this command be used only in conjunction with the system Upgrade Procedure for your target release. The Upgrade Procedure provides step-by-step information on performing an upgrade.

Parameters

action (mandatory)

The action to be performed for the upgrade process.

▲ Caution:

The `converttoam` and `netcomplete` actions should be used only under the direction of My Oracle Support (MOS).

Range:

yyyyyyyyyy

Up to 10 alphabetic characters. Valid actions are:

- `chkrel`—Validates the stored upgrade target release on the physical disk as specified by the `src` parameter.
- `converttoam`—Converts the standby OAM database.
- `convertstp`—Performs all OAM and network conversions necessary for an upgrade. This command transitions through all of the upgrade phases to upgrade completion. If measurement collection is turned on, this command automatically inhibits measurements during the upgrade. Upon completion of the upgrade, this command returns the MASPs to full-function mode with measurement collection turned back on.
- `createsets`—Assigns network cards to upgrade-grouping sets.
- `dbstatus`—Reports the status of all database partitions on the TDM fixed disks and the removable drive(s) (similar to the `rept-stat-db:display=version` command).
- `displaysets`—Reports the upgrade-grouping sets of network cards.
- `getrel`—Retrieves the upgrade target release file from either the EAGLE software release distribution server or the plug-in flash drive. It then expands the data on the inactive partition group of the hard disks.

- *netcomplete*—Indicates upgrade completion and places the system in a fully functional mode.
- *oamcomplete*—Sets the upgrade phase number to 3, and enables the beginning of controlled card loading.
- *refreshsets*—Not yet supported.
- *verifysets*—Verifies that the card set list is consistent with the current EAGLE configuration and displays detailed information on any inconsistencies found.

force (optional)

Allows the user to override Card Set List verification and perform upgrade when only minor inconsistencies are present.

Range:

yes

Override the Card Set List verification and perform the upgrade.

release (optional)

The name of the software release file to be downloaded.

This file contains the upgrade target release on the software release distribution server or plug-in flash drive.

Range:

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

1 alphabetic character followed by up to 29 alphanumeric characters. One or more periods can be used.

**Note:**

The value must be at least 11 characters in length and must contain a hyphen (-). The format of the value must be *xx.xx.xx-yy.yy.yy*, where *xx.xx.xx* is the release number, and *yy.yy.yy* is the engineering build number.

src (optional)

The physical disk that contains the upgrade target release.

Range:***fixed***

The upgrade target release is on the fixed disk

usb

The upgrade target release is on the removable media inserted in the flush-mount USB port

server

The upgrade target release is on the remote server

thres (optional)

Network Threshold value. The percentage of signaling links that is to remain in service (IS) during the network conversion phase. This enables SCCP thresholding and flashing on non-provisioned cards during the upgrade.

Range:

50 - 90

Default:

Network cards are updated serially

Example

```
act-upgrade:action=convertstp
act-upgrade:action=dbstatus
act-upgrade:action=convertstp:thres=75
act-upgrade:action=getrel:release="46.7.0.0.0-74.2.0.tar.gz":src=usb
act-upgrade:action=chkrel:src=fixed
```

Dependencies

The value specified for the `action` parameter must correspond to a specific upgrade phase:

- `action=converttoam`—upgrade phase=0 and 1
- `action=oamcomplete`—upgrade phase=2
- `action=convertnet`—upgrade phase=3
- `action=netcomplete`—upgrade phase=3
- `action=convertstp`—upgrade phase=0-3

The Measurements Collection function must be turned off (`chg-meas:collect=off`) or the Measurements Platform feature must be turned on (`chg-measopts:platformenable=on`) before a value of `converttoam`, `oamcomplete`, or `netcomplete` can be specified for the `action` parameter.

A valid upgrade release must reside on the plug-in flash drive or the inactive partition of the fixed disk.

The standby OAM database must be the source release.

The current OAM database must be the source release.

The database partition must be coherent.

The database partition must be in the correct functional mode.

The `action=convertstp` and `thres` parameters must be specified together in the command.

Upgrade conversion cannot be initiated from a telnet-type terminal (terminal IDs 17-40).

The DCM cards are obsolete for SS7IPGW, IPGWI, IPLIM, and IPLIMI applications.

The `action=getrel` and `release` parameters must be specified together in the command.

An IPSM card must be provisioned and in service before a value of `getrel` or `chkrel` can be specified for the `action` parameter.

The `ent-ftp-serv:app=dist` command must be entered before a value of `getrel` or `chkrel` can be specified for the `action` parameter.

The `act-upgrade:action=convertstp` cannot be issued with any removable media inserted in any of the USB ports.

Invalid hardware configuration alarms are set or an HMUX alarm must be addressed.

All cards that are in the auto-inhibited state must be removed before this command can be entered.

Cards that prevent the IMT buses from being inhibited during the upgrade cannot exist in the system.

The specified source drive must be at the correct database version for the upgrade to proceed.

The plug-in flash drive cannot contain an EAGLE backup image.

If the `src=usb` parameter is selected, then the plug-in flash drive upgrade media must be inserted in the Active OAM's flush-mounted USB port.

The internal RAM disk must be available for the plug-in flash drive's upgrade image to be unpackaged.

The disk that contains the upgrade target release must be in a known upgrade mode.

If the `src=usb` or `src=server` parameter is specified, then the `action=getrel` parameter must be specified. If the `src=fixed` parameter is specified, then the `action=getrel` parameter cannot be specified.

The EAGLE PVN address in the source database cannot be identical to the EAGLE FCNA or FCNB network address in the target database.

The `icdpnunknx` and `icdpnunknX` and the `gcdpnunknx` and `gcdpnunknX` NPP Action Sets cannot co-exist in the source release.

The value specified for the `release` parameter must be at least 11 characters in length and contain a hyphen (-). The format of the value must be `xx.xx.xx-yy.yy.yy`, where `xx.xx.xx` is the release number, and `yy.yy.yy` is the engineering build number.

The card must have sufficient DRAM memory to perform the GTMOD table Health Check.

The AMGTT data in the GTT table cannot exceed the capacity of the GTMOD table (100 K).

Unable to access GTT table from source drive.

The MFC feature must be ON prior to upgrading to release 46.2 or later.

The `action=refreshsets` and `action=verifysets` parameters are not supported.

The `thres` parameter cannot be specified if the threshold type (`threstype`) has been changed to `set`.

When issuing the `act-upgrade` command with the `threstype` assigned to card sets, the list of card sets needs to be created and valid.

When issuing the `act-upgrade` command with the `threstype` assigned to Card Set, the card set list must be consistent with the current EAGLE configuration, unless **force=yes** is allowed and specified. Details of any such inconsistencies and recovery instructions will be reported in a similar manner as `act-upgrade:action=verifysets`.

The `act-upgrade` command cannot be issued when SFAPP(P)->OAM sync is ON.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Notes

The `act-upgrade:action=convertstp` command executes all four upgrade phases consecutively.

If the `act-upgrade:action=convertstp` command is entered following a command abort, the upgrade processing determines the last upgrade phase that was successfully completed. The upgrade processing then attempts to restart from that point to successful completion. Re-entering the `act-upgrade:action=convertstp` command following a command abort is the recommended method for recovery.

The TDMs and plug-in flash drives have upgrade phase indicators. The upgrade command expects the disks to be in certain phases before executing a specific action. If the disks are not in the correct phases, an error is generated.

The `act-upgrade:action=dbstatus` command generates output similar to that provided by the `rept-stat-db:display=version` command.

The `thres` parameter is used to:

- Allow multiple cards to be upgraded together, as long as the specified percentage of links remains in service. The value is applied to groups of links based upon the link-supporting group or the entire system. The grouping is set by the `chg-upgrade-config:threstype=` command.
- Enable SCCP thresholding, which allows multiple Service Module cards to be upgraded together. The specified `thres` parameter value is not used to determine the number of Service Module cards to upgrade. The peak SCCP load since the last OAM boot is used to determine the number of cards that must remain in service (at least half of the cards must remain in service).
- Enable the non-provisioned flash function, which flash-downloads any boot-prom type card if the card is in the system but not provisioned.

The `act-upgrade:action=getrel` action defaults to getting the release from the provisioned IPSM card using the provisioned FTP Server. If the `src=usb` parameter is specified, then the release is obtained from the plug-in USB flash drive upgrade media.

Output

Note:

The `act-upgrade:action=convertstp` command performs the OAM conversion and the network conversion. During the conversion, this command broadcasts the current activity in the scroll area. Refer to Appendix B of the EAGLE Release Software Upgrade Procedure for a sample of message output.

The action `dbstatus` reports the current database status.

```
act-upgrade:action=dbstatus
```

Related Topics

- [rept-stat-db](#)

Range:

1101 - 1112, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118, 6202 - 6212, 6302 - 6312

init (optional)

This parameter initializes the contents of a PROM to contain only the record specified in the `data` parameter, if that record is a board identification record.

Range:**yes**

The contents of the PROM are initialized.

no

The contents of the PROM are not initialized.

Default:

no

typed (optional)

Type of board.

Range:***mbd***

main assembly

Example

This example initializes the contents of a main assembly BIP to contain only the record specified in the `data` parameter:

```
chg-bip-rec:loc=1105:data=xxxx:init=yes
```

This example displays the programming of the DCM Ethernet Addresses for Port A (ENT01):

```
chg-bip-rec:loc=1102:data="ENT01,AD00001704000D,cs104"
```

Dependencies

The value of the `loc` parameter cannot specify a location for a fixed disk or removable drive.

If the `init=yes` parameter is specified, then the value of the `data` parameter must be a Board IDentification (BID) record.

Notes

The card in the specified location must be inhibited.

Output

```
chg-bip-rec:loc=1107:data=xxx:init=yes
```

```

chg-ee-card

Use this command to enter/modify Eagle Eyes Network card data in the Eagle Eyes Card (EE CARD) table. The EE CARD entry consists of Card location and Eagle Eyes specific data.

Parameters**loc (mandatory)**

Eagle Eyes Card location.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

action (optional)

Action to be performed on the specified filter ID for the card.

Range:

attach

detach

Default:

No change to the current value.

System Default:

0

fltId (optional)

A comma-separated Eagle Eyes Filter ID list to be associated or disassociated with the card. Up to 8 FLT IDs can be specified in the list.

Range:

1-200

Default:

No change to the current value.

System Default:

0

kblim (optional)

Sets the file size limit of the capture file created, in kilobytes.

Range:

1-4000000

Default:

No change to the current value.

System Default:

none

pktlim (optional)

Sets the limit on the number of Ethernet frames to send.

Range:

1-10000000

none

Default:

No change to the current value.

System Default:

none

seclim (optional)

Sets the limit on the amount of time to perform the trace, in seconds.

Range:

1-5644800

none

Default:

No change to the current value.

System Default:

none

thr (optional)

Sets the sending rate of the Eagle Eyes throttle task in IMT packets per second. The packets will not be captured unless this parameter is set to a non-zero value for the particular card.

Range:

1000--10000

Default:

No change to the current value.

System Default:

0

Example

```
chg-ee-card:loc=1101:fltId=12:action=attach:thr=2000:pktlim=5000
```

```
chg-ee-card:loc=1102:kblim=40000:seclim=3000000
```

```
chg-ee-card:loc=1101:fltId=13:action=detach:pktlim=none
```

Dependencies

If the `fltId` parameter is specified, then the action parameter must be specified.

The EE CARD table cannot contain more than 256 entries.

The EE CARD table must be accessible.

At least one optional parameter must be specified.

The `fltId` specified should not be already associated with the card.

The value specified for the `fltId` parameter must already exist in the EE FLT table.

Maximum of 16 include filters can be attached to a card.

Maximum of 16 exclude filters can be attached to a card.

The value specified for the `loc` parameter must not be a system reserved location.

The IMT table must be accessible.

The card in the location specified by the `loc` parameter must have Eagle Eyes service capability.

The card `loc` specified to detach a filter must have Eagle Eyes configured.

The card at the specified location must be equipped.

The Filter `appl` and card `appl` should be same.

Notes

The value specified for the `loc` parameter must refer to a card running one of the following GPLs, and the referenced card must be equipped:

- IPHG, IPLHC, IPGHC
- ATMHC
- SS7HC
- SIPHC
- DEIRHC

Output

```
chg-ee-  
card:loc=1101:fltId=12:action=attach:thr=2000:pktlim=5000
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0
```

```
EE CARD table is (2 of 256) 1% full
```

chg-gedti-card

Use this command to configure GEDTI Hub for Eagle Eyes traffic capture.

Parameters

loc (mandatory)

IPSM Card location to be configured as GEDTI Hub.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

port (mandatory)

GEDTI Port to be set.

Range:

1025 - 65354

Example

```
chg-gedti-card:loc=1211:port=1124
```

Dependencies

The value specified for the loc parameter must correspond to the location of an IPSM card.

The value specified for the port parameter must not be configured on any other IPSM card.

If the GEDTI Hub is in ACTIVE state then port cannot be changed.

The EE Card table must be accessible.

Notes

None.

Output

```
chg-gedti-card:loc=1211:port=1245
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0

chg-tbl

Use this command to create, rename, or reset any table on a fixed disk or removable drive.

▲ Caution:

Before entering the `chg-tbl` command, contact My Oracle Support.

Parameters

action (mandatory)

The desired action to perform on the table.

Range:

create

Creates a DOS entry in the FAT table and updates the DOS directory table.

rename

Changes the name of an existing system table to a new DOS file name (does not update the *dms.cfg* file).

reset

Initializes an existing table to the value designated by the `resetchar` parameter.

disk (mandatory)

Target disk. The disk that contains the file.

Range:

remove

Removable drive

fixed

Fixed disk

usb

Argument to be used by Oracle personnel only.

ext (optional)

Extension. The three character DOS filename extension.

Range:

azz

0–3 ASCII characters

filelength (optional)

The amount of space the file occupies on the disk.

Range:
1 - 32505856

id (optional)
Table identification number.

Range:
0 - 499

name (optional)
Name of the file.

Range:
azzzzzzz
1–8 ASCII characters

prtnggrp (optional)
Partition group. The disk partition group to be changed.

Range:
active
inactive

Default:
active

resetchar (optional)
Reset character. The table reset character that is written to every byte of the table.

Range:
0 - 255

Example

```
chg-  
tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000  
chg-tbl:action=reset:disk=remove:id=0  
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old
```

Dependencies

If the `action=create/rename` parameter is specified, then the `name` parameter must be specified.

If the `action=create` parameter is specified, then the `name`, `ext`, and `filelength` parameters must be specified.

If the file type is a directory, the `filelength` parameter is not required. The directory entry file length is always 1 cluster in length.

The attributes used during file creation are current date and time of the active MASP. Readable/writable files are allocated contiguously from the last free FAT cluster.

If the `action=reset` parameter is specified, then the `id` parameter must be specified.

If the `action=rename` parameter is specified, then the `id`, `name`, and `ext` parameters must be specified.

This command cannot be used to modify the security log.

Notes

None

Output

```
chg-  
tbl:action=create:disk=remove:name=test:ext=sys:filelength=1500  
00
```

```
chg-tbl: CREATE OK : filename = test.sys, byte length = 150000  
chg-tbl: command complete  
;
```

```
chg-tbl:action=reset:disk=remove:id=0
```

```
chg-tbl: RESET OK : Table 0, DMS.CFG  
chg-tbl: command complete  
;
```

```
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old
```

```
chg-tbl: RENAME OK : Table 0, DMS.CFG to DMS.OLD  
chg-tbl: command complete  
;
```

chg-upgrade-config

Use this command to configure data used by the upgrade software during an upgrade of an in-service EAGLE from a source release to the target release.

Note:

This command stores data that will be used during the software upgrade. The command does not start the software upgrade.

Parameters

addtblcnv (optional)

This parameter sets the flag of the corresponding entry in the Table Conversion Definition table that forces the table to be converted during a software upgrade.

Caution:

The `addtblcnv` parameter should be used only under the direction of My Oracle Support (MOS).

Range:

0 - 1023

assignset (optional)

Assigned Set. The card specified by the `loc` parameter is assigned to the upgrade-grouping set specified by this parameter.

Range:

0

removes the card from the set list

2 - 10

assigns the card to that particular set list for the group corresponding to the card type

deltblcnv (optional)

This parameter clears the flag of the corresponding entry in the Table Conversion Definition table that forces the table to be converted during a software upgrade.

Caution:

The `deltblcnv` parameter should be used only under the direction of My Oracle Support (MOS).

Range:

0 - 1023

limsets (optional)

LIM Sets. This parameter sets the number of sets for link cards.

Range:

2 - 10

loc (optional)

Location. The location of a network card to be assigned to a set specified by the `assignset` parameter.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

src (optional)

Source. The disk that physically contains the upgrade target release.

Range:***fixed***

The upgrade target release is on the fixed disk

remove

The upgrade target release is on the removable drive

srvsets (optional)

Service Sets. This parameter sets the number of sets for service cards.

Range:

2 - 10

threstype (optional)

Threshold type. The type of thresholding to be used during the upgrade.

Range:***set***

Network conversion is based on the defined sets of cards

Example

```
chg-upgrade-config:addtblcnv=327
```

```
chg-upgrade-config:delttblcnv=327
```

```
chg-upgrade-config:sak=vbjyapdpbtejb:src=fixed
```

```
chg-upgrade-config:threstype=set:srvsets=2:limsets=4
```

Dependencies

The `addtblcnv` and `delttblcnv` parameters cannot be specified together in the command.

One of the optional parameters must be specified in the command.

The `srvsets` and `limsets` parameters cannot be specified unless the `threstype` is being changed to or has been changed to `set`.

The `loc` parameter is required when the `assignset` parameter is specified.

The value specified for the `assignset` parameter cannot be greater than the current value of `srvsets` or `limsets` for the specified card.

The `chg-upgrade-config` command cannot be issued when SFAPP(P)->OAM sync is ON.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Output

```
chg-upgrade-config:addtblcnv=327
```

```

clr-disk-stats

Use this command to clear the disk performance statistics. All associated disk statistics are zeroed.

Parameters

loc (mandatory)

Location. The location of the card.

Range:

1113, 1115

Default:

none

Example

```
clr-disk-stats:loc=1113
```

Dependencies

The specified card location must contain a card that is running an OAM (1113 or 1115).

A related command must not be in progress.

Notes

None

Output

```
clr-disk-stats:loc=1113
```

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0  
Disk performance statistics cleared.

copy-tbl

Use this command to copy a single table from one source to another. A table can be copied to any verifiable location in the system; however, the source and destination tables must have identical configurations (same number of entries, same entry size, both 1- dimensional and 2-dimensional).

**Note:**

A table cannot be copied onto itself.

Parameters**dloc (mandatory)**

Destination location. The location of the destination table.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

stb1 (mandatory)

Source table. The identifying number of the source table.

Range:*0 - 1023***drv (optional)**

Destination drive. The identification of the disk to which the table is copied.

Range:***fixed***

The fixed disk

remove

The removable drive

usb

Argument to be used by Oracle personnel only.

Default:*fixed***dprtngrp (optional)**

Disk partition group. The disk partition group of the destination table.

Range:***active******inactive*****Default:***active***dtb1 (optional)**

Destination table. The identifying number of the destination table.

Range:*0 - 1023***Default:**The `stb1` parameter value

sdrv (optional)

Source drive. The identification of the disk from which the table is copied.

Range:***fixed***

The fixed disk

remove

The removable drive

usb

Argument to be used by Oracle personnel only.

Default:

fixed

sprtnggrp (optional)

Source partition group. The disk partition group of the source table.

Range:***active******inactive*****Default:**

active

Example

```
copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed
```

Dependencies

Only one table copy command can be executed at a time.

The source and destination tables must exist and be compatible.

This command cannot be used to modify the security log.

The same value cannot be specified for the `sloc` and `dloc` or the `stbl` and `dtbl` parameters.

If a value of *fixed* is specified for the `sdrv` or `ddrv` parameter, then a value of 1114 or 1116 must be specified for the `sloc` or `dloc` parameter.

This command cannot be entered when CAT2 IPSPM to OAM syncing is in progress.

Notes

None

Output

```
copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed
```

```
rlghncxa03w 01-03-04 16:11:53 EST Rel 28.1.0
```

```
Table copy command complete.  
;
```

dact-ee

Use this command to deactivate an Eagle Eyes Card and stop capturing traffic on it. The state of the card is changed from ACT (Active) to DACT (Deactivated).

Note:

If the card boots, then the status of the card would be reset to DACT. This will clear the EE configuration from the card.

Parameters

loc (mandatory)

The Eagle Eyes card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
dact-ee:loc=1203
```

Dependencies

The card at the specified location must be equipped.

The card should be configured as an Eagle Eyes card.

Notes

The value specified for the loc parameter must refer to a card running one of the following GPLs, and the referenced card must be equipped:

- IPSPG, IPLHC, IPGHC
- ATMHC
- SS7HC
- SIPHC
- DEIRHC
- ERTHC

dact-ip-lnk

Use this command to deactivate an IP link and put the link out of service. The state of the link is changed from IS-NR (In-Service-Normal), IS-ANR (In-Service-Abnormal), or OOS-MT (Out-Of-Service-Maintenance), to OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled).

 **Note:**

The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

Parameters**loc (mandatory)**

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118, 1113, 1115

port (mandatory)

Ethernet interface Port ID.

Range:

a
IP Port A

b
IP Port B

c
IP Port C

d
IP Port D

fca
Fast Copy Port A

fcb
Fast Copy Port B

Example

```
dact-ip-lnk:loc=1102:port=a
dact-ip-lnk:loc=1203:port=fca
dact-ip-lnk:loc=1103:port=c
dact-ip-lnk:loc=1202:port=d
```

Dependencies

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG, or STPLAN application
- IPSM card
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B card
- SLIC card

A valid value must be specified for the `loc` parameter.

The value specified for the `port` parameter must be supported by the card:

- port A-E5-OAM card running OAMHC application, IPSM card, E5-MCPM-B card, E5-ENET-B card running the STPLAN application
- port A, B- E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application
- port A, B, FCA, FCB- E5-ENET-B card running the IPGWx or IPSG application
- ports A, B, C and D are valid for DEIR/SIP/ENUM applications running on SLIC card

The card at the specified location must be configured.

The card in the specified location must be Active before this command can be executed.

Notes

The `act-ip-lnk/dact-ip-lnk` commands were created as debug means - aids to turn off or disable the IP interface to troubleshoot network problems, specifically to allow the operator to troubleshoot IP network flooding issues that can cause EAGLE cards to boot repeatedly while trying to come up. These commands should NOT be used for general maintenance actions since they have not been rigorously tested and their usage should be limited to situations like described above.

Interface A/D is used for ExAP connectivity and interface B/C is used for the signaling network on the SLIC card running DEIR/SIP/ENUM applications.

Output

```
dact-ip-lnk:loc=1101:port=a

Related Topics

- [rtrv-ip-lnk](#)

dbg-ddb

Use this command to display the checksum, statistics, and wild write audit (WWA) updates of dynamic database (DDB) table entries, audit a specific table, and reset the DDB statistics on the cards.

Parameters

action (mandatory)

The action taken by the command.

Range:

stats

display dynamic database statistics

aud

audit a specific table

disp

display a table entry

wwa

display any entries updated by WWA task

rststat

reset following DDB audit statistics:

- Number of DDB updates
- Number of consecutive DDB update in progress
- Maximum DDB updates in 100 msec

- Idle period
- Maximum and minimum idle period

audtype (optional)

Audit type. This parameter specifies whether a unicast or multicast audit is performed.

Range:

mc
multicast

uc
unicast

Default:

mc

dpc (optional)

The destination point code value. The Route table entry corresponding to the DPC value is displayed.

Range:

p-, *000-255*, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)**dpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, *0-255*, *none*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

Enter *none* to delete the point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates

a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

Default:

No change to current value.

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--*p*

un---000---127

sna---000---15

mna---000---31

Default:

No change to the current value.

link (optional)

The entry in the Link table that corresponds to the specified link value.

Range:

a, *b*, *a1* -*a31*, *b1* - *b31*

loc (optional)

The location of the MTP card that is being debugged.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lsn (optional)

Linkset name. The entry in the Linkset table that corresponds to the specified linkset name.

Range:

ayyyyyyy

rloc (optional)

Reference card location. This parameter audits the table where the reference card is located.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

tbl (optional)

The table used as the source of the audit data.

Range:

lnk

Link table

ls

Linkset table

rte

Route table

tidx (optional)

Table index. This parameter displays the corresponding table entry.

Range:

0 - 16000

System Default:

0

Example

This command displays the 126th entry in the Link table.

```
dbg-ddb:loc=1105:tbl=lnk:action=disp:tidx=126
```

This command displays the entry in the Link table corresponding to link=a and

```
rloc=1107.
```

```
dbg-ddb:loc=1105:tbl=lnk:action=disp:rloc=1107:link=a
```

This command audits the Link table in multicast mode.

```
dbg-ddb:loc=1105:tbl=lnk:action=aud:audtype=mc
```

This command audits the Link table in unicast mode.

```
dbg-ddb:loc=1105:tbl=lnk:action=aud:audtype=uc
```

This command audits the Link table at the card location 1105 using the reference card 1107.

```
dbg-ddb:loc=1105:tbl=lnk:action=aud:audtype=uc:rloc=1107
```

This command displays the statistics of a specified card.

```
dbg-ddb:loc=1201:action=stats
```

This command displays the WWA entries on a specified card.

```
dbg-ddb:action=wwa:loc=1201
```

This command resets the statistics of a specified card.

```
dbg-ddb:action=rststat:loc=2100
```

This command resets the statistics of all active MTP cards.

```
dbg-ddb:action=rststat
```

Dependencies

The `dpc`, `tidx`, `lsn`, and `rloc` parameters cannot be specified together in the command.

The `dpc`, `tidx`, `lsn`, and `link` parameters cannot be specified together in the command.

The `action=disp` and `tbl=rte` parameters must be specified before the `dpc` parameter can be specified.

The `action=disp` and `tbl=ls` parameters must be specified before the `lsn` parameter can be specified.

The `action=disp` and `tbl=lnk` parameters must be specified before the `link` parameter can be specified.

The `action=disp` parameter must be specified before the `tidx` parameter can be specified.

The `action= aud` parameter must be specified before the `audtype` parameter can be specified.

The `action=disp` and `tbl=lnk` parameters or the `action=aud` and `audtype=uc` parameters must be specified before the `rloc` parameter can be specified.

If the `action` parameter has a value of `wwa`, `stats`, or `rststat`, then the `loc` parameter is the only other parameter that can be specified.

If the `action=disp` and `tbl=lnk` parameters are specified, then the `rloc` and `link` parameters must be specified together in the command.

The card location specified by the `loc` or `rloc` parameter must be equipped.

The value specified for the `loc` or `rloc` parameter must indicate an MTP card.

The status of the card at the location specified by the `loc` or `rloc` parameter must be active.

The linkset specified by the `lsn` parameter must already exist in the Linkset table.

The link specified by the `link` parameter must already be equipped.

The value specified for the `dpc` parameter must already exist in the Route table.

The Link table is corrupt or cannot be found.

The value specified for the `dpc` parameter must be a full point code, network point code, or a cluster point code.

Values of 1113 - 1118 cannot be specified for the `loc` or `rloc` parameters.

If the `action` parameter has a value of `disp`, `aud`, `stats`, or `wwa`, then the `loc` parameter must be specified.

If the `action=aud` parameter and the `rloc` parameter are specified, then the `audtype` parameter must be specified.

If the `action` parameter has a value of `disp` or `aud`, then the `tbl` parameter must be specified.

The J7 support feature must be enabled before the `opcn16/dpcn16` parameters can be specified.

Notes

For a multicast audit, the card that receives the message sends the audit request to all other MTP cards simultaneously. For a unicast audit, the card that receives the message sends the audit request to another MTP card, which sends the request to next MTP card, etc. This process continues until the last MTP card in the system receives the request.

A maximum of the last 10 entries of WWA updates are displayed.

Output

A maximum of 20 entries with mismatched card values can be displayed as necessary.

If mismatched card entries occur, the `SeqNo` field can be used to correlate the entries between two cards (e.g. `SeqNo: 1` of card 1 can be compared against `SeqNo: 1` of card 2.)

Legend

- **WWA**—Wild Write Audit
- **DDB**—Dynamic Database
- **Time stamp**—Card time stamp when the checksum was detected and updated by wild write audit. The time stamp is in *YY-MM-DD hh:mm:ss:msec* format.
- **TABLE**—Table where the checksum is being performed
- **Entry Idx**—Index of entry that is updated by wild write audit
- **Orig Chksum**—Original Checksum
- **Upd Chksum**—Checksum after update by wild write audit
- **Idle Period**—Time elapsed, in milliseconds, since the last DDB update was received by this card. All idle periods are displayed in *ind:hh:mm:ss:msec* format.
- **Number of WWA Updated Entries**—Number of entries updated by the WWA

disp-bip

Use this command to display the Board Identification PROM (BIP) hex and ASCII data for the specified card type and location. The PROM data consists of the board ID, part number, revision, date of manufacture, power, serial number, software match ID, and check sums.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

type (optional)

The board type to be displayed.

Range:

mbd

Displays the main assembly.

Example

This example displays the BIP data for the main assembly of the specified card location.

```
disp-bip:loc=1105
```

Dependencies

The value of the `loc` parameter cannot specify the location of a fixed disk or removable drive.

Notes

None.

Output

This example displays the BIP data for the main assembly:

```
disp-bip:loc=1105
```

disp-bp

Use this command to display currently active breakpoints in the communication and application processors.

Parameters

card (optional)

This parameter specifies the card location, in the form of *GPLID–Subsystem ID*.

Range: GPLID-Subsystem ID

GPLID

atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility

Subsystem ID

a, b, act, stb, all

The *oamhc* GPL can be specified with any of the subsystem IDs. For all other GPLs, only the *all* subsystem ID is valid.

imt (optional)

The IMT address of the card.

Range:

0 - 254

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

proc (optional)

This parameter specifies the processor type.

Range:

appl

Application processor

com

Communication processor

Default:

appl

ueng (optional)

The microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

Range:

0 - 5

Example

```
disp-bp:loc=1109:ueng=3
```

Dependencies

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

The `ueng` parameter can be specified only for IXP-based cards.

The `oamhc` GPLID accepts all subsystem values; all other GPLIDs accept only the `all` subsystem value.

The card location specified by the `loc` parameter must be in the database.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the `loc` parameter.

Notes

None

disp-disk-dir

Use this command to display the DOS directory on the specified disk. This command can display the creation date for each file or for selected files and applies to fixed disks and removable drives.

**Note:**

This command can be used to verify that the correct version of a file is on the disk.

Parameters**file (optional)**

The name of the file to be displayed.

Range:

ZZZZZZZZZZZZ

1–12 ASCII characters

Default:

All files are displayed

loc (optional)

The card location in the system.

Range:

1114

TDM

1116

TDM

1117

Removable cartridge drive

1113

Latched USB port

1115

Latched USB port

prtnggrp (optional)

Partition group. The disk partition group to be displayed.

Range:

active

inactive

Default:

active

src (optional)

Source. The identification of the disk containing the files to be displayed.

Range:**fixed**

The fixed disk

remove

The removable drive in the latched USB port of the E5-MCAP

usb

The plug-in USB flash drive in the flush-mounted USB port of the E5-MCAP

Default:

The fixed disk

Example

```
disp-disk-dir:loc=1117:file="dms.cfg"
```

```
disp-disk-dir:src=remove:file="fta"
```

```
disp-disk-dir:src=remove:file="*.*"
```

Dependencies

Valid filenames must be in the format *filename.extension* with the following requirements:

- File name—1–8 ASCII Characters
- Extension—0–3 ASCII Characters

Wildcards (asterisks) are allowed when the wildcard pattern is enclosed in parentheses.

- *—Matches all characters in either filename or extension
- ?—Matches one character in either filename or extension
- file="*.*"—Matches all files on disk
- file="*.tbl"—Matches all files on disk with *.tbl* as the extension

The `src` parameter must be specified.

The 1113 and 1115 locations are used by E5-MCAP cards. The 1114 and 1116 locations are used by E5-TDM cards.

A removable drive must be inserted in the slot indicated by the value specified for the `loc` or `src` parameter.

The card specified by the `loc` parameter must be connected to at least one IMT bus.

Legend

- **Filename**—Name of the file in the directory
- **Ext**—Extension of the file name (for example, for the file MFC.BIN, MFC is the file name and BIN is the extension of the file name)
- **Length**—Amount of space, in bytes, the file occupies on the disk
- **Last Modified**—Date and time the file was changed
- **Cluster**—A 2-byte, 16-digit binary number that represents the first section of the disk occupied by the file
- **LBA**—Starting logical block address that corresponds to the cluster
- **File(s)**—Number of files on the disk that match the search criteria
- **Bytes**—Amount of space, in bytes, the displayed files occupy on the disk
- **Volume**—11-character name for the disk
- **Bytes free**—Number of bytes that are available on the disk for file storage
- **Disk Size**—Total capacity of the specified disk

disp-disk-stats

Use this command to display the disk performance statistics.

Note:

The OAMs maintain disk read/writer access times as well as per table and per application statistics on the number of disk accesses and cache accesses. Per application and per table statistics that have zero values are not displayed if an application ID or table ID is not specified; only nonzero statistics are displayed in the default report.

Parameters

loc (mandatory)

The card location in the system.

Range:

1113, 1115

applid (optional)

Application ID. The application IDs used to define tasks.

Range:

0 - 255

Default:

all

tblid (optional)

Table ID. The table IDs used to define tables.

Range:

0 - 1023

Default:

all

Example

```
disp-disk-stats:loc=1113:applid=29
```

```
disp-disk-stats:loc=1113:applid=93
```

```
disp-disk-stats:loc=1113
```

Dependencies

The specified card location must contain a card that is running an OAM (1113 or 1115).

GPSM-II and E5-MCAP cards cannot co-exist in the system.

Notes

None

Output

```
disp-disk-stats:loc=1113:applid=29
```

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0

disp-mem

Use this command to display memory in communication and application processors. This display is in byte format.

Parameters

addr (optional)

The address in the form of *segment–offset*.

Range:

segment–offset
segment— h'00-h'ffff
offset— h'00-h'ffff

bc (optional)

Byte count. The number of data bytes to display.

Range:

1 - 65535

Default:

96

card (optional)

Card location. The card location in the form of *GPLID–Subsystem ID*.

Range:

GPLID–Subsystem ID

GPLID— *atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility*
Subsystem ID— *a, b, act, stb, all*

dformat (optional)

The memory dump format.

Range:

byte

word

dword

Default:

byte

imt (optional)

The IMT address.

Range:

0 - 254

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

paddr (optional)

The physical offset of the memory address.

Range:

h'00-h'ffffff

proc (optional)

The processor type.

Range:

appl

Application processor

com

Communication processor

Default:

appl

Example

```
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=dword
disp-mem:card=ss7ansi-all:addr=h'03a-h'001:bc=8
```

Dependencies

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The card location specified by the `loc` parameter must be in the database.

All of the subsystem values can be specified with the `oamhc` GPLID. The other GPLID values can be specified only with the `all` subsystem value.

Card locations 1114, 1116, 1117, and 1118 are not valid for memory commands.

The GPL specified in the `card` parameter must be supported.

The `addr` and `paddr` parameters cannot be specified together in the command.

Notes

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

Output

```
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word
```

```

disp-trace

Use this command to display trace entries.

Parameters

traceid (optional)

Trace ID. The trace entry to be displayed.

Range:

1 - 10

Example

```
disp-trace
```

```
disp-trace:traceid=5
```

Dependencies

A valid value must be specified for the `traceid` parameter.

None

Output

```
disp-trace
```

```

dlt-bp

Use this command to delete breakpoints in the communication or application processors.

Parameters

addr (optional)

The address in the form of *segment–offset*.

Range:

segment–offset

segment— h'00–h'ffff

offset— h'00–h'ffff

card (optional)

The card location in the form of *GPLID–Subsystem ID*.

Range:

GPLID-Subsystem ID

GPLID— atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility

Subsystem ID— a, b, act, stb, all

The OAMHC GPL can be specified with any of the subsystem IDs. For all other GPLs, only the *all* subsystem ID is valid.

imt (optional)

The IMT address of the card.

Range:

0 - 254

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

paddr (optional)

The physical offset of the memory address.

Range:

h'00–h'ffffff

proc (optional)

The processor type.

Range:

appl

Application processor

com

Communication processor

Default:

appl

ueng (optional)

The microengine number.

 **Note:**

This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

Range:

0 - 5

Example

```
dlt-bp:loc=1209:ueng=2
```

```
dlt-bp:card=hipr2-all
```

```
dlt-bp:loc=6312
```

Dependencies

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The `ueng` parameter can be specified only for IXP-based cards.

The card location specified by the `loc` parameter must be in the database.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the `loc` parameter.

All of the subsystem values can be specified with the `oamhc` GPLID. The other GPLID values can be specified only with the `all` subsystem value.

The `addr` and `paddr` parameters cannot be specified together in the command.

Notes

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

Output

```

dlt-ee-flt

Use this command to delete an Eagle Eyes Filter from the Eagle Eyes Filter (EE FLT) table. The EE FLT entry consists of a Filter ID and Filter specific data. It can be used to delete a filter only when it is not associated with any card.

Parameters

fltid (mandatory)

Eagle Eyes Filter ID.

Range:

1-200

Example

```
dlt-ee-flt:fltid=20
```

Dependencies

The specified Filter ID must exist in the EE FLT table.

The Eagle Eyes Filter table must be available.

The specified filter should not be associated with any network card.

Notes

None.

Output

```
dlt-ee-flt:fltid=3
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0

ent-bp

Use this command to add breakpoints in communications and application processors in the system.

Parameters

access (optional)

The access type, in the form of *access type-format*.

Use the `data` parameter to set the format on IXP-based cards.

Range:

access type-format

access type—*r*, *w*, *rw* (read, write, read-write)

format—*byte*, *word*, *dword*, *any*

Default:

For x86-based cards—*rw-byte*

For IXP-based cards—*rw-any*

addr (optional)

The memory location in the form of *segment-offset*.

Range:

segment-offset
segment—h'00–h'ffff
offset—h'00–h'ffff

bc (optional)

The number of data bytes to display.

For IXP-based cards, *bc* represents the number of bytes of memory. The number of bytes of stack to be displayed is $255 - bc$. For example, if *bc*=128, then 128 bytes of memory and 127 bytes of stack are displayed. If *bc*=0, then 0 bytes of memory and 255 bytes of stack are displayed. The exception to this rule is that 1 byte of stack is never displayed.

Range:

0 - 255

For x86-based cards, the maximum number of bytes is 96.

For IXP-based cards, the maximum number of bytes is 255.

ca (optional)

Condition “a” in the form of *register–condition–integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, greater than, less than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

Range:

register-condition-integer
register—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r1-r15
condition—eq, neq, gt, lt, gte, lte
integer—h'00–h'ffffff

card (optional)

The card location, in the form of *GPLID–Subsystem ID*.

Range:

GPLID-Subsystem ID
GPLID—atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility
Subsystem ID— a, b, act, stb, all

The OAMHC GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the *all* subsystem ID is valid.

cb (optional)

Condition b in the form of *register–condition–integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, greater than, less than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

Range:

register-condition-integer
register—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r0-r15

condition—*eq, neq, gt, lt, gte, lte*
integer—*h'00–h'ffffff*

ctx (optional)

The bit-mapped microengine context mask.

Range:

1 - 15

da (optional)

The dump address, in the form of *segment–offset*.

Range:

segment–offset

segment—*h'00–h'ffff*

offset—*h'00–h'ffff*

data (optional)

This parameter instructs a data breakpoint to qualify on a match of the data.

 **Note:**

This parameter is valid only on IXP-based cards.

Range:

value–mask

value—*0–0xFFFFFFFF*

mask—*0–0xFFFFFFFF*

Default:

0

dformat (optional)

Memory dump format (byte, doubleword, word).

Range:

byte

dword

word

Default:

byte

dpaddr (optional)

Memory dump address (physical offset).

Range:

h'00–h'ffffff

dr (optional)

The data register indirect memory dump, in the form *register–register–integer*.

The *register-register* value is the CPU internal register.
The *integer* value is the offset value.

Range:

register-register-integer

register—*sp, bp, ss, ds, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx*

register—*sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx*

integer— *h'00–h'ffffff*

drarm (optional)

ARM register indirect memory dump.

Range:

ARM register-integer

arm register- *r0-r15, sp, lr, pc*

mask- *0-65535*

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

Default:

0

dur (optional)

Breakpoint duration.

Range:

temp

perm

Default:

temp

imt (optional)

IMT address of the card.

Range:

0 - 254

ind (optional)

Indirection count.

Range:

0 - 3

Default:

0

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

paddr (optional)

The physical offset of the memory address.

Range:

h'00-h'ffffff

proc (optional)

Processor type.

Range:***appl***

Application processor

com

Communication processor

Default:

appl

rep (optional)

Repetitions for this breakpoint.

Range:

0 - 255

Default:

0

type (optional)

Breakpoint type in the form of processor type-breakpoint type

Range:

processor type-breakpoint type
processor type—p186, p286, p486, arm, ixp
breakpoint type—code, codehw, codesw, data

Default:

For x86-based cards—*p486-code*
For IXP-based cards—*arm-codesw*

ueng (optional)

Microengine number. This parameter is valid only on IXP-based cards.

 **Note:**

If this parameter is not specified for an IPX-based card, then the command is assumed to be intended for the ARM processor in the IXP chip.

Range:
0 - 5

Example

```
ent-bp:loc=1204:paddr=h'27c3c:type=p486-data:access=rw-word
ent-bp:loc=1109:paddr=h'401000:type=arm-codesw:access=rw-
any:ca=r7-eq-0
ent-bp:loc=1209:paddr=h'402000:type=arm-data:access=w-
any:data=h'1111-h'ff
ent-bp:loc=1309:paddr=h'403000:type=ixp-codesw:ueng=2:ctx=1
ent-bp:card=hipr2-all:paddr=h'404000:type=arm-
codehw:drarm=r3-0:bc=64
ent-bp:loc=1113:addr=h'03a-0001
```

Dependencies

All of the subsystem values can be specified with the OAMHC GPLID. The other GPLID values can be specified only with the *all* subsystem value.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the `loc` parameter.

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The `dr` parameter and the `da` parameter cannot be specified together in the command.

The `dur=perm` parameter and the `rep` parameter cannot be specified together in the command.

The `dur=perm` parameter cannot be specified when the value of the processor type portion of the `type` parameter is *p186* or *p286*.

When the `da`, `dr`, or `drarm` parameter is specified, the `dpaddr` parameter cannot be specified.

For the `type` parameter (which is in the form of *processor type-breakpoint type*), a breakpoint type of *data* cannot be specified in combination with a processor type of *P186*, *P286*, or *IXP*.

When the `paddr` parameter and the `bc` parameter are specified, either the `dpaddr` or `dr` parameter must be specified in the command.

The `access` parameter can be specified only when the `type` parameter value is *p486-data* or *arm-data*.

The `bc` parameter value cannot be greater than 96 for x86-based cards.

The `ind` parameter value cannot be greater than 3.

The specified card must be in use.

For 80286 processors, registers for 80386 processors cannot be specified.

For 80286 processors, `integer` values for registers and conditions must be less than 65535.

The `ueng` parameter is valid only on IXP-based cards (the value `ixp` is specified for the processor type portion of the `type` parameter).

The `cts` parameter is valid only on IXP-based cards (the value `ixp` is specified for the processor type portion of the `type` parameter).

The `data` parameter is valid only on IXP-based cards.

The `data` parameter is valid only when the value is `data` for the breakpoint type portion of the `type` parameter.

The register values `sp`, `lr`, `pc`, and `r0-r15` for the `ca` or `cb` parameters are valid only on IXP-based (ARM processor) cards.

The `ca` and `cb` parameters cannot be specified when the value `ixp` is specified for the processor type portion of the `type` parameter.

The `drarm` parameter can be specified only on IXP-based cards.

The `drarm` parameter can be specified only when the value `arm` is specified for the processor type portion of the `type` parameter.

The `dr` parameter cannot be specified for IXP-based cards.

The `data` and `codesw` values for the breakpoint type portion of the `type` parameter cannot be specified when the value `ixp` is specified for the processor type portion of the `type` parameter.

The `arm` and `ixp` values for the processor type portion of the `type` parameter are valid only on IXP-based cards.

The value `any` for the format portion of the `access` parameter can be specified only on IXP-based cards. The format value must be set to `any` on IXP-based cards.

When the value `ixp` is specified for the processor type portion of the `type` parameter, the `ueng` and `cts` parameters must be specified.

The `addr` parameter can be specified only when the `proc=com` parameter is specified for DS0 cards with PROM-based COM processors (such as TSMS).

When the `ca`, `cb`, and `dr` parameters are used with 80186 and 80286 processors, the register values `ip`, `fs`, `gs`, `esi`, `edi`, `ebp`, `esp`, `eip`, `efl`, `eax`, `ebx`, `ecx`, and `edx` cannot be specified. These registers can be used only with 80486 processors. The integer values for these parameters when used with 80186 and 80286 processors must be less than `h'ffff` (65535).

The `data` value for the breakpoint type portion of the `type` parameter cannot be specified with the values `p186`, `p286`, and `ixp` for the processor type portion of the `type` parameter.

The `da` parameter cannot be specified for IXP-based cards.

An ARM register value must be specified for an IXP-based card with an ARM processor.

The `addr` or `paddr` parameter must be specified in the command. Both parameters cannot be specified in the command.

Notes

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

Output

```
ent-bp:loc=1113:addr=h'03a-0001
```

```

ent-ee-flt

Use this command to enter Eagle Eyes Filter data in the Eagle Eyes Filter (EE FLT) table. The EE FLT entry consists of a Filter ID and Filter specific data. After the FLT ID is provisioned, it can be used in the `dlt-ee-flt` and `chg-ee-card` commands.

Parameters

type (mandatory)

Eagle Eyes Filter Type.

Range:

inc

exl

app1 (mandatory)

Card Application Type

Range:

atm

ip

e1t1

ipprot (optional)

Filter based on IP sub-protocol

Range:

sctp

tcp

udp

ipsrc (optional)

Filter based on IP source address

Range:

4 numbers separated by dots, with each number in the range of 0-255

ipdst (optional)

Filter based on IP destination address

Range:

4 numbers separated by dots, with each number in the range of 0-255

ssport (optional)

Filter based on SCTP source port

Range:

0-65535

sdport (optional)

Filter based on SCTP destination port.

Range:

0-65535

stype (optional)

Filter based on SCTP chunk type

Range:

abrt

data

err

hbak

htbt

inak

init

sack

sctppld (optional)

Filter based on SCTP data payload identifier.

Range:

diam

m2pa

m3ua

sua

unspec

sctpstr (optional)

Filter based on SCTP data stream identifier

Range:

0-65535

sscopsu (optional)

Filter based on SSCOP sub-protocol or SU type.

Range:

all

ctrl

data

mtp3si (optional)

Filter MTP3 user.

Range:

bicc

isup

sccp

snm

tup

port (optional)

Filter based on port.

Range:

a-b

a1-a31

b1-b31

all

sutype (optional)

Filter based on SU type.

Range:

allsu

lsu

msu

Example

```
ent-ee-
flt:appl=ip:type=inc:ipprot=sctp:ssport=2048:stype=data:sctpstr=100
ent-ee-flt:appl=atm:type=exl:port=a:sscopsu=data:mtp3si=sccp
ent-ee-flt:appl=e1t1:type=exl:port=a1:sutype=msu:mtp3si=tup
```

Dependencies

If the `appl=ip` then `ipprot`, `ipsrc` or `ipdst` parameters must be specified.

If the `ssport`, `sdport` or `stype` parameters are specified, then the `ipprot=sctp` parameter must be specified.

At least one optional parameter (`ipprot` or `port`) must be specified.

If the `sctpld` parameter is specified, then the `stype=data` and `ipprot=sctp` parameters must be specified.

If the `sctpstr` parameter is specified, then the `stype=data` and `ipprot=sctp` parameters must be specified.

The Eagle Eyes Filter table cannot contain more than 200 entries.

The Eagle Eyes Filter table must be available.

If the `appl=ip` parameter is specified, then the `appl=atm` and `appl=e1t1` parameters must not be specified.

If the `appl=atm` parameter is specified, then the `appl=ip` and `appl=e1t1` parameters must not be specified.

If the `appl=e1t1` parameter is specified, then the `appl=atm` and `appl=ip` parameters must not be specified.

If the `appl=atm` parameter is specified, then the `port` parameter can only be either `a`, `b` or `a1`.

Notes

IP7 parameters:

- *ipprot, ipsrc, ipdst, ssport, sdport, style, sctpld, sctpstr*

ATM parameters:

- *sscopsu, mtp3si, port*

E1T1 parameters:

- *sutype, mtp3si, port*

Output

```
ent-ee-flt:appl=atm:type=inc:port=a:sscopsu=data
```

```

ent-trace

Use this debug command to trace MSUs sent to Service Module cards or to LIM cards running the SS7ANSI, CCS7ITU, VSCCP, ATMITU, ATMANSI, IPLIMI, SS7IPGW, IPGWI, or IPSP applications.

The EAGLE traps MSUs that meet the provisioned tracing criteria, and the MSU remains in the trapped state for the life span of that MSU. The life span varies depending on the type of MSU. For MTP-Routed or GTT MSUs, the life span lasts until the MSU travels out of the EAGLE or is discarded. For LNP MSUs, the life span lasts until the request is processed. The response is not part of the LNP MSU. Trapping a response requires the provisioning of another MSU trace.

This command uses different parameters depending on the card type sending the MSU as shown:

- Service Module— *error, gt, lrn, tn, ssp/sspa/sspi/sspn/sspn24/sspn16, dn, entityid, imei, and imsi*
- LIM card running ANSI applications— *error, ssp/sspa, opc/opca, dpc/dpca, tlnpisuptype, and gt*
- LIM card running ITU applications— *error, sspi/sspn/sspn24/sspn16, opci/opcn/opcn24/opcn16, dpci/dpcn/dpcn24/dpcn16, and gt*

The *lrn, tn, dn, entityid, imsi, imei, and error* parameters are mutually exclusive.

The following parameters can be used once in a single MSU trace request with ONE of the mutually exclusive parameters specified above: *opc, dpc, ilsn, si, gt, ssp, h0h1, cpc, or cic/ecic*.

The *cic/ecic* parameters can be used only for ISUP traffic. The *ecic* parameter must be specified with the *cic* parameter.

For all cards supported by this command, the *error* parameter can be provisioned as the only optional parameter or in addition to any other optional parameter to trace any

messages that fail verification or processing. If the `error` parameter not specified, the default value is `error=no`.

▲ Caution:

If the system configuration approaches the maximum number of provisioned Service Module cards, then entering this command might cause an OAM to reset because of the amount of information that may be returned.

Parameters

card (mandatory)

The card location in the form of *APPL CLASS-Subsystem ID*.

Range:

APPL CLASS-Subsystem ID

APPL CLASS— atmansi, atmitu, ccs7itu, iplimi, ss7ansi, ss7ipgw, ipgwi, ipsg, vsccp
Subsystem ID— all

brief (optional)

This parameter specifies whether all information is provided for each MSU as it moves through the EAGLE.

Range:

no

All information, including data sections for the MSU, is displayed.

yes

The data sections for the MSU are not displayed.

cic (optional)

The beginning value for a CIC range.

Range:

0 - 16383

cpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

cpc

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

cpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

cpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnngc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

cpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

dn (optional)

Directory Number. This parameter is used for the ANSI41 AIQ, ATINP, G-Flex, G-Port, INP, PPSMS, or V-Flex features.

The *tn* parameter is used as the directory number for LNP.

Range:

5-15 digits

Valid digits are 0-9, a-f, A-F.

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*

Synonym:

dpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—*0-16383*

gc—*aa-zz*

m1-m2-m3-m4—*0-14* for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—*000-255*

ssa—*000-255*

sp—*000-255*

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

ecic (optional)

The end value for a CIC range.

Range:

0 - 16383

entityid (optional)

The entity ID.

Range:

1-15 digits

Valid digits are *0-9, a-f, A-F*

error (optional)

This parameter specifies whether to perform a trace on any message verification error and message processing error

Range:

yes

no

Default:

no

gt (optional)

Global title. The CdPA global title digits.

Range:

1-21 digits

Valid digits are *0-9, a-f, A-F*

h0h1 (optional)

A combination of values contained in some MSUs. The *h0* value is the code for a message group, and the *h1* value is the code for a message within that group.

Range:

0 - 255

ilsn (optional)

The incoming linkset name.

Range:

ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters.

imei (optional)

The International Equipment Identifier.

Range:

Exactly 14 digits; valid digits are *0-9, a-f, A-F*

imsi (optional)

The International Mobile Station Identifier.

Range:

5-15 digits

Valid digits are *0-9, a-f, A-F*

loc (optional)

The card location of the card as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lrn (optional)

The local routing number.

Range:

Exactly 14 digits: Valid digits are *0-9*.

mode (optional)

The type of output displayed.

Range:**default**

The default value of this parameter.

detail

Detailed information is displayed when an MSU matches the request.

debug

Complete information is displayed when an MSU matches the request.

opc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

opci (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opcni (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfnti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**opc_n24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000–255**ssa—000–255**sp—000–255***opc_n16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:*000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000--127**sna--000---15**mna---000--31***rep (optional)**

The number of MSUs to trap.

Range:*0 - 255***service (optional)**

The service offered by the EAGLE.

Range:*gflex**gport**inpmr**inpq*

smsmr

mnpsms

eir

idpr

idps

tif

tif2

tif3

tobr

aiq

si (optional)

Service indicator.

Range:

0 - 15

s1s (optional)

Signaling link selector.

Range:

0 - 255

ssp (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym

sspa

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

sspi (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

sspn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnngc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

sspn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

sspn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and the separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

tlnpisuptype (optional)

The ISUP message type.

Range:
0 - 255

tn (optional)
The directory number.

Range:
Exactly 10 digits. Valid digits are 0-9

Example

```
ent-trace:opc=1-1-1:card=SS7ANSI-ALL:rep=2
ent-trace:tlnpisuptype=01:card=SS7ANSI-ALL

all:sspn16=121-10-12:opcn16=121-10-13:dpcn16=121-10-14
```

Dependencies

The `card` parameter or the `loc` parameter must be specified.

At least one optional parameter must be specified. The `error` parameter can be specified as the only optional parameter or with any of the other optional parameters in the command.

The `gt`, `entityid`, `dn`, `imei`, and `imsi` parameters cannot have a value of *none*.

A valid value must be specified for the `card` parameter.

The only qualifier allowed for the `card` parameter is *all*.

The `gt`, `entityid`, `dn`, `imei`, `imsi`, `lrn`, and `tn` parameters are invalid for LIM cards running the SS7ANSI, ATMANSI, or SS7IPGW applications.

The `opci/opcn/opcn24/opcn16`, `dpci/dpcn/dpcn24/dpcn16`, and `sspi/sspn/sspn24/sspn16` ITU point code parameters are invalid for LIM cards running the SS7ANSI, ATMANSI, or SS7IPGW applications.

The `gt`, `entityid`, `dn`, `imei`, `imsi`, `lrn`, `tn`, and `tlnpisuptype` parameters are invalid for LIM cards running the ATMITU or IPLIMI applications.

The `opc/opca`, `dpc/dpca`, and `ssp/sspa` ANSI point code parameters are invalid for LIM cards running the IPLIMI application.

The `opc`, `dpc`, and `tlnpisuptype` parameters cannot be specified for Service Module cards.

The G-Flex feature or the Equipment Identity Register feature must be turned on before the `imsi` parameter can be specified.

If the ITUDUPPC feature is turned on, the ITU national point code must be specified as a full point code.

The EIR feature must be turned on before the `imei` parameter can be specified.

The AINPQ, G-Flex, G-Port, IDP Relay, INP, PPSMS, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the `dn` parameter can be specified.

The G-Flex, G-Port, INP, or V-Flex feature must be turned on or the ATINP, IDP Relay or any TIF feature must be enabled before the `entityid` parameter can be specified.

The `loc` and `card` parameters are mutually exclusive.

Only one of the `lrn`, `tn`, `dn`, `entityid`, `imsi`, `imei`, or `error` parameters can be specified in a single MSU trace request.

A maximum of 10 traces can be entered in the system at a time.

Values 1113 - 1118 cannot be specified for the `loc` parameter.

The J7 Support feature must be enabled before the `ssp16/opcn16/dpcn16` parameters can be specified.

Output

This example shows the output for an MTP trace:

rept-stat-ee

Use this command to generate the status report of Eagle Eyes on network cards.

Parameters**loc (optional)**

Eagle Eyes Card location.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rept-stat-ee
rept-stat-ee:loc=1102
```

Dependencies

The card location specified in the 'loc' parameter must be configured to use Eagle Eyes.

The shelf and card must be equipped.

The specified card location must not be a reserved card location.

Notes

This command can be canceled using the F9 function key or the `canc-cmd` command. See `canc-cmd` for more information

Output

This example generates the Eagle Eyes status report for the specified Network Card.

```
rept-stat-ee:loc=1101
```

```
tekelecstp 10-03-08 14:43:31 EST  EAGLE 46.0.0
LOC          STATE
-----
1101        ACTIVE
```

Command Completed.

This example generates the Eagle Eyes status report for all the EE configured Network Cards.

```
rept-stat-ee
```

```
tekelecstp 10-03-08 14:43:31 EST  EAGLE 46.0.0
LOC          STATE
-----
1101        ACTIVE
```

```
1103          INACTIVE
Command Completed.
```

rept-stat-gedti

Use this command to generate a report of the GEDTI Hub's status.

Parameters

loc (optional)

GEDTI Hub Card location.

Range:

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118*

Example

```
rept-stat-gedti
rept-stat-gedti:loc=1111
```

Dependencies

The value specified for the loc parameter must correspond to the location of an IPSM card which is configured as a GEDTI Hub.

Notes

This command can be canceled using the F9 function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This example generates the report of all the IPSM cards configured as GEDTI Hubs.

```
rept-stat-gedti

rtrv-ee-card

Use this command to display Eagle Eyes Card Configuration data from the Eagle Eyes Card (EE CARD) table. The EE CARD entry consists of a Card Loc and Eagle Eyes Card specific data.

Parameters

loc (optional)

Eagle Eyes Card location.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,
2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318,
3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318,
4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318,
5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318,
6101 - 6108, 6111 - 6118

Example

```
rtrv-ee-card  
rtrv-ee-card:loc=1102
```

Dependencies

The EE CARD table must be available.

The card location specified in the 'loc' parameter must be configured to use Eagle Eyes.

The Eagle Eyes Filter table must be available.

Notes

None.

Output

This example displays the Eagle Eyes parameters for all the EE configured network cards.

```
rtrv-ee-card  
  
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0

```

```
RTRV-EE-CARD: MASP A - COMPLTD
;
```

Legend

- **LOC---** Card location as stenciled on the shelf of the system.
- **THR---** The sending rate of the Eagle Eyes throttle task in IMT packets per second.
- **SECLIM---** The limit on the amount of time to perform the trace, in seconds.
- **PKTLIM---** The limit on the number of Ethernet frames to send.
- **KBLIM---** The file size limit of the capture file created, in kilobytes.
- **PORT---** Port being filtered.
- **ID---** Eagle Eyes Filter ID.
- **TYPE---** Eagle Eyes Filter Type.
- **SSCOPSU---** SSCOP sub-protocol or SU type filter.
- **MTP3SI---** MTP3 user filter.

rtrv-ee-flt

Use this command to retrieve Eagle Eyes Filter data from the Eagle Eyes Filter (EE FLT) table. The EE-FLT entry consists of a Filter ID and Filter specific data. It can be used to obtain the Filter ID of the filter to be associated to a card using the CHG-EE-CARD command.

Parameters

app1 (optional)

Card Application Type

Range:

ATM

IP

E1T1

fltid (optional)

Eagle Eyes Filter ID

Range:

1-200

Example

```
rtrv-ee-flt:appl=ip
```

```
rtrv-ee-flt:fltid=16
```

Dependencies

The Eagle Eyes Filter table must be available.

The specified Filter ID must exist in the EE FLT table.

The Filter ID and APPL are mutually exclusive parameters.

Notes

None.

Output

This example displays the Filter parameters for the specified Filter ID.

```
rtrv-ee-flt:fltid=85
```

```

rtrv-upgrade-config

Use this command to retrieve provisioned data used by the upgrade software during an upgrade of an in-service EAGLE from a source release to the target release.

Parameters

display (optional)

Display Indicator. This parameter indicates what type of output is to be displayed.

Range:

tblcnv

Displays a list of DMS tables that will be converted during the next upgrade. These tables are selected for conversion using the `chg-upgrade-config` command.

prtostat

This parameter is not implemented at this time.

all
Display all upgrade configuration data.

Default:
all

Example

Display a list of DMS tables that will be converted during the next upgrade.

```
rtrv-upgrade-config:display=tblcnv
```

```
rtrv-upgrade-config
```

Dependencies

None

Output

```
rtrv-upgrade-config:display=tblcnv
```

```
rlghncxa03w 07-03-13 08:15:45 EST EAGLE 37.5.0
```

```
The following tables will be converted:
```

```
FEAT_CTRL Table, ID=327
```

```
Command Completed.
```

```
;
```

```
rtrv-upgrade-config
```

```
rlghncxa03w 10-02-13 08:15:45 EST EAGLE 42.0.0
```

```
Software Access Key no longer required for this system
```

```
Configured Upgrade Threshold Type: SET
```

```
Command Completed.
```

```
;
```

send-msg

Use this command to manually simulate a system generated message from a user terminal. The parameters (not entered by the user) are defaulted to:

- Origination subsystem = *cam_active*
- Destination subsystem = *orig application ID=appl_ID_ui*
- Violation= *no report*
- Bus = *imt choice*
- Message length = *computed*

Parameters**da (mandatory)**

The destination application ID.

Range:

0 - 255

ds (mandatory)

The destination subsystem.

Range:

0 - 255

f (mandatory)

The function ID.

Range:

0 - 255

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

alt (optional)

This parameter specifies whether to use the alternate bus bit.

Range:

on

off

Default:

on

bus (optional)

The IMT bus.

Range:

a

b

Default:

a

d0 (optional)

The application data.

Range:
0 - 255

d1 (optional)
The application data.

Range:
0 - 255

d2 (optional)
The application data.

Range:
0 - 255

d3 (optional)
The application data.

Range:
0 - 255

d4 (optional)
The application data.

Range:
0 - 255

d5 (optional)
The application data.

Range:
0 - 255

d6 (optional)
The application data.

Range:
0 - 255

d7 (optional)
The application data.

Range:
0 - 255

d8 (optional)
The application data.

Range:
0 - 255

d9 (optional)
The application data.

Range:
0 - 255

len (optional)

The message length in bytes.

Range:

0 - 65535

Default:

Calculated

oa (optional)

The originating application ID.

Range:

0 - 255

Default:

2

os (optional)

The originating subsystem.

Range:

0 - 255

Default:

0

si (optional)

This parameter allows the service ID field in the violation indicator to be set.

Range:

0 - 31

Default:

0

sut (optional)

The signal unit type.

Range:

0 - 9

Default:

2

Example

```
send-msg:loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

```
send-msg:loc=1113:ds=2:oa=h'17:da=h'30:f=11
```

```
send-msg:loc=1116:ds=2:oa=h'17::da=h'30:f=12
```

```
send-msg:loc=1101:ds=1:da=65:f=27:d0=78:si=3
```

```
send-msg:loc=6212:ds=2:oa=h'17:da=h'30:f=11
```

```
send-msg:loc=6312:ds=1:da=64:f=171
```

Dependencies

The value of the `da` parameter must be valid.

The destination location must be equipped to receive messages.

Card locations `xy09` and `xy10` cannot be used with bus `b` and bus `a`, respectively.

The value of the `ds` parameter must be valid.

Notes

The `bus` and `sut` parameters must be used when sending a message to a MUX card.

If the `bus` parameter is not specified with a MUX card location on imt B (such as `xy10`), the bus `b` value is used instead of the bus `a` value.

Output

```
send-msg:loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

set-mem

Use this command to set values in memory in the communication and application processors. If a card is reloaded, these memory changes are lost.

Parameters

addr (optional)

The address, in the form of *segment–offset*.

Range:

```
segment–offset
segment—h'00–h'fff
offset—h'00–h'fff
```

byte (optional)

The byte value to write to the specified memory location(s).

Range:

```
0–h'00–h'ff
```

card (optional)

The card location, in the form of *GPLID–Subsystem ID*.

Range:*GPLID—Subsystem ID**GPLID— atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility**Subsystem ID— a, b, act, stb, all*

The OAMHC GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the *all* subsystem ID is valid.**dword (optional)**

A double word value to write to the specified memory location(s).

Range:*0-h'00-h'ffffff***fill (optional)**

The number of times that the value is to be written to successive addresses.

Range:*0 - 65535***Default:***1***imt (optional)**

The IMT address.

Range:*0 - 254***loc (optional)**

Location. The card location as stenciled on the shelf of the system.

Range:*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115***mask (optional)**

The mask that selects the bits that are to be included in the operation (op).

Range:*0-0xFFFFFFFF***Default:***0xFFFFFFFF***op (optional)**

Operation. The operation performed in order to arrive at the final value in the memory location.

Range:*replace**and**or**x***Default:***replace***paddr (optional)**

The physical offset of the memory address.

Range:*h'00–h'ffffff***proc (optional)**

The processor type.

Range:*appl*

Application processor

com

Communication processor

Default:*appl***word (optional)**

A word value to write to the specified memory location(s).

Range:*h'00–h'fff***Example**

```
set-mem:loc=1109:paddr=h'201000:byte=0:fill=1024
```

```
set-mem:card=hipr2-all:paddr=h'202000:word=h'2a:op=and:mask=h'fff
```

Dependencies

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The `card` location specified by the `loc` parameter must be in the database.

All of the subsystem values can be specified with the OAMHC GPLID. The other GPLID values can be specified only with the *all* subsystem value.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the `loc` parameter.

The `byte`, `word`, or `dword` parameter must be specified.

Only one of the `byte`, `word`, and `dword` parameters can be specified in the command.

The `paddr` parameter cannot be specified for an SS7 LIM card.

Memory Type of FWORD is NOT supported at this time.

The `addr` and `paddr` parameters cannot be specified together in the command.

The value specified for the `fill` parameter cannot exceed 65535.

Notes

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

Output

```
set-mem:loc=6205:paddr=h'0345fe:byte=2
```

```

Pass-Through Commands

This chapter introduces the pass-through commands and describes the command conventions. The pass-through commands are listed in alphabetical order.

These commands are intended for use by My Oracle Support (MOS) personnel and authorized engineering personnel in the operating companies. Documentation might not include all options and/or definitions of these commands.

▲ Caution:

These commands are to be used precisely as they are described in this chapter, and only under the direction of My Oracle Support (MOS) personnel. Any other use of these commands can result in a system failure.

Command Conventions

Pass-through commands are passed through the OAM and sent to individual cards for processing.

An example of a pass command is:

```
pass:loc=1201:cmd="connmgr -c"
```

The `cmd` parameter contains the pass-through command (`connmgr -c`) within the double quotes.

Pass-through commands consist of two types of tokens: command name and command options. Tokens are whitespace-delimited and null-terminated. The generalized format of a pass-through command is:

```
command_name option1 option2....option n-1.... option n
```

In the example, the *command_name* is `connmgr` and the option is `-c`.

Options and option parameters are made up of a specific character string or a variable. The variable is to be replaced with a value selected from a range of values. Option variables and option parameter variables are underlined. For example, the `arp` command option `-d` has the parameter variable IPaddress. Specify the IP address as in the command `arp -d 192.9.200.44`. Do not enter the underlined text; enter a value instead.

Help information for each pass-through command can be obtained by using the option `-h` on any command.

arp

This command is used to display and modify the internet to ethernet address translation tables used by the address resolution protocol.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `arp` command option `-d` has the parameter *IP address*. The IP address must be specified for which an ARP entry will be deleted, as in the command `arp -d 192.9.200.44`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a`

This option displays all entries in the ARP table.

`-d IP address`

This option deletes an ARP entry for the specified IP address.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

`-f`

This option flushes all entries from the ARP table.

`-h`

This option displays help (usage) information for the command.

`-s IP addressMAC address`

This option creates an ARP entry for the specified IP address and ethernet address.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. For example, *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine’s host number.

Range:

6 hexadecimal numbers separated by colons; each number in the range 0 - FF. The MAC (media access control) address is an ethernet address with the format *x:x:x:x:x:x*, where *x* is a hexadecimal integer from 0 to FF. For example, *08:00:20:1b:0f:f2*.

Example

```
arp -a
arp -s 192.9.200.44 08:00:20:1b:0f:f2
arp -d 192.9.200.44
arp -f
```

Dependencies

Only one of the options can be specified at a time.

The `arp` command with no options displays all of the current ARP cache entries.

Notes

The `arp` command is executed through the `pass` command.

Output

```
pass:loc=1105:cmd="arp" or
pass:loc=1105:cmd="arp -h"

Command Accepted - Processing

aslog

This command is used to display the state changes for a specified Application Server (AS).

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `aslog` command has the parameter `asname`. The Application Server name must be specified for which the log will be displayed, as in the command `aslog as1`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`asname`

This option specifies the Association Server name for the display.

`-h`

This option displays help (usage) information for the command.

Example

```
aslog as1
```

Dependencies

None

Notes

None

Output

```
pass:loc=1105:cmd="aslog as1"
```

```
Command Accepted - Processing
```

```

    rlghncxa03w 00-01-27 08:10:00 EST  EAGLE5 31.6.0

assocrtt

This command is used to display the SCTP round trip times for a specified association. Minimum, maximum, and average times are kept for each open association. The Retransmission Mode (RFC or LIN) and the configured Minimum and Maximum Retransmission Timeout limits are also displayed.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `assocrtt` command has the parameter `aname`. The association name must be specified for which the information will be displayed, as in the command `assocrtt c7000`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`aname`

This option specifies the association name for the display.

`-r`

This option resets all statistics for the specified association name.

Example

```

assocrtt c7000
assocrtt c7000 -r

```

Dependencies

None

Notes

This command does not indicate whether or not the socket is congested.

Output

```

connmgr

This command is used to generate reports about the status of the connection manager.

Options

-d

This option displays a connection manager data summary. For IPSPG cards, this report contains summary information and does not contain information for individual signaling links.

-h

This option displays help (usage) information for the command.

-i

This option displays SCTP instance and association data.

-l
This option displays the connection manager event log.

-n
This option displays the SCTP notification log.

-r
This option resets the connection manager event log.

Example

```
connmgr -r
```

```
connmgr -c
```

```
connmgr -s
```

Dependencies

Only one of the options can be specified at a time.

If no options are specified, usage information is displayed.

Notes

The `connmgr` command is executed through the `pass` command.

Output

```
pass:loc=1107:cmd="connmgr" or
pass:loc=1304:cmd="connmgr -h"
```

```
Command Accepted - Processing
```

```
rlghncxa03w 08-01-21 15:29:46 EST EAGLE5 38.0.0
pass:loc=1304:cmd="connmgr -h"
Command entered at terminal #1.
```

```
;
```

```
rlghncxa03w 08-01-21 15:29:46 EST EAGLE5 38.0.0
PASS: Command sent to card
```

```
;
```

```
rlghncxa03w 04-07-02 15:29:46 EST EAGLE5 31.6.0
Usage: CONNMGR [-d] [-h] [-i] [-l] [-n] [-r]
```

```
Options:
```

```
-d   Display connection manager data summary
-h   Displays this message
-i   Displays instance data
-l   Display the connection manager event log
-n   Display the SCTP notification log
-r   Reset the connection manager event log
```

```
;
```

```
pass:loc=1107:cmd="connmgr -d"
```

The Connection Manager Data Summary displays all provisioned signaling link ports.

In this example, signaling link port (slk) B is valid only for IPLIMx cards:

```
Command Accepted - Processing

    rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
    pass:loc=1107:cmd="connmgr -d"

Event descriptions for `connmgr -l`

- `Ink-act`-The signaling link (slk) was activated.
- `Ink-deact`-The signaling link (SLK) was deactivated.
- `adptr-clc`-An association was closed.
- `admin-open`-An association was opened via admin and available for connection.
- `admin-clc`-An association was closed via admin and not available for connection.
- `conn-rcvd`-A connection request has been received from a client.
- `conn-rfsd`-Connection request was refused by the server.
- `conn-grnt`-Connection was granted by the server.
- `conn-fail`-Connection request made by the client has failed.
- `conn-made`-A connection has been made between the client and server.
- `pause-rcv`-A connection received a pause event.
- `resume-rcv`-A connection received a resume event.
- `conn-cnsgd`-An association has become congested.
- `conn-uncng`-An association is no longer congested.
- `host-unreslvd`-A remote host is unresolved.
- `undef-evnt`-An undefined event has come in.

Event reasons for `connmgr -l`

- `Ink-not-actv`-The SLK (signaling link) is not active.
- `no-sock-avail`-No association is available.
- `unknown-sock`-Unknown association.
- `addr-in-use`-Address is in use.

- net-unreach-The network is unreachable.
- net-reset-Network dropped connection on reset.
- sw-abort-Software caused connection abort.
- conn-reset-The connection was reset by the peer.
- no-buffers-No buffer space available.
- is-connected-Association is already connected.
- not-connected-Association not connected.
- shutdown-Can't send after association shutdown.
- too-many-refs-Too many references : can't splice.
- timed-out-Connection timed out.
- refused-connection refused.
- net-down-The network is down.
- txt-busy-Text file is busy.
- loop-Too many levels of symbolic links.
- host-unreachb-Host unreachable.
- not-blk-Block device required.
- host-down-Host is down.
- host-unreslvd-Host is unresolved.
- host-mismatch-Remote Host validation rule fails.
- undef-reason-Undefined reason.

Notification descriptions for `connmgr -n`

- `init-recvd`-An INIT chunk was received to start an association.
- `assoc-up`-An association is up.
- `assoc-down`-An association is taken out of service.
- `intf-down`-Interface on an association is down and out of consideration for selection.
- `intf-up`-Interface on an association is up and now back in consideration for selection.
- `dg-fail`-The given datagram can not be delivered to the peer.
- `sdata-err`-A datagram was sent on a non-open stream.
- `assoc-abrt`-An association has been taken down ungracefully.
- `peer-strm`-Peer opened stream notification.
- `strm-ok`-Notification that the stream opened ok.
- `assoc-rst`-A Notification was received that an association was restarted.
- `hb-resp`-A response to a heartbeat request.
- `data-msg`-A DATA message has arrived. An SCTP packet includes user data encapsulated within SCTP DATA chunks.
- `host-mismatch`-Remote Host validation rule fails.
- `host-unreslvd`-Host is unresolved.
- `rem-unreslvd`-Remote host is unresolved.
- `invalid`-Invalid/Unknown event.

ftptest

Use this command to send a test file to a configured FTP server that is used for the Measurements Platform feature

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `ftptest` command option `-a` has the parameter `appl`. The FTP registered application to be tested can be specified, as in the command `ftptest -a meas`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-h`

This option provides help information for the command.

`-a appl`

This option specifies the FTP registered application to be tested.

Range:

meas

The Measurements Platform application

Example

```

ftptest
ftptest -h

ftptest -a meas

```

Dependencies

None

Notes

The `ftptest` command is executed through the `pass` command.

The specified card location must have an IP port configured to an FTP server using the `ent-ftp-serv` command, and the card must have its IP port configured using the `chg-ip-lnk` command.

Output

```

pass:loc=1105:cmd="ftptest-h"
or

```

```
pass:loc=1105:cmd="ftptest"
```

```
Command Accepted - Processing
```

```

  Diag Msg:   Server Connection Error

FTPTEST: Command Complete

;
```

linkinfo

This command is used to display the state of a signaling link and to retrieve/clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card. For IPLIMx cards, the *a:a7 - b:b7* signaling links are supported. For IPSP ENET cards, the *a:a15 - b:b15* signaling links are supported. For IPSP SLIC cards, the *a:a63 - b:b63* signaling links are supported.

For E5-E1T1-B cards, the *a:a31 - b:b31* signaling links are supported. For E5-ATM-B cards, the *a, a1, b* links are supported. E5-E1T1-B and E5-ATM-B cards only support the `-c` option, the output will display the buffer information and congestion levels information.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `linkinfo` command option `-i` has the parameter *event*. The event to be included in the report can be specified, as in the command `linkinfo a -a -i m2pa`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**Note:**

For E5-E1T1-B and E5-ATM-B cards, `-c` and `-h` are the only valid options.

`-h`

This option provides help information for the command.

`port`

This option specifies the signaling link port.

Range:

a, A1: A63-B, B1:B63

`-a`

This option displays the adapter layer interface (ALI) log for the specified signaling link. For M3UA associations the `link -a` option is used to display the UA event log. This command logs information on an association basis. The **link** parameter is used to obtain this report on IPSPG instead of the association name. This information is currently provided by the `ualog` command on IPGWx cards.

`-c`

This option displays congestion tuning parameters for M3UA and M2PA links. The report is enhanced to include card level congestion thresholds and the high-water mark for IPSPG cards.

This option also displays congestion levels for E5-E1T1-B and E5-ATM-B cards.

`-i event`

This option includes (does not filter) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the `ali` and `link` logs. Valid events for the ALI event log are *ua* and *service*.

Range:

ali, all, data, l2l3, l3l2, m2pa, state, ua, service
all-include all events

`-m`

This option displays acknowledgment times on an M2PA connection (minimum, maximum, weighted average, last recorded). For IPSPG cards, this measurement is supported for only IPSPG-M2PA links.

`-r`

This option resets (clears) the event log for the specified signaling link. This option is valid only with the `-a` option or `-l` option.

`-s`

This option displays the state information for the specified signaling link. For the IPSPG cards, this option is enhanced to display M3UA signaling link status.

`-v`

This option displays the link event filter configuration.

`-x event`

This option excludes (filters) a link event in the log. For IPSPG cards, this option may be used to include or exclude events for the `ali` and `link` logs. Valid events for the ALI event log are *ua* and *service*.

Range:

ali, all, data, l2l3, l3l2, m2pa, state, ua, service
all-exclude all events

Example

Provide help information for the command.

```
pass:loc=1301:cmd="linkinfo -h"
```

Set the filter to include ua events in the ua log report.

```
pass:loc=1304:cmd="linkinfo a -i ua"
```

Set the filter to include service events in the ua log report.

```
pass:loc=1304:cmd="linkinfo a -i service"
```

Display the ua log report for signaling link a.

```
pass:loc=1304:cmd="linkinfo a -a"
```

Display the ALI event log for signaling link a1.

```
pass:loc=1301:cmd="linkinfo a1 -a"
```

Reset/clear the link event log for signaling link a1.

```
pass:loc=1301:cmd="linkinfo a1 -l -r"
```

Clear the ua log report for signaling link a.

```
pass:loc=1304:cmd="linkinfo a -a -r"
```

Display the state information for signaling link a1.

```
pass:loc=1301:cmd="linkinfo a1 -s"
```

Display acknowledgement times for an M2PA connection on signaling link b1.

```
pass:loc=3315:cmd="linkinfo b1 -m"
```

Display congestion tuning information for an IPSPG-M3UA signaling link and Display congestion levels and buffer information for signaling links on E5-E1T1-B and E5-ATM-B cards.

```
pass:loc=1301:cmd="linkinfo a -c "
```

Dependencies

None

Notes

None

Output

This example shows the output for the help command on IPSPG cards:

```
pass:loc=1301:cmd="linkinfo" or
```

```
pass:loc=1301:cmd="linkinfo -h"
```

```
tekelecstp 16-05-25 12:38:16 EST EAGLE5 46.4.0.0.0-69.3.1
```

```
PASS: Command sent to card
```

```
;
```

```
tekelecstp 16-05-25 12:38:16 EST EAGLE5 46.4.0.0-69.3.1
```

```
Usage: LINKINFO port [-a [-r]] [-h] [-l [-r]]
      [-m [-r]] [-s] [-v] [-x event]
```

Options:

```
link      Signaling link port: a, b, a1, b1,.....a63, b63
-a        Display the ALI event log for a signaling link
-c        Display Congestion Tuning Information for a signaling link
-h        Displays this message
-i event  Include (do not filter) a link event type in the log
-l        Displays the event log for a signaling link
-m        Display Link Measurements
-r        Resets the specified event log for a signaling link
-s        Displays the state information for a signaling link
-v        View the link event filter configuration
-x event  Exclude (filter) a link event type from the log
```

```
Valid 'event' for link event log is ali, all, data, 1213, 1312, m2pa,
state
```

```
;
```

```
rlghncxa03w 04-07-29 11:31:09 EST EAGLE5 31.6.0
```

```
LINKINFO command complete
```

```
;
```

This example shows the output for the help command on E5-E1T1-B and E5-ATM-B cards:

```
pass:loc=1101:cmd="linkinfo" or
```

```
pass:loc=1101:cmd="linkinfo -h"
```

```

end of report

msucount

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and IP connections. These counts can be reported and reset at the same time to get accurate counts for longer periods of time. In addition to MSUs transmitted and received, the command also reports statistics on packets related to MTP Primitives and on discarded transmit and receive data.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msucount` command option `-l` has the parameter port. The link for which counts will be displayed can be specified, as in the command `msucount -l a1`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a`

This option is used to display IP connection statistics for a specific association. When `-a aname` is specified on the same line as `-k rtkey`, the output is assumed to be routing key output. When `-a aname` is specified on the command line without `-k rtkey`, association statistics output is generated.

For IPSPG cards, this option is enhanced to include receive and transmit counts for M3UA SSNMs (DAUD messages and M3UA SSNM PDUs) and replicated M3UA PDUs.

`-b`

This option is used to display signaling link bytes statistics. The signaling link bytes report displays data for measurements on a per-signaling-link basis for both the transmit and receive directions. The report can display link statistics for a specified signaling link number. If a link is not specified, the report displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx and IPSPG cards. If a signaling link is valid for the card and application type, but is unequipped, then the report displays all zeros.

`-h`

This option is used to provide help information for the command.

`-f`

This option is used to display a full report (IPGWx application only).

`-k rtkey`

This option is used to specify the routing key for which the counts will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

This option is not supported for the IPSPG cards.

The `-p` modifier can be specified to identify the point code type of the routing key that follows the `-k` option in the command.

The `-p` modifier is not supported for IPLIMx and IPSPG cards.

The rtkey variable is optional when used with `-t default`, and mandatory for all other cases.

The following formats are valid for the routing key that follows the `-k` option in the command:

- n-c-m:s:n-For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is 3 or *sccp*. The subsystem (*n*) is in the range 0-255.
- n-c-m:s-For DPC, SI, type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is in the range 0-2, 4, or 6-15. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.
- n-c-m:s:no-co-mo:cs:ce-For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is 5 or *isup*. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range 0-255. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range 0 to 16363.

-l

For IPSPG cards, this option displays the link report for all equipped signaling links on the card.

-l link

This option is used to display counts for links. The link report optionally allows display of link statistics for a specified port.

The link report contains data, per link, for MSUs (tx/rcv), MSU bytes (tx/rcv), MGMT msgs (tx/rcv), and discarded data (tx/rcv).

For the IPSPG card, the M2PA link report is the same as the IPLIMx M2PA report. The M3UA link report contains an additional detail line for non-discard pegs for SS7 SNM and Replicated M3UA PDU counts.

Range:

a, b, a1, b1, a2, b2, a3, b3a:a63-b:b63

If a port is not specified, `msucount` displays link statistics for port *a* for IPGWx links, and port *a* and port *b* for IPLIMx links.

The `msucount` link statistics report contains all zeros for a port that is valid for the card and application type but is unequipped.

The range *a:a15-b:b15* is valid for IPSPG ENET cards.

The range *a:a63-b:b63* is valid for IPSPG ENET cards.

-l

link -f

This option displays the full link report. For IPSPG-M2PA links, this option displays the same report as the `-l <link>` option. For IPSPG-M3UA links the report includes the data from the `-l <link>` report and includes an additional detail line displaying tx/rcv discards counts and discard data.

-p point code type

This option modifier can be specified along with the `-k` option to identify the point code type (ANSI, ITU international, ITU-national, 24-bit ITU national, 16-bit ITU national, ITU international spare, and ITU national spare) in the routing key that follows the `-k` option in the command.

Range:

ansi, itui, itun, itun24, itun16, ituis, ituns

-r

This option is used with other options to reset counts at the same time of reporting them.

`-t keytype`

This option is used to display the routing key type (IPGWx only).

`-x`

The routing context is an index that uniquely defines a routing key associated with an SUA or M3UA AS. For the IPGS card, the option displays a link report for all signaling links on the card that are members of the linkset that contains the specified routing context value (equivalent to the **msucount -l** report. The `-x` option is used as an alternative to the `-k` option to identify the routing key by specifying its routing context in the command line.

Note:

The `-x rc` option can only be used to specify routing keys containing M3UA/SUA associations.

Example

Link counts only. Displays brief count for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

```
msucount -l
```

Link counts only, for signaling link port a1.

```
msucount -l a1
```

Full/detail report for signaling link a for IPGWx.

```
msucount -l -f
```

Counts for the specified association only.

```
msucount -a association name
```

Counts for first matching routing key

```
msucount -k 10-10-10:3:16
```

Counts for the routing key report using the routing context.

```
msucount -x 5
```

Counts for first matching routing key and an associated association.

```
msucount -a association name -k rtkey
```

Counts for the default routing key

```
msucount -k -t default
```

Counts for a matching partial routing key.

```
msucount -k 3-3-3 -t partial
```

Counts for counts for link only. Displays brief report for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

```
msucount
```

Resets the signaling link count measurements.

```
msucount -r
```

Brief version of help text.

```
msucount -h
```

Full version of help text.

```
msucount -h full  
Counts for link and first matching routing key
```

```
msucount -b  
Byte report for signaling link A for IPGWx cards. Byte report for all equipped signaling  
links for IPLIMx cards.
```

```
msucount -b -link  
Byte report for specified signaling link.
```

```
msucount -l -k 10-10-10:3:16  
Use with other parameters to display and reset counts. Valid with the above  
combinations.
```

```
msucount -l -r
```

```
msucount -r
```

```
msucount -x 5 -r
```

Examples showing the correct syntax to specify partial or default keys, or to specify a key by routing context:

```
pass:loc=1105:cmd="msucount -k 5-5-1:5:6-6-6 -t partial
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:5 -t partial"
```

```
pass:loc=1105:cmd="msucount -p ITUI -t partial -k 1-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351-gr
```

```
pass:loc=1105:cmd="msucount -t partial -k :2 "
```

```
pass:loc=1105:cmd="msucount -k -t default"
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN16 -t partial -k 1-2-1"
```

Examples of other valid routing key inputs:

```
pass:loc=1105:cmd="msucount -r -k 5-5-6:5:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:4:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:3:5 -a assoc1"
```

```
pass:loc=1105:cmd="msucount -r -p ITUN24 -k  
15-105-16:5:15-105-17:1:1000"
```

Dependencies

At least one option must be specified.

Notes

The `msucount` command is executed through the `pass` command.

Combinations of the `-l`, `-a`, `-k`, `-t`, `-x` and `-b` options provide count information based on the entered combination.

If no parameters are specified, then the `-l` brief report is output.

Multiple reports are not supported with the IP Signaling Serviceability feature.

For the SS7IPGW and IPGWI GPLs, 4 types of reports can be generated: the link report, the routing key report, the IP connection statistics report, and the signaling link bytes report. For the IPLIMI card, the routing key report is not supported.

The 4 reports are:

1. The link report (`-l` option) contains statistics per link about MSUs (transmit/receive), MSU bytes (transmit/receive), MGMT messages (transmit/receive), and discarded data (transmit/receive).
2. The routing key report (`-k` option) contains statistics for a specific routing key about MSUs (transmit), MSU bytes (transmit), and discards on the transmit path for the routing key.

A list of one or more IP connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also displayed. If `-a aaname` is in the same input command with `-k rtkey`, only the connection association data for the specified connection is displayed. If `-a aaname` is not specified with `-k rtkey`, all connection associations are listed. If `-x rc` is specified, only the connection association data for the specified routing context is displayed.

The `-p` (point code type) modifier option can be used with the `-k` option to specify the point code type of the routing key that follows the `-k` option in the command.

For the `-k` options, the routing key must be an exact match of a routing key that exists in the static Routing Key table.

3. The IP connection statistic report (`-a aaname` option) contains statistics for a specified IP connection about MSUs (transmit/receive), MSU bytes (transmit/receive), and discarded data (transmit/receive).

When the `-a aaname` option is specified in the command with the `-k` option, the output type is assumed to be routing key output.

When the `-a aaname` option is specified in the command without the `-k` option, association statistics output is generated.

4. The signaling link bytes report (`-b` option) provides the following information for both IPGWx and IPLIMx cards: bytes/sec for the last second, average MSU size during the last second, and maximum one-second average MSU size since card load time or reset. For the IPLIMx cards, the report also provides the following information: sum of bytes/sec for the last second for all signaling link, average MSU size for last second for all signaling links, maximum average MSU size since load time or reset for all signaling links, and maximum MSU size since load time or reset for all signaling links.

The link report, routing key report, and IP connection statistics report (IPGWx only) can display individual transmit MSUs that were discarded at layer 2. The first 32 bytes of the MSU transmit data that is discarded is stored beginning at the SIO bytes. If the MSU is not 32 bytes long, the remaining bytes are set to 0.

The signaling link bytes report optionally allows display of link statistics for a specified signaling link number. If a link is not specified for the bytes report, the `msucount` command displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx cards.

The signaling link bytes report contains all zeros for a signaling link that is valid for the card and application type but that is unequipped.

The link and IP connection statistics reports can display individual receive packets that were discarded at layer 2. If the storage space is larger than the service data, the extra bytes are set to 0.

The reset option (`-r`) resets the specified measurements. This option can be added to any command.

Output

In these examples, the hexadecimal output for discarded *transmit* data represents data stored beginning at the SIO bytes through the first 32 bytes of the MSU. If the MSU was less than 32 bytes, the remaining bytes are represented by zeros.

Stored *receive* data takes the following format:

- Bytes 13-x = Service data. If the storage space is greater than the size of the service data, the remaining bytes are zeroed.

Output Specific to SS7IPGW and IPGWI

Either brief or full help reports can be displayed. A full help report is generated by adding the `full` (`-f`) option to the command line.

This example shows a brief help report:

```
pass:loc=1105:cmd="msucount -h"

tekelecstp 10-09-10 11:50:34 EST  EAGLE 43.0.0

Usage: msucount [ [-l [link]] | [-b [link]] ] |
               [ [-a aname] ] |
               [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
               [-f] [-r] [-h [full]]

Options: -l  display signaling link report
         -b  display signaling link bytes report
         -a  display association report
         -x  routing key report using routing context
         -k  routing key report using MTP3 parameters
            rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
         -p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS,
ITUNS)
         -t  routing key type
            keytype :: (<full>, partial, default)
         -f  display full report
         -r  resets the specified counts
         -h  display command help (brief or full)

tekelecstp 10-09-10 11:50:34 EST  EAGLE 43.0.0
MSUCOUNT command complete

;
```

This example shows a full help report:

```
pass:loc=1105:cmd="msucount -h full"
```

```
tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0

         -f display full report
         -r resets the specified counts
         -h display command help (brief or full)
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUN16	U-S-M	Non-Spare ITU National, 16-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

SS7 Traffic Partition	RTKEY Parameter	Example
Any User Part to DPC 1-1-1	-k 1-1-1	-t partial
SCCP to DPC 1-1-1	-k 1-1-1:3	-t partial

Routing Key Report Output Examples

The routing key report contains data about MSUs (tx), MSU bytes (tx), and discards on the transmit path for the routing key. A list of one or more connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also presented. If `-a aname` is in the same input command with `-k rtkey`, only the connection association data for the specified connection is displayed. If `-a aname` is not specified with `-k rtkey`, all connection associations are listed. If `-x rc` is specified, only the connection association data for the specified routing context is displayed.

Note:

For IPGWx, `-k rtkey` is optional when used with `-t default`, and mandatory for all other cases.

The report output itself does not display the routing key that was entered, other than an exact copy of the command line being generated as part of the output.

Partial routing keys (where some fields in the MSU are ignored with respect to finding a routing key to use for the MSU) and default keys can be specified in the command. The output does not change for these key types; the only difference is the routing key syntax (`-p`) that must be processed as part of identifying the partial and default keys. (See the Example section of this command description for syntax examples).

This example shows a routing key report for an ANSI routing key that specifies the Routing Key table:

```
pass:loc=1105:cmd="msucount -k 5-5-1:3: -t partial"
```

```
tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0

bytes/ sec	avg msu	max avg msu	max msu	bytes/ sec	avg msu	max avg msu	max msu
444400	2020	2020	2020	444400	2020	2020	2020

```
MSUCOUNT: command complete
```

Output Specific to IPLIMI

Note:

The routing key report is not supported for IPLIMx applications. The -k, -t, -p, -x options are not supported because the IPLIMx card does not use routing keys.

Note:

The IPLIMx reports include all equipped signaling links instead of just ports A and B. These reports include the transmit/receive counts alongside each other for the link case.

This example shows help for using the command:

```
pass:loc=1103:cmd="msucount -h" or
pass:loc=1103:cmd="msucount"
```

               [ [-a aname] ]
               [-r] [-h]
```

```
Options: -l display signaling link report
         -b display signaling link bytes report
```

```

-a display association report
-r resets the specified counts
-h display command help

tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0
MSUCOUNT command complete

;

```

This example shows a link report for an IPLIMx card with 2 M2PA links.

The report does not contain MTPP or RGRP MGMT statistics, because those capabilities are not supported on the IPLIMx applications. The report also does not contain tx/rcv discard data, because there are no discards performed at layer 2 of the IPLIMx applications. The IPLIMx card can also contain 2 links per card; the output contains link data for each link.

```

pass:loc=1301:cmd="msucount"
or

```

```

pass:loc=1301:cmd="msucount -l"

```

```

```
MSUCOUNT: command complete
```

Enhanced Reset Option

The reset option resets the specified measurements without displaying `msucount` output. The default is to reset the link measurements report.

This example shows resetting link measurements:

```
pass:loc=1305:cmd="msucount -l -r"
```

or

```
pass:loc=1305:cmd="msucount -r"
```

```
eagle10212 06-06-01 08:50:47 EST EAGLE 35.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Link measurements have been reset.
```

```
MSUCOUNT: command complete
```

This example shows resetting Routing Key measurements:

```
pass:loc=1305:cmd="msucount -x -5 -r"
```

```
eagle10212 06-01-05 08:50:47 EST EAGLE 35.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Routing Key measurements have been reset.
```

```
MSUCOUNT: command complete
```

Output specific to IPSG Cards

The option to display a full help report is not supported for IPSG cards.

```
pass:loc=1304:cmd="msucount -h"
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
Usage: msucount [ [-l [link]] | [-b [link]] | [-l link -f] ] |
               [ [-a aname] ]
               [ [-x rc] ]
               [-r] [-h]
```

```
Options: -l display signaling link report
         -b display signaling link bytes report
         -a display association report
         -x display routing context report
         -f display full report
         -r resets the specified counts
         -h display command help
```

;

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
MSUCOUNT: command complete
```

For link reports on IPSPG signaling links, if a specific link is not requested, then counts for all equipped signaling links on the card are displayed. The report includes counts for up to 32 links per card. The `-l <link>` report adds counts for *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, and *SS7 SNM Counts sent* for M3UA links.

This example shows a brief measurements report:

```
pass:loc=1303:cmd="msucount -l"
```

```
tekelecstp 16-05-25 12:38:16 EST EAGLE5 46.4.0.0.0-69.3.1
pass:loc=1303:cmd="msucount -l"
```

```
MSUCOUNT: MSU Count Report
```

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
A	0	3	72	0	0	0
B	0	62	1916	0	62	1916
A41	0	2	48	0	0	0
A2	0	1	24	0	0	0
A3	0	0	0	0	0	0
A54	0	0	0	0	0	0
-----				-----		
	0	68	2060	0	62	1916
-----				-----		

```
MSUCOUNT: command complete
```

This example shows a measurement report for an IPSPG-M3UA signaling link:

```
pass:loc=1303:cmd="msucount -l a"
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
MSUCOUNT: MSU Count Report
```

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
A	0	3	72	0	0	0

Replicated M3UA PDU counts		SS7 SNM counts
sent	rcvd	sent
0	0	3

This example shows a measurement report for an IPSP-M2PA signaling link:

```
pass:loc=1303:cmd="msucount -l b"
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
MSUCOUNT: MSU Count Report
```

SLK Transmit counts				SLK Receive counts		
slk	rate	msus	bytes	rate	msus	bytes
B	0	62	1916	0	62	1916

```
MSUCOUNT: command complete
```

The `msucount -l <link> -f` report displays the same information as the brief report (`msucount -l <link>`) for IPSP-M2PA links. For IPSP-M3UA links, the `msucount -l <link> -f` report displays both the information from the brief report and the *discarded tx due to M3UA Conversion Error*, *discarded rcv due to M3UA PDU Error*, *discarded rcv due to Management Blocking*, and *discarded rcv due to Lrg BICC not supported* discard counts.

This example shows a full report for an IPSP-M3UA signaling link when discard counts are not received:

```
pass:loc=1303:cmd=msucount -l a -f
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

MSUCOUNT: command complete

;

IP Connection Report

The IP connection statistic report for an IPSPG card contains data regarding MSUs (tx/rcv), MSU bytes (tx/rcv), and discarded data (tx/rcv) for a specific socket or an association. The `-a <aname>` report for M3UA links adds the *Replicated M3UA PDU*

sent, Replicated M3UA PDU rcvd, SS7 SNM sent, Discarded rcv due to SS7 SNM not supported, and Discarded rcv due to no SS7 SNM capacity.

The existing *Discarded rcv due to M3UA PDU error* and *Invalid rcontext counts* are also supported.

This example shows an aname report:

```
pass:loc=1303:cmd="msucount -a a1303a"
```

```

Link Reports

The link report contains the statistics of the equipped links (TDM/ATM) on the SS7HC/ATMHC cards collected on a per link basis.

An SS7HC/ATMHC generic link report is reported if the MSUCOUNT command is entered without any parameters. The output contains data regarding MSU bytes (tx/rcv), %bandwidth used (tx/rcv), MSUs (tx/rcv) collected during the last full second per link. Total MSU counts (tx/rcv) per link since the card load time or the last reset are also displayed.

```

If the `-l slk` option is specified, then the statistics for the specified link is shown (if the link is equipped).

On cards running SS7HC GPL, in addition to the information shown in the Generic and Full reports, data is collected for the error counts (MSUs and SUs) and retransmits pegged during the last full second. Averages for the MSUs, percent bandwidth, bytes transmitted and received for the last rolling sampling period, and the maximum of these averages since the card was loaded or the data was reset is also displayed.

msuroute

This command is used to provide a list of all routing keys currently configured on an SS7IPGW/IPGWI card that could be used to route a particular MSU. With 3 types of routing keys (fully specified, partial and default) the complexity associated with figuring out how a particular MSU would be routed at any point in time is not trivial. This command provides output to help determine how MSUs will be routed based on current conditions.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msuroute` command option `-k` has the parameter `rtkey`. The full routing key must be specified for the MSU for which the summary will be displayed, as in the command `msuroute -k 5-5-5:5:6-6-6:1100`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-h`

This option is used to provide help information for the command.

`-k rtkey`

This option is mandatory in the command to specify the full routing key for the MSU for which the summary will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

The `-p point code type` modifier is used to identify the format of the routing key that follows the `-k` option in the command.

The following are valid formats for the routing key that follows the `-k` option in the command:

- `n-c-m:s:n`—For DPC, SI, SSN type routing keys. The network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is 3 or *sccp*. The subsystem (n) is in the range 0-255.
- `n-c-m:s`—For DPC, SI, type routing keys. The network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is in the range 0-2, 4, or 6-15. There is no subsystem.
- `n-c-m:s:no-co-mo:cs:ce`—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is 5 or *isup*. There is no subsystem. The OPC network, cluster and member (no-co-mo) are in the range 0-255. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range 0 to 16363.

`-p point code type`

This option modifier is used to identify the point code type (ANSI, ITU international, ITU national, 24-bit ITU national, 16-bit ITU national, ITU international spare, ITU national spare) in the routing key that follows the `-k` option in the command.

Range:

ansi, itui, itun, itun24, itun16, ituis, ituns

Default:

ansi

`-x routing context`

This option modifier is used to display the routing key report using routing context.

Example

```
msuroute -h
msuroute -p ansi -k 5-5-5:5:6-6-6:1100

msuroute -p ansi -k 5-5-5:5:6-6-6:1100:1100

msuroute -k 5-5-5:5:6-6-6:1100

msuroute -k 5-5-5:5:6-6-6:1100:1100

msuroute -p ansi -k 5-5-5:8

msuroute -p itun -k 345:5:678:100:200

msuroute -p itun -k 345-gr:5:678-gr:100:200

msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100

msuroute -p itun16 -k 1-2-1:5:1-2-1:1:100
```

Dependencies

The `-k` option must be specified in the command, and must specify a full routing key.

This command is not supported for IPLIM/IPLIMI cards.

Notes

The `msuroute` command is executed through the `pass` command.

The `-ppoint_code_type` modifier option can be used with the `-k` option to specify the format of the routing key that follows the `-k` option in the command.

Output

The output for each `msuroute` command consists of a list of all of the routing keys that exist on the IPGWx card that could be used to route the MSU. The list of routing keys is presented in the hierarchical search order in which the keys would be used. The list of routing keys indicates keys that have IP connections available for traffic, and indicates which routing key would currently be used to route the MSU (marked with ***).

For the routing key that is selected to route the MSU, the list of IP connections associated with the key is also displayed.

Note:

Most of the following output examples show command entries for ANSI MSUs. Because, other than echoing the input command back to the screen, there is nothing in the output that contains specific fields from any configured keys. The output would not be different if the user entered ITUI MSUs instead of ANSI MSUs.

Either brief or full help reports can be displayed. A full help report is generated by adding the `-h full` option to the command line.

This example shows a brief help report:

```
pass:loc=1105:cmd="msuroute -h"
```

```
Command Accepted - Processing
```

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)
        -h display command help (brief or full)
```

```
;
```

This example shows a full help report:

```
pass:loc=1305:cmd="msuroute -h full"
```

```
0          1          2          3          4          5          6          7
1234567890123456789012345678901234567890123456789012345678901234567
8
```

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: dpc:si:opc:cics:cice | dpc:si:ssn | dpc:si
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)
        -h display command help (brief or full)
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUN16	U-S-M	Non-Spare ITU National, 16-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

SS7 Traffic Partition

RTKEY Parameter Example

```

      SSCP SSN 5 to DPC 1-1-1           -k 1-1-1:3:5
      ISUP CIC 1 to 1-1-1 from 2-2-2    -k 1-1-1:5:2-2-2:1
      TUP CIC 1 to 1-1-1 from 2-2-2    -k 1-1-1:4:2-2-2:1
      QBICC CIC 1 to 1-1-1 from 2-2-2  -k 1-1-1:13:2-2-2:1
      ISUP CIC 0-5 to 1-1-1 from 2-2-2 -k 1-1-1:5:2-2-2:0:5
      TUP CIC 0-5 to 1-1-1 from 2-2-2  -k 1-1-1:4:2-2-2:0:5
      QBICC CIC 0-5 to 1-1-1 from 2-2-2 -k 1-1-1:13:2-2-2:0:5
;
eagle10212 06-06-01 12:56:46 EST  EAGLE 35.0.0
MSURROUTE command complete

```

This example shows output for an ANSI CIC-based MSU, showing at least 1 routing key of every key type in the search hierarchy configured on the 1105 card. Only key types that are configured on the card will be listed in the display.

```
pass:loc=1105:cmd="msuroute -p ANSI -k 5-5-5:5:6-6-6:1100"

MSUROUTE command complete
;

```

msutrace

This command provides filter and trace capability for MSUs passing through the IP7 GPLs. This command provides a view of MSU data as it exists in the PSTN network and its corresponding format as it exists in the IP network.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msutrace` command option `-a` has the parameter action. The action that the command is to take can be specified, as in the command `msutrace -a acttrace`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a action`

Action option.

Range:

acttrace

Activate (turn on) MSU tracing

clrtrace

Clear all data from trace buffers

dacttrace

Deactivate (turn off) MSU tracing

chgfilter

Change filter used to indicate which MSUs are placed in the trace buffers

-g get_option

Get option.

Range:

config

Displays the current command settings: trace ON/OFF status, filter settings, and trace buffers used/available

trace

Displays contents of trace buffers containing captured MSU data

-h help

This option displays help information about the command.

Range:

full

If *full* is specified, the detailed version of the help information is displayed.

If *full* is not specified (just -h), the simple version of the help information is displayed.

-m mode

This option specifies which MSUs are captured.

Range:

normerr

trace only MSUs with normalization errors

all

trace all MSUs regardless of MSU contents

-p point_code_type

This option specifies which type of point code is contained in the filter key, when the key contains a DPC or OPC.

Range:

ansi, itui, itun, itun24, itun16, ituis, ituns

Default:

ansi

-k filter_key

The `-k`, `-c`, and `-p` options are used to specify the filter key used to determine which MSUs will have data placed in the trace buffers.

Range:

`-k filter key [-p] [-c pcType]`

The syntax for the filter key portion of the `-k filter key` option is specified as a single string parameter with up to five colon-separated fields. The filter key can contain one or more of the following fields:

- *n-c-m*—ANSI DPC in the format *network-cluster-member*
- *no-co-mo*—ANSI OPC in the format *network-cluster-member*
- *z-a-i*—ITU-I DPC in the format *zone-area-id*
- *zo-ao-io*—ITU-I OPC in the format *zone-area-id*
- *un-sna-mna---*16-bit ITU-N DPC in the format *unit number-sub number area-main number area*
- *msa-ssa-sp*—24-bit ITU-N DPC in the format *main signaling area-sub signaling area-signaling point*
- *nnnnn*—ITU-N DPC
- *nnnnn-gc*—ITU-N DPC with Group Code when the Duplicate Point Code feature is ON
- *no*—ITU-N OPC
- *no-gc*—ITU-N OPC with Group Code when the Duplicate Point Code feature is ON
- *s*—SI (Service Indicator)
- *cs*—CIC Start value (start of the CIC range)
- *ce*—CIC End value (end of the CIC range)
- *n*—SSN (Subsystem Number)

These examples show valid formats:

- *n-c-m:s:n*—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is 3 or sccp. The subsystem (*n*) is in the range 0-255.
- *n-c-m:s*—For DPC, SI type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is in the range 0-2, 4, or 6-15. There is no subsystem number. As a default, counts for all routing keys within the option combination are displayed.
- *n-c-m:s:no-co-mo:cs:ce*—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is 5 or isup. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range 0-255. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range 0 - 16363.
- *z-a-i*—For DPCN and DPCI routing keys, the zone, area and ID (*z-a-i*) are in the range of 000-007 (zone and ID) and 000-255 (area).
- *msa-ssa-sp*—For 24-bit DPCN routing keys, the main signaling area, sub signaling area and signaling point (*msa-ssa-sp*) are in the range of 000-255.
- *un-sna-mna---*For 16-bit DPCN routing keys, the unit number, sub number area and main number area (*un-sna-mna*) are in the range of 0-127, 0-15, 0-31 respectively.

-t

This option specifies the routing key type (IPGWx only).

-x rc

This option generates a routing key report using routing context.

Example

```

pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
pass:loc=1105:cmd="msutrace -a chgfilter -m all"

pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k
1-1-1:5:2-2-2:10:1000"

```

Dependencies

If no options are specified, the simple version of the help information is displayed.

The point code type defaults to ANSI when the `-p` option is not specified.

The `-p` option is allowed only on key types that contain a DPC or OPC.

Notes

The `msutrace` command is executed through the `pass` command.

The `mustrace` command captures the data portion of the PSTN packet, starting at the SIO bytes.

The `msutrace` command captures the entire M3UA or SUA packet. This includes the M3UA or SUA header and additional data stored inside system buffer chain elements. The `msutrace` command currently does not support the trace and capture of M3UA / SUA SSNM (Class 2) messages.

The `msutrace` command captures data in trace buffers. If the set of trace buffers becomes full with captured MSU data after MSU tracing is activated, no more data capturing will take place. The `-aclrtrace` option must be specified to reset (clear) the content of the trace buffers. After the trace buffers are empty again, `msutrace` will restart capturing qualified MSUs.

If MSU tracing is activated with the `-a acttrace` option before a properly formatted filter key is entered, the `msutrace` command will not capture any data due to lack of a proper filter. When the `-a chgfilter` option is specified to enter a properly formatted filter, the `msutrace` command will start capturing qualified MSUs.

Output

Note:

The `msutrace pass` command exists on the IPLIMI cards as a debug-only pass command. All command syntax and output are identical to the `SS7IPGW` and `IPGWI` commands described in this section.

Both brief and full versions of IPGW reports can be requested. A full report is requested by including the `-f` in the command line.

This example shows a brief help report:

```
pass:loc=1305:cmd="msutrace -h"
```

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
              [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              [-m mode] [-h [full]]

Options:
  -a  action_cmd: an Action Command
  -g  get_cmd: a Get Command
  -x  routing key report using routing context
  -k  routing key report using MTP3 parameters
      rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
  -p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)
      routing key type
  -t  routing key type
      keytype :: (<full>, partial, default)
  -m  mode: mode for qualifying MSUs captured=[normerr | all]
  -h  displays this message (brief or full)

get_cmd:      [config | trace]
  config      config
  trace       trace

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
  acttrace    acttrace
  chgfilter   chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
              (valid fltrkey should be present either before
              specifying mode or in the same command)
  clrtrace    clrtrace
  dacttrace   dacttrace

<fltrkey>:    [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              (see 'msutrace -h full' for complete description)

MSUTRACE command complete
;
```

This example shows a full help report:

```
pass:loc=1305:cmd="msutrace -h full"
```

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
           [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
           [-m mode] [-h [full]]

Options:
  -a  action_cmd: an Action Command
  -g  get_cmd: a Get Command
  -x  routing key report using routing context
  -k  routing key report using MTP3 parameters
      rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
  -p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS,
ITUNS)
  -t  routing key type
      keytype :: (<full>, partial, default)
  -m  mode: mode for qualifying MSUs captured = [normerr | all]
  -h  displays this message (brief or full)

get_cmd:      [config | trace]
  config      Display the current MSUTRACE settings:
              trace On/Off status, filter settings, and
              trace buffers used/available.
              ex: msutrace -g config
  trace       Display content of trace buffers containing
captured      MSU data
              ex: msutrace -g trace

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace ]
  acttrace    Activate (turn-on) MSU-tracing.
              ex: msutrace -a acttrace
  chgfilter   chgfilter [<fltrkey>] | [-m mode] (at least 1
required)
              (valid fltrkey should be present either
before
              specifying mode or in the same command)
              Change filter used to qualify which MSUs are
placed in
              trace buffers:
              Flow of command should be
              Either entering filter key before specifying mode :
              ex: To trace MSUs based on MSU content:
                  msutrace -a chgfilter <fltrkey>
              ex: To only trace MSUs with Normalization errors:
                  msutrace -a chgfilter -m normerr
              ex: To trace all MSUs regardless of error
conditions:
              msutrace -a chgfilter -m all
              Or entering filter key along with mode:
              ex: To trace MSUs based on MSU content
                  with Normalization errors:
```

```

msutrace -a chgfilter <fltrkey> -m normerr
ex: To trace MSUs based on MSU content
    regardless of error conditions:
msutrace -a chgfilter <fltrkey> -m all

```

```

clrtrace    Clear all data from trace buffers.
ex: msutrace -a clrtrace

```

```

dacttrace  Deactivate (turn-off) MSU-tracing.
ex: msutrace -a dacttrace

```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

For IPSPG both ANSI and ITU network point code formats are eligible for trace when the default filter or an SI only filter is specified. The IPSPG default pctype is ANSI when the filter contains OPC or DPC and the -p option is not specified.

Network	PC Format	Notes
ANSI	N-C-M	
ITUN	N	Non-Spare ITU National, no group code
ITUN	N-GC	Non-Spare ITU National with group code
ITUI	Z-A-I	Non-Spare ITU International
ITUN24	N-C-M	Non-Spare ITU National, 24-bits
ITUN16	U-S-M	Non-Spare ITU National, 16-bits
ITUNS	N	Spare ITU National, no group code
ITUNS	N-GC	Spare ITU National with group code
ITUIS	Z-A-I	Spare ITU International

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key or LS.

SS7 Traffic Partition	RTKEY/MTP3	Parameter	Example
Any User Part to DPC 1-1-1	-k 1-1-1	-t partial	
SCCP to DPC 1-1-1	-k 1-1-1:3	-t partial	
ISUP to DPC 1-1-1	-k 1-1-1:5	-t partial	
TUP to DPC 1-1-1	-k 1-1-1:4	-t partial	
QBICC to DPC 1-1-1	-k 1-1-1:13	-t partial	
SI [0-2,6-12,14,15] to DPC 1-1-1	-k 1-1-1:SI		
SCCP SSN 5 to DPC 1-1-1	-k 1-1-1:3:5		
ISUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:5:2-2-2	-t partial	
TUP to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:4:2-2-2	-t partial	
QBICC to DPC 1-1-1 from OPC 2-2-2	-k 1-1-1:13:2-2-2	-t partial	
ISUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:1		
TUP CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:1		
QBICC CIC 1 to 1-1-1 from 2-2-2	-k 1-1-1:13:2-2-2:1		
ISUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:5:2-2-2:0:5		
TUP CIC 0-5 to 1-1-1 from 2-2-2	-k 1-1-1:4:2-2-2:0:5		

```

        QBICC CIC 0-5 to 1-1-1 from 2-2-2 -k 1-1-1:13:2-2-2:0:5
        Default Routing Key                -k                    -t
default
        Any User Part to DPC=LS APC        -x LS RCONTEXT        (IPSG
Only)

Examples for Entering a Filter Key

The output shown at the end of these command examples is the same for each example, except for the echo of the entered command.

Command with the `-a chgfilter` option to insert a fully specified ANSI PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

- SI = 5
- OPC = 4-4-4 (ANSI)
- CIC = [10..1000]

```
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k  
3-3-3:5:4-4-4:10:1000"
```

Command with the `-a chgfilter` option to insert a fully specified ANSI SCCP filter.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 3
- SSN = 230

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:3:230"
```

Command with the `-a chgfilter` option to insert a fully specified ANSI DPC SI filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 6

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:6"
```

Command with the `-a chgfilter` option to insert a fully specified ITUN24 PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-103-3 (ITUN24)
- SI = 5
- OPC = 14-104-4 (ITUN24)
- CIC = [10..1000]

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k  
13-103-3:5:14-104-4:10:1000"
```

Command with the `-a chgfilter` option to insert a partial ITUI DPC SI OPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1-3-3 (ITUI)
- SI = 5
- OPC = 2-4-4 (ITUI)

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -k 1-3-3:5:2-4-4"
```

Command with the `-a chgfilter` option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned off:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536 (ITUN)
- SI = 5

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536:5"
```

Command with the `-a chgfilter` option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned on:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536-bb (ITUN)
- SI = 5

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536-bb:5"
Command with the -a chgfilter option to insert a partial ANSI DPC filter key.
```

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3"
Command with the -a chgfilter option to insert a partial SI filter key. Because no DPC
or OPC field is specified, point code type does not have to be indicated.
```

This filter key qualifies for capture MSUs with the following properties:

- SI = 5

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-113-3 (ITUN24)

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-113-3"
```

Command Accepted - Processing

```

eagle20003 06-06-01 10:16:57 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k
3-3-3:5:4-4-4:10:1000"
Command entered at terminal #1.
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0

MSUTRACE command completed
;
```

These commands include the -m *mode* option to change the trace capture mode.

Mode to have a 'capture-on-normalization error' property such that only MSUs with normalization processing errors are traced:

```
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
```

Set a default filter key and the filter's mode at the same time:

```
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
```

Command Accepted - Processing

```

eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"

MSUTRACE command completed
;
```

These commands insert a partial DPC-SI filter key with ITU-I spare point code and show the `msutracegetfilter` command output with the filter key after the `chgfilter` command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPCI = (ITU-I Spare) 2-11-1
- SI=5

```
pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"

netstat

This command is used to display network statistics from the TCP/IP stack. This command allows troubleshooting of network interface and routing configuration problems within the private EPAP-Service Module IP network.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `netstat` command option `-m` has the parameter buffer pool. The pool for which information will be displayed can be specified, as in the command `netstat -m sys`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a`

This option displays socket information for all protocols.

`-d`

This option displays driver measurement data.

The `-m` modifier displays multicast information. The `-p` modifier displays PHY registers. The `-z` modifier clears driver measurements. The `-h` modifier displays history measurements for the past 24 hours or the measurements collected a user defined hour ago. The `-f` modifier displays driver measurement data in full format (for GPLs that are loaded on E5-based cards only).

The `-m`, `-p`, and `-h` modifiers are not supported for GPLs that are loaded on E5-based cards.

`-e`

This option displays DPL driver measurement data. This option is supported only for GPLs that are loaded on E5-based cards.

-f, -h

These options provide help information for the command.

-i

This option displays interface information for all interfaces.

-m buffer_pool

This option displays buffer pool information for the specified pool.

Range:

data

SENS protocol stack data buffer pool

sys

system buffer pool

dd

Ethernet device driver buffer pool

Default:

All three buffer pools are displayed.

-p protocol

This option displays information for the specified protocol.

Rnage:

tcp

transmission control protocol

udp

user datagram protocol

ip

internet protocol

icmp

internet control message protocol

sctp

stream control transmission protocol

Default:

None

-r

This option displays the Route table.

Example

```
pass:cmd="netstat -i":loc=1105
```

```
pass:cmd="netstat -a":loc=1111
```

```
pass:cmd="netstat -p tcp":loc=1111
```

```
pass:cmd="netstat -m data":loc=1105
```

```
pass:cmd="netstat -r":loc=1105
```

```
pass:cmd="netstat -e":loc=1111
pass:cmd="netstat -d 0 -f":loc=1111
```

Dependencies

Only one of the options can be specified at a time.

Notes

The `netstat` command is executed through the `pass` command.

The options `{-m,-p,-h}` are not supported for GPLs that are loaded on E5-based cards.

Output for GPLs that are NOT loaded on E5-based cards

```
pass:loc=1107:cmd="netstat"
or
pass:loc=1107:cmd="netstat -h"

      Command Accepted - Processing

tekelecstp 08-02-02 12:16:34 EST  EAGLE 38.0.0
PASS: Command sent to card

Usage: netstat [-a] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp]
          [-i] [-r] [-d 0|1] [-m] [-p] [-z] [-h 1..24]]

Options:
  -a      display socket information for all protocols
  -h      Displays this message
  -m      display buffer pool information for 1 of the system pools
  -p      display socket information for 1 of the protocols
  -i      display interface information for all interfaces
  -r      display the route table information
  -d      display driver measurement data

NETSTAT command complete

;

```

Output for the `netstat -i` command varies based on the card type. The GEI interfaces are the ports that carry signaling and monitoring traffic external to the EAGLE. The number of these ports varies with the IP connection. Information for all 4 GEI interfaces is displayed on only FC Capable cards as shown below.

The interfaces listed in the `netstat -i` output correspond to a card's ports as follows:

- For Signaling GPLs (IPSG, IPLIMx, IPGWx):
- `gei 2` = IP signaling interface A
- `gei 0` = IP signaling interface B
- `gei 3` = Fast Copy interface A
- `gei 1` = Fast Copy interface B
- `DPLend` = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- `LO` = local loopback interface

For SCCPx GPLs:

- `gei 0` = IP interface A
- `gei 1` = IP interface B
- `DPLend` = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- `LO` = local loopback interface
- `BOND` = interface formed by bonding the two IP interfaces

```

nslookup

This command returns the IP address for a given hostname, or returns a hostname for a given IP address.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `nslookup` command has the option destination. An IP address or hostname can be specified for the destination, as in the commands `nslookup 192.168.100.3` and `nslookup dcm1107a`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is `192.9.200.44`, where `192.9.200` is the network number and `44` is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

hostname

Hostname. The logical name assigned to the device with the IP address indicated.

Range:

`a-z, A-Z, 0-9, -, .`

(any string of characters beginning with a letter and comprising up to 60 characters in length)

`-h`

This option provides help information for the command.

Example

```
nslookup 192.9.200.44
```

```
nslookup nc.tekelec.com
```

```
nslookup 2005:1a3c:2a3e:12ef:9064:8b6c:567a:78fd
```

Dependencies

The actual `nslookup` text string must be followed by a destination (either a hostname or IP address).

Whether a host is found depends on the configuration of the host table and domain name servers.

Notes

The `nslookup` command is executed through the `pass` command.

Output

```
pass:loc=1105:cmd="nslookup"
or
pass:loc=1105:cmd="nslookup -h"

Command Accepted - Processing

NSLOOKUP command complete

pct

This command is used to maintain per-translation statistics and to test Point Code and CIC Translation (PCT) functionality. The command can use Stats mode to reset or display per-translation statistics or Test mode to test PCT behavior.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-h

This option is used to provide help information for the command.

The following options are common to both Stats mode and Test mode:

-p pctype

Point Code Type. This option applies to all point codes in the option list.

Range:

ansi, itui, itun

Default

ansi

The following options apply to only Stats mode:

-a realpc

Real Point Code

-c cicr

CIC range. This option can be specified only if SI is 4, 5, or 13.

Range:

The option can be in one of these forms:

- wildcard(*)
- *ecics-ecice:rcics-rcice*, e.g., *5-10:15-20*
- *ecics:rcics* (e.g., *5:6*, which is equivalent to *5-5:6-6*)

-e epc

Emulated Point Code

-f fpc

Filter Point Code. This option can be a wildcard (*).

-l

List the stats for the selected rules. The -e or -a option must be supplied. Both of these options can be specified.

-r

Resets the stats for selected rules. If no other options are specified, then this option resets stats on all rules. If other options are specified, then the `-e` or `-a` option must be specified.

`-s si`

Range:

0, 3, 4, 5, 13, or wildcard (*)

`-u ssn`

Subsystem Number. The `si=3` option must be specified before this option can be specified. This option can be a wildcard (*)

The following options apply only to Test mode.

`-c cic`

CIC in simulated MSU. If a value of 4, 5, or 13 is specified for the `si` option, then the `-c` must be specified.

`-d dpc`

Destination Point Code in simulated MSU.

`-o opc`

Originating Point Code in simulated MSU.

`-s si`

SI in simulated MSU.

`-u ssn`

Subsystem number in CgPA and CdPA in simulated MSU. The `si=3` option must be specified before the `-u` option can be specified. If the `-u` is not specified, and the `si=3` is specified, then the route on SSN is off.

```
pass:loc=1201:cmd="pct -h"
```

```
pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"
```

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"
```

Dependencies

None

Notes

None

Output

This example shows a help report:

```
pass:loc=1201:cmd="pct -h"
```

```
Command Accepted - Processing
```

```
Usage:
```

```
pct -m stats [-l | -r] [-p pctype] [-e epc] [-f fpc] [-a realpc] [-s  
si] [-u ssn] [-c cicr]
```

```
pct -m test [-p pctype] -d dpc -o opc -s si [-c cic] [-u ssn]
```

```
pct -h
```

```
Modes:
```

```

stats - reset or display per-rule stats
test  - test PCT behavior for a message with the specified field
values
Common Options:
-p    pctype is ANSI, ITUI, or ITUN
stats Mode Options:
-r    reset the stats for selected rules
      with no other options, resets stats on all rules
      if other options present, -e or -a must be supplied
-l    list the stats for selected rules (default)
      the -e or -a option must be supplied
      both -e and -a may be supplied
-e    emulated point code
-a    real point code
-c    cicr is in these forms:
      * (see Note 1)
      ecics-ecice:rcics-rcice, e.g., 5-10:15-20
      ecics:rcics, e.g., 5:6 which is equiv to 5-5:6-6
      allowed only if SI is 4, 5, or 13
-f    filter pc; may be * (see Note 1)
-s    si; can be 0, 3, 4, 5, 13, or * (see Note 1)
-u    ssn; may be * (see Note 1)
      allowed only if SI is 3
test Mode Options:
-d    DPC in simulated MSU
-o    OPC in simulated MSU
-s    SI in simulated MSU
-u    SSN in CgPA and CdPA in simulated MSU;
      if absent and si is 3, indicates that route on SSN is off;
      allowed only if SI is 3
-c    CIC in simulated MSU;
      required if SI is 4, 5, or 13
Notes:
1. an explicit * will match only with rule containing a
wildcard; to match
      on wildcard or a specific value, do not specify the
associated option

```

Stats Mode

With the `-l` option, all matching translations are displayed along with the following three statistics for each translation:

- DPCLKP – Number of successful translations of the DPC and/or CIC of a message (the number of successful DPC lookups).
- OPCLKP – Number of successful translations of the OPC and/or CIC of a message (the number of successful OPC lookups).
- MSUDISC – Number of messages discarded after successfully translating the DPC of a message from an emulated point code to a real point code, but where the real point code is unreachable.

The IDX (index) column is the unique row number of the entry in the PCT table. The index for a particular translation is the same across all cards.

The output for a single translation consists of two or three lines.

For translations with an SI of 4, 5, or 13, the CIC range field is displayed only for translations with a specific value for the CIC range.

This example lists all translations with an EPC of 4-3-1 (ANSI):

```
pass:loc=1201:cmd="pct -m stats -l -e 4-3-1"
```

This example resets counters for all translations with an EPC of 4-3-1 (ANSI):

```
pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"
```

```
Command Accepted - Processing
```

```
Stats reset on 20 rules
```

Test Mode

Test mode allows determination of whether an incoming message with the specified field values would result in a match on an entry in the PCT table. Output includes the content of the message, as specified on the command line, the lookup result, and the matching entry if a match exists.

This example shows a match on the DPC lookup:

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"
```

```
Command Accepted - Processing
```

```
Point Code and CIC Translation Lookup Test
```

```
MSU content:
```

```
OPC: 007-002-030
```

```
DPC: 004-003-001
```

```
SI: 3
```

```
SSN: 26
```

```
Lookup result:
```

```
Match on DPC was found
```

```
Matching entry:
```

idx	epc	rpc	fpc	si	ssn
7	004-003-001	007-003-002	007-002-030	3	26

This example shows a match on the OPC lookup:

```
pass:loc=1201:cmd="pct -m test -d 7-2-30 -o 7-3-2 -s 3 -u 26"
```

```
Command Accepted - Processing
```

```
Point Code and CIC Translation Lookup Test
```

```
MSU content:
```

```
OPC: 007-003-002
```

```
DPC: 007-002-030
```

```
SI: 3
```

```
SSN: 26
```

```
Lookup result:
```

```
Match on OPC was found
```

```
Matching entry:
```

idx	epc	rpc	fpc	si	ssn
7	004-003-001	007-003-002	007-002-030	3	26

This example shows a match on a DPC lookup where the matching translation has a wildcard Filter PC and a wildcard SI:

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 9-9-9 -s 4 -c 106"
```

```
Command Accepted - Processing
```

```
Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    009-009-009
  DPC:    004-003-001
  SI:      4
  CIC:      106
Lookup result:
  Match on DPC was found
Matching entry:
idx      epc      rpc      fpc si ssn
25      004-003-001  007-003-091 ----- * ---
```

ping

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `ping` command has the option destination. An IP address or hostname can be specified for the destination, as in the commands `ping 192.9.200.44` and `ping nc.tekelec.com`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. An example IP address is `192.9.200.44`, where `192.9.200` is the network number and `44` is the machine's host number.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

hostname

Hostname. The logical name assigned to the device with the IP address indicated.

Range:

any string of characters beginning with a letter and comprising (a..z, A..Z, 0..9, '-', or '.') up to 120 characters in length.

-i

The number of ping requests to send.

Range:

1 - 5

Default:

3

-n

The size of message to use in test.

Range:

12 - 2048

Default:

64

-h

This option provides help information for the command.

-f

This option sets the DF (Don't Fragment) bit in the IP header of ICMP packet.

Example

```
ping 192.9.200.44
ping nc.tekelec.com

ping 192.9.200.44 -i 5 -n 2048

ping 10.254.111.21 -f -n 1480
```

Dependencies

The actual `ping` text string must be followed by a destination (either a hostname or IP address) prior to the options.

Notes

The `ping` command is executed through the `pass` command.

Output

```
pass:loc=1105:cmd="ping" or
pass:loc=1105:cmd="ping -h"
```

```
Command Accepted - Processing
```

```
    rlghncxa03w 04-07-27 08:29:35 EST  EAGLE5 31.6.0
    pass:loc=1105:cmd="ping"

sctp

This command is used to provide a view of SCTP instance and association information.

Options

`-a aname`

This option is used to retrieve the measurements and information for a specific association.

`-l`

This option is used to display logging details for associations. The logging details are independent of the association state (close or open).

`-p <port>`

This option is used to retrieve the measurements for a specified SCTP port.

`-r`

This option is used to reset specified measurements. The associated report is not displayed.

`-h`

This option is used to display help information for the command. Either brief or full help reports can be generated.

`-m`

This option is used to display SCTP incoming/outgoing (IO) header audit reports for common and dedicated IO header pools. The IO header is a transmission sequence number (TSN) control block used in processing SCTP chunks. The report shows total, currently available, and minimum IO header counts for the IO header pool shared by all associations (common pool) and the IO header pool for each association (dedicated pool).

Example

```

pass:cmd="sctp -a aname":loc=1307
pass:cmd="sctp -l":loc=1307

```

```

pass:cmd="sctp -l aname":loc=1307
pass:cmd="sctp -p port":loc=1307
pass:cmd="sctp -r -a aname":loc=1307
pass:cmd="sctp -r -l aname":loc=1307
pass:cmd="sctp -m"
pass:cmd="sctp"

```

Dependencies

The `-r` option can be specified in the same command as the `-a`, `-p`, or `-l` option. Otherwise, only one option can be specified at a time.

Notes

None

Output

Either brief or full help reports can be displayed. A full help report is generated by adding the `-h full` option to the command line.

This example shows a brief help report:

```
pass:loc=1305:cmd="sctp -h"
```

```
Usage: [ [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]]] | [-m] | [-h [full]] ]
```

Options:

(no parameters)	display list of SCTP ports
-a aname	display association report
-p port	display SCTP port report
-r	reset specified SCTP measurements
-m	display IO header usage report
-l aname	display association event log
-l	display all event logs
-r -l	reset all SCTP event logs
-r -s	reset all SCTP measurements and pegs
-h	displays command help (brief or full)

```
;
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

```
SCTP command complete
```

```
;
```

This example shows a full help report:

```
pass:loc=1307:cmd="sctp -h full"
```

```
Usage: sctp [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]] |
[-m] | [-h [full]]]
```

Options:

```
(no parameters)    display list of SCTP ports
-a aname           display association report
-p port           display SCTP port report
-r               reset specified SCTP measurements
-m               display IO header usage report
-l aname          display association event log
-l               display all event logs
-r -l            reset all SCTP event logs
-r -s            reset all SCTP measurements and pegs
-h               displays command help (brief or full)
```

no parameters option

Summary list of all SCTP instances. To list all the SCTP ports issue the following command:

```
sctp
```

-a aname option details

Retrieves detailed information and measurements for a specific association. For example the following SCTP command will get

the

measurements and detailed information for the association with association name = assoc1.

```
sctp -a assoc1
```

In remote address field of output configured RHOST or ARHOST or both IP

address will be displayed based on the presence in association remote network

```
array
```

-p port option details

Retrieves detailed information for a specified SCTP port. For example the following SCTP command will get the detailed information for the SCTP port with a local port of 200.

```
sctp -p 200
```

In remote address field of output configured RHOST or ARHOST or both IP

address will be displayed based on the presence in association remote network

```
array
```

-r option details

Resets specified SCTP Measurements. See examples below.

Resets measurements for specified association:

```
sctp -r -a assoc
```

Resets measurements for all associations on port 2000:

```
sctp -r -p 2000
```

Resets measurements and event logs for all ports/associations:

```
sctp -r
```

Resets event logs for specified association:

```

sctp -r -l assoc
Resets event logs for all associations:
sctp -r -l
Resets measurements for all associations:
sctp -r -s

```

-m

This option displays SCTP IO header audit report for common and dedicated IO header pools. The report shows total, currently available and minimum (low water mark) IO header counts for common and each association's dedicated pool. IO header is a TSN control block used in processing SCTP chunks. Common pool is IO header pool shared by all associations. Dedicated pool is a per-association IO header pool.

```
sctp -m;
```

-l option details

This option displays logging details for associations. The logging details are independent of the association state (close or open). See examples below:

The following SCTP command will get the logging details for all associations on the specified card.

```
sctp -l
```

The following SCTP command will get the logging details for the association with association name = assoc1.

```
sctp -l assoc1
```

```

Field Descriptions for `sctp -a` Output

- Local Address-IP Address of the near end. The address that the local SCTP endpoint should bind.
- Local Port-SCTP port number, if ULP wants it to be specified.
- Remote Address-IP Address of the far end/destination. Destination address for transporting DATA.
- Remote Port-Port number of the destination.

Configuration:[Following rows are SCTP configured values]

- Retransmission Mode-Configured retransmission mode. Values are "LIN" or "RFC".
- Min. Retransmission Timeout-Minimum Retransmission Timeout value configured.
- Max. Number of Retries-Configured maximum number of retries.
- Min. Congestion Window-Minimum and initial congestion window.
- Inbound Streams-The maximum number of inbound streams this association allows the peer end to create. The value can not be 0.

- Outbound Streams-The maximum number of outbound streams this association allows the peer end to create. The value can not be 0.

State: [Following rows are association state values]

- State-State of the association.
- ULP association id-Upper Layer Protocol association id.
- Number of nets-Number of networks.
- Inbound Streams-Number of Inbound streams the far end can support.
Min(requested,offered)
- Outbound Streams-Number of Outbound streams the far end can support.
Min(requested,offered)
- Checksum Algorithm-32 bit checksum field that is included in the SCTP common header. The CRC32c checksum should be set by the sender of each SCTP packet to provide additional protection against data corruption in the network.
- Send/Rcv Buffer Size-The maximum size of data to be transmitted/received in bytes.
- Nets Data-All of the available remote IP addresses and if they are reachable or not.
- Last Net Sent To-IP address of the last network sent on.
- Last Net Rcvd From-IP address of the last network received on.
- Over All Error Count-Total error count on the association.
- Peers Rwnd-The peers receive window.
- My Rwnd-My receive window.
- Max Window-Maximum receive window (the peers receive window is set to this value until it is learned).
- Initial Seq Number-Initial sequence number started at.
- Next Sending Seq Number-Next Sending sequence number.
- Last Acked Seq Number-Highest consecutive TSN that has been Acked.
- Maximum Outbound Char Count-Maximum outbound byte count (high water mark).
- Current Outbound Char Count-Current outbound byte count.
- Number Unsent Char Count-Number of unsent bytes.
- Outbound Data Chunk Count-Number of data chunks that were sent.
- ip datagrams rcvd-Number of IP packets received.
- ip datagrams with data chunks rcvd-Number of IP packets containing SCTP data chunks received.
- data chunks rcvd-Number of SCTP data chunks received.
- data chunks read-Number of SCTP data chunks read.
- dup tsns rcvd-Number of duplicate data chunks received.
- sacks rcvd-Number of selective acknowledgements received.

- gap ack blocks rcvd-Indicates the number of GAP Ack Blocks included in a SACK. This value informs the peer endpoint of gaps in the received sequences of DATA chunks as represented by their TSNs.
- heartbeat requests rcvd-Number of heartbeat requests received.
- heartbeat acks rcvd-Number of heartbeat acknowledges received.
- heartbeat requests sent-Number of heartbeat requests sent.
- ip datagrams sent-Number of IP packets transmitted.
- ip datagrams with data chunks sent-Number of IP packets containing SCTP data transmitted.
- data chunks sent-Number of data chunks sent.
- retransmit data chunks sent-Number of retransmitted data chunks for this association.
- sacks sent-Number of selective acknowledgements sent.
- send failed-Number of selective acknowledgements failed.
- retransmit timer count-Reports the retransmit timer count. Number of times the transmit timer has expired.
- consecutive retransmit timeouts-Count of the number of times consecutive timeouts occurred.
- RTO between RMIN and RMAX inclusive-If the calculated RTO is between the configured RMIN value and the RMAX value inclusively, then increment this peg count. This peg serves as an indication that the RMIN value may be configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- RTT greater than RMAX-If the calculated RTT is above the configured RMAX value, then increment this peg count. This peg serves as an indication that the RMAX value is configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- fast retransmit count-Number of retransmits due to fast retransmit.
- rcv timer count-Number of times the receive timer has expired.
- heartbeat timer count-Number of times the heartbeat timer has expired.
- none left tosend-Number of times a transmit is attempted and there is no data chunks to send.
- none left rwnd gate-Number of times a transmit is denied due to no receive window space at peer.
- none left cwnd gate-Number of times a transmit is denied due to exceeding the local congestion window.
- UNKNOWN-Number of retransmit Datagrams for this assoc for error monitoring.

Event descriptions for the `sctp -l` command

- Shutdwn ACK tmr exp-No shutdown complete was received in response to the shutdown acknowledgement within the timer's limits.
- PathMTU tmr expr-Indicates the PathMTU daemon timer has expired. At the expiration of this timer, path MTU for each path of each association that is not at the default of 1500 bytes is marked for retesting by raising that path's MTU. The MTU will be adjusted accordingly when the next frame that exceeds the updated MTU occurs, thereby allowing the path MTU to reflect dynamic network conditions.
- INIT tmr expr-If the T1-initialized timer expires, the endpoint must retransmit INIT and restart the T1-init timer without changing state.
- RECV tmr expr-If the receive timer expires, then a stand alone SACK is sent to the peer and this timer is moved back to idle.
- Send tmr expr-This retransmission timer will expire when outstanding data sent to an address has not been acknowledged.
- Shutdwn tmr expr-No shutdown acknowledgement was received in response to the transmitted shutdown within the timer's limits.
- HB tmr expr-No heartbeat acknowledgement was received in response to the transmitted heartbeat within the timer's limits.
- Cookie tmr expr-No cookie acknowledgement was received in response to the transmitted cookie echo within the timer's limits.
- New Cookie tmr expr-When this occurs, time to schedule another timer for the cookie change.
- Tx CHK tmr expr-Transmit check timer expired.
- Unknwn tmr expr-An unknown timer expired.
- INIT Rcv-An INIT was received for an association.
- Datagram Ignored-When an unrecognized chunk time is encountered.
- Assoc Down-An association is taken out of service.
- INTF Down-Interface on an association is down and out of consideration for selection.
- INTF Up-Interface on an association is up and now back in consideration for selection.
- Datagram Send Fail-IP Packet failed to send.
- Ignore Cookie-Happens when the cookie is not received first.
- Ignore INIT-If the INIT message is not received first, is not the only chunk, is received with a non-zero Verification tag, if the T bit value is 1 or if mandatory parameters are missing then the INIT message is discarded/ignored.
- Ignore INIT ACK-If the INIT ACK is not first, not the only chunk or too small (missing mandatory parameters), then the INIT ACK chunk is ignored.
- Ignore Shutdwn ACK-The SHUTDOWN Complete MUST be the only chunk, otherwise the packet is ignored.

- Ignore HB ACK-The received HB acknowledgement was ignored due to asymmetric routing (HBA not received on the same interface the original HB was transmitted on).
- Op Error Rcv-Occurs when the peer notifies that we are using an invalid stream or we received a Stale cookie.
- Assoc UP-Association up notification was generated for the upper layer.
- Assoc Restart-Association restart notification was generated for the upper layer.
- Shutdn ack send fail-Attempt to transmit a shutdown acknowledgement chunk failed.
- Shutdown ack send-A shutdown acknowledgement chunk was transmitted to the far end.
- Cookie ack send fail-An attempt to send a Cookie ACK to a specified address failed.
- Cookie ack send-A Cookie ACK was sent to a specified address.
- Stale Cookie send fail-Attempt to send a stale cookie error to the far end failed.
- Stale Cookie send-A stale cookie error was sent to the far end.
- HB req send fail-Attempt to send a HB to the far end failed.
- HB resp send fail-Attempt to send a HB acknowledgement to the far end failed.
- Shutdown send fail-The Shutdown chunk sent to a specified association failed.
- Shutdown send-A Shutdown chunk was sent to a specified association.
- Abort send fail-The Abort chunk sent to a specified association failed.
- Abort send-An Abort chunk was sent to a specified association.
- Abt W cause snd fail-The Abort chunk sent with the Cause parameter to a specified association failed.
- Abort wth cause send-An Abort chunk was sent to a specified association with the Cause parameter.
- SACK send fail-Attempt to send a SACK to the far end failed.
- Initiate send fail-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT send has failed.
- Initiate send-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT was successfully sent.
- OprErr send-An endpoint sends this chunk to its peer endpoint to notify it of certain error conditions. It contains one or more error causes. This event occurs when the OPPErr was successfully sent.
- OprErr send Fail-This event occurs when the OPPErr send failed.
- Init ack send fail-This event occurs when an INIT ACK send has failed.
- Init ack sent-This event occurs when an INIT ACK was successfully sent.
- Ck echo ack snd fail-An attempt to send a Cookie-Echo has failed.
- Cookie echo ack send-A cookie echo was sent to the far end in response to an accepted init-ack.
- Chunks send fail-This event occurs when a chunk that was sent has failed.
- Chunks send-This event occurs when a chunk has been successfully sent.
- Cookie send fail-Attempt to transmit a cookie to the far end during the four-way handshake failed.

- Init ack recv-Init acknowledgement chunk was received.
- Shutdown ack recv-Shutdown ack chunk was received.
- Shutdown ack sent-Shutdown ack chunk was transmitted to the far end in response to a received shutdown chunk.
- Abort sent-An Abort message was sent to ungracefully shutdown an association.
- Shutdn complete sent-Shutdown complete chunk was transmitted to the far end.

This example clears the logged events for an association:

```

sockrft

This command is used to report and reset the round-trip time statistics for application sockets. Minimum, maximum, and average times are kept for each open socket. The Retransmission Mode (BSD, FIXED, or MOD) and the Fixed Round Trip Time are also displayed.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `sockrtt` command has the option socket_name. The socket name must be specified for which statistics will be displayed, as in the command `sockrtt socyellow`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

socket_name

This option is **mandatory** and specifies the socket name for which statistics are to be displayed.

Range:

up to 15 alphanumeric characters.

`-r`

This option resets all statistics for the given socket name.

`-h`

This option provides help information for the command.

Example

```
sockrtt
sockrtt -h

sockrtt socyellow
sockrtt socyellow -r
```

Dependencies

None

Notes

The `sockrtt` command is executed through the `pass` command.

Output

```
pass:loc=1105:cmd="sockrtt" OR
pass:loc=1105:cmd="sockrtt -h"
```

```
Command Accepted - Processing
```

```

soipdata

This command is used to display the SOIP operational data captured for the last 24 hours.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-f

This option displays full operational data (all counts).

-s

This option displays the number of errors received with error type Bad Source.

-d

This option displays the number of of errors received with error type Bad Destination.

-v

This option displays the number of errors received with error type Bad Version.

-g

This option displays the number of Good Day messages received.

-e

This option displays the number of error messages sent (Sum of Bad Version, Bad Source and Bad Destination).

-u

This option displays the number of UPL messages received.

-t

This option displays the number of UPL messages transmitted.

-r

This option resets the specified error count.

-h
This option displays help for the command.

Example

```
soipdata -h
soipdata -f

soipdata -r

soipdata -u
```

Dependencies

None

Notes

None

Output

```
pass:loc=1305:cmd= "soipdata -h"
```

```
Usage: soipdata [[-f ] | [[-s] [-d] [-v] [-g] [-e] [-u] [-t] [-r] [-h]]
```

```
Options:
-f  Display Full Operational data (all the counts)
-s  Display number of SR-5129 Messages received with Bad Source
-d  Display number of SR-5129 Messages received with Bad Destination
-v  Display number of SR-5129 Messages received with Bad Version
-g  Display number of Good Day Messages Received.
-e  Display number of error messages sent (Sum of BadVersion, BadSource
and BadDestination)
-u  Display number of Number of UPL messages received
-t  Display number of Number of UPL messages transmitted.
-r  Reset the Specified Error Count
-h  display command help
```

```
pass:loc=1305:cmd=" soipdata -f"
```

```
SOIPDATA: SR-5129 Operational Data Report

```

soiplog

This command is used to display the logs for the SR-5129 messages for a particular SEAS terminal.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-l

This option enables and disables logging.

-d

This option displays live message logs

-n X

This option displays the last X number of messages.

-h
This option displays the help for this command.

Example

```
soiplog -h
soiplog -l enable":loc=XXXX
```

Dependencies

None

Notes

With two active connections to the CCS MR, logging must be enabled on each IPSM card that has an active SEAS terminal in order to properly log all SR-5129 communication data.

Assuming a message size of 500 bytes, each IPSM card can log approximately 2000 messages.

If an attempt is made to enable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

"Warning: SOIP Logging Enabled from Terminal: <New logging enabled terminal>"

If an attempt is made to disable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal

"Warning: SOIP Logging disabled from Terminal: <New logging enabled terminal>"

If an attempt is made to turn on logging on a terminal when it is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

"Warning: SOIPLLOG Started on Terminal: <New logging enabled terminal>"

Output

```
pass:loc=1305:cmd= "soiplog -h"
```

```
Usage: SOIPLLOG [[-l option] |
                [-d] [-n] [-h]]

Options:
  -l <enable/disable>    Enable/Disable the logs
  -d                      Display live message logs
  -n <num>               Display last <num> number of messages.
Range=1..2000
  -h                      Display Command Help
```

To Enable Real time logging and display, the following commands must be entered one after the other:

```
pass:cmd="soiplog -l enable":loc=XXXX
pass:cmd="soiplog -d":loc=XXXX
```

To enable logging and to display the last N number of logged messages, the following commands must be entered one after the other:

```
pass:cmd="soiplog -l enable":loc=XXXX
pass:cmd="soiplog -n N":loc=XXXX
```

```

traceroute

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `traceroute` command has the option destination. The IP address can be specified for the remote host to which the UDP message is sent, as in the command `traceroute 208.55.20.177`.

Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine’s host number.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

hostname

Hostname. The logical name assigned to the device with the IP address indicated.

Range:

String of characters, beginning with a letter, up to 120 characters in length. Valid characters are *a-z*, *A-Z*, *0-9*, - (hyphen), . (period)

-h

This option provides help information for the command.

-m maximum hops

This option specifies the maximum number of hops before the trace is terminated.

Range:

1-30

Default:

10

-n

This option specifies that only the IP Address of each host will be displayed (not the hostname).

-p port

This option provides the user port number.

Range:

1-65535

Default:

33434

Example

```
traceroute
```

```
traceroute www.remotedest.com
```

```
traceroute www.remotedest.com -m 20
```

```
traceroute www.remotedest.com -m 20 -n
```

```
traceroute 208.55.20.177
```

```
traceroute 208.55.20.177 -m 20 -p 40000
```

Dependencies

If a Domain Name is specified, the Domain Name must exist in the IP Host table or the Domain Name Server A or B must be provisioned.

Notes

The `traceroute` command is executed through the `pass` command.

Output

This example shows the help information for the command:

```
pass:loc=1103:cmd="traceroute" or
pass:loc=1103:cmd="traceroute -h"

    Command entered at terminal #1.
;

ualog

Use this command to report on the user adapter (UA) state machine history for a specified association name. State machine history is kept in a circular buffer in memory. The `-i` and `-x` options are used to include or exclude groups of events from the state machine history.

Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `ualog` command has the parameter aname. The association name must be specified for which the user adapter log will be displayed, as in the command `ualog s7000`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

`-h`

This option displays help (usage) information for the command.

`-i event_group`

This option includes groups of events in the state machine history.

Range:

service

ua

-xevent_group

This option excludes groups of events from the state machine history.

Range:

service

ua

Example

```
pass:loc=1105:cmd="ualog s7000"
```

Dependencies

None

Notes

None

Output

```
pass:loc=1105:cmd="ualog s7000"
```

```

Error Codes

 **Note:**

Error codes 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18 are not used in M3UA

Error codes that can appear in the error messages:

- **0x01**—Invalid Version
A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.
- **0x03**—Unsupported Message Class
A message was received with an unexpected or unsupported Message Class.
- **0x04**—Unsupported Message Type
A message was received with an unexpected or unsupported Message Type.
- **0x05**—Unsupported Traffic Handling Mode
This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).
- **0x06**—Unexpected Message
This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.
- **0x07**—Protocol Error
This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.
- **0x09**—Invalid Stream Identifier
A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).
- **0x0d**—Refused - Management Blocking
An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.
- **0x0e**—ASP Identifier Required
This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.
- **0x0f**—Invalid ASP Identifier
This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier.
- **0x11**—Invalid Parameter Value

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

- **0x12**—Parameter Field Error
A message is received with a parameter that has a wrong length field.
- **0x13**—Unexpected Parameter
A message contains an invalid parameter.
- **0x14**—Destination Status Unknown
This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.
- **0x15**—Invalid Network Appearance
This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.
- **0x16**—Missing Parameter
A message is received, and a mandatory parameter is not included in the message.
- **0x19**—Invalid Routing Context
A message is received from a peer with an invalid (unconfigured) Routing Context value. The invalid Routing Context is included in the error message.
- **0x1a**—No Configured AS for ASP
A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

A

Reference Information

This Appendix contains information that is used by multiple commands.

Summary of Range Values for :link Parameter

[Table A-1](#) lists the valid *link* parameter range values for signaling links assigned to each type of card for which a location can be specified in the command's `loc` parameter. The commands that use these values refer to this table in their *link* parameter description.

Note:

The *port* parameter is a synonym for the *link* parameter in signaling link definitions for EAGLE commands. The *port* parameter will be removed in a future EAGLE release.

Table A-1 Summary of Ranges for *link* Parameter

Card	Link	Supported Application
E5-E1T1-B	A-A31, B-B31	SS7ANSI or CCS7ITU application.
E5-E1T1-B for SE-HSL	A, B	SS7ANSI or CCS7ITU application. The card can support a maximum of 2 SE-HSL links.
E5-E1T1-B for ST-HSL-A	A, B	SS7ANSI application. The card can support a maximum of 2 ST-HSL-A links.
E5-ATM-B	A, A1, B	ATMANSI or ATMITU application. The card can support up to 3 signaling links.
E5-ENET/E5-ENET-B	A-A7, B-B7	IPLIMI application with sockets, M2PA/SCTP associations, or M3UA/SCTP associations.
E5-ENET/E5-ENET-B SLIC	A-A15, B-B15 A-A63, B-B63	IPSG application. IPSG application, SLIC card running IPSG application can support up to 128 links.

Valid CIC Ranges for SI and MSU Types in Routing Key Static Entries

Table A-2 lists the valid CIC ranges for use with SI and MSU types in Routing Key table static entries.

Table A-2 Valid CIC Ranges for SI and MSU Types

SI	MSU for ANSI DPC	MSU for ITU DPC	Comments
4 (TUP)	N/A	CIC is 12 bits. Range is 0-4095.	The TUP protocol is used only in ITU networks.
5 (ISUP)	CIC is 14 bits. Range is 0-16383.	CIC is 12 bits. Range is 0-4095.	
13 (QBICC)	CIC is 32 bits. Range is 0-4294967295.		

DRANAIV/DRANAI Mapping

Table A-5 shows the mapping between the *drainaiv* and *dranai* parameters.

Table A-3 DRANAIV/DRANAI Mapping

DRANAIV	DRANAI	Description
1	sub	Subscriber Number
2	unknown	Unknown
3	natl	National significant number
4	intl	International number
5	ntwk	Network

DRANPV/DRANP Mapping

Table A-6 shows the mapping between the *dranpv* and *dranp* parameters.

Table A-4 DRANPV/DRANP Mapping

DRANPV	DRANP	Description
1	E164	ISDN/telephony numbering plan
3	X121	Data numbering plan
4	F69	Telex Numbering Plan

NAIV/NAI Mapping

Table 58: NAIV/NAI Mapping shows the mapping between the *naiv* and the *nai* parameters.

Table A-5 NAIV/NAI Mapping

NAIV	NAI	Description
0	–	Unknown
1	Sub	Subscriber Number
2	Rsvd	Reserved for national use
3	Natl	National significant number
4	Intl	International number
5–127	–	Spare

NPV/NP Mapping

Table A-8 shows the mapping between the *npv* and the *np* parameters.

Table A-6 NPV/NP Mapping

NPV	NP	Description
0	–	Unknown
1	E164	ISDN/telephony numbering plan
2	Generic	Generic numbering plan
3	X121	Data numbering plan
4	F69	Telex numbering plan
5	E210	Maritime mobile numbering plan
6	E212	Land mobile numbering plan
7	E214	ISDN/mobile numbering plan
8	Private	Private network or network-specific numbering plan
9-15	-	Spare

Cards that use the ent-card Command

Table 60 contains information about cards that use the `ent-card` command for provisioning.

Table A-7 Valid Card Applications and Types

Card Name (as shown on card label)	Part Number	Card Type (:type)	Application Type (:appl)	Maximum Cards in the Database
E5-APP-B	870-3096-01	e5appb	epap elap	2 2

Table A-7 (Cont.) Valid Card Applications and Types

Card Name (as shown on card label)	Part Number	Card Type (:type)	Application Type (:appl)	Maximum Cards in the Database
E5-APP-B	870-3096-02	e5appb	lsms nas imf	2 1 255
E5-ATM-B	870-2972-01 (R)	limatm lime1atm	atmansi atmitu	180 if only one link is provisioned per card. A maximum of 180 links for either application can exist in the system.
E5-E1T1-B††	870-2970-01	lime1 limt1	ss7ansi ccs7itu	250 for each application
E5-ENET-B	870-2971-01 (R)	dcm enet enetb ipsm stc	ss7ipgw ipgwi iplimi stplan eroute ips ipsg	125 for IPGWx 125 for IPLIMx 100 for ipsg 32 for stplan 32 for eroute
E5-MCPM-B*	870-3089-01 (R)	mcpm	mcp	250
E5-SM4G***	870-2860-01 (R) 870-2860-02 (R)	dsm	vsccp	18 for use with ELAP 32 for use with EPAP
E5-SM8G-B***	870-2990-01 (R)	dsm	vsccp	18 for use with ELAP 32 for use with EPAP
E5-SM8G-B***	870-2990-01 (R)	dsm	siphc deirhc enumhc	16 of the E5- SM8G-B cards connected to ELAP or EPAP for siphc and deirhc 16 of the E5- SM8G-B cards connected to EPAP for enumhc
E5-TSM SLIC	870-2943-03 (R)	tsm slic	gls ipsg siphc deirhc enumhc vsccp sfapp	8 40 for use as GTT on IPSTG 75 for use as GTT- disabled IPSTG 40 for use as Service Module cards

Table A-7 (Cont.) Valid Card Applications and Types

Card Name (as shown on card label)	Part Number	Card Type (:type)	Application Type (:appl)	Maximum Cards in the Database
TELCO	870-2904-01	telco	switch	136

* Though the system allows 250 MCPM cards, practical usage is 2.

*** If any MPS-based features are running in the system, up to 25 Service Modules are allowed in the system. If only GTT is running, up to 32 Service Modules can be used in the system with the 50,000 GTT feature.

† † For the E1 or T1 interface, either SS7 application (SS7ANSI or CCS7ITU) can be assigned to these cards. For more information on the E1 or T1 interface go to Appendix A "E1 Interface" or Appendix B "T1 Interface" in the *Database Administration - SS7 User's Guide*.

Part numbers followed by (R) are ROHS numbers. These numbers are equivalent to the non-ROHS numbers that they are paired with.

***Connectivity to a TekServer 3 (T1200) with EPAP 13.0 or higher or connectivity to an E5-APP-B card with EPAP 15.0 or higher is required for more than 25 Service Module cards.

Summary of Loopback Testing Commands and Functions

[Table A-8](#) and [Figure A-1](#) summarize the loopback testing commands and functions in the system.

The `tst-slk` command provides several methods for testing signaling links. The `loopback` parameter provides the ability to select *lxvr* (local transceiver), *oam*, *line*, *payload*, and *sltc* loopback tests. The command will be rejected if a loopback test is not compatible with the link type.

- For low-speed links, the *lxvr* and *sltc* tests are allowed.
- For high-speed links (ATM, E5-ATM-B), the *lxvr*, *oam*, *line*, *payload*, and *sltc* tests are allowed.
- For SS7IPGW and IPGWI DCMs, the `tst-slk` command is not supported.
- For LIME1 or LIMT1 cards, or for the E5-ENET-B cards running the IPSP application, only the `loopback=sltc` test is allowed.
- The E5-E1T1-B cards can function as either an E1 MIM card or a T1 MIM card, depending on how the card is provisioned. The `loopback=sltc` test is allowed.

The `act-lbp` command activates test on one or more loopback points for testing data signaling link elements in one CCS7 transmission path. The maximum number of loopback points is 32.

For a single loopback point test, the parameters can be entered on the command line. If the parameters are not entered at the command line, the LFS database is used. For multiple loopback point tests, the LFS database must be used.

The `ent-lbp` command is used to create the loopback points in the LFS database. The LBPs may be entered in any order.

See the command descriptions in this manual for details on entering parameters and using the commands.

Table A-8 Loopback Testing Commands and Functions

Command/Function	Card Supported	Testing limits
<p><i>act/dact-cdl NETWORK payload low-level loopback test.</i></p> <p>Link State-Down</p> <p>Equipment tested-All links on the T1 port</p> <p>Purpose-tests connectivity between 2 nodes at the T1 level with some isolation for the LIU and/or framer</p> <p>Description-Tests near-end card for line, lxr, and network payload loopback and far-end card for line and payload loopback.</p> <p>Typical use-Tests connectivity</p>	<ul style="list-style-type: none"> E5-E1T1-B E5-ATM-B 	1024 concurrent tests per system
<p><i>ent-lbp OAM Database for Multiple LFS points per LFS tests</i></p> <p>No impact on link behavior other than allowing multiple points</p>	<ul style="list-style-type: none"> E5-E1T1-B (T1 mode) (channelized) 	32 points per card no limit on # of cards
<p><i>act/dact-lbp EAGLE initiated Level 1 DS0 LFS tests</i></p> <p>Link State-Down</p> <p>Equipment tested-Level 1 element(s) in a signaling path</p> <p>Purpose-Test the error rates of a signaling path</p> <p>Description-Sends loopback code to establish loopback, then performs BERT test for a specified period of timed</p> <p>Typical use-Validates signaling path has acceptable error rate</p>	<ul style="list-style-type: none"> E5-E1T1-B (T1 mode) (channelized) 	1024 concurrent tests per system

Table A-8 (Cont.) Loopback Testing Commands and Functions

Command/Function	Card Supported	Testing limits
<p>Remote Loopback FAR END initiated DS0 LFS Test Link State-Up or down Equipment tested-Near end hardware up to level 2 and far end hardware level 1 interface Purpose-Auto-Loopback a BERT test to the far end Description-When receiving a loopback code, deactivate the link and go into loopback Typical use-Remotely tests the far end with standard DS0 BERT tests</p>	<ul style="list-style-type: none"> • E5-E1T1-B (channelized) 	no limit on # of cards
<p><code>tst-slk</code> SLTC EAGLE initiated Level 3 SS7 SLT Link State-Up Equipment tested-Near and far end up to Level 3 Purpose-Test the entire path to the far end at Level 3 Description-Sends an SLTM out and expects an SLTA back Typical use-Validates connectivity of a signaling path</p>	<ul style="list-style-type: none"> • E5-E1T1-B • IPGW • E5-ATM-B 	1024 concurrent link tests per system
<p><code>tst-slk</code> OAM EAGLE initiated Level 1 ATM test Link State-Down Equipment tested-Near and far end level 1 software and hardware including all hardware on the cards Purpose-Test the entire near and far end level 1 hardware by exchanging ATM cells Description-Sends OAM cells out to far end for 60 seconds if no errors, or 2 minutes if errors are received Typical use-Verifies ATM cells can be exchanged between 2 signaling points</p>	<ul style="list-style-type: none"> • E5-ATM-B 	1024 concurrent link tests per system

Possible Values for PST/SST/AST

This section lists the possible values for the primary state (PST), secondary state (SST), and associated state (AST) shown in the output of the Report Status (rept-stat-) commands.

PST

Primary state possible values are the following:

IS-ANR

(IN SERVICE - ABNORMAL) The entity is in service but only able to perform a limited subset of its normal service functions.

IS-NR

(IN SERVICE - NORMAL) The entity is in service and handling all its normal service functions.

OOS-MA

(OUT OF SERVICE - MEMORY ADMINISTRATION) The entity is out of service because it has not been equipped.

OOS-MT

(OUT OF SERVICE - MAINTENANCE) The entity is out of service and is not available to perform its normal service function. The maintenance system is actively working to restore the entity to service.

OOS-MT-DSBLD

(OUT OF SERVICE - MAINTENANCE - DISABLED) The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

SST

Secondary state possible values are the following:

Active

(ACTIVE) The entity is currently in use and is handling its normal service function as the primary service provider. (MASTER) The entity is currently in a master state in relation to its redundant unit.

Allowed

(ALLOWED) The entity is handling its normal service function.

Avail

(AVAILABLE) Entity service is available to another entity.

Blocked

(BLOCKED) The entity has been manually prohibited from handling traffic.

Busy

(BUSY) The entity is handling the maximum traffic capacity and has no spare capacity for new service requests.

Conn

(CONNECT) The card's entity status is in connected state.

DDL Hunt

(DDL HUNTING) The entity is currently in a state where the DDL is hunting for crossload info.

DDL Inhib

(DDL INHIBITED) The entity is currently in a state where the DDL is inhibited from crossload.

DDL NoXld

(DDL Unable to XLOAD) The entity is currently in a state where the DDL is unable to crossload.

DDLunstab

(DDL UNSTABLE) The entity is currently in DDL unstable state.

Disc

(Disconnect) The card's entity status is in disconnected state.

Fault

(FAULT) The entity has failed.

Idle

(IDLE) The entity is in use and has spare capacity for service.

Inhibited

(INHIBITED) The entity has been manually prevented from performing its normal service function.

Isolated

(ISOLATED) The entity cannot be detected through software or hardware.

LPBK

(LOOPBACK) The entity is currently in the Loopback state.

Manual

(MANUAL) The entity has manually been removed from service and is not carrying any traffic.

MEA

(Maintenance Equipment Administration) The entity has been auto-inhibited and has been restricted from functioning because it has not met the minimum hardware requirements for the current configuration.

MPS Unavl

(MPS unavailable). MPS is required, but unavailable for the entity.

Ovflw-1

(OVERFLOW) One entity cannot provide service to another entity due to service denial.

Prohibit

(PROHIBITED) The entity is not handling traffic because of a failure in the network.

Proh-Blk

(PROHIBITED and BLOCKED) The entity has been prohibited and blocked from handling traffic.

Restart

(RESTART) The entity is in MTP Restart.

Restrict

(RESTRICTED) Normal operation for the entity is restricted. The normal capacity or configuration is not being used because of a failure in the network. The normal capacity, functionality or configuration of an entity may be restricted during loading or syncing of data. This can occur when the Measurements Platform has not yet been enabled.

Standby

(STANDBY) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. (SLAVE) The entity is currently in a slave state in relation to its redundant unit.

Test

(TEST) The entity is currently in a test state.

Unavail

(UNAVAILABLE) Entity service is unavailable to another entity.

Ueq

(UNEQUIPPED) The entity is not equipped.

Unblocked

(UNBLOCKED) The entity is handling its normal service function.

AST

Associated state possible values are the following:

(BLANK) The field may be left blank.

ACCESS

(ACCESSIBLE) Traffic is being carried between the local entity and an adjacent, or remote, service provider. A full connection has been completed.

ALMINH

(ALARM INH) The alarms on the entity are inhibited.

BRDG MSTR

(MASTER) The E1/T1 channel bridge is in Master mode.

BRDG SLAVE

(SLAVE) The E1/T1 channel bridge is in Slave mode when the adjacent odd-numbered channel bridge is provisioned in Master mode.

CDL

(COMMAND DRIVEN LOOPBACK) The entity is in command driven loopback state.

DB DIFF

(DATABASE DIFFERENT) The entity has a database difference.

ENET FLT

(ETHERNET FAULT) An Ethernet fault exists.

EXT BERT

(EXTENDED BERT TEST) The entity is undergoing Extended BERT.

FE LINE

(FAR END LINE LOOPBACK) The entity is in far end line loopback.

FE PAYLD

(FAR END PAYLOAD LOOPBACK) The entity is in far end payload loopback.

FLT CHK

(FAULT ISOLATION TEST) The entity is undergoing a fault isolation test.

INACCESS

(INACCESSIBLE) Traffic is not being carried from the local entity to another service provider. A breakdown in a complete circuit has been detected.

LFS

(LINK FAULT SECTIONALIZATION) The entity is in Link Fault State.

LINE

(LINE LOOPBACK) The entity is in line loopback state.

LOCAL

(LOCAL) The entity has become locally isolated.

LXVR

(LXVR LOOPBACK) The entity is in local transceiver loopback state.

M BIP ERR

(MOTHERBOARD IDENTITY PROM) The entity has a motherboard prom error.

NOT BRDGD

(NOT BRIDGED) The E1/T1 port channel is not bridged.

OAM F5 FM

(OAM LOOPBACK) The entity is in OAM initiated loopback state.

PAYLOAD

(PAYLOAD LOOPBACK) The entity is in payload loopback state.

SLTM

(SPECIAL MAINTENANCE TEST MESSAGES) The entity is in SLTM testing state.

Point Code Formats and Conversion

Many of the commands used for database configuration use point codes. This section describes the point code formats that the system supports. If you need additional information or procedural information, refer to the *Database Administration Manual - SS7*.

The system supports four different point code formats:

- ANSI point codes
- ITU International point codes
- ITU National point codes
- ITU National 24-bit point codes

Each format is described in further detail in the following sections.

ANSI Point Codes

ANSI point codes are made up of three groups of digits called the network indicator (*ni*), network cluster (*nc*), and network cluster member (*ncm*). The values for ANSI point codes depend on the value of the `pctype` parameter of the `chg-sid` command, either *ansi* or *other*.

If the `pctype=ansi` command is entered, the range of values for an ANSI point code is as follows:

- *ni-001-255*
- *nc-001-255* (if *ni* = 001-005)
- *-000-255, ** (if *ni* = 006-255)
- *ncm-000-255*

The following rules apply to provisioning ANSI point codes if the `pctype=ansi` parameter is specified:

- An *ni* value of 0 is not allowed (e.g., `dpc=0-1-1` and `dpc=0-0-0` are not valid point codes).
- If the *ni* value is 1, 2, 3, 4, or 5, then the *nc* value cannot be 0 (e.g., `dpc=5-0-1` is rejected).
- If the *ni* value is 1, 2, 3, 4, or 5, then network routing point codes are not allowed (e.g., `dpc=4-*-*` is rejected).

If the `pctype=other` parameter is specified, the ANSI point codes do not meet ANSI standards. The range of values for these ANSI point codes is as follows:

- `ni-000-255`
- `nc-000-255, *`
- `ncm -000-255, *`

The following rules apply to provisioning ANSI point code if the `pctype=other` parameter is specified:

- An `ni` value of 0 is allowed, however `dpc=0-0-0` is rejected (e.g., `dpc=0-1-1` is accepted).
- The `nc` value can be 0 for all values of `ni` (e.g., `dpc=5-0-1` is accepted).
- Network routing point codes are allowed for all values of `ni` (e.g., `dpc=4-*-*` is accepted).

An ANSI point code containing all zeros (0-0-0) is not a valid point code and cannot be entered into the database.

ANSI point codes support the Private (Internal) Point Code subtype prefix (p-). The prefix can be specified before the point code subfield values to indicate a Private Point Code (i.e p-5-0-1). See [Spare and Private Point Code Subtype Prefixes](#).

Note:

Point codes specified by many commands, including those for site identification, routing keys, and LNP, are required to be full point codes. The asterisk values are not valid in the commands that specify these point codes. The command Dependencies sections identify the point codes that must be full point codes in the commands.

A range of values for a subfield is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The asterisk (*) point code value indicates a single cluster address for a cluster point code (e.g., 20-2-*) or a network routing destination (20-*-*). If * is used for the `nc` subfield, then * must be also be used for the `ncm` subfield.

A double asterisk (**) and a triple asterisk (***) can also be used for the `nc` and `ncm` subfields of the ANSI point code, but only for the `rtrv-dstn`, `rept-stat-dstn`, `rtrv-rte`, and `rept-stat-rte` commands. If *, **, or *** is used for the `nc` subfield, then *, **, or *** must be used for the `ncm` field

For examples of all of these point code values, see the `rtrv-dstn` command output.

ITU International Point Codes

The ITU international point codes are made up of three groups of digits called *zone*, *area*, and *id*. The range of varnames for ITU International point codes are:

- `zone-0-7`
- `area-000-255`
- `id-0-7`

An ITU international point code containing all zeros (0-000-0) is not a valid point code and cannot be entered into the database.

ITU international point codes support the Spare Point Code subtype prefix (s-). The prefix can be specified before the point code subfield varnames to indicate a Spare Point Code (s-5-222-1, for example). See [Spare and Private Point Code Subtype Prefixes](#).

ITU National Point Codes

The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers (members) separated by dashes.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is on, ITU national point codes can have group codes assigned to them. The point code is a 1- to 5-digit number. The group code is a two-character field ranging from aa to zz that is entered as the last subfield of the point code and is separated by a dash from the rest of the point code. An example is 12345-az.

If the flexible point codes option is enabled (see the `chg-stpopts` command, `:npcfmt` parameter), an ITU national point code format consists of 2, 3, or 4 numbers separated by dashes (formatted as *m1-m2-m3-m4*). When the ITUDUPPC feature is also on, the format is *m1-m2-m3-m4-gc* with a group code. If one of the *m1*, *m2*, *m3*, *m4* members is set to zero bits, no value is entered for that position in the point code. For example, if the `npcfmt` parameter value is set to 3-8-3-0, valid point codes would be 1-100-1-aa with a group code, or 7-255-7 with no group code. See the tables in the `chg-stpopts` command description for valid member values and additional examples.

The following ranges of values are valid:

- *nnnnn016383*
- *nnnnn-gc0-16363*; group code is aa-zz (the ITUDUPPC feature must be on)
- *m1-m2-m3-m4* Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from 0 - 14. Each member must be specified; the member value of 0 indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14.
- *m1-m2-m3-m4-gc* Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from 0 to 14. Each member must be specified; the member value of 0 indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14. Group code is aa-zz (the ITUDUPPC feature must be on).

An asterisk value (*) is allowed only for the `rtrv-dstn` and `rtrv-rte` commands to retrieve ITU-N DPCs if the ITUDUPPC feature is on (for point codes with group codes). The node and group code cannot both be *. For example, `dpcn=12345-*` and `dpcn=*aa` are allowed, but `dpcn=**` is not allowed.

If flexible point codes are also used, all valid *m1*, *m2*, *m3*, and *m4* must all be either a number or an *. For example, 1-100-1-aa and *-*-aa are allowed, but 1-*-aa is not allowed.

ITU national point codes support the Spare Point Code subtype prefix (s-). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (s-12345 or s-1-3-5-5-gc, for example). See [Spare and Private Point Code Subtype Prefixes](#).

Converting ITU National Point Code Formats

Gateway screening only allows ITU national point codes to be provisioned in the database by the enter, delete, or change gateway screening commands, and displayed by the gateway screening retrieve commands as a single number. If a format other than a single number (14-0-0-0) for the ITU national point code has been defined by the `npcfnti` parameter of the `chg-stpopts` command, the ITU national point code must be converted into a single number so that it can be used by gateway screening.

For example, the format of the ITU national point code is 4-4-4-2 and you would like to add point code 7-7-7-1 into the allowed OPC screen. The point code 7-7-7-1 would have to be converted to a single number so that the point code can be added to the allowed OPC screen. To determine what multiple-part ITU national point code is represented by the single number ITU national point code in the gateway screening table, the single number point code must be converted to a multiple-part point code.

To convert a single number ITU national point code to a multiple-part point code, go to [Converting Single Number ITU National Point Codes](#).

To convert a multiple-part ITU national point code to a single number point code, go to [Converting Multiple-Part ITU National Point Codes](#).

For a definition of the different formats that can be used for ITU national point codes, see [ITU National Point Codes](#).

When the ITU national point codes are converted from single numbers to multiple-part point codes, the resulting value of the multiple-part point code depends on the point code format specified by the `npcfnti` parameter of the `chg-stpopts` command. When converting the single number point code 14781 to the point code format 3-8-3-0, the resulting point code value is 7-55-5. If point code 14781 is converted to the point code format 4-4-4-2, the resulting point code value is 14-6-15-1.

Converting Single Number ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the `NPCFMTI` field of the `rtrv-stpopts` command output. For this example, the ITU national point codes 14781 and 695 are converted to point codes using the 3-8-3-0 format.

Convert a single number ITU national point code to a multiple-part ITU national point code as follows.

Converting a Single Number ITU national point code to a multiple-part ITU national point code

1. Convert the point code to a binary number. This can be done with most scientific calculators.

The number **14781** converts to the binary number 11100110111101.

The number **695** converts to the binary number 1010110111.

 **Note:**

Make sure the binary number contains 14 digits. If it does not, add leading zeros to the binary number to bring the total number of digits in the number to 14.

In this example, the binary equivalent for the decimal number 695 (1010110111) contains 10 digits; four zeros must be added to the beginning of the binary number. The resulting binary number is now 00001010110111.

2. Divide the binary number into the number of parts required by the format of the ITU national point code. For this example, the format is 3-8-3-0. Because the last part of the point code format is 0, the point code format contains only three parts. Divide the point code into three parts, the first part of the point code contains the first three digits of the 14-digit binary number, the second part of the point code contains the next eight digits of the 14-digit binary number, and the third part of the point code contains the last three digits of the 14-digit binary number.

For this example, the binary numbers would be divided like this:

11100110111101 = 111 00110111 101

00001010110111 = 000 01010110 111

3. Convert each part of the point code into a decimal number using the same scientific calculator used in step 1 and separate each part of the point code with dashes. The results are as follows.

111 00110111 101 = **7-55-5**

000 01010110 111 = **0-86-7**

Converting Multiple-Part ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the `npcfmt_i` field of the `rtrv-stpopts` command output. For this example, the ITU national point codes 7-55-5 and 0-86-7, using the 3-8-3-0 point code format, are converted into a single number.

Convert multiple-part ITU national point codes to a single number as follows.

Converting Multiple-Part ITU National Point Codes to a Single Number

Converting Multiple-Part ITU National Point Codes to a Single Number

1. Convert each part of the point code into a binary number using a scientific calculator. The results are as follows.

7-55-5 = 111 00110111 101

0-86-7 = 000 01010110 111

2. Combine each part of the point code into a single binary number as follows.

111 00110111 101 = 11100110111101

000 01010110 111 = 00001010110111

 **Note:**

If the binary number has any zeros at the beginning of the number, remove these zeros as they are not necessary.

In this example, the binary equivalent for the point code **0-86-7** (00001010110111) contains four zeros at the beginning of the binary number. When the leading zeros are removed from the binary number, the resulting binary number is now 1010110111.

3. Convert the binary number to a decimal number using the same scientific calculator used in step 1.

The binary number 11100110111101 converts to the decimal number 14781.

The binary number 1010110111 converts to the decimal number 695.

24-bit ITU-National Point Codes

The 24-bit ITU national point codes are made up of three groups of digits called *main signaling area*, *sub signaling area*, and *signaling point*. The valid values for 24-bit ITU national point codes are:

- *main signaling area-000-255*
- *sub signaling area-000-255*
- *signaling point-000-255*

24-bit ITU national point codes support the Private (Internal) Point Code subtype prefix (p-). The prefix can be specified before the point code field values to indicate a Private Point Code (p-2055-222-2011, for example). See [Spare and Private Point Code Subtype Prefixes](#).

Spare and Private Point Code Subtype Prefixes

The Spare Point Code Support feature and the Internal Point Code Support feature provide optional point code subtype prefixes. The Spare Point Code feature must be enabled before a point code subtype prefix can be specified for a point code.

 **Note:**

The SEAS interface does not support point code subtype prefixes.

The values *p-*, *s-*, and *ps-* are valid point code subtype prefixes. The dash- separates the point code subtype prefix from the remainder of the point code. The prefixes are displayed in lower case. The syntax for the remainder of the point code remains the same.

The Spare Point Code prefix (*s-*) applies only to ITU-I and ITU-N point code domains (ITU-N24 point codes do not support the Spare Point Code prefix), to allow the EAGLE to fully support ITU National and International Spare Point Codes. [Table A-9](#) lists the commands that support the Spare Point Code subtype prefix.

The Private (Internal) Point Code prefix (*p-*) applies to all point code domain types (including ITU-N24 point codes), to allow messages destined to the End Office Node to be routed from the inbound LIM to the outbound IPGWx. [Table A-10](#) lists the commands that support the Private Point Code subtype prefix.

The subtype prefix *ps-* can be specified when the point code parameter supports both the spare and private point code prefixes.

Table A-9 Commands that support the Spare Point Code Prefix

Command	Description	Applicable Point Code Parameters
alm	Alarm	<i>dpci</i> and <i>dpcn</i>
appl-rtkey	Application Route Key	<i>dpci</i> and <i>dpcn</i> ; <i>opci</i> and <i>opcn</i>
cspc	Concerned Signaling Point Code	<i>pci</i> and <i>pcn</i>
dstn	Destination	<i>spci</i> and <i>spcn</i> ; <i>dpci</i> and <i>dpcn</i> ; and Alias combinations.
ent-trace	Enter Trace	<i>dpci</i> and <i>dpcn</i> ; <i>opci</i> and <i>opcn</i>
gsmmap-scrn	GSM MAP Screening	<i>npci</i> and <i>npcn</i>
gsmopts	GSM Options	<i>ppsmspci1</i> , <i>ppsmspci2</i> , <i>ppsmspcn1</i> , <i>ppsmspcn2</i>
gsms-opcode	GSM Short Message Services OP-Code	<i>pci</i> and <i>pcn</i>
gtt/gta	Global Title Translation/Global Title Address	<i>pci</i> and <i>pcn</i>
ls	Linkset	<i>apci</i> and <i>apcn</i>
map	Mated Application	<i>pci</i> and <i>pcn</i> ; <i>mpci</i> and <i>mpcn</i>
mrn	Mated Relay Node	<i>pci</i> and <i>pcn</i> ; <i>pci1</i> and <i>pcn1</i> ; <i>pci2</i> and <i>pcn2</i> ; <i>pci3</i> and <i>pcn3</i> ; <i>pci4</i> and <i>pcn4</i>
na	Network Appearance	<i>type=ituis</i> , <i>type=ituns</i>
pass	Pass Commands	Syntax for routing keys
rmt-appl	Remote Application	<i>ipci</i> and <i>ipcn</i>
rte	Route	<i>dpci</i> and <i>dpcn</i>
scr-aftpc	Gateway Screening Allowed Affected Point Code	<i>pcst</i> and <i>pctype</i>
scr-blkdpc	Gateway Screening Blocked Destination Point Code	<i>pcst</i> and <i>pctype</i>
scr-blkopc	Gateway Screening Blocked Origination Point Code	<i>pcst</i> and <i>pctype</i>
scr-cdpa	Gateway Screening Called Party (CDPA PC Destination) Point Code	<i>pcst</i> and <i>pctype</i>
scr-cgpa	Gateway Screening Calling Party (Origination) Point Code	<i>pcst</i> and <i>pctype</i>
scr-destfld	Gateway Screening Affected Destination (Concerned) Point Code	<i>pcst</i> and <i>pctype</i>
scr-dpc	Gateway Screening Destination Point Code	<i>pcst</i> and <i>pctype</i>
scr-opc	Gateway Screening Origination Point Code	<i>pcst</i> and <i>pctype</i>

Table A-9 (Cont.) Commands that support the Spare Point Code Prefix

Command	Description	Applicable Point Code Parameters
sid	Site ID	True <i>pci</i> and <i>pcn</i> ; <i>cpci</i> and <i>cpcn</i> ; <i>ncpci</i> and <i>ncpcn</i> .
spc	Secondary Point Code	<i>spci</i> and <i>spcn</i>

Table A-10 Commands that support the Private Point Code Prefix

Command	Description	Applicable Point Code Parameters
dstn	Destination	<i>spci</i> and <i>spcn</i> ; <i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i> Does not apply to Aliases
ls	Linkset	If <i>ipgwpc=yes</i> , <i>apc</i> , <i>apcn</i> , <i>apci</i> , and <i>apcn</i>
gtt/gta	Global Title Translation	<i>pc</i> , <i>pca</i> , <i>pci</i> , and <i>pcn</i>
inh/unhb-alm	Destination alarm inhibit	<i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>
rept-stat-cluster	Report Cluster Status	<i>dpc</i> and <i>dpca</i>
rept-stat-dstn	Report Destination Status	<i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>
rmt-appl	Remote Application	<i>ipc</i> , <i>ipca</i> , <i>ipci</i> , and <i>ipcn</i>
rst-dstn	Restore Destination	<i>dpc</i> and <i>dpca</i>
rte	Route	<i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>

B

Acronyms and Abbreviations

Acronyms and Abbreviations

A-Port

ANSI-41 Mobile Number Portability

AINPQ

ANSI-41 INP Query

AAL

ATM Adaptation Layer

AAL5

ATM Adaptation Layer 5

AAL5CP

ATM Adaptation Layer 5 Common Port

AATM

ATM Applique

ACG

Automatic Call Gapping

ADJ DPC

Adjacent Destination Point Code

AI

Address Indicator

AIN

Advanced Intelligent Network

AINF

Application Interface Applique

ANSI

American National Standards Institute

AP

Application Processor

APC

Adjacent Point Code

ARP

Address Resolution Protocol

AS

Application Server; a logical entity serving a specific Routing Key

ASP

Application Server Process

ATI

Any Time Interrogation

ATM

Asynchronous Transfer Mode

ATMANSI

The application software for the ATM (high-speed) SS7 signaling links

ATM HSL

Asynchronous Transfer Mode High Speed Link

ATMM

ATM Layer Management

AVL

Availability Measurements report

AVLD

Daily Availability measurements report

AVLDTH

Day-to-Hour Availability measurements report

BCSM

Basic Call State Model

BIP

Board Identification PROM

BITS

Building Integrated Timing System

BLM

Bulk Load Module

BSD

Berkeley Software Distribution

BSN

Backward Sequence Number

CAS

Channel Associated Signaling

CCM

Command Class Management

CCS

Common Channel Signaling

CCS7
Common Channel Signaling System #7

CCS7ITU
The application software for the ITU SS7 signaling links

CDPA
Called Party Address

CDPN
Called Party Number

CGPA
Calling Party Address

CF
Control Frame

CIC
Circuit Identification Code

CLLI
Common Language Location Identifier

CLU
Network Cluster

CM
Cluster Management

CNCF
Calling Name Conversion Facility

CP
Communication Processor

CPU
Central Processing Unit

CRC
Cyclic Redundancy Check

CRMD
Cluster Routing and Management Diversity

CRP
Circular Route Prevention

CSL
Common Screening List

CSPC
Concerned Signaling Point Code Group

CSU
Channel Service Unit

DB

Database

DCM

Database Communications Module

DIP

Dual In-Line Package

DIX

Digital/Intel/Xerox de facto standard for Ethernet Media Access Control Type

DN

Dialed or Directory Number

DPC

Destination Point Code

DRAM

Dynamic Random Access Memory

DSM

Database Services Module

DSU

Data Service Unit

DTA

Database Transport Access

E5IS

EAGLE 5 Integrated Monitoring Support

EBDA

Enhanced Bulk Download and Audit

EDR

Efficient Data Representation

EF

Extension Frame

EGTT

Enhanced Global Title Translation

EIA

Electronic Industries Association

EIR

Equipment Identity Register

ELAP

EAGLE LNP Application Processor

EMP

EAGLE Monitoring Protocol

EMSALM
Element Management System Alarm Monitor

ENET
Ethernet

EOAM
Enhanced Operations, Administration, and Maintenance

EOAP
Enhanced OSS Application Process

EPAP
EAGLE Provisioning Application Processor

EPM
Embedded Processor Module

EPROM
Erasable PROM

ESP
Extended Services Platform

FAK
Feature Access Key

FAP
Fuse and Alarm Panel

FAS
Frame Alignment Signal

FISU
Fill In Signal Unit

FPBA
Frame Power Budget Alarm

FPCR
Full Point Code Routing

FPT
Frame Power Threshold

FSN
Forward Sequence Number

FTA
File Transfer Area

FTP
File Transfer Protocol

FTRA
FTP-based Table Retrieve Application

GDB	GSM Real-Time Database
G-Flex	GSM Flexible Numbering
G-Port	GSM Mobile Number Portability
GLS	Generic Loading Service
GMSC	Gateway MSC
GPL	Generic Program Load
GPSM	General Purpose Service Module
GSL	Generic Software Load
GSM	Global System for Mobile Communications
GTA	Global Title Address
GTI	Global Title Indicator
GTT	Global Title Translation
GTWY	Gateway Administration measurements report
GWS	Gateway Screening
GWSA	Gateway Screening Application
GWSM	Gateway Screening Messages
HDB3	High Density Bipolar 3 encoding
HIPR	High Speed IMT Packet Router
HLR	Home Location Register

HOMERN
Home Network Routing Number Prefix

HMUX
High-Speed Multiplexer

HRN
Home Routing Number

HSL
High-Speed Links

IAM
Initial Address Message

IC
Integrated Circuit

ICMP
Internet Control Message Protocol

ID
Identity

IDP
Initial Detection Point

IEC
International Escape Code

IETF
Internet Engineering Task Force

IGM
IS41 GSM Migration

IGTTLS
Intermediate Global Title Translation Load Sharing

IL
Incremental loading

ILA
Integrated LIM Applique

IMEI
International Mobile Equipment Identifier

IMF
Integrated Message Feeder

IMSI
International Mobile Station Identifier

IMT
Inter-processor Message Transport

IN
Intelligent Network

INAP
Intelligent Network Application Part

INET
Internet

INH
Inhibit

INP
INAP-based Number Portability

INSL
In-Network Subscriber List

IP
Internet Protocol

IPGWI
An ITU version of SS7IPGW

IPGWx
Point to multi-point IP Transport GPL, referring to SS7IPGW (ANSI) and IPGWI (ITU)

IPLIMI
The application software used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

IPLIMx
Point to point IP Transport GPL, referring to IPLIMI (ITU)

IPMX
IMT Power and Multiplexer

IPS
Internet Protocol Services

IS-41
Interim Standard 41, same as and interchangeable with ANSI-41

IS-ANR
In Service - Abnormal

ISDN
Integrated Services Digital Network

IS-NR
In Service - Normal

ISUP
ISDN User Part

ITU
International Telecommunications Union

ITUDUPPC
ITU National Duplicate Point Code

JIP
Jurisdiction Indicator Parameter

LAN
Local Area Network

LB
Load Balancing

LBP
Loop Back Point

LC
Logical channel

LED
Light Emitting Diode

LFS
Link Fault Sectionalization

LNP
Local Number Portability

LNPMR
LNP Message Relay

LNPQS
LNP Query Service

LNP SMS
LNP Short Message Service

LPE
Logical Processing Element

LPO
Link Processor Outage

LRN
Location Routing Number

LS
Link Set

LSA
Link Status Alignment

LSB
Least Significant Bit (bit 1)

LSL
Low-Speed Link

LSMS	Local Service Management System
LSN	Link Set Name
LSO	Link Status out of Service
LSPE	Link Status Proving Emergency
LSPN	Link Status Proving Normal
LSR	Link Status Ready
LSSU	Link Status Signal Unit
M2PA	SS7 MTP2-User Peer-to-Peer Adaptation Layer
M3UA	SS7 MTP3-User Adaptation Layer
MAAL	Management ATM Adaptation Layer
MAP	Mobile Application Part
MAPSCRN	GSM MAP Screening measurements report
MCAP	MAS Communication Application Processor Card
MCC	Mobile Country Code
MCM	Maintenance Communication Module
MCP	Measurement Collection Processor
MCPM	Measurement Collection and Polling Module
MDAL	Maintenance Disk and Alarm (card)
MDN	Mobile Dialed Number

MGT

Mobile Global Title

MGTT

Modified Global Title Translation

MF

Miscellaneous Frame

MFC

Message Flow Control

MIM

Multi-Channel Interface Module

MIN

Mobile Identification Number

MLPRST

MTP Low Priority Route Set

MNP

Mobile Number Portability

MNP SMS

Portability Check for Mobile Originated SMS

MNP-SRF

Signaling Relay Function for support of Mobile Number Portability

MOBR

Origin-based MTP Routing feature

MPC

Multiple Point Code feature

MPL

Multi-port LIM

MPS

Multi-Purpose Server

MR

Message Relay

MRN

Mated Relay Node

MRN

Message Reference Number

MS

Mobile Station

MSB

Most Significant Bit

MSC

Mobile Switching Center

MSAR

Memory space accounting reporting

MSISDN

Mobile Station ISDN Number or Mobile Switching ISDN Number

MSRN

Mobile Station Roaming Number

MSU

Message Signal Unit

MTCD

Maintenance Daily measurements report

MTCDTH

Maintenance Day-to-Hour measurements report

MTCH

Maintenance Hourly (marginal) measurements report

MTCS

Maintenance Status (link/link set) measurements report

MTP

Message Transfer Part

MTP2

Message Transfer Part, Level 2

NAI

Nature of Address Indicator

NCAI

Nested Cluster Allowed Indicator

NCR

Nested Cluster Routing

NEC

National Escape Code

NFAS

Non-Frame Alignment Signal

NI

Network Indicator

NIC

Network Information Center

NID

Network Identification

NM	Network Management
NP	Number Plan
NPA	Numbering Plan Area
NPAC	Number Portability Administration Center
NPANXX	Numbering Plan Area and Exchange
NRT	Network Routing
NSAP	Network Service Access Point
NSE	Network Security Enhancement
NSFI	Next Screening Function Indicator
NSP	Network Services Part
NSPC	New Secondary Point Code
OAM	Operations, Administration, and Maintenance
OAP	Operation System Support Application Processor
OAMP	Operations, Administration and Maintenance Part
OBSR	Origin-based SCCP Routing feature
OCU	Office Channel Unit
OOS-MA	Out of Service - Memory Administration
OOS-MT	Out of Service - Maintenance
OOS-MT-DSBLD	Out of Service - Maintenance Disabled

OPC
Origination Point Code

OPCODE
Operation Code

OPNAME
Operation Name

OSI
Open Systems Interconnection

OSS
Operations Systems Support

PC
Point Code

PCR
Preventive Cyclic Retransmission

PCS
Personal Communications Service (North American GSM)

PDBA
Provisioning Database Application

PDBI
Provisioning Database Interface

PDN
Packet Data Network

PDS
Persistent Device States

PLNP
PCS 1900 LNP

PLNPQS
LNPQS support provided for PLNP

PPSMS
Prepaid Short Message Service Intercept

PROM
Programmable Read-Only Memory

PSEL
Presentation Selector

PST
Primary State for Maintenance

PSTN
Public Switched Telephone Network

PVC	Permanent Virtual Circuit
PVN	Private Virtual Network
Q3	Q.3 Protocol
RAM	Random Access Memory
RBASE	Record Base measurements report
RC	Relative Cost
RI	Routing Indicator
RFC	Request for Comments
RMC	Remote Maintenance Center
RMTP	Reliable Multicast Transport Protocol
RN	Routing Number
RTDB	DSM Real-time database
RTT	Round Trip Time
SAAL	Signaling ATM Adaptation Layer
SAPC	Secondary Adjacent Point Code
SCCP	Signaling Connection Control Part
SCM	System Configuration Manager
SCMG	SCCP Management
SCP	Service Control Point

SCRSET

Screen Set

SCSI

Small Computer System Interface

SCTP

Stream Control Transmission Protocol

SE-HSL

Synchronous E1 High Speed Link

SEAS

Signaling Engineering and Administration System

SFAPP

Stateful Applications

SIB

Status Indication "Busy"

SIE

Status Indication "Emergency" Alignment

SIN

Status Indication "Normal Alignment"

SIO

Service Information Octet

SIO

Status Indication "Out of Alignment"

SIOS

Status Indication "Out of Service"

SK

Service Key

SKTS

Service Key/TeleService List

SLIC

Service and Link Interface Card

SLK

Signaling Link

SLS

Signaling Link Selection

SLSCI

Signaling Link Conversion Indicator

SLTA

Signaling Link Test Acknowledgement

SLTM	Signaling Link Test Message
SMS	Short Message Service
SMSC	Short Message Service Center
SMSMR	Prepaid Short Message Service
SNAI	Service Nature of Address Indicator
SNM	Signaling Network Management
SNR	Subsystem Normal Routing
SOR	Support for Optimal Routing
SORP	Socket Option Registration Primitive
SPC	Secondary Point Code Signaling Point Code
SRF	Signaling Relay Function
SRI	Send Routing Information
SRVSEL	Service Selector
SS7	Signaling System #7
SS7ANSI	The application software for the ANSI SS7 signaling links
SSA	Subsystem Allowed (An SCCP management message)
SSEL	Session Selector
SSN	SS7 Subsystem Number
SSP	Service Switching Point

SSU

Status Signal Unit

ST

Stop Digit—BCD value 15 (0xF)—used to indicate the end of dialing in some applications

STC

Signaling Transport Card

STP

Signal Transfer Point

STP LAN

The application software for the STP LAN feature

SUA

SS7 SCCP-User Adaptation Layer

SVC

Switched Virtual Circuit

TALI

Transport Adapter Layer Interface (RFC 3094)

TCP

Transmission Control Protocol

TCAP

Transaction Capabilities Application Part

TDM

Terminal Disk Module

TFA

Transfer Allowed

TFC

Transfer Congested (traffic)

TFP

Transfer Prohibited

TFR

Transfer Restricted

TLNP

Triggerless LNP

TOS

Type of Service

TPS

Transactions Per Second

TRA

Traffic Restarting Allowed

TRBL

Trouble

TRW

Traffic Restarting Waiting

TSC

Time Slot Counter Synchronization

TSM

Translation Services Module

TT

Translation Type

TUP

Telephone User Part

TV

Ticket Voucher

UA

IETF User Adaptation Layers

UAM

Unsolicited Alarm Message

UART

Universal Asynchronous Receiver - Transmit

UDP

User Datagram Protocol

UDTS

Unit Data Transfer Service

UI

User Interface

UID

User ID

UIM

Unsolicited Informational Message

UPD

Update

VGTT

Variable Length GTT

VLR

Visitor Location Register

VMSC

Voice Mail Service Center Visited Mobile Switching Center

VSCCP

VxWorks Signaling Connection Control Part

WNP

Wireless Number Portability

WNPQS

Wireless Number Portability Query Service

X.25 DE

X.25 Destination Entity

XGTT

Expanded GTT (GTT Table Expansion)

XMAP

Expanded MAP Table
