U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

This software or hardware and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

## **Table of Contents**

1.	Pre	face	1–1
1	.1	Intended Audience	1–1
1	.2	Documentation Accessibility	1–1
1	.3	Access to Oracle Support	1–1
1	.4	Structure	1–1
1	.5	Related Information Sources	1–1
2.	Obj	jective and Scope	2-1
2	.1	Background	2-1
2	.2	Objective	2-1
2	.3	Scope	2-2
2	.4	Structure	2-3
3.	Arc	hitecture of Service Tier	3-1
4.	Ext	ensible Points in Service Tier	4-1
4	.1	REST Tier	4-1
4	.2	Service Extensions	4-3
4	.3	Business Policy	4-10
4	.4	Dictionary	4-12
4	.5	Domain Extensions	4-15
4	.6	Error Messages	4-22
4	.7	Adapter Tier	4-22
4	.8	Outbound web service extensions	4-32
4	.9	Security Customizations	4-35
4	.10	Taxonomy Validations	4-35
4	.11	Miscellaneous	4-35
5.	Ext	ensible Points in Approval	5-48
5	.1	Adding a new Rule Criteria	5-48
6.	Arc	hitecture of GUI Tier	6-1
7.	Ext	ensible Points in GUI Tier	7-1
7	.1	Theme and Brand	7-1
7	.2	Component Extensibility	7-1
7	.3	Calling custom REST service	7-3

8.	Libr	aries	.8-1
8.1	1	OBAPI Libraries	8-1
9.	Dig	x Scheduler Application	9–1
9.1	1	Create New Scheduler Class	9–1
9.2	2	Configure Scheduler Class	9–2

# 1. Preface

## 1.1 Intended Audience

This document is intended for the following audience:

- Customers
- Partners

## 1.2 **Documentation Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <a href="http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc">http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc</a>.

## 1.3 Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs\_if you are hearing impaired.

## 1.4 Structure

This manual is organized into the following categories:

Preface gives information on the intended audience. It also describes the overall structure of the User Manual.

The subsequent chapters describes following details:

- Introduction
- Preferences & Database
- Configuration / Installation.

## 1.5 **Related Information Sources**

For more information on Oracle Banking APIs Patchset Release 21.1.4.0.0, refer to the following documents:

Oracle Banking APIs Installation Manuals

# 2. Objective and Scope

## 2.1 Background

OBAPI is designed to help banks respond strategically to today's business challenges, while also transforming their business models and processes to reduce operating costs and improve productivity across both front and back offices. It is a one-stop solution for a bank that seeks to leverage Oracle Fusion experience across its core banking operations across its retail and corporate offerings.

OBAPI provides a unified yet scalable IT solution for a bank to manage its data and end-to-end business operations with an enriched user experience. It comprises pre-integrated enterprise applications leveraging and relying on the underlying Oracle Technology Stack to help reduce inhouse integration and testing efforts.

## 2.2 Objective

While most product development can be accomplished via highly flexible system parameters and business rules, further competitive differentiation can be achieved via IT configuration & extension support. Time consuming, custom coding to enable region specific, site specific or bank specific customizations can be minimized by offering extension points and customization support which can be implemented by the bank and / or by partners.

### Extensibility objective

OBAPI when extended & customized by the Bank and / or Partners results in reduced dependence on Oracle. As a result of this, the Bank does not have to align plans with Oracle's release plans for getting certain customizations or product upgrades. The bank has the flexibility to choose and do the customizations themselves or have them done by partners.

One of the key considerations towards enabling extensibility in OBAPI has been to ensure that the developed software can respond to future growth. This has been achieved by disciplined software development leading to cleaner dependencies, well defined interfaces and abstractions with corresponding reduction in high cohesion & coupling. Hence, the extensions are kept separate from Core – Bank can take advantage of OBAPI Core upgrades as most extensions done for a previous release can sit directly on top of the upgraded version. This reduces testing effort thereby reducing overall costs of planning & taking up an upgrade. This would also improve TTM significantly as the bank enjoys the advantage of getting universal features through upgrades.

The broad guiding principles w.r.t. providing extensibility in OBAPI are summarized below:

- Strategic intent for enabling customers and partners to extend the application.
- Internal development uses the same principles for client specific customizations.
- Localization packs.
- Extensions by Oracle Consultants, Oracle Partners, Banks or Bank Partners.
- Extensions through the addition of new functionality or modification of existing functionality.
- Planned focus on this area of the application.
- Standards based.

- Leverage large development pool for standards based technology.
- Developer tool sets provided for as part of JDeveloper and Eclipse for productivity.

## 2.3 <u>Scope</u>

The scope of this document is to explain the *customization* & *extension* of OBAPI for the following use cases:

- Customizing OBAPI application services and implement composite application services
- Adding pre-processing or post processing validations in the application services extension
- Adding Business Logic in pre hook or post hook points in the application services extension
- Altering the product behavior at customizations hooks provided as adapter calls in functional areas that are prone to change and in between modules that can be replaced (e.g. alerts, content management)
- Adding new fields to the OBAPI domain model and including it on the corresponding screen.
- Defining the security related access and authorization policies
- Defining different security related rules, validator and processing logics
- Customizing OBAPI UI
- Adding a new field or a table on the screen
- Removing fields from the UI

This document would be a useful tool for Oracle Consulting, bank IT and partners for customizing and extending the product.

The document is a developer's extensibility guide and does not intend to work as a replacement of the functional specification which would be the primary resource covering the following:

- OBAPI installation & configuration.
- OBAPI parameterization as part of implementation.
- Functional solution and product user guide.

#### Out of scope

The scope of extensibility does not intend to suggest that OBAPI is forward compatible.

## 2.4 <u>Structure</u>

This document is organized into following chapters

- Architecture of Service Tier: Provides overall architecture of the service tier of OBAPI platform. This chapter will set the context for further chapters and also will introduce you to various terminologies that you will encounter throughout this document
- Extensible Points in Service Tier: Provides in depth knowledge about various extensible hooks available in the service tier.
- Architecture of GUI Tier: Provides overall architecture of the GUI tier of OBAPI platform. This chapter will introduce you to various terminologies that you will encounter for UI extensibility.
- Extensible points in GUI Tier: Provides in depth knowledge about various extensible hooks available in the GUI tier.
- Libraries: Provides a listing of various libraries provided by OBAPI out of the box along with their usage
- Workspace Setup: Provides step by step guidelines for setting up Eclipse workspace for extensibility
- Deployment: Provides information in packaging and deployment of the customized code on Weblogic server
- GUI Tier Workspace Setup: Provides step by step guidelines for setting up workspace for GUI tier extensibility
- GUI Tier Deployment: Provides information on packaging and deployment of customized GUI code on HTTP server
- Use Cases: This chapter discusses some of the extensibility points covered in earlier chapters with the help of some use cases.

Home

# **3. Architecture of Service Tier**

Let's go through the building blocks of OBAPI framework (also known as DIGX framework). To build a REST API, each of these framework components (as mentioned below) needs to be addressed and that's why it becomes important to have a holistic idea about each of them. The arrangement of all of these framework components can be clearly understood in the following diagram:

### Figure 1 DIGX Service Layer

- REST: The endpoint layer which gets invoked whenever a request URI is called. Also known as the layer which contains REST annotations and path to resources or sub-resources of an application
- 2. **Service:** Also called as module layer of the framework. Generally, the core modules of DIGX application will have their own service implementation classes responsible for implementing core business logic, validation and security checks
- 3. **Assemblers:** These are the mapping classes which convert data object containing request or response parameters into domain or database compatible form. These classes help us to get the required domain objects which can be further used in object-relational mapping
- 4. **Business Policy/ System Constraints:** Before letting the query data read or persisted in the core application, certain business policies need to be validated. This separate layer of constraints check let the application behave as per the policies configured
- 5. **Domain/Entity:** Represents the Java Object form of Database. This domain layer also contains data to be persisted or query response fetched through Object relational mapping
- 6. **Domain Repository:** The term 'repository' denotes any data storage component. Each module of the application will have its own repository to manage its CRUD operations and that can be easily done using this component of the DIGX framework
- Domain Repository Adapter: Adapters are the connecting points to some external system and as the name suggests, this part of the framework contacts two kinds of repositories of DIGX application – Local Repository and Remote Repository. Eventually, the configured one out of these two will be invoked

- 8. Adapters: Finally these are the adapter classes that can call either Local Database (DIGX specific tables) or Remote Repository (external system). Remote adapters can further be mocked if required
- 9. External System/ Host: The core banking application such as UBS/FCORE or OBP or any third-party application which operates final banking transactions.

Home

# 4. Extensible Points in Service Tier

Various extensible points / hooks provided by OBAPI framework, are explained in detail in this section

## 4.1 REST Tier

Customization developer can extend the REST tier by writing new REST services. This new REST service will consume new or existing application service. Please note that it is not possible to customize the REST services provided out of the box. Extensibility in REST tier is limited to writing new services.

References:

Please refer to workspace setup of DTO (xface) and REST service.

Please refer to Use case 1 for steps to write new REST service along with sample code.

### 4.1.1 Guidelines

- OBAPI REST tier follows façade pattern, meaning that it is just an endpoint built on top of application service(s).
- A REST service should not have any business logic. It should consume one or more application services and prepare the response.
- Before coding a new REST service, developer should decide the resource(s) and subresources(s) that s/he needs to develop. Based on this, the developer can design required URIs. E.g. A 'Demand Deposit Account' is a resource in the system and /accounts/demandDeposit/{accountId} is the REST URI to access it.
- The service should be annotated suitably using JAX-RS annotations.
- The service should wrap its operation in 'Channel Interaction'.
- The service should use adequate logging.

### 4.1.2 HTTP Standards

### **HTTP Methods**

OBAPI resources support following HTTP methods. New services also should use these methods appropriately.

Method	Purpose
GET	Retrieve / fetch the resource
POST	Create a new resource
PUT	Update / modify an existing resource. The payload is expected to have full resource.
РАТСН	Update / modify very small part of an existing resource. The payload is expected to have only the fields to be updated.
DELETE	Delete a resource

### **HTTP Response Codes**

Following HTTP response codes are used. New REST services should return appropriate response code based on result of the operation.

Code	Status	Description
200	ОК	Request successfully executed and the response has content
201	Created	Resource successfully created
202	Accepted	Request has been accepted for processing but processing has not been completed
204	No Content	Request successfully executed and the response doesn't have content
304	Not Modified	The resource has not been modified for a conditional GET request
400	Bad Request	The request could not be understood by the server due to malformed syntax

Code	Status	Description
401	Unauthorized	The request requires user authentication, or authorization has been refused for the credential passed in the request
404	Not Found	The requested resource was not found
500	Internal Server Error	The server encountered an unexpected condition which prevented it from fulfilling the request

## 4.2 Service Extensions

This extension point should be used when the customization developer needs additional business logic for an application service. This additional logic, which is not available as part of the API product functionality, but could be a client requirement. For these purposes, two hooks are provided in the application code:

### Pre-extension hook

This extension point is available in application service before it performs any validations and executes business logic. This hook can be important in the following scenarios:

- Additional input validations
- Execution of business logic, which necessarily has to happen before going ahead with normal service execution.

### Post-extension hook

This extension point is available in the application service after it has executed business logic. This hook can be important in the following scenarios:

- Output response manipulation
- Custom data logging for subsequent processing or reporting.

Both 'pre' and 'post' service extensions are available in the application service layer (also known as the 'app' layer) of OBAPI.

This hook in implemented using service extension executor and service extensions. These components are explained in detail below. Customization developer can use these components suitably based on the requirement.

Below class diagram depicts the relationship between application service, extension executor and extensions. The diagram considers a sample 'create' method in application service.

**Note:** The RequestDTO and ResponseDTO components depicted in above diagram are explained in subsequent sections. For now, note that the RequestDTO contains inputs to the application service method and ResponseDTO contains output generated by the method.

### 4.2.1 Service Extension Interface

This interface has a pair of pre and post method definitions for each application service method of the present. A service extension class has to implement this interface. The 'pre' method is the preextension hook as explained before. Similarly the 'post' method is the post-extension hook.

Multiple implementations can be defined for a particular service. The service extensions executor invokes all the implementations defined for the particular service both before and after the actual service executes. The signatures of these methods are:

public void pre<Method\_Name>(SessionContext, <Method\_Parameters>) throws Exception;

public void post<Method\_Name>(SessionContext, <Method\_Parameters>, ResponseDTO) throws Exception;

#### **Naming Convention**

The naming convention of service extension interface is

I<Service\_Name>Ext

For example, consider below code sample.

public interface ILoanApplicationExt {

```
* Extension point for LoanApplication.create. The method is intended to keep all the extensions required before
* creating loan applications from the Service class {@code LoanApplicationApplicationService}.
 *
    Othrows Exception
public void preCreate(SessionContext sessionContext, LoanApplicationCreateRequestDTO loanApplicationCreateRequestDTO)
         throws Exception;
 * Extension point for LoanApplication.create. The method is intended to keep all the extensions required after
* creating loan applications from the Service class {@code LoanApplicationApplicationService}.
 * @param sessionContext
                 The session context of request in the form of {@link SessionContext}.
 * Oparam loanApplicationCreateRequestDTO
                 The instance of type {@link LoanApplicationCreateRequestDTO} used for creating loan application
                 request.
 * @param loanApplicationResponseDTO
                 The instance of type {@link LoanApplicationCreateResponseDTO} used for creating loan application
                response.
 * @throws Exception
public void postCreate(SessionContext sessionContext,
          LoanApplicationCreateRequestDTO loanApplicationCreateRequestDTO,
         LoanApplicationCreateResponseDTO loanApplicationResponseDTO) throws Exception;
 * Extension point for LoanApplication.update. The method is intended to keep all the extensions required before
* updating loan applications from the Service class {@code LoanApplicationApplicationService}.
 * @param sessionContext
                 The session context of request in the form of {@link SessionContext}.
   @param loanApplicationUpdateRequestDTO
                 The request DTO of type {@link LoanApplicationUpdateRequestDTO} used for updating loan application of
                any party.
 * @throws Exception
```

### 4.2.2 Service Extension Executor Interface

This acts as an interface for the application service to access service extensions. The implementing class creates an instance each of all the extensions defined in the service extensions configuration file. If no extensions are defined for a particular service, the executor creates an instance of the default extension for the service. The executor also has a pair of pre and post methods for each method of the actual service. These methods in turn call the corresponding methods of all the extension classes defined for the service (extension chaining).

#### Naming convention

The naming convention for extension executor class is as below:

Interface : I<Service\_Name>ExtExecutor

Implementation : <Service\_Name>ExtExecutor

For example, consider below code sample:

### 4.2.3 Default Extension (Void Extension)

This class, named as Void<Service\_Name>Ext, is provided out of the box for each application service. This class implements the aforementioned service extension interface without any business logic viz. the implemented methods are empty.

The default extension is a useful & convenient mechanism to implement the pre and / or post extension hooks for specific methods of an application service. Instead of implementing the entire interface, one should extend the default extension class and override only required methods with the additional business logic. Product developers do not implement any logic, including product extension logic, inside the default extension classes.

#### For example:

) 🖲 import com.ofss.digx.app.origination.dto.submission.application.LoanApplicationCreateRequestDTO; 🗌
} ● /**
<ul> <li>* Represents the Extension Interface for Loan applications Service. Extensions for initiating and updating loan</li> <li>* application, getting all the offer related information in the loan application, selecting and updating offers,</li> <li>* updating insurance and service charges related information, information about loan and re-payment instructions can be</li> <li>* specified in this class. Instance of the Interface of this class returns the extensions list required by the</li> <li>* application service Extension Executor Class.</li> </ul>
application service Extension Executor Class.
3 */
public class VoidLoanApplicationExt implements ILoanApplicationExt {
* Extension point for LoanApplication.create. The method is intended to keep all the extensions required before * creating loan applications from the Service class {@code LoanApplicationApplicationService}.
7 # Aparam sessionContext
The session context of request in the form of (@link SessionContext).
* @param loanApplicationCreateRequestDTO
The request instance of type {@link LoanApplicationCreateRequestDTO} for creating loan application request.
* @throws Exception
* echilos exception
<pre>@Override public void preCreate(SessionContext sessionContext, LoanApplicationCreateRequestDTO loanApplicationCreateRequestDTO)</pre>
5 }
* Extension point for LoanApplication.create. The method is intended to keep all the extensions required after * creating loan applications from the Service class {@code LoanApplicationApplicationService}.
* Aparam sessionContext
7 The session context of request in the form of (@link SessionContext).
#@param loanApplicationCreateRequestDTO     The instance of type {@link LoanApplicationCreateRequestDTO} used for creating loan application     request.
L request.
* @param loanApplicationResponseDTO * The instance of type {@link LoanApplicationCreateResponseDTO} used for creating loan application * response.
r coporación de la copo
p − 7/ P⊖ @Override
<pre>governade governade g</pre>
L LoanApplicationCreateRequestDTO loanApplicationCreateRequestDTO,
2 LoanApplicationCreateResponseDTO loanApplicationResponseDTO) throws Exception {

### 4.2.4 Custom Extension

Below is an example of customized service extension class that implements methods of application service extension interface. This class contains pre hook and post hook point for the service. The pre method of this customized extension is executed before the actual service method and the post method of this is executed after the service method.

Note: The concept of 'Dictionary' is explained in detail in subsequent section.

### 4.2.5 Service Extension Configurations

Set the property id and the property values in the digx\_fw\_config\_all\_b table. The property id will be the fully qualified name of the service and the value will be the fully qualified name of the custom extension created.

For example:

insert into digx\_fw\_config\_all\_b (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS\_FLAG, OBJECT\_VERSION\_NUMBER)

values ('com.ofss.digx.app.origination.service.submission.applicant.Applicant', 'ServiceExtensionsConfig', 'com.ofss.digx.app.origination.service.submission.application.ext.CustomLoanApplicationExtensi on', 'N', 'asdf', 'asdf', '', 'asdf', '', 'asdf', '', 'Y', 1);

### 4.2.6 Sequence of events in service extension

Every application service method has a standard set of framework method calls as shown in the sequence diagram below:

The pre hook is provided after the invocation of *fetchTransactionStatus* call inside the application service. At this step, the current task code is received, any additional manipulation of the input received from the User interface channel can be done in the pre hook. Apart from this additional data coming from the screen specific to client requirements can be handled in the pre hook.

The post hook is provided after the business logic corresponding to the application service invoked has executed and before the successful execution of the entire service is marked in the status object. This ensures that the status marking takes into consideration any execution failures of post hook prior to reporting the result to the calling source. Both, the pre and the post hooks accept the service input parameters as the inputs. The post hook also accepts the Response parameter as the input.

## 4.3 **Business Policy**

OBAPI supports three types of validations

**DTO field validations:** These are the field level validations such as syntax check of the input. These validations are achieved by using field level annotations in request DTO. These validations are not available for extension. Below is the list of out of box annotations available

Annotation	Description
@Email	This annotation is used to validate the respective field with email regular- expression. If the field doesn't satisfy the mentioned regular-expression then the respective error code is thrown
@Mandatory	This annotation marks the fields as mandatory. Once marked, if the field is null then respective error-code is thrown Eg. @Mandatory(errorCode = DemandDepositErrorConstants.DDA_MANDATORY_ACCOUNT_ID) private Account accountId;
@Length	This annotation marks the lengths of the fields. Once marked, if the validation is violated then the respective error code is thrown. Eg. @Length(min = 2, max = 20, errorCode = PartyErrorConstants.PI_LENGTH_EXTERNAL_REF_ID)
@NonNegative	This annotation checks that the value is non-negative
@Regex	This annotation checks if the value matches regular expression provided

**System Constraints:** System performs these checks mandatorily. It is not possible to override or bypass these checks.

**Business Policies:** These are typically the business validations required to be performed before executing business logic. OBAPI framework allows customization developer to override business policies as per the requirement.

### 4.3.1 Adding new business policy

Customization developer can add new business policy for new or existing services. System support multiple business policies for a single service. Following are the steps to add a new business policy:

- 1. Create new business policy DTO. This DTO is supposed to encapsulate all the input fields upon which validation is to be performed.
- 2. Create new business policy. BusinessPolicy class must have constructor which accepts one parameter of type IBusinessPolicyDTO. This class must extend com.ofss.fc.framework.domain.policy.AbstractBusinessPolicy class and implement the validatePolicy() method.

This method should have the validation logic and if the validation fails, then it should call addValidationError() method with a new instance of ValidationError as parameter. One of the parameter to the constructor of ValidationError is error code. A new error could be added by following guidelines provided in Error Messages section.

3. Use of **isPolicyToBeValidated()** method

In case multiple business policies configured for one service then policy execution can be controlled by overriding isPolicyToBeValided() method in CustomBusinessPolicy class. By default, all Business Policies configured in DB will be executed as isPolicyToBeValidated() method in AbstractBusinessPolicy will always return true.

To control the business policy validation based on data check, please override method isPolicyToBeValidated() in your BusinessPolicyClass.

4. **Configure new business policy(s)**. The business policy class created in above step should be configured in digx\_fw\_config\_all\_b table with category\_id as 'CustomBusinessPolicy' and prop\_id as the policy identifier.

insert INTO digx\_fw\_config\_all\_b ( prop\_id, category\_id, prop\_value, actory\_shipped\_flag, prop\_comments, summary\_text, created\_by, reation\_date, last\_updated\_by, last\_updated\_date, object\_status\_flag, object\_version\_number)VALUES ('<service\_id>',' CustomBusinessPolicy ',

'**<CustomBusinessPolicy1>,<CustomBusinessPolicy2>**','N','Comments','Summary','ofssu ser', sysdate, 'ofssuser', sysdate, 'Y', 1); For example:

insert INTO digx\_fw\_config\_all\_b ( prop\_id, category\_id, prop\_value, actory\_shipped\_flag, prop\_comments, summary\_text, created\_by, reation\_date, last\_updated\_by,

last\_updated\_date, object\_status\_flag, object\_version\_number)VALUES

('com.ofss.digx.app.report.service.ReportRequest.create ',' CustomBusinessPolicy ','com.ofss.digx.cz.domain.td.entity.policy.CustomBusinessPolicy1,com.ofss.digx.cz.domain.t d.entity.policy.CustomBusinessPolicy2','N','Comments','Summary','ofssuser', sysdate, 'ofssuser', sysdate, 'Y', 1);

The class diagram for new custom business policy.

### 4.3.2 Extending existing business policy

OBAPI provides out of box business policies for all services. If only a part of the validation is to be modified or a new validation is to be added in addition to the validations that the existing business policy does, then it is possible to extend existing business policy and override existing validation.

Please note that this capability depends on how the original business policy is coded. If the out of box business performs all its validations in validatePolicy() method, then this approach may not be useful. On the other hand, if the out of box business policy has separate individual methods for validations and validatePolicy() method calls these methods one by one, then extension of the business policy is useful.

The steps to be followed as same as mentioned in earlier section, except the difference that the custom business policy class will extend the out of box business policy class and override its methods as per the requirement.

## 4.4 **Dictionary**

Dictionary is not an extension point in itself, but it plays an important role in enabling extensibility of domain. Hence, it is worth understanding the 'Dictionary' before proceeding to subsequent sections

### Data transfer object (DTO)

Data transfer object (DTO) is a design pattern used to transfer data between an external system and the application service. All the information may be wrapped in a single DTO containing all the details and passed as input request as well as returned as an output response. The client can then invoke accessory (or getter) methods on the DTO to get the individual attribute values from the Transfer Object. All request response classes in OBAPI application services are modelled as data transfer objects.

```
public abstract class DataTransferObject extends Validatable implements Serializable {
    /**
     */
    private static final long serialVersionUID = -6584908885732656582L;
       Subclasses of the Customized AbstractDomainObject corresponding to this
     * AbstractDomainObject<br/>
       are defined with the help of this attribute. This concept can be extended
     * to have joined or<br>
     * union subclass heirarchy in subsequent releases.
    private Dictionary[] dictionaryArray;
    1+
     * Returns data for subclasses of the Customized Domain Object as name value
       pair data with the<br>
      name being a fact.
     * @return
    public Dictionary[] getDictionaryArray() {
        return dictionaryArray;
    3
    public void setDictionaryArray(Dictionary[] dictionaryArray) {
        this.dictionaryArray = dictionaryArray;
    3
```

#### Dictionary

All data transfer objects extend a base class **DataTransferObject** which holds an array of Dictionary object. The Dictionary encapsulates an array of **NameValuePairDTO** which is used to pass data of custom data fields or attributes from the UI layer to the host middleware. Below class diagram shows the relationship between these classes

#### Dictionary class looks like

```
🚮 Dictionary.class 🕱 🕕 CustomLoanApplicationExtension.java
 1 package com.ofss.fc.framework.domain.common.dto;
 3 import java.io.Serializable;
 4
 5 import javax.xml.bind.annotation.XmlType;
 6
7 @XmlType(namespace="http://dto.common.domain.framework.fc.ofss.com")
8 public class Dictionary implements Serializable {
 9
         /**
 100

```

Following image shows use of dictionary with NameValuePairDTO and added it to the Data Transfer Object.

```
@Override
public void preCreate(SessionContext sessionContext, CollaborationDTO collaborationDTO) throws Exception {
    // calling a custom class to check DTO integrity.
    this.checkCollaborationDTO();
    try{
    NameValuePairDTO[] valuePairDTO = new NameValuePairDTO[1];
    valuePairDTO[0] = new NameValuePairDTO("mobileCustomer", "9595959595", "String");
    valuePairDTO[0].setGenericName("com.ofss.digx.domain.collaboration.entity.customdemo.CustomCollaborationDomainObject.mobileCustomer");
    Dictionary[] dictionary = new Dictionary[1]; //array of dictionary
    dictionary[0] = new Dictionary();
    dictionary[0].setNameValuePairDTOArray(valuePairDTO);
    collaborationDTOArray(dictionary);
    }catch(java.lang.Exception e)
    {
        Logger.log(Level.FINE, formatter.formatMessage("Pre-Create extension implementation sample"));
    }
}
```

## 4.5 **Domain Extensions**

The Domain layer is a central layer in designing entities in OBAPI. The design philosophy is called domain driven design. In this, the domain object (also referred as 'entity' in OBAPI context) is central to the design. The domain captures all attributes of the real time entity that it models.

OBAPI provides infrastructure to customize existing domains. It also allows to add new domains.

### 4.5.1 Custom Domain Objects

OBAPI framework (leveraging undelaying OBP infrastructure) provides a standard mechanism to customize the domain objects that are provided out of the box. The Dictionary object plays an important role in this mechanism.

This section describes how consultants or other third parties can extend domain and achieve Extensibility. This provides true domain model extension capabilities by allowing addition of custom data fields to the underlying domain objects.

#### Translating Dictionary data into custom domain object

If dictionary is added to DTO then it is necessary to get customized domain Object which extends base Domain Object. Method getCustomizedDomainObject in AbstractAssembler is used for the same.

Following image shows call to get Customized domain Object if additional data (Dictionary) is added to the request DTO.

### Writing Custom Domain Object

The custom domain object must extend existing domain object class. Mapping for same should be done in database as Customized Abstract Domain Object Configuration. This class contains additional fields added at UI layer and getter, setter for the same.

Below diagram shows the custom domain object and also depicts the role of Dictionary in mapping additional fields from DTO to this custom domain object.

#### For Example:

### Configure Customized domain object in database

The domain object created needs to be mapped as a custom domain object for the existing domain object. For example:

insert into digx\_fw\_config\_all\_b (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS\_FLAG, OBJECT\_VERSION\_NUMBER)

values ('com.ofss.digx.domain.origination.entity.submission.lending.application', 'CustomizedAbstractDomainObjectConfig', 'com.ofss.digx.domain.origination.entity.submission.lending.application.ext.Application', 'N', 'asdf', 'asdf', 'asdf', '', 'asdf', '', 'Y', 1);

Three main columns that need to be fed with new information are.

- CATEGORY\_ID : "CustomizedAbstractDomainObjectConfig"
- PROP\_VALUE:" CLASS NAME of the class implementing the custom domain object "
- PROP\_ID:" CLASS NAME of the DomainObject".

### **ORM Mapping**

If this domain needs to be persisted in local database, then you need to create Eclipselink ORM mapping to map fields in the domain to database table. Follow these steps:

- Create new ORM file to handle Customized Domain Object. This ORM file should contain entries for all columns in corresponding domain object table.
- Add an entry for this ORM XML in the mapping configuration XML
- Create new table corresponds to newly created Domain Object.

Newly created ORM file will look like (CollaborationDemo.orm.xml):

	xml version="1.0" encoding="UTF-8" <mark>?&gt;</mark>
	ntity-mappings version="2.5" xmlns="http://www.eclipse.org/eclipselink/xsds/persistence/orm" xmlns:xsi=

Here Assembler should fetch customized domain object. Following example shows Assembler calls **getCustomizedDomainObject** which returns customized domain object with mapping of **nameValuePairDTOArray** to this customized domain Object internally.

#### For example:

#### Sequence Diagram

### Configuring this custom domain object at appropriate entity level

insert into digx\_me\_entity\_determinant\_b (DOMAIN\_OBJECT\_NAME, DETERMINANT\_TYPE, REPRESENTED\_FIELD, IS\_FEATURE\_ENABLED)

values ('<Fully qualified domain name>', '<Determinant Type>', '<Represented Name>', 'Y');

There are four possible determinant types as follows:

- Enterprise (ENT)
- Legal Entity (LGE)
- Market Entity (MKE)
- Business Unit (BNU)

### 4.5.2 Adding new Domain

The customization developer can add new domain. Below are the steps to add a new domain.

- 1. Create new domain class. The new domain class must extend AbstractDomainObject and implement IPersistenceObject
- 2. Identify attributes and operations supported by the domain and add them to above domain class accordingly
- 3. The domain object will typically have associated DTO that encapsulates same fields as in domain. This DTO will be used in request and responses. An assembler will be used to map fields between domain object and the DTO. Below diagram depicts this relationship.

4. Configure this new domain for appropriate entity level

insert into digx\_me\_entity\_determinant\_b (DOMAIN\_OBJECT\_NAME, DETERMINANT\_TYPE, REPRESENTED\_FIELD, IS\_FEATURE\_ENABLED)

values ('<Fully qualified domain name>', '<Determinant Type>', '<Represented Name>', 'Y');

For example,

insert into digx\_me\_entity\_determinant\_b (DOMAIN\_OBJECT\_NAME, DETERMINANT\_TYPE, REPRESENTED\_FIELD, IS\_FEATURE\_ENABLED)

values (' com.ofss.digx.cz.domain.payment.entity.payee.Payee', 'BNU', 'New Payee', 'Y');

## 4.6 Error Messages

If an API fails, It returns an error code and an error message which briefly specifies the failure reason of the API call. Error message is returned from service to convey the cause of transaction failure.

### 4.6.1 Adding Error Message

Error codes with their error messages are stored in DIGX\_FW\_ERROR\_MESSAGES table. One can add a new error message in the table with a unique error code.

ERROR\_CODE column should contain unique value.

ERROR\_MESSAGE column contains the error message which need to be added.

### 4.6.2 Mapping Host Error Code To OBAPI Error Code

When a transaction fails in host, it provides an error code in response to the failed transaction. This error code provided by the host could be mapped with OBAPI error code to provide a user friendly error message.

This host error code and OBAPI error code mapping is done in DIGX FW ERR COD MAP table.

THIRD\_PARTY\_ERR\_COD column holds the host error code.

LOCAL ERR COD column holds OBAPI error code which must be present in DIGX\_FW\_ERROR\_MESSAGES table from where error message will be picked.

## 4.7 Adapter Tier

An adapter, by definition, helps the interfacing or integrating components adapt. In software it represents a coding discipline that helps two different modules or systems to communicate with each other and helps the consuming side adapt to any incompatibility of the invoked interface work together. Incompatibility could be in the form of input data elements which the consumer does not have and hence might require defaulting or the invoked interface might be a third party interface with a different message format requiring message translation. Such functions, which do not form part of the consumer functionality, can be implemented in the adapter layer.

### 4.7.1 Service Provider Interface (SPI) Approach

This section provides information about the SPI approach and how adapters are packaged and derived at runtime based on current entity and domain under consideration.

Service Provider Interface (SPI) is an API intended to be implemented or extended by a third party. It can be used to enable framework extension and replaceable components.

- <u>https://docs.oracle.com/javase/tutorial/ext/basics/spi.html</u>
- <u>http://www.developer.com/java/article.php/3848881/Service-Provider-Interface-Creating-Extensible-Java-Applications.htm</u>

All the external facing adapters will be loaded using SPI.

Benefits of SPI

- No database entries are required.
- No need of adapter factories.
- Can add adapters at run-time.
- Provides the list of available implementations from which we can use the best suited one.

In this approach adapter is selected using the following call.

ExtxfaceAdapterFactory.getInstance().getAdapter(Interface.class, "method", DeterminantType);

Here,

- 'Interface.class' is object of interface implemented by the host (external system) adapter.
- 'Method' is name of method which we are intended to call of that adapter.
- DeterminantType is determinant type of the domain from which this call is made.

Sample code is as follows:

#### Adapter configuration:

For adapter configurations, the preference **ExtxfaceAdapterPreference** is used. This preference contains Entity as key and External System (Host Name + Version) as value. So we can use select external systems (Hosts) on the basis of entity. E.g. For entity 000 we want to use UBS 12.4 and for entity 001 use OBP 2502 then the entries will be

∲ PR	OP_ID 🕴 CATEGORY_ID	PROP_VALUE	E 🕴 FACTORY_SHIPPED	_FLAG 🕀 PROP_COMMENTS
1 000	extxfaceadapterco	onfig UBS12.4	N	(null)
2 001	extxfaceadapterco	onfig OBP2502	N	(null)

We can also give multiple External System separated by comma "," for an entity, and then adapter will get selected on the basis sequences of external systems given in value.

E.g. if the value is UBS12.4,BI1.0 then first implementation is searched in UBS 12.4 jar if is not found then it will look in BI1.0 jar.

#### Adapter Registration:

After adding adapter java file in project it need to be register as provider. To register your service provider, create a provider configuration file, which is stored in the META-INF/services directory of the project. The name of the configuration file is the fully qualified class name of the service provider(interface implemented by adapter), and file content which is fully qualified name of the adapter class.

>	🖶 com.ofss.digx.ubs123.adapter.impl.handler
>	🖶 com.ofss.extsystem.ubs.business.extsystems.adapters.ubs
$\sim$	🗁 META-INF
	✓
	com.ofss.digx.app.adapter.core.lBranchCurrencyAdapter
	com.ofss.digx.app.adapter.core.ICoreApplicationServiceAdapter
	📄 com.ofss.digx.app.adapter.core.lValueDateAdapter
	📄 com.ofss.digx.app.alerts.adapter.lHostAdapter
	com.ofss.digx.app.common.adapter.lEnumerationAdapter

#### How will system derive adapter?

In the external system interface implementation project like (com.ofss.digx.extxface.ubs124.impl), inside **src/META-INF** folder, we will have a **MANIFEST.MF** file inside which we will define the following attributes:-

Implementation-Title: UBS

Implementation-Version: 12.4

It will tell us that the adapters are for external system UBS 12.4. While adding a new interface implementation project, we need to create MANIFEST.MF file too, defining implementation title and version.

While calling an adapter, we provide three parameters 1. Interface class name 2.method name 3.determinant type(for particular domain class).

Determinant type for particular domain class (digx\_me\_entity\_determinant\_b).

{} DOMAIN_OBJECT_NAME		_TYPE	IS_FEATURE_ENABLED
1 com.ofss.digx.domain.payment.entity.merchant.Merchant	LGE	Merchant Maintenance	Y
<pre>2 com.ofss.digx.domain.collaboration.entity.mailbox.usergroupsubjectmap</pre>	LGE	User Group Subject Map	Y
3 com.ofss.digx.domain.config.entity.ConfigVarBDomain	BNU	ConfigVarB Details	Y
<pre>4 com.ofss.digx.domain.report.entity.ReportAdhocRequest</pre>	LGE	Report Request	У
5 com.ofss.digx.domain.fileupload.entity.FileIdentifierRegistration	BNU	FI Registration	У
<pre>6 com.ofss.digx.domain.fileupload.entity.FileDetails</pre>	BNU	Uploaded File Details	У

We match determinant type to market entity, then business unit and then legal entity.

On the first match, we derive the external systems using ExtxfaceAdapterPreference explained above. Then we derive external systems corresponding to others(lower order ones). Thus we have a list(list 1) of external systems in order.

For example, if 1st match is market entity. Then we will have external systems corresponding to entries for market entity, then business unit and finally legal entity if entries are found.(in order).

If 1st match is business unit, then we will have external systems corresponding to entries for business unit and legal entity if found(in order).

Here in the diagram above, for domain class ConfigVarBDomain, determinant\_type is BNU(business unit). lets suppose corresponding determinant value is 000.

PROP_ID	CATEGORY_ID	PROP_VALUE	FACTORY_SHIPPED_FLAG	PROP_COMMENTS	SUMMARY	CREATED_BY	CREATION_DATE	LAST_UPDATED_BY	LAST_UPDATED_DATE
1 900	extxfaceadapterconfig	UBS12.3, ipm1.0	N	(null)	(null) of	ssuser	26-SEP-17 06.42.09.000000000 AM	ofssuser	26-SEP-17 06.42.09.000000000 AM
2,001	extxfaceadapterconfig	TP1.0	N	(null)	(null) Fil	ter)er	26-SEP-17 06.42.09.000000000 AM	ofssuser	26-SEP-17 06.42.09.000000000 AM
3 01	extxfaceadapterconfig	UBS12.4,ipm1.0	N	(null)	(null) of	asuser	20-SEP-17 11.31.25.000000000 AM	ofssuser	20-SEP-17 11.31.25.000000000 AM

Now, for prop\_id=000, it will fetch extsystems as UBS12.3, ipm1.0.

Now for legal entity(LGE), lets suppose corresponding determinant value is 001. so it will fetch external system as TP1.0.

So we have external system list (list 1) as {UBS12.3, imp1.0, TP1.0};

Also If none matches, we derive external system corresponding to enterprise. for eg. for enterprise, lets suppose corresponding determinant value as 01. so external system list(list 1) will be {UBS12.4,ipm1.0}.

#### How the adapters are loaded:

Now we will load all those adapter classes, that will implement the interface which we get as first parameter. Now we will maintain another list or map (list 2) of external systems to adapter, that we will resolve from all those adapter classes. (How will system know that a adapter belongs to which external system or host?).

We will iterate through list 1(list of external systems that we got from preference entry) in order. When we find the first matching external system in list 2, we will return the corresponding adapter.

For example, we iterate through list 1 : {UBS12.3,imp1.0,TP1.0}. it will first find if loaded adapter class contains adapter that belongs to external system UBS12.3. then it will return that adapter. if not found, it will search if any loaded adapter class belongs to imp1.0. if found it will return that adapter. if not, then it will similarly go for TP1.0.

#### How to override an adapter?

One can enter (interface class name + "."+ method name or only interface class name) in ExtxfaceAdapterPreference against which one can specify the adapter that one want to be overriden by.

E.g.

Insert into digx\_fw\_config\_all\_b

(PROP\_ID,CATEGORY\_ID,PROP\_VALUE,FACTORY\_SHIPPED\_FLAG,PROP\_COMMENTS,S UMMARY\_TEXT,CREATED\_BY,CREATION\_DATE,LAST\_UPDATED\_BY,LAST\_UPDATED\_D ATE,OBJECT\_STATUS,OBJECT\_VERSION\_NUMBER,EDITABLE,CATEGORY\_DESCRIPTIO N)

values (<Fully qualified adapter interface name>,'extxfaceadapterconfig', <Fully qualified adapter implementation name>,'N',null,",'ofssuser', sysdate,'ofssuser', sysdate,'Y',1,'N',null);

sample:-

Insert into digx\_fw\_config\_all\_b

(PROP\_ID,CATEGORY\_ID,PROP\_VALUE,FACTORY\_SHIPPED\_FLAG,PROP\_COMMENTS,S UMMARY\_TEXT,CREATED\_BY,CREATION\_DATE,LAST\_UPDATED\_BY,LAST\_UPDATED\_D ATE,OBJECT\_STATUS,OBJECT\_VERSION\_NUMBER,EDITABLE,CATEGORY\_DESCRIPTIO N)

values ('com.ofss.digx.app.loan.adapter. ILoanAccountAdapter','extxfaceadapterconfig', 'com.ofss.digx.extxface.loan.impl.LoanAccountMockAdapter','N',null,'','ofssuser', sysdate,'ofssuser', sysdate,'Y',1,'N',null);

### 4.7.2 Adding a custom adapter

Please follow below steps for adding a new custom adapter:

- Create a new project for customized adapter interfaces. Typically, there will be only one customized adapter interfaces project. The name of the project should have the phrase 'cz' indicating that it is customized version. For example, com.ofss.digx.cz.extxface
- Please refer to the 'Workspace Setup' section and its 'Adapter Interfaces' subsection for details.
- Add required adapter interfaces in this project
- Create another new project for customized adapter implementation classes. Typically, one
  project will need to be created per entity, however if the core banking host is same for different
  entities, then one project can be used for multiple entities. This decision should be taken based
  on implementation scenario. If you are interfacing with any other external system apart from
  core banking system (e.g. content management system), then separate project should be
  created for adapters interfacing with such systems.
- Please refer to the 'Workspace Setup' section and its 'Adapter Implementation' subsection for details.
- Name of the project should be having the phrase 'cz' indicating that it is part of the customization. The name should also include external system name and version. This will bring clarity about contents of the project by looking at the name. The same name will be used for the JAR packaged out of this project. For example, name of the project for customized adapters for UBS 12.4 will be com.ofss.digx.cz.extxface.ubs124.impl
- The MANIFEST.MF file within this project should have implementation title and implementation version. The implementation title should also capture the phrase 'CZ' to indicate that it is a customized adapter package.

Implementation-Title: CZUBS

Implementation-Version: 12.4

- Write required adapter implementation classes that implement appropriate adapter interface
- Create folder 'META-INF/services' under the 'src' folder.
- Create a file under this 'services' folder with the name as fully qualified name of the adapter interface.
- In this file, write the fully qualified name of the adapter implementation class
- Package the adapter interface in JAR
- Package the adapter implementation project(s) in JAR(s)
- Configure the adapter implementation package in digx\_fw\_config\_all\_b. The prop\_value should have comma separated external system IDs. For example,

Insert into digx\_fw\_config\_all\_b (PROP\_ID,CATEGORY\_ID,PROP\_VALUE,FACTORY\_SHIPPED\_FLAG,PROP\_COMMEN TS,SUMMARY\_TEXT,CREATED\_BY,CREATION\_DATE,LAST\_UPDATED\_BY,LAST\_UPD ATED\_DATE,OBJECT\_STATUS,OBJECT\_VERSION\_NUMBER,EDITABLE,CATEGORY\_ DESCRIPTION)

values ('01','extxfaceadapterconfig', 'CZUBS12.4,UBS12.4,ipm1.0','N',null,",'ofssuser', sysdate,'ofssuser', sysdate,'Y',1,'N',null);

• Package all customized adapters in obapi.cz.extsystem.domain.ear and deploy it as a library

#### Customizing existing adapters (Custom Adapter)

If an added functionality or replacement functionality is required for an existing adapter or existing method in an adapter, the customization developer has to develop a new adapter and corresponding adapter factory and override the method in a new custom adapter class. The custom adapter would have to override and implement the methods which need changes.

#### **Custom Adapter Example**

We take the example of LoanApplicationRequirementAdapter. For example the requirement is to send an email alert when the requirements of a particular loan application are updated. The OBAPI application by default does not provide any integration with an SMTP/Email server. The additional interfacing with the gateway can be done in the custom adapter. The following steps would have to be followed for implementation of a custom LoanApplicationRequirementAdapter.

Develop a *CustomLoanApplicationRequirementAdapter* and *Custom* LoanApplicationRequirementAdapterFactory. As a guideline, the custom adapter should extend the existing adapter and override the methods which needs to be replaced with new functionality.

#### For Example:

#### **Custom Adapter Configuration**

insert into digx\_fw\_config\_all\_b (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS\_FLAG, OBJECT\_VERSION\_NUMBER)

values ('IS\_LOAN\_APPLICATION\_REQUIREMNT\_ADAPTER\_CUSTOM', 'customadapterconfig', 'true', 'N', 'asdf', 'asdf', 'asdf', '', 'asdf', '', '1);

#### **Mock Adapter**

Mock adapter represents the intermediate layer required for communicating with third party host system. operations supported by Mock adapter are create, fetch, etc. Mock Adapter is basically responsible for generating required response from the core banking system for a given request.

#### Mock Adapter Example

Here it is responsible for communicating with third party host system as part of Loan requirement for a party.

#### Mock Adapter Configuration

insert into digx\_fw\_config\_all\_b (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS\_FLAG, OBJECT\_VERSION\_NUMBER)

values ('PARTY\_COLLECTION\_ADAPTER\_MOCKED', 'adapterfactoryconfig', 'true', 'N', 'asdf', 'asdf', 'asdf', '', 'asdf', '', 'Y', 1);

### 4.7.3 Host adapter extension to populate pagination information

This extension feature helps developer to provide information regarding pagination from the host system. This will be typically used in inquiry transactions where large number of records is expected in response. To display such large data, pagination approach is used in user interface to display limited number of records at a time. Based on user action the subsequent records are fetched. The pagination information provided by this extension can be used in UI layer to display pagination response as per developer's requirement. The supported extension parameters are –

- more : a Boolean field to represent if any more data is available in response
- totalRecords : an Integer containing total number of records for the respective query
- *startSequence* : an Integer which can typically contain the sequence number of the first record in the next pagination records list.

To use the above extension following steps need to be executed.

- The response DTO of service should implement '*com.ofss.digx.app.dto.lpaginable*' interface and should override all the methods of this interface.
- Add following snippet in respective extxface adapter after calling 'HostAdapterManager.processRequest(hostRequest)'.

The host specific adapter should return values for 'hasMore', 'totalRecords', 'startSequence' in order to set the same in the Thread attribute.

 The extension parameters set in the thread attribute will be available in the REST response as follows:

## 4.8 Outbound web service extensions

The outbound webservice configurations are set of properties defined to invoke services from the host. The host is the core bank system where the business logic for core banking facilities is written and contains the corresponding services to access that data. The existing OBAPI application has an Adapter layer which directly interacts with the host. There are extension endpoints available for configuring a different host in the adapter layer. Following steps need to be followed:

#### Using your own web service constants

The web service constants will change depending on the WSDL specification provided by the host system. An Example WebServiceConstants file is shown below:

1 package com.ofss.digx.common; 2	-
2 30/**	
4 * Constants for web service invocation from the adapter implementation.	E
5 */	
6 public class WebserviceConstants { 7	
/ 8⊖ /**	
9 * Holds the service name to be invoked from the adapter.	
10 */	
<pre>public static final String PRODUCT MANUFACTURING APPLICATION SERVICE = "ProductManufacturingApplicationServiceSpi";</pre>	
140 /**	
15 * Holds the Offer Inquiry Application service name to be invoked from the adapter. 16 */	
<pre>10</pre>	
180 /**	
19 * Holds the Purpose Application Service Spi name to be invoked from the adapter. 20 */	
<pre>20 */ 21 public static final String PURPOSE APPLICATION SERVICE SPI = "PurposeApplicationServiceSpi";</pre>	
220 /** /*	
23 * Holds the Submission Creation Application Service Spi name to be invoked from the adapter.	
24 */ 5 sublis statis final their suburtation spectrum and tation semurate and sublision analysis familie fam	
public static final String SUBMISSION_CREATION_APPLICATION_SERVICE_SPI = "SubmissionCreationApplicationServiceSpi";	
270 /**	
28 * Holds the Submission Product Application Service Spi name to be invoked from the adapter.	
29 */ 30 public static final String SUBMISSION PRODUCT_APPLICATION_SERVICE_SPI = "SubmissionProductApplicationServiceSpi";	
and static time stills some state where the state s	
320 /**	
33 * Holds the Detailed Application Tracker Application Service Spi name to be invoked from the adapter.	
34 */ 35 public static final String DETAILED APPLICATION TRACKER APPLICATION SERVICE SPI = "DetailedApplicationTrackerApplicationServiceSpi";	
36	
370 /**	
38 * Holds the operation name to fetch list of all product groups. 39 */	
<pre>volume to public static final String FETCH ALL_PRODUCT_GROUPS = "fetchAllProductGroups";</pre>	
41	
43 * Holds the operation name to fetch list of all products for the group code. 44 */	
<pre>45 public static final String FETCH_ALL_PRODUCTS_FOR_GROUP_CODE = "fetchAllProductsForGroupCode";</pre>	
46	
470 /** 48 * Holds the method name of host to fetch offers linked to product.	
49 */	
50 public static final String FETCH_OFFERS_LINKED_TO_PRODUCT = "fetchOffersLinkedToProduct";	
510 /**	
52 * Holds the method name of host to fetch purpose code linked to a group code. 53 */	
54 public static final String FETCH PURPOSE CODES FOR GROUP CODE = "fetchPurposeCodesForGroupCode";	-

#### Web service configuration

digx\_fw\_config\_out\_ws\_cfg\_b. Holds the entries for the host service endpoints.

#### For Example:

insert into digx\_fw\_config\_out\_ws\_cfg\_b (SERVICE\_ID, PROCESS, URL, ENDPOINT\_URL, NAMESPACE, TIME\_OUT, SERVICE, STUB\_CLASS, SECURITY\_POLICY, ENDPOINT\_NAME, STUB\_SERVICE, HTTP\_BASIC\_AUTH\_CONNECTOR, HTTP\_BASIC\_AUTH\_REALM, PROXY\_CLASS\_NAME, IP, PORT, USERNAME, PASSWORD, CREATED\_BY, LAST\_UPDATED\_BY, CREATION\_DATE, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER, ANONYMOUS\_SECURITY\_POLICY, ANONYMOUS\_SECURITY\_KEY\_NAME)

values ('inquireApplication', 'BaseApplicationServiceSpi', 'http://ofss310406.in.oracle.com:8001/com.ofss.fc.webservice/services/origination/BaseApplicati onServiceSpi?wsdl', ",

'http://application.core.service.origination.appx.fc.ofss.com/BaseApplicationServiceSpi', 1200000, 'BaseApplicationServiceSpi', '', '', 'BaseApplicationServiceSpiPort', 'com.ofss.fc.appx.origination.service.core.application.baseapplicationservice

#### Class Diagram

#### Client Jar

Generate the corresponding service stubs from the WSDL specifications using The JAX-WS RI tool. Package the generated code as a jar and include it in the Adapter implementation.

#### **Custom Adapter**

Lastly create a custom adapter to handle the changes made in the host configurations. The custom adapter will be using the JAXWSFacotry to create instances of the desired service stubs. The rest of the custom adapter implementation is the same as mentioned in the section 5.3

#### For example:

## 4.9 Security Customizations

OBAPI comprising of several modules has to interface with various systems in an enterprise to transfer/share data which is generated during business activity that takes place during teller operations or processing. While managing the transactions that are within OBAPI, it is needed to consider security & identity management and the uniform way in which these services need to be consumed by all applications in the enterprise.

OBAPI provides a mechanism for creating permissions and role based authorization model that controls access of the user to OBAPI services.

### 4.9.1 Out of box seeding of policies

When the application is installed, access policies are seeded for Day 0 configuration and access point definition by default.

The application is shipped with a CSV file – Day0Policy.csv, the policy data to be seeded by default.

## 4.10 Taxonomy Validations

For extensions in taxonomy validations, please refer to **Oracle Banking Digital Experience Taxonomy Configuration Guide.pdf** 

## 4.11 Miscellaneous

This section lists some other features in OBAPI platform that can be extended

### 4.11.1 Task Configurations

#### **Task Registration:**

Every new service to be integrated as a part of **OBAPI** needs to provide a task code. This task code is required while integrating the service with various infrastructural aspects applicable to the service. Few examples of infrastructural aspects or cross cutting concerns provided out of the box with **OBAPI** are:

- Limits
- Approvals
- Two Factor Authentication
- Transaction Blackout
- Working Window
- Account Relationship

#### Guidelines for formulating a task code are as follows:

A task code should ideally comprise of 3 parts:

- 1. **Module Name** : The first 2 alphabets representing the module to which the service in question belongs. eg TD represents Term Deposits module.
- 2. Task Type(type of service) : OBAPI supports the following 6 types of services.
  - a. **FINANCIAL\_TRANSACTION(F)**: Any transaction as a result of which there is a change in the status of the finances of accounts of the participating parties. In general any transaction that involves monetary transfer between parties via their accounts. Few examples include Self transfer, New deposit(Open term deposit), Bill payment etc.
  - NONFINANCIAL\_TRANSACTION(N) : Any transaction that pertains to an account but there is no monetary payment or transfer involved in it. For example Cheque book request.
  - c. **INQUIRY(I)**: Any read only transaction supported in OBAPI that does not manipulate any business domain of the financial institution. For example list debit cards, read loan repayment details, fetch term deposit penalties etc.
  - d. **ADMINISTRATION(A) :** Transactions performed by bank admins and corporate admins for a party come under this category. Few examples of such transactions include limit definition, limit package definition, user creation, rule creation and various others.
  - e. **MAINTENANCE(M)**: Maintenances done by a party for itself fall under this category. Maintenance transactions performed by a non admin user which does not involve any account or monetary transaction comprise of this transaction type. Example add biller.
  - f. COMMON(C) : Common transactions include transactions which do not fall under any of the above mentioned categorization. Example login.
     So 1 alphbet F,N,I,A,M or C for each of the above mentioned task types respectively forms the second part of the task code.
- Abbreviation for service name : A 3 to 10 lettered abbreviation for the service name. Example OTD for Open Term Deposit. All the above mentioned 3 parts are delimited by an underscore character. Example : TD\_F\_OTD where TD represents module name. F represents that its a financial transaction i.e. task type and OTD is the abbreviated form of the transaction(service) name.

#### **Task Aspects:**

An 'aspect' of a task is a behavior or feature supported by the task. OBAPI framework defines a set of aspects that can be supported by a task in the system. These aspects need to be configured in table DIGX\_CM\_TASK\_ASPECTS. So if a task supports given aspect, then only its entry should be made in this table. If for any task, entry does not exist in this table for given aspect, then system treats it as that aspect is not supported by the task.

Additionally an aspect can be temporarily disabled using the 'ENABLED' column of this table. If the 'ENABLED' value is set as 'N', then system will treat it as this aspect is not supported by the task. Note that if a task is never going to support an aspect, then its entry should not be there in DIGX\_CM\_TASK\_ASPECTS table. The 'ENABLED'='N' option for disabling aspect should be used only when the task generally supports the aspect but it needs to be disabled for small duration.

Note that just having an entry in this table does not imply that the feature will be enabled for the task. The entry in this table only tells that system that the task supports this feature. Individual feature might need further configurations for them to work properly.

List of aspects supported by OBAPI framework is listed below. Please note that aspects are not extensible – in other words it is not possible to add new aspects as part of customization.

Aspect	Description	
grace-period	Indicates that the task supports grace period. Grace period is an additional period offered by Approval framework for approving a transaction           Note: Grace Period will be applicable for the transactions with due	
	date only.	
ereceipt	Indicates that the task supports generation of e-receipts	
audit	Indicates that the task supports audit logging	
2fa	Indicates that the task supports two factor authentication	
working- window	Indicates that the task supports working window	
approval	Indicates that the task supports approval	
blackout	Indicates that the task supports blackout	
limit	Indicates that the task supports limit	
Account Relationship	Indicates that the task supports account relationship check	

#### Steps to register a task with OBAPI:

The task code needs to be configured in the database table DIGX\_CM\_TASK. For example if we consider Open Term Deposit then the below guery fulfills the requirement mentioned in this step.

Insert into DIGX\_CM\_TASK (ID, NAME, PARENT\_ID, EXECUTABLE, TASK\_TYPE, MODULE\_TYPE, CREATED\_BY, CREATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER) values ('TD\_F\_OTD', 'New Deposit', 'TD\_F', 'Y', 'FINANCIAL\_TRANSACTION', 'TD', 'ofssuser', sysdate, 'ofssuser', sysdate, null, 1);

As evident from the above query example Tasks have a hierarchy. Every task might have a parent task denoted by the task code value held by the PARENT ID column of DIGX CM TASK. In most of the cases its a 3 level hierarchy.

- Leaf level tasks to which services are mapped at the lowest level
- Task representing the module to which the service belongs at the mid level
- Task representing the task type at the root level

For instance consider the task code AP\_N\_CUG which represents the Usergroup creation service under module approvals(AP). So the

PARENT\_ID column of task AP\_N\_CUG(leaf level task) has task code as AP(mid level task). If we look at the entry for task code

AP(mid level task) then the value in the PARENT\_ID column of DIGX\_CM\_TASK has MT(root level task) which is the task code representing

task type ADMINISTRATION. The leaf level task has 'Y' as the value in its EXECUTABLE column. The mid level and root level tasks have 'N' as the value in its EXECUTABLE column.

**Step 2 –** Configure aspects supported by the task. For example, if above task supports blackout, approval and working window, then following entries should be made.

Insert into DIGX\_CM\_TASK\_ASPECTS (TASK\_ID,ASPECT,ENABLED)

values ('TD\_F\_OTD','approval','Y');

Insert into DIGX\_CM\_TASK\_ASPECTS (TASK\_ID,ASPECT,ENABLED) values ('TD\_F\_OTD','working-window','Y');

Insert into DIGX\_CM\_TASK\_ASPECTS (TASK\_ID,ASPECT,ENABLED) values ('TD\_F\_OTD','blackout','Y');

Step 3 - Register the newly created service against this task. For this step firstly, you need to get the service id for your service(transaction). Service id is the fully qualified name of the class appended by the dot character (.) and the method name. For example taking open term deposit into consideration, the business logic for the service is encapsulated in the method named create of the service class com.ofss.digx.app.td.service.account.core.TermDeposit. Hence the service id is derived as : com.ofss.digx.app.td.service.account.core.TermDeposit.create Secondly the below guery fulfills the requirement mentioned in this step.

insert into DIGX\_CM\_RESOURCE\_TASK\_REL (ID, RESOURCE\_NAME, TASK\_ID, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER) values ('1', 'com.ofss.digx.app.td.service.account.core.TermDeposit.create', 'TD\_F\_OTD', 'ofssuser', sysdate, 'ofssuser', sysdate, null,1);

The aforesaid procedure enrolls your newly created service as a task in OBAPI.

#### Limit Configuration

The below procedure describes the steps required to enable Limits for a newly developed service.

A prerequisite to this configuration is that this newly developed service should be registered as a task in OBAPI. Refer "<u>Task Registration</u>" section for further details. **The types of Limits supported by the system are:** 

- <u>Periodic Limit(Cumulative)</u>: Limits that get reset after the expiration of a period. Example Dailylimits.
- <u>Duration Limit(Cooling Period)</u>: Limits that get applicable after the occurrence of an event, for instance payee creation, and then are applicable for the specified duration after commencement of the event.
- <u>Transaction Limit</u> : Limits applicable to each invocation of a transaction. Holds minimum and maximum amount that can be transacted in a single transaction invocation.

# Limits are applicable to targets. The types of targets supported by OBAPI are Task and Payee.

- Task : Any service developed as a part of OBAPI and registered as a task as mentioned in earlier sections
- Payee : A payee resource created via Payee creation transaction in OBAPI.

# To enable limits for a service, rather for a task mapped to the service to be precise, we need to follow the below mentioned steps:

- Ensure that the 'limit' aspect is configured in DIGX\_CM\_TASK\_ASPECTS table and ENABLED column is updated as 'Y' for your task id.
- Step 2. Register taskEvaluatorFactory for your task code. This needs an insert in DIGX\_FW\_CONFIG\_ALL\_B table under the category\_id 'taskEvaluatorFactories' as shown below

Insert into DIGX\_FW\_CONFIG\_ALL\_B (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER) values (<<taskcode>>, 'taskEvaluatorFactories', 'com.ofss.digx.framework.task.evaluator.DefaultTaskEvaluatorFactory', 'N', null, 'Task Evaluator Factory for Mixed FT', 'ofssuser', sysdate, 'ofssuser', sysdate, 'Y', 1);

4. Code a LimitDataEvaluator for the task. LimitDataEvaluator is a class that extends AbstractLimitDataEvaluator class present in com.ofss.digx.finlimit.core.jar. This class is an abstract class which has only 1 abstract method having signature as shown below:

/\*\*

\* provide {@link AbstractAspectData} of currently executing task.

\*

- \* @param serviceInputs
- \* the service inputs
- \* @return {@link AbstractAspectData} required for limit utilization and validation
- \* @throws Exception

\*/

public T evaluate(List<Object> serviceParameters) throws Exception

This method receives a List<Object> as an input. This list has all the arguments that were passed to the newly coded service for which limits needs to be enabled. For instance, consider the service to open a termed deposit. Signature of the service is as shown below.

public TermDepositAccountResponseDTO create(SessionContext sessionContext, TermDepositAccountDTO termDepositAccountDTO) throws Exception

In this case when the LimitDataEvaluator coded for open term deposit task i.e. TD\_F\_OTD is invoked by the OBAPI framework, the serviceInputs argument of evaluate method will contain 2 objects in the list namely SessionContext and TermDepositAccountDTO. The return type of evaluate method is LimitData. The state of a LimitData object comprises of three variables:

- **CurrencyAmount :** an Object of type CurrencyAmount which represents the monetary amount involved in the ongoing transaction along with the currency in the transfer or payment is made.
- <u>payee</u>: An object of type PayeeDTO. Needs to be populated in case a payee is involved in the transaction.
- <u>limitTypesToBeValidated</u>: A list of LimitTypes. For all unexceptional practical purposes this needs to be populated as shown below:

#### *limitTypesToBeValidated = new*

ArrayList<LimitType>(Arrays.asList(LimitType.PERIODIC,LimitType.DURATION,LimitType.TRAN SACTION));

These 3 fields in case applicable needs to be derived from the argument serviceInputs and populated in the returned LimitData object.

• Register the LimitDataEvaluator coded in Step 3.

This needs an insert in **DIGX\_FW\_CONFIG\_ALL\_B** table under the category\_id '**limitDataEvaluator**' as shown below

Insert into DIGX\_FW\_CONFIG\_ALL\_B (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER) values (<<task code>>, 'limitDataEvaluator', <<limitDataEvaluator>>, 'N', 'Limit data evaluator for <<service name>> service', null, 'ofssuser', sysdate, 'ofssuser', sysdate, 'A', 1);

In the above query <<*task code>>* is the task code for the service, <*limitDataEvaluator>>* is the fully qualified name of the class coded in Step 3. <<*service name>>* is a descriptive name for the service.

• **Step 5.** Code a TargetEvaluator for your task.

**Note:** This step is needed only if your task requires limits involving Payees. Example Duration Limits and payee limits.

Payee limits are Periodic and Transactional limits applied on a Payee.

TargetEvaluator is a class that implements ITargetEvaluator interface. ITargetEvaluator is a functional interface that has only 1 method as shown below :

/\*\*

\* Evaluates the Target details for the given evaluated task code and service inputs in the form of \* {@link TargetDTO}.

- \*
- \* @param evaluatedTaskCode
- \* the given evaluated task code
- \* @param serviceInputs
- \* inputs of the service using this evaluator
- \* @return target details of the target for this task code and service inputs in the form of {@link TargetDTO}.
- \* @throws Exception

\* exception while evaluating {@link TargetDTO}

\*/

public TargetDTO evaluate(String evaluatedTaskCode, List<Object> serviceInputs) throws Exception;

This method accepts the task code and serviceInputs in case something needs to be derived from the arguments passed to the service.

It returns a TargetDTO. TargetDTO has an id, name, value and TargetTypeDTO. TargetType tells whether the target is of type task or payee. If the TargetType is TASK then the variable value of TargetDTO holds the task code for the service.

If the TargetType is PAYEE then the variable value of TargetDTO holds the payeeld of the payee involved in the service.

As this step is required only for limits pertaining to payees so TargetType will be PAYEE and targetDTO's value will be payeeld.

Register the TargetEvaluator coded in Step 5.

**Note:** This step is needed only if your task requires limits involving Payees. Example Duration Limits and payee limts.

Payee limits are Periodic and Transactional limits applied on a Payee.

This needs an insert in **DIGX\_FL\_TARGET\_EVALUATOR** table as shown below:

Insert into DIGX\_FL\_TARGET\_EVALUATOR (TASK\_CODE, TARGET\_TYPE, EVALUATOR, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER) values (<<task code>>, 'PAYEE', <<TargetEvaluator>>, null, 'target evaluator for <<service name>> service', 'ofssuser', sysdate, 'ofssuser', sysdate, 'Y', 1);

In the above query <<*task code>>* is the task code for the service, <<*TargetEvaluator>>* is the fully qualified name of the

class coded in Step 5. <<service name>> is a descriptive name for the service.

The aforesaid procedure enables limits for a task in OBAPI.

#### Approval Configuration

The below procedure describes the steps required to enable Approvals for a newly developed service.

A prequisite to this configuration is that this newly developed service should be registered as a task in OBAPI. Refer "<u>Task Registration</u>" section for further details.

To enable approvals for a service, rather for a task mapped to the service to be precise, we need to follow the below mentioned steps:

 Ensure that the 'approval' aspect is configured in DIGX\_CM\_TASK\_ASPECTS table and ENABLED column is set to 'Y' for your task id.

Note : If the newly created task is of type ADMINISTRATION and the maintenance is not specific to a party then this step is not required. Examples of such transaction are 2 Factor Authentication maintenance, limit maintenance and limit package maintenance.
 Tasks of type ADMINISTRATION which are specific to a party like Rule management tasks, workflow management tasks etc require this step.
 Tasks of type
 FINANCIAL\_TRANSACTION,NONFINANCIAL\_TRANSACTION,MAINTENANCE,INQUIRY and COMMON require this step.

Code an approval assembler for the new task. An approval assembler is a class that extends AbstractApprovalAssembler.

There are 4 methods in abstract approval assembler out of which the one with the below signature:

public abstract T toDomainObject(D requestDTO) throws Exception;

will encapsulate the logic required to populate Transaction domain which is used by approvals framework.

Rest of the methods need to be overridden with empty or null implementations. As evident from the signature quoted above this method accepts a requestDTO(an object that IS A DataTransferObject) and a transaction(an object that IS A Transaction). requestDTO is the same DataTransferObject that was passed to your newly created service. For instance consider the service to open a termed deposit. Signature of the service is as shown below.

#### public TermDepositAccountResponseDTO create(SessionContext sessionContext, TermDepositAccountDTO termDepositAccountDTO) throws Exception

In this case when the ApprovalAssembler coded for open term deposit task i.e. TD\_F\_OTD is invoked by the OBAPI framework, the requestDTO argument of toDomainObject method will be the same as termDepositAccountDTO.

This method populates the transaction object on the basis of the requestDTO and returns the transaction domain. The guidelines to override this method are as follows:-

#### • Instantiation:

The transaction object passed will be null and needs to be instantiated. If the task type of the newly created service is FINANCIAL\_TRANSACTION then the transaction needs to be instantiated as an object of AmountAccountTransaction.

transaction = new AmountAccountTransaction();

If the task type of the newly created service is NONFINANCIAL\_TRANSACTION then the transaction needs to be instantiated as an object of AccountTransaction.

transaction = new AccountTransaction();

If the task type of the newly created service is MAINTENANCE then the transaction needs to be instantiated as an object of PartyTransaction.

#### transaction = new PartyTransaction();

If the task is of type ADMINISTRATION and the maintenance is specific to a party then the transaction needs to be instantiated as an object of PartyTransaction.

#### transaction = new PartyTransaction();

If the task is of type ADMINISTRATION and the maintenance is not specific to a party then the transaction needs to be instantiated as an object of Transaction.

#### transaction = new Transaction();

• Call to AbstractApprovalAssembler :

#### Call transaction = super.toDomainObject(requestDTO, transaction);

This populates the generic state of transaction domain which does not change with the task for which approvals is being configured.

c. Populate the state of the transaction domain which is specific to the task for which approvals is being configured. Cast the

requestDTO to the type being accepted by the service. For example cast it to TermDepositAccountDTO as per the aforesaid example.

Use this DTO to populate the service specific state of the transaction domain like amount, account etc.

 Step 3. Register an approval assembler for your service or task. To register an approval assembler for your service an entry needs to be made in the database table *DIGX\_FW\_CONFIG\_ALL\_B* with the value of column *CATEGORY\_ID* as 'approval\_assembler'.

If the newly created task is of type *ADMINISTRATION* and the maintenance is not specific to a party then the approval assembler to be registered against your service is om.ofss.digx.framework.domain.transaction.assembler.GenericDTOTransactionAssembler 2 Factor Authentication Maintenance is a fine example of such transactions. The service id for this transaction is com.ofss.digx.app.security.service.authentication.maintenance. AuthenticationMaintenance.

create

The below query fulfills the requirement of this step:

Insert into DIGX\_FW\_CONFIG\_ALL\_B (PROP ID. CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT STATUS, OBJECT\_VERSION\_NUMBER) values ('com.ofss.digx.app.security.service.authentication.maintenance.AuthenticationMaintenance. create'. 'approval\_assembler', 'com.ofss.digx.framework.domain.transaction.assembler.GenericDTOTransactionAssembler' , 'N', 'assembler class for conversion from UserSegmentTFAMaintenanceDTO to Transaction

domain'. 'assembler class for conversion from UserSegmentTFAMaintenanceDTO to Transaction domain', 'ofssuser', sysdate, 'ofssuser', sysdate, Ά', 1); In all other cases where you have implemented a custom approval assembler as per the

guidelines in step 2, the fully qualified class name of that approval assembler will be registered against your service. The below query fulfills the requirement of this step:

Insert into DIGX\_FW\_CONFIG\_ALL\_B (PROP ID. CATEGORY ID. PROP\_VALUE, FACTORY SHIPPED FLAG. PROP COMMENTS, SUMMARY\_TEXT, CREATED BY. CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT STATUS, OBJECT\_VERSION\_NUMBER) values (<<service id>>, 'approval assembler'. <<ApprovalAssembler>>, 'N', 'assembler class for conversion from DataTransferObject to Transaction domain'. 'assembler class for conversion from DataTransferObject to Transaction domain', 'ofssuser', sysdate, 'ofssuser', sysdate, 'A', 1);

In the above query <<service id>> is the fully qualified name of the class appended by the dot character (.) and the method name. <<ApprovalAssembler>> denotes the fully qualified class name of the approval assembler coded in Step 2.

The aforesaid procedure enables approvals for a task in OBAPI.

#### Account Relationship

Using this aspect, one can control accounts for a transaction.

#### 1. Account Number List Filtration

To filter the account list based on Account Relationship configuration, task code should be provided in REST call in following manner

```
../digx/v1/accounts/demandDeposit?taskCode=TD_F_OTD
```

Above REST will return only allowed accounts for 'New Deposit' transaction.

#### 2. Account Number Validation

Here we validate account number(s) using Account Relationship Configuration.

Following changes need to be done to achieve this

**Evaluator class** – If 'Account Relationship Check' is enabled for a transaction, then application looks for registered evaluator class. This class is used to identify account number(s) from incoming request object and converts it into input which is required for account relationship checking.

Evaluator class should implement interface 'com.ofss.digx.app.accountrelationship.evaluator.mapping.IAccountRelationshipDataEvaluator'

Example - 'com.ofss.digx.app.td.evaluator.accountrelationship.TDAccountRelationshipEvaluator' is an evaluator class which is used for 'New Deposit' transaction.

Inside 'evaluate' method of this class, account number from request object 'com.ofss.digx.app.td.dto.account.TermDepositAccountDTO' is being get converted into list of 'com.ofss.digx.app.party.dto.relation.account.PartyToAccountRelationshipDTO'.

Following database entry has been made to register evaluator class 'com.ofss.digx.app.td.evaluator.accountrelationship.TDAccountRelationshipEvaluator' with task code 'TD\_F\_OTD' of 'New Deposit' transaction.

Insert into DIGX\_FW\_CONFIG\_ALL\_B

(PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER, EDITABLE,

CATEGORY\_DESCRIPTION) values

('TD\_F\_OTD', 'accountRelationshipEvaluator', 'com.ofss.digx.app.td.evaluator.accountrelationship.TDAccountRelationshipEvaluator',

'N', 'Account Relationship evaluator for TD', null, 'ofssuser', sysdate, 'ofssuser',

sysdate, 'A', 1, 'N', null);

# **5. Extensible Points in Approval**

This article explains extensible points in Approval framework.

## 5.1 Adding a new Rule Criteria

Every rule in the system is created against a TaskType. TaskType decides which Rule Criteria are to be associated with a Rule being created. Examples of existing Rule Criteria are Transaction, Account, Amount and Currency.

If the existing Rule Criteria does not meet your requirement, then a new Rule Criteria can be extended in the system by following the steps given below:

### 5.1.1 Adding New Rule Criteria

Add a new rule criteria in the Table DIGX\_AP\_RULE\_CRITERIA shown below against the TASK\_TYPE to which the customized Task belongs:

select * from OBDX	_UBSADM.dig	<_ap_rule_criteria;						
Query Result ×								
📇 🚻 🏂 SQL   All Row	s Fetched: 18 in (	0.223 seconds						
() ID	NAME	UVEIGHTAGE	USER_TYPE	TASK_TYPE	CREATED_BY	CREATION_DATE	UAST_UPDATED_BY	LAST_UPDATE
1 RULE_CRITERIA_001	TRANSACTION	5 STRING	CUSTOMER	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
2 RULE_CRITERIA_002	TRANSACTION	5 STRING	CUSTOMER	NONFINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
3 RULE_CRITERIA_003	TRANSACTION	5 STRING	CUSTOMER	MAINTENANCE	(null)	(null)	(null)	(null)
4 RULE_CRITERIA_004	TRANSACTION	5 STRING	ADMIN	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
5 RULE_CRITERIA_005	TRANSACTION	5 STRING	ADMIN	NONFINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
6 RULE_CRITERIA_006	TRANSACTION	5 STRING	ADMIN	ADMINISTRATION	(null)	(null)	(null)	(null)
7 RULE_CRITERIA_007	ACCOUNT	5 STRING	CUSTOMER	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
8 RULE_CRITERIA_008	ACCOUNT	5 STRING	CUSTOMER	NONFINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
9 RULE_CRITERIA_009	ACCOUNT	5 STRING	ADMIN	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
10 RULE_CRITERIA_010	ACCOUNT	5 STRING	ADMIN	NONFINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
11 RULE_CRITERIA_011	AMOUNT	5 BIGDECIMAL	CUSTOMER	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
12 RULE_CRITERIA_012	AMOUNT	5 BIGDECIMAL	ADMIN	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
13 RULE_CRITERIA_013	TRANSACTION	5 STRING	CUSTOMER	ADMINISTRATION	(null)	(null)	(null)	(null)
14 RULE_CRITERIA_014	CURRENCY	15 STRING	CUSTOMER	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
15 RULE_CRITERIA_015	CURRENCY	15 STRING	ADMIN	FINANCIAL_TRANSACTION	(null)	(null)	(null)	(null)
16 RULE_CRITERIA_016	AMOUNT	5 BIGDECIMAL	CUSTOMER	AMOUNT_FIN_TRANSACTION	(null)	(null)	(null)	(null)
17 RULE_CRITERIA_017	CURRENCY	15 STRING	CUSTOMER	AMOUNT_FIN_TRANSACTION	(null)	(null)	(null)	(null)
18 RULE CRITERIA 018	TRANSACTION	5 STRING	CUSTOMER	AMOUNT FIN TRANSACTION	(null)	(null)	(null)	(null)

### 5.1.2 Implementing a Rule Criteria Handler

For the newly created RuleCriteria mentioned in step above , create a RuleCriteriaHandler implementation. This class implements the interface named com.ofss.digx.app.approval.service.rulecriteria.handler.IRuleCriteriaHandler

Override the methods

addRuleCriteriaRelationships : This method returns the list of

RuleRuleCriteriaRelationshipDTO to be added as a part of the newly created RuleCriteria to the rule being created for the TaskType to which the customized task belongs. **getRuleCriteriaMultiplierForRule:** returns a multiplier (datatype :double) which gives precedence to a rule over other rule in case both the rules are applicable for a particular instance of a transaction.

Note: While implementing Rule Criteria Handler make sure that it is implemented in a way that it does not impact existing Tasks in the system belonging to the TaskType against which it is added.

### 5.1.3 Registering a Rule Criteria Handler

The Rule Criteria Handler implemented in the step above needs to be registered in the system. To register make an entry in the table DIGX\_FW\_CONFIG\_ALL\_B as shown in the example query below.

insert into DIGX\_FW\_CONFIG\_ALL\_B (PROP\_ID, CATEGORY\_ID, PROP\_VALUE, FACTORY\_SHIPPED\_FLAG, PROP\_COMMENTS, SUMMARY\_TEXT, CREATED\_BY, CREATION\_DATE, LAST\_UPDATED\_BY, LAST\_UPDATED\_DATE, OBJECT\_STATUS, OBJECT\_VERSION\_NUMBER)

values ('<<Rule Criteria Name>>', 'RuleCriteriaHandlerConfig', '<<Fully qualified name of the Handler implementation class created in the step above>>', 'N', 'Specifies the class name of the Handler for rule criteria type <<Rule Criteria Name>>.', 'Specifies the class name of the Handler for rule criteria type <<Rule Criteria Name>>.', 'ofssuser', sysdate, 'ofssuser', sysdate, 'A', 1);

# 6. Architecture of GUI Tier

Below diagram shows structure of the UI artifacts and some of the important artifacts are explained subsequently.

Home

# 7. Extensible Points in GUI Tier

This article provide the guidelines for UI Extensibility.

## 7.1 Theme and Brand

- CSS Custom Properties are available for modifications. You can change the variables by creating a new CSS file which has updated value of CSS custom properties. Make sure that file is imported after the main.css file. Same functionality you can achieve by Branding. It is recommended that implementer should use Branding functionality.
- We are not allowing adding new styles in the core UI.
- For the Images you are free to do modifications.

## 7.2 Component Extensibility

- Framework Elements like (header,dashboard, menu etc) are not available for the modification and customization.
- All components available under component folder are available for the extension.

### 7.2.1 Adding New and Overriding Existing Components

If you want to add new component place that component in <CHANNEL\_ROOT\_PATH>/extensions/components. It follow the same structure which is present in components folder. Same thing is applicable for the existing components. If you want to change anything then copy that component and place it extensions/components folder with the same structure.

If resource bundle needs to change for that component place related resource bundle in <CHANNEL\_ROOT\_PATH>/extensions/resources location. Structure remain same for <CHANNEL\_ROOT\_PATH>/resources and <CHANNEL\_ROOT\_PATH>/extensions/resources folder. Make sure that you updated the resource bundle path in your component.

If any component is present in <CHANNEL\_ROOT\_PATH>/extensions/components will take precedence over the <CHANNEL\_ROOT\_PATH>/components. For it we maintaining the list of components available in extensions in <CHANNEL\_ROOT\_PATH>/extensions/extension.json which is to be entered manually. For example:

#### Sample JSON for extension.json

```
{
```

"components": [<component1>,<component2>].

"partials" : ["partial1.html","partial2.html"]

}

In the Same manner you can override the partial templates.

**Note:** Out of the box we are providing extension for Internal Account Input Component (inernalaccount-input). This extension need to be implemented in scenario where the bank account number do not have branch code prefixed in the account.

### 7.2.2 Add / Modify Validations

All the validation available in the application are maintained in **<CHANNEL\_ROOT\_PATH>/framework/js/base-models/validations/obapilocale.js.** Implementer can override and add new validations in the application without changing this file. An extension hook is given at :

For OBAPI 18.1 at <CHANNEL\_ROOT\_PATH>/extensions/validations/obapi-locale.js

From OBAPI 18.2 onwards <CHANNEL\_ROOT\_PATH>extensions\override\obapi-locale.js

In this file Implementer can add or override validations.

For Example: If you need to change the pattern which validate Mobile Number. Add updated pattern in this file as below.

## 7.3 Calling custom REST service

In implementation if any new services are written by implementer it has been directed to change the context root for new REST to digx/cz/v1. For supporting it from the UI, implementer has to pass cz/v1 in the version field of the AJAX setting from his model.

For example see the snippet below:

```
fetchDetails = function(urlParams, deferred) {
  var options = {
    url: urlParams,
    version: "cz/v1",
    success: function(data) {
        deferred.resolve(data);
    },
    error: function(data) {
        deferred.reject(data);
     }
    };
    baseService.fetch(options);
},
```

# 8. Libraries

OBAPI has bundled its platform features and capabilities in various libraries based on logical separation of features. This section provides a list of such libraries along with their purpose

## 8.1 **OBAPI Libraries**

This section provides information about various OBAPI libraries that are provided out of the box.

### 8.1.1 Core/Framework Libraries

Provide infrastructure features of OBAPI platform. These libraries are packaged in the digx-shared-libs.war

Library	Description
com.ofss.digx.infra	Provides basic infrastructure classes.
com.ofss.digx.infra.audit	Provides basic infrastructure classes for audit.
com.ofss.digx.infra.crypto com.ofss.digx.infra.crypto.asymmetric.impl.db com.ofss.digx.infra.crypto.asymmetric.impl.keystore com.ofss.digx.infra.crypto.asymmetric.impl.remote	Provides cryptography functions such as hash generation, public private key generation and symmetric cryptography provider.
com.ofss.digx.infra.crypto.impl.jar	Provides default implementations of cryptography functions such as hash generation, public private key generation and symmetric cryptography provider.
com.ofss.digx.framework.domain	Provides base classes for entities, assemblers, repositories etc.
com.ofss.digx.framework.rest	Provides classes for calling host REST services.
com.ofss.digx.framework.adapter	Provides adapter interfaces for cross- domain invocation required for the framework.
com.ofss.digx.appx.core.rest	Provides infrastructure classes for OBAPI REST services

Library	Description
com.ofss.digx.datatype	Provides complex data types used in OBAPI application
com.ofss.digx.core.enumeration	Provides enumerations required for the core framework of the application.
com.ofss.digx.appcore	Provides base classes for application services, Interaction classes etc.
com.ofss.digx.security.core	Provides two factor authentication related core classes.
com.ofss.digx.appcore.dto	Provides DTOs used in infrastructure services
com.ofss.digx.annotations	Provides various annotations used in OBAPI application
com.ofss.digx.appx.core.soap	Provides infrastructure classes for OBAPI REST services
com.ofss.digx.core.enumeration.converters	Provides infrastructure classes for defining converter logic for enumeration
com.ofss.digx.framework.scheduler	Provides infrastructure classes for OBAPI scheduler
com.ofss.digx.infra.orms	Contains ORM mapping files for framework domains
com.ofss.digx.infra.token.security	Contains infrastructure classes for provide user/subject information using token.

## 8.1.2 Common Library

Provide common libraries used across all modules of the application. These libraries are packaged in digx-shared-libs.war

Library	Description		
com.ofss.digx.accountrelationship.core	Provides classes for account relationship evaluators.		
com.ofss.digx.adapter	Provides interfaces for cross-domain adapters.		

Library	Description
com.ofss.digx.common	Provides all constants and utilities to be used across the application.
com.ofss.digx.enumeration	Provides all enumerations.
com.ofss.digx.extxface	Provides adapters for interaction with external applications.
com.ofss.digx.finlimit.core	Provides core classes for financial limits processing
com.ofss.digx.access.core	Provides core classes for account access processing

### 8.1.3 Modules

Provide functional module available in the application.

- digx-access.war
- digx-account.war
- digx-accountaggregation.war
- digx-accountrelationship.war
- digx-alerts.war
- digx-analytics.war
- digx-approval.war
- digx-associatedparty.war
- digx-audit.war
- digx-berlinaisp.war
- digx-berlinpiisp.war
- digx-berlinpisp.war
- digx-brand.war
- digx-budget.war
- digx-bulkadmin.war
- digx-bulkcms.war
- digx-bulkinvoice.war
- digx-bulkpayment.war

- digx-bulkscf.war
- digx-bulktradefinance.war
- digx-bulkvam.war
- digx-card.war
- digx-chatbot.war
- digx-cms.war
- digx-collaboration.war
- digx-common.war
- digx-config.war
- digx-content.war
- digx-creditfacility.war
- digx-cutoff.war
- digx-dda.war
- digx-ebpp.war
- digx-feedback.war
- digx-finlimit.war
- digx-forexdeal.war
- digx-goal.war
- digx-insight.war
- digx-invoice.war
- digx-liquiditymanagement.war
- digx-loan.war
- digx-loanapplication.war
- digx-location.war
- digx-login.war
- digx-me.war
- digx-mobile.war
- digx-nlp.war
- digx-oauth.war
- digx-obc.war
- digx-origination.war
- digx-party.war
- digx-payment.war
- digx-pm.war
- digx-processmanagement.war

- digx-report.war
- digx-rewards.war
- digx-scf.war
- digx-security.war
- digx-sms.war
- digx-smsbanking.war
- digx-social.war
- digx-spendanalysis.war
- digx-sr.war
- digx-td.war
- digx-tradefinance.war
- digx-ukaisp.war
- digx-ukcbpii.war
- digx-ukpisp.war
- digx-user.war
- digx-vam.war
- digx-wallet.war
- digx-wm.war

### 8.1.4 External System Adapters

These are packaged into module specific wars.

Library	Description
com.ofss.digx. <module_name>.extxfa ce</module_name>	Provides all external interfaces
com.ofss.digx.extxface. <host Name&gt;.impl</host 	Provides adapter implementations of the external interfaces for particular host
com.ofss. <host name="">.soap.client</host>	Provides stubs used for communicating with host

Home

# 9. Digx Scheduler Application

This section describes how to create custom schedulers in OBAPI.

## 9.1 Create New Scheduler Class

Follow the steps given below while creating new scheduler

a. Implement the class with org.quartz.Job, java.io.Serializable.

Example :

public class ReportSchedulerImpl implements Serializable, Job {

}

b. Define the required business logic in the overridden method execute(JobExecutionContext) required for scheduling.

Example :

@Override

public void execute(JobExecutionContext paramJobExecutionContext) throws

JobExecutionException {

// business logic required for scheduling

}

c. Get the SessionContext and AccessPoint objects from the method parameter before calling the business logic (if any). Set both the objects in the thread attributes.

Example:

SessionContext sessionContext = (SessionContext) paramJobExecutionContext.getJobDetail().getJobDataMap().get("sessionContext");

AccessPointDTO accessPoint = (AccessPointDTO) paramJobExecutionContext.getJobDetail().getJobDataMap().get("accessPoint");

com.ofss.digx.infra.thread.ThreadAttribute.set(com.ofss.digx.infra.thread.ThreadAttribute. ACCESS\_POINT, accessPoint);

ThreadAttribute.set(ThreadAttribute.SESSION\_CONTEXT, sessionContext);

#### d. Call the respective service class (if any) for business logic.

Example:

try {

ReportRequest service = new ReportRequest();

service.executeScheduled(sessionContext);

} catch (Exception e) {

logger.log(Level.SEVERE, "Error occurred while executing ReportSchedulerImpl class at : " + new java.util.Date(), e);

} catch (java.lang.Exception e) {

logger.log(Level.SEVERE, "Error occurred while executing ReportSchedulerImpl class at : " + new java.util.Date(), e);

}

## 9.2 Configure Scheduler Class

Configure the newly created scheduler class in "DIGX\_CM\_TIMER" table as per the following script.

Example:

Insert into digx\_cm\_timer (TIMER\_ID,TIMER\_CLASS,SECONDS,MINUTE,HOUR,DAY\_OF\_WEEK,DAY\_OF\_MONTH,MO NTH,YEAR,IS\_ENABLED,IS\_PESISTENT,JVM\_ID,CREATED\_BY,CREATION\_DATE,LAST\_UP DATED\_BY,LAST\_UPDATED\_DATE,OBJECT\_VERSION\_NUMBER) values ('ReportSchedulerTimer','com.ofss.digx.scheduler.report.ReportSchedulerImpl','0','\*/15','\*',null,null ,null,null,'Y','N','1','ofssuser',sysdate,'ofssuser',sysdate,1);
