5.6  Reinstalling Your Software ......................................................................................... 5-4

A  Understanding the WebLogic Server and Coherence Distribution

B  Understanding the Oracle WebLogic Server and Coherence Directory Structure
Preface

This document describes how to install and configure Oracle WebLogic Server and Coherence.

Audience

This document is intended for system administrators or application developers who are installing WebLogic Server. It is assumed that readers are familiar with Web technologies and have a general understanding of Windows and UNIX platforms.

Document Organization

The document is organized as follows:

- Chapter 1, "Planning Your Oracle WebLogic Server Installation," lists the products that are included with the WebLogic Server and Coherence distribution, and describes the high-level tasks and basic information that you should know prior to installing your software.

- Chapter 2, "Installing the Oracle WebLogic Server and Coherence Software," describes how to install your software on Windows and UNIX platforms, using a Java-based graphical user interface (GUI).

- Chapter 3, "Creating and Configuring a WebLogic Domain" describes how to create and configure your WebLogic Server domain using the configuration wizard.

- Chapter 4, "Next Steps After Configuring a WebLogic Server Domain," provides information about post-installation tasks.

- Chapter 5, "Deinstalling Oracle WebLogic Server and Coherence," provides procedures for deinstalling your software in graphical, console, and silent modes.

- Appendix A, "Understanding the WebLogic Server and Coherence Distribution" lists the products and feature sets included in the Oracle WebLogic Server and Coherence distribution.

- Appendix B, "Understanding the Oracle WebLogic Server and Coherence Directory Structure" provides a description of the directory structure created on your system as a result of this installation.
Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents in the 12c (12.1.2) documentation library:

- **Upgrading Oracle WebLogic Server**

  If you are upgrading your Oracle WebLogic Server installation from an earlier version (for example from a 10.x release in 11g to a 12c release), this document explains how to upgrade the entire WebLogic Server environment, including applications, the WebLogic domains in which they are deployed, and any application data associated with the domain. This may include external resources, such as database servers, firewalls, load balancers, and LDAP servers.

- **Installing and Configuring the Oracle Fusion Middleware Infrastructure**

  Oracle WebLogic Server is also available as part of the Oracle Fusion Middleware Infrastructure distribution. Refer to this book if you want to install Oracle WebLogic Server with Infrastructure capabilities.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
This chapter helps to prepare you for your Oracle WebLogic Server and Coherence installation.

Various topics are covered that should be reviewed thoroughly to help ensure that you do not encounter any problems either during or after the product installation and domain configuration.

The following sections are included:

- **Section 1.1, “Using this Document”**
- **Section 1.2, “Understanding the WebLogic Server and Coherence Standard Installation Topology”**
- **Section 1.3, “Roadmap for Installing and Configuring the Installation Topology”**
- **Section 1.4, “Roadmap for Verifying Your System Environment”**
- **Section 1.5, “Understanding and Obtaining the Oracle WebLogic Server and Coherence Distribution”**

**Note:** If you are installing Oracle WebLogic Server and Coherence as part of an upgrade procedure, follow the instructions in this book to install the software, but do not run the Configuration Wizard to create a WebLogic domain.

After the software is installed, refer to *Upgrading Oracle WebLogic Server*.

### 1.1 Using this Document

This section contains the following topics:

- **Section 1.1.1, "Using the Standard Installation Topology as a Starting Point"**
- **Section 1.1.2, "Using this Document in an Upgrade Scenario"**
- **Section 1.1.3, "Using this Document to Extend a Domain"**

#### 1.1.1 Using the Standard Installation Topology as a Starting Point

This guide will help you create the standard installation topology for Oracle WebLogic Server and Coherence (Figure 1–1). This topology can be extended to be highly available and secure, making it suitable for a production system.
The standard installation topology represents a sample topology for this product; it is not the only topology that is supported. For more information, see "Understanding the Standard Installation Topology" in Planning an Installation of Oracle Fusion Middleware.

1.1.2 Using this Document in an Upgrade Scenario

If you are installing Oracle WebLogic Server and Coherence as part of an upgrade procedure, follow the instructions in this book to install the software, but do not run the Configuration Wizard to create a WebLogic domain.

After the software is installed, refer to Upgrading Oracle WebLogic Server.

1.1.3 Using this Document to Extend a Domain

The instructions in this document describe how to create a new domain; the same instructions can be used to extend an existing domain. If you choose to do this, be sure to read "Installing Multiple Products in the Same Domain" in Planning an Installation of Oracle Fusion Middleware for important information.

If you are creating a new domain but your needs do not match the instructions given in the procedure, be sure to make your selections accordingly and refer to the supporting documentation for additional details.

1.2 Understanding the WebLogic Server and Coherence Standard Installation Topology

The standard installation topology for Oracle WebLogic Server and Coherence is shown in Figure 1–1.

*Figure 1–1 Oracle WebLogic Server and Coherence Topology*

This topology includes a standard WebLogic Server domain that contains two Managed Servers in a cluster and an Administration Server, all configured on a single host.

Each element in this topology illustration is described in Table 1–1.

*Table 1–1 Description of the Elements in the Oracle WebLogic Server and Coherence Standard Installation Topology*

<table>
<thead>
<tr>
<th>Element</th>
<th>Description and Links to Additional Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPHOST</td>
<td>Standard term used in Oracle documentation referring to the machine that is hosting the application tier.</td>
</tr>
</tbody>
</table>
A roadmap describing the necessary steps to arriving at this topology can be found in Section 1.3.

### 1.3 Roadmap for Installing and Configuring the Installation Topology

This guide provides all the steps required to install and configure WebLogic Server. Within the procedures, the guide also provides references to additional information you can use if you want to create a modified version of this topology.

Table 1–2 show the steps required to install and configure Oracle WebLogic Server.

<table>
<thead>

<th>Description</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify your system environment</td>
<td>Before beginning the installation, verify that the minimum system and network requirements are met.</td>
<td>Section 1.4.</td>
</tr>
<tr>
<td>Obtain the appropriate distribution</td>
<td>To create the topology described in this section, obtain the Oracle WebLogic Server and Coherence distribution (wls_121200.jar).</td>
<td>Section 1.5.</td>
</tr>
<tr>
<td>Determine your installation directories</td>
<td>Verify that the directories that will need to be created can be created or accessed by the installer, and exist on systems that meet the minimum requirements.</td>
<td>Appendix B.</td>
</tr>
</tbody>
</table>
### 1.4 Roadmap for Verifying Your System Environment

This section (Table 1–3) contains important information that you must read and understand prior to beginning the installation and configuration process. It identifies important tasks and checks to perform to make sure your environment is properly prepared for installing and configuring Oracle Fusion Middleware Infrastructure.

#### Table 1–3 Roadmap for Verifying Your System Environment

<table>
<thead>

<tbody>
<tr>
<td>Verify certification and system requirements.</td>
<td>Verify that your operating system is certified and properly configured for Oracle Fusion Middleware Infrastructure installation and configuration.</td>
<td>See &quot;Verifying Certification and System Requirements&quot; in Planning an Installation of Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Identify a proper installation user.</td>
<td>Verify that the installation user has the proper permissions to install and configure the software.</td>
<td>See &quot;Selecting an Installation User&quot; in Planning an Installation of Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Select the installation and configuration directories on your system.</td>
<td>Verify that you are able to create the necessary directories for installation and configuration, according to the recommended directory structure.</td>
<td>See &quot;Selecting Directories for Installation and Configuration&quot; in Planning an Installation of Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Install a certified JDK.</td>
<td>The installation program for the distribution requires a certified JDK present on your system.</td>
<td>See &quot;Installing a JDK&quot; in Planning an Installation of Oracle Fusion Middleware.</td>
</tr>
</tbody>
</table>

### 1.5 Understanding and Obtaining the Oracle WebLogic Server and Coherence Distribution

The Oracle WebLogic Server and Coherence distribution is available as a .jar file. You must have a certified JDK already installed on your system in order to install and configure this distribution.

**Tip:** For more information about distributions, see "Understanding and Obtaining Product Distributions" in Planning an Installation of Oracle Fusion Middleware.

This distribution contains the products and features described in Appendix A. For information on how to obtain the distribution, see "Obtaining Product Distributions" in Planning an Installation of Oracle Fusion Middleware.
Installing the Oracle WebLogic Server and Coherence Software

This chapter describes how to start the Oracle WebLogic Server and Coherence installation program in graphical mode. It also describes the sequence of screens that appear in the installation process.

The following sections are included:

- Section 2.1, "Starting the Installation Program"
- Section 2.2, "Navigating the Installation Screens"
- Section 2.3, "Understanding the Coherence Installation Type"

2.1 Starting the Installation Program

To start the installation program, perform the following steps.

1. Log in to the target system.

2. The installer requires that a certified JDK already exists on your system. For more information, see the appropriate certification document for 12c (12.1.2) on the Oracle Fusion Middleware Supported System Configurations page.

3. Go to the directory where you downloaded the installation program.

4. Launch the installation program by invoking \texttt{java -jar} from the JDK directory on your system, as shown in the examples below:

   - On UNIX operating systems:
     \texttt{/home/Oracle/jdk7_15/jdk1.7.0_15/bin/java -jar wls_121200.jar}

   - On Windows operating systems:
     \texttt{C:\Program Files\Java\jdk1.7.0_15\bin\java -jar wls_121200.jar}

   Be sure to replace JDK location in these examples with the actual JDK location on your system.

   When the installation program appears, you are ready to begin the installation. See Section 2.2 for a description of each installation program screen.

2.2 Navigating the Installation Screens

The installation program displays a series of screens, in the order listed in Table 2–1. If you need additional help with any of the installation screens, click the screen name.
Table 2–1 Oracle WebLogic Server and Coherence Installation Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installation Inventory Setup</td>
<td>On UNIX operating systems, this screen will appear if this is the first time you are installing any Oracle product on this host. Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location. For more information about the central inventory, see “Understanding the Oracle Central Inventory” in Installing Software with the Oracle Universal Installer. This screen will not appear on Windows operating systems.</td>
</tr>
<tr>
<td>Welcome</td>
<td>This screen introduces you to the product installer.</td>
</tr>
<tr>
<td>Installation Location</td>
<td>Use this screen to specify the location of your Oracle home directory. For more information about Oracle Fusion Middleware directory structure, see “Selecting Directories for Installation and Configuration” in Planning an Installation of Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Installation Type</td>
<td>To create the standard installation topology for WebLogic Server and Coherence, select the WebLogic Server Installation installation type. NOTE: The topology in this document does not include server examples; Oracle strongly recommends that you do not install the examples into a production environment. See Section 2.3 for more information about the Coherence Installation installation type.</td>
</tr>
<tr>
<td>Prerequisite Checks</td>
<td>This screen verifies that your system meets the minimum necessary requirements. If there are any warning or error messages, you can refer to one of the following documents in Section 1.4.</td>
</tr>
<tr>
<td>Specify Security Updates</td>
<td>If you already have an Oracle Support account, use this screen to indicate how you would like to receive security updates. If you do not have one and are sure you want to skip this step, clear the check box and verify your selection in the follow-up dialog box.</td>
</tr>
<tr>
<td>Installation Summary</td>
<td>Use this screen to verify the installation options you selected. If you want to save these options to a response file, click Save Response File and provide the location and name of the response file. Response files can be used later in a silent installation situation. For more information about silent or command line installation, see “Using the Oracle Universal Installer in Silent Mode” in Installing Software with the Oracle Universal Installer.</td>
</tr>
<tr>
<td>Installation Progress</td>
<td>This screen allows you to see the progress of the installation.</td>
</tr>
</tbody>
</table>
2.3 Understanding the Coherence Installation Type

For the WebLogic Server and Coherence standard installation topology, select the WebLogic Server Installation installation type. When you select this installation type and use the instructions in this guide, the standard installation topology includes a Coherence cluster that contains storage-enabled Managed Coherence Servers.

The Coherence Installation installation type is available for users who want to deploy and manage Coherence applications using the WebLogic Management Framework. For more information, see the following:

- "Deploying Coherence Applications" in Administering Oracle Coherence.
- "What is the WebLogic Management Framework?" in Understanding Oracle Fusion Middleware.

---

**Table 2-1** (Cont.) Oracle WebLogic Server and Coherence Installation Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
</table>
| Installation Complete | This screen appears when the installation is complete. The next step is to launch the configuration wizard to create your WebLogic domain. There are two ways to do this:  
- Select **Automatically Launch the Configuration Wizard** on this screen. After you click **Finish** to dismiss the installer, the configuration wizard is started and you can begin to configure your domain. If you choose to do this, proceed to Section 3.1.2.  
- Do not select **Automatically Launch the Configuration Wizard** on this screen. After you click **Finish** to dismiss the installer, you must manually start the configuration wizard to begin configuring your domain. If you choose to do this, proceed to Section 3.1.1.  
If you chose the Complete Installation installation type, this screen will give you the option to start the Quick Start Configuration Wizard, which enables you to create sample domains. For more information, see "Quick Start Configuration Wizard" in Creating Domains Using the Configuration Wizard. |
This chapter describes the steps required to create your WebLogic Server domain after your software has been successfully installed.

The following topics are covered:

- Section 3.1, "Configuring Your WebLogic Domain"
- Section 3.2, "Starting the Servers"
- Section 3.3, "Verifying Your Configuration"

### 3.1 Configuring Your WebLogic Domain

This section provides instructions for creating a WebLogic domain using the configuration wizard. For more information on other methods available for domain creation, see "Additional Tools for Creating, Extending, and Managing WebLogic Domains" in Creating Domains Using the Configuration Wizard.

The following topics are covered in this section:

- Section 3.1.1, "Starting the Configuration Wizard"
- Section 3.1.2, "Navigating the Configuration Wizard Screens to Configure the Domain"

#### 3.1.1 Starting the Configuration Wizard

To begin domain configuration, navigate to the `ORACLE_HOME/oracle_common/common/bin` directory and start the WebLogic Server Configuration Wizard.

On UNIX operating systems:

```
./config.sh
```

On Microsoft Windows operating systems:

```
config.cmd
```

#### 3.1.2 Navigating the Configuration Wizard Screens to Configure the Domain

Follow the instructions in this section to configure the domain using the Configuration Wizard.
Task 1, "Selecting the Domain Type and Domain Home Location"
Task 2, "Selecting the Configuration Templates"
Task 3, "Configuring the Administrator Account"
Task 4, "Specifying the Domain Mode and JDK"
Task 5, "Selecting Advanced Configuration Options"
Task 6, "Configuring the Administration Server Listen Address"
Task 7, "Configuring Node Manager"
Task 8, "Configuring Managed Servers"
Task 9, "Configure a Cluster"
Task 10, "Assigning Managed Servers to the Cluster"
Task 11, "Configuring Coherence Clusters"
Task 12, "Configuring a New Machine"
Task 13, "Assigning Servers to Machines"
Task 14, "Reviewing Your Configuration Specifications and Configuring the Domain"
Task 15, "Writing Down Your Domain Home and Administration Server URL"

Task 1 Selecting the Domain Type and Domain Home Location
On the Configuration Type screen, select Create a New Domain.
In the Domain Location field, specify your Domain home directory.
It is recommended that you locate your Domain home in accordance with the
directory structure summarized in Appendix B, where the Domain home is located
outside the Oracle home directory. This directory structure will help you avoid issues
when you need to upgrade or re-install your software.

Tip: More information about the Domain home directory can be
found in “Choosing a Domain Home” in Planning an Installation of Oracle Fusion Middleware.

More information about re-installing the software can be found in
Section 5.6

More information about the other options on this screen can be found
in Configuration Type in Creating Domains Using the Configuration Wizard.
Task 2  Selecting the Configuration Templates
On the Templates screen select the following templates for configuration:

- **Basic WebLogic Server Domain** (selected by default)
- **WebLogic Coherence Cluster Extension**

Selecting this template will cause the Managed Servers in the cluster to be managed Coherence servers, and the cluster will be a managed Coherence cluster. This serves as a starting point for setting up your Coherence environment. For more detailed information and next steps, see Table 4-1.

Task 3  Configuring the Administrator Account
On the Administrator Account screen, specify the user name and password for the default WebLogic Administrator account for the domain. This account is used to boot and connect to the domain’s Administration Server.

**Tip:** You must make a note of the user name and password you choose to enter here; you will need this in order to be able to start and access the Administration Server.

Task 4  Specifying the Domain Mode and JDK
On the Domain Mode and JDK screen:

- Select **Production** in the Domain Mode field.
- Select **Oracle Hotspot JDK** in the JDK field.

Selecting **Production Mode** on this screen gives your environment a higher degree of security, requiring a user name and password to deploy applications and to start the Administration Server.

**Tip:** More information about the options on this screen, including the differences between development mode and production mode, can be found in Domain Mode and JDK in Creating Domains Using the Configuration Wizard.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see “Creating a Boot Identity File for an Administration Server” in Administering Server Startup and Shutdown for Oracle WebLogic Server.
Task 5 Selecting Advanced Configuration Options
To complete domain configuration for the topology, the following must be selected on the Advanced Configuration screen:

- **Administration Server**
  This is required to properly configure the listen address of the Administration Server.

- **Node Manager**
  This is required to configure Node Manager.

- **Managed Servers, Clusters and Coherence**
  This is required to configure the Managed Servers and cluster, and also for configuring the machine and targeting the Managed Servers to the machine.

  **Tip:** If you want to configure dynamic clusters, see the following:
  - "Overview of Dynamic Clusters" in Understanding Oracle WebLogic Server.
  - "Creating Dynamic Clusters" in Administering Clusters for Oracle WebLogic Server.

Task 6 Configuring the Administration Server Listen Address
On the Administration Server screen, select the drop-down list next to Listen Address and select the IP address on the host where the Administration Server will reside. Do not use "All Local Addresses."

Task 7 Configuring Node Manager
The Node Manager screen can be used to select the type of node manager you want to configure, along with the Node Manager credentials.

Select **Per Domain** as the Node Manager type, then specify the user name and password.

  **Tip:** More information about the options on this screen can be found in Node Manager in Creating Domains Using the Configuration Wizard.

More information about the types of Node Manager can be found in "Node Manager Overview" in Administering Node Manager for Oracle WebLogic Server.

Task 8 Configuring Managed Servers
Use the Managed Servers screen to create two new Managed Servers:

1. Click the **Add** button to create a new Managed Server.
2. Specify `wls_server_1` in the Server name column.
3. In the Listen Address drop-down list, select the IP address of the host on which the Managed Server will reside. Do not use "All Local Addresses."
4. Repeat this process to create a second Managed Server named `wls_server_2`.

Configuring a second Managed Server is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.
For more information about the high availability standard topology, see "Understanding the Fusion Middleware Standard HA Topology" in High Availability Guide.

For more information about the next steps to prepare for high availability after your domain is configured, see Section 4.3.

These server names will be referenced throughout this document; if you choose different names then be sure to replace them as needed.

Task 9 Configure a Cluster
Use the Clusters screen to create a new cluster.

1. Click the Add button.
2. Specify wls_cluster_1 in the Cluster Name field.
3. Leave the cluster Address field blank.

By default, server instances in a cluster communicate with one another using unicast. If you want to change your cluster communications to use multicast, refer to "Considerations for Choosing Unicast or Multicast" in Administering Clusters for Oracle WebLogic Server.

Tip: More information about the options on this screen can be found in Managed Servers in Creating Domains Using the Configuration Wizard.

Task 10 Assigning Managed Servers to the Cluster
Use the Assign Servers to Clusters screen to assign wls_server_1 and wls_server_2 to the new cluster wls_cluster_1.

1. In the Clusters pane, select the cluster to which you want to assign the servers; in this case, wls_cluster_1.
2. In the Servers pane, assign wls_server_1 to wls_cluster_1 by doing one of the following:
   - Click once on wls_server_1 to select it, then click on the right arrow to move it beneath the selected cluster (wls_cluster_1) in the Clusters pane.
   - Double-click on wls_server_1 to move it beneath the selected cluster (wls_cluster_1) in the clusters pane.

Tip: More information about the options on this screen can be found in Clusters in Creating Domains Using the Configuration Wizard.
3. Repeat to assign `wls_server_2` to `wls_cluster_1`.

Tip: More information about the options on this screen can be found in Assign Servers to Clusters in Creating Domains Using the Configuration Wizard.

Task 11 Configuring Coherence Clusters
Use the Coherence Clusters screen to configure the Coherence cluster that is automatically added to the domain. Leave the default port number 0 as the Coherence cluster listen port.

Note: Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that can be assigned to a Managed Server port number is 60535, instead of 65535.

See Table 4–2 for more information and next steps for configuring Coherence.

Note: For Coherence licensing information, refer to "Oracle Coherence" in Licensing Information.

Task 12 Configuring a New Machine
Use the Machines screen to create a new machine in the domain. A machine is required in order for the Node Manager to be able to start and stop the servers.

Tip: If you plan to create a high availability environment and know the list of machines required for your target topology, you can follow the directions in this section to create all of the machines at this time. For more information, see "Optional Scale Out Procedure" in High Availability Guide.

1. Click the Add button to create a new machine.
2. Specify `wls_machine_1` in the Name field.
3. In the Node Manager Listen Address field, select the IP address of the machine where the Managed Servers are being configured.
   You must select a specific interface and not "localhost." This allows Coherence cluster addresses to be dynamically calculated.
4. Verify the port in the Node Manager Listen Port field.
   The port number 5556, shown in this example, may be referenced by other examples in the documentation. Replace this port number with your own port number as needed.
Task 13 Assigning Servers to Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, wls_machine_1.
2. In the Servers pane, assign AdminServer to wls_machine_1 by doing one of the following:
   - Click once on AdminServer to select it, then click on the right arrow to move it beneath the selected machine (wls_machine_1) in the Machines pane.
   - Double-click on AdminServer to move it beneath the selected machine (wls_machine_1) in the Machines pane.
3. Repeat to assign both wls_server_1 and wls_server_2 to wls_machine_1.

Tip: More information about the options on this screen can be found in Machines in Creating Domains Using the Configuration Wizard.

If you plan to create a high availability environment and know the list of machines required for your target topology, you can create all of the machines at this time. For more information, see Task 13 Assigning Servers to Machines in Creating Domains Using the Configuration Wizard.

Task 14 Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen contains the detailed configuration information for the domain you are about to create. Review the details of each item on the screen and verify that the information is correct.
You can go back to any previous screen if you need to make any changes, either by using the Back button or by selecting the screen in the navigation pane.

Domain creation will not begin until you click Create.

**Tip:** More information about the options on this screen can be found in Configuration Summary in *Creating Domains Using the Configuration Wizard*.

**Task 15 Writing Down Your Domain Home and Administration Server URL**

The Configuration Success screen will show the following items about the domain you just configured:

- Domain Location
- Administration Server URL

You must make a note of both items as you will need them to start the servers and access the Administration Server.

Click **Finish** to dismiss the configuration wizard.

---

**3.2 Starting the Servers**

After configuration is complete, in order to access the tools with which you can manage your domain, you must do the following:

- **Section 3.2.1, "Starting the Node Manager"
- **Section 3.2.2, "Starting the Administration Server"
- **Section 3.2.3, "Starting the Managed Servers"

**3.2.1 Starting the Node Manager**

To start your per-domain Node Manager, go to the `DOMAIN_HOME/bin` directory.

On UNIX operating systems, start Node Manager as shown below, using `nohup` and `nm.out` as an example output file:

```
nohup ./startNodeManager.sh > nm.out &
```

On Windows operating systems, run:

```
startNodeManager.cmd
```
Starting the Servers

3.2.2 Starting the Administration Server

To start the Administration Server, go to the \texttt{DOMAIN_HOME}/bin directory.

On UNIX operating systems, run:

```
./startWebLogic.sh
```

On Windows operating systems, run:

```
startWebLogic.cmd
```

If you selected \textbf{Production Mode} on the Domain Mode and JDK screen in \textbf{Task 4}, you will be prompted for the login credentials of the Administrator user as provided on the Administrator Account screen in \textbf{Task 3}.

\textbf{Tip:} For more information about starting the Administration Server, see "Starting and Stopping Administration Servers" in \textit{Administering Oracle Fusion Middleware}.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see "Creating a Boot Identity File for an Administration Server" in \textit{Administering Server Startup and Shutdown for Oracle WebLogic Server}.

3.2.3 Starting the Managed Servers

To start the Managed Servers, go to the \texttt{DOMAIN_HOME}/bin directory and run the following command:

On UNIX operating systems:

```
./startManagedWebLogic.sh managed_server_name admin_server_url
```

On Windows operating systems:

```
startManagedWebLogic.cmd managed_server_name admin_server_url
```

Replace \texttt{managed_server_name} with the names of the Managed Server you want to start. For this topology, the Managed Server names are \texttt{wls_server_1} and \texttt{wls_server_2}, as defined on the Managed Server screen in \textbf{Task 8}. You need to run this command twice; once for each Managed Server.

Replace \texttt{admin_server_url} with the full URL of the Administration Server, as provided on the Configuration Success screen in \textbf{Task 14}.

Below are sample commands used to start \texttt{wls_server_1} and \texttt{wls_server_2} on UNIX operating systems:

```
./startManagedWebLogic.sh wls_server_1 t3:\examplehost.exampledomain.com:7001 &
./startManagedWebLogic.sh wls_server_2 t3:\examplehost.exampledomain.com:7001 &
```

\textbf{Note:} It is recommended that you install Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

For more information, see "Running Node Manager as a Startup Service" in \textit{Administering Node Manager for Oracle WebLogic Server}.

\textbf{Tip:} For more information about starting the Administration Server, see "Starting and Stopping Administration Servers" in \textit{Administering Oracle Fusion Middleware}.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see "Creating a Boot Identity File for an Administration Server" in \textit{Administering Server Startup and Shutdown for Oracle WebLogic Server}.
3.3 Verifying Your Configuration

To verify that your domain is configured properly, see Section 4.1. You should familiarize yourself with the tasks described in this section and perform them to verify that your domain is properly configured.

**Tip:** For more information about starting Managed Servers, see "Starting and Stopping Managed Servers" in *Administering Oracle Fusion Middleware*. 
Next Steps After Configuring a WebLogic Server Domain

This chapter describes common tasks you might want to perform on a newly created WebLogic Server domain.

The following sections are included:

- Section 4.1, "Performing Basic Administrative Tasks"
- Section 4.2, "Performing Additional Domain Configuration Tasks"
- Section 4.3, "Preparing Your Environment For High Availability"

4.1 Performing Basic Administrative Tasks

Table 4–1 lists some common administration tasks you will likely want to perform on your newly created domain.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Getting familiar with Fusion Middleware</td>
<td>Get familiar with the various tools available which you can use to manage your environment.</td>

</table>
Deinstalling Oracle WebLogic Server and Coherence

This chapter describes how to deinstall and reinstall Oracle WebLogic Server and Coherence.

You should always use the instructions provided in this chapter for removing the software. If you try to remove the software manually, you may experience problems when you try to reinstall the software again at a later time. Following the procedures in this chapter will ensure that the software is properly removed.

This chapter includes the following sections:

- Section 5.1, "Understanding Product Deinstallation"
- Section 5.2, "Stopping Oracle Fusion Middleware"
- Section 5.3, "Deinstalling the Software"
- Section 5.4, "Removing the Oracle Home Directory Manually"
- Section 5.5, "Removing Your Domain and Application Data"
- Section 5.6, "Reinstalling Your Software"

### 5.1 Understanding Product Deinstallation

The Oracle Fusion Middleware deinstaller removes software from the Oracle home directory from which it is started. Table 5–1 summarizes the procedure and provides links to supporting documentation.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description and Documentation</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop Oracle Fusion Middleware.</td>
<td>All servers and processes in your domain should be stopped before running the deinstaller.</td>
<td>See Section 5.2.</td>
</tr>
<tr>
<td>Remove the software.</td>
<td>Run the product deinstaller to remove Oracle WebLogic Server and Coherence.</td>
<td>See Section 5.3.</td>
</tr>
<tr>
<td>Remove the Oracle home directory.</td>
<td>The deinstaller does not remove all files and folders from the Oracle home directory. After the deinstaller is finished, you must manually remove the Oracle home to complete your product removal.</td>
<td>See Section 5.4.</td>
</tr>
<tr>
<td>Remove your domain and application data.</td>
<td>The deinstaller does not remove data contained in your Domain home or Application home directories, even if they are located inside the Oracle home. You must remove these directories manually.</td>
<td>See Section 5.5.</td>
</tr>
</tbody>
</table>
Not all files and directories in the Oracle home are removed by the deinstaller.

The deinstaller does not remove the JDK or any user-created data such as WebLogic domains or custom application data. Only the components that were installed by the installation program are removed by the deinstaller.

5.2 Stopping Oracle Fusion Middleware

Before running the deinstaller, you should stop all servers and processes associated with the Oracle home you are going to remove.

For more information, see "Stopping an Oracle Fusion Middleware Environment" in Administering Oracle Fusion Middleware.

5.3 Deinstalling the Software

Follow the instructions in this section to start the product deinstaller and remove the software.

- Section 5.3.1, "Starting the Deinstallation Program"
- Section 5.3.2, "Navigating the Deinstallation Screens"

If you want to perform a silent (command-line) deinstallation, see "Running the Oracle Universal Installer for Silent Deinstallation" in Installing Software with the Oracle Universal Installer.

5.3.1 Starting the Deinstallation Program

To start the deinstaller on a Windows operating system, do one of the following:

1. Use a file manager window to go to the ORACLE_HOME\oui\bin directory and double click on deinstall.cmd.
2. From the command line, go to the ORACLE_HOME\oui\bin and enter the following command:
   deinstall.cmd
3. From the Start menu, select All Programs, then select Oracle, then select OracleHome, then select Uninstall Oracle Middleware.

To start the deinstaller on a UNIX operating system, go to the ORACLE_HOME/oui/bin directory and enter the following command:

```
./deinstall.sh
```

5.3.2 Navigating the Deinstallation Screens

The deinstallation program displays a series of screens, in the order listed in Table 5–2.

If you need additional help with any of the deinstallation screens, click the screen name.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>This screen introduces you to the product deinstaller.</td>
</tr>
</tbody>
</table>
5.4 Removing the Oracle Home Directory Manually

After the deinstaller is finished, you must manually remove your Oracle home directory and any existing sub-directories that were not removed by the deinstaller. For example, if your Oracle home directory was /home/Oracle/products/Oracle_Home on a UNIX operating system:

> cd /home/Oracle/products
> rm -rf Oracle_Home

On a Windows operating system, if your Oracle home directory was C:\Oracle\Products\Oracle_Home, use a file manager window and navigate to the C:\Oracle\Products directory, then right-click on the Oracle_Home folder and select Delete.

5.5 Removing Your Domain and Application Data

To remove your domain and application data:

1. Manually remove your Domain home directory.
   For example, if your Domain home directory was /home/Oracle/config/domains/infra_domain on a UNIX operating system:
   > cd /home/Oracle/config/domains
   > rm -rf infra_domain

   On a Windows operating system, if your Domain home directory was C:\Oracle\Config\domains\infra_domain, use a file manager window and navigate to the C:\Oracle\Config\domains directory, then right-click on the infra_domain folder and select Delete.

2. Manually remove your Application home directory.
   For example, if your Application home directory was /home/Oracle/config/applications/infra_domain on a UNIX operating system:
   > cd /home/Oracle/config/applications
   > rm -rf infra_domain

   On a Windows operating system, if your Application home directory was C:\Oracle\Config\applications\infra_domain, use a file manager window and navigate to the C:\Oracle\Config\applications directory, then right-click on the infra_domain folder and select Delete.
3. Backup the `domain_registry.xml` file in your Oracle home, then edit the file and remove the line associated with the domain you are removing. For example, to remove the `infra_domain`, find the following line and remove it:

```xml
<domain location="/home/Oracle/config/domains/infra_domain"/>
```

Save and exit the file when you are finished.

### 5.6 Reinstalling Your Software

You can reinstall your software into the same Oracle home as a previous installation only if you have deinstalled the software according to the instructions in this chapter, including manually removing the Oracle home directory. When you reinstall, you can then specify the same Oracle home as your previous installation.

Consider the following cases where the Oracle home is not empty:

- **Installing in an existing Oracle home that contains the same feature sets.**

  The installer will warn you that the Oracle home you specified during the installation already contains the same software you are trying to install. Your options are to:
  
  a. Select a different installation type. In this case, only the feature sets that do not already exist in the Oracle home directory will be installed.
  
  b. Select a different Oracle home directory.

- **Installing in an existing, non-empty Oracle home.**

  For example, suppose that you have chosen to create your Domain home or Application home somewhere inside your existing Oracle home. This data is not removed during the deinstallation process, so if you attempt to reinstall into the same Oracle home, the installer will not allow it. Your options are to:

  a. Deinstall your software from the Oracle home as described in this chapter, and then remove the Oracle home directory. After this is complete, you can reinstall and reuse the same Oracle home location, using the instructions in Chapter 2. Any domain or application data that was in the Oracle home will have to be re-created.

  b. Select a different Oracle home directory.
This appendix describes the contents of the Oracle WebLogic Server and Coherence distribution (wls_121200.jar).

The products and feature sets included with this distribution are described in Table A–1.

**Note:** Oracle WebLogic Server is also available with the Oracle Fusion Middleware Infrastructure distribution (fmw_infra_121200.jar). See "Understanding the Oracle Fusion Middleware Infrastructure Distribution" in *Installing and Configuring the Oracle Fusion Middleware Infrastructure*. 
<table>
<thead>
<tr>
<th>Product</th>

</tbody>
</table>
This appendix describes the directory structure that will be created on your system at the end of your Oracle WebLogic Server and Coherence installation and domain configuration.

The directory structure is illustrated in Figure B–1.

Note that this example shows the recommended directory structure, as described in "Understanding the Recommended Directory Structure" in Planning an Installation of Oracle Fusion Middleware. Your directory structure may differ slightly based on where you choose to create these directories on your system.
The Domain home, Application home, and contents of the Oracle home directories are described in more detail in Table B–1.

**Table B–1 Directory Description for the WebLogic Server and Coherence Oracle Home**
