Oracle Text Reference, Release 9.0.1

Part No. A90121-01

Copyright © 1996, 2001, Oracle Corporation. All rights reserved.

Primary Author: Colin McGregor

Contributors: Omar Alonso, Shamim Alpha, Steve Buxton, Chung-Ho Chen, Yun Cheng, Michele Cyran, Paul Dixon, Mohammad Faisal, Elena Huang, Garret Kaminaga, Ji Sun Kang, Bryn Llewellyn, Wesley Lin, Yasuhiro Matsuda, Gerda Shank, and Steve Yang.

The Programs (which include both the software and documentation) contain proprietary information of Oracle Corporation; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. Oracle Corporation does not warrant that this document is error free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of Oracle Corporation.

If the Programs are delivered to the U.S. Government or anyone licensing or using the programs on behalf of the U.S. Government, the following notice is applicable:

**Restricted Rights Notice** Programs delivered subject to the DOD FAR Supplement are "commercial computer software" and use, duplication, and disclosure of the Programs, including documentation, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement. Otherwise, Programs delivered subject to the Federal Acquisition Regulations are "restricted computer software" and use, duplication, and disclosure of the Programs shall be subject to the restrictions in FAR 52.227-19, Commercial Computer Software - Restricted Rights (June, 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy, and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and Oracle Corporation disclaims liability for any damages caused by such use of the Programs.

Oracle is a registered trademark, and ConText, Oracle Text, Oracle8, Oracle8i, Oracle9i, Oracle Call Interface, PL/SQL, SQL\*Plus, and SQL\*Loader are trademarks or registered trademarks of Oracle Corporation. Other names may be trademarks of their respective owners.

<b>Send Us Your Comments .....</b>	<b>xv</b>
<b>Preface.....</b>	<b>xvii</b>
<b>What's New in Oracle Text? .....</b>	<b>xxv</b>
<b>1 SQL Statements and Operators</b>	
<b>ALTER INDEX .....</b>	<b>1-2</b>
<b>CATSEARCH .....</b>	<b>1-13</b>
<b>CONTAINS.....</b>	<b>1-18</b>
<b>CREATE INDEX.....</b>	<b>1-21</b>
<b>DROP INDEX .....</b>	<b>1-36</b>
<b>MATCHES .....</b>	<b>1-37</b>
<b>SCORE .....</b>	<b>1-38</b>
<b>2 Indexing</b>	
<b>Overview .....</b>	<b>2-2</b>
Creating Preferences .....	2-2
<b>Datastore Types .....</b>	<b>2-3</b>
DIRECT_DATASTORE .....	2-3
MULTI_COLUMN_DATASTORE.....	2-4
DETAIL_DATASTORE .....	2-8
FILE_DATASTORE.....	2-11
URL_DATASTORE .....	2-12

USER_DATASTORE .....	2-16
NESTED_DATASTORE .....	2-20
<b>Filter Types</b> .....	2-23
CHARSET_FILTER .....	2-24
INSO_FILTER .....	2-26
NULL_FILTER .....	2-30
USER_FILTER .....	2-31
PROCEDURE_FILTER .....	2-32
<b>Lexer Types</b> .....	2-37
BASIC_LEXER .....	2-38
MULTI_LEXER .....	2-46
CHINESE_VGRAM_LEXER .....	2-47
JAPANESE_VGRAM_LEXER .....	2-48
JAPANESE_LEXER .....	2-48
KOREAN_LEXER .....	2-49
KOREAN_MORPH_LEXER .....	2-50
<b>Wordlist Type</b> .....	2-55
BASIC_WORDLIST .....	2-55
BASIC_WORDLIST Example .....	2-59
<b>Storage Types</b> .....	2-62
BASIC_STORAGE .....	2-62
<b>Section Group Types</b> .....	2-65
Section Group Examples .....	2-66
<b>Stoplists</b> .....	2-68
Multi-Language Stoplists .....	2-68
Creating Stoplists .....	2-68
Modifying the Default Stoplist .....	2-68
<b>System-Defined Preferences</b> .....	2-70
Data Storage .....	2-70
Filter .....	2-71
Lexer .....	2-71
Section Group .....	2-72
Stoplist .....	2-73
Storage .....	2-73
Wordlist .....	2-73

<b>System Parameters</b> .....	2-74
General System Parameters .....	2-74
Default Index Parameters.....	2-75

### 3 CONTAINS Query Operators

<b>Operator Precedence</b> .....	3-3
Group 1 Operators.....	3-3
Group 2 Operators and Characters.....	3-3
Procedural Operators.....	3-4
Precedence Examples .....	3-4
Altering Precedence .....	3-5
<b>ABOUT</b> .....	3-6
<b>ACCUMulate ( , )</b> .....	3-9
<b>AND (&amp;)</b> .....	3-11
<b>Broader Term (BT, BTG, BTP, BTI)</b> .....	3-12
<b>EQUIValence (=)</b> .....	3-15
<b>Fuzzy</b> .....	3-16
<b>HASPATH</b> .....	3-18
<b>INPATH</b> .....	3-20
<b>MINUS (-)</b> .....	3-27
<b>Narrower Term (NT, NTG, NTP, NTI)</b> .....	3-28
<b>NEAR (;)</b> .....	3-31
<b>NOT (~)</b> .....	3-35
<b>OR ( )</b> .....	3-36
<b>Preferred Term (PT)</b> .....	3-37
<b>Related Term (RT)</b> .....	3-38
<b>soundex (!)</b> .....	3-39
<b>stem (\$)</b> .....	3-40
<b>Stored Query Expression (SQE)</b> .....	3-41
<b>SYNonym (SYN)</b> .....	3-42
<b>threshold (&gt;)</b> .....	3-44
<b>Translation Term (TR)</b> .....	3-45
<b>Translation Term Synonym (TRSYN)</b> .....	3-47
<b>Top Term (TT)</b> .....	3-49
<b>weight (*)</b> .....	3-50

<b>wildcards (% _)</b> .....	3-52
Right-Truncated Queries .....	3-52
Left- and Double-Truncated Queries .....	3-52
Improving Wildcard Query Performance .....	3-53
<b>WITHIN</b> .....	3-54

## 4 Special Characters in Queries

<b>Grouping Characters</b> .....	4-2
<b>Escape Characters</b> .....	4-3
Querying Escape Characters .....	4-3
<b>Reserved Words and Characters</b> .....	4-4

## 5 CTX\_ADM Package

<b>RECOVER</b> .....	5-2
<b>SET_PARAMETER</b> .....	5-3
<b>SHUTDOWN</b> .....	5-5

## 6 CTX\_DDL Package

<b>ADD_ATTR_SECTION</b> .....	6-3
<b>ADD_FIELD_SECTION</b> .....	6-5
<b>ADD_INDEX</b> .....	6-9
<b>ADD_SPECIAL_SECTION</b> .....	6-11
<b>ADD_STOPCLASS</b> .....	6-13
<b>ADD_STOP_SECTION</b> .....	6-14
<b>ADD_STOPTHEME</b> .....	6-16
<b>ADD_STOPWORD</b> .....	6-17
<b>ADD_SUB_LEXER</b> .....	6-19
<b>ADD_ZONE_SECTION</b> .....	6-22
<b>CREATE_INDEX_SET</b> .....	6-26
<b>CREATE_PREFERENCE</b> .....	6-27
<b>CREATE_SECTION_GROUP</b> .....	6-30
<b>CREATE_STOPLIST</b> .....	6-33
<b>DROP_INDEX_SET</b> .....	6-35
<b>DROP_PREFERENCE</b> .....	6-36

<b>DROP_SECTION_GROUP .....</b>	<b>6-37</b>
<b>DROP_STOPLIST .....</b>	<b>6-38</b>
<b>OPTIMIZE_INDEX .....</b>	<b>6-39</b>
<b>REMOVE_INDEX.....</b>	<b>6-42</b>
<b>REMOVE_SECTION .....</b>	<b>6-43</b>
<b>REMOVE_STOPCLASS .....</b>	<b>6-45</b>
<b>REMOVE_STOPTHEME .....</b>	<b>6-46</b>
<b>REMOVE_STOPWORD .....</b>	<b>6-47</b>
<b>SET_ATTRIBUTE .....</b>	<b>6-48</b>
<b>SYNC_INDEX.....</b>	<b>6-49</b>
<b>UNSET_ATTRIBUTE .....</b>	<b>6-51</b>

## **7 CTX\_DOC Package**

<b>FILTER .....</b>	<b>7-2</b>
<b>GIST .....</b>	<b>7-5</b>
<b>HIGHLIGHT .....</b>	<b>7-10</b>
<b>IFILTER.....</b>	<b>7-13</b>
<b>MARKUP .....</b>	<b>7-14</b>
<b>PKENCODE .....</b>	<b>7-20</b>
<b>SET_KEY_TYPE .....</b>	<b>7-22</b>
<b>THEMES .....</b>	<b>7-23</b>
<b>TOKENS .....</b>	<b>7-26</b>

## **8 CTX\_OUTPUT Package**

<b>ADD_EVENT.....</b>	<b>8-2</b>
<b>END_LOG .....</b>	<b>8-3</b>
<b>LOGFILENAME.....</b>	<b>8-4</b>
<b>REMOVE_EVENT .....</b>	<b>8-5</b>
<b>START_LOG .....</b>	<b>8-6</b>

## **9 CTX\_QUERY Package**

<b>BROWSE_WORDS.....</b>	<b>9-2</b>
<b>COUNT_HITS .....</b>	<b>9-5</b>
<b>EXPLAIN .....</b>	<b>9-6</b>

HFEEDBACK .....	9-9
REMOVE_SQE .....	9-14
STORE_SQE .....	9-15

## 10 CTX\_THES Package

ALTER_PHRASE .....	10-3
ALTER_THESAURUS .....	10-5
BT .....	10-7
BTG .....	10-10
BTI .....	10-12
BTP .....	10-14
CREATE_PHRASE .....	10-16
CREATE_RELATION .....	10-18
CREATE_THESAURUS .....	10-20
CREATE_TRANSLATION .....	10-21
DROP_PHRASE .....	10-22
DROP_RELATION .....	10-24
DROP_THESAURUS .....	10-27
DROP_TRANSLATION .....	10-28
HAS_RELATION .....	10-29
NT .....	10-30
NTG .....	10-33
NTI .....	10-35
NTP .....	10-37
OUTPUT_STYLE .....	10-39
PT .....	10-40
RT .....	10-42
SN .....	10-44
SYN .....	10-45
THES_TT .....	10-48
TR .....	10-49
TRSYN .....	10-51
TT .....	10-53
UPDATE_TRANSLATION .....	10-55

## 11 Executables

<b>Thesaurus Loader (ctxload)</b> .....	11-2
Text Loading.....	11-2
ctxload Syntax .....	11-2
ctxload Examples .....	11-5
<b>Knowledge Base Extension Compiler (ctxkbtc)</b> .....	11-6
ctxkbtc Syntax .....	11-6
ctxkbtc Usage Notes .....	11-7
ctxkbtc Limitations .....	11-8
ctxkbtc Constraints on Thesaurus Terms.....	11-8
ctxkbtc Constraints on Thesaurus Relations.....	11-8
Extending the Knowledge Base .....	11-9
Adding a Language-Specific Knowledge Base .....	11-10
Order of Precedence for Multiple Thesauri.....	11-11
Size Limits for Extended Knowledge Base .....	11-12

## A Result Tables

<b>CTX_QUERY Result Tables</b> .....	A-2
EXPLAIN Table.....	A-2
HFEEDBACK Table.....	A-5
<b>CTX_DOC Result Tables</b> .....	A-8
Filter Table .....	A-8
Gist Table .....	A-8
Highlight Table .....	A-10
Markup Table.....	A-10
Theme Table .....	A-11
Token Table .....	A-11
<b>CTX_THES Result Tables and Data Types</b> .....	A-12
EXP_TAB Table Type.....	A-12

## B Supported Document Formats

<b>About Inso Filtering Technology</b> .....	B-2
Supported Platforms .....	B-2
Environment Variable Location .....	B-3

Requirements for UNIX Platforms .....	B-3
OLE2 Object Support.....	B-4
<b>Supported Document Formats .....</b>	<b>B-5</b>
Word Processing - Generic .....	B-5
Word Processing - DOS .....	B-5
Word Processing - International.....	B-7
Word Processing - Windows.....	B-7
Word Processing - Macintosh .....	B-8
Spreadsheets Formats .....	B-8
Databases Formats .....	B-9
Display Formats .....	B-10
Presentation Formats.....	B-10
Standard Graphic Formats .....	B-11
Other .....	B-12
<b>Unsupported Formats.....</b>	<b>B-14</b>

## C Loading Examples

<b>SQL INSERT Example .....</b>	<b>C-2</b>
<b>SQL*Loader Example .....</b>	<b>C-3</b>
Creating the Table.....	C-3
Issuing the SQL*Loader Command .....	C-3
<b>Structure of ctxload Thesaurus Import File .....</b>	<b>C-6</b>
Alternate Hierarchy Structure .....	C-8
Usage Notes for Terms in Import Files.....	C-9
Usage Notes for Relationships in Import Files.....	C-10
Examples of Import Files.....	C-11

## D Supplied Stoplists

<b>English Default Stoplist .....</b>	<b>D-2</b>
<b>Danish (dk) Default Stoplist .....</b>	<b>D-3</b>
<b>Dutch (nl) Default Stoplist.....</b>	<b>D-4</b>
<b>Finnish (sf) Default Stoplist .....</b>	<b>D-5</b>
<b>French (f) Default Stoplist.....</b>	<b>D-6</b>
<b>German (d) Default Stoplist .....</b>	<b>D-7</b>
<b>Italian (i) Default Stoplist .....</b>	<b>D-8</b>

Portuguese (pt) Default Stoplist .....	D-9
Spanish (e) Default Stoplist.....	D-10
Swedish (s) Default Stoplist.....	D-11

## E    Alternate Spelling Conventions

Overview .....	E-2
Enabling Alternate Spelling .....	E-2
Disabling Alternate Spelling.....	E-2
German Alternate Spelling.....	E-3
Danish Alternate Spelling .....	E-4
Swedish Alternate Spelling.....	E-5

## F    Scoring Algorithm

Scoring Algorithm for Word Queries .....	F-2
Example.....	F-3
DML and Scoring.....	F-3

## G    Views

CTX_CLASSES .....	G-4
CTX_INDEXES .....	G-4
CTX_INDEX_ERRORS .....	G-5
CTX_INDEX_OBJECTS .....	G-5
CTX_INDEX_PARTITIONS .....	G-6
CTX_INDEX_SETS .....	G-6
CTX_INDEX_SET_INDEXES .....	G-7
CTX_INDEX_SUB_LEXERS .....	G-7
CTX_INDEX_SUB_LEXER_VALUES .....	G-8
CTX_INDEX_VALUES.....	G-9
CTX_OBJECTS .....	G-9
CTX_OBJECT_ATTRIBUTES.....	G-10
CTX_OBJECT_ATTRIBUTE_LOV .....	G-10
CTX_PARAMETERS .....	G-11
CTX_PENDING .....	G-13
CTX_PREFERENCES .....	G-13

CTX_PREFERENCE_VALUES .....	G-14
CTX_SECTIONS .....	G-14
CTX_SECTION_GROUPS .....	G-15
CTX_SERVERS .....	G-15
CTX_SQES .....	G-16
CTX_STOPLISTS .....	G-16
CTX_STOPWORDS .....	G-16
CTX_SUB_LEXERS .....	G-17
CTX_THESAURI .....	G-17
CTX_THES_PHRASES .....	G-17
CTX_USER_INDEXES .....	G-18
CTX_USER_INDEX_ERRORS .....	G-19
CTX_USER_INDEX_OBJECTS .....	G-19
CTX_USER_INDEX_PARTITIONS .....	G-20
CTX_USER_INDEX_SETS .....	G-20
CTX_USER_INDEX_SET_INDEXES .....	G-20
CTX_USER_INDEX_SUB_LEXERS .....	G-21
CTX_USER_INDEX_SUB_LEXER_VALS .....	G-21
CTX_USER_INDEX_VALUES .....	G-22
CTX_USER_PENDING .....	G-22
CTX_USER_PREFERENCES .....	G-22
CTX_USER_PREFERENCE_VALUES .....	G-23
CTX_USER_SECTIONS .....	G-23
CTX_USER_SECTION_GROUPS .....	G-23
CTX_USER_SQES .....	G-24
CTX_USER_STOPLISTS .....	G-24
CTX_USER_STOPWORDS .....	G-24
CTX_USER_SUB_LEXERS .....	G-25
CTX_USER_THESAURI .....	G-25
CTX_USER_THES_PHRASES .....	G-25
CTX_VERSION .....	G-26

## H Stopword Transformations

Understanding Stopword Transformations .....	H-2
Word Transformations .....	H-3

AND Transformations .....	H-3
OR Transformations .....	H-3
ACCUMulate Transformations .....	H-4
MINUS Transformations .....	H-5
NOT Transformations.....	H-5
EQUIValence Transformations .....	H-6
NEAR Transformations .....	H-6
Weight Transformations .....	H-7
Threshold Transformations .....	H-7
WITHIN Transformations .....	H-7

## I English Knowledge Base Category Hierarchy

<b>Branch 1: science and technology .....</b>	<b>I-2</b>
<b>Branch 2: business and economics .....</b>	<b>I-8</b>
<b>Branch 3: government and military.....</b>	<b>I-9</b>
<b>Branch 4: social environment .....</b>	<b>I-10</b>
<b>Branch 5: geography.....</b>	<b>I-14</b>
<b>Branch 6: abstract ideas and concepts .....</b>	<b>I-17</b>

# Send Us Your Comments

**Oracle Text Reference, Release 9.0.1**

**Part No. A90121-01**

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this document. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most?

If you find any errors or have any other suggestions for improvement, please indicate the document title and part number, and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- Electronic mail: [infodev\\_us@oracle.com](mailto:infodev_us@oracle.com)
- FAX: (650) 506-7227 Attn: Server Technologies Documentation Manager
- Postal service:  
Oracle Corporation  
Server Technologies Documentation  
500 Oracle Parkway, Mailstop 40p11  
Redwood Shores, CA 94065  
USA

If you would like a reply, please give your name, address, telephone number, and (optionally) electronic mail address.

If you have problems with the software, please contact your local Oracle Support Services.

---

# Preface

This manual provides reference information for Oracle Text. Use it as a reference for creating Oracle Text indexes, for issuing Oracle Text queries, for presenting documents, and for using the Oracle Text PL/SQL packages.

This preface contains these topics:

- [Audience](#)
- [Organization](#)
- [Related Documentation](#)
- [Conventions](#)
- [Documentation Accessibility](#)

## Audience

Oracle Text Reference is intended for an Oracle Text application developer or a system administrator responsible for maintaining the Oracle Text system.

To use this document, you need experience with the Oracle relational database management system, SQL, SQL\*Plus, and PL/SQL. See the documentation provided with your hardware and software for additional information.

If you are unfamiliar with the Oracle RDBMS and related tools, read Chapter 1, “An Introduction to the Oracle Server”, in *Oracle9i Concepts*. The chapter is a comprehensive introduction to the concepts and terminology used throughout Oracle documentation.

## Organization

This document contains:

### **Chapter 1, "SQL Statements and Operators"**

This chapter describes the SQL statements and operators you can use with Oracle Text.

### **Chapter 2, "Indexing"**

This chapter describes the indexing types you can use to create an Oracle Text index.

### **Chapter 3, "CONTAINS Query Operators"**

This chapter describes the operators you can use in CONTAINS queries.

### **Chapter 4, "Special Characters in Queries"**

This chapter describes the special characters you can use in CONTAINS queries.

### **Chapter 5, "CTX\_ADM Package"**

This chapter describes the procedures in the CTX\_ADM PL/SQL package.

### **Chapter 6, "CTX\_DDL Package"**

This chapter describes the procedures in the CTX\_DDL PL/SQL package. Use this package for maintaining your index.

### **Chapter 7, "CTX\_DOC Package"**

This chapter describes the procedures in the CTX\_DOC PL/SQL package. Use this package for document services such as document presentation.

### **Chapter 8, "CTX\_OUTPUT Package"**

This chapter describes the procedures in the CTX\_OUTPUT PL/SQL package. Use this package to manage your index error log files.

### **Chapter 9, "CTX\_QUERY Package"**

This chapter describes the procedures in the CTX\_QUERY PL/SQL package. Use this package to manage queries such as to count hits and to generate query explain plan information.

### **Chapter 10, "CTX\_THES Package"**

This chapter describes the procedures in the CTX\_THES PL/SQL package. Use this package to manage your thesaurus.

### **Chapter 11, "Executables"**

This chapter describes the supplied executables for Oracle Text including ctxload, the thesaurus loading program, and ctxkbt, the knowledge base compiler.

### **Appendix A, "Result Tables"**

This appendix describes the result tables for some of the procedures in CTX\_DOC, CTX\_QUERY, and CTX\_THES packages.

### **Appendix B, "Supported Document Formats"**

This appendix describes the supported document formats that can be filtered with the Inso filter for indexing.

### **Appendix C, "Loading Examples"**

This appendix provides some basic examples for populating a text table.

### **Appendix D, "Supplied Stoplists"**

This appendix describes the supplied stoplist for each supported language.

### **Appendix E, "Alternate Spelling Conventions"**

This appendix describes the alternate spelling conventions used for German, Danish, and Swedish.

### **Appendix F, "Scoring Algorithm"**

This appendix describes the scoring algorithm used for word queries.

### **Appendix G, "Views"**

This appendix describes the Oracle Text views.

### **Appendix H, "Stopword Transformations"**

This appendix describes stopwords transformations.

### **Appendix I, "English Knowledge Base Category Hierarchy"**

This appendix describes the supplied English Knowledge Base.

## **Related Documentation**

In North America, printed documentation is available for sale in the Oracle Store at

<http://oraclestore.oracle.com/>

Customers in Europe, the Middle East, and Africa (EMEA) can purchase documentation from

<http://www.oraclebookshop.com/>

Other customers can contact their Oracle representative to purchase printed documentation.

To download free release notes, installation documentation, *Oracle Text* code samples, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

<http://technet.oracle.com/membership/index.htm>

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

<http://technet.oracle.com/docs/index.htm>

You can obtain Oracle Text technical information, collateral, code samples, training slides and other material at:

<http://technet.oracle.com/products/text/>

## Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- [Conventions in Text](#)
- [Conventions in Code Examples](#)

### Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
<b>Bold</b>	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	The C datatypes such as <b>ub4</b> , <b>sword</b> , or <b>OCINumber</b> are valid.  When you specify this clause, you create an <b>index-organized table</b> .

Convention	Meaning	Example
<i>Italics</i>	Italic typeface indicates query terms, book titles, emphasis, syntax clauses, or placeholders.	The following query searches for <i>oracle</i> .  <i>Oracle9i Concepts</i>  You can specify the <i>parallel_clause</i> .  Run <i>Uold_release</i> .SQL where <i>old_release</i> refers to the release you installed prior to upgrading.
UPPERCASE monospace (fixed-width font)	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, user names, and roles.	You can specify this clause only for a NUMBER column.  You can back up the database using the BACKUP command.  Query the TABLE_NAME column in the USER_TABLES data dictionary view.  Specify the ROLLBACK_SEGMENTS parameter.  Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width font)	Lowercase monospace typeface indicates executables and sample user-supplied elements. Such elements include computer and database names, net service names, and connect identifiers, as well as user-supplied database objects and structures, column names, packages and classes, user names and roles, program units, and parameter values.	Enter sqlplus to open SQL*Plus.  The department_id, department_name, and location_id columns are in the hr.departments table.  Set the QUERY_REWRITE_ENABLED initialization parameter to true.  Connect as oe user.

## Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL\*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[ ]	Brackets enclose one or more optional items. Do not enter the brackets.	DECIMAL (digits [ , precision ])

Convention	Meaning	Example
{ }	Braces enclose two or more items, one of which is required. Do not enter the braces.	{ENABLE   DISABLE}
	A vertical bar represents a choice of two or more options within brackets or braces. Enter one of the options. Do not enter the vertical bar.	{ENABLE   DISABLE} [COMPRESS   NOCOMPRESS]
...	Horizontal ellipsis points indicate either: <ul style="list-style-type: none"> <li>■ That we have omitted parts of the code that are not directly related to the example</li> <li>■ That you can repeat a portion of the code</li> </ul>	CREATE TABLE ... AS subquery;  SELECT col1, col2, ... , coln FROM employees;
.	Vertical ellipsis points indicate that we have omitted several lines of code not directly related to the example.	
Other notation	You must enter symbols other than brackets, braces, vertical bars, and ellipsis points as it is shown.	acctbal NUMBER(11,2); acct        CONSTANT NUMBER(4) := 3;
<i>Italics</i>	Italicized text indicates variables for which you must supply particular values.	CONNECT SYSTEM/ <i>system_password</i>
UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. However, because these terms are not case sensitive, you can enter them in lowercase.	SELECT last_name, employee_id FROM employees; SELECT * FROM USER_TABLES; DROP TABLE hr.employees;
lowercase	Lowercase typeface indicates programmatic elements that you supply. For example, lowercase indicates names of tables, columns, or files.	SELECT last_name, employee_id FROM employees; sqlplus hr/hr

## Documentation Accessibility

Oracle's goal is to make our products, services, and supporting documentation accessible to the disabled community with good usability. To that end, our

documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For additional information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

JAWS, a Windows screen reader, may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, JAWS may not always read a line of text that consists solely of a bracket or brace.

---

# What's New in Oracle Text?

This section describes new features of Oracle Text (formerly Oracle8i *interMedia* Text) and provides pointers to additional information. The following sections describe the new features in Oracle Text:

- [Release 9.0.1 New Features in Oracle Text](#)

## Release 9.0.1 New Features in Oracle Text

The following sections outline the new features in this release.

### ■ Document Classification

A document classification application is one that classifies an incoming stream of documents based on their content. These applications are also known as document routing or filtering applications. For example, an online news agency might need to classify its incoming stream of articles as they arrive into categories such as politics, crime, and sports.

Oracle Text enables you to build such applications with the new CTXRULE index type. This index type indexes the rules (queries) that define classifications or routing criteria. When documents arrive, the new [MATCHES](#) operator can be used to categorize and route each document.

---

---

**Note:** Oracle Text supports document classification for only plain text, XML, and HTML documents.

---

---

**See Also:** [CREATE INDEX](#) and [MATCHES](#) statements in [Chapter 1, "SQL Statements and Operators"](#).

*Oracle Text Application Developer's Guide* for more information about document classification.

### ■ Local Partitioned Index Support

You can create local partitioned indexes on partitioned text tables. To do so, use [CREATE INDEX](#) with the LOCAL PARTITION clause. You can also rebuild partitioned indexes with [ALTER INDEX](#).

**See Also:** [CREATE INDEX](#) and [ALTER INDEX](#) in [Chapter 1, "SQL Statements and Operators"](#).

### ■ IGNORE Format Column Value

The format column in your text table allows you to specify whether binary or text data is stored in the text column.

A new format column value of IGNORE is provided. When you issue the [CREATE INDEX](#) statement and specify a format column, any row whose format column is set to IGNORE is ignored during indexing. This feature is useful for

indexing text columns that contain data incompatible with text indexing such as images or raw binary data.

**See Also:** [CREATE INDEX](#) in [Chapter 1, "SQL Statements and Operators"](#).

#### ■ **USER\_DATASTORE Enhancement**

When you specify your user procedure for the USER\_DATASTORE, you can return permanent BLOB and CLOB locators for your IN/OUT parameter.

**See Also:** [USER\\_DATASTORE](#) in [Chapter 2, "Indexing"](#).

#### ■ **New Korean Lexer**

In this release, Oracle Text continues to support the indexing and querying of Korean text with a new Korean lexer, [KOREAN\\_MORPH\\_LEXER](#). The KOREAN\_MORPH\_LEXER lexer offers the following benefits over the KOREAN\_LEXER:

- better morphological analysis of Korean text
- faster indexing
- smaller indexes
- more accurate query searching

**See Also:** [KOREAN\\_MORPH\\_LEXER](#) in [Chapter 2, "Indexing"](#).

#### ■ **New Japanese Lexer**

In this release, Oracle Text continues to support the indexing and querying of Japanese text with a new Japanese lexer [JAPANESE\\_LEXER](#). This lexer offers the following benefits over the JAPANESE\_VGRAM\_LEXER:

- generates a smaller index
- better query response time
- generates real word tokens resulting in better query precision

**See Also:** [JAPANESE\\_LEXER](#) in [Chapter 2, "Indexing"](#).

- **XMLType Indexing**

Oracle Text supports the indexing of text columns of type XMLType.

---

---

**Note:** XMLType indexing is supported only for the context index type.

---

---

**See Also:** *Oracle Text Application Developer's Guide* for more information about XMLType indexing.

- **All Language Stopwords**

You can create a MULTI\_STOPLIST type stoplist that contains words that are to be stopped in more than one language. This new stopword type is called ALL. For example, you can use an ALL stopword when you need to index international documents that contain English fragments.

**See Also:** [ADD\\_STOPWORD](#) in [Chapter 6, "CTX\\_DDL Package"](#).

- **UTF-16 Auto-detection**

Oracle Text supports UTF-16 conversion to the database character set with the charset and Inso filters. These filters can convert documents that are UTF-16 big-endian (AL16UTF16) or little-endian (AL16UTF16LE).

Oracle Text also supports endian auto-detection when the character set column or charset filter is set to UTF16AUTO.

**See Also:** [CHARSET\\_FILTER](#) in [Chapter 2, "Indexing"](#).

- **INSO\_FILTER Timeout Attribute**

The [INSO\\_FILTER](#) document filter has a new *timeout* attribute that allows you to specify the maximum time Oracle waits for a document to be filtered during indexing. You can use this mechanism to avoid hanging during the index operation.

**See Also:** [INSO\\_FILTER](#) in [Chapter 2, "Indexing"](#).

- **XML Path Searching**

XML documents can have parent-child tag structures such as the following:

```
<A> <B> <C> dog </C> </B> </A>
```

In this example, tag C is a child of tag B which is a child of tag A.

Oracle Text now enables you to do path searching with the new PATH\_SECTION\_GROUP. This section group allows you to specify direct parentage in queries, such as to find all documents that contain the term *dog* in element C which is a child of element B and so on.

The new section group also allows you to do tag attribute value searching and attribute equality testing.

The new operators associated with this feature are

- [INPATH](#)
- [HASPETH](#)

**See Also:** [INPATH](#) and [HASPETH](#) operators in [Chapter 3, "CONTAINS Query Operators"](#).

*Oracle Text Application Developer's Guide* for more information about path section searching with XML documents.

- **CTX\_DDL Updated Procedures**

The following procedures in the CTX\_DDL PL/SQL package have been updated:

- [CTX\\_DDL.SYNC\\_INDEX](#)  
This procedure has two new parameters for specifying memory size and partition name.
- [CTX\\_DDL.SET\\_ATTRIBUTE](#)

**See Also:** [Chapter 6, "CTX\\_DDL Package"](#).

This procedure accepts ON/OFF boolean attributes in addition to TRUE, T, FALSE, F, YES, Y, NO, and N.

- **CTX\_DOC New Procedure**

- CTX\_DOC.[IFILTER](#)

**See Also:** [Chapter 7, "CTX\\_DOC Package"](#).

Use this procedure when you need your USER\_DATASTORE procedure to filter binary data to text before concatenation.

- **CTX\_OUTPUT New Procedures**

The CTX\_OUTPUT package has the following new procedures:

- CTX\_OUTPUT.[ADD\\_EVENT](#)
- CTX\_OUTPUT.[REMOVE\\_EVENT](#)

Use the first procedure to augment the index log file with rowid information, which is useful for debugging an index operation.

**See Also:** [Chapter 8, "CTX\\_OUTPUT Package"](#).

- **New and Updated Views**

The following views have been updated for this release:

- [CTX\\_VERSION](#)
- [CTX\\_PENDING](#)
- [CTX\\_USER\\_PENDING](#)

The CTX\_VERSION view has a new column VER\_CODE which is the version number of the Oracle Text code linked in to the Oracle shadow process. Use this column to detect and verify patch releases.

The following views are new. Use the first four for querying information about sub-lexers with multi-lexer preference:

- [CTX\\_INDEX\\_SUB\\_LEXERS](#)
- [CTX\\_USER\\_INDEX\\_SUB\\_LEXERS](#)
- [CTX\\_INDEX\\_SUB\\_LEXER\\_VALUES](#)
- [CTX\\_USER\\_INDEX\\_SUB\\_LEXER\\_VALS](#)
- [CTX\\_INDEX\\_PARTITIONS](#)
- [CTX\\_USER\\_INDEX\\_PARTITIONS](#)

- [CTX\\_INDEX\\_SETS](#)
- [CTX\\_USER\\_INDEX\\_SETS](#)
- [CTX\\_INDEX\\_SET\\_INDEXES](#)
- [CTX\\_USER\\_INDEX\\_SET\\_INDEXES](#)
- [CTX\\_THES\\_PHRASES](#)
- [CTX\\_USER\\_THES\\_PHRASES](#)

**See Also:** [Appendix G, "Views"](#).

---

# SQL Statements and Operators

This chapter describes the SQL statements and Oracle Text operators you use for creating and managing Text indexes and performing Text queries.

The following statements are described in this chapter:

- ALTER INDEX
- CATSEARCH
- CONTAINS
- CREATE INDEX
- CATSEARCH
- MATCHES
- SCORE

---

## ALTER INDEX

---

**Note:** This section describes the ALTER INDEX statement as it pertains to managing a Text domain index.

For a complete description of the ALTER INDEX statement, see *Oracle9i SQL Reference*.

---

### Purpose

Use ALTER INDEX to perform the following maintenance tasks for a context, ctxcat, or ctxrule index:

#### All Indextypes

- Rename the index or index partition. See [RENAME Syntax](#).
- Rebuild the index using different preferences. Some restrictions apply for the CTXCAT indextype. See [REBUILD Syntax](#).
- Add stopwords to the index. See [REBUILD Syntax](#).

#### CONTEXT and CTXRULE Indextypes

- Resume a failed index operation (creation/optimization). See [REBUILD Syntax](#).
- Process DML in batch (synchronize). See [REBUILD Syntax](#).
- Optimize the index, fully or by token. See [REBUILD Syntax](#).
- Add sections and stop sections to the index. See [REBUILD Syntax](#).

## RENAME Syntax

Use the following syntax to rename an index or index partition:

```
ALTER INDEX [schema.]index_name RENAME TO new_index_name;
```

```
ALTER INDEX [schema.]index_name RENAME PARTITION part_name TO new_part_name;
```

### **[schema.]index\_name**

Specify the name of the index to rename.

### **new\_index\_name**

Specify the new name for `schema.index`. The `new_index_name` parameter can be no more than 25 bytes. If you specify a name longer than 25 bytes, Oracle returns an error and the renamed index is no longer valid.

---

---

**Note:** When `new_index_name` is more than 25 bytes and less than 30 bytes, Oracle renames the index, even though the system returns an error. To drop the index and associated tables, you must DROP `new_index_name` with the DROP INDEX statement and then re-create and drop `index_name`.

---

---

### **part\_name**

Specify the name of the index partition to rename.

### **new\_part\_name**

Specify the new name for partition.

## REBUILD Syntax

The following syntax is used to rebuild the index, rebuild an index partition, resume a failed operation, perform batch DML, add stopwords to index, add sections and stop sections to index, or optimize the index:

```
ALTER INDEX [schema.] index REBUILD [PARTITION partname] [ONLINE] [PARAMETERS (paramstring)];
```

### **PARTITION *partname***

Rebuilds the index partition *partname*. Only one index partition can be built at a time.

When you rebuild a partition you can specify only *sync*, *optimize full/fast*, or *replace* in *paramstring*. These operations work only on the *partname* you specify.

**Adding Partitions** To add a partition to the base table use the ALTER TABLE SQL statement. When you add a partition to an indexed table, Oracle automatically creates the metadata for the new index partition. The new index partition has the same name as the new table partition. You can change the index partition name with ALTER INDEX RENAME. To populate the new index partition, you must rebuild it with ALTER INDEX REBUILD.

**Splitting or Merging Partitions** Splitting or merging a table partition with ALTER TABLE renders the index partition(s) invalid. You must rebuild them with ALTER INDEX REBUILD.

### **[ONLINE]**

Optionally specify the **ONLINE** parameter for nonblocking operation, which allows the index to be queried during an ALTER INDEX synchronize or optimize operation. You cannot specify **ONLINE** for replace, resume, or when adding stopwords or stop sections.

**PARAMETERS (paramstring)**

Optionally specify paramstring. If you do not specify paramstring, Oracle rebuilds the index with existing preference settings.

The syntax for paramstring is as follows:

```
paramstring =
    'REPLACE
      [datastore datastore_pref]
      [filter filter_pref]
      [lexer lexer_pref]
      [wordlist wordlist_pref]
      [storage storage_pref]
      [stoplist stoplist]
      [section group section_group]
      [memory memsize]
      [index set index_set]

      |
      resume [memory memsize]
      |
      optimize [token index_token | fast | full [maxtime (time | unlimited)]
      |
      sync [memory memsize]
      |
      add stopword word [language language]
      |
      add zone section section_name tag tag
      |
      add field section section_name tag tag [(VISIBLE | INVISIBLE)]
      |
      add attr section section_name tag tag@attr
      |
      add stop section tag'
```

**replace [optional\_preference\_list]**

Rebuilds an index. You can optionally specify preferences, your own or system-defined.

You can only replace preferences that are supported for that index type. For instance, you cannot replace index set for a context or ctxrule index. Similarly, for the ctxcat index type, you can replace only lexer, wordlist, storage index set, and memory preferences.

**See Also:** [Chapter 2, "Indexing"](#) for more information about creating and setting preferences, including information about system-defined preferences.

**resume** [**memory** *memsize*]

Resumes a failed index operation. You can optionally specify the amount of memory to use with *memsize*.

---

**Note:** This ALTER INDEX operation applies only to *context* and *ctxrule* indexes. It does not apply to *ctxcat* indexes.

---

**optimize** [**token** *index\_token* | **fast** | **full** [**maxtime** (*time* | **unlimited**)]

---

**Note:** This ALTER INDEX operation will not be supported in future releases.

To optimize your index, use CTX\_DDL.[OPTIMIZE\\_INDEX](#).

---

Optimizes the index. Specify *token*, *fast*, or *full* optimization. You typically optimize after you synchronize the index.

When you optimize in *token* mode, Oracle optimizes only the index *token index\_token* in *token* mode. Use this method of optimization to quickly optimize index information for specific words.

When you optimize in *fast* mode, Oracle works on the entire index, compacting fragmented rows. However, in *fast* mode, old data is not removed.

When you optimize in *full* mode, you can optimize the whole index or a portion. This method compacts rows and removes old data (deleted rows).

---

**Note:** Optimizing in *full* mode runs even when there are no deleted document rows. This is useful when you need to optimize time-limited batches with the *maxtime* parameter.

---

You use the *maxtime* parameter to specify in minutes the time Oracle is to spend on the optimization operation. Oracle starts the optimization where it left off and optimizes until complete or until the time limit has been reached, whichever comes first. Specifying a time limit is useful for automating index optimization, where you set Oracle to optimize the index for a specified time on a regular basis.

When you specify `maxtime unlimited`, the entire index is optimized. This is the default. When you specify `0` for `maxtime`, Oracle performs minimal optimization.

---

**Note:** This ALTER INDEX operation applies only to `context` and `ctxrule` indexes. It does not apply to `ctxcat` indexes.

---

#### **sync [memory *memsize*]**

---

**Note:** This ALTER INDEX operation will not be supported in future releases.

To synchronize your index, use [CTX\\_DDL.SYNC\\_INDEX](#).

---

Synchronizes the index. You can optionally specify the amount of runtime memory to use with `memsize`. You synchronize the index when you have DML operations on your base table.

---

**Note:** This ALTER INDEX operation applies only to `context` and `ctxrule` indexes. It does not apply to `ctxcat` indexes.

---

**Memory Considerations** The memory parameter `memsize` specifies the amount of memory Oracle uses for the ALTER INDEX operation before flushing the index to disk. Specifying a large amount of memory improves indexing performance because there is less I/O and improves query performance and maintenance because there is less fragmentation.

Specifying smaller amounts of memory increases disk I/O and index fragmentation, but might be useful if you want to track indexing progress or when run-time memory is scarce.

#### **add stopword *word* [language *language*]**

Dynamically adds a stopword `word` to the index.

When your stoplist is a multi-language stoplist, you must specify `language`.

The index is *not* rebuilt by this statement.

#### **add zone section *section\_name* tag *tag***

Dynamically adds the zone section `section_name` identified by `tag` to the existing index.

The added section `section_name` applies only to documents indexed after this operation. For the change to take effect, you must manually re-index any existing documents that contain the tag.

The index is *not* rebuilt by this statement.

---

---

**Note:** This ALTER INDEX operation applies only to CONTEXT and CTXRULE indexes. It does not apply to `ctxcat` indexes.

---

---

**See Also:** ["Add Section Constraints"](#) on page 1-9.

**add field section *section\_name* tag *tag* [(VISIBLE | INVISIBLE)]**

Dynamically adds the field section `section_name` identified by `tag` to the existing index.

Optionally specify VISIBLE to make the field sections visible. The default is INVISIBLE.

**See Also:** `CTX_DDL.ADD_FIELD_SECTION` for more information on visible and invisible field sections.

The added section `section_name` applies only to documents indexed after this operation. For the change to affect previously indexed documents, you must explicitly re-index the documents that contain the tag.

The index is *not* rebuilt by this statement.

---

---

**Note:** This ALTER INDEX operation applies only to CONTEXT CTXRULE indexes. It does not apply to CTXCAT indexes.

---

---

**See Also:** ["Add Section Constraints"](#) on page 1-9.

**add attr section *section\_name* tag *tag@attr***

Dynamically adds an attribute section `section_name` to the existing index. You must specify the XML tag and attribute in the form `tag@attr`. You can add attribute sections only to XML section groups.

The added section `section_name` applies only to documents indexed after this operation. Thus for the change to take effect, you must manually re-index any existing documents that contain the tag.

The index is *not* rebuilt by this statement.

---

**Note:** This ALTER INDEX operation applies only to `context` indexes. It does not apply to `ctxcat` indexes.

---

**See Also:** ["Add Section Constraints"](#) in this section.

### **add stop section *tag***

Dynamically adds the stop section identified by `tag` to the existing index. As stop sections apply only to automatic sectioning of XML documents, the index must use the `AUTO_SECTION_GROUP` section group. The tag you specify must be case sensitive and unique within the automatic section group or else ALTER INDEX raises an error.

The added stop section tag applies only to documents indexed after this operation. For the change to affect previously indexed documents, you must explicitly re-index the documents that contain the tag.

The text within a stop section is always searchable.

The number of stop sections you can add is unlimited.

The index is *not* rebuilt by this statement.

---

**Note:** This ALTER INDEX operation applies only to `context` indexes. It does not apply to `ctxcat` indexes.

---

### **Add Section Constraints**

Before altering the index section information, Oracle checks the new section against the existing sections to ensure that all validity constraints are met. These constraints are the same for adding a section to a section group with the `CTX_DDL` PL/SQL package and are as follows:

- You cannot add zone, field, or stop sections to a `NULL_SECTION_GROUP`.
- You cannot add zone, field, or attribute sections to an automatic section group.
- You cannot add attribute sections to anything other than XML section groups.

- You cannot have the same tag for two different sections.
- Section names for zone, field, and attribute sections cannot intersect.
- You cannot exceed 64 field sections.
- You cannot add stop sections to basic, HTML, XML, or news section groups.
- SENTENCE and PARAGRAPH are reserved section names.

## Examples

### Resuming Failed Index

The following statement resumes the indexing operation on `newsindex` with 2 megabytes of memory:

```
ALTER INDEX newsindex REBUILD PARAMETERS('resume memory 2M');
```

### Rebuilding an Index

The following statement rebuilds the index, replacing the stoplist preference with `new_stop`.

```
ALTER INDEX newsindex REBUILD PARAMETERS('replace stoplist new_stop');
```

### Rebuilding a Partitioned Index

The following example creates a partitioned text table, populates it, and creates a partitioned index. It then adds a new partition to the table and then rebuilds the index with `ALTER INDEX`:

```
PROMPT create partitioned table and populate it
```

```
create table part_tab (a int, b varchar2(40)) partition by range(a)
(partition p_tab1 values less than (10),
 partition p_tab2 values less than (20),
 partition p_tab3 values less than (30));
```

```
insert into part_tab values (1,'Actinidia deliciosa');
insert into part_tab values (8,'Distictis buccinatoria');
insert into part_tab values (12,'Actinidia quinata');
insert into part_tab values (18,'Distictis Rivers');
insert into part_tab values (21,'pandorea jasminoides Lady Di');
insert into part_tab values (28,'pandorea rosea');
```

```
commit;
```

```
PROMPT create partitioned index
create index part_idx on part_tab(b) indextype is ctxsys.context
local (partition p_idx1, partition p_idx2, partition p_idx3);
```

```
PROMPT add a partition and populate it
alter table part_tab add partition p_tab4 values less than (40);
insert into part_tab values (32, 'passiflora citrina');
insert into part_tab values (33, 'passiflora alatocaerulea');
commit;
```

The following statement rebuilds the index in the newly populated partition. In general, the index partition name for a newly added partition is the same as the table partition name, unless it is already been used. In this case, Oracle generates a new name.

```
alter index part_idx rebuild partition p_tab4;
```

The following statement queries the table for the two hits in the newly added partition:

```
select * from part_tab where contains(b,'passiflora') >0;
```

The following statement queries the newly added partition directly:

```
select * from part_tab partition (p_tab4) where contains(b,'passiflora') >0;
```

## Optimizing the Index

Optimizing your index with ALTER INDEX will not be supported in future releases. To optimize your index, use CTX\_DDL.[OPTIMIZE\\_INDEX](#).

## Synchronizing the Index

Synchronizing the index with ALTER INDEX will not be supported in future releases. To synchronize your index, use CTX\_DDL.[SYNC\\_INDEX](#).

## Adding a Zone Section

To add to the index the zone section author identified by the tag <author>, issue the following statement:

```
ALTER INDEX myindex REBUILD PARAMETERS('add zone section author tag author');
```

### Adding a Stop Section

To add a stop section identified by tag <fluff> to the index that uses the AUTO\_SECTION\_GROUP, issue the following statement:

```
ALTER INDEX myindex REBUILD PARAMETERS('add stop section fluff');
```

### Adding an Attribute Section

Assume that the following text appears in an XML document:

```
<book title="Tale of Two Cities">It was the best of times.</book>
```

You want to create a separate section for the title attribute and you want to name the new attribute section booktitle. To do so, issue the following statement:

```
ALTER INDEX myindex REBUILD PARAMETERS('add attr section booktitle tag  
title@book');
```

CTX\_DDL.OPTIMIZE\_INDEX in [Chapter 6, "CTX\\_DDL Package"](#)

[CREATE INDEX](#)

## CATSEARCH

Use the CATSEARCH operator to search CTXCAT indexes. Use this operator in the WHERE clause of a SELECT statement.

### About Performance

You use the CATSEARCH operator mainly to improve mixed query performance. You specify your text query condition with `text_query` and your structured condition with `structured_query`.

However, internally, Oracle always evaluates the `text_query` parameter first and then applies the `structured_query` condition against the rows returned from `text_query`.

This operator does not support the reverse behavior, also known as functional invocation. In this method, Oracle first retrieves the rows that satisfy the `structured_query` condition and then applies the `text_query` condition. Because of this, some CATSEARCH queries might not perform optimally.

### Syntax

```
CATSEARCH(  
    [schema.]column,  
    text_query      VARCHAR2,  
    structured_query VARCHAR2,  
    RETURN NUMBER;
```

#### **[schema.]column**

Specify the text column to be searched on. This column must have a CTXCAT index associated with it.

#### **text\_query**

Specify the query expression that defines your search in `column`. The CATSEARCH operator supports only the following query operations:

- Logical AND
- Logical OR (|)
- Logical NOT (-)
- " " (quoted phrases)

■ Wildcarding

These operators have the following syntax:

Operation	Syntax	Description of Operation
Logical AND	a b c	Returns rows that contain a, b and c.
Logical OR	a   b   c	Returns rows that contain a, b, or c.
Logical NOT	a - b	Returns rows that contain a and not b.
hyphen with no space	a-b	Hyphen treated as a regular character.  For example, if the hyphen is defined as skipjoin, words such as <i>web-site</i> are treated as the single query term <i>website</i> .  Likewise, if the hyphen is defined as a printjoin, words such as <i>web-site</i> are treated as <i>web site</i> in the CTXCAT query language.
" "	"a b c"	Returns rows that contain the phrase "a b c".  For example, entering "Sony CD Player" means return all rows that contain this sequence of words.
()	(A B)   C	Parentheses group operations. This query is equivalent to the CONTAINS query (A &B)   C.
wildcard (right and double truncated)	term* a*b	The wildcard character matches zero or more characters.  For example, <i>do*</i> matches <i>dog</i> , and <i>gl*s</i> matches <i>glass</i> .  Left truncation not supported.  Note: Oracle recommends that you create a prefix index if your application uses wildcard searching. You set prefix indexing with the <a href="#">BASIC_WORDLIST</a> preference.

**structured\_query**

Specify the structured conditions and the ORDER BY clause. There must exist an index for any column you specify. For example, if you specify 'category\_id=1 order by bid\_close', you must have an index for 'category\_id, bid\_close' as specified with CTX\_DDL.ADD\_INDEX.

With `structured_query`, you can use standard SQL syntax with only the following operators:

- =
- <=
- >=
- >
- <
- IN
- BETWEEN

## Examples

**Create the Table** The following statement creates the table to be indexed.

```
CREATE TABLE auction (category_id number primary key, title varchar2(20),
bid_close date);
```

The following table inserts the values into the table:

```
INSERT INTO auction values(1, 'Sony CD Player', '20-FEB-2000');
INSERT INTO auction values(2, 'Sony CD Player', '24-FEB-2000');
INSERT INTO auction values(3, 'Pioneer DVD Player', '25-FEB-2000');
INSERT INTO auction values(4, 'Sony CD Player', '25-FEB-2000');
INSERT INTO auction values(5, 'Bose Speaker', '22-FEB-2000');
INSERT INTO auction values(6, 'Tascam CD Burner', '25-FEB-2000');
INSERT INTO auction values(7, 'Nikon digital camera', '22-FEB-2000');
INSERT INTO auction values(8, 'Canon digital camera', '26-FEB-2000');
```

**Create the CTXCAT Index** The following statements create the CTXCAT index:

```
begin
  ctx_ddl.create_index_set('auction_iset');
  ctx_ddl.add_index('auction_iset','bid_close');
end;
```

```
CREATE INDEX auction_titlex ON auction(title) INDEXTYPE IS CTXCAT PARAMETERS
('index set auction_iset');
```

**Query the Table** A typical query with CATSEARCH might include a structured clause as follows to find all rows that contain the word *camera* ordered by *bid\_close*:

```
SELECT * FROM auction WHERE CATSEARCH(title, 'camera', 'order by bid_close
desc')> 0;
```

CATEGORY_ID	TITLE	BID_CLOSE
-----	-----	-----
8	Canon digital camera	26-FEB-00
7	Nikon digital camera	22-FEB-00

The following query finds all rows that contain the phrase *Sony CD Player* and that have a bid close date of February 20, 2000:

```
SELECT * FROM auction WHERE CATSEARCH(title, "Sony CD Player", 'bid_
close='20-FEB-2000')> 0;
```

CATEGORY_ID	TITLE	BID_CLOSE
-----	-----	-----
1	Sony CD Player	20-FEB-00

The following query finds all rows with the terms *Sony* and *CD* and *Player*:

```
SELECT * FROM auction WHERE CATSEARCH(title, 'Sony CD Player', 'order by bid_
close desc')> 0;
```

CATEGORY_ID	TITLE	BID_CLOSE
-----	-----	-----
4	Sony CD Player	25-FEB-00
2	Sony CD Player	24-FEB-00
1	Sony CD Player	20-FEB-00

The following query finds all rows with the term *CD* and not *Player*:

```
SELECT * FROM auction WHERE CATSEARCH(title, 'CD - Player', 'order by bid_close
desc')> 0;
```

CATEGORY_ID	TITLE	BID_CLOSE
-----	-----	-----
6	Tascam CD Burner	25-FEB-00

The following query finds all rows with the terms *CD* or *DVD* or *Speaker*:

```
SELECT * FROM auction WHERE CATSEARCH(title, 'CD | DVD | Speaker', 'order by  
bid_close desc')> 0;
```

CATEGORY_ID	TITLE	BID_CLOSE
3	Pioneer DVD Player	25-FEB-00
4	Sony CD Player	25-FEB-00
6	Tascam CD Burner	25-FEB-00
2	Sony CD Player	24-FEB-00
5	Bose Speaker	22-FEB-00
1	Sony CD Player	20-FEB-00

The following query finds all rows that are about *audio equipment*:

```
SELECT * FROM auction WHERE CATSEARCH(title, 'ABOUT(audio equipment)', NULL)> 0;
```

## Related Topics

[Syntax for CTXCAT Indextype](#) in this chapter.

*Oracle Text Application Developer's Guide*

## CONTAINS

---

Use the CONTAINS operator in the WHERE clause of a SELECT statement to specify the query expression for a Text query.

CONTAINS returns a relevance score for every row selected. You obtain this score with the [SCORE](#) operator.

### Syntax

```
CONTAINS(  
    [ schema. ] column ,  
    text_query          VARCHAR2  
    [ , label           NUMBER ] )  
RETURN NUMBER;
```

#### **[*schema.*]*column***

Specify the text column to be searched on. This column must have a Text index associated with it.

#### ***text\_query***

Specify the query expression that defines your search in column.

**See Also:** [Chapter 3, "CONTAINS Query Operators"](#) for more information about the operators you can use in query expressions.

#### ***label***

Optionally specify the label that identifies the score generated by the CONTAINS operator.

### Returns

For each row selected, CONTAINS returns a number between 0 and 100 that indicates how relevant the document row is to the query. The number 0 means that Oracle found no matches in the row.

**Note:** You must use the SCORE operator with a label to obtain this number.

## Example

The following example searches for all documents in the `text` column that contain the word *oracle*. The score for each row is selected with the `SCORE` operator using a label of 1:

```
SELECT SCORE(1), title from newsindex
       WHERE CONTAINS(text, 'oracle', 1) > 0;
```

The `CONTAINS` operator must always be followed by the `> 0` syntax, which specifies that the score value calculated by the `CONTAINS` operator must be greater than zero for the row to be selected.

When the `SCORE` operator is called (e.g. in a `SELECT` clause), the `CONTAINS` clause must reference the score label value as in the following example:

```
SELECT SCORE(1), title from newsindex
       WHERE CONTAINS(text, 'oracle', 1) > 0 ORDER BY SCORE(1) DESC;
```

## Notes

### Querying Multi-Language Tables

With the multi-lexer preference, you can create indexes from multi-language tables.

At query time, the multi-lexer examines the session's language setting and uses the sub-lexer preference for that language to parse the query. If the language setting is not mapped, then the default lexer is used.

When the language setting is mapped, the query is parsed and run as usual. The index contains tokens from multiple languages, so such a query can return documents in several languages.

To limit your query to returning document of a given language, use a structured clause on the language column.

### Query Performance Limitation with a Partitioned Index

Oracle Text supports the `CONTEXT` indexing and querying of a partitioned text table.

However, for optimal performance when querying a partitioned table with an `ORDER BY SCORE` clause, query the partition. If you query the entire table and use an `ORDER BY SCORE` clause, the query might not perform optimally unless you include a range predicate that can limit the query to a single partition.

For example, the following statement queries the partition `p_tab4` partition directly:

```
select * from part_tab partition (p_tab4) where contains(b,'oracle') >0 ORDER BY  
SCORE;
```

## CREATE INDEX

---

---

**Note:** This section describes the CREATE INDEX statement as it pertains to creating a Text domain index.

For a complete description of the CREATE INDEX statement, see *Oracle9i SQL Reference*.

---

---

### Purpose

Use CREATE INDEX to create an Oracle Text index. An Oracle Text index is an Oracle domain index of type `context`, `ctxcat`, or `ctxrule`.

You must create an appropriate Oracle Text index to issue CONTAINS, CATSEARCH, or MATCHES queries.

You can create the following types of Oracle Text indexes:

- **CONTEXT** index. This is an index on one text column. You query this index with the CONTAINS operator in the WHERE clause of a SELECT statement. See [Syntax for CONTEXT Indextype](#).
- **CTXCAT** index. This is a combined index on a text column and one or more other columns. You query this index with the CATSEARCH operator in the WHERE clause of a SELECT statement. This type of index is optimized for mixed queries. See [Syntax for CTXCAT Indextype](#).
- **CTXRULE** index. This is an index on a column containing a set of queries. You query this index with the MATCHES operator in the WHERE clause of a SELECT statement. See [Syntax for CTXRULE Indextype](#).

### Required Privileges

You do not need the CTXAPP role to create an Oracle Text index. If you have Oracle grants to create a b-tree index on the text column, you have sufficient permission to create a text index. The issuing owner, table owner, and index owner can all be different users, which is consistent with Oracle standards for creating regular B-tree indexes.

## Syntax for CONTEXT Indextype

```
CREATE INDEX [schema.]index ON [schema.]table(column) INDEXTYPE IS
    ctxsys.context
LOCAL [(PARTITION [partition] [PARAMETERS('paramstring')]]
    [, PARTITION [partition] [PARAMETERS('paramstring')]])]
    [PARAMETERS(paramstring)] [PARALLEL n];
```

### **[*schema.*]*index***

Specify the name of the Text index to create.

### **[*schema.*]*table*(*column*)**

Specify the name of the table and column to index.

Your table can optionally contain a primary key if you prefer to identify your rows as such when you use procedures in CTX\_DOC. When your table has no primary key, document services identifies your documents by ROWID.

The column you specify must be one of the following types: CHAR, VARCHAR, VARCHAR2, BLOB, CLOB, BFILE, or XMLType.

DATE, NUMBER, and nested table columns cannot be indexed. Object columns also cannot be indexed, but their attributes can be, provided they are atomic data types.

Indexes on multiple columns are not supported with the context index type. You must specify only one column in the column list.

---

**Note:** With the `ctxcat` indextype, you can create indexes on text and structured columns. See [Syntax for CTXCAT Indextype](#) in this chapter.

---

### **LOCAL [(PARTITION [*partition*] [PARAMETERS('paramstring')])]**

Specify LOCAL to create a local partitioned context index on a partitioned table. The partitioned table must be partitioned by range. Hash, composite and list partitions are not supported.

You can specify the list of index partition names with *partition*. If you do not specify a partition name, the system assigns one. The order of the index partition list must correspond to the table partition by order.

The PARAMETERS clause associated with each partition specifies the parameters string specific to that partition. You can only specify *memory* and *storage* for each index partition.

You can query the views [CTX\\_INDEX\\_PARTITIONS](#) or [CTX\\_USER\\_INDEX\\_PARTITIONS](#) to find out index partition information, such as index partition name, and index partition status.

**Query Performance Limitation with Partitioned Index** For optimal performance when querying a partitioned index with an ORDER BY SCORE clause, query the partition. If you query the entire table and use an ORDER BY SCORE clause, the query might not perform optimally unless you include a range predicate that can limit the query to a single partition.

**See Also:** ["Query Performance Limitation with a Partitioned Index"](#) in this chapter under [CONTAINS](#).

### PARALLEL n

Optionally specify with n the parallel degree for parallel indexing. You must have a partitioned text table to use parallel indexing with Oracle Text. Each parallel indexing process works on its own partition, so n must not exceed the number of partitions.

The initialization parameter JOB\_QUEUE\_PROCESSES must also be set in the initialization parameter file to use parallel indexing. The parallel degree n you specify must be less than the value of JOB\_QUEUE\_PROCESSES.

A complete example of how to create an index in parallel is given in the Examples section.

**See Also:** *Oracle9i Reference* and *Oracle9i Administrator's Guide* for more information about these initialization parameters.

### PARAMETERS(*paramstring*)

Optionally specify indexing parameters in *paramstring*. You can specify preferences owned by another user using the user.preference notation.

The syntax for *paramstring* is as follows:

```
paramstring =
    '[datastore datastore_pref]
    [filter filter_pref]
    [charset column charset_column_name]
    [format column format_column_name]

    [lexer lexer_pref]
    [language column language_column_name]
```

```
[wordlist wordlist_pref]  
[storage storage_pref]  
[stoplist stoplist]  
[section group section_group]  
[memory memsize]  
[populate | nopopulate]'
```

You create datastore, filter, lexer, wordlist, and storage preferences with CTX\_DDL.[CREATE\\_PREFERENCE](#) and then specify them in the paramstring.

---

**Note:** When you specify no paramstring, Oracle uses the system defaults.

For more information about these defaults, see "[Default Index Parameters](#)" in [Chapter 2](#).

---

***datastore *datastore\_pref****

Specify the name of your datastore preference. Use the datastore preference to specify where your text is stored. See [Datastore Types](#) in [Chapter 2](#).

***filter *filter\_pref****

Specify the name of your filter preference. Use the filter preference to specify how to filter formatted documents to plain text or HTML. See [Filter Types](#) in [Chapter 2](#).

***charset column *charset\_column\_name****

Specify the name of the character set column. This column must be in the same table as the text column, and it must be of type CHAR, VARCHAR, or VARCHAR2. Use this column to specify the document character set for conversion to the database character set. The value is case insensitive. You must specify an NLS character set string such as JA16EUC.

When the document is plain text or HTML, the INSO\_FILTER object and CHARSET filter object use this column to convert the document character set to the database character set for indexing.

You use this column when you have plain text or HTML documents with different character sets or in a character set different from the database character set.

---

**Note:** Documents are not marked for re-indexing when only the charset column changes. The indexed column must be updated to flag the re-index.

---

**format column *format\_column\_name***

Specify the name of the format column. The format column must be in the same table as the text column and it must be CHAR, VARCHAR, or VARCHAR2 type.

The INSO\_FILTER uses the format column when filtering documents. Use this column with heterogeneous document sets to optionally bypass INSO filtering for plain text or HTML documents.

In the format column, you can specify one of the following

- TEXT
- BINARY
- IGNORE

TEXT indicates that the document is either plain text or HTML. When TEXT is specified the document is not filtered, but might be character set converted.

BINARY indicates that the document is a format supported by the INSO\_FILTER object other than plain text or HTML, such as PDF. BINARY is the default if the format column entry cannot be mapped.

IGNORE indicates that the row is to be ignored during indexing. Use this value when you need to bypass rows that contain data incompatible with text indexing such as image data.

---

---

**Note:** Documents are not marked for re-indexing when only the format column changes. The indexed column must be updated to flag the re-index.

---

---

**lexer *lexer\_pref***

Specify the name of your lexer or multi-lexer preference. Use the lexer preference to identify the language of your text and how text is tokenized for indexing. See [Lexer Types](#) in [Chapter 2](#).

**language column *language\_column\_name***

Specify the name of the language column when using a multi-lexer preference. See [MULTI\\_LEXER](#) in [Chapter 2](#).

This column must exist in the base table. It cannot be the same column as the indexed column. Only the first 30 bytes of the language column is examined for language identification.

---

**Note:** Documents are not marked for re-indexing when only the language column changes. The indexed column must be updated to flag the re-index.

---

**wordlist *wordlist\_pref***

Specify the name of your wordlist preference. Use the wordlist preference to enable features such as fuzzy, stemming, and prefix indexing for better wildcard searching. See [Wordlist Type](#) in [Chapter 2](#).

**storage *storage\_pref***

Specify the name of your storage preference for the Text index. Use the storage preference to specify how the index tables are stored. See [Storage Types](#) in [Chapter 2](#).

**stoplist *stoplist***

Specify the name of your stoplist. Use stoplist to identify words that are not to be indexed. See CTX\_DDL.[CREATE\\_STOPLIST](#) in [Chapter 6](#).

**section group *section\_group***

Specify the name of your section group. Use section groups to create searchable sections in structured documents. See CTX\_DDL.[CREATE\\_SECTION\\_GROUP](#) in [Chapter 6](#).

**memory *memsize***

Specify the amount of run-time memory to use for indexing. The syntax for memsize is as follows:

```
memsize = number[M|G|K]
```

where M stands for megabytes, G stands for gigabytes, and K stands for kilobytes.

The value you specify for memsize must be between 1M and the value of MAX\_INDEX\_MEMORY in the [CTX\\_PARAMETERS](#) view. To specify a memory size larger than the MAX\_INDEX\_MEMORY, you must reset this parameter with CTX\_ADM.[SET\\_PARAMETER](#) to be larger than or equal to memsize.

The default is the value specified for DEFAULT\_INDEX\_MEMORY in CTX\_PARAMETERS.

The memsize parameter specifies the amount of memory Oracle uses for indexing before flushing the index to disk. Specifying a large amount memory improves indexing performance because there are fewer I/O operations and improves query performance and maintenance since there is less fragmentation.

Specifying smaller amounts of memory increases disk I/O and index fragmentation, but might be useful when run-time memory is scarce.

### **populate | nopopulate**

Specify nopopulate to create an empty index. The default is populate.

---

**Note:** This is the only option whose default value cannot be set with CTX\_ADM.[SET\\_PARAMETER](#).

---

Empty indexes are populated by updates or inserts to the base table. You might create an empty index when you need to create your index incrementally or to selectively index documents in the base table. You might also create an empty index when you require only theme and Gist output from a document set.

## **CONTEXT Index Examples**

The following sections give examples of creating a CONTEXT index.

### **Creating CONTEXT Index Using Default Preferences**

The following example creates a CONTEXT index called `myindex` on the `docs` column in `mytable`. Default preferences are used.

```
CREATE INDEX myindex ON mytable(docs) INDEXTYPE IS ctxsys.context;
```

**See Also:** For more information about default settings, see "[Default Index Parameters](#)" in [Chapter 2](#).

Also refer to "[Indexing](#)" in [Chapter 1](#).

### **Creating CONTEXT Index with Custom Preferences**

The following example creates a CONTEXT index called `myindex` on the `docs` column in `mytable`. The index is created with a custom lexer preference called `my_lexer` and a custom stoplist called `my_stop`.

This example also assumes that these preferences were previously created with CTX\_DDL.[CREATE\\_PREFERENCE](#) for `my_lexer`, and CTX\_DDL.[CREATE](#)

[STOPLIST](#) for `my_stop`. Default preferences are used for the unspecified preferences.

```
CREATE INDEX myindex ON mytable(docs) INDEXTYPE IS ctxsys.context
  PARAMETERS('LEXER my_lexer STOPLIST my_stop');
```

Any user can use any preference. To specify preferences that exist in another user's schema, add the user name to the preference name. The following example assumes that the preferences `my_lexer` and `my_stop` exist in the schema that belongs to user `kenny`:

```
CREATE INDEX myindex ON mytable(docs) INDEXTYPE IS ctxsys.context
  PARAMETERS('LEXER kenny.my_lexer STOPLIST kenny.my_stop');
```

### Creating CONTEXT Index with Multi-Lexer Preference

The multi-lexer decides which lexer to use for each row based on a language column. This is a character column in the table which stores the language of the document in the text column. For example, you create the table `globaldoc` to hold documents of different languages:

```
CREATE TABLE globaldoc (
  doc_id NUMBER PRIMARY KEY,
  lang VARCHAR2(10),
  text CLOB
);
```

Assume that `global_lexer` is a multi-lexer preference you created. To index the `global_doc` table, you specify the multi-lexer preference and the name of the language column as follows:

```
CREATE INDEX globalx ON globaldoc(text) INDEXTYPE IS ctxsys.context PARAMETERS
('LEXER global_lexer LANGUAGE COLUMN lang');
```

**See Also:** For more information about creating multi-lexer preferences, see [MULTI\\_LEXER](#) in [Chapter 2](#).

## Parallel Indexing

This example shows how to set up parallel indexing. Do the following:

1. Set the job queue parameter in the Oracle initialization file to accommodate parallel indexing:

```
job_queue_processes = 8
```

The JOB\_QUEUE\_PROCESSES parameter must be greater than or equal to your parallel degree.

**See Also:** For more information about this initialization parameter, see Oracle9i Reference and Oracle9i Administrator's Guide

2. Create a partitioned text table. The following example creates a hash-partitioned table using values in the pk column as the hash key:

```
CREATE TABLE mypart_tab(pk number primary key, text varchar2(80))
PARTITION BY HASH (pk) PARTITIONS 8;
```

3. Create the index with a parallel degree. This example uses a parallel degree of 3.

```
CREATE INDEX myindex ON mypart_tab(pk) INDEXTYPE IS ctxsys.context PARALLEL 3;
```

## Creating a Local Partitioned Index

The following example creates a text table partitioned into three, populates it, and then creates a partitioned index.

PROMPT create partitioned table and populate it

```
CREATE TABLE part_tab (a int, b varchar2(40)) PARTITION BY RANGE(a)
(partition p_tab1 values less than (10),
 partition p_tab2 values less than (20),
 partition p_tab3 values less than (30));
```

PROMPT create partitioned index

```
CREATE INDEX part_idx on part_tab(b) INDEXTYPE IS CTXSYS.CONTEXT
LOCAL (partition p_idx1, partition p_idx2, partition p_idx3);
```

## Viewing Index Errors

After a CREATE INDEX or ALTER INDEX operation, you can view index errors with Oracle Text views. To view errors on your indexes, query the [CTX\\_USER\\_](#)

[INDEX\\_ERRORS](#) view. To view errors on all indexes as CTXSYS, query the [CTX\\_INDEX\\_ERRORS](#) view.

For example, to view the most recent errors on your indexes, you can issue:

```
SELECT err_timestamp, err_text FROM ctx_user_index_errors ORDER BY err_timestamp  
DESC;
```

### Deleting Index Errors

To clear the index error view, you can issue:

```
DELETE FROM ctx_user_index_errors;
```

## Syntax for CTXCAT Indextype

```
CREATE INDEX [schema.]index ON [schema.]table(column) INDEXTYPE IS ctxsys.ctxcat
  [PARAMETERS
    ('[index set index_set]
    [lexer lexer_pref]
    [storage storage_pref]
    [stoplist stoplist]
    [wordlist wordlist_pref]
    [memory memsize]' )];
```

### [*schema.*]*table*(*column*)

Specify the name of the table and column to index.

The column you specify when you create a CTXCAT index must be of type CHAR or VARCHAR2. No other types are supported for CTXCAT.

## Supported Preferences

### **index set *index\_set***

Specify the index set preference to create the CTXCAT index. See [Creating a CTXCAT Index](#) example in this chapter.

**Index Performance and Size Considerations** Although a CTXCAT index offers query performance benefits, creating the index has its costs. The time Oracle takes to create a CTXCAT index depends on its total size, and the total size of a CTXCAT index is directly related to

- total text to be indexed
- number of component indexes in the index set
- number of columns in the base table that make up the component indexes

Having many component indexes in your index set also degrades DML performance since more indexes must be updated.

Because of these added costs in creating a CTXCAT index, carefully consider the query performance benefit each component index gives your application before adding it to your index set.

**See Also:** *Oracle Text Application Developer's Guide* for more information about creating CTXCAT indexes and its benefits.

**Other Preferences**

When you create an index of type CTXCAT, you can use only the following index preferences in the `parameters` string:

**Table 1–1**

Preference Class	Supported Types
Datastore	None.
Filter	None
Lexer	<a href="#">BASIC_LEXER</a> (index_themes attribute not supported) <a href="#">CHINESE_VGRAM_LEXER</a> <a href="#">JAPANESE_VGRAM_LEXER</a> <a href="#">KOREAN_LEXER</a> <a href="#">KOREAN_MORPH_LEXER</a>
Wordlist	<a href="#">BASIC_WORDLIST</a>
Storage	<a href="#">BASIC_STORAGE</a>
Stoplist	Supports single language stoplists only (BASIC_STOPLIST type.)
Section Group	None

**Unsupported Preferences and Parameters**

When you create a CTXCAT index, you cannot specify datastore, filter and section group preferences. You also cannot specify language, format, and charset columns as with a CONTEXT index.

**Creating a CTXCAT Index**

This section gives a brief example for creating a CTXCAT index. For a more complete example, see the *Oracle Text Application Developer's Guide*.

Consider a table called AUCTION with the following schema:

```
create table auction(  
  item_id number,  
  title varchar2(100),  
  category_id number,  
  price number,  
  bid_close date);
```

Assume that queries on the table involve a mandatory text query clause and optional structured conditions on category\_id. Results must be sorted based on bid\_close and category\_id.

You can create a catalog index to support the different types of structured queries a user might enter. For structured queries, a ctxcat index improves query performance over a context index.

To create the indexes, first create the index set preference then add the required indexes to it:

```
begin
  ctx_ddl.create_index_set('auction_iset');
  ctx_ddl.add_index('auction_iset','bid_close');
  ctx_ddl.add_index('auction_iset','price, bid_close');
end;
```

Create the CTXCAT index with CREATE INDEX as follows:

```
create index auction_titlex on AUCTION(title) indextype is CTXSYS.CTXCAT
parameters ('index set auction_iset');
```

### Querying a CTXCAT Index

To query the title column for the word *pokemon*, you can issue regular and mixed queries as follows:

```
select * from AUCTION where CATSEARCH(title, 'pokemon',NULL)> 0;
select * from AUCTION where CATSEARCH(title, 'pokemon', 'price < 50 order by
bid_close desc')> 0;
```

**See Also:** *Oracle Text Application Developer's Guide* for a complete CTXCAT example.

## Syntax for CTXRULE Indextype

```
CREATE INDEX [schema.]index on [schema.]table(column) INDEXTYPE IS
  ctxsys.ctxrule
  [PARAMETERS ('[lexer lexer_pref] [storage storage_pref]
    [section group section_pref] [wordlist wordlist_pref]');
  [PARALLEL n];
```

### **[*schema.*]table(*column*)**

Specify the name of the table and column to index.

The column you specify when you create a CTXRULE index must be VARCHAR2 or CLOB. No other types are supported for CTXRULE.

### **lexer\_pref**

Specify the lexer preference to be used for processing the queries and the documents to be classified with the MATCHES function. Currently, only the [BASIC\\_LEXER](#) lexer type is supported.

For processing queries, this lexer supports the following operators: ABOUT, STEM, AND, NEAR, NOT, OR, and WITHIN.

The thesaural operators (BT\*, NT\*, PT, RT, SYN, TR, TRSYS, TT etc.) are supported. However, these operators are expanded using a snapshot of the thesaurus at index time, not when the MATCHES function is issued. This means that if you change your thesaurus after you index, you must re-index your query set

The following operators are not supported: ACCUM, EQUIUV, MINUS, WEIGHT, THRESHOLD, WILDCARD, FUZZY, and SOUNDEX.

### **storage\_pref**

Specify the storage preference for the index on the queries. Use the storage preference to specify how the index tables are stored. See [Storage Types](#) in [Chapter 2](#).

### **section group**

Specify the section group. This parameter does not affect the queries. It applies to sections in the documents to be classified. The following section groups are supported for the CTXRULE indextype:

- BASIC\_SECTION\_GROUP
- HTML\_SECTION\_GROUP
- XML\_SECTION\_GROUP
- AUTO\_SECTION\_GROUP

See [Section Group Types](#) in [Chapter 2, "Indexing"](#).

**wordlist\_pref**

Specify the wordlist preferences. This is used to enable stemming operations on query terms. See [Wordlist Type](#) in [Chapter 2](#).

**Example for Creating a CTXRULE Index**

See the *Oracle Text Application Developer's Guide* for a complete example of using the CTXRULE indextype in a document routing application.

---

## DROP INDEX

---

**Note:** This section describes the DROP INDEX statement as it pertains to dropping a Text domain index.

For a complete description of the DROP INDEX statement, see *Oracle9i SQL Reference*.

---

### Purpose

Use DROP INDEX to drop a specified Text index.

### Syntax

```
DROP INDEX [schema.]index [force];
```

**[force]**

Optionally force the index to be dropped.

### Examples

The following example drops an index named `doc_index` in the current user's database schema.

```
DROP INDEX doc_index;
```

### Notes

Use force option when Oracle cannot determine the state of the index, such as when an indexing operation crashes.

### Related Topics

[ALTER INDEX](#)

[CREATE INDEX](#)

## MATCHES

Use this operator to find all rows in a query table that match a given document. The document must be a plain text, HTML, or XML document.

This operator requires a CTXRULE index on your set of queries.

MATCHES returns 1 for one or more matches and 0 for no match.

### Syntax

```
MATCHES(  
    [schema.]column,  
    document VARCHAR2 or CLOB,  
    RETURN NUMBER;
```

#### **column**

Specify the column containing the indexed query set.

#### **document**

Specify the document to be classified. The document can be plain-text, HTML, or XML. Binary formats are not supported.

### Example

Assuming that a table `querytable` has a CTXRULE index associated with it, you can issue the following query that passes in a document string to be classified. The SELECT statement returns all rows (queries) that are satisfied by the incoming document:

```
SELECT classification FROM querytable WHERE MATCHES(text, 'Smith is a common  
name in the United States') > 0;
```

### Related Topics

[Syntax for CTXRULE Indextype](#) in this chapter.

---

## SCORE

Use the SCORE operator in a SELECT statement to return the score values produced by a [CONTAINS](#) query.

### Syntax

```
SCORE(label NUMBER)
```

#### label

Specify a number to identify the score produced by the query. You use this number to identify the score in the CONTAINS clause.

### Notes

The SCORE operator can be used in a SELECT, ORDER BY, or GROUP BY clause.

### Example

#### Single CONTAINS

When the SCORE operator is called (e.g. in a SELECT clause), the CONTAINS clause must reference the score label value as in the following example:

```
SELECT SCORE(1), title from newsindex
      WHERE CONTAINS(text, 'oracle', 1) > 0 ORDER BY SCORE(1) DESC;
```

#### Multiple CONTAINS

Assume that a news database stores and indexes the title and body of news articles separately. The following query returns all the documents that include the words *Oracle* in their title and *java* in their body. The articles are sorted by the scores for the first CONTAINS (*Oracle*) and then by the scores for the second CONTAINS (*java*).

```
SELECT title, body, SCORE(10), SCORE(20)
FROM news
WHERE CONTAINS (news.title, 'Oracle', 10) > 0 OR
      CONTAINS (news.body, 'java', 20) > 0
ORDER BY NVL(SCORE(10),0), NVL(SCORE(20),0);
```

### Related Topics

## Appendix F, "Scoring Algorithm"

This chapter describes the various elements you can use to create your Oracle Text index.

The following topics are discussed in this chapter:

- [Overview](#)
- [Datastore Types](#)
- [Filter Types](#)
- [Lexer Types](#)
- [Wordlist Type](#)
- [Storage Types](#)
- [Section Group Types](#)
- [Stoplists](#)
- [System-Defined Preferences](#)
- [System Parameters](#)

# Overview

When you use [CREATE INDEX](#) to create an index or [ALTER INDEX](#) to manage an index, you can optionally specify indexing preferences, stoplists, and section groups in the parameter string. Specifying a preference, stoplist, or section group answers one of the following questions about the way Oracle indexes text:

Preference Class	Answers the Question
Datastore	How are your documents stored?
Filter	How can the documents be converted to plain text?
Lexer	What language is being indexed?
Wordlist	How should stem and fuzzy queries be expanded?
Storage	How should the index tables be stored?
Stop List	What words or themes are not to be indexed?
Section Group	Is querying within sections enabled, and how are the document sections defined?

This chapter describes how to set each preference. You enable an option by creating a preference with one of the types described in this chapter.

For example, to specify that your documents are stored in external files, you can create a datastore preference called `mydatastore` using the [FILE\\_DATASTORE](#) type. You specify `mydatastore` as the datastore preference in the parameter clause of `CREATE INDEX`.

## Creating Preferences

To create a datastore, lexer, filter, wordlist, or storage preference, you use the `CTX_DDL.CREATE_PREFERENCE` procedure and specify one of the types described in this chapter. For some types, you can also set attributes with the `CTX_DDL.SET_ATTRIBUTE` procedure.

To create a stoplists, use `CTX_DDL.CREATE_STOPLIST`. You can add stopwords to a stoplist with `CTX_DDL.ADD_STOPWORD`.

To create section groups, use `CTX_DDL.CREATE_SECTION_GROUP` and specify a section group type. You can add sections to section groups with `CTX_DDL.ADD_ZONE_SECTION` or `CTX_DDL.ADD_FIELD_SECTION`.

## Datastore Types

Use the datastore types to specify how your text is stored. To create a datastore preference, you must use one of the following datastore types:

Datastore Type	Use When
<a href="#">DIRECT_DATASTORE</a>	Data is stored internally in the text column. Each row is indexed as a single document.
<a href="#">MULTI_COLUMN_DATASTORE</a>	Data is stored in a text table in more than one column. Columns are concatenated to create a virtual document, one per row.
<a href="#">DETAIL_DATASTORE</a>	Data is stored internally in the text column. Document consists of one or more rows stored in a text column in a detail table, with header information stored in a master table.
<a href="#">FILE_DATASTORE</a>	Data is stored externally in operating system files. Filenames are stored in the text column, one per row.
<a href="#">NESTED_DATASTORE</a>	Data is stored in a nested table.
<a href="#">URL_DATASTORE</a>	Data is stored externally in files located on an intranet or the Internet. Uniform Resource Locators (URLs) are stored in the text column.
<a href="#">USER_DATASTORE</a>	Documents are synthesized at index time by a user-defined stored procedure.

## DIRECT\_DATASTORE

Use the `DIRECT_DATASTORE` type for text stored directly in the text column, one document per row. `DIRECT_DATASTORE` has no attributes.

The following columns types are supported: `CHAR`, `VARCHAR`, `VARCHAR2`, `BLOB`, `CLOB`, `BFILE`, or `XMLType`.

---

**Note:** If your column is a `BFILE`, you must grant read permission to `CTXSYS` on all directories used by the `BFILES`.

---

### DIRECT\_DATASTORE CLOB Example

The following example creates a table with a `CLOB` column to store text data. It then populates two rows with text data and indexes the table using the system-defined preference `CTXSYS.DEFAULT_DATASTORE`.

```
create table mytable(id number primary key, docs clob);

insert into mytable values(111555,'this text will be indexed');
insert into mytable values(111556,'this is a direct_datastore example');
commit;

create index myindex on mytable(docs)
  indextype is ctxsys.context
  parameters ( 'DATASTORE CTXSYS.DEFAULT_DATASTORE' );
```

**MULTI\_COLUMN\_DATASTORE**

Use this datastore when your text is stored in more than one column. During indexing, the system concatenates the text columns and indexes the text as a single document.

MULTI\_COLUMN\_DATASTORE has the following attributes:

Attribute	Attribute Value
columns	<p>Specify a comma separated list of columns to be concatenated during indexing. You can also specify any expression allowable for the select statement column list for the base table. This includes expressions, PL/SQL functions, column aliases, and so on.</p> <p>NUMBER and DATE column types are supported. They are converted to text before indexing using the default format mask. The TO_CHAR function can be used in the column list for formatting.</p> <p>RAW and BLOB columns are directly concatenated as binary data.</p> <p>LONG, LONG RAW, NCHAR, and NCLOB, nested table columns and collections are not supported.</p> <p>The column list is limited to 500 bytes.</p>

**Indexing and DML**

To index, you must create a dummy column to specify in the CREATE INDEX statement. This column’s contents are not made part of the virtual document, unless its name is specified in the columns attribute.

The index is synchronized only when the dummy column is updated. You can create triggers to propagate changes if needed.

## MULTI\_COLUMN\_DATASTORE Security

Only CTXSYS is allowed to create preferences for the MULTI\_COLUMN\_DATASTORE type. Any other user who attempts to create a MULTI\_COLUMN\_DATASTORE preference receives an error.

Oracle makes this restriction because when the columns attribute contains a function call, the call is made by the CTXSYS schema. The potential exists for a malicious CTXAPP users to execute arbitrary functions for which they do not have execute permission.

If this is too restrictive, you can create a stored procedure under CTXSYS to create MULTI\_COLUMN\_DATASTORE preferences. The effective user is CTXSYS, who creates and owns the preferences. However, you can call this procedure from any schema as CTXSYS.

## MULTI\_COLUMN\_DATASTORE Example

The following example creates a multi-column datastore preference called `my_multi` with three text columns:

```
begin
  ctx_ddl.create_preference('my_multi', 'MULTI_COLUMN_DATASTORE');
  ctx_ddl.set_attribute('my_multi', 'columns', 'column1, column2, column3');
end;
```

## Tagging Behavior

During indexing, the system creates a virtual document for each row. The virtual document is composed of the contents of the columns concatenated in the listing order with column name tags automatically added. For example:

```
create table mc(id number primary key, name varchar2(10), address varchar2(80));
insert into mc values(1, 'John Smith', '123 Main Street');
```

```
exec ctx_ddl.create_preference('mynds', 'MULTI_COLUMN_DATASTORE');
exec ctx_ddl.set_attribute('mynds', 'columns', 'name, address');
```

This produces the following virtual text for indexing:

```
<NAME>
John Smith
</NAME>
<ADDRESS>
123 Main Street
</ADDRESS>
```

The system indexes the text between the tags, ignoring the tags themselves.

### Indexing Columns as Sections

To index these tags as sections, you can optionally create field sections with the BASIC\_SECTION\_GROUP.

---

---

**Note:** No section group is created when you use the MULTI\_COLUMN\_DATASTORE. To create sections for these tags, you must create a section group.

---

---

When you use expressions or functions, the tag is composed of the first 30 characters of the expression unless a column alias is used.

For example, if your expression is as follows:

```
exec ctx_ddl.set_attribute('mynds', 'columns', '4 + 17');
```

then it produces the following virtual text:

```
<4 + 17>
21
</4 + 17>
```

If your expression is as follows:

```
exec ctx_ddl.set_attribute('mynds', 'columns', '4 + 17 coll');
```

then it produces the following virtual text:

```
<coll>
21
<coll>
```

The tags are in uppercase unless the column name or column alias is in lowercase and surrounded by double quotes. For example:

```
exec ctx_ddl.set_attribute('mynds', 'COLUMNS', 'foo');
```

produces the following virtual text:

```
<FOO>
content of foo
</FOO>
```

For lowercase tags, use the following:

```
exec ctx_ddl.set_attribute('mynds', 'COLUMNS', 'foo "foo"');
```

This expression produces:

```
<foo>  
content of foo  
</foo>
```

## DETAIL\_DATASTORE

Use the DETAIL\_DATASTORE type for text stored directly in the database in detail tables, with the indexed text column located in the master table.

DETAIL\_DATASTORE has the following attributes:

Attribute	Attribute Value
binary	Specify TRUE for Oracle to add <i>no</i> newline character after each detail row.  Specify FALSE for Oracle to add a newline character (\n) after each detail row automatically.
detail_table	Specify the name of the detail table (OWNER.TABLE if necessary)
detail_key	Specify the name of the detail table foreign key column(s)
detail_lineno	Specify the name of the detail table sequence column.
detail_text	Specify the name of the detail table text column.

### Synchronizing Master/Detail Indexes

Changes to the detail table do not trigger re-indexing when you synchronize the index. Only changes to the indexed column in the master table triggers a re-index when you synchronize the index.

You can create triggers on the detail table to propagate changes to the indexed column in the master table row.

### Example Master/Detail Tables

This example illustrates how master and detail tables are related to each other.

**Master Table Example** Master tables define the documents in a master/detail relationship. You assign an identifying number to each document. The following table is an example master table, called `my_master`:

Column Name	Column Type	Description
article_id	NUMBER	Document ID, unique for each document (Primary Key)
author	VARCHAR2(30)	Author of document
title	VARCHAR2(50)	Title of document

Column Name	Column Type	Description
body	CHAR(1)	Dummy column to specify in CREATE INDEX

---

**Note:** Your master table must include a primary key column when you use the DETAIL\_DATASTORE type.

---

**Detail Table Example** Detail tables contain the text for a document, whose content is usually stored across a number of rows. The following detail table `my_detail` is related to the master table `my_master` with the `article_id` column. This column identifies the master document to which each detail row (sub-document) belongs.

Column Name	Column Type	Description
article_id	NUMBER	Document ID that relates to master table
seq	NUMBER	Sequence of document in the master document defined by article_id
text	VARCHAR2	Document text

**Detail Table Example Attributes** In this example, the DETAIL\_DATASTORE attributes have the following values:

Attribute	Attribute Value
binary	TRUE
detail_table	my_detail
detail_key	article_id
detail_lineno	seq
detail_text	text

You use CTX\_DDL.[CREATE\\_PREFERENCE](#) to create a preference with DETAIL\_DATASTORE. You use CTX\_DDL.[SET\\_ATTRIBUTE](#) to set the attributes for this preference as described above. The following example shows how this is done:

```
begin
  ctx_ddl.create_preference('my_detail_pref', 'DETAIL_DATASTORE');
  ctx_ddl.set_attribute('my_detail_pref', 'binary', 'true');
  ctx_ddl.set_attribute('my_detail_pref', 'detail_table', 'my_detail');
  ctx_ddl.set_attribute('my_detail_pref', 'detail_key', 'article_id');
  ctx_ddl.set_attribute('my_detail_pref', 'detail_lineno', 'seq');
  ctx_ddl.set_attribute('my_detail_pref', 'detail_text', 'text');
end;
```

**Master/Detail Index Example** To index the document defined in this master/detail relationship, you specify a column in the master table with CREATE INDEX. The column you specify must be one of the allowable types.

This example uses the `body` column, whose function is to allow the creation of the master/detail index and to improve readability of the code. The `my_detail_pref` preference is set to DETAIL\_DATASTORE with the required attributes:

```
CREATE INDEX myindex on my_master(body) indextype is ctxsys.context
parameters('datastore my_detail_pref');
```

In this example, you can also specify the `title` or `author` column to create the index. However, if you do so, changes to these columns will trigger a re-index operation.

## FILE\_DATASTORE

The FILE\_DATASTORE type is used for text stored in files accessed through the local file system.

FILE\_DATASTORE has the following attribute(s):

Attribute	Attribute Values
path	<i>path1:path2: :pathn</i>

### path

Specify the full directory path name of the files stored externally in a file system. When you specify the full directory path as such, you need only include file names in your text column.

You can specify multiple paths for path, with each path separated by a colon (:). File names are stored in the text column in the text table.

If you do not specify a path for external files with this attribute, Oracle requires that the path be included in the file names stored in the text column.

### FILE\_DATASTORE Example

This example creates a file datastore preference called COMMON\_DIR that has a path of /mydocs:

```
begin
  ctx_ddl.create_preference('COMMON_DIR', 'FILE_DATASTORE');
  ctx_ddl.set_attribute('COMMON_DIR', 'PATH', '/mydocs');
end;
```

When you populate the table mytable, you need only insert filenames. The path attribute tells the system where to look during the indexing operation.

```
create table mytable(id number primary key, docs varchar2(2000));
insert into mytable values(111555, 'first.txt');
insert into mytable values(111556, 'second.txt');
commit;
```

Create the index as follows:

```
create index myindex on mytable(docs)
  indextype is ctxsys.context
  parameters ('datastore COMMON_DIR');
```

## URL\_DATASTORE

Use the URL\_DATASTORE type for text stored:

- In files on the World Wide Web (accessed through HTTP or FTP)
- In files in the local file system (accessed through the file protocol)

You store each URL in a single text field.

### URL Syntax

The syntax of a URL you store in a text field is as follows (with brackets indicating optional parameters):

```
[URL:]<access_scheme>://<host_name>[:<port_number>]/[<url_path>]
```

The access\_scheme string you specify can be either *ftp*, *http*, or *file*. For example:

```
http://mymachine.us.oracle.com/home.html
```

As this syntax is partially compliant with the RFC 1738 specification, the following restriction holds for the URL syntax:

- The URL must contain only printable ASCII characters. Nonprintable ASCII characters and multibyte characters must be escaped with the %xx notation, where xx is the hexadecimal representation of the special character.

---

---

**Note:** The login:password@ syntax within the URL is not supported.

---

---

### URL\_DATASTORE Attributes

URL\_DATASTORE has the following attributes:

Attribute	Attribute Values
timeout	Specify the timeout in seconds. The valid range is 15 to 3600 seconds. The default is 30.
maxthreads	Specify the maximum number of threads that can be running simultaneously. Use a number between 1 and 1024. The default is 8.
urlsize	Specify the maximum length of URL string in bytes. Use a number between 32 and 65535. The default is 256.

Attribute	Attribute Values
maxurls	Specify maximum size of URL buffer. Use a number between 32 and 65535. The defaults is 256.
maxdocsize	Specify the maximum document size. Use a number between 256 and 2,147,483,647 bytes (2 gigabytes). The defaults is 2,000,000.
http_proxy	Specify the host name of http proxy server. Optionally specify port number with a colon in the form hostname:port.
ftp_proxy	Specify the host name of ftp proxy server. Optionally specify port number with a colon in the form hostname:port.
no_proxy	Specify the domain for no proxy server. Use a comma separated string of up to 16 domain names.

**timeout**

Specify the length of time, in seconds, that a network operation such as a connect or read waits before timing out and returning a timeout error to the application. The valid range for timeout is 15 to 3600 and the default is 30.

**Note:** Since timeout is at the network operation level, the total timeout may be longer than the time specified for timeout.

**maxthreads**

Specify the maximum number of threads that can be running at the same time. The valid range for maxthreads is 1 to 1024 and the default is 8.

**urlsize**

Specify the maximum length, in bytes, that the URL data store supports for URLs stored in the database. If a URL is over the maximum length, an error is returned. The valid range for urlsize is 32 to 65535 and the default is 256.

**Note:** The product values specified for maxurls and urlsize cannot exceed 5,000,000.

In other words, the maximum size of the memory buffer (maxurls \* urlsize) for the URL is approximately 5 megabytes.

**maxurls**

Specify the maximum number of rows that the internal buffer can hold for HTML documents (rows) retrieved from the text table. The valid range for maxurls is 32 to 65535 and the default is 256.

---

---

**Note:** The product values specified for maxurls and urlsize cannot exceed 5,000,000.

In other words, the maximum size of the memory buffer (maxurls \* urlsize) for the URL is approximately 5 megabytes.

---

---

Specify the maximum size, in bytes, that the URL datastore supports for accessing HTML documents whose URLs are stored in the database. The valid range for maxdocsize is 1 to 2,147,483,647 (2 gigabytes), and the default is 2,000,000.

**http\_proxy**

Specify the fully qualified name of the host machine that serves as the HTTP proxy (gateway) for the machine on which Oracle Text is installed. You can optionally specify port number with a colon in the form hostname:port.

You must set this attribute if the machine is in an intranet that requires authentication through a proxy server to access Web files located outside the firewall.

**ftp\_proxy**

Specify the fully-qualified name of the host machine that serves as the FTP proxy (gateway) for the machine on which Oracle Text is installed. You can optionally specify a port number with a colon in the form hostname:port.

This attribute must be set if the machine is in an intranet that requires authentication through a proxy server to access Web files located outside the firewall.

**no\_proxy**

Specify a string of domains (up to sixteen, separate by commas) which are found in most, if not all, of the machines in your intranet. When one of the domains is encountered in a host name, no request is sent to the machine(s) specified for ftp\_proxy and http\_proxy. Instead, the request is processed directly by the host machine identified in the URL.

For example, if the string *us.oracle.com*, *uk.oracle.com* is entered for `no_proxy`, any URL requests to machines that contain either of these domains in their host names are not processed by your proxy server(s).

### URL\_DATASTORE Example

This example creates a URL\_DATASTORE preference called URL\_PREF for which the `http_proxy`, `no_proxy`, and `timeout` attributes are set. The defaults are used for the attributes that are not set.

```
begin
  ctx_ddl.create_preference('URL_PREF','URL_DATASTORE');
  ctx_ddl.set_attribute('URL_PREF','HTTP_PROXY','www-proxy.us.oracle.com');
  ctx_ddl.set_attribute('URL_PREF','NO_PROXY','us.oracle.com');
  ctx_ddl.set_attribute('URL_PREF','Timeout','300');
end;
```

Create the table and insert values into it:

```
create table urls(id number primary key, docs varchar2(2000));
insert into urls values(111555,'http://context.us.oracle.com');
insert into urls values(111556,'http://www.sun.com');
commit;
```

To create the index, specify URL\_PREF as the datastore:

```
create index datastores_text on urls ( docs )
  indextype is ctxsys.context
  parameters ( 'Datastore URL_PREF' );
```

## USER\_DATASTORE

Use the USER\_DATASTORE type to define stored procedures that synthesize documents during indexing. For example, a user procedure might synthesize author, date, and text columns into one document to have the author and date information be part of the indexed text.

The USER\_DATASTORE has the following attributes:

Attribute	Attribute Value
procedure	<p>Specify the procedure that synthesizes the document to be indexed.</p> <p>This procedure must be owned by CTXSYS and must be executable by the index owner.</p>
output_type	<p>Specify the data type of the second argument to procedure. Valid values are CLOB, BLOB, CLOB_LOC, BLOB_LOC, or VARCHAR2. The default is CLOB.</p> <p>When you specify CLOB_LOC, BLOB_LOC, you indicate that no temporary CLOB or BLOB is needed, since your procedure copies a locator to the IN/OUT second parameter.</p>

### procedure

Specify the name of the procedure that synthesizes the document to be indexed. This specification must be in the form PROCEDURENAME or PACKAGENAME.PROCEDURENAME. The schema owner name is constrained to CTXSYS, so specifying owner name is not necessary.

The procedure you specify must have two arguments defined as follows:

```
procedure (r IN ROWID, c IN OUT NOCOPY <output_type>)
```

The first argument *r* must be of type ROWID. The second argument *c* must be of type output\_type. NOCOPY is a compiler hint that instructs Oracle to pass parameter *c* by reference if possible.

---

**Note:** The procedure name and its arguments can be named anything. The arguments *r* and *c* are used in this example for simplicity.

---

The stored procedure is called once for each row indexed. Given the rowid of the current row, procedure must write the text of the document into its second argument, whose type you specify with `output_type`.

**Constraints** The following constraints apply to procedure:

- procedure must be owned by CTXSYS
- procedure must be executable by the index owner
- procedure cannot issue DDL or transaction control statements like COMMIT

**Editing Procedure after Indexing** If you change or edit the stored procedure, indexes based upon it will not be notified, so you must manually recreate such indexes. So if the stored procedure makes use of other columns, and those column values change, the row will not be re-indexed. The row is re-indexed only when the indexed column changes.

#### **output\_type**

Specify the datatype of the second argument to procedure. You can use either CLOB, BLOB, CLOB\_LOC, BLOB\_LOC, or VARCHAR2.

### **USER\_DATASTORE with CLOB Example**

Consider a table in which the author, title, and text fields are separate, as in the `articles` table defined as follows:

```
create table articles(  
    id          number,  
    author      varchar2(80),  
    title       varchar2(120),  
    text        clob );
```

The author and title fields are to be part of the indexed document text. Assume user `appowner` writes a stored procedure with the user datastore interface that synthesizes a document from the text, author, and title fields:

```
create procedure myproc(rid in rowid, tlob in out clob) is
begin
    for c1 in (select author, title, text from articles
               where rowid = rid)
    loop
        dbms_lob.writeappend(tlob, length(c1.title), c1.title);
        dbms_lob.writeappend(tlob, length(c1.author), c1.author);
        dbms_lob.writeappend(tlob, length(c1.text), c1.text);
    end loop;
end;
```

This procedure takes in a rowid and a temporary CLOB locator, and concatenates all the article's columns into the temporary CLOB.

Because only procedures owned by CTXSYS are allowed for the user datastore, CTXSYS must wrap the user procedure (owned by `appowner`) with a CTXSYS owned procedure as follows:

```
create procedure s_myproc(rid in rowid, tlob in out clob) is
begin
    appowner.myproc(rid, tlob);
end;
```

The CTXSYS user must make sure that the index owner can execute the stub procedure by granting execute privileges as follows:

```
grant execute on s_myproc to appowner ;
```

The user `appowner` creates the preference, setting the procedure attribute to the name of the `ctxsys` stub procedure as follows:

```
begin
    ctx_ddl.create_preference('myud', 'user_datastore');
    ctx_ddl.set_attribute('myud', 'procedure', 's_myproc');
    ctx_ddl.set_attribute('myud', 'output_type', 'CLOB');
end;
```

When `appowner` creates the index on `articles(text)` using this preference, the indexing operation sees author and title in the document text.

## USER\_DATASTORE with BLOB\_LOC Example

The following procedure might be used with OUTPUT\_TYPE BLOB\_LOC:

```

procedure myds(rid in rowid, dataout in out nocopy blob)
is
  l_dtype varchar2(10);
  l_pk    number;
begin
  select dtype, pk into l_dtype, l_pk from mytable where rowid = rid;
  if (l_dtype = 'MOVIE') then
    select movie_data into dataout from movietab where fk = l_pk;
  elsif (l_dtype = 'SOUND') then
    select sound_data into dataout from soundtab where fk = l_pk;
  end if;
end;
```

Because only procedures owned by CTXSYS are allowed for the user datastore, CTXSYS must wrap the user procedure (owned by appowner) with a CTXSYS owned procedure as follows:

```

create procedure s_myproc(rid in rowid, tlob in out blob) is
begin
  appowner.myds(rid, tlob);
end;
```

The CTXSYS user must make sure that the index owner can execute the stub procedure by granting execute privileges as follows:

```
grant execute on s_myproc to appowner ;
```

The user appowner creates the preference, setting the procedure and output\_type attributes to correspond to the ctxsys stub procedure as follows:

```

begin
  ctx_ddl.create_preference('myud', 'user_datastore');
  ctx_ddl.set_attribute('myud', 'procedure', 's_myproc');
  ctx_ddl.set_attribute('myud', 'output_type', 'blob_loc');
end;
```

## NESTED\_DATASTORE

Use the nested datastore type to index documents stored as rows in a nested table.

Attribute	Attribute Value
nested_column	Specify the name of the nested table column. This attribute is required. Specify only the column name. Do not specify schema owner or containing table name.
nested_type	Specify the type of nested table. This attribute is required. You must provide owner name and type.
nested_lineno	Specify the name of the attribute in the nested table that orders the lines. This is like <code>DETAIL_LINENO</code> in detail datastore. This attribute is required.
nested_text	Specify the name of the column in the nested table type that contains the text of the line. This is like <code>DETAIL_TEXT</code> in detail datastore. This attribute is required. <code>LONG</code> column types are not supported as nested table text columns.
binary	Specify <code>FALSE</code> for Oracle to automatically insert a new line between lines when synthesizing the document text. If you specify <code>TRUE</code> , Oracle does not do this. This attribute is not required. The default is <code>FALSE</code> .

When using the nested table datastore, you must index a dummy column, because the extensible indexing framework disallows indexing the nested table column. See the example.

DML on the nested table is not automatically propagated to the dummy column used for indexing. For DML on the nested table to be propagated to the dummy column, your application code or trigger must explicitly update the dummy column.

Filter defaults for the index are based on the type of the `nested_text` column.

During validation, Oracle checks that the type exists and that the attributes you specify for `nested_lineno` and `nested_text` exist in the nested table type. Oracle does not check that the named nested table column exists in the indexed table.

## NESTED\_DATASTORE Example

**Create the Nested Table.** The following code creates a nested table and a storage table mytab for the nested table:

```
create type nt_rec as object (
  lno number, -- line number
  ltxt varchar2(80) -- text of line
);

create type nt_tab as table of nt_rec;
create table mytab (
  id number primary key, -- primary key
  dummy char(1), -- dummy column for indexing
  doc nt_tab -- nested table
)
nested table doc store as myntab;
```

**Insert Values into Nested Table** The following code inserts values into the nested table for the parent row with id equal to 1.

```
insert into mytab values (1, null, nt_tab());
insert into table(select doc from mytab where id=1) values (1, 'the dog');
insert into table(select doc from mytab where id=1) values (2, 'sat on mat ');
commit;
```

**Create Nested Table Preferences** The following code sets the preferences and attributes for the NESTED\_DATASTORE according to the definitions of the nested table type nt\_tab and the parent table mytab:

```
begin
-- create nested datastore pref
ctx_ddl.create_preference('ntds','nested_datastore');

-- nest tab column in main table
ctx_ddl.set_attribute('ntds','nested_column', 'doc');

-- nested table type
ctx_ddl.set_attribute('ntds','nested_type', 'scott.nt_tab');

-- lineno column in nested table
ctx_ddl.set_attribute('ntds','nested_lineno','lno');

--text column in nested table
ctx_ddl.set_attribute('ntds','nested_text', 'ltxt');
```

```
end;
```

**Create Index on Nested Table** The following code creates the index using the nested table datastore:

```
create index myidx on mytab(dummy) -- index dummy column, not nest table  
indextype is ctxsys.context parameters ('datastore ntds');
```

**Query Nested Datastore** The following select statement queries the index built from a nested table:

```
select * from mytab where contains(dummy, 'dog and mat')>0;  
-- returns document 1, since it has dog in line 1 and mat in line 2.
```

## Filter Types

Use the filter types to create preferences that determine how text is filtered for indexing. Filters allow word processor and formatted documents as well as plain text, HTML, and XML documents to be indexed.

For formatted documents, Oracle stores documents in their native format and uses filters to build temporary plain text or HTML versions of the documents. Oracle indexes the words derived from the plain text or HTML version of the formatted document.

To create a filter preference, you must use one of the following types:

Filter Preference type	Description
<a href="#">CHARSET_FILTER</a>	Character set converting filter
<a href="#">INSO_FILTER</a>	Inso filter for filtering formatted documents
<a href="#">NULL_FILTER</a>	No filtering required. Use for indexing plain text, HTML, or XML documents
<a href="#">USER_FILTER</a>	User-defined external filter to be used for custom filtering
<a href="#">PROCEDURE_FILTER</a>	User-defined stored procedure filter to be used for custom filtering.

## CHARSET\_FILTER

Use the CHARSET\_FILTER to convert documents from a non-database character set to the database character set.

CHARSET\_FILTER has the following attribute:

Attribute	Attribute Value
charset	<p>Specify the NLS name of source character set.</p> <p>If you specify UTF16AUTO, this filter automatically detects the if the character set is UTF16 big- or little-endian.</p> <p>Specify JAAUTO for Japanese character set auto-detection. This filter automatically detects the custom character specification in JA16EUC or JA16SJIS and converts to the database character set. This filter is useful in Japanese when your data files have mixed character sets.</p>

**See Also:** *Oracle9i Globalization and National Language Support Guide* for more information about the supported NLS character sets.

### UTF-16 Big- and Little-Endian Detection

If your character set is UTF-16, you can specify UTF16AUTO to automatically detect big- or little-endian data. Oracle does so by examining the first two bytes of the document row.

If the first two bytes are 0xFE, 0xFF, the document is recognized as little-endian and the remainder of the document minus those two bytes is passed on for indexing.

If the first two bytes are 0xFF, 0xFE, the document is recognized as big-endian and the remainder of the document minus those two bytes is passed on for indexing.

If the first two bytes are anything else, the document is assumed to be big-endian and the whole document including the first two bytes is passed on for indexing.

### Indexing Mixed-Character Set Columns

A mixed character set column is one that stores documents of different character sets. For example, a text table might store some documents in WE8ISO8859P1 and others in UTF8.

To index a table of documents in different character sets, you must create your base table with a character set column. In this column, you specify the document

character set on a per-row basis. To index the documents, Oracle converts the documents into the database character set.

Character set conversion works with the `CHARSET_FILTER`. When the `charset` column is `NULL` or not recognized, Oracle assumes the source character set is the one specified in the `charset` attribute.

---

---

**Note:** Character set conversion also works with the `INSO_FILTER` when the document format column is set to `TEXT`.

---

---

**Indexing Mixed-Character Set Example** For example, create the table with a `charset` column:

```
create table hdocs (
    id number primary key,
    fmt varchar2(10),
    cset varchar2(20),
    text varchar2(80)
);
```

**Insert plain-text documents and name the character set:**

```
insert into hdocs values(1, 'text', 'WE8ISO8859P1', '/docs/iso.txt');
insert in hdocs values (2, 'text', 'UTF8', '/docs/utf8.txt');
commit;
```

**Create the index and name the charset column:**

```
create index hdocsx on hdocs(text) indextype is ctxsys.context
parameters ('datastore ctxsys.file_datastore
filter ctxsys.charset_filter
format column fmt
charset column cset');
```

## INSO\_FILTER

The Inso filter is a universal filter that filters most document formats. This filtering technology is licensed from Inso Chicago Corporation.

Use it for indexing single and mixed-format columns.

**See Also:** For a list of the formats supported by INSO\_FILTER and to learn more about how to set up your environment to use this filter, see [Appendix B, "Supported Document Formats"](#).

The INSO\_FILTER has the following attribute:

Attribute	Attribute Values
timeout	<p>Specify the INSO_FILTER timeout in seconds. Use a number between 0 and 42,949,672. Default is 120. Setting this value 0 disables the feature.</p> <p>This value is the time Oracle waits for the INSO_FILTER to start writing filtered output for a document row. If this time is reached and the INSO_FILTER has not started to write output, the indexing operation terminates for the document row and an error is recorded in the CTX_USER_INDEX_ERRORS view. Oracle moves to the next document row to be indexed.</p> <p>This feature is disabled for rows for which the corresponding charset and format column cause the INSO_FILTER to bypass the row, such as when format is marked TEXT.</p> <p>Use this feature to prevent the Oracle indexing operation from waiting indefinitely on a hanging Inso filter operation.</p>

### Indexing Formatted Documents

To index a text column containing formatted documents such as Microsoft Word, use the INSO\_FILTER. This filter automatically detects the document format. You can use the CTXSYS.INSO\_FILTER system-defined preference in the parameter clause as follows:

```
create index hdocsx on hdocs(text) indextype is ctxsys.context
  parameters ('datastore ctxsys.file_datastore
    filter ctxsys.inso_filter');
```

## Bypassing Plain Text or HTML in Mixed Format Columns

A mixed-format column is a text column containing more than one document format, such as a column that contains Microsoft Word, PDF, plain text, and HTML documents.

The INSO\_FILTER can index mixed-format columns. However, you might want to have the INSO filter bypass the plain text or HTML documents. Filtering plain text or HTML with the INSO\_FILTER is redundant.

The format column in the base table allows you to specify the type of document contained in the text column. The only two types you can specify are TEXT and BINARY. During indexing, the INSO\_FILTER ignores any document typed TEXT (assuming the charset column is not specified.)

To set up the INSO\_FILTER bypass mechanism, you must create a format column in your base table.

For example:

```
create table hdocs (
    id number primary key,
    fmt varchar2(10),
    text varchar2(80)
);
```

Assuming you are indexing mostly Word documents, you specify BINARY in the format column to filter the Word documents. Alternatively, to have the INSO\_FILTER ignore an HTML document, specify TEXT in the format column.

For example, the following statements add two documents to the text table, assigning one format as BINARY and the other TEXT:

```
insert into hdocs values(1, 'binary', '/docs/myword.doc');
insert in hdocs values (2, 'text', '/docs/index.html');
commit;
```

To create the index, use CREATE INDEX and specify the format column name in the parameter string:

```
create index hdocsx on hdocs(text) indextype is ctxsys.context
parameters ('datastore ctxsys.file_datastore
filter ctxsys.inso_filter
format column fmt');
```

If you do not specify TEXT or BINARY for the format column, BINARY is used.

---

---

**Note:** You need not specify the format column in CREATE INDEX when using the INSO\_FILTER.

---

---

### Character Set Conversion With Inso

The INSO\_FILTER converts documents to the database character set when the document format column is set to TEXT. In this case, the INSO\_FILTER looks at the charset column to determine the document character set.

If the charset column value is not an Oracle character set name, the document is passed through without any character set conversion.

---

---

**Note:** You need not specify the charset column when using the INSO\_FILTER.

---

---

If you do specify the charset column and do not specify the format column, the INSO\_FILTER works like the [CHARSET\\_FILTER](#), except that in this case there is no Japanese character set auto-detection.

**See Also:** ["CHARSET\\_FILTER"](#) on page 2-31.

### Plain Text Indexing and the INSO\_FILTER

Oracle does not recommend using INSO\_FILTER to index plain text documents.

If your table contains text documents exclusively, use the [NULL\\_FILTER](#) or the [USER\\_FILTER](#).

If your table contains text documents mixed with formatted documents, Oracle recommends creating a format column and marking the text documents as TEXT to bypass INSO\_FILTER. In such cases, Oracle also recommends creating a charset column to indicate the document character set.

However, if you use INSO\_FILTER to index nonbinary (text) documents *and* you specify no format column and no charset column, the INSO\_FILTER processes the document. Your indexing process is thus subject to the character set limitations of

Inso technology. Specifically, your application must ensure that one of the following conditions is true:

- The document character set is the same as the database character set and the database character set is one of the following:
  - US7ASCII
  - WE8ISO8859P1
  - JA16SJIS
  - KO16KSC5601
  - ZHS16CGB231280
  - ZHT16BIG5
- The database character set is none of those listed above and the document is in the WE8ISO8859P1 character set.

## NULL\_FILTER

Use the NULL\_FILTER type when plain text or HTML is to be indexed and no filtering needs to be performed. NULL\_FILTER has no attributes.

### Indexing HTML Documents

If your document set is entirely HTML, Oracle recommends that you use the NULL\_FILTER in your filter preference.

For example, to index an HTML document set, you can specify the system-defined preferences for NULL\_FILTER and HTML\_SECTION\_GROUP as follows:

```
create index myindex on docs(htmlfile) indextype is ctxsys.context
  parameters('filter ctxsys.null_filter
             section group ctxsys.html_section_group');
```

**See Also:** For more information on section groups and indexing HTML documents, see ["Section Group Types"](#) in this chapter.

## USER\_FILTER

Use the `USER_FILTER` type to specify an external filter for filtering documents in a column. `USER_FILTER` has the following attribute:

Attribute	Attribute Values
command	Specify the name of the filter executable.

### command

Specify the executable for the single external filter used to filter all text stored in a column. If more than one document format is stored in the column, the external filter specified for `command` must recognize and handle all such formats.

The executable you specify must exist in the `$ORACLE_HOME/ctx/bin` directory. You must create your user-filter executable with two parameters: the first is the name of the input file to be read, and the second is the name of the output file to be written to.

If all the document formats are supported by `INSO_FILTER`, use `INSO_FILTER` instead of `USER_FILTER` unless additional tasks besides filtering are required for the documents.

### User Filter Example

The following example perl script to be used as the user filter. This script converts the input text file specified in the first argument to uppercase and writes the output to the location specified in the second argument:

```
#!/usr/local/bin/perl

open(IN, $ARGV[0]);
open(OUT, ">". $ARGV[1]);

while (<IN>)
{
    tr/a-z/A-Z/;
    print OUT;
}

close (IN);
close (OUT);
```

Assuming that this file is named `upcase.pl`, create the filter preference as follows:

```
begin
  ctx_ddl.create_preference
  (
    preference_name => 'USER_FILTER_PREF',
    object_name      => 'USER_FILTER'
  );
  ctx_ddl.set_attribute
  ('USER_FILTER_PREF', 'COMMAND', 'upcase.pl');
end;
```

Create the index in SQL\*Plus as follows:

```
create index user_filter_idx on user_filter ( docs )
  indextype is ctxsys.context
  parameters ( 'FILTER USER_FILTER_PREF' );
```

**PROCEDURE\_FILTER**

Use the `PROCEDURE_FILTER` type to filter your documents with a stored procedure. The stored procedure is called each time a document needs to be filtered.

This type has the following attributes:

Attribute	Purpose	Allowable Values
procedure	Name of the filter stored procedure.	Any CTXSYS owned procedure. The procedure can be a PL/SQL or Java stored procedure.
input_type	Type of input argument for stored procedure.	VARCHAR2, BLOB, CLOB, FILE
output_type	Type of output argument for stored procedure.	VARCHAR2, CLOB, FILE
rowid_parameter	Include rowid parameter?	TRUE/FALSE
format_parameter	Include format parameter?	TRUE/FLASE
charset_parameter	Include charset parameter?	TRUE/FLASE

**procedure**

Specify the name of the stored procedure to use for filtering. The procedure can be a PL/SQL or Java stored procedure. The procedure can be a safe callout or call a safe callout.

The procedure must be owned by CTXSYS and have one of the following signatures:

```
PROCEDURE(IN BLOB, IN OUT NOCOPY CLOB)
PROCEDURE(IN CLOB, IN OUT NOCOPY CLOB)
PROCEDURE(IN VARCHAR, IN OUT NOCOPY CLOB)
PROCEDURE(IN BLOB, IN OUT NOCOPY VARCHAR2)
PROCEDURE(IN CLOB, IN OUT NOCOPY VARCHAR2)
PROCEDURE(IN VARCHAR2, IN OUT NOCOPY VARCHAR2)
PROCEDURE(IN BLOB, IN VARCHAR2)
PROCEDURE(IN CLOB, IN VARCHAR2)
PROCEDURE(IN VARCHAR2, IN VARCHAR2)
```

The first argument is the content of the unfiltered row as passed out by the datastore. The second argument is for the procedure to pass back the filtered document text.

The procedure attribute is mandatory and has no default.

**input\_type**

Specify the type of the input argument of the filter procedure. You can specify one of the following:

Type	Description
BLOB	The input argument is of type BLOB. The unfiltered document is contained in the BLOB passed in.
CLOB	The input argument is of type CLOB. The unfiltered document is contained in the CLOB passed in.  No pre-filtering or character set conversion is done. If the datastore outputs binary data, that binary data is written directly to the CLOB, with NLS doing implicit mapping to character data as best it can.
VARCHAR2	The input argument is of type VARCHAR2. The unfiltered document is contained in the VARCHAR2 passed in.  The document can be a maximum of 32767 bytes of data. If the unfiltered document is greater than this length, an error is raised for the document and the filter procedure is not called.

Type	Description
FILE	<p>The input argument is of type VARCHAR2. The unfiltered document content is contained in a temporary file in the file system whose filename is stored in the VARCHAR2 passed in.</p> <p>For example, the value of the passed-in VARCHAR2 might be 'tmp/mydoc.tmp' which means that the document content is stored in the file '/tmp/mydoc.tmp'.</p> <p>The file input type is useful only when your procedure is a safe callout, which can read the file.</p>

The input\_type attribute is not mandatory. If not specified, BLOB is the default.

**output\_type**

Specify the type of output argument of the filter procedure. You can specify one of the following types:

Type	Description
CLOB	The output argument is IN OUT NOCOPY CLOB. Your procedure must write the filtered content to the CLOB passed in.
VARCHAR2	The output argument is IN OUT NOCOPY VARCHAR2. Your procedure must write the filtered content to the VARCHAR2 variable passed in.
FILE	<p>The output argument must be IN VARCHAR2. On entering the filter procedure, the output argument is the name of a temporary file. The filter procedure must write the filtered contents to this named file.</p> <p>Using a FILE output type is useful only when the procedure is a safe callout, which can write to the file.</p>

The output\_type attribute is not mandatory. If not specified, CLOB is the default.

**rowid\_parameter**

When you specify TRUE, the rowid of the document to be filtered is passed as the first parameter, before the input and output parameters.

For example, with INPUT\_TYPE BLOB, OUTPUT\_TYPE CLOB, and ROWID\_PARAMETER TRUE, the filter procedure must have the signature as follows:

```
procedure(in rowid, in blob, in out nocopy clob)
```

This attribute is useful for when your procedure requires data from other columns or tables. This attribute is not mandatory. The default is FALSE.

**format\_parameter**

When you specify TRUE, the value of the format column of the document being filtered is passed to the filter procedure before input and output parameters, but after the rowid parameter, if enabled.

You specify the name of the format column at index time in the parameters string, using the keyword 'format column <columnname>'. The parameter type must be IN VARCHAR2.

The format column value can be read via the rowid parameter, but this attribute allows a single filter to work on multiple table structures, because the format attribute is abstracted and does not require the knowledge of the name of the table or format column.

FORMAT\_PARAMETER is not mandatory. The default is FALSE.

**charset\_parameter**

When you specify TRUE, the value of the charset column of the document being filtered is passed to the filter procedure before input and output parameters, but after the rowid and format parameter, if enabled.

You specify the name of the charset column at index time in the parameters string, using the keyword 'charset column <columnname>'. The parameter type must be IN VARCHAR2.

CHARSET\_PARAMETER attribute is not mandatory. The default is FALSE.

**Parameter Order**

ROWID\_PARAMETER, FORMAT\_PARAMETER, and CHARSET\_PARAMETER are all independent. The order is rowid, the format, then charset, but the filter procedure is passed only the minimum parameters required.

For example, assume that INPUT\_TYPE is BLOB and OUTPUT\_TYPE is CLOB. If your filter procedure requires all parameters, the procedure signature must be:

```
(id IN ROWID, format IN VARCHAR2, charset IN VARCHAR2, input IN BLOB, output IN OUT NOCOPY CLOB)
```

If your procedure requires only the ROWID, then the procedure signature must be:

```
(id IN ROWID, input IN BLOB, output IN OUT NOCOPY CLOB)
```

## Create Index Requirements

In order to create an index using a `PROCEDURE_FILTER` preference, the index owner must have execute permission on the procedure. Oracle checks this at index time, which is similar to the security measures for `USER_DATASTORE`.

## Error Handling

The filter procedure can raise any errors needed through the normal PL/SQL `raise_application_error` facility. These errors are propagated to the [CTX\\_USER\\_INDEX\\_ERRORS](#) view or reported to the user, depending on how the filter is invoked.

## Procedure Filter Preference Example

Consider a filter procedure `CTXSYS.NORMALIZE` that you define with the following signature:

```
PROCEDURE NORMALIZE(id IN ROWID, charset IN VARCHAR2, input IN CLOB,  
output IN OUT NOCOPY VARCHAR2);
```

To use this procedure as your filter, set up your filter preference as follows:

```
begin  
ctx_ddl.create_preference('myfilt', 'procedure_filter');  
ctx_ddl.set_attribute('myfilt', 'procedure', 'normalize');  
ctx_ddl.set_attribute('myfilt', 'input_type', 'clob');  
ctx_ddl.set_attribute('myfilt', 'output_type', 'varchar2');  
ctx_ddl.set_attribute('myfilt', 'rowid_parameter', 'TRUE');  
ctx_ddl.set_attribute('myfilt', 'charset_parameter', 'TRUE');  
end;
```

# Lexer Types

Use the lexer preference to specify the language of the text to be indexed. To create a lexer preference, you must use one of the following lexer types:

type	Description
<a href="#">BASIC_LEXER</a>	Lexer for extracting tokens from text in languages, such as English and most western European languages that use white space delimited words.
<a href="#">MULTI_LEXER</a>	Lexer for indexing tables containing documents of different languages
<a href="#">CHINESE_VGRAM_LEXER</a>	Lexer for extracting tokens from Chinese text
<a href="#">JAPANESE_VGRAM_LEXER</a>	Lexer for extracting tokens from Japanese text.
<a href="#">JAPANESE_LEXER</a>	Lexer for extracting tokens from Japanese text.
<a href="#">KOREAN_LEXER</a>	Lexer for extracting tokens from Korean text.
<a href="#">KOREAN_MORPH_LEXER</a>	Lexer for extracting tokens from Korean text (recommended).

## BASIC\_LEXER

Use the BASIC\_LEXER type to identify tokens for creating Text indexes for English and all other supported whitespace delimited languages.

The BASIC\_LEXER also enables base-letter conversion, composite word indexing, case-sensitive indexing and alternate spelling for whitespace delimited languages that have extended character sets.

In English and French, you can use the BASIC\_LEXER to enable theme indexing.

---

---

**Note:** Any processing the lexer does to tokens before indexing (for example, removal of characters, and base-letter conversion) are also performed on query terms at query time. This ensures that the query terms match the form of the tokens in the Text index.

---

---

BASIC\_LEXER supports any database character set.

BASIC\_LEXER has the following attributes:

Attribute	Attribute Values
continuation	<i>characters</i>
numgroup	<i>characters</i>
numjoin	<i>characters</i>
printjoins	<i>characters</i>
punctuations	<i>characters</i>
skipjoins	<i>characters</i>
startjoins	<i>non alphanumeric characters that occur at the beginning of a token (string)</i>
endjoins	<i>non alphanumeric characters that occur at the end of a token (string)</i>
whitespace	<i>characters (string)</i>
newline	NEWLINE (\n) CARRIAGE_RETURN (\r)
base_letter	NO (disabled)
	YES (enabled)
mixed_case	NO (disabled)

Attribute	Attribute Values
	YES (enabled)
composite	DEFAULT (no composite word indexing, default) GERMAN (German composite word indexing) DUTCH (Dutch composite word indexing)
index_themes	YES (enabled) NO (disabled, default)
index_text	YES (enabled, default) NO (disabled)
prove_themes	YES(enabled, default) NO (disabled)
theme_language	AUTO (default) (any NLS supported language)
alternate_spelling	GERMAN (German alternate spelling) DANISH (Danish alternate spelling) SWEDISH (Swedish alternate spelling) NONE (No alternate spelling, default)

### continuation

Specify the characters that indicate a word continues on the next line and should be indexed as a single token. The most common continuation characters are hyphen '-' and backslash '\'.

### numgroup

Specify a single character that, when it appears in a string of digits, indicates that the digits are groupings within a larger single unit.

For example, comma ',' might be defined as a numgroup character because it often indicates a grouping of thousands when it appears in a string of digits.

### numjoin

Specify the characters that, when they appear in a string of digits, cause Oracle to index the string of digits as a single unit or word.

For example, period '.' can be defined as numjoin characters because it often serves as decimal points when it appears in a string of digits.

---

---

**Note:** The default values for numjoin and numgroup are determined by the NLS initialization parameters that are specified for the database.

In general, a value need not be specified for either numjoin or numgroup when creating a lexer preference for BASIC\_LEXER.

---

---

### printjoins

Specify the non alphanumeric characters that, when they appear anywhere in a word (beginning, middle, or end), are processed as alphanumeric and included with the token in the Text index. This includes printjoins that occur consecutively.

For example, if the hyphen '-' and underscore '\_' characters are defined as printjoins, terms such as *pseudo-intellectual* and *\_file\_* are stored in the Text index as *pseudo-intellectual* and *\_file\_*.

---

---

**Note:** If a printjoins character is also defined as a punctuations character, the character is only processed as an alphanumeric character if the character immediately following it is a standard alphanumeric character or has been defined as a printjoins or skipjoins character.

---

---

### punctuations

Specify the non-alphanumeric characters that, when they appear at the end of a word, indicate the end of a sentence. The defaults are period '.', question mark '?', and exclamation point '!'.

Characters that are defined as punctuations are removed from a token before text indexing. However, if a punctuations character is also defined as a printjoins character, the character is removed only when it is the last character in the token and it is immediately preceded by the same character.

For example, if the period (.) is defined as both a printjoins and a punctuations character, the following transformations take place during indexing and querying as well:

Token	Indexed Token
.doc	.doc
dog.doc	dog.doc
dog..doc	dog..doc
dog.	dog
dog...	dog..

In addition, BASIC\_LEXER uses punctuations characters in conjunction with newline and whitespace characters to determine sentence and paragraph delimiters for sentence/paragraph searching.

### skipjoins

Specify the non-alphanumeric characters that, when they appear within a word, identify the word as a single token; however, the characters are not stored with the token in the Text index.

For example, if the hyphen character '-' is defined as a skipjoins, the word *pseudo-intellectual* is stored in the Text index as *pseudointellectual*.

---

---

**Note:** printjoins and skipjoins are mutually exclusive. The same characters cannot be specified for both attributes.

---

---

### startjoins/endjoins

For startjoins, specify the characters that when encountered as the first character in a token explicitly identify the start of the token. The character, as well as any other startjoins characters that immediately follow it, is included in the Text index entry for the token. In addition, the first startjoins character in a string of startjoins characters implicitly ends the previous token.

For endjoins, specify the characters that when encountered as the last character in a token explicitly identify the end of the token. The character, as well as any other *startjoins* characters that immediately follow it, is included in the Text index entry for the token.

The following rules apply to both startjoins and endjoins:

- The characters specified for startjoins/endjoins cannot occur in any of the other attributes for BASIC\_LEXER.

- startjoins/endjoins characters can occur only at the beginning or end of tokens

### **whitespace**

Specify the characters that are treated as blank spaces between tokens. BASIC\_LEXER uses whitespace characters in conjunction with punctuations and newline characters to identify character strings that serve as sentence delimiters for sentence and paragraph searching.

The predefined default values for whitespace are 'space' and 'tab'. These values cannot be changed. Specifying characters as whitespace characters adds to these defaults.

### **newline**

Specify the characters that indicate the end of a line of text. BASIC\_LEXER uses newline characters in conjunction with punctuations and whitespace characters to identify character strings that serve as paragraph delimiters for sentence and paragraph searching.

The only valid values for newline are NEWLINE and CARRIAGE\_RETURN (for carriage returns). The default is NEWLINE.

### **base\_letter**

Specify whether characters that have diacritical marks (umlauts, cedillas, acute accents, and so on) are converted to their base form before being stored in the Text index. The default is NO (base-letter conversion disabled).

---

---

**Note:** In German, if alternate spelling is set with base letter conversion, Oracle reduces word queries to their alternate spelling forms.

---

---

### **mixed\_case**

Specify whether the lexer leaves the tokens exactly as they appear in the text or converts the tokens to all uppercase. The default is NO (tokens are converted to all uppercase).

---

---

**Note:** Oracle ensures that word queries match the case sensitivity of the index being queried. As a result, if you enable case sensitivity for your Text index, queries against the index are always case sensitive.

---

---

## composite

Specify whether composite word indexing is disabled or enabled for either GERMAN or DUTCH text. The default is DEFAULT (composite word indexing disabled).

---

---

**Note:** Base-letter indexing is always off when composite word indexing is set for GERMAN or DUTCH.

Case sensitivity is always on when composite is set for GERMAN.

Case sensitivity can be on or off when composite is set for DUTCH.

---

---

**Composite User-Dictionary** In your language, you can create a user dictionary to customize how words are decomposed.

You create the user dictionary in the \$ORACLE\_HOME/ctx/data/<language id> directory. The user dictionary must have the suffix .dct.

For example, the supplied user dictionary file for German is:

```
$ORACLE_HOME/ctx/data/del/drde.dct
```

The format for the user dictionary is as follows:

```
input term <tab> output term
```

The individual parts of the decomposed word must be separated by the # character. The following example entries are for the German word *Hauptbahnhof*:

```
Hauptbahnhof<tab>Haupt#Bahnhof
Hauptbahnhofes<tab>Haupt#Bahnhof
Hauptbahnhof<tab>Haupt#Bahnhof
Hauptbahnhofef<tab>Haupt#Bahnhof
```

## index\_themes

Specify YES to index theme information in English or French. This makes ABOUT queries more precise. The index\_themes and index\_text attributes cannot both be NO.

If you use the BASIC\_LEXER and specify no value for index\_themes, this attribute defaults to NO.

---

---

**Note:** The `index_themes` attribute is supported only for the `CONTEXT` and `CTXRULE` index types.

If you create a `CTXCAT` index with `index_themes` set, the system ignores this parameter.

---

---

### **prove\_themes**

Specify YES to prove themes. Theme proving attempts to find related themes in a document. When no related themes are found, parent themes are eliminated from the document.

While theme proving is acceptable for large documents, short text descriptions with a few words rarely prove parent themes, resulting in poor recall performance with `ABOUT` queries.

Theme proving results in higher precision and less recall (less rows returned) for `ABOUT` queries. For higher recall in `ABOUT` queries and possibly less precision, you can disable theme proving. Default is YES.

The `prove_themes` attribute is supported for `CONTEXT` and `CTXRULE` indexes.

### **theme\_language**

Specify which knowledge base to use for theme generation when `index_themes` is set to YES. When `index_themes` is NO, setting this parameter has no effect on anything.

You can specify any NLS supported language or `AUTO`. You must have a knowledge base for the language you specify. This release provides a knowledge base in only English and French. In other languages, you can create your own knowledge base.

**See Also:** ["Adding a Language-Specific Knowledge Base" in Chapter 11, "Executables"](#).

The default is `AUTO`, which instructs the system to set this parameter according to the language of the environment.

### **index\_text**

Specify YES to index word information. The `index_themes` and `index_text` attributes cannot both be NO.

The default is NO.

### **alternate\_spelling**

Specify either GERMAN, DANISH, or SWEDISH to enable the alternate spelling in one of these languages. Enabling alternate spelling allows you to query a word in any of its alternate forms.

By default, alternate spelling is enabled in all three languages. You can specify NONE for no alternate spelling.

---

---

**Note:** In German, if alternate spelling is set with base letter conversion, Oracle reduces word queries to their alternate spelling forms.

---

---

**See Also:** For more information about the alternate spelling conventions Oracle uses, see [Appendix E, "Alternate Spelling Conventions"](#).

### **BASIC\_LEXER Example**

The following example sets printjoin characters and disables theme indexing with the BASIC\_LEXER:

```
begin
ctx_ddl.create_preference('mylex', 'BASIC_LEXER');
ctx_ddl.set_attribute('mylex', 'printjoins', '_-');
ctx_ddl.set_attribute ( 'mylex', 'index_themes', 'NO');
ctx_ddl.set_attribute ( 'mylex', 'index_text', 'YES');
end;
```

To create the index with no theme indexing and with printjoins characters set as above, issue the following statement:

```
create index myindex on mytable ( docs )
  indextype is ctxsys.context
  parameters ( 'LEXER mylex' );
```

## MULTI\_LEXER

Use MULTI\_LEXER to index text columns that contain documents of different languages. For example, you can use this lexer to index a text column that stores English, German, and Japanese documents.

This lexer has no attributes.

You must have a language column in your base table. To index multi-language tables, you specify the language column when you create the index.

You create a multi-lexer preference with the CTX\_DDL.CREATE\_PREFERENCE. You add language-specific lexers to the multi-lexer preference with the CTX\_DDL.ADD\_SUB\_LEXER procedure.

During indexing, the MULTI\_LEXER examines each row's language column value and switches in the language-specific lexer to process the document.

### Multi-language Stoplists

When you use the MULTI-LEXER, you can also use a multi-language stoplist for indexing.

**See Also:** [Multi-Language Stoplists](#) in this chapter.

### MULTI\_LEXER Example

Create the multi-language table with a primary key, a text column, and a language column as follows:

```
create table globaldoc (
    doc_id number primary key,
    lang varchar2(3),
    text clob
);
```

Assume that the table holds mostly English documents, with the occasional German or Japanese document. To handle the three languages, you must create three sub-lexers, one for English, one for German, and one for Japanese:

```
ctx_ddl.create_preference('english_lexer','basic_lexer');
ctx_ddl.set_attribute('english_lexer','index_themes','yes');
ctx_ddl.set_attribute('english_lexer','theme_language','english');

ctx_ddl.create_preference('german_lexer','basic_lexer');
ctx_ddl.set_attribute('german_lexer','composite','german');
ctx_ddl.set_attribute('german_lexer','mixed_case','yes');
```

```
ctx_ddl.set_attribute('german_lexer','alternate_spelling','german');

ctx_ddl.create_preference('japanese_lexer','japanese_vgram_lexer');
```

Create the multi-lexer preference:

```
ctx_ddl.create_preference('global_lexer','multi_lexer');
```

Since the stored documents are mostly English, make the English lexer the default using CTX\_DDL.ADD\_SUB\_LEXER:

```
ctx_ddl.add_sub_lexer('global_lexer','default','english_lexer');
```

Now add the German and Japanese lexers in their respective languages with CTX\_DDL.ADD\_SUB\_LEXER procedure. Also assume that the language column is expressed in the standard ISO 639-2 language codes, so add those as alternate values.

```
ctx_ddl.add_sub_lexer('global_lexer','german','german_lexer','ger');
ctx_ddl.add_sub_lexer('global_lexer','japanese','japanese_lexer','jpn');
```

Now create the index globalx, specifying the multi-lexer preference and the language column in the parameter clause as follows:

```
create index globalx on globaldoc(text) indextype is ctxsys.context
parameters ('lexer global_lexer language column lang');
```

## Querying Multi-Language Tables

At query time, the multi-lexer examines the language setting and uses the sub-lexer preference for that language to parse the query. If the language is not set, then the default lexer is used.

Otherwise, the query is parsed and run as usual. The index contains tokens from multiple languages, so such a query can return documents in several languages. To limit your query to a given language, use a structured clause on the language column.

## CHINESE\_VGRAM\_LEXER

The CHINESE\_VGRAM\_LEXER type identifies tokens in Chinese text for creating Text indexes. It has no attributes.

You can use this lexer if your database character set is one of the following:

- ZHS16CGB231280

- ZHS16GBK
- ZHT32EUC
- ZHT16BIG5
- ZHT32TRIS
- AL24UTFSS
- UTF8

## **JAPANESE\_VGRAM\_LEXER**

The JAPANESE\_VGRAM\_LEXER type identifies tokens in Japanese for creating Text indexes. It has no attributes.

You can use this lexer if your database character set is one of the following:

- JA16SJIS
- JA16EUC
- UTF8

## **JAPANESE\_LEXER**

The JAPANESE\_LEXER type identifies tokens in Japanese for creating Text indexes. It has no attributes.

This lexer offers the following benefits over the JAPANESE\_VGRAM\_LEXER:

- generates a smaller index
- better query response time
- generates real word tokens resulting in better query precision

Because the JAPANESE\_LEXER uses a new algorithm to generate tokens, indexing time is longer than with JAPANESE\_VGRAM\_LEXER.

The JAPANESE\_LEXER supports the following character sets:

- JA16SJIS
- JA16EUC
- UTF8

## Japanese Lexer Example

When you specify JAPANESE\_LEXER for creating text index, the JAPANESE\_LEXER resolves a sentence into words.

For example, the following compound word (natural language institute)

‘ 自然言語処理 ’

is indexed as three tokens:

‘ 自然 ’, ‘ 言語 ’, ‘ 処理 ’

In order to resolve a sentence into words, the internal dictionary is referenced. When a word cannot be found in the internal dictionary, Oracle uses the JAPANESE\_VGRAM\_LEXER to resolve it.

## KOREAN\_LEXER

The KOREAN\_LEXER type identifies tokens in Korean text for creating Text indexes.

---

---

**Note:** This lexer is supported for backward compatibility with older versions of Oracle Text that supported only this Korean lexer. If you are building a new application, Oracle recommends that you use the [KOREAN\\_MORPH\\_LEXER](#).

---

---

You can use this lexer if your database character set is one of the following:

- KO16KSC5601
- UTF8

When you use the KOREAN\_LEXER, you can specify the following boolean attributes:

Attribute	Attribute Values
verb	Specify TRUE or FALSE to index verbs. Default is TRUE.
adjective	Specify TRUE or FALSE to index adjectives. Default is TRUE.
adverb	Specify TRUE or FALSE to index adverb. Default is TRUE.
onechar	Specify TRUE or FALSE to index one character. Default is TRUE.
number	Specify TRUE or FALSE to index number. Default is TRUE.
udic	Specify TRUE or FALSE to index user dictionary. Default is TRUE.
xdic	Specify TRUE or FALSE to index x-user dictionary. Default is TRUE.
composite	Specify TRUE or FALSE to index composite words.
morpheme	Specify TRUE or FALSE for morphological analysis. Default is TRUE.
toupper	Specify TRUE or FALSE to convert English to uppercase. Default is TRUE.
tohangul	Specify TRUE or FALSE to convert to hanga to hangeul. Default is TRUE.

### Limitations

Sentence and paragraph sections are not supported with the Korean lexer.

## KOREAN\_MORPH\_LEXER

The KOREAN\_MORPH\_LEXER type identifies tokens in Korean text for creating Oracle Text indexes. The KOREAN\_MORPH\_LEXER lexer offers the following benefits over KOREAN\_LEXER:

- better morphological analysis of Korean text
- faster indexing
- smaller indexes
- more accurate query searching

## Supplied Dictionaries

The KOREAN\_MORPH\_LEXER uses four dictionaries:

Dictionary	File
System	\$ORACLE_HOME/ctx/data/kolx/drk2sdic.dat
Grammar	\$ORACLE_HOME/ctx/data/kolx/drk2gram.dat
Stopword	\$ORACLE_HOME/ctx/data/kolx/drk2xdic.dat
User-defined	\$ORACLE_HOME/ctx/data/kolx/drk2udic.dat

The grammar, user-defined, and stopword dictionaries are text format KSC 5601. You can modify these dictionaries using the defined rules. The system dictionary must not be modified.

You can add unregistered words to the user-defined dictionary file. The rules for specifying new words are in the file.

## Supported Character Sets

You can use KOREAN\_MORPH\_LEXER if your database character set is one of the following:

- KO16KSC5601
- UTF8

## Attributes

When you use the KOREAN\_MORPH\_LEXER, you can specify the following attributes:

Attribute	Attribute Values
verb_adjective	Specify TRUE or FALSE to index verbs and adjectives. Default is FALSE.
one_char_word	Specify TRUE or FALSE to index one syllable. Default is FALSE.
number	Specify TRUE or FALSE to index number. Default is FALSE.
user_dic	Specify TRUE or FALSE to index user dictionary. Default is TRUE.
stop_dic	Specify TRUE or FALSE to use stop-word dictionary. Default is TRUE. The stop-word dictionary belongs to KOREAN_MORPH_LEXER.

Attribute	Attribute Values
composite	<p>Specify indexing style of composite noun.</p> <p>Specify COMPOSITE_ONLY to index only composite nouns.</p> <p>Specify NGRAM to index all noun components of a composite noun.</p> <p>Specify COMPONENT_WORD to index single noun components of composite nouns as well as the composite noun itself. Default is COMPONENT_WORD.</p> <p>The example below describes the difference between NGRAM and COMPONENT_WORD.</p>
morpheme	Specify TRUE or FALSE for morphological analysis. If set to FALSE, tokens are created from the words that are divided by delimiters such as white space in the document. Default is TRUE.
to_upper	Specify TRUE or FALSE to convert English to uppercase. Default is TRUE.
hanja	Specify TRUE to index hanja characters. If set to FALSE, hanja characters are converted to hangul characters. Default is FALSE.
long_word	Specify TRUE to index long words that have more than 16 syllables in Korean. Default is FALSE.
japanese	Specify TRUE to index Japanese characters in KSC5601 code. Default is FALSE.
english	Specify TRUE to index alphanumeric strings. Default is TRUE.

## Limitations

Sentence and paragraph sections are not supported with the Korean lexer.

## KOREAN\_MORPH\_LEXER Example: Setting Composite Attribute

You can use the composite attribute to control how composite nouns are indexed.

**NGRAM Example** When you specify NGRAM for the composite attribute, composite nouns are indexed with all possible component tokens. For example, the following composite noun (information processing institute):

‘정보처리학회’;

is indexed as six tokens:

‘정보’, ‘처리’, ‘학회’, ‘정보처리’,

‘처리학회’, ‘정보처리학회’

You can specify NGRAM indexing as follows:

```
begin
ctx_ddl.create_preference('korean_lexer','KOREAN_MORPH_LEXER');
ctx_ddl.set_attribute('korean_lexer','COMPOSITE','NGRAM');
end
```

To create the index:

```
create index koreanx on korean(text) indextype is ctxsys.context
parameters ('lexer korean_lexer');
```

**COMPONENT\_WORD Example** When you specify COMPONENT\_WORD for the composite attribute, composite nouns and their components are indexed. For example, the following composite noun (information processing institute):

‘정보처리학회’

is indexed as four tokens:

‘정보처리학회’

‘정보’, ‘처리’, ‘학회’

You can specify COMPONENT\_WORD indexing as follows:

```
begin
ctx_ddl.create_preference('korean_lexer','KOREAN_MORPH_LEXER');
ctx_ddl.set_attribute('korean_lexer','COMPOSITE','COMPONENT_WORD');
end
```

To create the index:

```
create index koreanx on korean(text) indextype is ctxsys.context
parameters ('lexer korean_lexer');
```

## Wordlist Type

Use the wordlist preference to enable the query options such as stemming, fuzzy matching for your language. You can also use the wordlist preference to enable substring and prefix indexing which improves performance for wildcard queries with CONTAINS and CATSEARCH.

To create a wordlist preference, you must use BASIC\_WORDLIST, which is the only type available.

### BASIC\_WORDLIST

Use BASIC\_WORDLIST type to enable stemming and fuzzy matching for Text indexes.

**See Also:** For more information about the stem and fuzzy operators, see [Chapter 3, "CONTAINS Query Operators"](#).

BASIC\_WORDLIST has the following attributes:

*Table 2–1*

Attribute	Attribute Values
stemmer	Specify which language stemmer to use. You can specify one of the following: NULL (no stemming) ENGLISH (English inflectional) DERIVATIONAL (English derivational) DUTCH FRENCH GERMAN ITALIAN SPANISH AUTO (automatic language-detection for stemming)

Table 2–1

Attribute	Attribute Values
fuzzy_match	Specify which fuzzy matching cluster to use. You can specify one of the following: GENERIC JAPANESE_VGRAM KOREAN CHINESE_VGRAM ENGLISH DUTCH FRENCH GERMAN ITALIAN SPANISH OCR AUTO (automatic language detection for stemming)
fuzzy_score	Specify a default lower limit of fuzzy score. Specify a number between 0 and 80. Text with scores below this number is not returned. Default is 60.
fuzzy_numresults	Specify the maximum number of fuzzy expansions. Use a number between 0 and 5,000. Default is 100.
substring_index	Specify TRUE for Oracle to create a substring index. A substring index improves left-truncated and double-truncated wildcard queries such as %ing or %benz%. Default is FALSE.
prefix_index	Specify YES to enable prefix indexing. Prefix indexing improves performance for right truncated wildcard searches such as TO%. Defaults to NO.
prefix_length_min	Specify the minimum length of indexed prefixes. Defaults to 1.
prefix_length_max	Specify the maximum length of indexed prefixes. Defaults to 64.
wildcard_maxterms	Specify the maximum number of terms in a wildcard expansion. Use a number between 1 and 15,000. Default is 5,000.

**stemmer**

Specify the stemmer used for word stemming in Text queries. When you do not specify a value for stemmer, the default is ENGLISH.

Specify AUTO for the system to automatically set the stemming language according to the language setting of the session. When there is no stemmer for a language, the default is NULL. With the NULL stemmer, the stem operator is ignored in queries.

**fuzzy\_match**

Specify which fuzzy matching routines are used for the column. Fuzzy matching is currently supported for English, Japanese, and, to a lesser extent, the Western European languages.

---

---

**Note:** The fuzzy\_match attribute values for Chinese and Korean are dummy attribute values that prevent the English and Japanese fuzzy matching routines from being used on Chinese and Korean text.

---

---

The default for fuzzy\_match is GENERIC.

Specify AUTO for the system to automatically set the fuzzy matching language according to language setting of the session.

**fuzzy\_score**

Specify a default lower limit of fuzzy score. Specify a number between 0 and 80. Text with scores below this below this number are not returned. The default is 60.

Fuzzy score is a measure of how close the expanded word is to the query word. The higher the score the better the match. Use this parameter to limit fuzzy expansions to the best matches.

**fuzzy\_numresults**

Specify the maximum number of fuzzy expansions. Use a number between 0 and 5000. The default is 100.

Setting a fuzzy expansion limits the expansion to a specified number of the best matching words.

**substring\_index**

Specify TRUE for Oracle to create a substring index. A substring index improves performance for left-truncated or double-truncated wildcard queries such as *%ing* or *%benz%*. The default is false.

Substring indexing has the following impact on indexing and disk resources:

- Index creation and DML processing is up to 4 times slower

- The size of the substring index created is approximately the size of the \$X index on the word table.
- Index creation with `substring_index` enabled requires more rollback segments during index flushes than with substring index off. Oracle recommends that you do either of the following when creating a substring index:
  - make available double the usual rollback or
  - decrease the index memory to reduce the size of the index flushes to disk

**prefix\_index**

Specify `yes` to enable prefix indexing. Prefix indexing improves performance for right truncated wildcard searches such as `TO%`. Defaults to `NO`.

---

---

**Note:** Enabling prefix indexing increases index size.

---

---

Prefix indexing chops up tokens into multiple prefixes to store in the \$I table. For example, words `TOKEN` and `TOY` are normally indexed like this in the \$I table:

Token	Type	Information
TOKEN	0	DOCID 1 POS 1
TOY	0	DOCID 1 POS 3

With prefix indexing, Oracle indexes the prefix substrings of these tokens as follows with a new token type of 6:

Token	Type	Information
TOKEN	0	DOCID 1 POS 1
TOY	0	DOCID 1 POS 3
T	6	DOCID 1 POS 1 POS 3
TO	6	DOCID 1 POS 1 POS 3
TOK	6	DOCID 1 POS 1
TOKE	6	DOCID 1 POS 1
TOKEN	6	DOCID 1 POS 1
TOY	6	DOCID 1 POS 3

Wildcard searches such as TO% are now faster because Oracle does no expansion of terms and merging of result sets. To obtain the result, Oracle need only examine the (TO,6) row.

**prefix\_length\_min**

Specify the minimum length of indexed prefixes. Defaults to 1.

For example, setting `prefix_length_min` to 3 and `prefix_length_max` to 5 indexes all prefixes between 3 and 5 characters long.

---

---

**Note:** A wildcard search whose pattern is below the minimum length or above the maximum length is searched using the slower method of equivalence expansion and merging.

---

---

**prefix\_length\_max**

Specify the maximum length of indexed prefixes. Defaults to 64.

For example, setting `prefix_length_min` to 3 and `prefix_length_max` to 5 indexes all prefixes between 3 and 5 characters long.

---

---

**Note:** A wildcard search whose pattern is below the minimum length or above the maximum length is searched using the slower method of equivalence expansion and merging.

---

---

**wildcard\_maxterms**

Specify the maximum number of terms in a wildcard (%) expansion. Use this parameter to keep wildcard query performance within an acceptable limit. Oracle returns an error when the wildcard query expansion exceeds this number.

## BASIC\_WORDLIST Example

### Enabling Fuzzy Matching and Stemming

The following example enables stemming and fuzzy matching for English. The preference `STEM_FUZZY_PREF` sets the number of expansions to the maximum

allowed. This preference also instructs the system to create a substring index to improve the performance of double-truncated searches.

```
begin
  ctx_ddl.create_preference('STEM_FUZZY_PREF', 'BASIC_WORDLIST');
  ctx_ddl.set_attribute('STEM_FUZZY_PREF', 'FUZZY_MATCH', 'ENGLISH');
  ctx_ddl.set_attribute('STEM_FUZZY_PREF', 'FUZZY_SCORE', '0');
  ctx_ddl.set_attribute('STEM_FUZZY_PREF', 'FUZZY_NUMRESULTS', '5000');
  ctx_ddl.set_attribute('STEM_FUZZY_PREF', 'SUBSTRING_INDEX', 'TRUE');
  ctx_ddl.set_attribute('STEM_FUZZY_PREF', 'STEMMER', 'ENGLISH');
end;
```

To create the index in SQL, issue the following statement:

```
create index fuzzy_stem_subst_idx on mytable ( docs )
  indextype is ctxsys.context parameters ('Wordlist STEM_FUZZY_PREF');
```

## Enabling Sub-string and Prefix Indexing

The following example sets the wordlist preference for prefix and sub-string indexing. For prefix indexing, it specifies that Oracle create token prefixes between 3 and 4 characters long:

```
begin
  ctx_ddl.create_preference('mywordlist', 'BASIC_WORDLIST');
  ctx_ddl.set_attribute('mywordlist', 'PREFIX_INDEX', 'YES');
  ctx_ddl.set_attribute('mywordlist', 'PREFIX_MIN_LENGTH', 3);
  ctx_ddl.set_attribute('mywordlist', 'PREFIX_MAX_LENGTH', 4);
  ctx_ddl.set_attribute('mywordlist', 'SUBSTRING_INDEX', 'YES');
end
```

## Setting Wildcard Expansion Limit

Use the `wildcard_maxterms` attribute to set the maximum allowed terms in a wildcard expansion.

```
--- create a sample table
drop table quick ;
create table quick
(
  quick_id number primary key,
  text      varchar(80)
);

--- insert a row with 10 expansions for 'tire%'
```

```
insert into quick ( quick_id, text )
  values ( 1, 'tire tirea tireb tirec tired tiree tiref tireg tireh tirei
tirej' ) ;
commit;

--- create an index using wildcard_maxterms=100
begin
  Ctx_Ddl.Create_Preference('wildcard_pref', 'BASIC_WORDLIST');
  ctx_ddl.set_attribute('wildcard_pref', 'wildcard_maxterms', 100) ;
end;
/
create index wildcard_idx on quick(text)
  indextype is ctxsys.context
  parameters ('Wordlist wildcard_pref') ;

--- query on 'tire%' - should work fine
select quick_id from quick
  where contains ( text, 'tire%' ) > 0;

--- now recreate the index with wildcard_maxterms=5

drop index wildcard_idx ;

begin
  Ctx_Ddl.Drop_Preference('wildcard_pref');
  Ctx_Ddl.Create_Preference('wildcard_pref', 'BASIC_WORDLIST');
  ctx_ddl.set_attribute('wildcard_pref', 'wildcard_maxterms', 5) ;
end;
/

create index wildcard_idx on quick(text)
  indextype is ctxsys.context
  parameters ('Wordlist wildcard_pref') ;

--- query on 'tire%' gives "wildcard query expansion resulted in too many terms"
select quick_id from quick
  where contains ( text, 'tire%' ) > 0;
```

# Storage Types

Use the storage preference to specify tablespace and creation parameters for tables associated with a Text index. The system provides a single storage type called BASIC\_STORAGE:

type	Description
BASIC_STORAGE	Indexing type used to specify the tablespace and creation parameters for the database tables and indexes that constitute a Text index.

## BASIC\_STORAGE

The BASIC\_STORAGE type specifies the tablespace and creation parameters for the database tables and indexes that constitute a Text index.

The clause you specify is added to the internal CREATE TABLE (CREATE INDEX for the i\_index\_clause) statement at index creation. You can specify most allowable clauses, such as storage, LOB storage, or partitioning. However, you cannot specify an index organized table clause.

**See Also:** For more information about how to specify CREATE TABLE and CREATE INDEX statements, see *Oracle9i SQL Reference*.

BASIC\_STORAGE has the following attributes:

Attribute	Attribute Value
i_table_clause	Parameter clause for dr\$indexname\$I table creation. Specify storage and tablespace clauses to add to the end of the internal CREATE TABLE statement.  The I table is the index data table.
k_table_clause	Parameter clause for dr\$indexname\$K table creation. Specify storage and tablespace clauses to add to the end of the internal CREATE TABLE statement.  The K table is the keymap table.
r_table_clause	Parameter clause for dr\$indexname\$R table creation. Specify storage and tablespace clauses to add to the end of the internal CREATE TABLE statement.  The R table is the rowid table.  The default clause is: 'LOB(DATA) STORE AS (CACHE)'

Attribute	Attribute Value
n_table_clause	Parameter clause for dr\$ <i>indexname</i> \$N table creation. Specify storage and tablespace clauses to add to the end of the internal CREATE TABLE statement.  The N table is the negative list table.
i_index_clause	Parameter clause for dr\$ <i>indexname</i> \$X index creation. Specify storage and tablespace clauses to add to the end of the internal CREATE INDEX statement. The default clause is: 'COMPRESS e'
p_table_clause	Parameter clause for the substring index if you have enabled SUBSTRING_INDEX in the BASIC_WORDLIST.  Specify storage and tablespace clauses to add to the end of the internal CREATE INDEX statement. The P table is an index-organized table so the storage clause you specify must be appropriate to this type of table.

### Storage Default Behavior

By default, BASIC\_STORAGE attributes are not set. In such cases, the Text index tables are created in the index owner's default tablespace. Consider the following statement, issued by user IUSER, with no BASIC\_STORAGE attributes set:

```
create index IOWNER.idx on TOWNER.tab(b) indextype is ctxsys.context;
```

In this example, the text index is created in IOWNER's default tablespace.

### Storage Example

The following examples specify that the index tables are to be created in the foo tablespace with an initial extent of 1K:

```
begin
ctx_ddl.create_preference('mystore', 'BASIC_STORAGE');
ctx_ddl.set_attribute('mystore', 'I_TABLE_CLAUSE',
    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'K_TABLE_CLAUSE',
    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'R_TABLE_CLAUSE',
    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'N_TABLE_CLAUSE',
    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'I_INDEX_CLAUSE',
    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'P_TABLE_CLAUSE',
```

```
end;                                'tablespace foo storage (initial 1K)';
```

## Section Group Types

In order to issue WITHIN queries on document sections, you must create a section group before you define your sections. You specify your section group in the parameter clause of [CREATE INDEX](#).

To create a section group, you can specify one of the following group types with the CTX\_DDL.[CREATE\\_SECTION\\_GROUP](#) procedure:

Section Group Preference	Description
NULL_SECTION_GROUP	Use this group type when you define no sections or when you define <i>only</i> SENTENCE or PARAGRAPH sections. This is the default.
BASIC_SECTION_GROUP	Use this group type for defining sections where the start and end tags are of the form <A> and </A>.
HTML_SECTION_GROUP	Use this group type for indexing HTML documents and for defining sections in HTML documents.
XML_SECTION_GROUP	Use this group type for indexing XML documents and for defining sections in XML documents.
AUTO_SECTION_GROUP	<p>Use this group type to automatically create a zone section for each start-tag/end-tag pair in an XML document. The section names derived from XML tags are case sensitive as in XML.</p> <p>Attribute sections are created automatically for XML tags that have attributes. Attribute sections are named in the form attribute@tag.</p> <p>Stop sections, empty tags, processing instructions, and comments are not indexed.</p> <p>The following limitations apply to automatic section groups:</p> <ul style="list-style-type: none"> <li>■ You cannot add zone, field, or special sections to an automatic section group.</li> <li>■ Automatic sectioning does not index XML document types (root elements.) However, you can define stop sections with document type.</li> <li>■ The length of the indexed tags, including prefix and namespace, cannot exceed 64 characters. Tags longer than this are not indexed.</li> </ul>

Section Group Preference	Description
PATH_SECTION_GROUP	Use this group type to index XML documents. Behaves like the AUTO_SECTION_GROUP.  The difference is that with this section group you can do path searching with the INPATH and HASPATH operators. Queries are also case-sensitive for tag and attribute names. Stop sections are not allowed.
NEWS_SECTION_GROUP	Use this group for defining sections in newsgroup formatted documents according to RFC 1036.

## Section Group Examples

### Creating Section Groups in HTML Documents

The following statement creates a section group called `htmgroup` with the `HTML` group type.

```
begin
ctx_ddl_create_section_group('htmgroup', 'HTML_SECTION_GROUP');
end;
```

You can optionally add sections to this group using the `CTX_DDL.ADD_SECTION` procedure. To index your documents, you can issue a statement such as:

```
create index myindex on docs(htmlfile) indextype is ctxsys.context
parameters('filter ctxsys.null_filter section group htmgroup');
```

### Creating Sections Groups in XML Documents

The following statement creates a section group called `xmlgroup` with the `XML_SECTION_GROUP` group type.

```
begin
ctx_ddl_create_section_group('xmlgroup', 'XML_SECTION_GROUP');
end;
```

You can optionally add sections to this group using the `CTX_DDL.ADD_SECTION` procedure. To index your documents, you can issue a statement such as:

```
create index myindex on docs(htmlfile) indextype is ctxsys.context
parameters('filter ctxsys.null_filter section group xmlgroup');
```

### Automatic Sectioning in XML Documents

The following statement creates a section group called `auto` with the `AUTO_SECTION_GROUP` group type. This section group automatically creates sections from tags in XML documents.

```
begin
    ctx_ddl_create_section_group('auto', 'AUTO_SECTION_GROUP');
end;

CREATE INDEX myindex on docs(htmlfile) INDEXTYPE IS ctxsys.context
PARAMETERS('filter ctxsys.null_filter section group auto');
```

## Stoplists

Stoplists identify the words in your language that are not to be indexed. In English, you can also identify stopthemes that are not to be indexed. By default, the system indexes text using the system-supplied stoplist that corresponds to your database language.

Oracle Text provides default stoplists for most languages including English, French, German, Spanish, Dutch, and Danish. These default stoplists contain only stopwords.

**See Also:** For more information about the supplied default stoplists, see [Appendix D, "Supplied Stoplists"](#).

## Multi-Language Stoplists

You can create multi-language stoplists to hold language-specific stopwords. A multi-language stoplist is useful when you use the `MULTI_LEXER` to index a table that contains documents in different languages, such as English, German, and Japanese.

To create a multi-language stoplist, use the `CTX_DLL.CREATE_STOPLIST` procedure and specify a stoplist type of `MULTI_STOPLIST`. You add language specific stopwords with `CTX_DDL.ADD_STOPWORD`.

At indexing time, the language column of each document is examined, and only the stopwords for that language are eliminated. At query time, the session language setting determines the active stopwords, like it determines the active lexer when using the multi-lexer.

## Creating Stoplists

You can create your own stoplists using the `CTX_DLL.CREATE_STOPLIST` procedure. With this procedure you can create a `BASIC_STOPLIST` for single language stoplist, or you can create a `MULTI_STOPLIST` for a multi-language stoplist.

When you create your own stoplist, you must specify it in the parameter clause of `CREATE INDEX`.

## Modifying the Default Stoplist

The default stoplist is always named `CTXSYS.DEFAULT_STOPLIST`. You can use the following procedures to modify this stoplist:

- CTX\_DDL.[ADD\\_STOPWORD](#)
- CTX\_DDL.[REMOVE\\_STOPWORD](#)
- CTX\_DDL.[ADD\\_STOPTHEME](#)
- CTX\_DDL.[ADD\\_STOPCLASS](#)

When you modify CTXSYS.DEFAULT\_STOPLIST with the CTX\_DDL package, you must re-create your index for the changes to take effect.

### Dynamic Addition of Stopwords

You can *add* stopwords dynamically to a default or custom stoplist with [ALTER INDEX](#). When you add a stopwords dynamically, you need not re-index, because the word immediately becomes a stopwords and is removed from the index.

---

---

**Note:** Even though you can dynamically add stopwords to an index, you cannot dynamically remove stopwords. To remove a stopwords, you must use CTX\_DDL.[REMOVE\\_STOPWORD](#), drop your index and recreate it.

---

---

**See Also:** [ALTER INDEX](#) in Chapter 1, "SQL Statements and Operators".

## System-Defined Preferences

When you install Oracle Text, some indexing preferences are created. You can use these preferences in the parameter clause of [CREATE INDEX](#) or define your own.

The default index parameters are mapped to some of the system-defined preferences described in this section.

**See Also:** For more information about default index parameters, see "[Default Index Parameters](#)" on page 2-75.

System-defined preferences are divided into the following categories:

- [Data Storage](#)
- [Filter](#)
- [Lexer](#)
- [Section Group](#)
- [Stoplist](#)
- [Storage](#)
- [Wordlist](#)

### Data Storage

#### CTXSYS.DEFAULT\_DATASTORE

This preference uses the [DIRECT\\_DATASTORE](#) type. You can use this preference to create indexes for text columns in which the text is stored directly in the column.

#### CTXSYS.FILE\_DATASTORE

This preference uses the [FILE\\_DATASTORE](#) type.

#### CTXSYS.URL\_DATASTORE

This preference uses the [URL\\_DATASTORE](#) type.

## Filter

### CTXSYS.NULL\_FILTER

This preference uses the [NULL\\_FILTER](#) type.

### CTXSYS.INSO\_FILTER

This preference uses the [INSO\\_FILTER](#) type.

## Lexer

### CTXSYS.DEFAULT\_LEXER

The default lexer depends on the language used at install time. The following sections describe the default settings for CTXSYS.DEFAULT\_LEXER for each language.

**American and English Language Settings** If your language is English, this preference uses the [BASIC\\_LEXER](#) with the `index_themes` attribute disabled.

**Danish Language Settings** If your language is Danish, this preference uses the [BASIC\\_LEXER](#) with the following option enabled:

- alternate spelling (`alternate_spelling` attribute set to DANISH)

**Dutch Language Settings** If your language is Dutch, this preference uses the [BASIC\\_LEXER](#) with the following options enabled:

- composite indexing (`composite` attribute set to DUTCH)
- alternate spelling (`alternate_spelling` attribute set to DUTCH)

**German and German DIN Language Settings** If your language is German, this preference uses the [BASIC\\_LEXER](#) with the following options enabled:

- case-sensitive indexing (`mixed_case` attribute enabled)
- composite indexing (`composite` attribute set to GERMAN)
- alternate spelling (`alternate_spelling` attribute set to GERMAN)

**Finnish, Norwegian, and Swedish Language Settings** If your language is Finnish, Norwegian, or Swedish, this preference uses the [BASIC\\_LEXER](#) with the following option enabled:

- alternate spelling (alternate\_spelling attribute set to SWEDISH)

**Japanese Language Settings** If your language is Japanese, this preference uses the [JAPANESE\\_VGRAM\\_LEXER](#).

**Korean Language Settings** If your language is Korean, this preference uses the [KOREAN\\_MORPH\\_LEXER](#). All attributes for the KOREAN\_MORPH\_LEXER are enabled.

**Simplified Chinese Language Settings** If your language is Simplified Chinese, this preference uses the [CHINESE\\_VGRAM\\_LEXER](#).

**Other Languages** For all other languages not listed in this section, this preference uses the [BASIC\\_LEXER](#) with no attributes set.

**See Also:** To learn more about these options, see [BASIC\\_LEXER](#) on page 2-38.

### **CTXSYS.BASIC\_LEXER**

This preference uses the BASIC\_LEXER.

## **Section Group**

### **CTXSYS.NULL\_SECTION\_GROUP**

This preference uses the NULL\_SECTION\_GROUP type.

### **CTXSYS.HTML\_SECTION\_GROUP**

This preference uses the HTML\_SECTION\_GROUP type.

### **CTXSYS.AUTO\_SECTION\_GROUP**

This preference uses the AUTO\_SECTION\_GROUP type.

### **CTXSYS.PATH\_SECTION\_GROUP**

This preference uses the PATH\_SECTION\_GROUP type.

## Stoplist

### CTXSYS.DEFAULT\_STOPLIST

This stoplist preference defaults to the stoplist of your database language.

**See Also:** For a complete list of the stop words in the supplied stoplists, see [Appendix D, "Supplied Stoplists"](#).

### CTXSYS.EMPTY\_STOPLIST

This stoplist has no words.

## Storage

### CTXSYS.DEFAULT\_STORAGE

This storage preference uses the [BASIC\\_STORAGE](#) type.

## Wordlist

### CTXSYS.DEFAULT\_WORDLIST

This preference uses the language stemmer for your database language. If your language is not listed in [Table 2-1](#) on page 2-55, this preference defaults to the NULL stemmer and the GENERIC fuzzy matching attribute.

# System Parameters

This section describes the Oracle Text system parameters. They fall into the following categories:

- [General System Parameters](#)
- [Default Index Parameters](#)

## General System Parameters

When you install Oracle Text, in addition to the system-defined preferences, the following system parameters are set:

System Parameter	Description
MAX_INDEX_MEMORY	This is the maximum indexing memory that can be specified in the parameter clause of CREATE INDEX and ALTER INDEX.
DEFAULT_INDEX_MEMORY	This is the default indexing memory used with CREATE INDEX and ALTER INDEX.
LOG_DIRECTORY	This is the directory for CTX_OUTPUT log files.
CTX_DOC_KEY_TYPE	This is the default input key type, either ROWID or PRIMARY_KEY, for the CTX_DOC procedures. Set to ROWID at install time.  See also: CTX_DOC. <a href="#">SET_KEY_TYPE</a> on page 7-22.

You can view system defaults by querying the [CTX\\_PARAMETERS](#) view. You can change defaults using the CTX\_ADM.[SET\\_PARAMETER](#) procedure.

## Default Index Parameters

This section describes the index parameters you can use when you create context and ctxcat indexes.

### CONTEXT Index Parameters

The following default parameters are used when you do not specify preferences in the parameter clause of [CREATE INDEX](#) when you create a context index. Each default parameter names a system-defined preference to use for data storage, filtering, lexing, and so on.

System Parameter	Used When	Default Value
DEFAULT_DATASTORE	No datastore preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_DATASTORE</a>
DEFAULT_FILTER_FILE	No filter preference specified in parameter clause of CREATE INDEX, and either of the following conditions is true: <ul style="list-style-type: none"> <li>■ Your files are stored in external files (BFILES) or</li> <li>■ You specify a datastore preference that uses FILE_DATASTORE</li> </ul>	<a href="#">CTXSYS.INSO_FILTER</a>
DEFAULT_FILTER_BINARY	No filter preference specified in parameter clause of CREATE INDEX, and Oracle detects that the text column datatype is RAW, LONG RAW, or BLOB.	<a href="#">CTXSYS.INSO_FILTER</a>
DEFAULT_FILTER_TEXT	No filter preference specified in parameter clause of CREATE INDEX, and Oracle detects that the text column datatype is either LONG, VARCHAR2, VARCHAR, CHAR, or CLOB.	<a href="#">CTXSYS.NULL_FILTER</a>
DEFAULT_SECTION_HTML	No section group specified in parameter clause of CREATE INDEX, and when either of the following conditions is true: <ul style="list-style-type: none"> <li>■ Your datastore preference uses URL_DATASTORE or</li> <li>■ Your filter preference uses INSO_FILTER.</li> </ul>	<a href="#">CTXSYS.HTML_SECTION_GROUP</a>

System Parameter	Used When	Default Value
DEFAULT_SECTION_TEXT	No section group specified in parameter clause of CREATE INDEX, and when you do <i>not</i> use either URL_DATASTORE or INSO_FILTER.	<a href="#">CTXSYS.NULL_SECTION_GROUP</a>
DEFAULT_STORAGE	No storage preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STORAGE</a>
DEFAULT_LEXER	No lexer preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_LEXER</a>
DEFAULT_STOPLIST	No stoplist specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STOPLIST</a>
DEFAULT_WORDLIST	No wordlist preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_WORDLIST</a>

### CTXCAT Index Parameters

The following default parameters are used when you create a CTXCAT index with CREATE INDEX and do not specify any parameters in the parameter string. The CTXCAT index supports only the index set, lexer, storage, stoplist, and wordlist parameters. Each default parameter names a system-defined preference.

System Parameter	Used When	Default Value
DEFAULT_CTXCAT_INDEX_SET	No index set specified in parameter clause of CREATE INDEX.	
DEFAULT_CTXCAT_STORAGE	No storage preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STORAGE</a>
DEFAULT_CTXCAT_LEXER	No lexer preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_LEXER</a>
DEFAULT_CTXCAT_STOPLIST	No stoplist specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STOPLIST</a>
DEFAULT_CTXCAT_WORDLIST	No wordlist preference specified in parameter clause of CREATE INDEX.  Note that while you can specify a wordlist preference for CTXCAT indexes, most of the attributes do not apply, since the catsearch query language does not support wildcarding, fuzzy, and stemming. The only attribute that is useful is PREFIX_INDEX for Japanese data.	<a href="#">CTXSYS.DEFAULT_WORDLIST</a>

## CTXRULE Index Parameters

The following default parameters are used when you create a CTXRULE index with CREATE INDEX and do not specify any parameters in the parameter string. The CTXRULE index supports only the lexer, storage, stoplist, and wordlist parameters. Each default parameter names a system-defined preference.

System Parameter	Used When	Default Value
DEFAULT_CTXRULE_LEXER	No lexer preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_LEXER</a>
DEFAULT_CTXRULE_STORAGE	No storage preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STORAGE</a>
DEFAULT_CTXRULE_STOPLIST	No stoplist specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_STOPLIST</a>
DEFAULT_CTXRULE_WORDLIST	No wordlist preference specified in parameter clause of CREATE INDEX.	<a href="#">CTXSYS.DEFAULT_WORDLIST</a>

## Viewing Default Values

You can view system defaults by querying the [CTX\\_PARAMETERS](#) view. For example, to see all parameters and values, you can issue:

```
SQL> SELECT par_name, par_value from ctx_parameters;
```

## Changing Default Values

You can change a default value using the CTX\_ADM.[SET\\_PARAMETER](#) procedure to name another custom or system-defined preference to use as default.

---

## CONTAINS Query Operators

This chapter describes operator precedence and provides description, syntax, and examples for every **CONTAINS** operator. The following topics are covered:

- Operator Precedence
- ABOUT
- ACCUMulate ( , )
- AND (&)
- Broader Term (BT, BTG, BTP, BTI)
- EQUIValence (=)
- Fuzzy
- HASPATH
- INPATH
- MINUS (-)
- Narrower Term (NT, NTG, NTP, NTI)
- NEAR (;)
- NOT (~)
- OR (|)
- Preferred Term (PT)
- Related Term (RT)
- soundex (!)
- stem (\$)

- 
- Stored Query Expression (SQE)
  - SYNonym (SYN)
  - threshold (>)
  - Translation Term (TR)
  - Translation Term Synonym (TRSYN)
  - Top Term (TT)
  - weight (\*)
  - wildcards (% \_)
  - WITHIN

## Operator Precedence

Operator precedence determines the order in which the components of a query expression are evaluated. Text query operators can be divided into two sets of operators that have their own order of evaluation. These two groups are described below as Group 1 and Group 2.

In all cases, query expressions are evaluated in order from left to right according to the precedence of their operators. Operators with higher precedence are applied first. Operators of equal precedence are applied in order of their appearance in the expression from left to right.

### Group 1 Operators

Within query expressions, the Group 1 operators have the following order of evaluation from highest precedence to lowest:

1. **EQUIValence (=)**
2. **NEAR (;)**
3. **weight (\*), threshold (>)**
4. **MINUS (-)**
5. **NOT (~)**
6. **WITHIN**
7. **AND (&)**
8. **OR (|)**
9. **ACCUMulate ( , )**

### Group 2 Operators and Characters

Within query expressions, the Group 2 operators have the following order of evaluation from highest to lowest:

1. **Wildcard Characters**
2. **ABOUT**
3. **stem (\$)**
4. **Fuzzy**
5. **soundex (!)**

## Procedural Operators

Other operators not listed under Group 1 or Group 2 are procedural. These operators have no sense of precedence attached to them. They include the SQE and thesaurus operators.

## Precedence Examples

Query Expression	Order of Evaluation
w1   w2 & w3	(w1)   (w2 & w3)
w1 & w2   w3	(w1 & w2)   w3
?w1, w2   w3 & w4	(?w1), (w2   (w3 & w4))
abc = def ghi & jkl = mno	((abc = def) ghi) & (jkl=mno)
dog and cat WITHIN body	dog and (cat WITHIN body)

In the first example, because AND has a higher precedence than OR, the query returns all documents that contain *w1* and all documents that contain both *w2* and *w3*.

In the second example, the query returns all documents that contain both *w1* and *w2* and all documents that contain *w3*.

In the third example, the fuzzy operator is first applied to *w1*, then the AND operator is applied to arguments *w3* and *w4*, then the OR operator is applied to term *w2* and the results of the AND operation, and finally, the score from the fuzzy operation on *w1* is added to the score from the OR operation.

The fourth example shows that the equivalence operator has higher precedence than the AND operator.

The fifth example shows that the AND operator has lower precedence than the WITHIN operator.

## Altering Precedence

Precedence is altered by grouping characters as follows:

- Within parentheses, expansion or execution of operations is resolved before other expansions regardless of operator precedence
- Within parentheses, precedence of operators is maintained during evaluation of expressions.
- Within brackets, expansion operators are not applied to expressions unless the operators are also within the brackets

**See Also:** For more information, see [Grouping Characters" in Chapter 4, "Special Characters in Queries"](#).

---

## ABOUT

### General Behavior

In all languages, an ABOUT query increases the number of relevant documents returned from the same query without this operator. Oracle scores results for an ABOUT query with the most relevant document receiving the highest score.

### English and French Behavior

In English and French, use the ABOUT operator to query on concepts. The system looks up concept information in the theme component of the index.

---

---

**Note:** You need not have a theme component in the index to issue ABOUT queries in English. However, having a theme component in the index yields the best results for ABOUT queries.

Currently, you can only create a theme component with a CONTEXT index.

---

---

Oracle retrieves documents that contain concepts that are related to your query word or phrase. For example, if you issue an ABOUT query on *California*, the system might return documents that contain the terms *Los Angeles* and *San Francisco*, which are cities in California. The document need not contain the term *California* to be returned in this ABOUT query.

The word or phrase specified in your ABOUT query need not exactly match the themes stored in the index. Oracle normalizes the word or phrase before performing lookup in the index.

You can use the ABOUT operator with the CONTAINS and CATSEARCH SQL operators.

### Improving ABOUT Results

The ABOUT operator uses the supplied knowledge base in English and French to interpret the phrase you enter. Your ABOUT query therefore is limited to knowing and interpreting the concepts in the knowledge base.

You can improve the results of your ABOUT queries by adding your application-specific terminology to the knowledge base.

**See Also:** [Extending the Knowledge Base](#) in [Chapter 11](#), "Executables".

Syntax

Syntax	Description
about( <i>phrase</i> )	<p>In all languages, increases the number of relevant documents returned for the same query without the ABOUT operator. The <i>phrase</i> parameter can be a single word or a phrase, or a string of words in free text format.</p> <p>In English, returns documents that contain concepts related to <i>phrase</i>. The score returned is a relevance score.</p> <p>Oracle ignores any query operators that are included in <i>phrase</i>.</p> <p>If your index contains only theme information, an ABOUT operator and operand must be included in your query on the text column or else Oracle returns an error.</p> <p>The <i>phrase</i> you specify cannot be more than 4000 characters.</p>

Case-Sensitivity

ABOUT queries give the best results when your query is formulated with proper case. This is because the normalization of your query is based on the knowledge catalog which is case-sensitive.

However, you need not type your query in exact case to obtain results from an ABOUT query. The system does its best to interpret your query. For example, if you enter a query of CISCO and the system does not find this in the knowledge catalog, the system might use Cisco as a related concept for look-up.

Limitations

The phrase you specify in an ABOUT query cannot be more than 4000 characters.

## Examples

### Single Words

To search for documents that are about soccer, use the following syntax:

```
'about(soccer)'
```

### Phrases

You can further refine the query to include documents about soccer rules in international competition by entering the phrase as the query term:

```
'about(soccer rules in international competition)'
```

In this English example, Oracle returns all documents that have themes of *soccer*, *rules*, or *international competition*.

In terms of scoring, documents which have all three themes will generally score higher than documents that have only one or two of the themes.

### Unstructured Phrases

You can also query on unstructured phrases, such as the following:

```
'about(japanese banking investments in indonesia)'
```

### Combined Queries

You can use other operators, such as AND or NOT, to combine ABOUT queries with word queries.

For example, you can issue the following combined ABOUT and word query:

```
'about(dogs) and cat'
```

You can combine an ABOUT query with another ABOUT query as follows:

```
'about(dogs) not about(labradors)'
```

---

## ACCUMulate ( , )

Use the ACCUM operator to search for documents that contain at least one occurrence of any of the query terms. The accumulate operator ranks documents according to the total term weight of a document.

### Syntax

Syntax	Description
<i>term1,term2</i>	Returns documents that contain <i>term1</i> or <i>term2</i> . Ranks documents according to document term weight, with the highest scores assigned to documents that have the highest total term weight.
<i>term1 accum term2</i>	

### Examples

The following example returns documents that contain either *soccer*, *Brazil*, or *cup* and assigns the highest scores to the documents that contain all three terms:

```
'soccer, Brazil, cup'
```

The following example also returns documents that contain either *soccer*, *Brazil*, or *cup*. However, the weight operator ensures that documents with *Brazil* score higher than documents that contain only *soccer* and *cup*.

```
'soccer, Brazil*3, cup'
```

### Notes

#### Accumulate Scoring

ACCUM scores documents based on two criteria:

- document term weights
- document term scores

Term weight refers to the weight you place on a query term. A query such as *x,y,z* has term weights of 1 for each term. A query of *x, 3\*y, z*, has term weights of 1, 3, and 1 for the individual terms.

Accumulate scoring guarantees that if a document A matches *p* terms with a total term weight of *m*, and document B matches *q* terms with a total term weight of *m+1*,

document B is guaranteed to have a higher relevance score than document A, regardless of the numbers  $p$  and  $q$ .

If two documents have the same weight  $M$ , the higher relevance score goes to the document with the higher weighted average term score.

This following table illustrates accumulate scoring:

Document	query	Score(x)	Score(y)	Score(z)	Total Term Weight	Score(query)
A	x,y,z	10	0	0	1	3
B	x,y,z	10	20	0	2	38
C	x,y,z	10	20	30	3	73
D	x,y,z	50	50	0	2	50
E	x, y*3, z	100	0	100	2	40
F	x, y*3, z	0	1	0	3	41

Each row in the table shows the score for an accumulate query. The first four rows show the scores for query  $x,y,z$  for documents A, B, C, D. The next two rows show the scores for query  $x, y*3,z$  for documents E and F. Assume that  $x, y$  and  $z$  stand for three different words. The query for document E and F has a weight of 3 on the second query term to arbitrarily make it the most important query term.

The total document term weight is shown for each document. For example, document A has a matching weight of one since only one query term matches the document. Similarly document C has a weight of 3 since all query terms with weight 1 match the document.

The table shows that documents that have higher query term weights are always scored higher than those that contain lower query term weights. For example, document C always scores higher than documents A, B, and D, since document C has the highest query term weight. Similarly, document F scores higher than document E, since F has a higher matching weight.

For documents that have equal term weights, such as document B and D, the higher score goes to the document with the higher weighted average term score, which is document D.

# AND (&)

Use the AND operator to search for documents that contain at least one occurrence of *each* of the query terms.

## Syntax

Syntax	Description
<i>term1</i> & <i>term2</i>	Returns documents that contain <i>term1</i> and <i>term2</i> . Returns the minimum score of its operands. All query terms must occur; lower score taken.
<i>term1</i> and <i>term2</i>	

## Examples

To obtain all the documents that contain the terms *blue* and *black* and *red*, issue the following query:

`'blue & black & red'`

## Notes

In an AND query, the score returned is the score of the lowest query term. In the example above, if the three individual scores for the terms *blue*, *black*, and *red* is 10, 20 and 30 within a document, the document scores 10.

---

## Broader Term (BT, BTG, BTP, BTI)

Use the broader term operators (BT, BTG, BTP, BTI) to expand a query to include the term that has been defined in a thesaurus as the broader or higher level term for a specified term. They can also expand the query to include the broader term for the broader term and the broader term for that broader term, and so on up through the thesaurus hierarchy.

### Syntax

Syntax	Description
<code>BT(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include the term defined in the thesaurus as a broader term for term.
<code>BTG(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all terms defined in the thesaurus as broader generic terms for term.
<code>BTP(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the terms defined in the thesaurus as broader partitive terms for term.
<code>BTI(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the terms defined in the thesaurus as broader instance terms for term.

#### term

Specify the operand for the broader term operator. Oracle expands *term* to include the broader term entries defined for the term in the thesaurus specified by *thes*. For example, if you specify *BTG(dog)*, the expansion includes only those terms that are defined as broader term generic for *dog*.

The number of broader terms included in the expansion is determined by the value for *level*.

#### qualifier

Specify a qualifier for *term*, if *term* is a homograph (word or phrase with multiple meanings, but the same spelling) that appears in two or more nodes in the same hierarchy branch of *thes*.

If a qualifier is not specified for a homograph in a broader term query, the query expands to include the broader terms of all the homographic terms.

**level**

Specify the number of levels traversed in the thesaurus hierarchy to return the broader terms for the specified term. For example, a level of 1 in a BT query returns the broader term entry, if one exists, for the specified term. A level of 2 returns the broader term entry for the specified term, as well as the broader term entry, if one exists, for the broader term.

The level argument is optional and has a default value of one (1). Zero or negative values for the level argument return only the original query term.

**thes**

Specify the name of the thesaurus used to return the expansions for the specified term. The thes argument is optional and has a default value of DEFAULT. A thesaurus named DEFAULT *must* exist in the thesaurus tables if you use this default value.

---

---

**Note:** If you specify thes, you must also specify level.

---

---

## Examples

The following query returns all documents that contain the term *tutorial* or the BT term defined for *tutorial* in the DEFAULT thesaurus:

```
'BT(tutorial)'
```

When you specify a thesaurus name, you must also specify level as in:

```
'BT(tutorial, 2, mythes)'
```

### Broader Term Operator on Homographs

If *machine* is a broader term for *crane* (*building equipment*) and *bird* is a broader term for *crane* (*waterfowl*) and no qualifier is specified for a broader term query, the query

```
BT(crane)
```

expands to:

```
'{crane} or {machine} or {bird}'
```

If *waterfowl* is specified as a qualifier for *crane* in a broader term query, the query

```
BT(crane{(waterfowl)})
```

expands to the query:

'{crane} or {bird}'

---

---

**Note:** When specifying a qualifier in a broader or narrower term query, the qualifier and its notation (parentheses) must be escaped, as is shown in this example.

---

---

## Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the broader terms in your thesaurus, see CTX\_THES.BT in [Chapter 10, "CTX\\_THES Package"](#).

---

## EQUIValence (=)

Use the EQUIV operator to specify an acceptable substitution for a word in a query.

### Syntax

Syntax	Description
<i>term1=term2</i>	Specifies that term2 is an acceptable substitution for term1. Score calculated as the sum of all occurrences of both terms.
<i>term1 equiv term2</i>	

### Examples

The following example returns all documents that contain either the phrase *alsatians are big dogs* or *labradors are big dogs*:

```
'labradors=alsatians are big dogs'
```

### Operator Precedence

The EQUIV operator has higher precedence than all other operators except the expansion operators (fuzzy, soundex, stem).

---

# Fuzzy

Use the fuzzy operator to expand queries to include words that are spelled similarly to the specified term. This type of expansion is helpful for finding more accurate results when there are frequent misspellings in your document set.

The new fuzzy syntax enables you to rank the result set so that documents that contain words with high similarity to the query word are scored higher than documents with lower similarity. You can also limit the number of expanded terms.

Unlike stem expansion, the number of words generated by a fuzzy expansion depends on what is in the index. Results can vary significantly according to the contents of the index.

## Supported Languages

Oracle Text supports fuzzy definitions for English, German, Italian, Dutch, Spanish, and OCR.

## Stopwords

If the fuzzy expansion returns a stopword, the stopword is not included in the query or highlighted by CTX\_DOC.HIGHLIGHT or CTX\_DOC.MARKUP.

## Base-Letter Conversion

If base-letter conversion is enabled for a text column and the query expression contains a fuzzy operator, Oracle operates on the base-letter form of the query.

## Syntax

```
fuzzy(term, score, numresults, weight)
```

Parameter	Description
term	Specify the word on which to perform the fuzzy expansion. Oracle expands term to include words only in the index.
score	Specify a similarity score. Terms in the expansion that score below this number are discarded. Use a number between 1 and 80. The default is 60.
numresults	Specify the maximum number of terms to use in the expansion of term. Use a number between 1 and 5000. The default is 100.

Parameter	Description
weight	Specify WEIGHT or W for the results to be weighted according to their similarity scores. Specify NOWEIGHT or N for no weighting of results.

## Examples

Consider the CONTAINS query:

```
...CONTAINS(TEXT, 'fuzzy(government, 70, 6, weight)', 1) > 0;
```

This query expands to the first six fuzzy variations of *government* in the index that have a similarity score over 70.

In addition, documents in the result set are weighted according to their similarity to *government*. Documents containing words most similar to government receive the highest score.

You can skip unnecessary parameters using the appropriate number of commas. For example:

```
'fuzzy(government,, ,weight)'
```

## Backward Compatibility Syntax

The old fuzzy syntax from previous releases is still supported. This syntax is as follows:

Parameter	Description
?term	Expands term to include all terms with similar spellings as the specified term.

# HASPATH

Use this operator to find all XML documents that contain a specified section path. You can also use this operator to do section equality testing.

Your index must be created with the PATH\_SECTION\_GROUP for this operator to work.

## Syntax

Syntax	Description
HASPATH(path)	Searches an XML document set and returns a score of 100 for all documents where <i>path</i> exists. Separate parent and child paths with the / character. For example, you can specify <i>A/B/C</i> .  See example.
HASPATH(A="value")	Searches an XML document set and returns a score of 100 for all documents that have the element A with content <i>value</i> and only <i>value</i> .  See example.

## Example

### Path Testing

The query

```
HASPATH(A/B/C)
```

finds and returns a score of 100 for the document

```
<A><B><C>dog</C></B></A>
```

without the query having to reference *dog* at all.

### Section Equality Testing

The query

```
dog INPATH A
```

finds

```
<A>dog</A>
```

but it also finds

```
<A>dog park</A>
```

To limit the query to the term *dog* and nothing else, you can use a section equality test with the HASPATH operator. For example,

```
HASPETH ( A="dog" )
```

finds and returns a score of 100 only for the first document, and not the second.

## Limitations

Because of how XML section data is recorded, false matches might occur with XML sections that are completely empty as follows:

```
<A><B><C></C></B><D><E></E></D></A>
```

A query of HASPATH(A/B/E) or HASPATH(A/D/C) falsely matches this document. This type of false matching can be avoided by inserting text between empty tags.

---

# INPATH

Use this operator to do path searching in XML documents. This operator is like the WITHIN operator except that the right-hand side is a parentheses enclosed path, rather than a single section name.

Your index must be created with the PATH\_SECTION\_GROUP for the INPATH operator to work.

## Syntax

The INPATH operator has the following syntax:

### Top-Level Tag Searching

Syntax	Description
term INPATH (/A)	Returns documents that have <i>term</i> within the top-level tags <A> and </A>. The A tag must be a top-level tag, which is the document-type tag.
term INPATH (A)	

### Any-Level Tag Searching

Syntax	Description
term INPATH (//A)	Returns documents that have <i>term</i> in the <A> tag at any level. This query is the same as ' <i>term WITHIN A</i> '

### Direct Parentage Path Searching

Syntax	Description
term INPATH (A/B)	Returns documents where <i>term</i> appears in a B element which is a direct child of a top-level A element.  For example, a document containing  <A><B>term</B></A>  is returned.

## Single-Level Wildcard Searching

Syntax	Description
term INPATH (A/* /B)	<p>Returns documents where <i>term</i> appears in a B element which is a grandchild (two levels down) of a top-level A element.</p> <p>For example a document containing</p> <pre>&lt;A&gt;&lt;D&gt;&lt;B&gt;term&lt;/B&gt;&lt;/D&gt;&lt;/A&gt;</pre> <p>is returned.</p>

## Multi-level Wildcard Searching

Syntax	Description
term INPATH (A/* /B/* /* /C)	<p>Returns documents where <i>term</i> appears in a C element which is 3 levels down from a B element which is two levels down (grandchild) of a top-level A element.</p>

## Any-Level Descendant Searching

Syntax	Description
term INPATH(A /B)	<p>Returns documents where <i>term</i> appears in a B element which is some descendant (any level) of a top-level A element.</p>

## Attribute Searching

Syntax	Description
term INPATH (//A/@B)	<p>Returns documents where <i>term</i> appears in the B attribute of an A element at any level. Attributes must be bound to a direct parent.</p>

Descendant/Attribute Existence Testing

Syntax	Description
term INPATH (A[B])	Returns documents where term appears in a top-level A element which has a B element as a direct child.
term INPATH (A[./ /B])	Returns documents where term appears in a top-level A element which has a B element as a descendant at any level.
term INPATH (/ /A[@B])	Finds documents where term appears in an A element at any level which has a B attribute. Attributes must be tied to a direct parent.

Attribute Value Testing

Syntax	Description
term INPATH (A[@B = "value"])	Finds all documents where <i>term</i> appears in a top-level A element which has a B attribute whose value is <i>value</i> .
term INPATH (A[@B != "value"])	Finds all documents where <i>term</i> appears in a top-level A element which has a B attribute whose value is not <i>value</i> .

Tag Value Testing

Syntax	Description
term INPATH (A[B = "value"])	Returns documents where <i>term</i> appears in an A tag which has a B tag whose value is <i>value</i> .

Not

Syntax	Description
term INPATH (A[NOT(B)])	Finds documents where <i>term</i> appears in a top-level A element which does not have a B element as an immediate child.

## AND and OR Testing

Syntax	Description
term INPATH (A[B and C])	Finds documents where <i>term</i> appears in a top-level A element which has a B and a C element as an immediate child.
term INPATH (A[B and @C="value"]])	Finds documents where <i>term</i> appears in a top-level A element which has a B element and a C attribute whose value is <i>value</i> .
term INPATH (A [B OR C])	Finds documents where <i>term</i> appears in a top-level A element which has a B element or a C element.

## Combining Path and Node Tests

Syntax	Description
term INPATH (A[@B = "value"]/C/D)	Returns documents where <i>term</i> appears in aD element which is the child of a C element, which is the child of a top-level A element with a B attribute whose value is <i>value</i> .

## Nested INPATH

You can nest the entire INPATH expression in another INPATH expression as follows:

```
(dog INPATH (//A/B/C) INPATH (D))
```

When you do so, the two INPATH paths are completely independent. The outer INPATH path does not change the context node of the inner INPATH path. For example:

```
(dog INPATH (A)) INPATH (D)
```

never finds any documents, because the inner INPATH is looking for *dog* within the top-level tag A, and the outer INPATH constrains that to document with top-level tag D. A document can have only one top-level tag, so this expression never finds any documents.

## Case-Sensitivity

Tags and attribute names in path searching are case-sensitive. That is,

`dog INPATH (A)`

finds `<A>dog</A>` but does not find `<a>dog</a>`. Instead use

`dog INPATH (a)`

## Examples

### Top-Level Tag Searching

To find all documents that contain the term *dog* in the top-level tag `<A>`:

`dog INPATH (/A)`

or

`dog INPATH(A)`

### Any-Level Tag Searching

To find all documents that contain the term *dog* in the `<A>` tag at any level:

`dog INPATH(//A)`

This query finds the following documents:

`<A>dog</A>`

and

`<A><B><C>dog</C></B></A>`

### Direct Parentage Searching

To find all documents that contain the term *dog* in a B element that is a direct child of a top-level A element:

`dog INPATH(A/B)`

This query finds the following XML document:

`<A><B>My dog is friendly.</B></A>`

but does not find:

`<C><B>My dog is friendly.</B></C>`

## Tag Value Testing

You can test the value of tags. For example, the query:

```
dog INPATH(A[B="dog"])
```

Finds the following document:

```
<A><B>dog</B></A>
```

But does not find:

```
<A><B>My dog is friendly.</B></A>
```

## Attribute Searching

You can search the content of attributes. For example, the query:

```
dog INPATH(//A/@B)
```

Finds the document

```
<C><A B="snoop dog"> </A> </C>
```

## Attribute Value Testing

You can test the value of attributes. For example, the query

```
California INPATH (//A[@B = "home address"])
```

Finds the document:

```
<A B="home address">San Francisco, California, USA</A>
```

But does not find:

```
<A B="work address">San Francisco, California, USA</A>
```

## Path Testing

You can test if a path exists with the HASPATH operator. For example, the query:

```
HASPATH(A/B/C)
```

finds and returns a score of 100 for the document

```
<A><B><C>dog</C></B></A>
```

without the query having to reference *dog* at all.

## Limitations

### Testing for Equality

The following is an example of an INPATH equality test.

```
dog INPATH (A[@B = "foo"])
```

The following limitations apply for these expressions:

- Only equality and inequality are supported. Range operators and functions are not supported.
- The left hand side of the equality must be an attribute. Tags and literals here are not allowed.
- The right hand side of the equality must be a literal. Tags and attributes here are not allowed.
- The test for equality depends on your lexer settings. With the default settings, the query

```
dog INPATH (A[@B= "pot of gold"])
```

matches the following sections:

```
<A B="POT OF GOLD">dog</A>  
and
```

```
<A B="pot of gold">dog</A>  
because lexer is case-insensitive by default.
```

```
<A B="POT BLACK GOLD">dog</A>  
because OF is a default stopword in English and the query matches any word in  
that position.
```

```
<A B="POT_OF_GOLD">dog</A>  
because the underscore character is not a join character by default.
```

# MINUS (-)

Use the MINUS operator to search for documents that contain one query term and you want the presence of a second query term to cause the document to be ranked lower. The MINUS operator is useful for lowering the score of documents that contain unwanted noise terms.

## Syntax

Syntax	Description
<i>term1-term2</i>	Returns documents that contain <i>term1</i> . Calculates score by subtracting occurrences of <i>term2</i> from occurrences of <i>term1</i> .
<i>term1</i> minus <i>term2</i>	

## Examples

Suppose a query on the term *cars* always returned high scoring documents about *Ford cars*. You can lower the scoring of the Ford documents by using the expression:

`'cars - Ford'`

In essence, this expression returns documents that contain the term *cars* and possibly *Ford*; however, the score for a returned document is the number of occurrences of *cars* minus the number of occurrences of *Ford*. If a document does not contain any occurrences of the term *Ford*, no value is subtracted from the score.

---

## Narrower Term (NT, NTG, NTP, NTI)

Use the narrower term operators (NT, NTG, NTP, NTI) to expand a query to include all the terms that have been defined in a thesaurus as the narrower or lower level terms for a specified term. They can also expand the query to include all of the narrower terms for each narrower term, and so on down through the thesaurus hierarchy.

### Syntax

Syntax	Description
<code>NT(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the lower level terms defined in the thesaurus as narrower terms for <i>term</i> .
<code>NTG(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the lower level terms defined in the thesaurus as narrower generic terms for <i>term</i> .
<code>NTP(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the lower level terms defined in the thesaurus as narrower partitive terms for <i>term</i> .
<code>NTI(<i>term</i>[(<i>qualifier</i>)][,<i>level</i>][,<i>thes</i>])</code>	Expands a query to include all the lower level terms defined in the thesaurus as narrower instance terms for <i>term</i> .

#### **term**

Specify the operand for the narrower term operator. *term* is expanded to include the narrower term entries defined for the term in the thesaurus specified by *thes*. The number of narrower terms included in the expansion is determined by the value for *level*.

#### **qualifier**

Specify a qualifier for *term*, if *term* is a homograph (word or phrase with multiple meanings, but the same spelling) that appears in two or more nodes in the same hierarchy branch of *thes*.

If a qualifier is not specified for a homograph in a narrower term query, the query expands to include all of the narrower terms of all homographic terms.

**level**

Specify the number of levels traversed in the thesaurus hierarchy to return the narrower terms for the specified term. For example, a level of 1 in an NT query returns all the narrower term entries, if any exist, for the specified term. A level of 2 returns all the narrower term entries for the specified term, as well as all the narrower term entries, if any exist, for each narrower term.

The level argument is optional and has a default value of one (1). Zero or negative values for the level argument return only the original query term.

**thes**

Specify the name of the thesaurus used to return the expansions for the specified term. The thes argument is optional and has a default value of DEFAULT. A thesaurus named DEFAULT *must* exist in the thesaurus tables if you use this default value.

---

---

**Note:** If you specify thes, you must also specify level.

---

---

## Examples

The following query returns all documents that contain either the term *cat* or any of the NT terms defined for *cat* in the DEFAULT thesaurus:

```
'NT(cat)'
```

If you specify a thesaurus name, you must also specify level as in:

```
'NT(cat, 2, mythes)'
```

The following query returns all documents that contain either *fairy tale* or any of the narrower instance terms for *fairy tale* as defined in the DEFAULT thesaurus:

```
'NTI(fairy tale)'
```

That is, if the terms *cinderella* and *snow white* are defined as narrower term instances for *fairy tale*, Oracle returns documents that contain *fairy tale*, *cinderella*, or *snow white*.

## Notes

Each hierarchy in a thesaurus represents a distinct, separate branch, corresponding to the four narrower term operators. In a narrower term query, Oracle only expands the query using the branch corresponding to the specified narrower term operator.

## Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the narrower terms in your thesaurus, see CTX\_THES.NT in [Chapter 10, "CTX\\_THES Package"](#).

---

## NEAR (;

Use the NEAR operator to return a score based on the proximity of two or more query terms. Oracle returns higher scores for terms closer together and lower scores for terms farther apart in a document.

---

---

**Note:** The NEAR operator works with only word queries. You cannot use NEAR in ABOUT queries.

---

---

### Syntax

---

#### Syntax

---

NEAR((*word1*, *word2*,..., *wordn*) [, *max\_span* [, *order*]])

---

#### **word1-n**

Specify the terms in the query separated by commas. The query terms can be single words or phrases.

#### **max\_span**

Optionally specify the size of the biggest clump. The default is 100. Oracle returns an error if you specify a number greater than 100.

A clump is the smallest group of words in which all query terms occur. All clumps begin and end with a query term.

For near queries with two terms, *max\_span* is the maximum distance allowed between the two terms. For example, to query on *dog* and *cat* where *dog* is within 6 words of *cat*, issue the following query:

```
'near((dog, cat), 6)'
```

#### **order**

Specify TRUE for Oracle to search for terms in the order you specify. The default is FALSE.

For example, to search for the words *monday*, *tuesday*, and *wednesday* in that order with a maximum clump size of 20, issue the following query:

```
'near((monday, tuesday, wednesday), 20, TRUE)'
```

---

---

**Note:** To specify order, you must always specify a number for the `max_span` parameter.

---

---

Oracle might return different scores for the same document when you use identical query expressions that have the order flag set differently. For example, Oracle might return different scores for the same document when you issue the following queries:

```
'near((dog, cat), 50, FALSE)'  
'near((dog, cat), 50, TRUE)'
```

## NEAR Scoring

The scoring for the NEAR operator combines frequency of the terms with proximity of terms. For each document that satisfies the query, Oracle returns a score between 1 and 100 that is proportional to the number of clumps in the document and inversely proportional to the average size of the clumps. This means many small clumps in a document result in higher scores, since small clumps imply closeness of terms.

The number of terms in a query also affects score. Queries with many terms, such as seven, generally need fewer clumps in a document to score 100 than do queries with few terms, such as two.

A clump is the smallest group of words in which all query terms occur. All clumps begin and end with a query term. You can define clump size with the `max_span` parameter as described in this section.

## NEAR with Other Operators

You can use the NEAR operator with other operators such as AND and OR. Scores are calculated in the regular way.

For example, to find all documents that contain the terms *tiger*, *lion*, and *cheetah* where the terms *lion* and *tiger* are within 10 words of each other, issue the following query:

```
'near((lion, tiger), 10) AND cheetah'
```

The score returned for each document is the lower score of the near operator and the term *cheetah*.

You can also use the equivalence operator to substitute a single term in a near query:

```
'near((stock crash, Japan=Korea), 20)'
```

This query asks for all documents that contain the phrase *stock crash* within twenty words of *Japan* or *Korea*.

## Backward Compatibility NEAR Syntax

You can write near queries using the syntax of previous ConText releases. For example, to find all documents where *lion* occurs near *tiger*, you can write:

```
'lion near tiger'
```

or with the semi-colon as follows:

```
'lion;tiger'
```

This query is equivalent to the following query:

```
'near((lion, tiger), 100, FALSE)'
```

---

---

**Note:** Only the syntax of the NEAR operator is backward compatible. In the example above, the score returned is calculated using the clump method as described in this section.

---

---

## Highlighting with the NEAR Operator

When you use highlighting and your query contains the near operator, all occurrences of all terms in the query that satisfy the proximity requirements are highlighted. Highlighted terms can be single words or phrases.

For example, assume a document contains the following text:

```
Chocolate and vanilla are my favorite ice cream flavors. I like chocolate
served in a waffle cone, and vanilla served in a cup with carmel syrup.
```

If the query is *near((chocolate, vanilla)), 100, FALSE)*, the following is highlighted:

```
<<Chocolate>> and <<vanilla>> are my favorite ice cream flavors. I like
<<chocolate>> served in a waffle cone, and <<vanilla>> served in a cup with
carmel syrup.
```

However, if the query is *near((chocolate, vanilla), 4, FALSE)*, only the following is highlighted:

<<Chocolate>> and <<vanilla>> are my favorite ice cream flavors. I like chocolate served in a waffle cone, and vanilla served in a cup with caramel syrup.

**See Also:** For more information about the procedures you can use for highlighting, see [Chapter 7, "CTX\\_DOC Package"](#).

## Section Searching and NEAR

You can use the NEAR operator with the WITHIN operator for section searching as follows:

```
'near((dog, cat), 10) WITHIN Headings'
```

When evaluating expressions such as these, Oracle looks for clumps that lie entirely within the given section.

In the example above, only those clumps that contain *dog* and *cat* that lie entirely within the section *Headings* are counted. That is, if the term *dog* lies within *Headings* and the term *cat* lies five words from *dog*, but outside of *Headings*, this pair of words does not satisfy the expression and is not counted.

---

## NOT (~)

Use the NOT operator to search for documents that contain one query term and not another.

### Syntax

Syntax	Description
<i>term1~term2</i>	Returns documents that contain <i>term1</i> and not <i>term2</i> .
<i>term1 not term2</i>	

### Examples

To obtain the documents that contain the term *animals* but not *dogs*, use the following expression:

```
'animals ~ dogs'
```

Similarly, to obtain the documents that contain the term *transportation* but not *automobiles* or *trains*, use the following expression:

```
'transportation not (automobiles or trains)'
```

---

---

**Note:** The NOT operator does not affect the scoring produced by the other logical operators.

---

---

---

# OR (|)

Use the OR operator to search for documents that contain at least one occurrence of *any* of the query terms.

## Syntax

Syntax	Description
<i>term1</i>   <i>term2</i>	Returns documents that contain <i>term1</i> or <i>term2</i> . Returns the maximum score of its operands. At least one term must exist; higher score taken.
<i>term1</i> or <i>term2</i>	

## Examples

For example, to obtain the documents that contain the term *cats* or the term *dogs*, use either of the following expressions:

```
'cats | dogs'
'cats OR dogs'
```

## Scoring

In an OR query, the score returned is the score for the highest query term. In the example above, if the scores for *cats* and *dogs* is 30 and 40 within a document, the document scores 40.

---

## Preferred Term (PT)

Use the preferred term operator (PT) to replace a term in a query with the preferred term that has been defined in a thesaurus for the term.

### Syntax

Syntax	Description
PT( <i>term</i> [, <i>thes</i> ])	Replaces the specified word in a query with the preferred term for <i>term</i> .

#### **term**

Specify the operand for the preferred term operator. *term* is replaced by the preferred term defined for the term in the specified thesaurus. However, if no PT entries are defined for the term, *term* is not replaced in the query expression and *term* is the result of the expansion.

#### **thes**

Specify the name of the thesaurus used to return the expansions for the specified term. The *thes* argument is optional and has a default value of DEFAULT. As a result, a thesaurus named DEFAULT *must* exist in the thesaurus tables before using any of the thesaurus operators.

### Examples

The term *automobile* has a preferred term of *car* in a thesaurus. A PT query for *automobile* returns all documents that contain the word *car*. Documents that contain the word *automobile* are not returned.

### Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the preferred terms in your thesaurus, see CTX\_THES.PT in [Chapter 10, "CTX\\_THES Package"](#).

---

# Related Term (RT)

Use the related term operator (RT) to expand a query to include all related terms that have been defined in a thesaurus for the term.

## Syntax

Syntax	Description
RT( <i>term</i> [, <i>thes</i> ])	Expands a query to include all the terms defined in the thesaurus as a related term for term.

**term**  
Specify the operand for the related term operator. term is expanded to include term and all the related entries defined for term in thes.

**thes**  
Specify the name of the thesaurus used to return the expansions for the specified term. The thes argument is optional and has a default value of DEFAULT. As a result, a thesaurus named DEFAULT *must* exist in the thesaurus tables before using any of the thesaurus operators.

## Examples

The term *dog* has a related term of *wolf*. A RT query for *dog* returns all documents that contain the word *dog* and *wolf*.

## Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package

**See Also:** For more information on browsing the related terms in your thesaurus, see CTX\_THES.RT in [Chapter 10, "CTX\\_THES Package"](#).

---

## soundex (!)

Use the soundex (!) operator to expand queries to include words that have similar sounds; that is, words that sound like other words. This function allows comparison of words that are spelled differently, but sound alike in English.

### Syntax

Syntax	Description
<i>!term</i>	Expands a query to include all terms that sound the same as the specified term (English-language text only).

### Examples

```
SELECT ID, COMMENT FROM EMP_RESUME
WHERE CONTAINS (COMMENT, '!SMYTHE') > 0 ;
```

```
ID COMMENT
--
23 Smith is a hard worker who..
```

### Language

Soundex works best for languages that use a 7-bit character set, such as English. It can be used, with lesser effectiveness, for languages that use an 8-bit character set, such as many Western European languages.

If you have base-letter conversion specified for a text column and the query expression contains a soundex operator, Oracle operates on the base-letter form of the query.

---

# stem (\$)

Use the stem (\$) operator to search for terms that have the same linguistic root as the query term.

The Oracle Text stemmer, licensed from Xerox Corporation’s XSoft Division, supports the following languages: English, French, Spanish, Italian, German, and Dutch.

## Syntax

Syntax	Description
<i>\$term</i>	Expands a query to include all terms having the same stem or root word as the specified term.

## Examples

Input	Expands To
\$scream	scream screaming screamed
\$distinguish	distinguish distinguished distinguishes
\$guitars	guitars guitar
\$commit	commit committed
\$cat	cat cats
\$sing	sang sung sing

## Behavior with Stopwords

If stem returns a word designated as a stopwords, the stopwords is not included in the query or highlighted by CTX\_QUERY.HIGHLIGHT or CTX\_QUERY.MARKUP.

# Stored Query Expression (SQE)

Use the SQE operator to call a stored query expression created with the CTX\_QUERY.STORE\_SQE procedure.

Stored query expressions can be used for creating predefined bins for organizing and categorizing documents or to perform iterative queries, in which an initial query is refined using one or more additional queries.

## Syntax

Syntax	Description
SQE(SQE_name)	Returns the results for the stored query expression SQE_name.

## Examples

To create an SQE named *disasters*, use CTX\_QUERY.STORE\_SQE as follows:

```
begin
ctx_query.store_sqe('disasters', 'hurricane or earthquake or blizzard');
end;
```

This stored query expression returns all documents that contain either *hurricane*, *earthquake* or *blizzard*.

This SQE can then be called within a query expression as follows:

```
SELECT SCORE(1), docid FROM news
WHERE CONTAINS(resume, 'sqe(disasters)', 1)> 0
ORDER BY SCORE(1);
```

---

## SYNonym (SYN)

Use the synonym operator (SYN) to expand a query to include all the terms that have been defined in a thesaurus as synonyms for the specified term.

### Syntax

Syntax	Description
SYN( <i>term</i> [, <i>thes</i> ])	Expands a query to include all the terms defined in the thesaurus as synonyms for <i>term</i> .

**term**  
Specify the operand for the synonym operator. term is expanded to include term and all the synonyms defined for term in thes.

**thes**  
Specify the name of the thesaurus used to return the expansions for the specified term. The thes argument is optional and has a default value of DEFAULT. A thesaurus named DEFAULT must exist in the thesaurus tables if you use this default value.

### Examples

The following query expression returns all documents that contain the term *dog* or any of the synonyms defined for *dog* in the DEFAULT thesaurus:

```
'SYN(dog)'
```

#### Compound Phrases in Synonym Operator

Expansion of compound phrases for a term in a synonym query are returned as AND conjunctives.

For example, the compound phrase *temperature + measurement + instruments* is defined in a thesaurus as a synonym for the term *thermometer*. In a synonym query for *thermometer*, the query is expanded to:

```
{thermometer} OR ({temperature}&{measurement}&{instruments})
```

## Related Topics

You can browse your thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the synonym terms in your thesaurus, see CTX\_THES.SYN in [Chapter 10, "CTX\\_THES Package"](#).

---

## threshold (>)

Use the threshold operator (>) in two ways:

- at the expression level
- at the query term level

The threshold operator at the expression level eliminates documents in the result set that score below a threshold number.

The threshold operator at the query term level selects a document based on how a term scores in the document.

### Syntax

Syntax	Description
<i>expression</i> > <i>n</i>	Returns only those documents in the result set that score above the threshold <i>n</i> .
<i>term</i> > <i>n</i>	Within an expression, returns documents that contain the query term with score of at least <i>n</i> .

### Examples

At the expression level, to search for documents that contain *relational databases* and to return only documents that score greater than 75, use the following expression:

```
'relational databases > 75'
```

At the query term level, to select documents that have at least a score of 30 for *lion* and contain *tiger*, use the following expression:

```
'(lion > 30) and tiger'
```

## Translation Term (TR)

Use the translation term operator (TR) to expand a query to include all defined foreign language equivalent terms.

### Syntax

Syntax	Description
TR( <i>term</i> [, <i>lang</i> , [ <i>thes</i> ]])	Expands <i>term</i> to include all the foreign equivalents that are defined for <i>term</i> .

#### **term**

Specify the operand for the translation term operator. *term* is expanded to include all the foreign language entries defined for *term* in *thes*.

#### **lang**

Optionally, specify which foreign language equivalents to return in the expansion. The language you specify must match the language as defined in *thes*. If you omit this parameter, the system expands to use all defined foreign language terms.

#### **thes**

Optionally, specify the name of the thesaurus used to return the expansions for the specified term. The *thes* argument has a default value of DEFAULT. As a result, a thesaurus named DEFAULT *must* exist in the thesaurus tables before you can use any of the thesaurus operators.

---

**Note:** If you specify *thes*, you must also specify *lang*.

---

### Examples

Consider a thesaurus MY\_THES with the following entries for *cat*:

```
cat
  SPANISH: gato
  FRENCH:  chat
```

To search for all documents that contain *cat* and the spanish translation of *cat*, issue the following query:

```
'tr(cat, spanish, my_thes)'
```

This query expands to:

```
'{cat} | {gato} | {chat}'
```

## Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the related terms in your thesaurus, see CTX\_THES.[TR](#) in [Chapter 10, "CTX\\_THES Package"](#).

## Translation Term Synonym (TRSYN)

Use the translation term operator (TR) to expand a query to include all the defined foreign equivalents of the query term, the synonyms of query term, and the foreign equivalents of the synonyms.

### Syntax

Syntax	Description
TRSYN( <i>term</i> [, <i>lang</i> , [ <i>thes</i> ]])	Expands <i>term</i> to include foreign equivalents of <i>term</i> , the synonyms of <i>term</i> , and the foreign equivalents of the synonyms.

#### **term**

Specify the operand for this operator. *term* is expanded to include all the foreign language entries and synonyms defined for *term* in *thes*.

#### **lang**

Optionally, specify which foreign language equivalents to return in the expansion. The language you specify must match the language as defined in *thes*. If you omit this parameter, the system expands to use all defined foreign language terms.

#### **thes**

Optionally, specify the name of the thesaurus used to return the expansions for the specified term. The *thes* argument has a default value of **DEFAULT**. As a result, a thesaurus named **DEFAULT** *must* exist in the thesaurus tables before you can use any of the thesaurus operators.

---

---

**Note:** If you specify *thes*, you must also specify *lang*.

---

---

### Examples

Consider a thesaurus MY\_THES with the following entries for *cat*:

```
cat
  SPANISH: gato
  FRENCH:  chat
  SYN lion
    SPANISH: leon
```

To search for all documents that contain *cat*, the spanish equivalent of *cat*, the synonym of *cat*, and the spanish equivalent of *lion*, issue the following query:

```
'trsyn(cat, spanish, my_thes)'
```

This query expands to:

```
'{cat}|{gato}|{lion}|{leon}'
```

## Related Topics

You can browse a thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the translation and synonym terms in your thesaurus, see CTX\_THES.[TRSYN](#) in [Chapter 10, "CTX\\_THES Package"](#).

---

## Top Term (TT)

Use the top term operator (TT) to replace a term in a query with the top term that has been defined for the term in the standard hierarchy (BT, NT) in a thesaurus. Top terms in the generic (BTG, NTG), partitive (BTP, NTP), and instance (BTI, NTI) hierarchies are not returned.

### Syntax

Syntax	Description
TT( <i>term</i> [, <i>thes</i> ])	Replaces the specified word in a query with the top term in the standard hierarchy (BT, NT) for <i>term</i> .

#### **term**

Specify the operand for the top term operator. *term* is replaced by the top term defined for the term in the specified thesaurus. However, if no TT entries are defined for *term*, *term* is not replaced in the query expression and *term* is the result of the expansion.

#### **thes**

Specify the name of the thesaurus used to return the expansions for the specified term. The *thes* argument is optional and has a default value of DEFAULT. A thesaurus named DEFAULT must exist in the thesaurus tables if you use this default value.

### Examples

The term *dog* has a top term of *animal* in the standard hierarchy of a thesaurus. A TT query for *dog* returns all documents that contain the phrase *animal*. Documents that contain the word *dog* are not returned.

### Related Topics

You can browse your thesaurus using procedures in the CTX\_THES package.

**See Also:** For more information on browsing the top terms in your thesaurus, see CTX\_THES.TT in [Chapter 10, "CTX\\_THES Package"](#).

---

# weight (\*)

The weight operator multiplies the score by the given factor, topping out at 100 when the score exceeds 100. For example, the query *cat, dog\*2* sums the score of *cat* with twice the score of *dog*, topping out at 100 when the score is greater than 100.

In expressions that contain more than one query term, use the weight operator to adjust the relative scoring of the query terms. You can reduce the score of a query term by using the weight operator with a number less than 1; you can increase the score of a query term by using the weight operator with a number greater than 1 and less than 10.

The weight operator is useful in accumulate, OR, or AND queries when the expression has more than one query term. With no weighting on individual terms, the score cannot tell you which of the query terms occurs the most. With term weighting, you can alter the scores of individual terms and hence make the overall document ranking reflect the terms you are interested in.

## Syntax

Syntax	Description
<i>term*n</i>	Returns documents that contain <i>term</i> . Calculates score by multiplying the raw score of <i>term</i> by <i>n</i> , where <i>n</i> is a number from 0.1 to 10.

## Examples

You have a collection of sports articles. You are interested in the articles about soccer, in particular Brazilian soccer. It turns out that a regular query on *soccer or Brazil* returns many high ranking articles on US soccer. To raise the ranking of the articles on Brazilian soccer, you can issue the following query:

```
'soccer or Brazil*3'
```

[Table 3–1](#) illustrates how the weight operator can change the ranking of three hypothetical documents A, B, and C, which all contain information about soccer.

The columns in the table show the total score of four different query expressions on the three documents.

**Table 3-1**

	soccer	Brazil	soccer or Brazil	soccer or Brazil*3
A	20	10	20	30
B	10	30	30	90
C	50	20	50	60

The score in the third column containing the query *soccer or Brazil* is the score of the highest scoring term. The score in the fourth column containing the query *soccer or Brazil\*3* is the larger of the score of the first column *soccer* and of the score *Brazil* multiplied by three, *Brazil\*3*.

With the initial query of *soccer or Brazil*, the documents are ranked in the order C B A. With the query of *soccer or Brazil\*3*, the documents are ranked B C A, which is the preferred ranking.

---

## wildcards (% \_)

Wildcard characters can be used in query expressions to expand word searches into pattern searches. The wildcard characters are:

Wildcard Character	Description
%	The percent wildcard specifies that any characters can appear in multiple positions represented by the wildcard.
_	The underscore wildcard specifies a single position in which any character can occur.

---

**Note:** When a wildcard expression translates to a stopword, the stopword is not included in the query and not highlighted by CTX\_DOC.HIGHLIGHT or CTX\_DOC.MARKUP.

---

### Right-Truncated Queries

Right truncation involves placing the wildcard on the right-hand-side of the search string.

For example, the following query expression finds all terms beginning with the pattern *scal*:

`'scal%'`

### Left- and Double-Truncated Queries

Left truncation involves placing the wildcard on the left-hand-side of the search string.

To find words such as *king*, *wing* or *sing*, you can write your query as follows:

`'_ing'`

You can write this query more generally as:

`'%ing'`

You can also combine left-truncated and right-truncated searches to create double-truncated searches. The following query finds all documents that contain words that contain the substring `%benz%`

```
'%benz%'
```

## Improving Wildcard Query Performance

You can improve wildcard query performance by adding a substring or prefix index.

When your wildcard queries are left- and double-truncated, you can improve query performance by creating a substring index. Substring indexes improve query performance for all types of left-truncated wildcard searches such as `%ed`, `_ing`, or `%benz%`.

When your wildcard queries are right-truncated, you can improve performance by creating a prefix index. A prefix index improves query performance for wildcard searches such as `to%`.

**See Also:** For more information about creating substring and prefix indexes, see ["BASIC\\_WORDLIST"](#) in [Chapter 2](#).

---

# WITHIN

You can use the WITHIN operator to narrow a query down into document sections. Document sections can be one of the following:

- zone sections
- field sections
- attribute sections
- special sections (sentence or paragraph)

## Syntax

Syntax	Description
<i>expression</i> WITHIN <i>section</i>	<p>Searches for expression within the pre-defined zone, field, or attribute section.</p> <p>If section is a zone, expression can contain one or more WITHIN operators (nested WITHIN) whose section is a zone or special section.</p> <p>If section is a field or attribute section, expression cannot contain another WITHIN operator.</p>
<i>expression</i> WITHIN SENTENCE	<p>Searches for documents that contain expression within a sentence. Specify an AND or NOT query for expression.</p> <p>The expression can contain one or more WITHIN operators (nested WITHIN) whose section is a zone or special section.</p>
<i>expression</i> WITHIN PARAGRAPH	<p>Searches for documents that contain expression within a paragraph. Specify an AND or NOT query for expression.</p> <p>The expression can contain one or more WITHIN operators (nested WITHIN) whose section is a zone or special section.</p>

## Examples

### Querying Within Zone Sections

To find all the documents that contain the term *San Francisco* within the section *Headings*, write your query as follows:

```
'San Francisco WITHIN Headings'
```

To find all the documents that contain the term *sailing* and contain the term *San Francisco* within the section *Headings*, write your query in one of two ways:

```
'(San Francisco WITHIN Headings) and sailing'
```

```
'sailing and San Francisco WITHIN Headings'
```

**Compound Expressions with WITHIN** To find all documents that contain the terms *dog* and *cat* within the same section *Headings*, write your query as follows:

```
'(dog and cat) WITHIN Headings'
```

The above query is logically different from:

```
'dog WITHIN Headings and cat WITHIN Headings'
```

This query finds all documents that contain *dog* and *cat* where the terms *dog* and *cat* are in *Headings* sections, regardless of whether they occur in the same *Headings* section or different sections.

**Near with WITHIN** To find all documents in which *dog* is near *cat* within the section *Headings*, write your query as follows:

```
'dog near cat WITHIN Headings'
```

---

---

**Note:** The near operator has higher precedence than the WITHIN operator so braces are not necessary in this example. This query is equivalent to *(dog near cat) WITHIN Headings*.

---

---

## Nested WITHIN Queries

You can nest the within operator to search zone sections within zone sections.

For example, assume that a document set had the zone section AUTHOR nested within the zone BOOK section. You write a nested WITHIN query to find all occurrences of *scott* within the AUTHOR section of the BOOK section as follows:

```
'(scott WITHIN AUTHOR) WITHIN BOOK'
```

## Querying Within Field Sections

The syntax for querying within a field section is the same as querying within a zone section. The syntax for most of the examples given in the previous section, ["Querying Within Zone Sections"](#), apply to field sections.

However, field sections behave differently from zone sections in terms of

- **Visibility:** You can make text within a field section invisible.
- **Repeatability:** WITHIN queries cannot distinguish repeated field sections.
- **Nestability:** You cannot issue a nested WITHIN query with a field section.

The following sections describe these differences.

**Visible Flag in Field Sections** When a field section is created with the visible flag set to FALSE in CTX\_DDL.ADD\_FIELD\_SECTION, the text within a field section can only be queried using the WITHIN operator.

For example, assume that TITLE is a field section defined with visible flag set to FALSE. Then the query *dog* without the WITHIN operator will *not* find a document containing:

```
<TITLE>the dog</TITLE>. I like my pet.
```

To find such a document, you can use the WITHIN operator as follows:

```
'dog WITHIN TITLE'
```

Alternatively, you can set the visible flag to TRUE when you define TITLE as a field section with CTX\_DDL.ADD\_FIELD\_SECTION.

**See Also:** For more information about creating field sections, see [ADD\\_FIELD\\_SECTION](#) in [Chapter 6, "CTX\\_DDL Package"](#).

**Repeated Field Sections** WITHIN queries *cannot* distinguish repeated field sections in a document. For example, consider the document with the repeated section `<author>`:

```
<author> Charles Dickens </author>
<author> Martin Luther King </author>
```

Assuming that `<author>` is defined as a field section, a query such as (*charles and martin*) *within author* returns the document, even though these words occur in separate tags.

To have WITHIN queries distinguish repeated sections, define the sections as zone sections.

**Nested Field Sections** You cannot issue a nested WITHIN query with field sections. Doing so raises an error.

### Querying Within Sentence or Paragraphs

Querying within sentence or paragraph boundaries is useful to find combinations of words that occur in the same sentence or paragraph. To query sentence or paragraphs, you must first add the special section to your section group before you index. You do so with CTX\_DDL.ADD\_SPECIAL\_SECTION.

To find documents that contain *dog* and *cat* within the same sentence:

```
'(dog and cat) WITHIN SENTENCE'
```

To find documents that contain *dog* and *cat* within the same paragraph:

```
'(dog and cat) WITHIN PARAGRAPH'
```

To find documents that contain sentences with the word *dog* but not *cat*:

```
'(dog not cat) WITHIN SENTENCE'
```

### Querying Within Attribute Sections

You can query within attribute sections when you index with either XML\_SECTION\_GROUP or AUTOMATIC\_SECTION\_GROUP as your section group type.

Assume you have an XML document as follows:

```
<book title="Tale of Two Cities">It was the best of times.</book>
```

You can define the section `title@book` to be the attribute section `title`. You can do so with the `CTX_DLL.ADD_ATTR_SECTION` procedure or dynamically after indexing with `ALTER INDEX`.

---

**Note:** When you use the `AUTO_SECTION_GROUP` to index XML documents, the system automatically creates attribute sections and names them in the form `attribute@tag`.

If you use the `XML_SECTION_GROUP`, you can name attribute sections anything with `CTX_DDL.ADD_ATTR_SECTION`.

---

To search on *Tale* within the attribute section `title`, you issue the following query:

```
'Tale WITHIN title'
```

**Constraints for Querying Attribute Sections** The following constraints apply to querying within attribute sections:

- Regular queries on attribute text do not hit the document unless qualified in a `within` clause. Assume you have an XML document as follows:

```
<book title="Tale of Two Cities">It was the best of times.</book>
```

A query on *Tale* by itself does not produce a hit on the document unless qualified with `WITHIN title@book`. (This behavior is like field sections when you set the visible flag set to false.)

- You cannot use attribute sections in a nested `WITHIN` query.
- Phrases ignore attribute text. For example, if the original document looked like:

```
Now is the time for all good <word type="noun"> men </word> to come to the aid.
```

Then this document would hit on the regular query *good men*, ignoring the intervening attribute text.

- WITHIN queries can distinguish repeated attribute sections. This behavior is like zone sections but unlike field sections. For example, you have a document as follows:

```
<book title="Tale of Two Cities">It was the best of times.</book>
<book title="Of Human Bondage">The sky broke dull and gray.</book>
```

Assume that `book` is a zone section and `book@author` is an attribute section. Consider the query:

```
'(Tale and Bondage) WITHIN book@author'
```

This query does *not* hit the document, because *tale* and *bondage* are in different occurrences of the attribute section `book@author`.

## Notes

### Scoring

The WITHIN operator has no effect on score.

### Section Names

The WITHIN operator requires you to know the name of the section you search. A list of defined sections can be obtained using the [CTX\\_SECTIONS](#) or [CTX\\_USER\\_SECTIONS](#) views.

### Section Boundaries

For special and zone sections, the terms of the query must be fully enclosed in a particular occurrence of the section for the document to satisfy the query. This is not a requirement for field sections.

For example, consider the query where *bold* is a zone section:

```
'(dog and cat) WITHIN bold'
```

This query finds:

```
<B>dog cat</B>
```

but it does not find:

```
<B>dog</B><B>cat</B>
```

This is because `dog` and `cat` must be in the same *bold* section.

This behavior is especially useful for special sections, where

```
'(dog and cat) WITHIN sentence'
```

means find *dog* and *cat* within the same sentence.

Field sections on the other hand are meant for non-repeating, embedded meta-data such as a title section. Queries within field sections cannot distinguish between occurrences. All occurrences of a field section are considered to be parts of a single section. For example, the query:

```
(dog and cat) WITHIN title
```

can find a document like this:

```
<TITLE>dog</TITLE><TITLE>cat</TITLE>
```

In return for this field section limitation and for the overlap and nesting limitations, field section queries are generally faster than zone section queries, especially if the section occurs in every document, or if the search term is common.

## Limitations

The WITHIN operator has the following limitations:

- You cannot embed the WITHIN clause in a phrase. For example, you cannot write: *term1 WITHIN section term2*
- You cannot combine WITHIN with expansion operators, such as \$ ! and \*.
- Since WITHIN is a reserved word, you must escape the word with braces to search on it.

---

# Special Characters in Queries

This chapter describes the special characters that can be used in Text queries. In addition, it provides a list of the words and characters that Oracle Text treats as reserved words and characters.

The following topics are covered in this chapter:

- [Grouping Characters](#)
- [Escape Characters](#)
- [Reserved Words and Characters](#)

# Grouping Characters

The grouping characters control operator precedence by grouping query terms and operators in a query expression. The grouping characters are:

Grouping Character	Description
()	The parentheses characters serve to group terms and operators found between the characters
[]	The bracket characters serve to group terms and operators found between the characters; however, they prevent penetrations for the expansion operators (fuzzy, soundex, stem).

The beginning of a group of terms and operators is indicated by an open character from one of the sets of grouping characters. The ending of a group is indicated by the occurrence of the appropriate close character for the open character that started the group. Between the two characters, other groups may occur.

For example, the open parenthesis indicates the beginning of a group. The first close parenthesis encountered is the end of the group. Any open parentheses encountered before the close parenthesis indicate nested groups.

## Escape Characters

To query on words or symbols that have special meaning to query expressions such as *and* & *or* / *accum*, you must escape them. There are two ways to escape characters in a query expression:

Escape Character	Description
{ }	Use braces to escape a string of characters or symbols. Everything within a set of braces is considered part of the escape sequence.  When you use braces to escape a single character, the escaped character becomes a separate token in the query.
\	Use the backslash character to escape a single character or symbol. Only the character immediately following the backslash is escaped.

In the following examples, an escape sequence is necessary because each expression contains a Text operator or reserved symbol:

```
'AT\&T'
```

```
'{AT&T}'
```

```
'high\-voltage'
```

```
'{high-voltage}'
```

---

---

**Note:** If you use braces to escape an individual character within a word, the character is escaped, but the word is broken into three tokens.

For example, a query written as *high{-}voltage* searches for *high - voltage*, with the space on either side of the hyphen.

---

---

## Querying Escape Characters

The open brace { signals the beginning of the escape sequence, and the closed brace } indicates the end of the sequence. Everything between the opening brace and the closing brace is part of the escaped query expression (including any open brace characters). To include the close brace character in an escaped query expression, use } }.

To escape the backslash escape character, use \ \.

# Reserved Words and Characters

The following table lists the Oracle Text reserved words and characters that must be escaped when you want to search them in CONTAINS queries:

Reserved Word	Reserved Character	Operator
ABOUT	(none)	ABOUT
ACCUM	,	Accumulate
AND	&	And
BT	(none)	Broader Term
BTG	(none)	Broader Term Generic
BTI	(none)	Broader Term Instance
BTP	(none)	Broader Term Partitive
FUZZY	?	fuzzy
(none)	{ }	escape characters (multiple)
(none)	\	escape character (single)
(none)	( )	grouping characters
(none)	[ ]	grouping characters
HASPATH	(none)	HASPATH
INPATH	(none)	INPATH
MINUS	-	MINUS
NEAR	;	NEAR
NOT	~	NOT
NT	(none)	Narrower Term
NTG	(none)	Narrower Term Generic
NTI	(none)	Narrower Term Instance
NTP	(none)	Narrower Term Partitive
OR		OR
PT	(none)	Preferred Term
RT	(none)	Related Term

Reserved Word	Reserved Character	Operator
(none)	\$	stem
(none)	!	soundex
SQE	(none)	Stored Query Expression
SYN	(none)	Synonym
(none)	>	threshold
TR	(none)	Translation Term
TRSYN	(none)	Translation Term Synonym
TT	(none)	Top Term
(none)	*	weight
(none)	%	wildcard character (multiple)
(none)	—	wildcard character (single)
WITHIN	(none)	WITHIN

---

## CTX\_ADM Package

This chapter provides reference information for using the CTX\_ADM PL/SQL package to administer servers and the data dictionary.

CTX\_ADM contains the following stored procedures:

Name	Description
<a href="#">RECOVER</a>	Cleans up database objects for deleted Text tables.
<a href="#">SET_PARAMETER</a>	Sets system-level defaults for index creation.
<a href="#">SHUTDOWN</a>	Shuts down a single <code>ctxsrv</code> server or all currently running servers.

---

**Note:** Only the CTXSYS user can use the procedures in CTX\_ADM.

---

---

## RECOVER

The RECOVER procedure cleans up the Text data dictionary, deleting objects such as leftover preferences.

### Syntax

```
CTX_ADM.RECOVER;
```

### Example

```
begin  
  ctx_adm.recover;  
end;
```

### Notes

You need not call CTX\_ADM.RECOVER to perform system recovery if ctxsrv servers are running; any *ctxsrv* servers that are running automatically perform system recovery approximately every fifteen minutes. RECOVER provides a method for users to perform recovery on command.

## SET\_PARAMETER

The SET\_PARAMETER procedure sets system-level parameters for index creation.

### Syntax

```
CTX_ADM.SET_PARAMETER(param_name IN VARCHAR2,  
                      param_value IN VARCHAR2);
```

#### **param\_name**

Specify the name of the parameter to set, which can be one of the following:

- `max_index_memory` (maximum memory allowed for indexing)
- `default_index_memory` (default memory allocated for indexing)
- `log_directory` (directory for ctx\_output files)
- `ctx_doc_key_type` (default input key type for CTX\_DOC procedures)
- `file_access_role`
- `default_datastore` (default datastore preference)
- `default_filter_file` (default filter preference for data stored in files)
- `default_filter_text` (default text filter preference)
- `default_filter_binary` (default binary filter preference)
- `default_section_html` (default html section group preference)
- `default_section_xml` (default xml section group preference)
- `default_section_text` (default text section group preference)
- `default_lexer` (default lexer preference)
- `default_wordlist` (default wordlist preference)
- `default_stoplist` (default stoplist preference)
- `default_storage` (default storage preference)
- `default_ctxcat_lexer`
- `default_ctxcat_stoplist`
- `default_ctxcat_storage`

- default\_ctxcat\_wordlist
- default\_ctxrule\_lexer
- default\_ctxrule\_stoplist
- default\_ctxrule\_storage
- default\_ctxrule\_wordlist

**See Also:** To learn more about the default values for these parameters, see ["System Parameters"](#) in [Chapter 2](#).

**param\_value**

Specify the value to assign to the parameter. For `max_index_memory` and `default_index_memory`, the value you specify must have the following syntax:

`number[M|G|K]`

where M stands for megabytes, G stands for gigabytes, and K stands for kilobytes.

For each of the other parameters, specify the name of a preference to use as the default for indexing.

**Example**

```
begin
ctx_adm.set_parameter('default_lexer', 'my_lexer');
end;
```

## SHUTDOWN

---

The SHUTDOWN procedure shuts down the specified *ctxsrv* server.

### Syntax

```
CTX_ADM.SHUTDOWN(name    IN VARCHAR2 DEFAULT 'ALL',  
                  sdmode IN NUMBER   DEFAULT NULL);
```

#### **name**

Specify the name (internal identifier) of the *ctxsrv* server to shutdown.

Default is ALL.

#### **sdmode**

Specify the shutdown mode for the server:

- 0 or NULL (Normal)
- 1 (Immediate)
- 2 (Abort)

Default is NULL.

### Examples

```
begin  
ctx_adm.shutdown('DRSRV_3321', 1);  
end;
```

### Notes

If you do not specify a *ctxsrv* server to shut down, CTX\_ADM.SHUTDOWN shuts down all currently running *ctxsrv* servers.

The names of all currently running *ctxsrv* servers can be obtained from the CTX\_SERVERS view.

---

## CTX\_DDL Package

This chapter provides reference information for using the CTX\_DDL PL/SQL package to create and manage the preferences, section groups, and stoplists required for Text indexes.

CTX\_DDL contains the following stored procedures and functions:

Name	Description
<a href="#">ADD_ATTR_SECTION</a>	Adds an attribute section to a section group.
<a href="#">ADD_FIELD_SECTION</a>	Creates a filed section and assigns it to the specified section group
<a href="#">ADD_INDEX</a>	Adds an index to a catalog index preference.
<a href="#">ADD_SPECIAL_SECTION</a>	Adds a special section to a section group.
<a href="#">ADD_STOPCLASS</a>	Adds a stopclass to a stoplist.
<a href="#">ADD_STOP_SECTION</a>	Adds a stop section to an automatic section group.
<a href="#">ADD_STOPTHEME</a>	Adds a stoptheme to a stoplist.
<a href="#">ADD_STOPWORD</a>	Adds a stopword to a stoplist.
<a href="#">ADD_SUB_LEXER</a>	Adds a sub-lexer to a multi-lexer preference.
<a href="#">ADD_ZONE_SECTION</a>	Creates a zone section and adds it to the specified section group.
<a href="#">CREATE_INDEX_SET</a>	Creates an index set for CTXCAT index types.
<a href="#">CREATE_PREFERENCE</a>	Creates a preference in the Text data dictionary
<a href="#">CREATE_SECTION_GROUP</a>	Creates a section group in the Text data dictionary
<a href="#">CREATE_STOPLIST</a>	Creates a stoplist.

---

Name	Description
<a href="#">DROP_INDEX_SET</a>	Drops an index set.
<a href="#">DROP_PREFERENCE</a>	Deletes a preference from the Text data dictionary
<a href="#">DROP_SECTION_GROUP</a>	Deletes a section group from the Text data dictionary
<a href="#">DROP_STOPLIST</a>	Drops a stoplist.
<a href="#">OPTIMIZE_INDEX</a>	Optimize the index.
<a href="#">REMOVE_INDEX</a>	Removes an index from a CTXCAT index preference.
<a href="#">REMOVE_SECTION</a>	Deletes a section from a section group
<a href="#">REMOVE_STOPCLASS</a>	Deletes a stopclass from a section group.
<a href="#">REMOVE_STOPTHEME</a>	Deletes a stoptheme from a stoplist.
<a href="#">REMOVE_STOPWORD</a>	Deletes a stopword from a section group.
<a href="#">SET_ATTRIBUTE</a>	Sets a preference attribute.
<a href="#">SYNC_INDEX</a>	Synchronize index.
<a href="#">UNSET_ATTRIBUTE</a>	Removes a set attribute from a preference.

---

## ADD\_ATTR\_SECTION

Adds an attribute section to an XML section group. This procedure is useful for defining attributes in XML documents as sections. This allows you to search XML attribute text with the WITHIN operator.

---

**Note:** When you use AUTO\_SECTION\_GROUP, attribute sections are created automatically. Attribute sections created automatically are named in the form tag@attribute.

---

### Syntax

```
CTX_DDL.ADD_ATTR_SECTION(  
    group_name      in   varchar2,  
    section_name    in   varchar2,  
    tag             in   varchar2);
```

#### **group\_name**

Specify the name of the XML section group. You can add attribute sections only to XML section groups.

#### **section\_name**

Specify the name of the attribute section. This is the name used for WITHIN queries on the attribute text.

The section name you specify cannot contain the colon (:), comma (,), or dot (.) characters. The section name must also be unique within group\_name. Section names are case-insensitive.

Attribute section names can be no more than 64 bytes long.

#### **tag**

Specify the name of the attribute in tag@attr form. This parameter is case-sensitive.

### Examples

Consider an XML file that defines the BOOK tag with a TITLE attribute as follows:

```
<BOOK TITLE="Tale of Two Cities">  
    It was the best of times.  
</BOOK>
```

To define the title attribute as an attribute section, create an XML\_SECTION\_GROUP and define the attribute section as follows:

```
begin
ctx_ddl.create_section_group('myxmlgroup', 'XML_SECTION_GROUP');
ctx_ddl.add_attr_section('myxmlgroup', 'booktitle', 'book@title');
end;
```

When you define the TITLE attribute section as such and index the document set, you can query the XML attribute text as follows:

```
'Cities within booktitle'
```

## ADD\_FIELD\_SECTION

Creates a field section and adds the section to an existing section group. This enables field section searching with the [WITHIN](#) operator.

Field sections are delimited by start and end tags. By default, the text within field sections are indexed as a sub-document separate from the rest of the document.

Unlike zone sections, field sections cannot nest or overlap. As such, field sections are best suited for non-repeating, non-overlapping sections such as TITLE and AUTHOR markup in email- or news-type documents.

Because of how field sections are indexed, [WITHIN](#) queries on field sections are usually faster than WITHIN queries on zone sections.

### Syntax

```
CTX_DDL.ADD_FIELD_SECTION(  
    group_name      in    varchar2,  
    section_name    in    varchar2,  
    tag             in    varchar2,  
    visible         in    boolean default FALSE  
);
```

#### **group\_name**

Specify the name of the section group to which section\_name is added. You can add up to 64 field sections to a single section group. Within the same group, section zone names and section field names cannot be the same.

#### **section\_name**

Specify the name of the section to add to the group\_name. You use this name to identify the section in queries. Avoid using names that contain non-alphanumeric characters such as \_, since these characters must be escaped in queries. Section names are case-insensitive.

Within the same group, zone section names and field section names cannot be the same. The terms *Paragraph* and *Sentence* are reserved for special sections.

Section names need not be unique across tags. You can assign the same section name to more than one tag, making details transparent to searches.

**tag**

Specify the tag which marks the start of a section. For example, if the tag is <H1>, specify H1. The start tag you specify must be unique within a section group.

If group\_name is an HTML\_SECTION\_GROUP, you can create field sections for the META tag's NAME/CONTENT attribute pairs. To do so, specify tag as meta@namevalue where namevalue is the value of the NAME attribute whose CONTENT attribute is to be indexed as a section. Refer to the example.

Oracle knows what the end tags look like from the group\_type parameter you specify when you create the section group.

**visible**

Specify TRUE to make the text visible within rest of document.

By default the visible flag is FALSE. This means that Oracle indexes the text within field sections as a sub-document separate from the rest of the document. However, you can set the visible flag to TRUE if you want text within the field section to be indexed as part of the enclosing document.

## Examples

### Visible and Invisible Field Sections

The following code defines a section group basicgroup of the BASIC\_SECTION\_GROUP type. It then creates a field section in basicgroup called Author for the <A> tag. It also sets the visible flag to FALSE:

```
begin
  ctx_ddl.create_section_group('basicgroup', 'BASIC_SECTION_GROUP');
  ctx_ddl.add_field_section('basicgroup', 'Author', 'A', FALSE);
end;
```

Because the Author field section is not visible, to find text within the Author section, you must use the **WITHIN** operator as follows:

```
'(Martin Luther King) WITHIN Author'
```

A query of *Martin Luther King* without the WITHIN operator does not return instances of this term in field sections. If you want to query text within field sections without specifying WITHIN, you must set the visible flag to TRUE when you create the section as follows:

```
begin
  ctx_ddl.add_field_section('basicgroup', 'Author', 'A', TRUE);
```

```
end;
```

### Creating Sections for <META>Tags

When you use the HTML\_SECTION\_GROUP, you can create sections for META tags.

Consider an HTML document that has a META tag as follows:

```
<META NAME="author" CONTENT="ken">
```

To create a field section that indexes the CONTENT attribute for the <META NAME="author"> tag:

```
begin
ctx_ddl.create_section_group('myhtmlgroup', 'HTML_SECTION_GROUP');
ctx_ddl.add_field_section('myhtmlgroup', 'author', 'meta@author');
end
```

After indexing with section group mygroup, you can query the document as follows:

```
'ken WITHIN author'
```

## Limitations

### Nested Sections

Field sections cannot be nested. For example, if you define a field section to start with <TITLE> and define another field section to start with <FOO>, the two sections *cannot* be nested as follows:

```
<TITLE> dog <FOO> cat </FOO> </TITLE>
```

To work with nested section define them as zone sections.

### Repeated Sections

Repeated field sections are allowed, but WITHIN queries treat them as a single section. The following is an example of repeated field section in a document:

```
<TITLE> cat </TITLE>
<TITLE> dog </TITLE>
```

The query *dog and cat within title* returns the document, even though these words occur in different sections.

To have WITHIN queries distinguish repeated sections, define them as zone sections.

## ADD\_INDEX

---

Use this procedure to add an index to a catalog index preference. You create this preference to create catalog indexes of type CTXCAT.

### Syntax

```
CTX_DDL.ADD_INDEX(set_name in varchar2,  
                  column_list varchar2,  
                  storage_clause varchar2);
```

**set\_name**

Specify the name of the index set.

**column\_list**

Specify a comma separated list of columns to index.

**storage\_clause**

Specify a storage clause.

### Example

Consider a table called AUCTION with the following schema:

```
create table auction(  
    item_id number,  
    title varchar2(100),  
    category_id number,  
    price number,  
    bid_close date);
```

Assume that queries on the table involve a mandatory text query clause and optional structured conditions on category\_id. Results must be sorted based on bid\_close.

You can create a catalog index to support the different types of structured queries a user might enter.

To create the indexes, first create the index set preference then add the required indexes to it:

```
begin  
ctx_ddl.create_index_set('auction_iset');  
ctx_ddl.add_index('auction_iset','bid_close');
```

```
ctx_ddl.add_index('auction_iset','category_id, bid_close');  
ctx_ddl.add_index('auction_iset','price, bid_close');  
end;
```

Create the combined catalog index with **CREATE INDEX** as follows:

```
create index auction_titlex on AUCTION(title) indextype is CTXCAT parameters  
( 'index set auction_iset' );
```

## Querying

To query the title column for the word *pokemon*, you can issue regular and mixed queries as follows:

```
select * from AUCTION where CATSEARCH(title, 'pokemon',NULL)> 0;  
select * from AUCTION where CATSEARCH(title, 'pokemon', 'category_id=99 order by  
bid_close desc')> 0;
```

## ADD\_SPECIAL\_SECTION

Adds a special section, either SENTENCE or PARAGRAPH, to a section group. This enables searching within sentences or paragraphs in documents with the [WITHIN](#) operator.

A special section in a document is a section which is not explicitly tagged like zone and field sections. The start and end of special sections are detected when the index is created. Oracle supports two such sections: *paragraph* and *sentence*.

The sentence and paragraph boundaries are determined by the lexer. Therefore, if the lexer cannot recognize the boundaries, no sentence or paragraph sections are indexed.

### Syntax

```
CTX_DDL.ADD_SPECIAL_SECTION(  
    group_name      IN VARCHAR2,  
    section_name    IN VARCHAR2);
```

**group\_name**

Specify the name of the section group.

**section\_name**

Specify SENTENCE or PARAGRAPH.

### Example

The following code enables searching within sentences within HTML documents:

```
begin  
ctx_ddl.create_section_group('htmgroup', 'HTML_SECTION_GROUP');  
ctx_ddl.add_special_section('htmgroup', 'SENTENCE');  
end;
```

You can also add zone sections to the group to enable zone searching in addition to sentence searching. The following example adds the zone section *Headline* to the section group *htmgroup*:

```
begin  
ctx_ddl.create_section_group('htmgroup', 'HTML_SECTION_GROUP');  
ctx_ddl.add_special_section('htmgroup', 'SENTENCE');  
ctx_ddl.add_zone_section('htmgroup', 'Headline', 'H1');
```

```
end;
```

If you are only interested in sentence or paragraph searching within documents and not interested in defining zone or field sections, you can use the `NULL_SECTION_GROUP` as follows:

```
begin
ctx_ddl.create_section_group('nullgroup', 'NULL_SECTION_GROUP');
ctx_ddl.add_special_section('nullgroup', 'SENTENCE');
end;
```

## ADD\_STOPCLASS

Adds a stopclass to a stoplist. A stopclass is a class of tokens that is not to be indexed.

### Syntax

```
CTX_DDL.ADD_STOPCLASS(  
    stoplist_name in varchar2,  
    stopclass      in varchar2  
);
```

#### **stoplist\_name**

Specify the name of the stoplist.

#### **stopclass**

Specify the stopclass to be added to stoplist\_name. Currently, only the NUMBERS class is supported.

The maximum number of stopwords, stopthemes, and stopclasses you can add to a stoplist is 4095.

### Example

The following code adds a stopclass of NUMBERS to the stoplist `mystop`:

```
begin  
ctx_ddl.add_stopclass('mystop', 'NUMBERS');  
end;
```

### Related Topics

[CREATE\\_STOPLIST](#)

[REMOVE\\_STOPCLASS](#)

[DROP\\_STOPLIST](#)

---

## ADD\_STOP\_SECTION

Adds a stop section to an automatic section group. Adding a stop section causes the automatic section indexing operation to ignore the specified section in XML documents.

---

**Note:** Adding a stop section causes no section information to be created in the index. However, the text within a stop section is always searchable.

---

Adding a stop section is useful when your documents contain many low information tags. Adding stop sections also improves indexing performance with the automatic section group.

The number of stop sections you can add is unlimited.

Stop sections do not have section names and hence are not recorded in the section views.

### Syntax

```
CTX_DDL.ADD_STOP_SECTION(  
    section_group IN VARCHAR2,  
    tag IN VARCHAR2);
```

#### **section\_group**

Specify the name of the automatic section group. If you do not specify an automatic section group, this procedure returns an error.

#### **tag**

Specify the tag to ignore during indexing. This parameter is case-sensitive. Defining a stop tag as such also stops the tag's attribute sections, if any.

You can qualify the tag with document type in the form (doctype)tag. For example, if you wanted to make the <fluff> tag a stop section only within the mydoc document type, specify (mydoc)fluff for tag.

## Example

### Defining Stop Sections

The following code adds a stop section identified by the tag `<fluff>` to the automatic section group `myauto`:

```
begin
ctx_ddl.add_stop_section('myauto', 'fluff');
end;
```

This code also stops any attribute sections contained within `<fluff>`. For example, if a document contained:

```
<fluff type="computer">
```

Then the above code also stops the attribute section `fluff@type`.

### Doctype Sensitive Stop Sections

The following code creates a stop section for the tag `<fluff>` only in documents that have a root element of `mydoc`:

```
begin
ctx_ddl.add_stop_section('myauto', '(mydoc)fluff');
end;
```

## Related Topics

[ALTER INDEX](#) in Chapter 1, "SQL Statements and Operators".

[CREATE\\_SECTION\\_GROUP](#)

---

## ADD\_STOPTHEME

Adds a single stoptheme to a stoplist. A stoptheme is a theme that is not to be indexed.

In English, you query on indexed themes using the [ABOUT](#) operator.

### Syntax

```
CTX_DDL.ADD_STOPTHEME(  
    stoplist_name in varchar2,  
    stoptheme     in varchar2  
);
```

#### **stoplist\_name**

Specify the name of the stoplist.

#### **stoptheme**

Specify the stoptheme to be added to stoplist\_name. The system normalizes the stoptheme you enter using the knowledge base. If the normalized theme is more than one theme, the system does not process your stoptheme. For this reason, Oracle recommends that you submit single stopthemes.

The maximum number of stopwords, stopthemes, and stopclasses you can add to a stoplist is 4095.

### Example

The following example adds the stoptheme banking to the stoplist mystop:

```
begin  
ctx_ddl.add_stoptheme('mystop', 'banking');  
end;
```

### Related Topics

[CREATE\\_STOPLIST](#)

[REMOVE\\_STOPTHEME](#)

[DROP\\_STOPLIST](#)

[ABOUT](#) operator in [Chapter 3, "CONTAINS Query Operators"](#).

## ADD\_STOPWORD

---

Use this procedure to add a single stopword to a stoplist.

To create a list of stopwords, you must call this procedure once for each word.

### Syntax

```
CTX_DDL.ADD_STOPWORD(  
    stoplist_name in  varchar2,  
    stopword      in  varchar2,  
    language      in  varchar2 default NULL  
);
```

#### **stoplist\_name**

Specify the name of the stoplist.

#### **stopword**

Specify the stopword to be added.

Language-specific stopwords must be unique across the other stopwords specific to the language. For example, it is valid to have a German *die* and an English *die* in the same stoplist.

The maximum number of stopwords, stopthemes, and stopclasses you can add to a stoplist is 4095.

#### **language**

Specify the language of `stopword` when the stoplist you specify with `stoplist_name` is of type `MULTI_STOPLIST`. You must specify the NLS name or abbreviation of an Oracle-supported language.

To make a stopword active in multiple languages, specify `ALL` for this parameter. For example, defining `ALL` stopwords is useful when you have international documents that contain English fragments that need to be stopped in any language.

An `ALL` stopword is active in all languages. If you use the multi-lexer, the language-specific lexing of the stopword occurs, just as if it had been added multiple times in multiple specific languages.

Otherwise, specify `NULL`.

## Example

### Single Language Stoplist

The following example adds the stopwords *because*, *notwithstanding*, *nonetheless*, and *therefore* to the stoplist `mystop`:

```
begin
  ctx_ddl.add_stopword('mystop', 'because');
  ctx_ddl.add_stopword('mystop', 'notwithstanding');
  ctx_ddl.add_stopword('mystop', 'nonetheless');
  ctx_ddl.add_stopword('mystop', 'therefore');
end;
```

### Multi-Language Stoplist

The following example adds the German word *die* to a multi-language stoplist:

```
begin
  ctx_ddl.add_stopword('mystop', 'Die', 'german');
end;
```

---

---

**Note:** You can add stopwords after you create the index with `ALTER INDEX`.

---

---

### Adding An ALL Stopword

The following adds the word *the* as an ALL stopword to the multi-language stoplist *globallist*:

```
begin
  ctx_ddl.add_stopword('globallist', 'the', 'ALL');
end;
```

## Related Topics

[Appendix D, "Supplied Stoplists"](#)

## ADD\_SUB\_LEXER

Add a sub-lexer to a multi-lexer preference. A sub-lexer identifies a language in a multi-lexer (multi-language) preference. Use a multi-lexer preference when you want to index more than one language.

### Restrictions

The following restrictions apply to using CTX\_DDL.ADD\_SUB\_LEXER:

- The invoking user must be the owner of the multi-lexer or CTXSYS.
- The `lexer_name` parameter must name a preference which is a multi-lexer lexer.
- A lexer for default must be defined before the multi-lexer can be used in an index.
- The sub-lexer preference owner must be the same as multi-lexer preference owner.
- The sub-lexer preference must not be a multi-lexer lexer.
- A sub-lexer preference cannot be dropped while it is being used in a multi-lexer preference.
- CTX\_DDL.ADD\_SUB\_LEXER records only a reference. The sub-lexer values are copied at create index time to index value storage.

### Syntax

```
CTX_DDL.ADD_SUB_LEXER(  
    lexer_name in varchar2,  
    language  in varchar2,  
    sub_lexer in varchar2,  
    alt_value in varchar2 default null  
);
```

#### **lexer\_name**

Specify the name of the multi-lexer preference.

#### **language**

Specify the NLS language name or abbreviation of the sub-lexer. For example, you can specify ENGLISH or EN for English.

The sub-lexer you specify with `sub_lexer` is used when the language column has a value case-insensitive equal to the NLS name or abbreviation of language.

Specify `DEFAULT` to assign a default sub-lexer to use when the value of the language column in the base table is null, invalid, or unmapped to a sub-lexer. The `DEFAULT` lexer is also used to parse stopwords.

If a sub-lexer definition for language already exists, then it is replaced by this call.

**sub\_lexer**

Specify the name of the sub-lexer to use for this language.

**alt\_value**

Optionally specify an alternate value for language.

If you specify `DEFAULT` for language, you cannot specify an `alt_value`.

The `alt_value` is limited to 30 bytes and cannot be an NLS language name, abbreviation, or `DEFAULT`.

## Example

This example shows how to create a multi-language text table and how to set up the multi-lexer to index the table.

Create the multi-language table with a primary key, a text column, and a language column as follows:

```
create table globaldoc (  
    doc_id number primary key,  
    lang varchar2(3),  
    text clob  
);
```

Assume that the table holds mostly English documents, with the occasional German or Japanese document. To handle the three languages, you must create three sub-lexers, one for English, one for German, and one for Japanese:

```
ctx_ddl.create_preference('english_lexer','basic_lexer');  
ctx_ddl.set_attribute('english_lexer','index_themes','yes');  
ctx_ddl.set_attribute('english_lexer','theme_language','english');  
  
ctx_ddl.create_preference('german_lexer','basic_lexer');  
ctx_ddl.set_attribute('german_lexer','composite','german');  
ctx_ddl.set_attribute('german_lexer','mixed_case','yes');  
ctx_ddl.set_attribute('german_lexer','alternate_spelling','german');
```

```
ctx_ddl.create_preference('japanese_lexer','japanese_vgram_lexer');
```

**Create the multi-lexer preference:**

```
ctx_ddl.create_preference('global_lexer','multi_lexer');
```

**Since the stored documents are mostly English, make the English lexer the default:**

```
ctx_ddl.add_sub_lexer('global_lexer','default','english_lexer');
```

**Add the German and Japanese lexers in their respective languages. Also assume that the language column is expressed in ISO 639-2, so we add those as alternate values.**

```
ctx_ddl.add_sub_lexer('global_lexer','german','german_lexer','ger');  
ctx_ddl.add_sub_lexer('global_lexer','japanese','japanese_lexer','jpn');
```

**Create the index `globalx`, specifying the multi-lexer preference and the language column in the parameters string as follows:**

```
create index globalx on globaldoc(text) indextype is ctxsys.context  
parameters ('lexer global_lexer language column lang');
```

---

## ADD\_ZONE\_SECTION

Creates a zone section and adds the section to an existing section group. This enables zone section searching with the [WITHIN](#) operator.

Zone sections are sections delimited by start and end tags. The `<B>` and `</B>` tags in HTML, for instance, marks a range of words which are to be rendered in boldface.

Zone sections can be nested within one another, can overlap, and can occur more than once in a document.

### Syntax

```
CTX_DDL.ADD_ZONE_SECTION(  
    group_name      in    varchar2,  
    section_name    in    varchar2,  
    tag             in    varchar2  
);
```

#### **group\_name**

Specify the name of the section group to which `section_name` is added.

#### **section\_name**

Specify the name of the section to add to the `group_name`. You use this name to identify the section in `WITHIN` queries. Avoid using names that contain non-alphanumeric characters such as `_`, since most of these characters are special must be escaped in queries. Section names are case-insensitive.

Within the same group, zone section names and field section names cannot be the same. The terms *Paragraph* and *Sentence* are reserved for special sections.

Section names need not be unique across tags. You can assign the same section name to more than one tag, making details transparent to searches.

#### **tag**

Specify the pattern which marks the start of a section. For example, if `<H1>` is the HTML tag, specify `H1` for tag. The start tag you specify must be unique within a section group.

Oracle knows what the end tags look like from the `group_type` parameter you specify when you create the section group.

If `group_name` is an `HTML_SECTION_GROUP`, you can create zone sections for the `META` tag's `NAME/CONTENT` attribute pairs. To do so, specify tag as `meta@namevalue` where `namevalue` is the value of the `NAME` attribute whose `CONTENT` attributes are to be indexed as a section. Refer to the example.

If `group_name` is an `XML_SECTION_GROUP`, you can optionally qualify tag with a document type (root element) in the form `(doctype)tag`. Doing so makes `section_name` sensitive to the XML document type declaration. Refer to the example.

## Examples

### Creating HTML Sections

The following code defines a section group called `htmgroup` of type `HTML_SECTION_GROUP`. It then creates a zone section in `htmgroup` called `headline` identified by the `<H1>` tag:

```
begin
ctx_ddl.create_section_group('htmgroup', 'HTML_SECTION_GROUP');
ctx_ddl.add_zone_section('htmgroup', 'heading', 'H1');
end;
```

After indexing with section group `htmgroup`, you can query within the heading section by issuing a query as follows:

```
'Oracle WITHIN heading'
```

### Creating Sections for `<META NAME>` Tags

You can create zone sections for HTML `META` tags when you use the `HTML_SECTION_GROUP`.

Consider an HTML document that has a `META` tag as follows:

```
<META NAME="author" CONTENT="ken">
```

To create a zone section that indexes all `CONTENT` attributes for the `META` tag whose `NAME` value is `author`:

```
begin
ctx_ddl.create_section_group('htmgroup', 'HTML_SECTION_GROUP');
ctx_ddl.add_zone_section('htmgroup', 'author', 'meta@author');
end
```

After indexing with section group `htmgroup`, you can query the document as follows:

```
'ken WITHIN author'
```

### Creating Document Type Sensitive Sections (XML Documents Only)

You have an XML document set that contains the `<book>` tag declared for different document types. You want to create a distinct book section for each document type.

Assume that `mydocname` is declared as an XML document type (root element) as follows:

```
<!DOCTYPE mydocname ... [...
```

Within `mydocname`, the element `<book>` is declared. For this tag, you can create a section named `mybooksec` that is sensitive to the tag's document type as follows:

```
begin
ctx_ddl.create_section_group('myxmlgroup', 'XML_SECTION_GROUP');
ctx_ddl.add_zone_section('myxmlgroup', 'mybooksec', '(mydocname)book');
end;
```

## Notes

### Repeated Sections

Zone sections can repeat. Each occurrence is treated as a separate section. For example, if `<H1>` denotes a heading section, they can repeat in the same documents as follows:

```
<H1> The Brown Fox </H1>
```

```
<H1> The Gray Wolf </H1>
```

Assuming that these zone sections are named `Heading`, the query *Brown WITHIN Heading* returns this document. However, a query of *(Brown and Gray) WITHIN Heading* does not.

### Overlapping Sections

Zone sections can overlap each other. For example, if `<B>` and `<I>` denote two different zone sections, they can overlap in document as follows:

```
plain <B> bold <I> bold and italic </B> only italic </I> plain
```

## Nested Sections

Zone sections can nest, including themselves as follows:

```
<TD> <TABLE><TD>nested cell</TD></TABLE></TD>
```

Using the WITHIN operator, you can write queries to search for text in sections within sections. For example, assume the BOOK1, BOOK2, and AUTHOR zone sections occur as follows in documents doc1 and doc2:

doc1:

```
<book1> <author>Scott Tiger</author> This is a cool book to read.</book1>
```

doc2:

```
<book2> <author>Scott Tiger</author> This is a great book to read.</book2>
```

Consider the nested query:

```
'Scott within author within book1'
```

This query returns only doc1.

## CREATE\_INDEX\_SET

Creates an index set for CTXCAT index types. You name this index set in the parameter clause of CREATE INDEX when you create a CTXCAT index.

### Syntax

```
CTX_DDL.CREATE_INDEX_SET(set_name in    varchar2);
```

**set\_name**

Specify the name of the index set. You name this index set in the parameter clause of CREATE INDEX when you create a CTXCAT index.

## CREATE\_PREFERENCE

Creates a preference in the Text data dictionary. You specify preferences in the parameter string of [CREATE INDEX](#) or [ALTER INDEX](#).

### Syntax

```
CTX_DDL.CREATE_PREFERENCE(preference_name in varchar2,  
                           object_name     in varchar2);
```

#### **preference\_name**

Specify the name of the preference to be created.

#### **object\_name**

Specify the name of the preference type.

**See Also:** For a complete list of preference types and their associated attributes, see [Chapter 2, "Indexing"](#).

### Examples

#### **Creating Text-only Index**

The following example creates a lexer preference that specifies a text-only index. It does so by creating a BASIC\_LEXER preference called `my_lexer` with CTX\_DDL.CREATE\_PREFERENCE. It then calls CTX\_DDL.SET\_ATTRIBUTE twice, first specifying Y for the INDEX\_TEXT attribute, then specifying N for the INDEX\_THEMES attribute.

```
begin  
  ctx_ddl.create_preference('my_lexer', 'BASIC_LEXER');  
  ctx_ddl.set_attribute('my_lexer', 'INDEX_TEXT', 'YES');  
  ctx_ddl.set_attribute('my_lexer', 'INDEX_THEMES', 'NO');  
end;
```

#### **Specifying File Data Storage**

The following example creates a data storage preference called `mypref` that tells the system that the files to be indexed are stored in the operating system. The example

then uses `CTX_DDL.SET_ATTRIBUTE` to set the `PATH` attribute of to the directory `/docs`.

```
begin
ctx_ddl.create_preference('mypref', 'FILE_DATASTORE');
ctx_ddl.set_attribute('mypref', 'PATH', '/docs');
end;
```

**See Also:** For more information about data storage, see ["Datastore Types" in Chapter 2](#).

### Creating Master/Detail Relationship

You can use `CTX_DDL.CREATE_PREFERENCE` to create a preference with `DETAIL_DATASTORE`. You use `CTX_DDL.SET_ATTRIBUTE` to set the attributes for this preference. The following example shows how this is done:

```
begin
ctx_ddl.create_preference('my_detail_pref', 'DETAIL_DATASTORE');
ctx_ddl.set_attribute('my_detail_pref', 'binary', 'true');
ctx_ddl.set_attribute('my_detail_pref', 'detail_table', 'my_detail');
ctx_ddl.set_attribute('my_detail_pref', 'detail_key', 'article_id');
ctx_ddl.set_attribute('my_detail_pref', 'detail_lineno', 'seq');
ctx_ddl.set_attribute('my_detail_pref', 'detail_text', 'text');
end;
```

**See Also:** For more information about master/detail, see ["DETAIL\\_DATASTORE" in Chapter 2](#).

### Specifying Storage Attributes

The following examples specify that the index tables are to be created in the `foo` tablespace with an initial extent of 1K:

```
begin
ctx_ddl.create_preference('mystore', 'BASIC_STORAGE');
ctx_ddl.set_attribute('mystore', 'I_TABLE_CLAUSE',
                    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'K_TABLE_CLAUSE',
                    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'R_TABLE_CLAUSE',
                    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'N_TABLE_CLAUSE',
                    'tablespace foo storage (initial 1K)');
ctx_ddl.set_attribute('mystore', 'I_INDEX_CLAUSE',
```

```
        'tablespace foo storage (initial 1K)');  
end;
```

**See Also:** For more information about storage, see ["Storage Types"](#) in [Chapter 2](#).

### Creating Preferences with No Attributes

When you create preferences with types that have no attributes, you need only create the preference, as in the following example which sets the filter to the NULL\_FILTER:

```
begin  
ctx_ddl.create_preference('my_null_filter', 'NULL_FILTER');  
end;
```

### Related Topics

[SET\\_ATTRIBUTE](#)

---

# CREATE\_SECTION\_GROUP

Creates a section group for defining sections in a text column.

When you create a section group, you can add to it zone, field, or special sections with [ADD\\_ZONE\\_SECTION](#), [ADD\\_FIELD\\_SECTION](#), or [ADD\\_SPECIAL\\_SECTION](#).

When you index, you name the section group in the parameter string of [CREATE INDEX](#) or [ALTER INDEX](#).

After indexing, you can query within your defined sections with the [WITHIN](#) operator.

## Syntax

```
CTX_DDL.CREATE_SECTION_GROUP(  
    group_name      in    varchar2,  
    group_type      in    varchar2  
);
```

**group\_name**

Specify the section group name to create as [user.]section\_group\_name. This parameter must be unique within an owner.

**group\_type**

Specify section group type. The group\_type parameter can be one of:

Section Group Preference	Description
NULL_SECTION_GROUP	Use this group type when you define no sections or when you define <i>only</i> SENTENCE or PARAGRAPH sections. This is the default.
BASIC_SECTION_GROUP	Use this group type for defining sections where the start and end tags are of the form <A> and </A>.
HTML_SECTION_GROUP	Use this group type for indexing HTML documents and for defining sections in HTML documents.
XML_SECTION_GROUP	Use this group type for indexing XML documents and for defining sections in XML documents.

Section Group Preference	Description
AUTO_SECTION_GROUP	<p>Use this group type to automatically create a zone section for each start-tag/end-tag pair in an XML document. The section names derived from XML tags are case sensitive as in XML.</p> <p>Attribute sections are created automatically for XML tags that have attributes. Attribute sections are named in the form attribute@tag.</p> <p>Stop sections, empty tags, processing instructions, and comments are not indexed.</p> <p>The following limitations apply to automatic section groups:</p> <ul style="list-style-type: none"> <li>■ You cannot add zone, field, or special sections to an automatic section group.</li> <li>■ Automatic sectioning does not index XML document types (root elements.) However, you can define stop sections with document type.</li> <li>■ The length of the indexed tags, including prefix and namespace, cannot exceed 64 characters. Tags longer than this are not indexed.</li> </ul>
PATH_SECTION_GROUP	<p>Use this group type to index XML documents. Behaves like the AUTO_SECTION_GROUP.</p> <p>The difference is that with this section group you can do path searching with the INPATH and HASPATH operators. Queries are also case-sensitive for tag and attribute names.</p>
NEWS_SECTION_GROUP	<p>Use this group for defining sections in newsgroup formatted documents according to RFC 1036.</p>

## Example

The following command creates a section group called `htmgroup` with the HTML group type.

```
begin
  ctx_ddl.create_section_group('htmgroup', 'HTML_SECTION_GROUP');
end;
```

The following command creates a section group called `auto` with the AUTO\_SECTION\_GROUP group type to be used to automatically index tags in XML documents.

```
begin
    ctx_ddl.create_section_group('auto', 'AUTO_SECTION_GROUP');
end;
```

## CREATE\_STOPLIST

---

Use this procedure to create a new, empty stoplist. Stoplists can contain words or themes that are not to be indexed.

You can also create multi-language stoplists to hold language-specific stopwords. A multi-language stoplist is useful when you index a table that contains documents in different languages, such as English, German, and Japanese. When you do so, your text table must contain a language column.

You can add either stopwords, stopclasses, or stopthemes to a stoplist using [ADD\\_STOPWORD](#), [ADD\\_STOPCLASS](#), or [ADD\\_STOPTHEME](#).

You can specify a stoplist in the parameter string of [CREATE INDEX](#) or [ALTER INDEX](#) to override the default stoplist [CTXSYS.DEFAULT\\_STOPLIST](#).

### Syntax

```
CTX_DDL.CREATE_STOPLIST(  
    stoplist_name IN VARCHAR2,  
    stoplist_type IN VARCHAR2 DEFAULT 'BASIC_STOPLIST');
```

#### **stoplist\_name**

Specify the name of the stoplist to be created.

#### **stoplist\_type**

Specify BASIC\_STOPLIST to create a stoplist for a single language. This is the default.

Specify MULTI\_STOPLIST to create a stoplist with language-specific stopwords.

At indexing time, the language column of each document is examined, and only the stopwords for that language are eliminated. At query time, the session language setting determines the active stopwords, like it determines the active lexer when using the multi-lexer.

---

---

**Note:** When indexing a multi-language table with a multi-language stoplist, your table must have a language column.

---

---

## Example

### Single Language Stoplist

The following code creates a stoplist called `mystop`:

```
begin
ctx_ddl.create_stoplist('mystop', 'BASIC_STOPLIST');
end;
```

### Multi-Language Stoplist

The following code creates a multi-language stoplist called `multistop` and then adds two language-specific stopwords:

```
begin
ctx_ddl.create_stoplist('multistop', 'MULTI_STOPLIST');
ctx_ddl.add_stopword('mystop', 'Die', 'german');
ctx_ddl.add_stopword('mystop', 'Or', 'english');
end;
```

---

## DROP\_INDEX\_SET

Drops an index set.

### Syntax

```
CTX_DDL.DROP_INDEX_SET(set_name in varchar2);
```

**set\_name**

Specify the name of the index set to drop.

---

## DROP\_PREFERENCE

The DROP\_PREFERENCE procedure deletes the specified preference from the Text data dictionary. Dropping a preference does not affect indexes that have already been created using that preference.

### Syntax

```
CTX_DDL.DROP_PREFERENCE(preference_name IN VARCHAR2);
```

**preference\_name**

Specify the name of the preference to be dropped.

### Example

The following code drops the preference `my_lexer`.

```
begin
ctx_ddl.drop_preference('my_lexer');
end;
```

### Related Topics

[CREATE\\_PREFERENCE](#)

---

## DROP\_SECTION\_GROUP

The `DROP_SECTION_GROUP` procedure deletes the specified section group, as well as all the sections in the group, from the Text data dictionary.

### Syntax

```
CTX_DDL.DROP_SECTION_GROUP(group_name IN VARCHAR2);
```

**group\_name**

Specify the name of the section group to delete.

### Examples

The following code drops the section group `htmgroup` and all its sections:

```
begin
ctx_ddl.drop_section_group('htmgroup');
end;
```

### Related Topics

[CREATE\\_SECTION\\_GROUP](#)

---

## DROP\_STOPLIST

Drops a stoplist from the Text data dictionary. When you drop a stoplist, you must recreate or rebuild the index for the change to take effect.

### Syntax

```
CTX_DDL.DROP_STOPLIST(stoplist_name in varchar2);
```

**stoplist\_name**

Specify the name of the stoplist.

### Example

The following code drops the stoplist `mystop`:

```
begin
ctx_ddl.drop_stoplist('mystop');
end;
```

### Related Topics

[CREATE\\_STOPLIST](#)

# OPTIMIZE\_INDEX

Use this procedure to optimize the index. You optimize your index after you synchronize it. Optimizing the index removes old data and minimizes index fragmentation. Optimizing the index can improve query response time.

You can optimize in fast, full, or token mode. In token mode, you specify a specific token to be optimized. You can use token mode to optimize index tokens that are frequently searched, without spending time on optimizing tokens that are rarely referenced. An optimized token can improve query response time for that token.

**Note:** Optimizing an index can result in better response time only if you insert, delete, or update documents in your base table after your initial indexing operation.

Using this procedure to optimize your index is recommended over using the ALTER INDEX statement.

## Syntax

```
CTX_DDL.OPTIMIZE_INDEX(  
    idx_name IN VARCHAR2,  
    optlevel IN VARCHAR2,  
    maxtime  IN NUMBER DEFAULT NULL,  
    token    IN VARCHAR2 DEFAULT NULL,  
    part_name IN VARCHAR2 DEFAULT NULL);  
);
```

**idx\_name**  
Specify the name of the index.

**optlevel**  
Specify optimization level as a string. You can specify one of the following methods for optimization:

Value	Description
FAST or CTX_DDL.OPTLEVEL_FAST	This method compacts fragmented rows. However, old data is not removed.

Value	Description
FULL or CTX_DDL.OPTLEVEL_FULL	In this mode you can optimize the entire index or a portion of the index. This method compacts rows and removes old data (deleted rows). Optimizing in full mode runs even when there are no deleted rows.
TOKEN	<p>This method lets you specify a specific token to be optimized. Oracle does a FULL optimization on the token you specify with token.</p> <p>Use this method to optimize those tokens that are searched frequently.</p> <p>Token optimization is not supported for CTXRULE indexes.</p>

**maxtime**  
Specify maximum optimization time, in minutes, for FULL optimize.

When you specify the symbol CTX\_DDL.MAXTIME\_UNLIMITED (or pass in NULL), the entire index is optimized. This is the default.

**token**  
Specify the token to be optimized.

**part\_name**  
Specify the name of the index partition to optimize.

Examples

The following two examples optimize the index for fast optimization.

```
begin
ctx_ddl.optimize_index('myidx','FAST');
end;

begin
ctx_ddl.optimize_index('myidx',CTX_DDL.OPTLEVEL_FAST);
end;
```

The following example optimizes the index token *Oracle*:

```
begin
ctx_ddl.optimize_index('myidx','token', TOKEN=>'Oracle');
end;
```

## Related Topics

[ALTER INDEX](#) in Chapter 1, "SQL Statements and Operators".

---

## REMOVE\_INDEX

Removes the index with the specified column list from a CTXCAT index set preference.

---

---

**Note:** This procedure does not remove a CTXCAT sub-index from the existing index. To do so, you must drop your index and re-index with the modified index set preference.

---

---

### Syntax

```
CTX_DDL.REMOVE_INDEX(  
    set_name in varchar2,  
    column_list in varchar2  
    language in varchar2 default NULL  
);
```

**set\_name**

Specify the name of the index set

**column\_list**

Specify the name of the column list to remove.

## REMOVE\_SECTION

The REMOVE\_SECTION procedure removes the specified section from the specified section group. You can specify the section by name or by id. You can view section id with the CTX\_USER\_SECTIONS view.

### Syntax 1

Use the following syntax to remove a section by section name:

```
CTX_DDL.REMOVE_SECTION(  
    group_name      in   varchar2,  
    section_name    in   varchar2  
);
```

**group\_name**

Specify the name of the section group from which to delete section\_name.

**section\_name**

Specify the name of the section to delete from group\_name.

### Syntax 2

Use the following syntax to remove a section by section id:

```
CTX_DDL.REMOVE_SECTION(  
    group_name      in   varchar2,  
    section_id      in   number  
);
```

**group\_name**

Specify the name of the section group from which to delete section\_id.

**section\_id**

Specify the section id of the section to delete from group\_name.

### Examples

The following code drops a section called Title from the htmgroup:

```
begin  
    ctx_ddl.remove_section('htmgroup', 'Title');  
end;
```

## Related Topics

[ADD\\_FIELD\\_SECTION](#)

[ADD\\_SPECIAL\\_SECTION](#)

[ADD\\_ZONE\\_SECTION](#)

## REMOVE\_STOPCLASS

---

Removes a stopclass from a stoplist.

### Syntax

```
CTX_DDL.REMOVE_STOPCLASS(  
    stoplist_name in varchar2,  
    stopclass     in varchar2  
);
```

#### **stoplist\_name**

Specify the name of the stoplist.

#### **stopclass**

Specify the name of the stopclass to be removed.

### Example

The following code removes the stopclass NUMBERS from the stoplist mystop.

```
begin  
ctx_ddl.remove_stopclass('mystop', 'NUMBERS');  
end;
```

### Related Topics

[ADD\\_STOPCLASS](#)

---

## REMOVE\_STOPTHEME

Removes a stoptheme from a stoplist.

### Syntax

```
CTX_DDL.REMOVE_STOPTHEME(  
    stoplist_name    in    varchar2,  
    stoptheme        in    varchar2  
);
```

**stoplist\_name**

Specify the name of the stoplist.

**stoptheme**

Specify the stoptheme to be removed from stoplist\_name.

### Example

The following code removes the stoptheme *banking* from the stoplist `mystop`:

```
begin  
ctx_ddl.remove_stoptheme('mystop', 'banking');  
end;
```

### Related Topics

[ADD\\_STOPTHEME](#)

## REMOVE\_STOPWORD

---

Removes a stopword from a stoplist. To have the removal of a stopword be reflected in the index, you must rebuild your index.

### Syntax

```
CTX_DDL.REMOVE_STOPWORD(  
    stoplist_name in varchar2,  
    stopword      in varchar2,  
    language      in varchar2 default NULL  
);
```

#### **stoplist\_name**

Specify the name of the stoplist.

#### **stopword**

Specify the stopword to be removed from stoplist\_name.

#### **language**

Specify the language of stopword to remove when the stoplist you specify with stoplist\_name is of type MULTI\_STOPLIST. You must specify the NLS name or abbreviation of an Oracle-supported language. You can also remove ALL stopwords.

### Example

The following code removes a stopword *because* from the stoplist *mystop*:

```
begin  
    ctx_ddl.remove_stopword('mystop','because');  
end;
```

### Related Topics

[ADD\\_STOPWORD](#)

---

## SET\_ATTRIBUTE

Sets a preference attribute. You use this procedure after you have created a preference with CTX\_DDL.[CREATE\\_PREFERENCE](#).

### Syntax

```
ctx_ddl.set_attribute(preference_name in varchar2,  
                     attribute_name in varchar2,  
                     attribute_value in varchar2);
```

**preference\_name**

Specify the name of the preference.

**attribute\_name**

Specify the name of the attribute.

**attribute\_value**

Specify the attribute value. You can specify boolean values as TRUE or FALSE, T or F, YES or NO, Y or N, ON or OFF, or 1 or 0.

### Example

#### Specifying File Data Storage

The following example creates a data storage preference called `filepref` that tells the system that the files to be indexed are stored in the operating system. The example then uses CTX\_DDL.[SET\\_ATTRIBUTE](#) to set the `PATH` attribute to the directory `/docs`.

```
begin  
ctx_ddl.create_preference('filepref', 'FILE_DATASTORE');  
ctx_ddl.set_attribute('filepref', 'PATH', '/docs');  
end;
```

**See Also:** For more information about data storage, see "[Datastore Types](#)" in [Chapter 2, "Indexing"](#).

For more examples of using SET\_ATTRIBUTE, see [CREATE\\_PREFERENCE](#).

## SYNC\_INDEX

Synchronizes the index to process inserts, updates, and deletes to the base table.

### Syntax

```
ctx_ddl.sync_index(  
    idx_name IN VARCHAR2 DEFAULT NULL  
    memory IN VARCHAR2 DEFAULT NULL,  
    part_name IN VARCHAR2 DEFAULT NULL);
```

#### **idx\_name**

Specify the name of the index.

#### **memory**

Specify the runtime memory to use for synchronization. This value overrides the `DEFAULT_INDEX_MEMORY` system parameter.

The memory parameter specifies the amount of memory Oracle uses for the synchronization operation before flushing the index to disk. Specifying a large amount of memory:

- improves indexing performance because there is less I/O
- improves query performance and maintenance because there is less fragmentation

Specifying smaller amounts of memory increases disk I/O and index fragmentation, but might be useful when runtime memory is scarce.

#### **part\_name**

Specify the name of the index partition to synchronize.

### Example

The following example synchronizes the index `myindex` with 2 megabytes of memory:

```
begin  
    ctx_ddl.sync_index('myindex', '2M');  
end;
```

The following example synchronizes the `part1` index partition with 2 megabytes of memory:

```
begin
    ctx_ddl.sync_index('myindex', '2M', 'part1');
end;
```

## Related Topics

[ALTER INDEX](#) in Chapter 1, "SQL Statements and Operators".

## UNSET\_ATTRIBUTE

---

Removes a set attribute from a preference.

### Syntax

```
CTX_DDL.UNSET_ATTRIBUTE(preference_name varchar2,  
                        attribute_name  varchar2);
```

**preference\_name**

Specify the name of the preference.

**attribute\_name**

Specify the name of the attribute.

### Example

#### Enabling/Disabling Alternate Spelling

The following example shows how you can enable alternate spelling for German and disable alternate spelling with CTX\_DDL.UNSET\_ATTRIBUTE:

```
begin  
ctx_ddl.create_preference('GERMAN_LEX', 'BASIC_LEXER');  
ctx_ddl.set_attribute('GERMAN_LEX', 'ALTERNATE_SPELLING', 'GERMAN');  
end;
```

To disable alternate spelling, use the CTX\_DDL.UNSET\_ATTRIBUTE procedure as follows:

```
begin  
ctx_ddl.unset_attribute('GERMAN_LEX', 'ALTERNATE_SPELLING');  
end;
```

### Related Topics

[SET\\_ATTRIBUTE](#)

---

## CTX\_DOC Package

This chapter describes the CTX\_DOC PL/SQL package for requesting document services.

---

**Note:** You can use this package only when your index type is CONTEXT. This package does not support the CTXCAT index type.

---

The CTX\_DOC package includes the following procedures and functions:

Name	Description
<a href="#">FILTER</a>	Generates a plain text or HTML version of a document
<a href="#">GIST</a>	Generates a Gist or theme summaries for a document
<a href="#">HIGHLIGHT</a>	Generates plain text or HTML highlighting offset information for a document
<a href="#">IFILTER</a>	Generates a plain text version of binary data. Can be called from a USER_DATASTORE procedure.
<a href="#">MARKUP</a>	Generates a plain text or HTML version of a document with query terms highlighted
<a href="#">PKENCODE</a>	Encodes a composite textkey string (value) for use in other CTX_DOC procedures
<a href="#">SET_KEY_TYPE</a>	Sets CTX_DOC procedures to accept rowid or primary key document identifiers.
<a href="#">THEMES</a>	Generates a list of themes for a document
<a href="#">TOKENS</a>	Generates all index tokens for a document.

---

## FILTER

Use the `CTX_DOC.FILTER` procedure to generate either a plain text or HTML version of a document. You can store the rendered document in either a result table or in memory. This procedure is generally called after a query, from which you identify the document to be filtered.

### Syntax 1: In-memory Result Storage

```
CTX_DOC.FILTER(  
    index_name IN VARCHAR2,  
    textkey    IN VARCHAR2,  
    restab     IN OUT NOCOPY CLOB,  
    plaintext  IN BOOLEAN  DEFAULT FALSE);
```

### Syntax 2: Result Table Storage

```
CTX_DOC.FILTER(  
    index_name IN VARCHAR2,  
    textkey    IN VARCHAR2,  
    restab     IN VARCHAR2,  
    query_id   IN NUMBER  DEFAULT 0,  
    plaintext  IN BOOLEAN  DEFAULT FALSE);
```

#### **index\_name**

Specify the name of the index associated with the text column containing the document identified by textkey.

#### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The textkey parameter can be one of the following:

- a single column primary key value
- encoded specification for a composite (multiple column) primary key. Use `CTX_DOC.PKENCODING`.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using `CTX_DOC.SET_KEY_TYPE`.

**restab**

You can specify that this procedure store the marked-up text to either a table or to an in-memory CLOB.

To store results to a table specify the name of the table. The result table must exist before you make this call.

**See Also:** ["Filter Table" in Appendix A, "Result Tables"](#) for more information about the structure of the filter result table.

To store results in memory, specify the name of the CLOB locator. If restab is NULL, a temporary CLOB is allocated and returned. You must de-allocate the locator after using it.

If restab is not NULL, the CLOB is truncated before the operation.

**query\_id**

Specify an identifier to use to identify the row inserted into restab.

When query\_id is not specified or set to NULL, it defaults to 0. You must manually truncate the table specified in restab.

**plaintext**

Specify TRUE to generate a plaintext version of the document. Specify FALSE to generate an HTML version of the document if you are using the INSO filter or indexing HTML documents.

**Example****In-Memory Filter**

The following code shows how to filter a document to HTML in memory.

```
declare
mklob clob;
amt number := 40;
line varchar2(80);

begin
  ctx_doc.filter('myindex','1', mklob, FALSE);
  -- mklob is NULL when passed-in, so ctx-doc.filter will allocate a temporary
  -- CLOB for us and place the results there.
  dbms_lob.read(mklob, amt, 1, line);
  dbms_output.put_line('FIRST 40 CHARS ARE:'||line);
  -- have to de-allocate the temp lob
```

```
dbms_lob.freetemporary(mklob);  
end;
```

Create the filter result table to store the filtered document as follows:

```
create table filtertab (query_id  number,  
                        document  clob);
```

To obtain a plaintext version of document with textkey 20, issue the following statement:

```
begin  
ctx_doc.filter('newsindex', '20', 'filtertab', '0', TRUE);  
end;
```

---

## GIST

Use the CTX\_DOC.GIST procedure to generate a gist and theme summaries for a document. You can generate paragraph-level or sentence-level gists or theme summaries.

### Syntax 1: In-Memory Storage

```
CTX_DOC.GIST(
    index_name      IN VARCHAR2,
    textkey         IN VARCHAR2,
    restab          IN OUT CLOB,
    glevel          IN VARCHAR2 DEFAULT 'P',
    pov             IN VARCHAR2 DEFAULT 'GENERIC',
    numParagraphs   IN NUMBER DEFAULT NULL,
    maxPercent      IN NUMBER DEFAULT NULL,
    num_themes      IN NUMBER DEFAULT 50);
```

### Syntax 2: Result Table Storage

```
CTX_DOC.GIST(
    index_name      IN VARCHAR2,
    textkey         IN VARCHAR2,
    restab          IN VARCHAR2,
    query_id        IN NUMBER DEFAULT 0,
    glevel          IN VARCHAR2 DEFAULT 'P',
    pov             IN VARCHAR2 DEFAULT NULL,
    numParagraphs   IN NUMBER DEFAULT NULL,
    maxPercent      IN NUMBER DEFAULT NULL,
    num_themes      IN NUMBER DEFAULT 50);
```

#### **index\_name**

Specify the name of the index associated with the text column containing the document identified by `textkey`.

#### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The `textkey` parameter can be one of the following:

- a single column primary key value

- an encoded specification for a composite (multiple column) primary key. To encode a composite textkey, use the CTX\_DOC.PKENCODE procedure.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using CTX\_DOC.SET\_KEY\_TYPE.

**restab**

You can specify that this procedure store the gist and theme summaries to either a table or to an in-memory CLOB.

To store results to a table specify the name of the table.

**See Also:** ["Gist Table"](#) in [Appendix A, "Result Tables"](#) for more information about the structure of the gist result table, see

To store results in memory, specify the name of the CLOB locator. If restab is NULL, a temporary CLOB is allocated and returned. You must de-allocate the locator after using it.

If restab is not NULL, the CLOB is truncated before the operation.

**query\_id**

Specify an identifier to use to identify the row(s) inserted into restab.

**glevel**

Specify the type of gist or theme summary to produce. The possible values are:

- *P* for paragraph
- *S* for sentence

The default is *P*.

**pov**

Specify whether a gist or a single theme summary is generated. The type of gist or theme summary generated (sentence-level or paragraph-level) depends on the value specified for glevel.

To generate a gist for the entire document, specify a value of 'GENERIC' for pov. To generate a theme summary for a single theme in a document, specify the theme as the value for pov.

When using result table storage and you do not specify a value for `pov`, this procedure returns the generic gist plus up to fifty theme summaries for the document.

When using in-memory result storage to a CLOB, you must specify a `pov`. However, if you do not specify `pov`, this procedure generates only a generic gist for the document.

---

---

**Note:** The `pov` parameter is case sensitive. To return a gist for a document, specify 'GENERIC' in all uppercase. To return a theme summary, specify the theme *exactly* as it is generated for the document.

Only the themes generated by [THEMES](#) for a document can be used as input for `pov`.

---

---

### **numParagraphs**

Specify the maximum number of document paragraphs (or sentences) selected for the document gist or theme summaries. The default is 0.

---

---

**Note:** The `numParagraphs` parameter is used only when this parameter yields a smaller gist or theme summary size than the gist or theme summary size yielded by the `maxPercent` parameter.

This means that the system always returns the smallest size gist or theme summary.

---

---

### **maxPercent**

Specify the maximum number of document paragraphs (or sentences) selected for the document gist or theme summaries as a percentage of the total paragraphs (or sentences) in the document. The default is 0.

---

---

**Note:** The `maxPercent` parameter is used only when this parameter yields a smaller gist or theme summary size than the gist or theme summary size yielded by the `numParagraphs` parameter.

This means that the system always returns the smallest size gist or theme summary.

---

---

**num\_themes**

Specify the number of theme summaries to produce when you do not specify a value for `pov`. For example, if you specify 10, this procedure returns the top 10 theme summaries. The default is 50.

If you specify 0 or NULL, this procedure returns all themes in a document. If the document contains more than 50 themes, only the top 50 themes show conceptual hierarchy.

## Examples

### In-Memory Gist

The following example generates a non-default size generic gist of at most 10 paragraphs. The result is stored in memory in a CLOB locator. The code then de-allocates the returned CLOB locator after using it.

```
set serveroutput on;
declare
  gklob clob;
  amt number := 40;
  line varchar2(80);

begin
  ctx_doc.gist('newsindex','34',gklob, pov => 'GENERIC',numParagraphs => 10);
  -- gklob is NULL when passed-in, so ctx-doc.gist will allocate a temporary
  -- CLOB for us and place the results there.

  dbms_lob.read(gklob, amt, 1, line);
  dbms_output.put_line('FIRST 40 CHARS ARE:'||line);
  -- have to de-allocate the temp lob
  dbms_lob.freetemporary(gklob);
end;
```

### Result Table Gists

The following example creates a gist table called CTX\_GIST:

```
create table CTX_GIST (query_id number,
                      pov      varchar2(80),
                      gist      CLOB);
```

**Gists and Theme Summaries** The following example returns a default sized paragraph level gist for document 34 as well as the top 10 theme summaries in the document:

```
begin
    ctx_doc.gist('newsindex','34','CTX_GIST', 1, num_themes=10);
end;
```

The following example generates a non-default size gist of at most 10 paragraphs:

```
begin
    ctx_doc.gist('newsindex','34','CTX_GIST',1,pov =>'GENERIC',numParagraphs=>10);
end;
```

The following example generates a gist whose number of paragraphs is at most 10 percent of the total paragraphs in document:

```
begin
    ctx_doc.gist('newsindex','34','CTX_GIST',1,pov => 'GENERIC', maxPercent =>
10);
end;
```

**Theme Summary** The following example returns a paragraph level theme summary for *insects* for document 34. The default theme summary size is returned.

```
begin
    ctx_doc.gist('newsindex','34','CTX_GIST',1, pov => 'insects');
end;
```

---

## HIGHLIGHT

Use the CTX\_DOC.HIGHLIGHT procedure to generate highlight offsets for a document. The offset information is generated for the terms in the document that satisfy the query you specify. These highlighted terms are either the words that satisfy a word query or the themes that satisfy an ABOUT query.

You can generate highlight offsets for either plaintext or HTML versions of the document. You can apply the offset information to the same documents filtered with CTX\_DOC.FILTER.

You usually call this procedure after a query, from which you identify the document to be processed.

You can store the highlight offsets in either an in-memory PL/SQL table or a result table.

### Syntax 1: In-Memory Result Storage

```
CTX_DOC.HIGHLIGHT(  
    index_name  IN VARCHAR2,  
    textkey     IN VARCHAR2,  
    text_query  IN VARCHAR2,  
    restab      IN OUT NOCOPY HIGHLIGHT_TAB,  
    plaintext   IN BOOLEAN  DEFAULT FALSE);
```

### Syntax 2: Result Table Storage

```
CTX_DOC.HIGHLIGHT(  
    index_name  IN VARCHAR2,  
    textkey     IN VARCHAR2,  
    text_query  IN VARCHAR2,  
    restab      IN VARCHAR2,  
    query_id    IN NUMBER   DEFAULT 0,  
    plaintext   IN BOOLEAN  DEFAULT FALSE);
```

#### **index\_name**

Specify the name of the index associated with the text column containing the document identified by textkey.

#### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The textkey parameter can be one of the following:

- a single column primary key value
- encoded specification for a composite (multiple column) primary key. Use the CTX\_DOC.[PKENCODE](#) procedure.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using CTX\_DOC.[SET\\_KEY\\_TYPE](#).

### **text\_query**

Specify the original query expression used to retrieve the document. If NULL, no highlights are generated.

If text\_query includes wildcards, stemming, fuzzy matching which result in stopwords being returned, HIGHLIGHT does not highlight the stopwords.

If text\_query contains the threshold operator, the operator is ignored. The HIGHLIGHT procedure always returns highlight information for the entire result set.

### **restab**

You can specify that this procedure store highlight offsets to either a table or to an in-memory PL/SQL table.

To store results to a table specify the name of the table. The table must exist before you call this procedure.

**See Also:** see "[Highlight Table](#)" in [Appendix A](#) for more information about the structure of the highlight result table.

To store results to an in-memory table, specify the name of the in-memory table of type CTX\_DOC.HIGHLIGHT\_TAB. The HIGHLIGHT\_TAB datatype is defined as follows:

```
type highlight_rec is record (
    offset number;
    length number;
);
type highlight_tab is table of highlight_rec index by binary_integer;
```

CTX\_DOC.HIGHLIGHT clears HIGHLIGHT\_TAB before the operation.

### **query\_id**

Specify the identifier used to identify the row inserted into restab.

When `query_id` is not specified or set to `NULL`, it defaults to 0. You must manually truncate the table specified in `restab`.

**plaintext**

Specify `TRUE` to generate a plaintext offsets of the document.

Specify `FALSE` to generate HTML offsets of the document if you are using the INSO filter or indexing HTML documents.

## Examples

### Create Highlight Table

Create the highlight table to store the highlight offset information:

```
create table hightab(query_id number,  
                    offset number,  
                    length number);
```

### Word Highlight Offsets

To obtain HTML highlight offset information for document 20 for the word *dog*:

```
begin  
ctx_doc.highlight('newsindex', '20', 'dog', 'hightab', 0, FALSE);  
end;
```

### Theme Highlight Offsets

Assuming the index *newsindex* has a theme component, you obtain HTML highlight offset information for the theme query of *politics* by issuing the following query:

```
begin  
ctx_doc.highlight('newsindex', '20', 'about(politics)', 'hightab', 0, FALSE);  
end;
```

The output for this statement are the offsets to highlighted words and phrases that represent the theme of *politics* in the document.

## IFILTER

---

Use this procedure when you need to filter binary data to text.

This procedure takes binary data (BLOB IN), filters the data through with the Inso filter, and writes the text version to a CLOB. CTX\_DOC.IFILTER employs the safe callout, so can be called from a user datastore procedure, and it does not require an index to use, as CTX\_DOC.FILTER does.

### Requirements

Because CTX\_DOC.IFILTER employs the safe callout mechanism, the SQL\*Net listener must be running and configured for extproc agent startup.

### Syntax

```
CTX_DOC.IFILTER(data IN BLOB, text IN OUT NOCOPY CLOB);
```

#### **data**

Specify the binary data to be filtered.

#### **text**

Specify the destination CLOB. The filtered data is placed in here. This parameter must be a valid CLOB locator that is writable. Passing NULL or a non-writable CLOB will result in an error. Filtered text will be appended to the end of existing content, if any.

---

## MARKUP

The CTX\_DOC.MARKUP procedure takes a query specification and a document textkey and returns a version of the document in which the query terms are marked-up. These marked-up terms are either the words that satisfy a word query or the themes that satisfy an ABOUT query.

You can set the marked-up output to be either plaintext or HTML.

You can use one of the pre-defined tagsets for marking highlighted terms, including a tag sequence that enables HTML navigation.

You usually call CTX\_DOC.MARKUP after a query, from which you identify the document to be processed.

You can store the marked-up document either in memory or in a result table.

### Syntax 1: In-Memory Result Storage

```
CTX_DOC.MARKUP(  
    index_name    IN VARCHAR2,  
    textkey       IN VARCHAR2,  
    text_query    IN VARCHAR2,  
    restab        IN OUT NOCOPY CLOB,  
    plaintext      IN BOOLEAN    DEFAULT FALSE,  
    tagset        IN VARCHAR2    DEFAULT 'TEXT_DEFAULT',  
    starttag      IN VARCHAR2    DEFAULT NULL,  
    endtag        IN VARCHAR2    DEFAULT NULL,  
    prevtag       IN VARCHAR2    DEFAULT NULL,  
    nexttag       IN VARCHAR2    DEFAULT NULL);
```

## Syntax 2: Result Table Storage

```
CTX_DOC.MARKUP(
    index_name      IN VARCHAR2,
    textkey         IN VARCHAR2,
    text_query      IN VARCHAR2,
    restab          IN VARCHAR2,
    query_id        IN NUMBER    DEFAULT 0,
    plaintext       IN BOOLEAN   DEFAULT FALSE,
    tagset          IN VARCHAR2  DEFAULT 'TEXT_DEFAULT',
    starttag        IN VARCHAR2  DEFAULT NULL,
    endtag          IN VARCHAR2  DEFAULT NULL,
    prevtag         IN VARCHAR2  DEFAULT NULL,
    nexttag         IN VARCHAR2  DEFAULT NULL);
```

### **index\_name**

Specify the name of the index associated with the text column containing the document identified by textkey.

### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The textkey parameter can be one of the following:

- a single column primary key value
- encoded specification for a composite (multiple column) primary key. Use the CTX\_DOC.[PKENCOD](#) procedure.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using CTX\_DOC.[SET\\_KEY\\_TYPE](#).

### **text\_query**

Specify the original query expression used to retrieve the document.

If text\_query includes wildcards, stemming, fuzzy matching which result in stopwords being returned, MARKUP does not highlight the stopwords.

If text\_query contains the threshold operator, the operator is ignored. The MARKUP procedure always returns highlight information for the entire result set.

### **restab**

You can specify that this procedure store the marked-up text to either a table or to an in-memory CLOB.

To store results to a table specify the name of the table. The result table must exist before you call this procedure.

**See Also:** For more information about the structure of the markup result table, see ["Markup Table" in Appendix A](#).

To store results in memory, specify the name of the CLOB locator. If restab is NULL, a temporary CLOB is allocated and returned. You must de-allocate the locator after using it.

If restab is not NULL, the CLOB is truncated before the operation.

**query\_id**

Specify the identifier used to identify the row inserted into restab.

When query\_id is not specified or set to NULL, it defaults to 0. You must manually truncate the table specified in restab.

**plaintext**

Specify TRUE to generate plaintext marked-up document. Specify FALSE to generate a marked-up HTML version of document if you are using the INSO filter or indexing HTML documents.

**tagset**

Specify one of the following pre-defined tagsets. The second and third columns show how the four different tags are defined for each tagset:

Tagset	Tag	Tag Value
TEXT_DEFAULT	starttag	<<<
	endtag	>>>
	prevtag	
	nexttag	
HTML_DEFAULT	starttag	<B>
	endtag	</B>
	prevtag	
	nexttag	
HTML_NAVIGATE	starttag	<A NAME=ctx%CURNUM><B>

Tagset	Tag	Tag Value
	endtag	</B></A>
	prevtag	<A HREF=#ctx%PREVNUM>&lt; </A>
	nexttag	<A HREF=#ctx%NEXTNUM>&gt; </A>

**starttag**

Specify the character(s) inserted by MARKUP to indicate the start of a highlighted term.

The sequence of starttag, endtag, prevtag and nexttag with respect to the highlighted word is as follows:

... prevtag starttag word endtag nexttag...

**endtag**

Specify the character(s) inserted by MARKUP to indicate the end of a highlighted term.

**prevtag**

Specify the markup sequence that defines the tag that navigates the user to the previous highlight.

In the markup sequences prevtag and nexttag, you can specify the following offset variables which are set dynamically:

Offset Variable	Value
%CURNUM	the current offset number
%PREVNUM	the previous offset number
%NEXTNUM	the next offset number

See the description of the HTML\_NAVIGATE tagset for an example.

**nexttag**

Specify the markup sequence that defines the tag that navigates the user to the next highlight tag.

Within the markup sequence, you can use the same offset variables you use for prevtag. See the explanation for prevtag and the HTML\_NAVIGATE tagset for an example.

## Examples

### In-Memory Markup

The following code generates a marked-up document and stores it in memory. The code passes a NULL CLOB locator to MARKUP and then de-allocates the returned CLOB locator after using it.

```
set serveroutput on

declare
mklob clob;
amt number := 40;
line varchar2(80);

begin
  ctx_doc.markup('myindex','1','dog & cat', mklob);
  -- mklob is NULL when passed-in, so ctx-doc.markup will allocate a temporary
  -- CLOB for us and place the results there.
  dbms_lob.read(mklob, amt, 1, line);
  dbms_output.put_line('FIRST 40 CHARS ARE: '||line);
  -- have to de-allocate the temp lob
  dbms_lob.freetemporary(mklob);
end;
```

### Markup Table

Create the highlight markup table to store the marked-up document as follows:

```
create table markuptab (query_id  number,
                        document  clob);
```

### Word Highlighting in HTML

To create HTML highlight markup for the words *dog* or *cat* for document 23, issue the following statement:

```
begin
  ctx_doc.markup(index_name => 'my_index',
                  textkey   => '23',
                  text_query => 'dog|cat',
                  restab    => 'markuptab',
                  query_id  => '1',
                  tagset    => 'HTML_DEFAULT');
end;
```

## Theme Highlighting in HTML

To create HTML highlight markup for the theme of *politics* for document 23, issue the following statement:

```
begin
  ctx_doc.markup(index_name => 'my_index',
                 textkey => '23',
                 text_query => 'about(politics)',
                 restab => 'markuptab',
                 query_id => '1',
                 tagset => 'HTML_DEFAULT');
end;
```

---

## PKENCODE

The CTX\_DOC.PKENCODE function converts a composite textkey list into a single string and returns the string.

The string created by PKENCODE can be used as the primary key parameter textkey in other CTX\_DOC procedures, such as CTX\_DOC.[THEMES](#) and CTX\_DOC.[GIST](#).

### Syntax

```
CTX_DOC.PKENCODE(  
    pk1      IN VARCHAR2,  
    pk2      IN VARCHAR2 DEFAULT NULL,  
    pk4      IN VARCHAR2 DEFAULT NULL,  
    pk5      IN VARCHAR2 DEFAULT NULL,  
    pk6      IN VARCHAR2 DEFAULT NULL,  
    pk7      IN VARCHAR2 DEFAULT NULL,  
    pk8      IN VARCHAR2 DEFAULT NULL,  
    pk9      IN VARCHAR2 DEFAULT NULL,  
    pk10     IN VARCHAR2 DEFAULT NULL,  
    pk11     IN VARCHAR2 DEFAULT NULL,  
    pk12     IN VARCHAR2 DEFAULT NULL,  
    pk13     IN VARCHAR2 DEFAULT NULL,  
    pk14     IN VARCHAR2 DEFAULT NULL,  
    pk15     IN VARCHAR2 DEFAULT NULL,  
    pk16     IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

#### **pk1-pk16**

Each PK argument specifies a column element in the composite textkey list. You can encode at most 16 column elements.

### Returns

String that represents the encoded value of the composite textkey.

## Examples

```
begin
ctx_doc.gist('newsindex',CTX_DOC.PKENCODE('smith', 14), 'CTX_GIST');
end;
```

In this example, *smith* and *14* constitute the composite textkey value for the document.

---

## SET\_KEY\_TYPE

Use this procedure to set the CTX\_DOC procedures to accept either the ROWID or the PRIMARY\_KEY document identifiers. This setting affects the invoking session only.

### Syntax

```
ctx_doc.set_key_type(key_type in varchar2);
```

#### **key\_type**

Specify either ROWID or PRIMARY\_KEY as the input key type (document identifier) for CTX\_DOC procedures.

This parameter defaults to the value of the CTX\_DOC\_KEY\_TYPE system parameter.

---

---

**Note:** When your base table has no primary key, setting `key_type` to PRIMARY\_KEY is ignored. The `textkey` parameter you specify for any CTX\_DOC procedure is interpreted as a ROWID.

---

---

### Example

To set CTX\_DOC procedures to accept primary key document identifiers, do the following:

```
begin
ctx_doc.set_key_type('PRIMARY_KEY');
end
```

---

## THEMES

Use the CTX\_DOC.THEMES procedure to generate a list of themes for a document. You can store each theme as a row in either a result table or an in-memory PL/SQL table you specify.

### Syntax 1: In-Memory Table Storage

```
CTX_DOC.THEMES(  
    index_name      IN VARCHAR2,  
    textkey         IN VARCHAR2,  
    restab          IN OUT NOCOPY THEME_TAB,  
    full_themes     IN BOOLEAN DEFAULT FALSE,  
    num_themes      IN NUMBER DEFAULT 50);
```

### Syntax 2: Result Table Storage

```
CTX_DOC.THEMES(  
    index_name      IN VARCHAR2,  
    textkey         IN VARCHAR2,  
    restab          IN VARCHAR2,  
    query_id        IN NUMBER DEFAULT 0,  
    full_themes     IN BOOLEAN DEFAULT FALSE,  
    num_themes      IN NUMBER DEFAULT 50);
```

#### **index\_name**

Specify the name of the index for the text column.

#### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The textkey parameter can be one of the following:

- a single column primary key value
- an encoded specification for a composite (multiple column) primary key. When textkey is a composite key, you must encode the composite textkey string using the CTX\_DOC.PKENCOD procedure.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using CTX\_DOC.SET\_KEY\_TYPE.

**restab**

You can specify that this procedure store results to either a table or to an in-memory PL/SQL table.

To store results in a table, specify the name of the table.

**See Also:** ["Theme Table" in Appendix A, "Result Tables"](#) for more information about the structure of the theme result table.

To store results in an in-memory table, specify the name of the in-memory table of type THEME\_TAB. The THEME\_TAB datatype is defined as follows:

```
type theme_rec is record (  
    theme varchar2(2000);  
    weight number;  
);  
  
type theme_tab is table of theme_rec index by binary_integer;
```

CTX\_DOC.THEMES clears the THEME\_TAB you specify before the operation.

**query\_id**

Specify the identifier used to identify the row(s) inserted into `restab`.

**full\_themes**

Specify whether this procedure generates a single theme or a hierarchical list of parent themes (full themes) for each document theme.

Specify TRUE for this procedure to write full themes to the THEME column of the result table.

Specify FALSE for this procedure to write single theme information to the THEME column of the result table. This is the default.

**num\_themes**

Specify the number of themes to retrieve. For example, if you specify 10, the top 10 themes are returned for the document. The default is 50.

If you specify 0 or NULL, this procedure returns all themes in a document. If the document contains more than 50 themes, only the top 50 themes show conceptual hierarchy.

## Examples

### In-Memory Themes

The following example generates the top 10 themes for document 1 and stores them in an in-memory table called `the_themes`. The example then loops through the table to display the document themes.

```
declare
  the_themes ctx_doc.theme_tab;

begin
  ctx_doc.themes('myindex','1',the_themes, numthemes=>10);
  for i in 1..the_themes.count loop
    dbms_output.put_line(the_themes(i).theme || ':' || the_themes(i).weight);
  end loop;
end;
```

### Theme Table

The following example creates a theme table called `CTX_THEMES`:

```
create table CTX_THEMES (query_id number,
                        theme varchar2(2000),
                        weight number);
```

### Single Themes

To obtain a list of the top 20 themes where each element in the list is a single theme, issue a statement like the following:

```
begin
  ctx_doc.themes('newsindex','34','CTX_THEMES',1,full_themes => FALSE,
    num_themes=> 20);
end;
```

### Full Themes

To obtain a list of the top 20 themes where each element in the list is a hierarchical list of parent themes, issue a statement like the following:

```
begin
  ctx_doc.themes('newsindex','34','CTX_THEMES',1,full_themes => TRUE,
    num_themes=>20);
end;
```

---

## TOKENS

Use this procedure to identify all text tokens in a document. The tokens returned are those tokens which are inserted into the index. This feature is useful for implementing document classification, routing, or clustering.

Stopwords are not returned. Section tags are not returned because they are not text tokens.

### Syntax 1: In-Memory Table Storage

```
CTX_DOC.TOKENS(index_name      IN VARCHAR2,
                textkey        IN VARCHAR2,
                restab          IN OUT NOCOPY TOKEN_TAB);
```

### Syntax 2: Result Table Storage

```
CTX_DOC.TOKENS(index_name      IN VARCHAR2,
                textkey        IN VARCHAR2,
                restab          IN VARCHAR2,
                query_id        IN NUMBER DEFAULT 0);
```

#### **index\_name**

Specify the name of the index for the text column.

#### **textkey**

Specify the unique identifier (usually the primary key) for the document.

The textkey parameter can be one of the following:

- a single column primary key value
- encoded specification for a composite (multiple column) primary key. To encode a composite textkey, use the CTX\_DOC.[PKENCODE](#) procedure.
- the rowid of the row containing the document

You toggle between primary key and rowid identification using CTX\_DOC.[SET\\_KEY\\_TYPE](#).

#### **restab**

You can specify that this procedure store results to either a table or to an in-memory PL/SQL table.

The tokens returned are those tokens which are inserted into the index for the document (or row) named with `textkey`. Stop words are not returned. Section tags are not returned because they are not text tokens.

**Specifying a Token Table** To store results to a table, specify the name of the table. Token tables can be named anything, but must include the following columns, with names and data types as specified.

**Table 7–1**

Column Name	Type	Description
QUERY_ID	NUMBER	The identifier for the results generated by a particular call to CTX_DOC.TOKENS (only populated when table is used to store results from multiple TOKEN calls)
TOKEN	VARCHAR2(64)	The token string in the text.
OFFSET	NUMBER	The position of the token in the document, relative to the start of document which has a position of 1.
LENGTH	NUMBER	The character length of the token.

**Specifying an In-Memory Table** To store results to an in-memory table, specify the name of the in-memory table of type `TOKEN_TAB`. The `TOKEN_TAB` datatype is defined as follows:

```
type token_rec is record (
    token varchar2(64);
    offset number;
    length number;
);
```

```
type token_tab is table of token_rec index by binary_integer;
```

CTX\_DOC.TOKENS clears the `TOKEN_TAB` you specify before the operation.

#### **query\_id**

Specify the identifier used to identify the row(s) inserted into `restab`.

## Examples

### In-Memory Tokens

The following example generates the tokens for document 1 and stores them in an in-memory table, declared as `the_tokens`. The example then loops through the table to display the document tokens.

```
declare
  the_tokens ctx_doc.token_tab;

begin
  ctx_doc.tokens('myindex','1',the_tokens);
  for i in 1..the_tokens.count loop
    dbms_output.put_line(the_tokens(i).token);
  end loop;
end;
```

---

## CTX\_OUTPUT Package

This chapter provides reference information for using the CTX\_OUTPUT PL/SQL package.

CTX\_OUTPUT contains the following stored procedures:

Name	Description
<a href="#">ADD_EVENT</a>	Add an event to the index log.
<a href="#">END_LOG</a>	Halts logging of index and document services requests.
<a href="#">LOGFILENAME</a>	Returns the name of the current log file.
<a href="#">REMOVE_EVENT</a>	Remove an event from the index log.
<a href="#">START_LOG</a>	Starts logging index and document service requests.

---

## ADD\_EVENT

Use this procedure to add an event to the index log for more detailed log output. Currently the only event you can add is the `CTX_OUTPUT.EVENT_INDEX_PRINT_ROWID` which logs the rowid of each row after it is indexed. This is useful for debugging a failed index operation.

### Syntax

```
CTX_OUTPUT.ADD_EVENT(event in varchar2);
```

#### **event**

Specify the type of index event to log. Currently the only event you can add is the `CTX_OUTPUT.EVENT_INDEX_PRINT_ROWID` which logs the rowid of each row after it is indexed.

### Example

```
begin
    CTX_OUTPUT.ADD_EVENT(CTX_OUTPUT.EVENT_INDEX_PRINT_ROWID);
end;
```

---

## END\_LOG

Halt logging index and document service requests

### Syntax

```
CTX_OUTPUT.END_LOG;
```

### Example

```
begin  
  CTX_OUTPUT.END_LOG;  
end;
```

---

## LOGFILENAME

Returns the filename for the current log. This procedure looks for the log file in the directory specified by the LOG\_DIRECTORY system parameter.

### Syntax

```
CTX_OUTPUT.LOGFILENAME RETURN VARCHAR2;
```

### Returns

Log file name.

### Example

```
declare
    logname varchar2(100);
begin
    logname := CTX_OUTPUT.LOGFILENAME;
    dbms_output.put_line('The current log file is: '||logname);
end;
```

---

## REMOVE\_EVENT

Use this procedure to remove an event from the index log.

### Syntax

```
CTX_OUTPUT.REMOVE_EVENT(event in varchar2);
```

#### **event**

Specify the type of index event to remove from the log. Currently the only event you can add and remove is the CTX\_OUTPUT.EVENT\_INDEX\_PRINT\_ROWID.

### Example

```
begin
    CTX_OUTPUT.REMOVE_EVENT(CTX_OUTPUT.EVENT_INDEX_PRINT_ROWID);
end;
```

---

## START\_LOG

Begin logging index and document service requests.

### Syntax

```
CTX_OUTPUT.START_LOG(logfile in varchar2);
```

#### **logfile**

Specify the name of the log file. The log is stored in the directory specified by the system parameter LOG\_DIRECTORY.

### Example

```
begin
CTX_OUTPUT.START_LOG('mylog1');
end;
```

---

## CTX\_QUERY Package

This chapter describes the CTX\_QUERY PL/SQL package you can use for generating query feedback, counting hits, and creating stored query expressions.

---

**Note:** You can use this package only when your index type is CONTEXT. This package does not support the CTXCAT index type.

---

The CTX\_QUERY package includes the following procedures and functions:

Name	Description
<a href="#">BROWSE_WORDS</a>	Returns the words around a seed word in the index.
<a href="#">COUNT_HITS</a>	Returns the number hits to a query.
<a href="#">EXPLAIN</a>	Generates query expression parse and expansion information.
<a href="#">HFEEDBACK</a>	Generates hierarchical query feedback information (broader term, narrower term, and related term).
<a href="#">REMOVE_SQE</a>	Removes a specified stored query expression from the SQL tables.
<a href="#">STORE_SQE</a>	Executes a query and stores the results in stored query expression tables.

---

## BROWSE\_WORDS

This procedure enables you to browse words in an Oracle Text index. You specify a seed word and BROWSE\_WORDS returns the words around it in the index, and a rough count of the number of documents that contain each word.

This feature is useful for refining queries. You can identify the following:

- unselective words (words that have low document count)
- misspelled words in the document set

### Syntax 1: To Store Results in Table

```
ctx_query.browse_words(  
    index_name  IN   VARCHAR2,  
    seed        IN   VARCHAR2,  
    restab      IN   VARCHAR2,  
    browse_id   IN   NUMBER   DEFAULT 0,  
    numwords    IN   NUMBER   DEFAULT 10,  
    direction   IN   VARCHAR2 DEFAULT BROWSE_AROUND,  
    part_name   IN   VARCHAR2 DEFAULT NULL  
);
```

### Syntax 2: To Store Results in Memory

```
ctx_query.browse_words(  
    index_name  IN      VARCHAR2,  
    seed        IN      VARCHAR2,  
    resarr      IN OUT  BROWSE_TAB,  
    numwords    IN      NUMBER   DEFAULT 10,  
    direction   IN      VARCHAR2 DEFAULT BROWSE_AROUND,  
    part_name   IN      VARCHAR2 DEFAULT NULL  
);
```

#### index

Specify the name of the index. You can specify `schema.name`. Must be a local index.

**seed**

Specify the seed word. This word is lexed before browse expansion. The word need not exist in the token table. seed must be a single word. Using multiple words as the seed will result in an error.

**restab**

Specify the name of the result table. You can enter restab as `schema.name`. The table must exist before you call this procedure, and you must have INSERT permissions on the table. This table must have the following schema.

Column	Datatype
browse_id	number
word	varchar2(64)
doc_count	number

Existing rows in restab are not deleted before BROWSE\_WORDS is called.

**resarr**

Specify the name of the result array. resarr is of type `ctx_query.browse_tab`.

```
type browse_rec is record (  
    word varchar2(64),  
    doc_count number  
);  
type browse_tab is table of browse_rec index by binary_integer;
```

**browse\_id**

Specify a numeric identifier between 0 and  $2^{32}$ . The rows produced for this browse have a value of in the browse\_id column in restab. When you do not specify browse\_id, it defaults to 0.

**numwords**

Specify the number of words returned.

**direction**

Specify the direction for the browse. You can specify one of:

value	behavior
BEFORE	Browse seed word and words alphabetically before the seed.

value	behavior
AROUND	Browse seed word and words alphabetically before and after the seed.
AFTER	Browse seed word and words alphabetically after the seed.

Symbols CTX\_QUERY.BROWSE\_BEFORE, CTX\_QUERY.BROWSE\_AROUND, and CTX\_QUERY.BROWSE\_AFTER are defined for these literal values as well.

**part\_name**  
Specify the name of the index partition to browse.

Example

Browsing Words with Result Table

```
begin
ctx_query.browse_words('myindex','dog','myres',numwords=>5,direction=>'AROUND');
end;

select word, doc_count from myres order by word;
```

WORD	DOC_COUNT
-----	-----
CZAR	15
DARLING	5
DOC	73
DUNK	100
EAR	3

Browsing Words with Result Array

```
set serveroutput on;
declare
  resarr ctx_query.browse_tab;
begin
ctx_query.browse_words('myindex','dog',resarr,5,CTX_QUERY.BROWSE_AROUND);
for i in 1..resarr.count loop
  dbms_output.put_line(resarr(i).word || ':' || resarr(i).doc_count);
end loop;
end;
```

## COUNT\_HITS

---

Returns the number of hits for the specified query. You can call COUNT\_HITS in exact or estimate mode. Exact mode returns the exact number of hits for the query. Estimate mode returns an upper-bound estimate but runs faster than exact mode.

### Syntax

```
CTX_QUERY.COUNT_HITS (  
    index_name  IN VARCHAR2,  
    text_query  IN VARCHAR2,  
    exact       IN BOOLEAN  DEFAULT TRUE,  
    part_name   IN VARCHAR2 DEFAULT NULL  
) RETURN NUMBER;
```

**index\_name**

Specify the index name.

**text\_query**

Specify the query.

**exact**

Specify TRUE for an exact count. Specify FALSE for an upper-bound estimate. Specifying FALSE returns a less accurate number but runs faster.

**part\_name**

Specify the name of the index partition to query.

### Notes

If the query contains structured criteria, you should use SELECT COUNT(\*).

---

## EXPLAIN

Use `CTX_QUERY.EXPLAIN` to generate explain plan information for a query expression. The EXPLAIN plan provides a graphical representation of the parse tree for a Text query expression. This information is stored in a result table.

This procedure does *not* execute the query. Instead, this procedure can tell you how a query is expanded and parsed before you issue the query. This is especially useful for stem, wildcard, thesaurus, fuzzy, soundex, or about queries. Parse trees also show the following information:

- order of execution (precedence of operators)
- ABOUT query normalization
- query expression optimization
- stop-word transformations
- breakdown of composite-word tokens

Knowing how Oracle evaluates a query is useful for refining and debugging queries. You can also design your application so that it uses the explain plan information to help users write better queries.

### Limitation

You cannot use EXPLAIN with remote queries.

### Syntax

```
CTX_QUERY.EXPLAIN(  
    index_name      IN VARCHAR2,  
    text_query      IN VARCHAR2,  
    explain_table   IN VARCHAR2,  
    sharelevel      IN NUMBER DEFAULT 0,  
    explain_id      IN VARCHAR2 DEFAULT NULL,  
    part_name       IN VARCHAR2 DEFAULT NULL  
);
```

#### **index\_name**

Specify the name of the index to be queried.

**text\_query**

Specify the query expression to be used as criteria for selecting rows.

When you include a wildcard, fuzzy, or soundex operator in *text\_query*, this procedure looks at the index tables to determine the expansion.

Wildcard, fuzzy (?), and soundex (!) expression feedback does not account for lazy deletes as in regular queries.

**explain\_table**

Specify the name of the table used to store representation of the parse tree for *text\_query*. You must have at least INSERT and DELETE privileges on the table used to store the results from EXPLAIN.

**See Also:** For more information about the structure of the explain table, see "[EXPLAIN Table](#)" in [Appendix A](#).

**sharelevel**

Specify whether *explain\_table* is shared by multiple EXPLAIN calls. Specify 0 for exclusive use and 1 for shared use. This parameter defaults to 0 (single-use).

When you specify 0, the system automatically truncates the result table before the next call to EXPLAIN.

When you specify 1 for shared use, this procedure does not truncate the result table. Only results with the same *explain\_id* are updated. When no results with the same *explain\_id* exist, new results are added to the EXPLAIN table.

**explain\_id**

Specify a name that identifies the explain results returned by an EXPLAIN procedure when more than one EXPLAIN call uses the same shared EXPLAIN table. This parameter defaults to NULL.

**part\_name**

Specify the name of the index partition to query.

## Example

### Creating the Explain Table

To create an explain table called *test\_explain* for example, use the following SQL statement:

```
create table test_explain(  
    explain_id varchar2(30)  
    id number,  
    parent_id number,  
    operation varchar2(30),  
    options varchar2(30),  
    object_name varchar2(64),  
    position number,  
    cardinality number);
```

**Executing CTX\_QUERY.EXPLAIN**

To obtain the expansion of a query expression such as *comp% OR ?smith*, use CTX\_QUERY.EXPLAIN as follows:

```
ctx_query.explain(  
    index_name => 'newindex',  
    text_query => 'comp% OR ?smith',  
    explain_table => 'test_explain',  
    sharelevel => 0,  
    explain_id => 'Test');
```

**Retrieving Data from Explain Table**

To read the explain table, you can select the columns as follows:

```
select explain_id, id, parent_id, operation, options, object_name, position  
from test_explain order by id;
```

The output is ordered by ID to simulate a hierarchical query:

EXPLAIN_ID	ID	PARENT_ID	OPERATION	OPTIONS	OBJECT_NAME	POSITION
Test	1	0	OR	NULL	NULL	1
Test	2	1	EQUIVALENCE	NULL	COMP%	1
Test	3	2	WORD	NULL	COMPTROLLER	1
Test	4	2	WORD	NULL	COMPUTER	2
Test	5	1	EQUIVALENCE	(?)	SMITH	2
Test	6	5	WORD	NULL	SMITH	1
Test	7	5	WORD	NULL	SMYTHE	2

**Related Topics**

[Chapter 3, "CONTAINS Query Operators"](#)

[Appendix H, "Stopword Transformations"](#)

## HFEEDBACK

In English or French, this procedure generates hierarchical query feedback information (broader term, narrower term, and related term) for the specified query.

Broader term, narrower term, and related term information is obtained from the knowledge base. However, only knowledge base terms that are also in the index are returned as query feedback information. This increases the chances that terms returned from HFEEDBACK produce hits over the currently indexed document set.

Hierarchical query feedback information is useful for suggesting other query terms to the user.

---

---

**Note:** CTX\_QUERY.HFEEDBACK is only supported in English and French.

---

---

### Syntax

```
CTX_QUERY.HFEEDBACK(  
    index_name      IN VARCHAR2,  
    text_query      IN VARCHAR2,  
    feedback_table  IN VARCHAR2,  
    sharelevel      IN NUMBER DEFAULT 0,  
    feedback_id     IN VARCHAR2 DEFAULT NULL,  
    part_name       IN VARCHAR2 DEFAULT NULL  
);
```

**index\_name**

Specify the name of the index for the text column to be queried.

**text\_query**

Specify the query expression to be used as criteria for selecting rows.

**feedback\_table**

Specify the name of the table used to store the feedback terms.

**See Also:** For more information about the structure of the explain table, see "[HFEEDBACK Table](#)" in [Appendix A](#).

**sharelevel**

Specify whether `feedback_table` is shared by multiple HFEEDBACK calls. Specify 0 for exclusive use and 1 for shared use. This parameter defaults to 0 (single-use).

When you specify 0, the system automatically truncates the feedback table before the next call to HFEEDBACK.

When you specify 1 for shared use, this procedure does not truncate the feedback table. Only results with the same `feedback_id` are updated. When no results with the same `feedback_id` exist, new results are added to the feedback table.

**feedback\_id**

Specify a value that identifies the feedback results returned by a call to HFEEDBACK when more than one HFEEDBACK call uses the same shared feedback table. This parameter defaults to NULL.

**part\_name**

Specify the name of the index partition to query.

**Example****Create HFEEDBACK Result Table**

Create a result table to use with `CTX_QUERY.HFEEDBACK` as follows:

```
CREATE TABLE restab (  
    feedback_id VARCHAR2(30),  
    id          NUMBER,  
    parent_id   NUMBER,  
    operation   VARCHAR2(30),  
    options     VARCHAR2(30),  
    object_name VARCHAR2(80),  
    position    NUMBER,  
    bt_feedback ctx_feedback_type,  
    rt_feedback ctx_feedback_type,  
    nt_feedback ctx_feedback_type  
) NESTED TABLE bt_feedback STORE AS res_bt  
  NESTED TABLE rt_feedback STORE AS res_rt  
  NESTED TABLE nt_feedback STORE AS res_nt;
```

`CTX_FEEDBACK_TYPE` is a system-defined type in the CTXSYS schema.

**See Also:** For more information about the structure of the hfeedback table, see "[HFEEDBACK Table](#)" in [Appendix A](#).

## Call CTX\_QUERY.HFEEDBACK

The following code calls the hfeedback procedure with the query *computer industry*.

```
BEGIN
ctx_query.hfeedback (index_name      => 'my_index',
                    text_query       => 'computer industry',
                    feedback_table    => 'restab',
                    sharelevel        => 0,
                    feedback_id       => 'query10'
                    );
END;
```

## Select From the Result Table

The following code extracts the feedback data from the result table. It extracts broader term, narrower term, and related term feedback separately from the nested tables.

```
DECLARE
  i NUMBER;
BEGIN
  FOR frec IN (
    SELECT object_name, bt_feedback, rt_feedback, nt_feedback
    FROM restab
    WHERE feedback_id = 'query10' AND object_name IS NOT NULL
  ) LOOP

    dbms_output.put_line('Broader term feedback for ' || frec.object_name ||
    ':');
    i := frec.bt_feedback.FIRST;
    WHILE i IS NOT NULL LOOP
      dbms_output.put_line(frec.bt_feedback(i).text);
      i := frec.bt_feedback.NEXT(i);
    END LOOP;

    dbms_output.put_line('Related term feedback for ' || frec.object_name ||
    ':');
    i := frec.rt_feedback.FIRST;
    WHILE i IS NOT NULL LOOP
      dbms_output.put_line(frec.rt_feedback(i).text);
      i := frec.rt_feedback.NEXT(i);
    END LOOP;
```

```
        dbms_output.put_line('Narrower term feedback for ' || freq.object_name ||
        ':' );
        i := freq.nt_feedback.FIRST;
        WHILE i IS NOT NULL LOOP
            dbms_output.put_line(freq.nt_feedback(i).text);
            i := freq.nt_feedback.NEXT(i);
        END LOOP;

    END LOOP;
END;
```

## Sample Output

The following output is for the example above, which queries on *computer industry*:

Broader term feedback for computer industry:

hard sciences

Related term feedback for computer industry:

computer networking

electronics

knowledge

library science

mathematics

optical technology

robotics

satellite technology

semiconductors and superconductors

symbolic logic

telecommunications industry

Narrower term feedback for computer industry:

ABEND - abnormal end of task

AT&T Starlans

ATI Technologies, Incorporated

ActivCard

Actrade International Ltd.

Alta Technology

Amiga Format

Amiga Library Services

Amiga Shopper

Amstrat Action

Apple Computer, Incorporated

..

---

---

**Note:** The HFEEDBACK information you obtain depends on the contents of your index and knowledge base and as such might differ from above.

---

---

---

## REMOVE\_SQE

The CTX\_QUERY.REMOVE\_SQE procedure removes the specified stored query expression.

### Syntax

```
CTX_QUERY.REMOVE_SQE(query_name IN VARCHAR2);
```

#### **query\_name**

Specify the name of the stored query expression to be removed.

### Examples

```
begin
ctx_query.remove_sqe('disasters');
end;
```

## STORE\_SQE

---

This procedure creates a stored query expression. Only the query definition is stored.

### Supported Operators

Stored query expressions support all of the CONTAINS query operators. Stored query expressions also support all of the special characters and other components that can be used in a query expression, including other stored query expressions.

### Privileges

Users are allowed to create and remove stored query expressions owned by them. Users are allowed to use stored query expressions owned by anyone. The CTXSYS user can create or remove stored query expressions for any user.

### Syntax

```
CTX_QUERY.STORE_SQE(query_name      IN VARCHAR2,  
                    text_query      IN VARCHAR2);
```

#### **query\_name**

Specify the name of the stored query expression to be created. If you are CTXSYS, you can specify this as `user.name`.

#### **text\_query**

Specify the query expression to be associated with `query_name`.

### Examples

```
begin  
  ctx_query.store_sqe('disasters', 'hurricanes | earthquakes');  
end;
```

---

## CTX\_THES Package

This chapter provides reference information for using the CTX\_THES package to manage and browse thesauri. These thesaurus functions are based on the ISO-2788 and ANSI Z39.19 standards except where noted.

Knowing how information is stored in your thesaurus helps in writing queries with thesaurus operators. You can also use a thesaurus to extend the knowledge base, which is used for ABOUT queries in English and French and for generating document themes.

CTX\_THES contains the following stored procedures and functions:

Name	Description
<a href="#">ALTER_PHRASE</a>	Alters thesaurus phrase.
<a href="#">ALTER_THESAURUS</a>	Renames or truncates a thesaurus.
<a href="#">BT</a>	Returns all broader terms of a phrase.
<a href="#">BTG</a>	Returns all broader terms generic of a phrase.
<a href="#">BTI</a>	Returns all broader terms instance of a phrase.
<a href="#">BTP</a>	Returns all broader terms partitive of a phrase.
<a href="#">CREATE_PHRASE</a>	Adds a phrase to the specified thesaurus.
<a href="#">CREATE_RELATION</a>	Creates a relation between two phrases.
<a href="#">CREATE_THESAURUS</a>	Creates the specified thesaurus.
<a href="#">CREATE_TRANSLATION</a>	Creates a new translation for a phrase.
<a href="#">DROP_PHRASE</a>	Removes a phrase from thesaurus.
<a href="#">DROP_RELATION</a>	Removes a relation between two phrases.

---

Name	Description
<a href="#">DROP_THESAURUS</a>	Drops the specified thesaurus from the thesaurus tables.
<a href="#">DROP_TRANSLATION</a>	Drops a translation for a phrase.
<a href="#">HAS_RELATION</a>	Tests for the existence of a thesaurus relation.
<a href="#">NT</a>	Returns all narrower terms of a phrase.
<a href="#">NTG</a>	Returns all narrower terms generic of a phrase.
<a href="#">NTI</a>	Returns all narrower terms instance of a phrase.
<a href="#">NTP</a>	Returns all narrower terms partitive of a phrase.
<a href="#">OUTPUT_STYLE</a>	Sets the output style for the expansion functions.
<a href="#">PT</a>	Returns the preferred term of a phrase.
<a href="#">RT</a>	Returns the related terms of a phrase
<a href="#">SN</a>	Returns scope note for phrase.
<a href="#">SYN</a>	Returns the synonym terms of a phrase
<a href="#">THES_TT</a>	Returns all top terms for phrase.
<a href="#">TR</a>	Returns the foreign equivalent of a phrase.
<a href="#">TRSYN</a>	Returns the foreign equivalent of a phrase, synonyms of the phrase, and foreign equivalent of the synonyms.
<a href="#">TT</a>	Returns the top term of a phrase.
<a href="#">UPDATE_TRANSLATION</a>	Updates an existing translation.

**See Also:** [Chapter 3, "CONTAINS Query Operators"](#) for more information about the thesaurus operators.

# ALTER\_PHRASE

Alters an existing phrase in the thesaurus. Only CTXSYS or thesaurus owner can alter a phrase.

## Syntax

```
CTX_THES.ALTER_PHRASE(tname      in varchar2,  
                      phrase      in varchar2,  
                      op          in varchar2,  
                      operand     in varchar2 default null);
```

**tname**  
Specify thesaurus name.

**phrase**  
Specify phrase to alter.

**op**  
Specify the alter operation as a string or symbol. You can specify one of the following operations with the op and operand pair:'

op	meaning	operand
RENAME or CTX_THES.OP_RENAME	Rename phrase. If the new phrase already exists in the thesaurus, this procedure raises an exception.	Specify new phrase. You can include qualifiers to change, add, or remove qualifiers from phrases.
PT or CTX_THES.OP_PT	Make phrase the preferred term. Existing preferred terms in the synonym ring becomes non-preferred synonym.	(none)
SN or CTX_THES.OP_SN	Change the scope note on the phrase.	Specify new scope note.

**operand**  
Specify argument to the alter operation. See table for op.

## Examples

Correct misspelled word in thesaurus:

```
ctx_thes.alter_phrase('thes1', 'tee', 'rename', 'tea');
```

Remove qualifier from mercury (metal):

```
ctx_thes.alter_phrase('thes1', 'mercury (metal)', 'rename', 'mercury');
```

Add qualifier to mercury:

```
ctx_thes.alter_phrase('thes1', 'mercury', 'rename', 'mercury (planet)');
```

Make Kowalski the preferred term in its synonym ring:

```
ctx_thes.alter_phrase('thes1', 'Kowalski', 'pt');
```

Change scope note for view cameras:

```
ctx_thes.alter_phrase('thes1', 'view cameras', 'sn', 'Cameras with lens  
focusing');
```

# ALTER\_THESAURUS

Use this procedure to rename or truncate an existing thesaurus. Only the thesaurus owner or CTXSYS can invoke this function on a given thesaurus.

## Syntax

```
CTX_THES.ALTER_THESAURUS(tname      in   varchar2,
                          op         in   varchar2,
                          operand    in   varchar2 default null);
```

**tname**  
Specify the thesaurus name.

**op**  
Specify the alter operation as a string or symbol. You can specify one of two operations:

op	Meaning	operand
RENAME or CTX_THES.OP_RENAME	Rename thesaurus. Returns an error if the new name already exists.	Specify new thesaurus name.
TRUNCATE or CTX_THES.OP_TRUNCATE	Truncate thesaurus.	None.

**operand**  
Specify the argument to the alter operation. See table for op.

## Examples

Rename thesaurus THES1 to MEDICAL:

```
ctx_thes.alter_thesaurus('thes1', 'rename', 'medical');
```

or

```
ctx_thes.alter_thesaurus('thes1', ctx_thes.op_rename, 'medical');
```

You can use symbols for any op argument, but all further examples will use strings.

Remove all phrases and relations from thesaurus THES1:

```
ctx_thes.alter_thesaurus('thes1', 'truncate');
```

---

## BT

This function returns all broader terms of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.BT(restab IN OUT NOCOPY EXP_TAB,  
            phrase IN VARCHAR2,  
            lvl    IN NUMBER DEFAULT 1,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.BT(phrase IN VARCHAR2,  
            lvl    IN NUMBER DEFAULT 1,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of broader terms to return. For example 2 means get the broader terms of the broader terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of broader terms in the form:

```
{bt1}|{bt2}|{bt3} ...
```

## Example

### String Result

Consider a thesaurus named MY\_THES that has an entry for *cat* as follows:

```
cat
  BT1 feline
    BT2 mammal
      BT3 vertebrate
        BT4 animal
```

To look up the broader terms for *cat* up to two levels, issue the following statements:

```
set serveroutput on

declare
  terms varchar2(2000);
begin
  terms := ctx_thes.bt('CAT', 2, 'MY_THES');
  dbms_output.put_line('The broader expansion for CAT is: '||terms);
end;
```

This code produces the following output:

```
The broader expansion for CAT is: {cat}|{feline}|{mammal}
```

### Table Result

The following code does an broader term lookup for *white wolf* using the table result:

```
set serveroutput on

declare
  xtab ctx_thes.exp_tab;
begin
  ctx_thes.bt(xtab, 'white wolf', 2, 'my_thesaurus');
  for i in 1..xtab.count loop
    dbms_output.put_line(xtab(i).rel||' '||xtab(i).phrase);
  end loop;
```

```
    end loop;  
end;
```

This code produces the following output:

```
PHRASE WHITE WOLF  
BT WOLF  
BT CANINE  
BT ANIMAL
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Broader Term \(BT, BTG, BTP, BTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

---

## BTG

This function returns all broader terms generic of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.BTG(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             lvl    IN NUMBER DEFAULT 1,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.BTG(phrase IN VARCHAR2,  
            lvl     IN NUMBER DEFAULT 1,  
            tname   IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of broader terms to return. For example 2 means get the broader terms of the broader terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of broader terms generic in the form:

{bt1}||{bt2}||{bt3} ...

## Example

To look up the broader terms generic for *cat* up to two levels, issue the following statements:

```
set serveroutput on
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.btg('CAT', 2, 'MY_THES');
  dbms_output.put_line('the broader expansion for CAT is: '||terms);
end;
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Broader Term \(BT, BTG, BTP, BTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

---

## BTI

This function returns all broader terms instance of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.BTI(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             lvl    IN NUMBER DEFAULT 1,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.BTI(phrase IN VARCHAR2,  
            lvl     IN NUMBER DEFAULT 1,  
            tname   IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of broader terms to return. For example 2 means get the broader terms of the broader terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of broader terms instance in the form:

{bt1}||{bt2}||{bt3} ...

## Example

To look up the broader terms instance for *cat* up to two levels, issue the following statements:

```
set serveroutput on
declare
    terms varchar2(2000);
begin
    terms := ctx_thes.bti('CAT', 2, 'MY_THES');
    dbms_output.put_line('the broader expansion for CAT is: '||terms);
end;
```

[Broader Term \(BT, BTG, BTP, BTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

---

## BTP

This function returns all broader terms partitive of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.BTP(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             lvl    IN NUMBER DEFAULT 1,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.BTP(phrase IN VARCHAR2,  
            lvl     IN NUMBER DEFAULT 1,  
            tname   IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of broader terms to return. For example 2 means get the broader terms of the broader terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, the system default thesaurus is used.

## Returns

This function returns a string of broader terms in the form:

{bt1}||{bt2}||{bt3} ...

## Example

To look up the 2 broader terms partitive for *cat*, issue the following statements:

```
declare
    terms varchar2(2000);
begin
    terms := ctx_thes.btp('CAT', 2, 'MY_THES');
    dbms_output.put_line('the broader expansion for CAT is: '||terms);
end;
```

---

## CREATE\_PHRASE

The CREATE\_PHRASE procedure adds a new phrase to the specified thesaurus.

---

**Note:** Even though you can create thesaurus relations with this procedure, Oracle recommends that you use CTX\_THES.CREATE\_RELATION rather than CTX\_THES.CREATE\_PHRASE to create relations in a thesaurus.

---

### Syntax

```
CTX_THES.CREATE_PHRASE(tname    IN VARCHAR2,  
                        phrase    IN VARCHAR2,  
                        rel       IN VARCHAR2 DEFAULT NULL,  
                        relname   IN VARCHAR2 DEFAULT NULL);
```

#### **tname**

Specify the name of the thesaurus in which the new phrase is added or the existing phrase is located.

#### **phrase**

Specify the phrase to be added to a thesaurus or the phrase for which a new relationship is created.

#### **rel**

Specify the new relationship between *phrase* and *relname*. This parameter is supported only for backward compatibility. Use CTX\_THES.[CREATE\\_RELATION](#) to create new relations in a thesaurus.

#### **relname**

Specify the existing phrase that is related to *phrase*. This parameter is supported only for backward compatibility. Use CTX\_THES.[CREATE\\_RELATION](#) to create new relations in a thesaurus.

### Returns

The ID for the entry.

## Examples

### Creating Entries for Phrases

In this example, two new phrases (*os* and *operating system*) are created in a thesaurus named `tech_thes`.

```
begin
  ctx_thes.create_phrase('tech_thes','os');
  ctx_thes.create_phrase('tech_thes','operating system');
end;
```

---

# CREATE\_RELATION

Creates a relation between two phrases in the thesaurus.

---

**Note:** Oracle recommends that you use CTX\_THES.CREATE\_RELATION rather than CTX\_THES.CREATE\_PHRASE to create relations in a thesaurus.

---

Only thesaurus owner and CTXSYS can invoke this procedure on a given thesaurus.

## Syntax

```
CTX_THES.CREATE_RELATION(tname      in      varchar2,  
                           phrase    in      varchar2,  
                           rel        in      varchar2,  
                           relphrase in      varchar2);
```

**tname**  
Specify the thesaurus name

**phrase**  
Specify the phrase to alter or create. If phrase is a disambiguated homograph, you must specify the qualifier. If phrase does not exist in the thesaurus, it is created.

**rel**  
Specify the relation to create. The relation is from phrase to relphrase. You can specify one of the following relations:

relation	meaning	relphrase
BT*/NT*	Add hierarchical relation.	Specify related phrase. The relationship is interpreted from phrase to relphrase.
RT	Add associative relation.	Specify phrase to associate.
SYN	Add phrase to a synonym ring.	Specify an existing phrase in the synonym ring.
Specify language	Add translation for a phrase.	Specify new translation phrase.

**relphrase**

Specify the related phrase. If relphrase does not exist in tname, relphrase is created. See table for rel.

**Notes**

The relation you specify for rel is interpreted as from phrase to relphrase. For example, consider dog with broader term animal:

```
dog
  BT animal
```

To add this relation, specify the arguments as follows:

```
begin
CTX_THES.CREATE_RELATION('thes','dog','BT','animal');
end;
```

---

---

**Note:** The order in which you specify arguments for CTX\_THES.CREATE\_RELATION is different from the order you specify them with CTX\_THES. CREATE\_PHRASE.

---

---

**Examples**

Create relation VEHICLE NT CAR:

```
ctx_thes.create_relation('thes1','vehicle','NT','car');
```

Create Japanese translation for *you*:

```
ctx_thes.create_relation('thes1','you','JAPANESE:', 'kimi');
```

---

## CREATE\_THESAURUS

The CREATE\_THESAURUS procedure creates an empty thesaurus with the specified name in the thesaurus tables.

### Syntax

```
CTX_THES.CREATE_THESAURUS(name          IN VARCHAR2,  
                           casesens      IN BOOLEAN DEFAULT FALSE);
```

#### **name**

Specify the name of the thesaurus to be created. The name of the thesaurus must be unique. If a thesaurus with the specified name already exists, CREATE\_THESAURUS returns an error and does not create the thesaurus.

#### **casesens**

Specify whether the thesaurus to be created is case-sensitive. If casesens is *true*, Oracle retains the cases of all terms entered in the specified thesaurus. As a result, queries that use the thesaurus are case-sensitive.

### Example

```
begin  
  ctx_thes.create_thesaurus('tech_thes', FALSE);  
end;
```

## CREATE\_TRANSLATION

---

Use this procedure to create a new translation for a phrase in a specified language.

### Syntax

```
CTX_THES.CREATE_TRANSLATION(tname      in   varchar2,  
                             phrase     in   varchar2,  
                             language   in   varchar2,  
                             translation in   varchar2);
```

#### **tname**

Specify the name of the thesaurus, using no more than 30 characters.

#### **phrase**

Specify the phrase in the thesaurus to which to add a translation. Phrase must already exist in the thesaurus, or an error is raised.

#### **language**

Specify the language of the translation, using no more than 10 characters.

#### **translation**

Specify the translated term, using no more than 256 characters.

If a translation for this phrase already exists, this new translation is added without removing that original translation, so long as that original translation is not the same. Adding the same translation twice results in an error.

### Example

The following code adds the Spanish translation for *dog* to *my\_thes*:

```
begin  
  ctx_thes.create_translation('my_thes', 'dog', 'SPANISH', 'PERRO');  
end;
```

---

## DROP\_PHRASE

Removes a phrase from the thesaurus. Only thesaurus owner and CTXSYS can invoke this procedure on a given thesaurus.

### Syntax

```
CTX_THES.DROP_PHRASE(tname      in varchar2,  
                     phrase     in varchar2);
```

**tname**

Specify thesaurus name.

**phrase**

Specify phrase to drop. If phrase is a disambiguated homograph, you must include the qualifier. When phrase does not exist in tname, this procedure raises an exception.

BT\* / NT\* relations are patched around the dropped phrase. For example, if A has a BT B, and B has BT C, after B is dropped, A has BT C.

When a word has multiple broader terms, then a relationship is established for each narrower term to each broader term.

Note that BT, BTG, BTP, and BTI are separate hierarchies, so if A has BTG B, and B has BTI C, when B is dropped, there is no relation implicitly created between A and C.

RT relations are not patched. For example, if A has RT B, and B has RT C, then if B is dropped, there is no associative relation created between A and C.

### Example

Assume you have the following relations defined in *mythes*:

```
wolf  
  BT canine  
canine  
  BT animal
```

You drop phrase *canine*:

```
begin  
ctx_thes.drop_phrase('mythes', 'canine');  
end;
```

The resulting thesaurus is patched and looks like:

```
wolf  
  BT animal
```

# DROP\_RELATION

Removes a relation between two phrases from the thesaurus.

**Note:** CTX\_THES.DROP\_RELATION removes only the relation between two phrases. Phrases are never removed by this call.

Only thesaurus owner and CTXSYS can invoke this procedure on a given thesaurus.

## Syntax

```
CTX_THES.DROP_RELATION(tname      in   varchar2,  
                        phrase      in   varchar2,  
                        rel         in   varchar2,  
                        relphrase in   varchar2 default null);
```

**tname**  
Specify thesaurus name.

**phrase**  
Specify the filing phrase.

**rel**  
Specify relation to drop. The relation is from phrase to relphrase. You can specify one of the following relations:

relation	meaning	relphrase
BT*/NT*	Remove hierarchical relation.	Optional specify relphrase. If not provided, all relations of that type for the phrase are removed.
RT	Remove associative relation.	Optionally specify relphrase. If not provided, all RT relations for the phrase are removed.
SYN	Remove phrase from its synonym ring.	(none)
PT	Remove preferred term designation from the phrase. The phrase remains in the synonym ring.	(none)

relation	meaning	relphrase
language	Remove a translation from a phrase.	Optionally specify relphrase. You can specify relphrase when there are multiple translations for a phrase for the language, and you want to remove just one translation.  If relphrase is NULL, all translations for the phrase for the language are removed.

**relphrase**  
Specify the related phrase.

Notes

The relation you specify for rel is interpreted as from phrase to relphrase. For example, consider dog with broader term animal:

```
dog
  BT animal
```

To remove this relation, specify the arguments as follows:

```
begin
CTX_THES.DROP_RELATION('thes','dog','BT','animal');
end;
```

You can also remove this relation using NT as follows:

```
begin
CTX_THES.DROP_RELATION('thes','animal','NT','dog');
end;
```

Example

Remove relation VEHICLE NT CAR:

```
ctx_thes.drop_relation('thes1','vehicle','NT','car');
```

Remove all narrower term relations for vehicle:

```
ctx_thes.drop_relation('thes1','vehicle','NT');
```

Remove Japanese translations for me:

```
ctx_thes.drop_relation('thes1','me','JAPANESE:');
```

Remove a specific Japanese translation for *me*:

```
ctx_thes.drop_relation('thes1', 'me', 'JAPANESE:', 'boku')
```

---

## DROP\_THESAURUS

The DROP\_THESAURUS procedure deletes the specified thesaurus and all of its entries from the thesaurus tables.

### Syntax

```
CTX_THES.DROP_THESAURUS(name IN VARCHAR2);
```

**name**

Specify the name of the thesaurus to be dropped.

### Examples

```
begin  
ctx_thes.drop_thesaurus('tech_thes');  
end;
```

---

## DROP\_TRANSLATION

Use this procedure to remove one or more translations for a phrase.

### Syntax

```
CTX_THES.DROP_TRANSLATION (tname      in   varchar2,  
                           phrase     in   varchar2,  
                           language   in   varchar2 default null,  
                           translation in   varchar2 default null);
```

**tname**

Specify the name of the thesaurus, using no more than 30 characters.

**phrase**

Specify the phrase in the thesaurus to which to remove a translation. The phrase must already exist in the thesaurus or an error is raised.

**language**

Optionally, specify the language of the translation, using no more than 10 characters. If not specified, the translation must also not be specified and all translations in all languages for the phrase are removed. An error is raised if the phrase has no translations.

**translation**

Optionally, specify the translated term to remove, using no more than 256 characters. If no such translation exists, an error is raised.

### Example

The following code removes the Spanish translation for *dog*:

```
begin  
  ctx_thes.drop_translation('my_thes', 'dog', 'SPANISH', 'PERRO');  
end;
```

To remove all translations for *dog* in all languages:

```
begin  
  ctx_thes.drop_translation('my_thes', 'dog');  
end;
```

## HAS\_RELATION

Use this procedure to test that a thesaurus relation exists without actually doing the expansion. The function returns TRUE if the phrase has any of the relations in the specified list.

### Syntax

```
CTX_THES.HAS_RELATION(phrase in varchar2,  
                      rel in varchar2,  
                      tname in varchar2 default 'DEFAULT')  
returns boolean;
```

**phrase**

Specify the phrase.

**rel**

Specify a single thesaural relation or a comma-separated list of relations, except PT. Specify 'ANY' for any relation.

**tname**

Specify the thesaurus name.

### Example

The following example returns TRUE if the phrase "cat" in the DEFAULT thesaurus has any broader terms or broader generic terms:

```
set serveroutput on  
result boolean;  
  
begin  
  result := ctx_thes.has_relation('cat','BT,BTG');  
  if (result) then dbms_output.put_line('TRUE');  
  else dbms_output.put_line('FALSE');  
  end if;  
end;
```

---

## NT

This function returns all narrower terms of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.NT(restab IN OUT NOCOPY EXP_TAB,  
            phrase IN VARCHAR2,  
            lvl    IN NUMBER DEFAULT 1,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.NT(phrase IN VARCHAR2,  
            lvl    IN NUMBER DEFAULT 1,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of narrower terms to return. For example 2 means get the narrower terms of the narrower terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of narrower terms in the form:

```
{nt1}||{nt2}||{nt3} ...
```

## Example

### String Result

Consider a thesaurus named MY\_THES that has an entry for *cat* as follows:

```
cat
  NT domestic cat
  NT wild cat
  BT mammal
mammal
  BT animal
domestic cat
  NT Persian cat
  NT Siamese cat
```

To look up the narrower terms for *cat* down to two levels, issue the following statements:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.nt('CAT', 2, 'MY_THES');
  dbms_output.put_line('the narrower expansion for CAT is: '||terms);
end;
```

This code produces the following output:

```
the narrower expansion for CAT is: {cat}||{domestic cat}||{Persian cat}||{Siamese
cat}|| {wild cat}
```

### Table Result

The following code does an narrower term lookup for *canine* using the table result:

```
declare
  xtab ctx_thes.exp_tab;
begin
  ctx_thes.nt(xtab, 'canine', 2, 'my_thesaurus');
  for i in 1..xtab.count loop
    dbms_output.put_line(lpad(' ', 2*xtab(i).xlevel) ||
```

```
        xtab(i).xrel || ' ' || xtab(i).xphrase);  
    end loop;  
end;
```

**This code produces the following output:**

```
PHRASE CANINE  
NT WOLF (Canis lupus)  
    NT WHITE WOLF  
    NT GREY WOLF  
NT DOG (Canis familiaris)  
    NT PIT BULL  
    NT DASCHUND  
    NT CHIHUAHUA  
NT HYENA (Canis mesomelas)  
NT COYOTE (Canis latrans)
```

## Related Topics

### [OUTPUT\\_STYLE](#)

[Narrower Term \(NT, NTG, NTP, NTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

## NTG

---

This function returns all narrower terms generic of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.NTG(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             lvl    IN NUMBER DEFAULT 1,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.NTG(phrase IN VARCHAR2,  
            lvl     IN NUMBER DEFAULT 1,  
            tname   IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of narrower terms to return. For example 2 means get the narrower terms of the narrower terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of narrower terms generic in the form:

`{nt1}|{nt2}|{nt3} ...`

## Example

To look up the narrower terms generic for *cat* down to two levels, issue the following statements:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.ntg('CAT', 2, 'MY_THES');
  dbms_output.put_line('the narrower expansion for CAT is: '||terms);
end;
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Narrower Term \(NT, NTG, NTP, NTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

## NTI

---

This function returns all narrower terms instance of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.NTI(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             lvl    IN NUMBER DEFAULT 1,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.NTI(phrase IN VARCHAR2,  
            lvl    IN NUMBER DEFAULT 1,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of narrower terms to return. For example 2 means get the narrower terms of the narrower terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of narrower terms instance in the form:

```
{nt1}|{nt2}|{nt3} ...
```

## Example

To look up the narrower terms instance for *cat* down to two levels, issue the following statements:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.nti('CAT', 2, 'MY_THES');
  dbms_output.put_line('the narrower expansion for CAT is: '||terms);
end;
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Narrower Term \(NT, NTG, NTP, NTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

---

## NTP

This function returns all narrower terms partitive of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.NTP(restab IN OUT NOCOPY EXP_TAB,
             phrase IN VARCHAR2,
             lvl    IN NUMBER DEFAULT 1,
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.NTP(phrase IN VARCHAR2,
             lvl    IN NUMBER DEFAULT 1,
             tname  IN VARCHAR2 DEFAULT 'DEFAULT')
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (
    xrel varchar2(12),
    xlevel number,
    xphrase varchar2(256)
);
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **lvl**

Specify how many levels of narrower terms to return. For example 2 means get the narrower terms of the narrower terms of the phrase.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of narrower terms partitive in the form:

`{nt1}|{nt2}|{nt3} ...`

## Example

To look up the narrower terms partitive for *cat* down to two levels, issue the following statements:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.ntp('CAT', 2, 'MY_THES');
  dbms_output.put_line('the narrower expansion for CAT is: '||terms);
end;
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Narrower Term \(NT, NTG, NTP, NTI\) Operators in Chapter 3, "CONTAINS Query Operators"](#)

## OUTPUT\_STYLE

---

Sets the output style for the return string of the CTX\_THES expansion functions. This procedure has no effect on the table results to the CTX\_THES expansion functions.

### Syntax

```
CTX_THES.OUTPUT_STYLE (  
    showlevel      IN BOOLEAN DEFAULT FALSE,  
    showqualify    IN BOOLEAN DEFAULT FALSE,  
    showpt         IN BOOLEAN DEFAULT FALSE,  
    showid         IN BOOLEAN DEFAULT FALSE  
);
```

#### **showlevel**

Specify TRUE to show level in BT/NT expansions.

#### **showqualify**

Specify TRUE to show phrase qualifiers.

#### **showpt**

Specify TRUE to show preferred terms with an asterisk \*.

#### **showid**

Specify TRUE to show phrase ids.

### Notes

The general syntax of the return string for CTX\_THES expansion functions is:

```
{pt indicator:phrase (qualifier):level:phraseid}
```

Preferred term indicator is an asterisk then a colon at the start of the phrase. The qualifier is in parentheses after a space at the end of the phrase. Level is a number.

The following is an example return string for turkey the bird:

```
*:TURKEY (BIRD):1:1234
```

---

## PT

This function returns the preferred term of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.PT(restab IN OUT NOCOPY EXP_TAB,  
            phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN varchar2;
```

### Syntax 2: String Result

```
CTX_THES.PT(phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN varchar2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This function returns the preferred term as a string in the form:

```
{pt}
```

## Example

Consider a thesaurus MY\_THES with the following preferred term definition for *automobile*:

```
AUTOMOBILE  
  PT CAR
```

To look up the preferred term for *automobile*, execute the following code:

```
declare  
  terms varchar2(2000);  
begin  
  terms := ctx_thes.pt('AUTOMOBILE','MY_THES');  
  dbms_output.put_line('The preferred term for automobile is: '||terms);  
end;
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Preferred Term \(PT\) Operator](#) in [Chapter 3, "CONTAINS Query Operators"](#)

---

## RT

This function returns the related terms of a term in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.RT(restab IN OUT NOCOPY EXP_TAB,  
            phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.RT(phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN varchar2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types"](#) in [Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This function returns a string of related terms in the form:

```
{rt1}|{rt2}|{rt3}| ...
```

## Example

Consider a thesaurus MY\_THES with the following related term definition for dog:

```
DOG
  RT WOLF
  RT HYENA
```

To look up the related terms for *dog*, execute the following code:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.rt('DOG','MY_THES');
  dbms_output.put_line('The related terms for dog are: '||terms);
end;
```

This codes produces the following output:

```
The related terms for dog are: {dog}||{wolf}||{hyena}
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Related Term \(RT\) Operator](#) in [Chapter 3, "CONTAINS Query Operators"](#)

---

## SN

This function returns the scope note of the given phrase.

### Syntax

```
CTX_THES.SN(phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

**phrase**

Specify phrase to lookup in thesaurus.

**tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This function returns the scope note as a string.

### Example

```
declare  
    note varchar2(80);  
begin  
    note := ctx_thes.sn('camera', 'mythes');  
    dbms_output.put_line('CAMERA');  
    dbms_output.put_line(' SN ' || note);  
end;
```

sample output:

```
CAMERA  
SN Optical cameras
```

## SYN

---

This function returns all synonyms of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.SYN(restab IN OUT NOCOPY EXP_TAB,  
             phrase IN VARCHAR2,  
             tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.SYN(phrase IN VARCHAR2,  
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')  
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types"](#) in [Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This function returns a string of the form:

```
{syn1}|{syn2}|{syn3} ...
```

## Example

### String Result

Consider a thesaurus named **ANIMALS** that has an entry for *cat* as follows:

```
CAT
  SYN KITTY
  SYN FELINE
```

To look-up the synonym for *cat* and obtain the result as a string, issue the following statements:

```
declare
  synonyms varchar2(2000);
begin
  synonyms := ctx_thes.syn('CAT','ANIMALS');
  dbms_output.put_line('the synonym expansion for CAT is: '||synonyms);
end;
```

This code produces the following output:

```
the synonym expansion for CAT is: {CAT}|{KITTY}|{FELINE}
```

### Table Result

The following code looks up the synonyms for *canine* and obtains the results in a table. The contents of the table are printed to the standard output.

```
declare
  xtab ctx_thes.exp_tab;
begin
  ctx_thes.syn(xtab, 'canine', 'my_thesaurus');
  for i in 1..xtab.count loop
    dbms_output.put_line(lpad(' ', 2*xtab(i).xlevel) ||
      xtab(i).xrel || ' ' || xtab(i).xphrase);
  end loop;
end;
```

This code produces the following output:

```
PHRASE CANINE
  PT DOG
  SYN PUPPY
  SYN MUTT
  SYN MONGREL
```

## Related Topics

[OUTPUT\\_STYLE](#)

[SYNonym \(SYN\) Operator](#) in [Chapter 3, "CONTAINS Query Operators"](#)

---

## THES\_TT

This procedure finds and returns all top terms of a thesaurus. A top term is defined as any term which has a narrower term but has no broader terms.

This procedure differs from TT in that TT takes in a phrase and finds the top term for that phrase, but THES\_TT searches the whole thesaurus and finds all top terms.

### Large Thesauri

Since this function searches the whole thesaurus, it can take some time on large thesauri. Oracle recommends that you not call this often for such thesauri. Instead, your application should call this once, store the results in a separate table, and use those stored results.

### Syntax

```
CTX_THES.THES_TT(restab IN OUT NOCOPY EXP_TAB,  
                 tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types"](#) in [Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This procedure returns all top terms and stores them in restab.

---

## TR

For a given mono-lingual thesaurus, this function returns the foreign language equivalent of a phrase as recorded in the thesaurus.

---

**Note:** Foreign language translation is not part of the ISO-2788 or ANSI Z39.19 thesaural standards. The behavior of TR is specific to Oracle Text.

---

### Syntax 1: Table Result

```
CTX_THES.TR(restab IN OUT NOCOPY EXP_TAB,
            phrase IN VARCHAR2,
            lang   IN VARCHAR2 DEFAULT NULL,
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')
```

### Syntax 2: String Result

```
CTX_THES.TR(phrase IN VARCHAR2,
            lang   IN VARCHAR2 DEFAULT NULL,
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')
RETURN VARCHAR2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (
    xrel varchar2(12),
    xlevel number,
    xphrase varchar2(256)
);
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types"](#) in [Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

**lang**

Specify the foreign language. Specify 'ALL' for all translations of phrase.

**tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

**Returns**

This function returns a string of foreign terms in the form:

```
{ft1}||{ft2}||{ft3} ...
```

**Example**

Consider a thesaurus MY\_THES with the following entries for *cat*:

```
cat
  SPANISH: gato
  FRENCH:  chat
  SYN lion
  SPANISH: leon
```

To look up the translation for *cat*, you can issue the following statements:

```
declare
  trans      varchar2(2000);
  span_trans varchar2(2000);
begin
  trans := ctx_thes.tr('CAT','ALL','MY_THES');
  span_trans := ctx_thes.tr('CAT','SPANISH','MY_THES')
  dbms_output.put_line('the translations for CAT are: '||trans);
  dbms_output.put_line('the Spanish translations for CAT are: '||span_trans);
end;
```

This codes produces the following output:

```
the translations for CAT are: {CAT}||{CHAT}||{GATO}
the Spanish translations for CAT are: {CAT}||{GATO}
```

**Related Topics**

[OUTPUT\\_STYLE](#)

[Translation Term \(TR\) Operator](#) in [Chapter 3, "CONTAINS Query Operators"](#)

# TRSYN

For a given mono-lingual thesaurus, this function returns the foreign equivalent of a phrase, synonyms of the phrase, and foreign equivalent of the synonyms as recorded in the specified thesaurus.

---

---

**Note:** Foreign language translation is not part of the ISO-2788 or ANSI Z39.19 thesaural standards. The behavior of TRSYN is specific to Oracle Text.

---

---

## Syntax 1: Table Result

```
CTX_THES.TRSYN(restab IN OUT NOCOPY EXP_TAB,
               phrase IN VARCHAR2,
               lang   IN VARCHAR2 DEFAULT NULL,
               tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

## Syntax 2: String Result

```
CTX_THES.TRSYN(phrase IN VARCHAR2,
               lang   IN VARCHAR2 DEFAULT NULL,
               tname  IN VARCHAR2 DEFAULT 'DEFAULT')
RETURN VARCHAR2;
```

### restab

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (
    xrel varchar2(12),
    xlevel number,
    xphrase varchar2(256)
);
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types"](#) in [Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

### phrase

Specify phrase to lookup in thesaurus.

**lang**

Specify the foreign language. Specify 'ALL' for all translations of *phrase*.

**tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

## Returns

This function returns a string of foreign terms in the form:

{ft1}||{ft2}||{ft3} ...

## Example

Consider a thesaurus MY\_THES with the following entries for *cat*:

```
cat
  SPANISH: gato
  FRENCH:  chat
  SYN lion
  SPANISH: leon
```

To look up the translation and synonyms for *cat*, you can issue the following statements:

```
declare
  synonyms  varchar2(2000);
  span_syn  varchar2(2000);
begin
  synonyms := ctx_thes.trsyn('CAT','ALL','MY_THES');
  span_syn := ctx_thes.trsyn('CAT','SPANISH','MY_THES')
  dbms_output.put_line('all synonyms for CAT are: '||synonyms);
  dbms_output.put_line('the Spanish synonyms for CAT are: '||span_syn);
end;
```

This codes produces the following output:

```
all synonyms for CAT are: {CAT}||{CHAT}||{GATO}||{LION}||{LEON}
the Spanish synonyms for CAT are: {CAT}||{GATO}||{LION}||{LEON}
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Translation Term Synonym \(TRSYN\) Operator in Chapter 3, "CONTAINS Query Operators"](#)

---

## TT

This function returns the top term of a phrase as recorded in the specified thesaurus.

### Syntax 1: Table Result

```
CTX_THES.TT(restab IN OUT NOCOPY EXP_TAB,
            phrase IN VARCHAR2,
            tname  IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Syntax 2: String Result

```
CTX_THES.TT(phrase IN VARCHAR2,
            tname  IN VARCHAR2 DEFAULT 'DEFAULT')
RETURN varchar2;
```

#### **restab**

Optionally, specify the name of the expansion table to store the results. This table must be of type EXP\_TAB which the system defines as follows:

```
type exp_rec is record (
    xrel varchar2(12),
    xlevel number,
    xphrase varchar2(256)
);
type exp_tab is table of exp_rec index by binary_integer;
```

**See Also:** ["CTX\\_THES Result Tables and Data Types" in Appendix A, "Result Tables"](#) for more information about EXP\_TAB.

#### **phrase**

Specify phrase to lookup in thesaurus.

#### **tname**

Specify thesaurus name. If not specified, system default thesaurus is used.

### Returns

This function returns the top term string in the form:

```
{tt}
```

## Example

Consider a thesaurus MY\_THES with the following broader term entries for *dog*:

```
DOG
  BT1 CANINE
    BT2 MAMMAL
      BT3 VERTEBRATE
        BT4 ANIMAL
```

To look up the top term for *DOG*, execute the following code:

```
declare
  terms varchar2(2000);
begin
  terms := ctx_thes.tt('DOG','MY_THES');
  dbms_output.put_line('The top term for DOG is: '||terms);
end;
```

This code produces the following output:

```
The top term for dog is: {ANIMAL}
```

## Related Topics

[OUTPUT\\_STYLE](#)

[Top Term \(TT\) Operator](#) in [Chapter 3, "CONTAINS Query Operators"](#)

## UPDATE\_TRANSLATION

---

Use this procedure to update an existing translation.

### Syntax

```
CTX_THES.UPDATE_TRANSLATION(tname      in      varchar2,  
                             phrase     in      varchar2,  
                             language  in      varchar2,  
                             translation in      varchar2,  
                             new_translation in varchar2);
```

**tname**

Specify the name of the thesaurus, using no more than 30 characters.

**phrase**

Specify the phrase in the thesaurus to which to update a translation. The phrase must already exist in the thesaurus or an error is raised.

**language**

Specify the language of the translation, using no more than 10 characters.

**translation**

Specify the translated term to update. If no such translation exists, an error is raised.

You can specify NULL if there is only one translation for the *phrase*. An error is raised if there is more than one translation for the term in the specified language.

**new\_translation**

Optionally, specify the new form of the translated term.

### Example

The following code updates the Spanish translation for *dog*:

```
begin  
  ctx_thes.update_translation('my_thes', 'dog', 'SPANISH:', 'PERRO', 'CAN');  
end;
```

# 11

---

## Executables

This chapter discusses the executables shipped with Oracle Text. The following topics are discussed:

- [Thesaurus Loader \(ctxload\)](#)
- [Knowledge Base Extension Compiler \(ctxkbt\)](#)

## Thesaurus Loader (ctxload)

Use `ctxload` to do the following with a thesaurus:

- import a thesaurus file into the Oracle Text thesaurus tables.
- export a loaded thesaurus to a user-specified operating-system file.

An import file is an ASCII flat file that contains entries for synonyms, broader terms, narrower terms, or related terms which can be used to expand queries.

**See Also:** For examples of import files for thesaurus importing, see ["Structure of ctxload Thesaurus Import File"](#) in [Appendix C](#).

## Text Loading

The `ctxload` program no longer supports the loading of text columns. To load files to a text column in batch, Oracle recommends that you use SQL\*Loader.

**See Also:** ["SQL\\*Loader Example"](#) in [Appendix C](#), ["Loading Examples"](#)

## ctxload Syntax

```
ctxload -user username[/password][@sqlnet_address]
        -name object_name
        -file file_name

        [-thes]
        [-thescase y|n]
        [-thesdump]
        [-log file_name]
        [-trace]
        [-pk]
        [-export]
        [-update]
```

### Mandatory Arguments

**-user**

Specify the username and password of the user running `ctxload`.

The username and password can be followed immediately by `@sqlnet_address` to permit logon to remote databases. The value for `sqlnet_address` is a database connect string. If the `TWO_TASK` environment variable is set to a remote database, you do not have to specify a value for `sqlnet_address` to connect to the database.

**-name object\_name**

When you use `ctxload` to export/import a thesaurus, use `object_name` to specify the name of the thesaurus to be exported/imported.

You use `object_name` to identify the thesaurus in queries that use thesaurus operators.

---

---

**Note:** Thesaurus name must be unique. If the name specified for the thesaurus is identical to an existing thesaurus, `ctxload` returns an error and does not overwrite the existing thesaurus.

---

---

When you use `ctxload` to update/export a text field, use `object_name` to specify the index associated with the text column.

**-file file\_name**

When `ctxload` is used to import a thesaurus, use `file_name` to specify the name of the import file which contains the thesaurus entries.

When `ctxload` is used to export a thesaurus, use `file_name` to specify the name of the export file created by `ctxload`.

---

---

**Note:** If the name specified for the thesaurus dump file is identical to an existing file, `ctxload` *overwrites* the existing file.

---

---

## Optional Arguments

**-thes**

Import a thesaurus. Specify the source file with the `-file` argument. You specify the name of the thesaurus to be imported with `-name`.

**-thescase y | n**

Specify `y` to create a case-sensitive thesaurus with the name specified by `-name` and populate the thesaurus with entries from the thesaurus import file specified by `-file`. If `-thescase` is `y` (the thesaurus is case-sensitive), `ctxload` enters the terms in the thesaurus exactly as they appear in the import file.

The default for `-thescase` is `n` (case-insensitive thesaurus)

---

---

**Note:** -thescase is valid for use with only the -thes argument.

---

---

**-thesdump**

Export a thesaurus. Specify the name of the thesaurus to be exported with the -name argument. Specify the destination file with the -file argument.

**-log**

Specify the name of the log file to which ctxload writes any national-language supported (NLS) messages generated during processing. If you do not specify a log file name, the messages appear on the standard output.

**-trace**

Enables SQL statement tracing using ALTER SESSION SET SQL\_TRACE TRUE. This command captures all processed SQL statements in a trace file, which can be used for debugging. The location of the trace file is operating-system dependent and can be modified using the USER\_DUMP\_DEST initialization parameter.

**See Also:** For more information about SQL trace and the USER\_DUMP\_DEST initialization parameter, see *Oracle8 Administrator's Guide*.

**-pk**

Specify the primary key value of the row to be updated or exported.

When the primary key is compound, you must enclose the values within double quotes and separate the keys with a comma.

**-export**

Exports the contents of a CLOB or BLOB column in a database table into the operating system file specified by -file. ctxload exports the CLOB or BLOB column in the row specified by -pk.

When you use the -export, you must specify a primary key with -pk.

**-update**

Updates the contents of a CLOB or BLOB column in a database table with the contents of the operating system file specified by -file. ctxload updates the CLOB or BLOB column in for the row specified by -pk.

When you use -update, you must specify a primary key with -pk.

## ctxload Examples

This section provides examples for some of the operations that `ctxload` can perform.

**See Also:** For more document loading examples, see [Appendix C, "Loading Examples"](#).

### Thesaurus Import Example

The following example imports a thesaurus named `tech_doc` from an import file named `tech_thesaurus.txt`:

```
ctxload -user jsmith/123abc -thes -name tech_doc -file tech_thesaurus.txt
```

### Thesaurus Export Example

The following example dumps the contents of a thesaurus named `tech_doc` into a file named `tech_thesaurus.out`:

```
ctxload -user jsmith/123abc -thesdump -name tech_doc -file tech_thesaurus.out
```

## Knowledge Base Extension Compiler (ctxkbtc)

The knowledge base is the information source Oracle Text uses to perform theme analysis, such as theme indexing, processing ABOUT queries, and document theme extraction with the CTX\_DOC package. A knowledge base is supplied for English and French.

With the `ctxkbtc` compiler, you can do the following:

- Extend your knowledge base by compiling one or more thesauri with the Oracle Text knowledge base. The extended information can be application-specific terms and relationships. During theme analysis, the extended portion of the knowledge base overrides any terms and relationships in the knowledge base where there is overlap.
- Create a new user-defined knowledge base by compiling one or more thesauri. In languages other than English and French, this feature can be used to create a language-specific knowledge base.

**See Also:** For more information about the knowledge base packaged with Oracle Text, see [Appendix I, "English Knowledge Base Category Hierarchy"](#).

For more information about the ABOUT operator, see [ABOUT operator in Chapter 3](#).

For more information about document services, see [Chapter 7, "CTX\\_DOC Package"](#).

### Knowledge Base Character Set

Knowledge bases can be in any single-byte character set. Supplied knowledge bases are in WE8ISO8859P1. You can store an extended knowledge base in another character set such as US7ASCII.

### ctxkbtc Syntax

```
ctxkbtc -user uname/passwd
        [-name thesname1 [thesname2 ... thesname16]]
        [-revert]
        [-stoplist stoplistname]
        [-verbose]
        [-log filename]
```

**-user**

Specify the username and password for the administrator creating an extended knowledge base. This user must have write permission to the ORACLE\_HOME directory.

**-name *thesname1 [thesname2 ... thesname16]***

Specify the name(s) of the thesauri (up to 16) to be compiled with the knowledge base to create the extended knowledge base. The thesauri you specify must already be loaded with ctxload with the `-thescase Y` option

**-revert**

Reverts the extended knowledge base to the default knowledge base provided by Oracle Text.

**-stoplist *stoplistname***

Specify the name of the stoplist. Stopwords in the stoplist are added to the knowledge base as useless words that are prevented from becoming themes or contributing to themes. You can still add stopthemes after running this command using CTX\_DLL.ADD\_STOPTHEME.

**-verbose**

Displays all warnings and messages, including non-NLS messages, to the standard output.

**-log**

Specify the log file for storing all messages. When you specify a log file, no messages are reported to standard out.

## ctxkbtc Usage Notes

- Before running ctxkbtc, you must set the NLS\_LANG environment variable to match the database character set.
- The user issuing ctxkbtc must have write permission to the ORACLE\_HOME, since the program writes files to this directory.
- Running ctxkbtc twice removes the previous extension.
- Before being compiled, each thesaurus must be loaded into Oracle Text case sensitive with the `"-thescase Y"` option in ctxload.
- Running ctxkbtc twice removes the previous extension.

## ctxkbtc Limitations

The `ctxkbtc` program has the following limitations:

- When upgrading or downgrading your database to a different release, Oracle recommends that you recompile your extended knowledge base in the new environment for theme indexing and related features to work correctly.
- Knowledge base extension cannot be performed when theme indexing is being performed. In addition, any SQL sessions that are using Oracle Text functions must be exited and reopened to make use of the extended knowledge base.
- There can be only one user extension per installation. Since a user extension affects all users at the installation, only administrators or terminology managers should extend the knowledge base.

## ctxkbtc Constraints on Thesaurus Terms

Terms are case sensitive. If a thesaurus has a term in uppercase, for example, the same term present in lowercase form in a document will not be recognized.

The maximum length of a term is 80 characters.

Disambiguated homographs are not supported.

## ctxkbtc Constraints on Thesaurus Relations

The following constraints apply to thesaurus relations:

- BTG and BTP are the same as BT. NTG and NTP are the same as NT.
- Only preferred terms can have a BT, NTs or RTs.
- If a term has no USE relation, it will be treated as its own preferred term.
- If a set of terms are related by SYN relations, only one of them may be a preferred term.
- An existing category cannot be made a top term.
- There can be no cycles in BT and NT relations.
- A term can have at most one preferred term and at most one BT. A term may have any number of NTs.
- An RT of a term cannot be an ancestor or descendent of the term. A preferred term may have any number of RTs up to a maximum of 32.
- The maximum height of a tree is 16 including the top term level.

- When multiple thesauri are being compiled, a top term in one thesaurus should not have a broader term in another thesaurus.

---

**Note:** The thesaurus compiler will tolerate certain violations of the above rules. For example, if a term has multiple BTs, it ignores all but the last one it encounters.

Similarly, BTs between existing knowledge base categories will only result in a warning message.

Such violations are not recommended since they might produce undesired results.

---

## Extending the Knowledge Base

You can extend the supplied knowledge base by compiling one or more thesauri with the Oracle Text knowledge base. The extended information can be application-specific terms and relationships. During theme analysis, the extended portion of the knowledge base overrides any terms and relationships in the knowledge base where there is overlap.

When extending the knowledge base, Oracle recommends that new terms be linked to one of the categories in the knowledge base for best results in theme proving when appropriate.

**See Also:** For more information about the knowledge base, see [Appendix I, "English Knowledge Base Category Hierarchy"](#)

If new terms are kept completely disjoint from existing categories, fewer themes from new terms will be proven. The result of this is poorer precision and recall with ABOUT queries as well poor quality of gists and theme highlighting.

You link new terms to existing terms by making an existing term the broader term for the new terms.

### Example for Extending the Knowledge Base

You purchase a medical thesaurus `medthes` containing a hierarchy of medical terms. The four top terms in the thesaurus are the following:

- Anesthesia and Analgesia
- Anti-Allergic and Respiratory System Agents

- Anti-Inflammatory Agents, Antirheumatic Agents, and Inflammation Mediators
- Antineoplastic and Immunosuppressive Agents

To link these terms to the existing knowledge base, add the following entries to the medical thesaurus to map the new terms to the existing *health and medicine* branch:

health and medicine

NT Anesthesia and Analgesia

NT Anti-Allergic and Respiratory System Agents

NT Anti-Inflammatory Agents, Antirheumatic Agents, and Inflammation Mediators

NT Antineoplastic and Immunosuppressive Agents

Set your NLS language environment variable to match the database character set. For example, if your database character set is WE8ISO8859P1 and you are using American English, set your NLS\_LANG as follows:

```
setenv NLS_LANG AMERICAN_AMERICA.WE8ISO8859P1
```

Assuming the medical thesaurus is in a file called med.thes, you load the thesaurus as medthes with ctxload as follows:

```
ctxload -thes -thescase y -name medthes -file med.thes -user ctxsys/ctxsys
```

To link the loaded thesaurus medthes to the knowledge base, use ctxkbtc as follows:

```
ctxkbtc -user ctxsys/ctxsys -name medthes
```

## Adding a Language-Specific Knowledge Base

You can extend theme functionality to languages other than English or French by loading your own knowledge base for any single-byte whitespace delimited language, including Spanish.

Theme functionality includes theme indexing, ABOUT queries, theme highlighting, and the generation of themes, gists, and theme summaries with the CTX\_DOC PL/SQL package.

You extend theme functionality by adding a user-defined knowledge base. For example, you can create a Spanish knowledge base from a Spanish thesaurus.

To load your language-specific knowledge base, follow these steps:

1. Load your custom thesaurus using ctxload.

2. Set NLS\_LANG so that the language portion is the target language. The charset portion must be a single-byte character set.
3. Compile the loaded thesaurus using ctxkbtc:

```
ctxkbtc -user ctxsys/ctxsys -name my_lang_thes
```

This command compiles your language-specific knowledge base from the loaded thesaurus. To use this knowledge base for theme analysis during indexing and ABOUT queries, specify the NLS\_LANG language as the THEME\_LANGUAGE attribute value for the BASIC\_LEXER preference.

### Limitations for Adding a Knowledge Base

The following limitations hold for adding knowledge bases:

- Oracle supplies knowledge bases in English and French only. You must provide your own thesaurus for any other language.
- You can only add knowledge bases for languages with single-byte character sets. You cannot create a knowledge base for languages which can be expressed only in multi-byte character sets. If the database is a multi-byte universal character set, such as UTF-8, the NLS\_LANG parameter must still be set to a compatible single-byte character set when compiling the thesaurus.
- Adding a knowledge base works best for whitespace delimited languages.
- You can have at most one knowledge base per NLS language.
- Obtaining hierarchical query feedback information such as broader terms, narrower terms and related terms does not work in languages other than English and French. In other languages, the knowledge bases are derived entirely from your thesauri. In such cases, Oracle recommends that you obtain hierarchical information directly from your thesauri.

### Order of Precedence for Multiple Thesauri

When multiple thesauri are to be compiled, precedence is determined by the order in which thesauri are listed in the arguments to the compiler (most preferred first). A user thesaurus always has precedence over the built-in knowledge base.

## Size Limits for Extended Knowledge Base

The following table lists the size limits associated with creating and compiling an extended knowledge base:

Description of Parameter	Limit
Number of RTs (from + to) per term	32
Number of terms per a single hierarchy (i.e., all narrower terms for a given top term)	64000
Number of new terms in an extended knowledge base	1 million
Number of separate thesauri that can be compiled into a user extension to the KB	16

---

## Result Tables

This appendix describes the structure of the result tables used to store the output generated by the procedures in the CTX\_QUERY, CTX\_DOC, and CTX\_THES packages.

The following topics are discussed in this appendix:

- [CTX\\_QUERY Result Tables](#)
- [CTX\\_DOC Result Tables](#)
- [CTX\\_THES Result Tables and Data Types](#)

## CTX\_QUERY Result Tables

For the CTX\_QUERY procedures that return results, tables for storing the results must be created before the procedure is called. The tables can be named anything, but must include columns with specific names and data types.

This section describes the following types of result tables, and their required columns:

- [EXPLAIN Table](#)
- [HFEEDBACK Table](#)

### EXPLAIN Table

[Table A-1](#) describes the structure of the table to which CTX\_QUERY.EXPLAIN writes its results.

*Table A-1*

Column Name	Datatype	Description
EXPLAIN_ID	VARCHAR2(30)	The value of the explain_id argument specified in the FEEDBACK call.
ID	NUMBER	A number assigned to each node in the query execution tree. The root operation node has ID =1. The nodes are numbered in a top-down, left-first manner as they appear in the parse tree.
PARENT_ID	NUMBER	The ID of the execution step that operates on the output of the ID step. Graphically, this is the parent node in the query execution tree. The root operation node (ID =1) has PARENT_ID = 0.
OPERATION	VARCHAR2(30)	Name of the internal operation performed. Refer to <a href="#">Table A-2</a> for possible values.
OPTIONS	VARCHAR2(30)	Characters that describe a variation on the operation described in the OPERATION column. When an OPERATION has more than one OPTIONS associated with it, OPTIONS values are concatenated in the order of processing. See <a href="#">Table A-3</a> for possible values.
OBJECT_NAME	VARCHAR2(80)	Section name, wildcard term, weight, or threshold value or term to lookup in the index.

**Table A-1**

Column Name	Datatype	Description
POSITION	NUMBER	The order of processing for nodes that all have the same PARENT_ID. The positions are numbered in ascending order starting at 1.
CARDINALITY	NUMBER	Reserved for future use. You should create this column for forward compatibility.

### Operation Column Values

Table A-2 shows the possible values for the OPERATION column of the explain table.

**Table A-2**

Operation Value	Query Operator	Equivalent Symbol
ABOUT	ABOUT	(none)
ACCUMULATE	ACCUM	,
AND	AND	&
COMPOSITE	(none)	(none)
EQUIVALENCE	EQUIV	=
MINUS	MINUS	-
NEAR	NEAR	;
NOT	NOT	~
NO_HITS	(no hits will result from this query)	
OR	OR	
PHRASE	(a phrase term)	
SECTION	(section)	
THRESHOLD	>	>
WEIGHT	*	*
WITHIN	within	(none)
WORD	(a single term)	

**OPTIONS Column Values**

The following table list the possible values for the OPTIONS column of the explain table.

**Table A–3**

Options Value	Description
(\$)	Stem
(?)	Fuzzy
(!)	Soundex
(T)	Order for ordered Near.
(F)	Order for unordered Near.
(n)	A number associated with the max_span parameter for the Near operator.

## HFEEDBACK Table

[Table A-4](#) describes the table to which CTX\_QUERY.HFEEDBACK writes its results.

**Table A-4**

Column Name	Datatype	Description
FEEDBACK_ID	VARCHAR2(30)	The value of the <i>feedback_id</i> argument specified in the HFEEDBACK call.
ID	NUMBER	A number assigned to each node in the query execution tree. The root operation node has ID =1. The nodes are numbered in a top-down, left-first manner as they appear in the parse tree.
PARENT_ID	NUMBER	The ID of the execution step that operates on the output of the ID step. Graphically, this is the parent node in the query execution tree. The root operation node (ID =1) has PARENT_ID = 0.
OPERATION	VARCHAR2(30)	Name of the internal operation performed. Refer to <a href="#">Table A-5</a> for possible values.
OPTIONS	VARCHAR2(30)	Characters that describe a variation on the operation described in the OPERATION column. When an OPERATION has more than one OPTIONS associated with it, OPTIONS values are concatenated in the order of processing. See <a href="#">Table A-6</a> for possible values.
OBJECT_NAME	VARCHAR2(80)	Section name, wildcard term, weight, threshold value or term to lookup in the index.
POSITION	NUMBER	The order of processing for nodes that all have the same PARENT_ID. The positions are numbered in ascending order starting at 1.
BT_FEEDBACK	<a href="#">CTX_FEEDBACK_TYPE</a>	Stores broader feedback terms. See <a href="#">Table A-7</a> .
PT_FEEDBACK	<a href="#">CTX_FEEDBACK_TYPE</a>	Stores related feedback terms. See <a href="#">Table A-7</a> .
NT_FEEDBACK	<a href="#">CTX_FEEDBACK_TYPE</a>	Stores narrower feedback terms. See <a href="#">Table A-7</a> .

Operation Column Values

Table A-5 shows the possible values for the OPERATION column of the hfeedback table.

Table A-5

Operation Value	Query Operator	Equivalent Symbol
ABOUT	ABOUT	(none)
ACCUMULATE	ACCUM	,
AND	AND	&
EQUIVALENCE	EQUIV	=
MINUS	MINUS	-
NEAR	NEAR	;
NOT	NOT	~
OR	OR	
SECTION	(section)	
TEXT	word or phrase of a text query	
THEME	word or phrase of an ABOUT query	
THRESHOLD	>	>
WEIGHT	*	*
WITHIN	within	(none)

OPTIONS Column Values

The following table list the values for the OPTIONS column of the feedback table.

Table A-6

Options Value	Description
(T)	Order for ordered Near.
(F)	Order for unordered Near.
(n)	A number associated with the max_span parameter for the Near operator.

CTX\_FEEDBACK\_TYPE

The CTX\_FEEDBACK\_TYPE is a nested table of objects. This datatype is pre-defined in the ctxsys schema. Use this type to define the columns BT\_FEEDBACK, RT\_FEEDBACK, and NT\_FEEDBACK.

The nested table CTX\_FEEDBACK\_TYPE holds objects of type CTX\_FEEDBACK\_ITEM\_TYPE, which is also pre-defined in the ctxsys schema. This object is defined with three members and one method as follows:

Table A-7

CTX_FEEDBACK_ITEM_TYPE Members and Methods	Type	Description
text	member	Feedback term.
cardinality	member	(reserved for future use.)
score	member	(reserved for future use.)

The SQL code that defines these objects is as follows:

```
CREATE OR REPLACE TYPE ctx_feedback_type AS TABLE OF ctx_feedback_item_type;

CREATE OR REPLACE TYPE ctx_feedback_item_type AS OBJECT
(text          VARCHAR2(80),
 cardinality NUMBER,
 score         NUMBER,
 MAP MEMBER FUNCTION rank RETURN REAL,
 PRAGMA RESTRICT_REFERENCES (rank, RNDS, WNDS, RNPS, WNPS)
);

CREATE OR REPLACE TYPE BODY ctx_feedback_item_type AS
  MAP MEMBER FUNCTION rank RETURN REAL IS
  BEGIN
    RETURN score;
  END rank;
END;
```

**See Also:** For an example of how to select from the hfeedback table and its nested tables, refer to [CTX\\_QUERY.HFEEDBACK](#) in [Chapter 9](#).

## CTX\_DOC Result Tables

The CTX\_DOC procedures return results stored in a table. Before calling a procedure, you must create the table. The tables can be named anything, but must include columns with specific names and data types.

This section describes the following result tables and their required columns:

- [Filter Table](#)
- [Gist Table](#)
- [Highlight Table](#)
- [Markup Table](#)
- [Theme Table](#)

### Filter Table

A filter table stores one row for each filtered document returned by CTX\_DOC.[FILTER](#). Filtered documents can be plain text or HTML.

When you call CTX\_DOC.FILTER for a document, the document is processed through the filter defined for the text column and the results are stored in the filter table you specify.

Filter tables can be named anything, but must include the following columns, with names and datatypes as specified:

**Table A–8**

Column Name	Type	Description
QUERY_ID	NUMBER	The identifier for the results generated by a particular call to CTX_DOC.FILTER (only populated when table is used to store results from multiple FILTER calls)
DOCUMENT	CLOB	Text of the document, stored in plain text or HTML.

### Gist Table

A Gist table stores one row for each Gist/theme summary generated by CTX\_DOC.GIST.

Gist tables can be named anything, but must include the following columns, with names and data types as specified:

**Table A–9**

Column Name	Type	Description
QUERY_ID	NUMBER	Query ID.
POV	VARCHAR2(80)	Document theme. Case depends of how themes were used in document or represented in the knowledge base.  POV has the value of GENERIC for the document GIST.
GIST	CLOB	Text of Gist or theme summary, stored as plain text

## Highlight Table

A highlight table stores offset and length information for highlighted terms in a document. This information is generated by CTX\_DOC.HIGHLIGHT. Highlighted terms can be the words or phrases that satisfy a word or an ABOUT query.

If a document is formatted, the text is filtered into either plain text or HTML and the offset information is generated for the filtered text. The offset information can be used to highlight query terms for the same document filtered with CTX\_DOC.FILTER.

Highlight tables can be named anything, but must include the following columns, with names and datatypes as specified:

Table A-10

Column Name	Type	Description
QUERY_ID	NUMBER	The identifier for the results generated by a particular call to CTX_DOC.HIGHLIGHT (only populated when table is used to store results from multiple HIGHLIGHT calls)
OFFSET	NUMBER	The position of the highlight in the document, relative to the start of document which has a position of 1.
LENGTH	NUMBER	The length of the highlight.

## Markup Table

A markup table stores documents in plain text or HTML format with the query terms in the documents highlighted by markup tags. This information is generated when you call CTX\_DOC.MARKUP.

Markup tables can be named anything, but must include the following columns, with names and datatypes as specified:

Table A-11

Column Name	Type	Description
QUERY_ID	NUMBER	The identifier for the results generated by a particular call to CTX_DOC.MARKUP (only populated when table is used to store results from multiple MARKUP calls)
DOCUMENT	CLOB	Marked-up text of the document, stored in plain text or HTML format

## Theme Table

A theme table stores one row for each theme generated by CTX\_DOC.[THEMES](#). The value stored in the THEME column is either a single theme phrase or a string of parent themes, separated by colons.

Theme tables can be named anything, but must include the following columns, with names and data types as specified:

**Table A–12**

Column Name	Type	Description
QUERY_ID	NUMBER	Query ID
THEME	VARCHAR2(2000)	Theme phrase or string of parent themes separated by colons (:).
WEIGHT	NUMBER	Weight of theme phrase relative to other theme phrases for the document.

## Token Table

A token table stores the text tokens for a document as output by the CTX\_DOC.TOKENS procedure. Token tables can be named anything, but must include the following columns, with names and data types as specified.

**Table A–13**

Column Name	Type	Description
QUERY_ID	NUMBER	The identifier for the results generated by a particular call to CTX_DOC. <a href="#">HIGHLIGHT</a> (only populated when table is used to store results from multiple HIGHLIGHT calls)
TOKEN	VARCHAR2(64)	The token string in the text.
OFFSET	NUMBER	The position of the token in the document, relative to the start of document which has a position of 1.
LENGTH	NUMBER	The character length of the token.

## CTX\_THES Result Tables and Data Types

The CTX\_THES expansion functions such as BT, NT, and SYN can return the expansions in a table of type EXP\_TAB. You can specify the name of your table with the restab argument.

### EXP\_TAB Table Type

The EXP\_TAB table type is a table of rows of type EXP\_REC.

The EXP\_REC and EXP\_TAB types are defined as follows in the CTXSYS schema:

```
type exp_rec is record (  
    xrel varchar2(12),  
    xlevel number,  
    xphrase varchar2(256)  
);  
  
type exp_tab is table of exp_rec index by binary_integer;
```

When you call a thesaurus expansion function and specify restab, the system returns the expansion as an EXP\_TAB table. Each row in this table is of type EXP\_REC and represents a word or phrase in the expansion. The following table describes the fields in EXP\_REC:

EXP_REC Field	Description
xrel	The xrel field contains the relation of the term to the input term (e.g. 'SYN', 'PT', 'RT', etc.). The xrel value is PHRASE when the input term appears in the expansion. For translations, the xrel value is the language.
xlevel	<p>The xlevel field is the level of the relation. This is used mainly when xrel is a hierarchical relation (BT*/NT*).</p> <p>The xlevel field is 0 when xrel is PHRASE.</p> <p>The xlevel field is 2 for translations of synonyms under TRSYN.</p> <p>The xlevel field is 1 for operators that are not hierarchical, such as PT and RT.</p>
xphrase	The xphrase is the related term. This includes a qualifier in parentheses, if one exists for the related term. Compound terms are not de-compounded.

---

## Supported Document Formats

This appendix contains a list of the document formats supported by the Inso filtering technology. The following topics are covered in this appendix:

- [About Inso Filtering Technology](#)
- [Supported Document Formats](#)
- [Unsupported Formats](#)

## About Inso Filtering Technology

Oracle Text uses document filtering technology licensed from Inso Chicago Corporation. This filtering technology enables you to index most document formats. This technology also enables you to convert documents to HTML for document presentation, with the CTX\_DOC package.

**See Also:** For a list of supported formats, see "[Supported Document Formats](#)" in this Appendix.

To use Inso filtering for indexing and DML processing, you must specify the INSO\_FILTER object in your filter preference.

To use Inso filtering technology for converting documents to HTML with the CTX\_DOC package, you need not use the INSO\_FILTER indexing preference, but you must still set up your environment to use INSO filtering technology as described in this appendix.

To convert documents to HTML format, Inso filtering technology relies on shared libraries and data files licensed from Inso Corporation and Adobe Corporation.

The following sections discuss the supported platforms and how to enable Inso filtering on the different platforms.

## Supported Platforms

### Supported Platforms

Inso filter technology is supported on the following platforms:

- Sun Solaris on SPARC 32-bit and 64-bit (2.5.1 - 7)
- IBM AIX 32-bit and 64-bit (4.2 - 4.3)
- HP-UX 32-bit and 64-bit (10.2 - 11.0)
- DEC UNIX for Alpha/Tru64 UNIX (4.0)
- SGI IRIX 32-bit and 64-bit (6.3)
- Microsoft Windows
  - NT on Intel x86 (4.0)
  - 2000
  - Millennium

- 98
- 95
- Red Hat Linux for Intel x86 (5.2 - 6.2)

## Environment Variable Location

All environment variables related to Inso filtering must be made visible to Oracle Text. Set these variables in the following location:

- The operating system shell from where `ctxsrv` server is started. This makes the environment variables visible to the `ctxsrv` process, which does background DML.

---

**Note:** Since indexing is a trusted callout instead of a safe callout, it is not necessary to set variables in `listener.ora` file. Any Inso-specific variables set in the `listener.ora` file is ignored by the `INSO_FILTER` object.

---

## Requirements for UNIX Platforms

The following requirements apply to Solaris, IBM AIX, HP/UX, Digital UNIX, SGI, and Linux platforms:

- Ensure the \*.flt files have execute permission granted to the operating system user running the Oracle database and `ctxsrv` server.
- Set the `$PATH` variable to include the location of the \*.flt files, in particular to the location of the file `isunx2.flt`, and to `$ORACLE_HOME/ctx/lib` which is the location of the shared libraries for Inso filtering
- Set the `$HOME` environment variable to allow Inso technology to write files to a sub-directory (.inso) in `$HOME` directory.
- Access to a running X-Windows server is required to perform vector graphics image conversion.

### Solaris, SGI, and Digital UNIX

Set the system's shared library path (`$LD_LIBRARY_PATH`) environment variable to include `$ORACLE_HOME/ctx/lib`.

## IBM AIX

Set the system's shared library path (`$LIBPATH`) environment variable to include `$ORACLE_HOME/ctx/lib`.

You must include `/usr/lib:/lib` in `$LIBPATH`, because these directories are not searched by default once `$LIBPATH` environment variable is set.

## HP/UX

Set the system's shared library path (`$SHLIB_PATH`) environment variable to include `$ORACLE_HOME/ctx/lib`.

## Linux

Set the system's shared library path (`$LD_LIBRARY_PATH`) environment variable to include `$ORACLE_HOME/ctx/lib`.

## Filtering Vector Graphic Formats

Follow these steps to filter vector graphic formats on UNIX platforms:

- Start an X server to filter vector graphic formats. If no X server exists (system detects no X libraries, such as Xm, Xt, and X11), vector graphic filtering is not performed. Vector graphic formats include CAD drawings and presentation formats such as Power Point 97. Bitmap formats include GIF, JPEG, and TIF formats as well as bitmap formats.
- Because the system depends on X libraries to perform vector graphic conversion, ensure that the system-specific library path environment variable for the X libraries is set correctly.
- Set the `$DISPLAY` environment variable. For example, setting `DISPLAY=:0.0` tells the system to use the X server on the console.

## OLE2 Object Support

There are platform dependent limits on what Inso filter technology can do with OLE2 objects. On all platforms when a metafile snapshot is available, Inso technology will use it to convert the object.

When a metafile snapshot is not available on UNIX platforms, Inso technology cannot convert the OLE2 object.

However, when a metafile snapshot is not available on the NT platform, the original application is used (if available) to convert the OLE2 object.

## Supported Document Formats

The following table lists all of the document formats that Oracle Text supports for filtering. Document filtering is used for indexing, DML, and for converting documents to HTML with the CTX\_DOC package. This filtering technology is based on Inso Corporation's HTML export technology and is licensed from Inso Corporation.

---

---

**Note:** This list does *not* represent the complete list of formats that Oracle is able to process. The external filter framework enables Oracle to process *any* document format, provided an external filter exists which can filter all the formats to plain text.

---

### Word Processing - Generic

Format	Version
ASCII Text (7 & 8 bit versions)	All versions
ANSI Text (7 & 8 bit)	All versions
Unicode Text	All versions
HTML	Versions through 3.0
IBM Revisable Form Text	All versions
IBM FFT	All versions
Microsoft Rich Text Format (RTF)	All versions

### Word Processing - DOS

Format	Version
DEC WPS Plus	Versions through 4.1
DisplayWrite 2 & 3 (TXT)	All versions
DisplayWrite 4 & 5	Versions through Release 2.0
Enable	Versions 3.0, 4.0 and 4.5
First Choice	Versions through 3.0

<b>Format</b>	<b>Version</b>
Framework	Version 3.0
IBM Writing Assistant	Version 1.01
Lotus Manuscript	Versions through 2.0
MASS11	Versions through 8.0
Microsoft Word	Versions through 6.0
Microsoft Works	Versions through 2.0
MultiMate	Versions through 4.0
Navy DIF	All versions
Nota Bene	Version 3.0
Office Writer	Version 4.0 to 6.0
PC-File Letter	Versions through 5.0
PC-File+ Letter	Versions through 3.0
PFS:Write	Versions A, B, and C
Professional Write	Versions through 2.1
Q&A	Version 2.0
Samna Word	Versions through Samna Word IV+
SmartWare II	Version 1.02
Sprint	Versions through 1.0
Total Word	Version 1.2
Volkswriter 3 & 4	Versions through 1.0
Wang PC (IWP)	Versions through 2.6
WordMARC	Versions through Composer Plus
WordPerfect	Versions through 7.0
WordStar	Versions through 7.0
WordStar 2000	Versions through 3.0
XyWrite	Versions through III Plus

## Word Processing - International

<b>Format</b>	<b>Version</b>
Ichitaro	Version 5, 6, 8, 9, and 10

## Word Processing - Windows

<b>Format</b>	<b>Version</b>
AMI/AMI Professional	Versions through 3.1
Corel WordPerfect for Windows	Versions through 9.0
JustWrite	Versions through 3.0
Legacy	Versions through 1.1
Lotus WordPro (NT on Intel only)	SmartSuite 96, 97 and Millennium
Lotus WordPro (all supported platforms except NT on Intel)	SmartSuite 97 and Millennium (Text only)
Microsoft Windows Works	Versions through 4.0
Microsoft Windows Write	Versions through 3.0
Microsoft Word 97	Word 97
Microsoft Word 2000	Word 2000
Microsoft Word for Windows	Versions through 7.0
Microsoft WordPad	All versions
Novell Perfect Works	Version 2.0
Novell WordPerfect for Windows	Versions through 7.0
Professional Write Plus	Version 1.0

Reflex	Version 2.0
Q & A	Versions through 2.0
SmartWare II	Version 1.02

## Display Formats

<b>Format</b>	<b>Version</b>
PDF - Portable Document Format	Versions 1.0, 1.1, 1.2, and 1.3 including Japanese PDF.

## Presentation Formats

<b>Format</b>	<b>Version</b>
Corel Presentations	Versions 8.0 and 9.0
Novell Presentations	Versions 3.0 and 7.0
Harvard Graphics for DOS	Versions 2.x & 3.x
Harvard Graphics Presentation	Windows versions
Freelance 96 for Windows 95	Freelance 96
Freelance for Windows 95	SmartSuite 97 and Millennium
Freelance for Windows	Version 1.0 and 2.0
Freelance for OS/2	Versions through 2.0
Microsoft PowerPoint for Windows	Versions through 7.0
Microsoft PowerPoint 97	PowerPoint 97
Microsoft PowerPoint 2000	PowerPoint 2000
Microsoft PowerPoint for Macintosh	Version 4.0 and 98

## Standard Graphic Formats

The following table lists the graphic formats that the INSO filter recognizes. This means that indexing a text column that contains any of these formats produces no error. As such, it is safe for the column to contain any of these formats.

---

**Note:** The INSO filter cannot extract textual information from graphics.

---

Format	Version
Binary Group 3 Fax	All versions
BMP (including RLE, ICO, CUR & OS/2 DIB)	Windows
CDR (if TIFF image is embedded in it)	Corel Draw version 2.0 - 9.0
CGM - Computer Graphics Metafile	ANSI, CALS, NIST, Version 3.0
DCX (multi-page PCX)	Microsoft Fax
DRW - Micrografx Designer	Version 3.1
DRW - Micrografx Draw	Version 4.0
DXF (Binary and ASCII) AutoCAD Drawing Interchange Format	Versions through 13
EMF	Windows Enhanced Metafile
EPS - Encapsulated PostScript	If TIFF image is embedded in it
FPX - Kodak Flash Pix	No specific version
GIF - Graphics Interchange Format	Compuserve
GP4 - Group 4 CALS format	Types I and II
HPGL - Hewlett Packard Graphics Language	Version 2.0
IMG - GEM Paint	No specific version
JPEG	All versions including progressive JPEG
PBM - Portable Bitmap	No specific version
PCD - Kodak Photo CD	Version 1
PCX	PC Paintbrush
Perfect Works (Draw)	Novell version 2.0

Format	Version
PGM - Portable Graymap	No specific version
PIC	Lotus
PICT1 & PICT2 (Raster)	Macintosh Standard
PNG - Portable Network Graphics Internet Format	Version 1.0
PNTG	MacPaint
PPM - Portable Pixmap	No specific version
PSP - Paintshop Pro (NT on Intel only)	Versions 5.0 and 5.0.1
SDW	Ami Draw
Snapshot (Lotus)	All versions
SRS - Sun Raster File Format	No specific version
Targa	Truevision
TIFF	Versions through 6
TIFF CCITT Group 3 & 4	Fax Systems
Visio	Visio 4 (Page Preview only), 5, 2000
WBMP	WAP graphics standard
WMF	Windows Metafile
WordPerfect Graphics [WPG and WPG2]	Versions through 2.0
XBM - X-Windows Bitmap	x10 compatible
XPM - X-Windows Pixmap	x10 compatible
XWD - X-Windows Dump	x10 compatible

## Other

Format	Version
Executable (EXE, DLL)	No specific version
Executable for Windows NT	No specific version
Microsoft Project	Project 98 (Text only)
MSG	Microsoft Outlook mail format (Text only)

Format	Version
vCardElectronicBusinessCard	No specific version

## Unsupported Formats

Password protected documents and documents with password protected content are not supported by the Inso filter.

---

## Loading Examples

This appendix provides examples of how to load text into a text column. It also describes the structure of `ctxload` import files:

- [SQL INSERT Example](#)
- [SQL\\*Loader Example](#)
- [Structure of ctxload Thesaurus Import File](#)

## SQL INSERT Example

A simple way to populate a text table is to create a table with two columns, `id` and `text`, using `CREATE TABLE` and then use the `INSERT` statement to load the data. This example makes the `id` column the primary key, which is optional. The `text` column is `VARCHAR2`:

```
create table docs (id number primary key, text varchar2(80));
```

To populate the `text` column, use the `INSERT` statement as follows:

```
insert into docs values(1, 'this is the text of the first document');  
insert into docs values(12, 'this is the text of the second document');
```

## SQL\*Loader Example

The following example shows how to use SQL\*Loader to load mixed format documents from the operating system to a BLOB column. The example has two steps:

- create the table
- issue the SQL\*Loader command that reads control file and loads data into table

**See Also:** For a complete discussion on using SQL\*Loader, see Oracle9i Database Utilities

### Creating the Table

This example loads to a table `articles_formatted` created as follows:

```
CREATE TABLE articles_formatted (  
  ARTICLE_ID  NUMBER PRIMARY KEY ,  
  AUTHOR      VARCHAR2(30) ,  
  FORMAT      VARCHAR2(30) ,  
  PUB_DATE    DATE ,  
  TITLE       VARCHAR2(256) ,  
  TEXT        BLOB  
);
```

The `article_id` column is the primary key. Documents are loaded in the `text` column, which is of type BLOB.

### Issuing the SQL\*Loader Command

The following command starts the loader, which reads the control file `LOADER1.DAT`:

```
sqlldr userid=demo/demo control=loader1.dat log=loader.log
```

**Example Control File: loader1.dat**

This SQL\*Loader control file defines the columns to be loaded and instructs the loader to load the data line by line from loader2.dat into the articles\_formatted table. Each line in loader2.dat holds a comma separated list of fields to be loaded.

```
-- load file example
load data
infile 'loader2.dat'
into table articles_formatted
append
fields terminated by ','
(article_id sequence (max,1),
author char(30),
format,
pub_date sysdate,
title,
ext_fname filler char(80),
text lobfile(ext_fname) terminated by eof)
```

This control file instructs the loader to load data from loader2.dat to the articles\_formatted table in the following way:

1. The ordinal position of the line describing the document fields in loader2.dat is written to the article\_id column.
2. The first field on the line is written to author column.
3. The second field on the line is written to the format column.
4. The current date given by sysdate is written to the pub\_date column.
5. The title of the document, which is the third field on the line, is written to the title column.
6. The name of each document to be loaded is read into the ext\_fname temporary variable, and the actual document is loaded in the text BLOB column:

### Example Data File: loader2.dat

This file contains the data to be loaded into each row of the table, articles\_ formatted.

Each line contains a comma separated list of the fields to be loaded in articles\_ formatted. The last field of every line names the file to be loaded in to the text column:

```
Ben Kanobi, plaintext,Kawasaki news article,..../sample_docs/kawasaki.txt,
Joe Bloggs, plaintext,Java plug-in,..../sample_docs/javaplugin.txt,

```

## Structure of ctxload Thesaurus Import File

The import file must use the following format for entries in the thesaurus:

```
phrase
BT broader_term
NT narrower_term1
NT narrower_term2
. . .
NT narrower_termN

BTG broader_term
NTG narrower_term1
NTG narrower_term2
. . .
NTG narrower_termN

BTP broader_term
NTP narrower_term1
NTP narrower_term2
. . .
NTP narrower_termN

BTI broader_term
NTI narrower_term1
NTI narrower_term2
. . .
NTI narrower_termN

SYN synonym1
SYN synonym2
. . .
SYN synonymN

USE synonym1 or SEE synonym1 or PT synonym1

RT related_term1
RT related_term2
. . .
RT related_termN

SN text

language_key: term
```

**phrase**

is a word or phrase that is defined as having synonyms, broader terms, narrower terms, and/or related terms.

In compliance with ISO-2788 standards, a TT marker can be placed before a phrase to indicate that the phrase is the top term in a hierarchy; however, the TT marker is not required. In fact, ctxload ignores TT markers during import.

A top term is identified as any phrase that does not have a broader term (BT, BTG, BTP, or BTI).

---

**Note:** The thesaurus query operators (SYN, PT, BT, BTG, BTP, BTI, NT, NTG, NTP, NTI, and RT) are reserved words and, thus, cannot be used as phrases in thesaurus entries.

---

**BT, BTG, BTP, BTI broader\_termN**

are the markers that indicate broader\_termN is a broader (generic | partitive | instance) term for phrase.

broader\_termN is a word or phrase that conceptually provides a more general description or category for phrase. For example, the word *elephant* could have a broader term of *land mammal*.

**NT, NTG, NTP, NTI narrower\_termN**

are the markers that indicate narrower\_termN is a narrower (generic | partitive | instance) term for phrase.

If phrase does not have a broader (generic | partitive | instance) term, but has one or more narrower (generic | partitive | instance) terms, phrase is created as a top term in the respective hierarchy (in an Oracle Text thesaurus, the BT/NT, BTG/NTG, BTP/NTP, and BTI/NTI hierarchies are separate structures).

narrower\_termN is a word or phrase that conceptually provides a more specific description for phrase. For example, the word *elephant* could have a narrower terms of *indian elephant* and *african elephant*.

**SYN synonymN**

is a marker that indicates phrase and synonymN are synonyms within a synonym ring.

synonymN is a word or phrase that has the same meaning for phrase. For example, the word *dog* could have a synonym of *canine*.

---

---

**Note:** Synonym rings are not defined explicitly in Oracle Text thesauri. They are created by the transitive nature of synonyms.

---

---

### **USE SEE PT synonym1**

are markers that indicate phrase and synonym1 are synonyms within a synonym ring (similar to SYN).

The markers USE, SEE or PT also indicate synonym1 is the preferred term for the synonym ring. Any of these markers can be used to define the preferred term for a synonym ring.

### **RT related\_termN**

is the marker that indicates related\_termN is a related term for phrase.

related\_termN is a word or phrase that has a meaning related to, but not necessarily synonymous with phrase. For example, the word *dog* could have a related term of *wolf*.

---

---

**Note:** Related terms are not transitive. If a phrase has two or more related terms, the terms are related only to the parent phrase and not to each other.

---

---

### **SN text**

is the marker that indicates the following text is a scope note (i.e. comment) for the preceding entry.

### **language\_key term**

term is the translation of phrase into the language specified by language\_key.

## **Alternate Hierarchy Structure**

In compliance with thesauri standards, the load file supports formatting hierarchies (BT/NT, BTG/NTG, BTP, NTP, BTI/NTI) by indenting the terms under the top term and using NT (or NTG, NTP, NTI) markers that include the level for the term:

```
phrase
  NT1 narrower_term1
    NT2 narrower_term1.1
    NT2 narrower_term1.2
      NT3 narrower_term1.2.1
      NT3 narrower_term1.2.2
```

```

NT1 narrower_term2
. . .
NT1 narrower_termN

```

Using this method, the entire branch for a top term can be represented hierarchically in the load file.

## Usage Notes for Terms in Import Files

The following conditions apply to the structure of the entries in the import file:

- each entry (phrase, BT, NT, or SYN) must be on a single line followed by a newline character
- entries can consist of a single word or phrases
- the maximum length of an entry (phrase, BT, NT, or SYN) is 255 characters, not including the BT, NT, and SYN markers or the newline characters
- entries cannot contain parentheses or plus signs.
- each line of the file that starts with a relationship (BT, NT, etc.) must begin with at least one space
- a phrase can occur more than once in the file
- each phrase can have one or more narrower term entries (NT, NTG, NTP), broader term entries (BT, BTG, BTP), synonym entries, and related term entries
- each broader term, narrower term, synonym, and preferred term entry must start with the appropriate marker and the markers must be in capital letters
- the broader terms, narrower terms, and synonyms for a phrase can be in any order
- homographs must be followed by parenthetical disambiguators everywhere they are used

For example: cranes (birds), cranes (lifting equipment)

- compound terms are signified by a plus sign between each factor (e.g. buildings + construction)
- compound terms are allowed only as synonyms or preferred terms for other terms, never as terms by themselves, or in hierarchical relations.
- terms can be followed by a scope note (SN), total maximum length of 2000 characters, on subsequent lines

- multi-line scope notes are allowed, but require an SN marker on each line of the note

**Example of Incorrect SN usage:**

VIEW CAMERAS

SN Cameras with through-the lens focusing and a range of movements of the lens plane relative to the film plane

**Example of Correct SN usage:**

VIEW CAMERAS

SN Cameras with through-the lens focusing and a  
SN range of movements of the lens plane relative  
SN to the film plane

- Multi-word terms cannot start with reserved words (e.g. *use* is a reserved word, so *use other door* is not an allowed term; however, *use* is an allowed term)

## Usage Notes for Relationships in Import Files

The following conditions apply to the relationships defined for the entries in the import file:

- related term entries must follow a phrase or another related term entry
- related term entries start with one or more spaces, the RT marker, followed by white space, then the related term on the same line
- multiple related terms require multiple RT markers

**Example of incorrect RT usage:**

MOVING PICTURE CAMERAS

RT CINE CAMERAS

TELEVISION CAMERAS

**Example of correct RT usage:**

MOVING PICTURE CAMERAS

RT CINE CAMERAS

RT TELEVISION CAMERAS

- Terms are allowed to have multiple broader terms, narrower terms, and related terms

## Examples of Import Files

This section provides three examples of correctly formatted thesaurus import files.

### Example 1 (Flat Structure)

```
cat
  SYN feline
  NT domestic cat
  NT wild cat
  BT mammal
mammal
  BT animal
domestic cat
  NT Persian cat
  NT Siamese cat
wild cat
  NT tiger
tiger
  NT Bengal tiger
dog
  BT mammal
  NT domestic dog
  NT wild dog
  SYN canine
domestic dog
  NT German Shepard
wild dog
  NT Dingo
```

### Example 2 (Hierarchical)

```
animal
  NT1 mammal
    NT2 cat
      NT3 domestic cat
        NT4 Persian cat
        NT4 Siamese cat
      NT3 wild cat
        NT4 tiger
          NT5 Bengal tiger
    NT2 dog
      NT3 domestic dog
        NT4 German Shepard
      NT3 wild dog
```

NT4 Dingo

cat

SYN feline

dog

SYN canine

### Example 3

35MM CAMERAS

BT MINIATURE CAMERAS

CAMERAS

BT OPTICAL EQUIPMENT

NT MOVING PICTURE CAMERAS

NT STEREO CAMERAS

LAND CAMERAS

USE VIEW CAMERAS

VIEW CAMERAS

SN Cameras with through-the lens focusing and a range of  
SN movements of the lens plane relative to the film plane

UF LAND CAMERAS

BT STILL CAMERAS

---

## Supplied Stoplists

This appendix describes the default stoplists for all the different languages supported and list the stopwords in each. The following stoplists are described:

- [English Default Stoplist](#)
- [Danish \(dk\) Default Stoplist](#)
- [Dutch \(nl\) Default Stoplist](#)
- [Finnish \(sf\) Default Stoplist](#)
- [French \(f\) Default Stoplist](#)
- [German \(d\) Default Stoplist](#)
- [Italian \(i\) Default Stoplist](#)
- [Portuguese \(pt\) Default Stoplist](#)
- [Spanish \(e\) Default Stoplist](#)
- [Swedish \(s\) Default Stoplist](#)

# English Default Stoplist

The following English words are defined as stop words:

Stop word	Stop word	Stop word	Stop word	Stop word	Stop word	Stop word
a	be	had	it	only	she	was
about	because	has	its	of	some	we

de	hellre	ni	vem
dem	hon	nu	vems
den	hos	och	vi
denna	hur	oksa	vid
deras	i	om	vilken
dess	in	över	
det	ingen	på	
detta	innan	så	
du	inte	sådan	

---

# Alternate Spelling Conventions

This appendix describes the alternate spelling conventions that Oracle Text uses in the German, Danish, and Swedish languages. This chapter also describe how to enable alternate spelling.

The following topics are covered:

- [Overview](#)
- [German Alternate Spelling](#)
- [Danish Alternate Spelling](#)
- [Swedish Alternate Spelling](#)

## Overview

This chapter lists the alternate spelling conventions Oracle Text uses for German, Danish and Swedish. These languages contain words that have more than one accepted spelling.

When a language has more than one way of spelling a word, Oracle indexes the word in its basic form. For example in German, the basic form of the *ä* character is *ae*, and so words containing the *ä* character are indexed with *ae* as the substitution.

Oracle also converts query terms to their basic forms before lookup. As a result, users can query words with either spelling.

## Enabling Alternate Spelling

You enable alternate spelling by specifying either GERMAN, DANISH, or SWEDISH for the alternate spelling BASIC\_LEXER attribute. For example, to enable alternate spelling in German, you can issue the following statements:

```
begin
ctx_ddl.create_preference('GERMAN_LEX', 'BASIC_LEXER');
ctx_ddl.set_attribute('GERMAN_LEX', 'ALTERNATE_SPELLING', 'GERMAN');
end;
```

## Disabling Alternate Spelling

To disable alternate spelling, use the CTX\_DDL.UNSET\_ATTRIBUTE procedure as follows:

```
begin
ctx_ddl.unset_attribute('GERMAN_LEX', 'ALTERNATE_SPELLING');
end;
```

# German Alternate Spelling

The German alphabet is the English alphabet plus the additional characters: ä ö ü ß. The following table lists the alternate spelling conventions Oracle Text uses for these characters.

Character	Alternate Spelling Substitution
ä	ae
ü	ue
ö	oe
Ä	AE
Ü	UE
Ö	OE
ß	ss

## Danish Alternate Spelling

The Danish alphabet is the Latin alphabet without the *w*, plus the special characters: *ø æ å*. The following table lists the alternate spelling conventions Oracle Text uses for these characters.

Character	Alternate Spelling Substitution
æ	ae
ø	oe
å	aa
Æ	AE
Ø	OE
Å	AA

# Swedish Alternate Spelling

The Swedish alphabet is the English alphabet without the *w*, plus the additional characters: *å ä ö*. The following table lists the alternate spelling conventions Oracle Text uses for these characters.

Character	Alternate Spelling Substitution
ä	ae
å	aa
ö	oe
Ä	AE
Å	AA
Ö	OE

---

# Scoring Algorithm

This appendix describes the scoring algorithm for word queries. You obtain score using the SCORE operator.

---

**Note:** This appendix discusses how Oracle calculates score for word queries, which is different from the way it calculates score for ABOUT queries in English.

---

# Scoring Algorithm for Word Queries

To calculate a relevance score for a returned document in a word query, Oracle uses an inverse frequency algorithm based on Salton’s formula.

Inverse frequency scoring assumes that frequently occurring terms in a document set are noise terms, and so these terms are scored lower. For a document to score high, the query term must occur frequently in the document but infrequently in the document set as a whole.

The following table illustrates Oracle’s inverse frequency scoring. The first column shows the number of documents in the document set, and the second column shows the number of terms in the document necessary to score 100.

This table assumes that only one document in the set contains the query term.

Number of Documents in Document Set	Occurrences of Term in Document Needed to Score 100
1	34
5	20
10	17
50	13
100	12
500	10
1,000	9
10,000	7
100,000	5
1,000,000	4

The table illustrates that if only one document contained the query term and there were five documents in the set, the term would have to occur 20 times in the document to score 100. Whereas, if there were 1,000,000 documents in the set, the term would have to occur only 4 times in the document to score 100.

## Example

You have 5000 documents dealing with chemistry in which the term *chemical* occurs at least once in every document. The term *chemical* thus occurs frequently in the document set.

You have a document that contains 5 occurrences of *chemical* and 5 occurrences of the term *hydrogen*. No other document contains the term *hydrogen*. The term *hydrogen* thus occurs infrequently in the document set.

Because *chemical* occurs so frequently in the document set, its score for the document is lower with respect to *hydrogen*, which is infrequent in the document set as a whole. The score for *hydrogen* is therefore higher than that of *chemical*. This is so even though both terms occur 5 times in the document.

---

**Note:** Even if the relatively infrequent term *hydrogen* occurred 4 times in the document, and *chemical* occurred 5 times in the document, the score for *hydrogen* might still be higher, because *chemical* occurs so frequently in the document set (at least 5000 times).

---

Inverse frequency scoring also means that adding documents that contain *hydrogen* lowers the score for that term in the document, and adding more documents that do not contain *hydrogen* raises the score.

## DML and Scoring

Because the scoring algorithm is based on the number of documents in the document set, inserting, updating or deleting documents in the document set is likely to change the score for any given term before and after the DML.

If DML is heavy, you or your Oracle administrator must optimize the index. Perfect relevance ranking is obtained by executing a query right after optimizing the index.

If DML is light, Oracle still gives fairly accurate relevance ranking.

In either case, you or your Oracle administrator must synchronize the index either with `ALTER INDEX` or by running `ctxsrv` in the background.

**See Also:** For more information about ALTER INDEX, see [ALTER INDEX](#) in [Chapter 1](#).

For more information about `ctxsrv`, see "[Thesaurus Loader \(ctxload\)](#)" in [Chapter 11](#).

This appendix lists all of the views provided by Oracle Text. The system provides the following views:

- [CTX\\_CLASSES](#)
- [CTX\\_INDEXES](#)
- [CTX\\_INDEX\\_ERRORS](#)
- [CTX\\_INDEX\\_OBJECTS](#)
- [CTX\\_INDEX\\_PARTITIONS](#)
- [CTX\\_INDEX\\_SETS](#)
- [CTX\\_INDEX\\_SET\\_INDEXES](#)
- [CTX\\_INDEX\\_SUB\\_LEXERS](#)
- [CTX\\_INDEX\\_SUB\\_LEXER\\_VALUES](#)
- [CTX\\_INDEX\\_VALUES](#)
- [CTX\\_OBJECTS](#)
- [CTX\\_OBJECT\\_ATTRIBUTES](#)
- [CTX\\_OBJECT\\_ATTRIBUTE\\_LOV](#)
- [CTX\\_PARAMETERS](#)
- [CTX\\_PENDING](#)

## CTX\_CLASSES

This view displays all the preference categories registered in the Text data dictionary. It can be queried by any user.

Column Name	Type	Description
CLA_NAME	VARCHAR2(30)	Class name
CLA_DESCRIPTION	VARCHAR2(80)	Class description

## CTX\_INDEXES

This view displays all indexes that are registered in the Text data dictionary for the current user. It can be queried by CTXSYS.

Column Name	Type	Description
IDX_ID	NUMBER	Internal index id.
IDX_OWNER	VARCHAR2(30)	Owner of index.
IDX_NAME	VARCHAR2(30)	Name of index.
IDX_TABLE_OWNER	VARCHAR2(30)	Owner of table.
IDX_TABLE	VARCHAR2(30)	Table name.
IDX_KEY_NAME	VARCHAR2(256)	Primary key column(s).
IDX_TEXT_NAME	VARCHAR2(30)	Text column name.
IDX_DOCID_COUNT	NUMBER	Number of documents indexed.
IDX_STATUS	VARCHAR2(12)	Status.
IDX_LANGUAGE_COLUMN	VARCHAR2(256)	Name of the language column in base table.
IDX_FORMAT_COLUMN	VARCHAR2(256)	Name of the format column in base table.
IDX_CHARSET_COLUMN	VARCHAR2(256)	Name of the charset column in base table.

## CTX\_INDEX\_ERRORS

This view displays the DML errors and is queryable by CTXSYS.

Column Name	Type	Description
ERR_INDEX_OWNER	VARCHAR2(30)	Index owner.
ERR_INDEX_NAME	VARCHAR2(30)	Name of index.
ERR_TIMESTAMP	DATE	Time of error.
ERR_TEXTKEY	VARCHAR2(18)	ROWID of errored document or name of errored operation (i.e. ALTER INDEX)
ERR_TEXT	VARCHAR2(4000)	Error text.

## CTX\_INDEX\_OBJECTS

This view displays the objects that are used for each class in the index. It can be queried by CTXSYS.

Column Name	Type	Description
IXO_INDEX_OWNER	VARCHAR2(30)	Index owner.
IXO_INDEX_NAME	VARCHAR2(30)	Index name.
IXO_CLASS	VARCHAR2(30)	Class name.
IXO_OBJECT	VARCHAR2(30)	Object name.

## CTX\_INDEX\_PARTITIONS

This view displays all index partitions. It can be queried by CTXSYS.

Column Name	Type	Description
IXP_ID	NUMBER(38)	Index partition id.
IXP_INDEX_OWNER	VARCHAR2(30)	Index owner.
IXP_INDEX_NAME	VARCHAR2(30)	Index name.
IXP_INDEX_PARTITION_ NAME	VARCHAR2(30)	Index partition name.
IXP_TABLE_OWNER	VARCHAR2(30)	Table owner.
IXP_TABLE_NAME	VARCHAR2(30)	Table name.
IXP_TABLE_PARTITION_ NAME	VARCHAR2(30)	Table partition name.
IXP_DOCID_COUNT	NUMBER(38)	Number of documents associated with the partition.
IXP_STATUS	VARCHAR2(12)	Partition status.

## CTX\_INDEX\_SETS

This view displays all index set names. It can be queried by any user.

Column Name	Type	Description
IXS_OWNER	VARCHAR2(30)	Index set owner.
IXS_NAME	VARCHAR2(30)	Index set name.

## CTX\_INDEX\_SET\_INDEXES

This view displays all the sub-indexes in an index set. It can be queried by any user.

Column Name	Type	Description
IXX_INDEX_SET_OWNER	VARCHAR2(30)	Index set owner.
IXX_INDEX_SET_NAME	VARCHAR2(30)	Index set name.
IXX_COLLIST	VARCHAR2(500)	Column list of the sub-index.
IXX_STORAGE	VARCHAR2(500)	Storage clause of the sub-index.

## CTX\_INDEX\_SUB\_LEXERS

This view shows the sub-lexers for each language for each index. It can be queried by CTXSYS.

Column Name	Type	Description
ISL_INDEX_OWNER	VARCHAR2(30)	Index owner.
ISL_INDEX_NAME	VARCHAR2(30)	Index name.
ISL_LANGUAGE	VARCHAR2(30)	Language of sub-lexer
ISL_ALT_VALUE	VARCHAR2(30)	Alternate value of language.
ISL_OBJECT	VARCHAR2(30)	Name of lexer object used for this language.

# CTX\_INDEX\_SUB\_LEXER\_VALUES

Shows the sub-lexer attributes and their values. Accessible by CTXSYS.

Column Name	Type	Description
ISV_INDEX_OWNER	VARCHAR2(30)	Index owner.
ISV_INDEX_NAME	VARCHAR2(30)	Index name.
ISV_LANGUAGE	VARCHAR2(30)	Language of sub-lexer
ISV_OBJECT	VARCHAR2(30)	Name of lexer object used for this language.
ISV_ATTRIBUTE	VARCHAR2(30)	Name of sub-lexer attribute.
ISV_VALUE	VARCHAR2(500)	Value of attribute of sub-lexer.

## CTX\_INDEX\_VALUES

This view displays attribute values for each object used in indexes. This view is queryable by CTXSYS.

Column Name	Type	Description
IXV_INDEX_OWNER	VARCHAR2(30)	Index owner.
IXV_INDEX_NAME	VARCHAR2(30)	Index name.
IXV_CLASS	VARCHAR2(30)	Class name.
IXV_OBJECT	VARCHAR2(30)	Object name.
IXV_ATTRIBUTE	VARCHAR2(30)	Attribute name
IXV_VALUE	VARCHAR2(500)	Attribute value.

## CTX\_OBJECTS

This view displays all of the Text objects registered in the Text data dictionary. This view can be queried by any user.

Column Name	Type	Description
OBJ_CLASS	VARCHAR2(30)	Object class (Datastore, Filter, Lexer, etc.)
OBJ_NAME	VARCHAR2(30)	Object name
OBJ_DESCRIPTION	VARCHAR2(80)	Object description

## CTX\_OBJECT\_ATTRIBUTES

This view displays the attributes that can be assigned to preferences of each object. It can be queried by all users.

Column Name	Type	Description
OAT_CLASS	VARCHAR2(30)	Object class (Data Store, Filter, Lexer, etc.)
OAT_OBJECT	VARCHAR2(30)	Object name
OAT_ATTRIBUTE	VARCHAR2(64)	Attribute name
OAT_DESCRIPTION	VARCHAR2(80)	Description of attribute
OAT_REQUIRED	VARCHAR2(1)	Required attribute, either Y or N.
OAT_STATIC	VARCHAR2(1)	Not currently used.
OAT_DATATYPE	VARCHAR2(64)	Attribute datatype
OAT_DEFAULT	VARCHAR2(500)	Default value for attribute
OAT_MIN	NUMBER	Minimum value.
OAT_MAX	NUMBER	Maximum value.
OAT_MAX_LENGTH	NUMBER	Maximum length.

## CTX\_OBJECT\_ATTRIBUTE\_LOV

This view displays the allowed values for certain object attributes provided by Oracle Text. It can be queried by all users.

Column Name	Type	Description
OAL_CLASS	NUMBER(38)	Class of object.
OAL_OBJECT	VARCHAR2(30)	Object name.
OAL_ATTRIBUTE	VARCHAR2(32)	Attribute name.
OAI_LABEL	VARCHAR2(30)	Attribute value label.
OAL_VALUE	VARCHAR2(64)	Attribute value.
OAL_DESCRIPTION	VARCHAR2(80)	Attribute value description.

## CTX\_PARAMETERS

This view displays all system-defined parameters as defined by CTXSYS. It can be queried by any user.

Column Name	Type	Description
PAR_NAME	VARCHAR2(30)	Parameter name: <ul style="list-style-type: none"><li>max_index_memory</li><li>ctx_doc_key_type</li><li>default_index_memory</li><li>default_datastore</li><li>default_filter_binary</li><li>default_filter_text</li><li>default_filter_file</li><li>default_section_html</li><li>default_section_xml</li><li>default_section_text</li><li>default_lexer</li><li>default_stoplist</li><li>default_storage</li><li>default_wordlist</li><li>default_ctxcat_lexer</li><li>default_ctxcat_index_set</li><li>default_ctxcat_stoplist</li><li>default_ctxcat_storage</li><li>default_ctxcat_wordlist</li><li>default_ctxrule_lexer</li><li>default_ctxrule_stoplist</li><li>default_ctxrule_storage</li><li>default_ctxrule_wordlist</li><li>log_directory</li><li>file_access_role</li></ul>
PAR_VALUE	VARCHAR2(500)	Parameter value. For max_index_memory and default_index_memory, PAR_VALUE stores a string consisting of the memory amount. For the other parameter names, PAR_VALUE stores the names of the preferences used as defaults for index creation.

## CTX\_PENDING

This view displays a row for each of the user's entries in the DML Queue. It can be queried by CTXSYS.

Column Name	Type	Description
PND_INDEX_OWNER	VARCHAR2(30)	Index owner.
PND_INDEX_NAME	VARCHAR2(30)	Name of index.
PND_PARTITION_NAME	VARCHAR2(30)	Name of partition for local partition indexes. NULL for normal indexes.
PND_ROWID	ROWID	ROWID to be indexed
PND_TIMESTAMP	DATE	Time of modification

## CTX\_PREFERENCES

This view displays preferences created by Oracle Text users, as well as all the system-defined preferences included with Oracle Text. The view contains one row for each preference. It can be queried by all users.

Column Name	Type	Description
PRE_OWNER	VARCHAR2(30)	Username of preference owner.
PRE_NAME	VARCHAR2(30)	Preference name.
PRE_CLASS	VARCHAR2(30)	Preference class.
PRE_OBJECT	VARCHAR2(30)	Object used.

## CTX\_PREFERENCE\_VALUES

This view displays the values assigned to all the preferences in the Text data dictionary. The view contains one row for each value. It can be queried by all users.

Column Name	Type	Description
PRV_OWNER	VARCHAR2(30)	Username of preference owner.
PRV_PREFERENCE	VARCHAR2(30)	Preference name.
PRV_ATTRIBUTE	VARCHAR2(64)	Attribute name
PRV_VALUE	VARCHAR2(500)	Attribute value

## CTX\_SECTIONS

This view displays information about all the sections that have been created in the Text data dictionary. It can be queried by any user.

Column Name	Type	Description
SEC_OWNER	VARCHAR2(30)	Owner of the section group.
SEC_SECTION_GROUP	VARCHAR2(30)	Name of the section group.
SEC_TYPE	VARCHAR2(30)	Type of section, either ZONE, FIELD, SPECIAL, ATTR, STOP.
SEC_ID	NUMBER	Section id.
SEC_NAME	VARCHAR2(30)	Name of section.
SEC_TAG	VARCHAR2(64)	Section tag
SEC_VISIBLE	VARCHAR2(1)	Y or N visible indicator for field sections only.

## CTX\_SECTION\_GROUPS

This view displays information about all the section groups that have been created in the Text data dictionary. It can be queried by any user.

Column Name	Type	Description
SGP_OWNER	VARCHAR2(30)	Owner of section group.
SGP_NAME	VARCHAR2(30)	Name of section group.
SGP_TYPE	VARCHAR2(30)	Type of section group

## CTX\_SERVERS

This view displays `ctxsrv` servers that are currently active. It can be queried only by CTXSYS.

Column Name	Type	Description
SER_NAME	VARCHAR2(60)	Server identifier
SER_STATUS	VARCHAR2(8)	Server status (IDLE, RUN, EXIT)
SER_ADMMBX	VARCHAR2(60)	Admin pipe mailbox name for server.
SER_OOBMBX	VARCHAR2(60)	Out-of-band mailbox name for server.
SER_SESSION	NUMBER	No Longer Used
SER_AUDSID	NUMBER	Server audit session ID
SER_DBID	NUMBER	Server database ID
SER_PROCID	VARCHAR2(10)	No Longer Used
SER_PERSON_MASK	VARCHAR2(30)	Personality mask for server
SER_STARTED_AT	DATE	Date on which server was started
SER_IDLE_TIME	NUMBER	Idle time, in seconds, for server
SER_DB_INSTANCE	VARCHAR2(10)	Database instance ID
SER_MACHINE	VARCHAR2(64)	Name of host machine on which server is running

## CTX\_SQES

This view displays the definitions for all SQEs that have been created by users. It can be queried by all users.

Column Name	Type	Description
SQE_OWNER	VARCHAR2(30)	Owner of SQE.
SQE_NAME	VARCHAR2(30)	Name of SQE.
SQE_QUERY	VARCHAR2(2000)	Query Text

## CTX\_STOPLISTS

This view displays stoplists. Queryable by all users.

Column Name	Type	Description
SPL_OWNER	VARCHAR2(30)	Owner of stoplist.
SPL_NAME	VARCHAR2(30)	Name of stoplist.
SPL_COUNT	NUMBER	Number of stopwords
SPL_TYPE	VARCHAR2(30)	Type of stoplist, MULTI or BASIC.

## CTX\_STOPWORDS

This view displays the stopwords in each stoplist. Queryable by all users.

Column Name	Type	Description
SPW_OWNER	VARCHAR2(30)	Stoplist owner.
SPW_STOPLIST	VARCHAR2(30)	Stoplist name.
SPW_TYPE	VARCHAR2(10)	Stop type, either STOP_WORD, STOP_CLASS, STOP_THEME.
SPW_WORD	VARCHAR2(80)	Stopword.
SPW_LANGUAGE	VARCHAR2(30)	Stopword language.

## CTX\_SUB\_LEXERS

This view contains information on multi-lexers and the sub-lexer preferences they contain. It can be queried by any user.

Column Name	Type	Description
SLX_OWNER	VARCHAR2(30)	Owner of the multi-lexer preference.
SLX_NAME	VARCHAR2(30)	Name of the multi-lexer preference.
SLX_LANGUAGE	VARCHAR2(30)	Language of the referenced lexer (full name, not abbreviation).
SLX_ALT_VALUE	VARCHAR2(30)	An alternate value for the language.
SLX_SUB_OWNER	VARCHAR2(30)	Owner of the sub-lexer.
SLX_SUB_NAME	VARCHAR2(30)	Name of the sub-lexer.

## CTX\_THESAURI

This view displays information about all the thesauri that have been created in the Text data dictionary. It can be queried by any user.

Column Name	Type	Description
THS_OWNER	VARCHAR2(30)	Thesaurus owner
THS_NAME	VARCHAR2(30)	Thesaurus name

## CTX\_THES\_PHRASES

This view displays phrase information for all thesauri in the Text data dictionary. It can be queried by any user.

Column Name	Type	Description
THP_THESAURUS	VARCHAR2(30)	Thesaurus name.
THP_PHRASE	VARCHAR2(256)	Thesaurus phrase.
THP_QUALIFIER	VARCHAR2(256)	Thesaurus qualifier.
THP_SCOPE_NOTE	VARCHAR2(2000)	Thesaurus scope notes.

## CTX\_USER\_INDEXES

This view displays all indexes that are registered in the Text data dictionary for the current user. It can be queried by all users.

Column Name	Type	Description
IDX_ID	NUMBER	Internal index id.
IDX_NAME	VARCHAR2(30)	Name of index.
IDX_TYPE	VARCHAR2(30)	Type of index: CONTEXT, CTXCAT, OR CTXRULE
IDX_TABLE_OWNER	VARCHAR2(30)	Owner of table.
IDX_TABLE	VARCHAR2(30)	Table name.
IDX_KEY_NAME	VARCHAR2(256)	Primary key column(s).
IDX_TEXT_NAME	VARCHAR2(30)	Text column name.
IDX_DOCID_COUNT	NUMBER	Number of documents indexed.
IDX_STATUS	VARCHAR2(12)	Status, either INDEXED or INDEXING.
IDX_LANGUAGE_COLUMN	VARCHAR2(256)	Name of the language column of base table.
IDX_FORMAT_COLUMN	VARCHAR2(256)	Name of the format column of base table.
IDX_CHARSET_COLUMN	VARCHAR2(256)	Name of the charset column of base table.

## CTX\_USER\_INDEX\_ERRORS

This view displays the indexing errors for the current user and is queryable by all users.

Column Name	Type	Description
ERR_INDEX_NAME	VARCHAR2(30)	Name of index.
ERR_TIMESTAMP	DATE	Time of error.
ERR_TEXTKEY	VARCHAR2(18)	ROWID of errored document or name of errored operation (i.e. ALTER INDEX)
ERR_TEXT	VARCHAR2(4000)	Error text.

## CTX\_USER\_INDEX\_OBJECTS

This view displays the preferences that are attached to the indexes defined for the current user. It can be queried by all users.

Column Name	Type	Description
IXO_INDEX_NAME	VARCHAR2(30)	Name of index.
IXO_CLASS	VARCHAR2(30)	Object name
IXO_OBJECT	VARCHAR2(80)	Object description

## CTX\_USER\_INDEX\_PARTITIONS

This view displays all index partitions for the current user. It is queryable by all users.

Column Name	Type	Description
IXP_ID	NUMBER(38)	Index partition id.
IXP_INDEX_NAME	VARCHAR2(30)	Index name.
IXP_INDEX_PARTITION_NAME	VARCHAR2(30)	Index partition name.
IXP_TABLE_OWNER	VARCHAR2(30)	Table owner.
IXP_TABLE_NAME	VARCHAR2(30)	Table name.
IXP_TABLE_PARTITION_NAME	VARCHAR2(30)	Table partition name.
IXP_DOCID_COUNT	NUMBER(38)	Number of documents associated with the index partition.
IXP_STATUS	VARCHAR2(12)	Partition status.

## CTX\_USER\_INDEX\_SETS

This view displays all index set names that belong to the current user. It is queryable by all users.

Column Name	Type	Description
IXS_NAME	VARCHAR2(30)	Index set name.

## CTX\_USER\_INDEX\_SET\_INDEXES

This view displays all the indexes in an index set that belong to the current user. It is queryable by all users.

Column Name	Type	Description
IXX_INDEX_SET_NAME	VARCHAR2(30)	Index set name.
IXX_COLLIST	VARCHAR2(500)	Column list of the index.
IXX_STORAGE	VARCHAR2(500)	Storage clause of the index.

## CTX\_USER\_INDEX\_SUB\_LEXERS

This view shows the sub-lexers for each language for each index for the querying user. This view can be queried by all users.

Column Name	Type	Description
ISL_INDEX_NAME	VARCHAR2(30)	Index name.
ISL_LANGUAGE	VARCHAR2(30)	Language of sub-lexer
ISL_ALT_VALUE	VARCHAR2(30)	Alternate value of language.
ISL_OBJECT	VARCHAR2(30)	Name of lexer object used for this language.

## CTX\_USER\_INDEX\_SUB\_LEXER\_VALS

Shows the sub-lexer attributes and their values for the querying user. This view can be queried by all users.

Column Name	Type	Description
ISV_INDEX_NAME	VARCHAR2(30)	Index name.
ISV_LANGUAGE	VARCHAR2(30)	Language of sub-lexer
ISV_OBJECT	VARCHAR2(30)	Name of lexer object used for this language.
ISV_ATTRIBUTE	VARCHAR2(30)	Name of sub-lexer attribute.
ISV_VALUE	VARCHAR2(500)	Value of sub-lexer attribute.

## CTX\_USER\_INDEX\_VALUES

This view displays attribute values for each object used in indexes for the current user. This view is queryable by all users.

Column Name	Type	Description
IXV_INDEX_NAME	VARCHAR2(30)	Index name.
IXV_CLASS	VARCHAR2(30)	Class name.
IXV_OBJECT	VARCHAR2(30)	Object name.
IXV_ATTRIBUTE	VARCHAR2(30)	Attribute name
IXV_VALUE	VARCHAR2(500)	Attribute value.

## CTX\_USER\_PENDING

This view displays a row for each of the user's entries in the DML Queue. It can be queried by all users.

Column Name	Type	Description
PND_INDEX_NAME	VARCHAR2(30)	Name of index.
PND_PARTITION_NAME	VARCHAR2(30)	Name of partition for local partition indexes. NULL for normal indexes.
PND_ROWID	ROWID	Rowid to be indexed.
PND_TIMESTAMP	DATE	Time of modification.

## CTX\_USER\_PREFERENCES

This view displays all preferences defined by the current user. It can be queried by all users.

Column Name	Type	Description
PRE_NAME	VARCHAR2(30)	Preference name.
PRE_CLASS	VARCHAR2(30)	Preference class.
PRE_OBJECT	VARCHAR2(30)	Object used.

## CTX\_USER\_PREFERENCE\_VALUES

This view displays all the values for preferences defined by the current user. It can be queried by all users.

Column Name	Type	Description
PRV_PREFERENCE	VARCHAR2(30)	Preference name.
PRV_ATTRIBUTE	VARCHAR2(64)	Attribute name
PRV_VALUE	VARCHAR2(500)	Attribute value

## CTX\_USER\_SECTIONS

This view displays information about the sections that have been created in the Text data dictionary for the current user. It can be queried by all users.

Column Name	Type	Description
SEC__SECTION_GROUP	VARCHAR2(30)	Name of the section group.
SEC_TYPE	VARCHAR2(30)	Type of section, either ZONE, FIELD, SPECIAL, STOP, or ATTR.
SEC_ID	NUMBER	Section id.
SEC_NAME	VARCHAR2(30)	Name of section.
SEC_TAG	VARCHAR2(64)	Section tag
SEC_VISIBLE	VARCHAR2(1)	Y or N visible indicator for field sections.

## CTX\_USER\_SECTION\_GROUPS

This view displays information about the section groups that have been created in the Text data dictionary for the current user. It can be queried by all users.

Column Name	Type	Description
SGP_NAME	VARCHAR2(30)	Name of section group.
SGP_TYPE	VARCHAR2(30)	Type of section group

## CTX\_USER\_SQES

This view displays the definitions for all system and session SQEs that have been created by the current user. It can be viewed by all users.

Column Name	Type	Description
SQE_OWNER	VARCHAR2(30)	Owner of SQE.
SQE_NAME	VARCHAR2(30)	Name of SQE.
SQE_QUERY	VARCHAR2(2000)	Query Text

## CTX\_USER\_STOPLISTS

This view displays stoplists for current user. It is queryable by all users.

Column Name	Type	Description
SPL_NAME	VARCHAR2(30)	Name of stoplist.
SPL_COUNT	NUMBER	Number of stopwords
SPL_TYPE	VARCHAR2(30)	Type of stoplist, MULTI or BASIC.

## CTX\_USER\_STOPWORDS

This view displays stopwords in each stoplist for current user. Queryable by all users.

Column Name	Type	Description
SPW_STOPLIST	VARCHAR2(30)	Stoplist name.
SPW_TYPE	VARCHAR2(10)	Stop type, either STOP_WORD, STOP_CLASS, STOP_THEME.
SPW_WORD	VARCHAR2(80)	Stopword.
SPW_LANGUAGE	VARCHAR2(30)	Stopword language.

## CTX\_USER\_SUB\_LEXERS

For the current user, this view contains information on multi-lexers and the sub-lexer preferences they contain. It can be queried by any user.

Column Name	Type	Description
SLX_NAME	VARCHAR2(30)	Name of the multi-lexer preference.
SLX_LANGUAGE	VARCHAR2(30)	Language of the referenced lexer (full name, not abbreviation).
SLX_ALT_VALUE	VARCHAR2(30)	An alternate value for the language.
SLX_SUB_OWNER	VARCHAR2(30)	Owner of the sub-lexer.
SLX_SUB_NAME	VARCHAR2(30)	Name of the sub-lexer.

## CTX\_USER\_THESAURI

This view displays the information about all of the thesauri that have been created in the system by the current user. It can be viewed by all users.

Column Name	Type	Description
THS_NAME	VARCHAR2(30)	Thesaurus name

## CTX\_USER\_THES\_PHRASES

This view displays the phrase information of all thesaurus owned by the current user. It can be queried by all users.

Column Name	Type	Description
THP_THESAURUS	VARCHAR2(30)	Thesaurus name.
THP_PHRASE	VARCHAR2(256)	Thesaurus phrase.
THP_QUALIFIER	VARCHAR2(256)	Phrase qualifier.
THP_SCOPE_NOTE	VARCHAR2(2000)	Scope note of the phrase.

# CTX\_VERSION

This view displays the ctxsys data dictionary and code version number information.

Column Name	Type	Description
VER_DICT	CHAR(9)	The CTXSYS data dictionary version number.
VER_CODE	VARCHAR2(9)	<p>The version number of the code linked in to the Oracle shadow process.</p> <p>This column calls out to a trusted callout to fetch the version number for linked-in code. Thus, you can use this column to detect and verify patch releases.</p>

---

# Stopword Transformations

This appendix describes stopwords transformations. The following topic is covered:

- [Understanding Stopword Transformations](#)

## Understanding Stopword Transformations

When you use a stopword or stopword-only phrase as an operand for a query operator, Oracle rewrites the expression to eliminate the stopword or stopword-only phrase and then executes the query.

The following section describes the stopword rewrites or transformations for each operator. In all tables, the *Stopword Expression* column describes the query expression or component of a query expression, while the right-hand column describes the way Oracle rewrites the query.

The token *stopword* stands for a single stopword or a stopword-only phrase.

The token *non\_stopword* stands for either a single non-stopword, a phrase of all non-stopwords, or a phrase of non-stopwords and stopwords.

The token *no\_lex* stands for a single character or a string of characters that is neither a stopword nor a word that is indexed. For example, the + character by itself is an example of a *no\_lex* token.

When the *Stopword Expression* column completely describes the query expression, a rewritten expression of *no\_token* means that no hits are returned when you enter such a query.

When the *Stopword Expression* column describes a component of a query expression with more than one operator, a rewritten expression of *no\_token* means that a *no\_token* value is passed to the next step of the rewrite.

Transformations that contain a *no\_token* as an operand in the *Stopword Expression* column describe intermediate transformations in which the *no\_token* is a result of a previous transformation. These intermediate transformations apply when the original query expression has at least one stopword and more than one operator.

For example, consider the following compound query expression:

```
'(this NOT dog) AND cat'
```

Assuming that *this* is the only stopword in this expression, Oracle applies the following transformations in the following order:

stopword NOT non-stopword => no\_token

no\_token AND non\_stopword => non\_stopword

The resulting expression is:

```
'cat'
```

## Word Transformations

Stopword Expression	Rewritten Expression
stopword	no_token
no_lex	no_token

The first transformation means that a stopwords or stopwords-only phrase by itself in a query expression results in no hits.

The second transformation says that a term that is not lexed, such as the + character, results in no hits.

## AND Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> AND <i>stopword</i>	non_stopword
<i>non_stopword</i> AND <i>no_token</i>	non_stopword
<i>stopword</i> AND <i>non_stopword</i>	non_stopword
<i>no_token</i> AND <i>non_stopword</i>	non_stopword
<i>stopword</i> AND <i>stopword</i>	no_token
<i>no_token</i> AND <i>stopword</i>	no_token
<i>stopword</i> AND <i>no_token</i>	no_token
<i>no_token</i> AND <i>no_token</i>	no_token

## OR Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> OR <i>stopword</i>	non_stopword
<i>non_stopword</i> OR <i>no_token</i>	non_stopword
<i>stopword</i> OR <i>non_stopword</i>	non_stopword
<i>no_token</i> OR <i>non_stopword</i>	non_stopword

Stopword Expression	Rewritten Expression
<i>stopword</i> OR <i>stopword</i>	no_token
<i>no_token</i> OR <i>stopword</i>	no_token
<i>stopword</i> OR <i>no_token</i>	no_token
<i>no_token</i> OR <i>no_token</i>	no_token

ACCUMulate Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> ACCUM <i>stopword</i>	non_stopword
<i>non_stopword</i> ACCUM <i>no_token</i>	non_stopword
<i>stopword</i> ACCUM <i>non_stopword</i>	non_stopword
<i>no_token</i> ACCUM <i>non_stopword</i>	non_stopword
<i>stopword</i> ACCUM <i>stopword</i>	no_token
<i>no_token</i> ACCUM <i>stopword</i>	no_token
<i>stopword</i> ACCUM <i>no_token</i>	no_token
<i>no_token</i> ACCUM <i>no_token</i>	no_token

### MINUS Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> MINUS <i>stopword</i>	<i>non_stopword</i>
<i>non_stopword</i> MINUS <i>no_token</i>	<i>non_stopword</i>
<i>stopword</i> MINUS <i>non_stopword</i>	<i>no_token</i>
<i>no_token</i> MINUS <i>non_stopword</i>	<i>no_token</i>
<i>stopword</i> MINUS <i>stopword</i>	<i>no_token</i>
<i>no_token</i> MINUS <i>stopword</i>	<i>no_token</i>
<i>stopword</i> MINUS <i>no_token</i>	<i>no_token</i>
<i>no_token</i> MINUS <i>no_token</i>	<i>no_token</i>

### NOT Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> NOT <i>stopword</i>	<i>non_stopword</i>
<i>non_stopword</i> NOT <i>no_token</i>	<i>non_stopword</i>
<i>stopword</i> NOT <i>non_stopword</i>	<i>no_token</i>
<i>no_token</i> NOT <i>non_stopword</i>	<i>no_token</i>
<i>stopword</i> NOT <i>stopword</i>	<i>no_token</i>
<i>no_token</i> NOT <i>stopword</i>	<i>no_token</i>
<i>stopword</i> NOT <i>no_token</i>	<i>no_token</i>
<i>no_token</i> NOT <i>no_token</i>	<i>no_token</i>

## EQUIValence Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> EQUIV <i>stopword</i>	<i>non_stopword</i>
<i>non_stopword</i> EQUIV <i>no_token</i>	<i>non_stopword</i>
<i>stopword</i> EQUIV <i>non_stopword</i>	<i>non_stopword</i>
<i>no_token</i> EQUIV <i>non_stopword</i>	<i>non_stopword</i>
<i>stopword</i> EQUIV <i>stopword</i>	<i>no_token</i>
<i>no_token</i> EQUIV <i>stopword</i>	<i>no_token</i>
<i>stopword</i> EQUIV <i>no_token</i>	<i>no_token</i>
<i>no_token</i> EQUIV <i>no_token</i>	<i>no_token</i>

**Note:** When you use query explain plan, not all of the equivalence transformations are represented in the EXPLAIN table.

## NEAR Transformations

Stopword Expression	Rewritten Expression
<i>non_stopword</i> NEAR <i>stopword</i>	<i>non_stopword</i>
<i>non_stopword</i> NEAR <i>no_token</i>	<i>non_stopword</i>
<i>stopword</i> NEAR <i>non_stopword</i>	<i>non_stopword</i>
<i>no_token</i> NEAR <i>non_stopword</i>	<i>non_stopword</i>
<i>stopword</i> NEAR <i>stopword</i>	<i>no_token</i>
<i>no_token</i> NEAR <i>stopword</i>	<i>no_token</i>
<i>stopword</i> NEAR <i>no_token</i>	<i>no_token</i>
<i>no_token</i> NEAR <i>no_token</i>	<i>no_token</i>

### Weight Transformations

Stopword Expression	Rewritten Expression
<i>stopword</i> * n	no_token
<i>no_token</i> * n	no_token

### Threshold Transformations

Stopword Expression	Rewritten Expression
<i>stopword</i> > n	no_token
<i>no_token</i> > n	no_token

### WITHIN Transformations

Stopword Expression	Rewritten Expression
<i>stopword</i> WITHIN <i>section</i>	no_token
<i>no_token</i> WITHIN <i>section</i>	no_token

---

# English Knowledge Base Category Hierarchy

This appendix provides a list of all the concepts in the knowledge base that serve as categories.

The appendix is divided into six sections, corresponding to the six main branches of the knowledge base:

- [Branch 1: science and technology](#)
- [Branch 2: business and economics](#)
- [Branch 3: government and military](#)
- [Branch 4: social environment](#)
- [Branch 5: geography](#)
- [Branch 6: abstract ideas and concepts](#)

The categories are presented in an inverted-tree hierarchy and within each category, sub-categories are listed in alphabetical order.

---

**Note:** This appendix does not contain all the concepts found in the knowledge base. It only contains those concepts that serve as categories (meaning they are parent nodes in the hierarchy).

---

## Branch 1: science and technology

### [1] communications

- [2] **journalism**
  - [3] broadcast journalism
  - [3] photojournalism
  - [3] print journalism
  - [4] newspapers
- [2] **public speaking**
- [2] **publishing industry**
  - [3] desktop publishing
  - [3] periodicals
  - [4] business publications
  - [3] printing
- [2] **telecommunications industry**
  - [3] computer networking
    - [4] Internet technology
    - [5] Internet providers
    - [5] Web browsers
    - [5] search engines
  - [3] data transmission
  - [3] fiber optics
  - [3] telephone service

### [1] formal education

- [2] **colleges and universities**
  - [3] academic degrees
  - [3] business education
- [2] **curricula and methods**
- [2] **library science**
- [2] **reference books**
- [2] **schools**
- [2] **teachers and students**

### [1] hard sciences

- [2] **aerospace industry**
  - [3] satellite technology
  - [3] space exploration
    - [4] Mars exploration
    - [4] lunar exploration
    - [4] space explorers
    - [4] spacecraft and space stations
- [2] **chemical industry**
  - [3] chemical adhesives
  - [3] chemical dyes

- [3] chemical engineering
- [3] materials technology
  - [4] industrial ceramics
  - [4] metal industry
  - [5] aluminum industry
  - [5] metallurgy
  - [5] steel industry
- [4] plastics
- [4] rubber
- [4] synthetic textiles
- [3] paints and finishing materials
- [3] pesticides
  - [4] fungicides
  - [4] herbicides

### [2] chemistry

- [3] chemical properties
- [3] chemical reactions
- [3] chemicals
  - [4] chemical acids
  - [4] chemical elements
  - [4] molecular reactivity
  - [4] molecular structure
- [3] chemistry tools
  - [4] chemical analysis
  - [4] chemistry glassware
  - [4] purification and isolation of

chemicals

- [3] epistemology
- [3] ethics and aesthetics
- [3] metaphysics
- [3] philosophical logic
- [3] schools of philosophy

**[2] religion**

- [3] God and divinity
- [3] doctrines and practices
- [3] history of religion
- [3] religious institutions and structures
- [3] sacred texts and objects
  - [4] Bible
  - [4] liturgical garments
- [3] world religions
  - [4] Christianity
    - [5] Christian denominations
    - [5] Christian heresies
    - [5] Christian theology
    - [5] Mormonism
    - [5] Roman Catholicism
      - [6] popes
      - [6] religious orders
    - [5] evangelism
    - [5] protestant reformation
  - [4] Islam
  - [4] Judaism
  - [4] eastern religions
    - [5] Buddhism

- [5] Hinduism
- [6] Hindu deities

## [1] clothing and appearance

### [2] clothing

- [3] clothing accessories
  - [4] belts
  - [4] functional accessories
  - [4] gloves
- [3] fabrics
  - [4] laces
  - [4] leather and fur
- [3] footwear
- [3] garment parts
  - [4] garment fasteners
  - [4] garment trim
- [3] headgear
  - [4] hats
  - [4] helmets
- [3] laundry
- [3] neckwear
- [3] outer garments
  - [4] dresses
  - [4] formalwear
  - [4] jackets
  - [4] pants
  - [4] shirts
  - [4] skirts
  - [4] sporting wear
  - [4] sweaters
- [3] sewing
- [3] undergarments
  - [4] deshabelle
  - [4] hosiery
  - [4] lingerie
  - [4] men's underwear

### [2] cosmetics

- [3] facial hair
- [3] hair styling

### [2] fashion industry

- [3] supermodels

### [2] grooming

- [3] grooming aids

### [2] jewelry

## [1] emergency services

### [2] emergency dispatch

- [2] emergency medical services
- [2] fire prevention and suppression
- [2] hazardous material control
- [2] heavy rescue

## [1] family

- [2] death and burial
  - [3] funeral industry
- [2] divorce
- [2] infancy
- [2] kinship and ancestry
- [2] marriage
- [2] pregnancy
  - [3] contraception
- [2] upbringing

## [1] food and agriculture

- [2] agribusiness
- [2] agricultural equipment
- [2] agricultural technology
  - [3] soil management
    - [4] fertilizers
- [2] aquaculture
- [2] cereals
- [2] condiments
- [2] crop grain
- [2] dairy products
  - [3] cheeses
- [2] drinking and dining
  - [3] alcoholic beverages
    - [4] beers
    - [4] liqueurs
    - [4] liquors
    - [4] mixed drinks
    - [4] wines
      - [5] wineries
  - [3] cooking
  - [3] meals and dishes
    - [4] sandwiches
  - [3] non-alcoholic beverages
    - [4] coffee
    - [4] soft drinks
    - [4] tea
- [2] farming
- [2] fats and oils
  - [3] butter and margarine
- [2] food and drink industry

- [3] foodservice industry
- [3] meat packing industry
- [2] **forestry**
  - [3] forest products
- [2] **fruits and vegetables**
  - [3] legumes
- [2] **leavening agents**
- [2] **mariculture**
- [2] **meats**
  - [3] beef
  - [3] pate and sausages
  - [3] pork
  - [3] poultry
- [2] **nuts and seeds**
- [2] **pasta**
- [2] **prepared foods**
  - [3] breads
  - [3] candies
  - [3] crackers
  - [3] desserts
    - [4] cakes
    - [4] cookies
    - [4] pies
  - [3] pastries
  - [3] sauces
  - [3] soups and stews
- [2] **ranching**
- [2] **seafood**
- [2] **spices and flavorings**
  - [3] sweeteners

## [1] housekeeping and butlery

### [1] housewares

- [2] **beds**
- [2] **candles**
- [2] **carpets and rugs**
- [2] **cases, cabinets, and chests**
- [2] **chairs and sofas**
- [2] **curtains, drapes, and screens**

    - [4] NASCAR racing
    - [4] drag racing
    - [4] motorcycle racing
    - [4] off-road racing
  - [3] soccer
  - [3] sports equipment
  - [3] tennis
  - [3] track and field
  - [3] winter sports
    - [4] hockey
    - [4] ice skating
    - [4] skiing
- [2] **tobacco industry**
- [2] **toys**

## Branch 5: geography

### [1] cartography

#### [2] explorers

### [1] physical geography

#### [2] bodies of water

- [3] lakes
- [3] oceans
- [3] rivers

#### [2] land forms

- [3] coastlands
- [3] continents
- [3] deserts
- [3] highlands
- [3] islands
- [3] lowlands
- [3] mountains
- [3] wetlands

### [1] political geography

#### [2] Africa

- [3] Central Africa
  - [4] Angola
  - [4] Burundi
  - [4] Central African Republic
  - [4] Congo
  - [4] Gabon
  - [4] Kenya
  - [4] Malawi
  - [4] Rwanda
  - [4] Tanzania
  - [4] Uganda
  - [4] Zaire
  - [4] Zambia
- [3] North Africa
  - [4] Algeria
  - [4] Chad
  - [4] Djibouti
  - [4] Egypt
  - [4] Ethiopia
  - [4] Libya
  - [4] Morocco
  - [4] Somalia
  - [4] Sudan

- [4] Tunisia
- [3] Southern Africa
  - [4] Botswana
  - [4] Lesotho
  - [4] Mozambique
  - [4] Namibia
  - [4] South Africa
  - [4] Swaziland
  - [4] Zimbabwe
- [3] West Africa
  - [4] Benin
  - [4] Burkina Faso
  - [4] Cameroon
  - [4] Equatorial Guinea
  - [4] Gambia
  - [4] Ghana
  - [4] Guinea
  - [4] Guinea-Bissau
  - [4] Ivory Coast

## Branch 6: abstract ideas and concepts

### [1] dynamic relations

**[2] activity**

- [3] attempts
  - [4] achievement
  - [4] difficulty
  - [4] ease
  - [4] extemporaneousness
  - [4] failure
  - [4] preparation
  - [4] success
- [3] inertia
- [3] motion
  - [4] agitation
  - [4] directional movement
    - [5] ascent
    - [5] convergence
    - [5] departure
    - [5] descent
    - [5] divergence
    - [5] entrance
    - [5] inward motion
    - [5] jumps
    - [5] motions around
    - [5] outward motion
    - [5] progression
    - [5] withdrawal
  - [4] forceful motions
    - [5] friction
    - [5] pulls
    - [5] pushes
    - [5] throws
  - [4] haste
  - [4] slowness
  - [4] transporting
- [3] rest
- [3] violence

**[2] change**

- [3] exchanges
- [3] gradual change
- [3] major change
- [3] reversion

**[2] time**

- [3] future
- [3] longevity

- [3] past
- [3] regularity of time
- [3] relative age
  - [4] stages of development
- [3] simultaneity
- [3] time measurement
  - [4] instants
- [3] timeliness
  - [4] earliness
  - [4] lateness
- [3] transience

## **[1] human life and activity**

### **[2] communication**

- [3] announcements
- [3] conversation
- [3] declarations
- [3] disclosure
- [3] identifiers
- [3] implication
- [3] obscene language
- [3] representation
  - [4] interpretation
- [3] secrecy
- [3] shyness
- [3] speech
- [3] styles of expression
  - [4] boasting
  - [4] clarity
  - [4] eloquence
  - [4] intelligibility
  - [4] nonsense
  - [4] plain speech
  - [4] wordiness

### **[2] feelings and sensations**

- [3] calmness
- [3] composure
- [3] emotions
  - [4] anger
  - [4] contentment
  - [4] courage
  - [4] cowardice
  - [4] happiness
  - [4] humiliation
  - [4] ill humor
  - [4] insolence
  - [4] nervousness
  - [4] pickiness

- [4] regret
- [4] relief
- [4] sadness
- [4] vanity
- [3] excitement
- [3] five senses
  - [4] audiences
  - [4] hearing
    - [5] faintness of sound
    - [5] loudness
    - [5] silence
  - [5] sound
    - [6] cries
    - [6] dissonant sound
    - [6] harmonious sound
    - [6] harsh sound
    - [6] repeated sounds
- [4] sight
  - [5] appearance
  - [5] fading
  - [5] visibility
- [4] smelling
  - [5] odors
- [4] tasting
  - [5] flavor
  - [6] sweetness
- [4] touching
- [3] numbness
- [3] pleasure
- [3] suffering

### **[2] gender**

### **[2] intellect**

- [3] cleverness
- [3] foolishness
- [3] ignorance
- [3] intelligence and wisdom
- [3] intuition
- [3] knowledge
- [3] learning
- [3] teaching
- [3] thinking
  - [4] conclusion
    - [5] discovery
    - [5] evidence
    - [5] rebuttal
  - [4] consideration
    - [5] analysis
    - [5] questioning
    - [5] tests

- [4] faith
- [5] ideology
- [5] sanctimony
- [4] judgment
- [4] rationality
- [4] skepticism
- [4] sophistry
- [4] speculation
- [2] social attitude, custom**
  - [3] behavior
    - [4] approval
    - [4] courtesy
    - [4] criticism
    - [4] cruelty
    - [4] flattery
    - [4] forgiveness
    - [4] friendliness
    - [4] generosity
    - [4] gratitude
    - [4] hatred
    - [4] jealousy
    - [4] kindness
    - [4] love
      - [5] adoration
    - [4] respect
    - [4] rudeness
    - [4] ruthlessness
    - [4] stinginess
    - [4] sympathy
  - [3] morality and ethics
    - [4] evil
    - [4] goodness
    - [4] moral action
      - [5] asceticism
      - [5] decency
      - [5] deception
      - [5] integrity
      - [5] lewdness
      - [5] self-indulgence
    - [4] moral consequences
      - [5] allegation
      - [5] entitlement
      - [5] excuses
      - [5] punishment
      - [5] reparation
    - [4] moral states
      - [5] fairness
      - [5] guilt
      - [5] innocence
- [5] partiality
- [4] responsibility
- [3] reputation
  - [4] acclaim
  - [4] notoriety
- [3] social activities
  - [4] enjoyment
  - [4] monotony
- [3] social conventions
  - [4] conventionalism
  - [4] formality
  - [4] trends
- [3] social transactions
  - [4] debt
  - [4] offers
  - [4] payments
  - [4] petitions
  - [4] promises and contracts
- [2] states of mind**
  - [3] anticipation
    - [4] fear
    - [4] frustration
    - [4] hopefulness
    - [4] hopelessness
    - [4] prediction
    - [4] surprise
    - [4] warnings
  - [3] boredom
  - [3] broad-mindedness
  - [3] carelessness
  - [3] caution
  - [3] confusion
  - [3] creativity
  - [3] curiosity
  - [3] forgetfulness
  - [3] patience
  - [3] prejudice
  - [3] remembering
  - [3] seriousness
- [2] volition**
  - [3] assent
  - [3] choices
    - [4] denial
  - [3] decidedness
  - [3] dissent
  - [3] eagerness
  - [3] enticement
  - [3] evasion
    - [4] abandonment

- [4] escape
- [3] impulses
- [3] indecision
- [3] indifference
- [3] inevitability
- [3] motivation
- [3] obstinacy
- [3] tendency

### [1] potential relations

- [2] **ability, power**
  - [3] competence, expertise
  - [3] energy, vigor
  - [3] ineptness
  - [3] productivity
  - [3] provision
  - [3] strength
  - [3] weakness
- [2] **conflict**
  - [3] attacks
  - [3] competition
  - [3] crises
  - [3] retaliation
- [2] **control**
  - [3] anarchy
  - [3] command
    - [4] cancelations
    - [4] delegation
    - [4] permission
    - [4] prohibiting
  - [3] defiance
  - [3] influence
  - [3] leadership
  - [3] modes of authority
    - [4] confinement
    - [4] constraint
    - [4] discipline
    - [4] freedom
    - [4] leniency
    - [4] liberation
  - [3] obedience
  - [3] regulation
  - [3] servility
- [2] **possession**
  - [3] giving
  - [3] keeping
  - [3] losing
  - [3] receiving

- [3] sharing
- [3] taking

- [2] **possibility**
  - [3] chance
  - [3] falseness
  - [3] truth
- [2] **purpose**
  - [3] abuse
  - [3] depletion
  - [3] obsolescence
- [2] **support**
  - [3] cooperation
  - [3] mediation
  - [3] neutrality
  - [3] peace
  - [3] protection
  - [3] sanctuary
  - [3] security

### [1] relation

- [2] **agreement**
- [2] **cause and effect**
  - [3] causation
  - [3] result
- [2] **difference**
- [2] **examples**
- [2] **relevance**
- [2] **similarity**
  - [3] duplication
- [2] **uniformity**
- [2] **variety**

### [1] static relations

- [2] **amounts**
  - [3] fewness
  - [3] fragmentation
  - [3] large quantities
  - [3] majority
  - [3] mass quantity
  - [3] minority
  - [3] numbers
  - [3] quantity modification
    - [4] combination
    - [4] connection
    - [4] decrease
    - [4] increase
    - [4] remainders

- [4] separation
- [3] required quantity
  - [4] deficiency
  - [4] excess
  - [4] sufficiency
- [3] wholeness
  - [4] omission
  - [4] thoroughness
- [2] existence**
  - [3] creation
  - [3] life
- [2] form**
  - [3] defects
  - [3] effervescence
  - [3] physical qualities
    - [4] brightness and color
      - [5] color
        - [6] variegation
      - [5] colorlessness
      - [5] darkness
      - [5] lighting
        - [6] opaqueness
        - [6] transparency
    - [4] dryness
    - [4] fragility
    - [4] heaviness
    - [4] mass and weight measurement
    - [4] moisture
    - [4] pliancy
    - [4] rigidity
    - [4] softness
    - [4] temperature
      - [5] coldness
      - [5] heat
    - [4] texture
      - [5] fluids
      - [5] gaseousness
      - [5] jaggedness
      - [5] powderiness
      - [5] semiliquidity
      - [5] smoothness
    - [4] weightlessness
  - [3] shape
    - [4] angularity
    - [4] circularity
    - [4] curvature
    - [4] roundness
    - [4] straightness
  - [3] symmetry
- [3] tangibility
- [3] topological form
  - [4] concavity
  - [4] convexity
  - [4] covering
  - [4] folds
  - [4] openings
- [2] nonexistence**
  - [3] death
  - [3] destruction
- [2] quality**
  - [3] badness
  - [3] beauty
  - [3] cleanness
  - [3] complexity
  - [3] correctness
  - [3] deterioration
  - [3] dirtiness
  - [3] good quality
  - [3] improvement
  - [3] mediocrity
  - [3] mistakes
  - [3] normality
  - [3] perfection
  - [3] remedy
