Primary Author: Richard Smith

Contributors: Saheli Dey, Rajinder Gupta, Stephen Lee, Radikha Moolky, David Saslav

The Programs (which include both the software and documentation) contain proprietary information of Oracle Corporation; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. Oracle Corporation does not warrant that this document is error free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of Oracle Corporation.

If the Programs are delivered to the U.S. Government or anyone licensing or using the programs on behalf of the U.S. Government, the following notice is applicable:

**Restricted Rights Notice** Programs delivered subject to the DOD FAR Supplement are "commercial computer software" and use, duplication, and disclosure of the Programs, including documentation, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement. Otherwise, Programs delivered subject to the Federal Acquisition Regulations are "restricted computer software" and use, duplication, and disclosure of the Programs shall be subject to the restrictions in FAR 52.227-19, Commercial Computer Software - Restricted Rights (June, 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy, and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and Oracle Corporation disclaims liability for any damages caused by such use of the Programs.

# Send Us Your Comments

## **Oracle Internet Directory Application Developer's Guide, Release 2.0.6**

**Part No. A83775-02**

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this document. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most?

If you find any errors or have any other suggestions for improvement, please indicate the document title and part number, and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- E-mail - [infodev@us.oracle.com](mailto:infodev@us.oracle.com)
- FAX - (650) 506-7228. Attn: Oracle Internet Directory Documentation Manager
- Postal service:  
Oracle Corporation  
Oracle Internet Directory Documentation Manager  
500 Oracle Parkway, 40p7  
Redwood Shores, CA 94065  
U.S.A.

If you would like a reply, please give your name, address, telephone number, and (optionally) electronic mail address.

If you have problems with the software, please contact your local Oracle Support Services.

---

# Preface

*Oracle Internet Directory Application Developer's Guide* provides information for enabling applications to access Oracle Internet Directory by using the C API.

## Audience

*Oracle Internet Directory Application Developer's Guide* is intended for application developers who wish to enable applications to store and update directory information in an Oracle Internet Directory server. It is also intended for anyone who wants to know how the Oracle Internet Directory C API works.

## Organization

|                                                                  |                                                                                                                                                                                                                            |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Chapter 1, "Introduction"</a>                        | Briefly describes the intended audience and components of Oracle Internet Directory Software Developer's Kit Release 2.0.6. It also lists the other components of Oracle Internet Directory and the platforms it supports. |
| <a href="#">Chapter 2, "C Application Programming Interface"</a> | Introduces the Oracle Internet Directory C API and provides examples of how to use it                                                                                                                                      |
| <a href="#">Chapter 3, "Command Line Tools Syntax"</a>           | Provides syntax, usage notes, and examples for using LDAP Data Interchange Format (LDIF) and LDAP command line tools                                                                                                       |

## Conventions

The following conventions are used in this manual:

| Convention        | Meaning                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| .<br>. .<br>. . . | Vertical ellipsis points in an example mean that information not directly related to the example has been omitted.  |
| ...               | Horizontal ellipsis points in statements or commands mean that parts of the statement or command have been omitted. |
| <b>bold</b>       | Boldface text indicates text you must type in a command, or a subheading.                                           |

| Convention           | Meaning                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>italics</i>       | <p>Italics indicate:</p> <ul style="list-style-type: none"> <li>■ In a code example, a variable for which you must supply a value</li> <li>■ In regular text, special emphasis</li> <li>■ Book titles</li> </ul> |
| <code>courier</code> | Courier is used for user input and code examples.                                                                                                                                                                |
| <i>syntax</i>        | This typeface is used for syntax explanations in code examples.                                                                                                                                                  |
| < >                  | In code examples, angle brackets may enclose user-supplied names.                                                                                                                                                |
| [ ]                  | Brackets enclose a choice of optional items from which you can choose one or none.                                                                                                                               |
| { }                  | Braces enclose a choice of required items from which you can choose one.                                                                                                                                         |

---

# Introduction

This chapter briefly describes the intended audience and components of Oracle Internet Directory Software Developer's Kit Release 2.0.6. It also lists the other components of Oracle Internet Directory and the platforms it supports.

This chapter contains these topics:

- [About Oracle Internet Directory Software Developer's Kit Release 2.0.6](#)
- [Components of the Oracle Internet Directory Software Developer's Kit](#)
- [Other Components of Oracle Internet Directory](#)
- [Platforms Supported](#)

## About Oracle Internet Directory Software Developer's Kit Release 2.0.6

Oracle Internet Directory SDK Release 2.0.6 is intended for C & C++ application developers. Java developers can use the JNDI provider from Sun to access directory information in an Oracle Internet Directory server.

## Components of the Oracle Internet Directory Software Developer's Kit

Oracle Internet Directory Software Developer's Kit Release 2.0.6 consists of:

- An LDAP Version 2-compliant C API
- A sample program for a command line search tool
- *Oracle Internet Directory Application Developer's Guide* (this document)
- Command line tools

## Other Components of Oracle Internet Directory

The following components of Oracle Internet Directory Release 2.0.6, not part of the Oracle Internet Directory Software Developer's Kit, can be obtained separately:

- Oracle directory server, an LDAP Version 3-compliant directory server
- Oracle directory replication server
- Oracle Directory Manager, a Java-based graphical user interface
- Oracle Internet Directory bulk tools
- *Oracle Internet Directory Administrator's Guide*
- *Oracle Internet Directory Installation Guide*

## Platforms Supported

Oracle Internet Directory, both servers and clients, support the following platforms:

- Sun SPARC Solaris
- Microsoft Windows
  - Windows NT 4.0
  - Windows 95
  - Windows 98
  - Windows 2000
- HPUX
- AIX
- Compaq TRU64
- Intel Solaris
- SGI
- DGUX
- UNIXWARE

---

# C Application Programming Interface

This chapter introduces the Oracle Internet Directory API and provides examples of how to use it.

This document covers topics in the following sections:

- [About the Oracle Internet Directory C API](#)
- [Sample C API Usage](#)
- [Dependencies and Limitations](#)

## About the Oracle Internet Directory C API

The Oracle Internet Directory SDK C API Release 2.0.6 is based on:

- LDAP Version 2 C API
- Oracle extensions to support SSL

Oracle Internet Directory SDK C API Release 2.0.6 supports the following modes:

- SSL—All communication secured using SSL
- Non-SSL—Client-to-server communication not secure

To use the SSL mode, you must use the Oracle SSL call interface. You determine which mode you are using by the presence or absence of the SSL calls in the API usage. You can easily switch between SSL and non-SSL modes.

**See Also:** ["Sample C API Usage"](#) on page 2-7 for more details on how to use the two modes

This section contains these topics:

- [Oracle Internet Directory SDK C API SSL Extensions](#)
- [Summary of LDAP C API](#)

## Oracle Internet Directory SDK C API SSL Extensions

Oracle SSL extensions to the LDAP API are based on standard SSL protocol. The SSL extensions provide encryption and decryption of data over the wire, and authentication.

There are three modes of authentication:

- One-way—Only the server is authenticated by the client
- Two-way—Both the server and the client are authenticated by each other
- None—Neither client nor server is authenticated, and only SSL encryption is used

The type of authentication is indicated by a parameter in the SSL interface call.

### SSL Interface Calls

There is only one call required to enable SSL:

```
int ldap_init_SSL(Socketbuf *sb, text *sslwallet, text *sslwalletpasswd, int
sslauthmode)
```

The `ldap_init_SSL` call performs the necessary handshake between client and server using the standard SSL protocol. If the call is successful, all subsequent communication happens over a secure connection.

| Argument        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sb              | Socket buffer handle returned by the <i>ldap_open</i> call as part of LDAP handle.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| sslwallet       | Location of the user wallet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| sslwalletpasswd | Password required to use the wallet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| sslauthmode     | SSL authentication mode user wants to use. Possible values are: <ul style="list-style-type: none"><li>■ <code>GSLC_SSL_NO_AUTH</code>—No authentication required</li><li>■ <code>GSLC_SSL_ONeway_AUTH</code>—Only server authentication required.</li><li>■ <code>GSLC_SSL_TWOWay_AUTH</code>—Both server and client authentication required.</li></ul> A return value of 0 indicates success. A non zero return value indicates an error. The error code can be decoded by using the function <code>ldap_err2string</code> . |

**See Also:** See ["Sample C API Usage"](#) on page 2-7

### Wallet Support

To use the SSL feature, both the server and the client may require wallets, depending on which authentication mode is being used. Release 2.0.6 of the API supports only Oracle Wallet. You can create wallets using Oracle Wallet Manager.

## Summary of LDAP C API

This section lists all the calls available in the LDAP C API found in RFC 1823.

**See Also:** The following URL:  
<http://www.ietf.org/rfc/rfc1823.txt> for a more detailed  
explanation of these calls

This section contains these topics:

- [Initializing and Ending LDAP Sessions](#)
- [Authenticating to an LDAP Server](#)
- [Getting Search Results](#)
- [Working with Distinguished Names](#)
- [Freeing Memory](#)

### Initializing and Ending LDAP Sessions

|                            |                                     |
|----------------------------|-------------------------------------|
| <code>ldap_open()</code>   | Open a connection to an LDAP server |
| <code>ldap_unbind()</code> | End an LDAP session                 |

### Authenticating to an LDAP Server

|                                   |                                          |
|-----------------------------------|------------------------------------------|
| <code>ldap_bind()</code>          | General authentication to an LDAP server |
| <code>ldap_bind_s()</code>        |                                          |
| <code>ldap_simple_bind()</code>   | Simple authentication to an LDAP server  |
| <code>ldap_simple_bind_s()</code> |                                          |

## Performing LDAP Operations

|                                                                |                                                |
|----------------------------------------------------------------|------------------------------------------------|
| <code>ldap_add()</code> /<br><code>ldap_add_s()</code>         | Add a new entry to the directory               |
| <code>ldap_modify()</code> /<br><code>ldap_modify_s()</code>   | Modify an entry in the directory               |
| <code>ldap_delete()</code> /<br><code>ldap_delete_s()</code>   | Delete an entry from the directory             |
| <code>ldap_modrdn()</code> /<br><code>ldap_modrdn_s()</code>   | Modify the RDN of an entry in the directory    |
| <code>ldap_search()</code> /<br><code>ldap_search_s()</code>   | Search the directory                           |
| <code>ldap_search_st()</code>                                  | Search the directory with a timeout value      |
| <code>ldap_compare()</code> /<br><code>ldap_compare_s()</code> | Compare entries in the directory               |
| <code>ldap_result()</code>                                     | Check the results of an asynchronous operation |
| <code>ldap_abandon()</code>                                    | Cancel an asynchronous operation               |

## Getting Search Results

|                                     |                                                          |
|-------------------------------------|----------------------------------------------------------|
| <code>ldap_get_dn()</code>          | Get the distinguished name for an entry                  |
| <code>ldap_first_entry()</code>     | Get the first entry in a chain of search results         |
| <code>ldap_next_entry()</code>      | Get the next entry in a chain of search results          |
| <code>ldap_count_entries()</code>   | Count the number of entries in a chain of search results |
| <code>ldap_first_attribute()</code> | Get the name of the first attribute in an entry          |
| <code>ldap_next_attribute()</code>  | Get the name of the next attribute in an entry           |
| <code>ldap_get_values()</code>      | Get the string values of an attribute                    |
| <code>ldap_get_values_len()</code>  | Get the binary values of an attribute                    |

`ldap_count_values()` Count the string values of an attribute

`ldap_count_values_len()` Count the binary values of an attribute

## Working with Distinguished Names

`ldap_get_dn()` Get the distinguished name for an entry

`ldap_explode_dn()` Split up a distinguished name into its components

`ldap_dn2ufn()` Converts the name into a more user friendly format

## Handling Errors

`ldap_result2error()` Returns the error code from result message.

`ldap_err2string()` Get the error message for a specific error code

`ldap_perror` Prints the message supplied in message.

## Freeing Memory

`ldap_memfree()` Free memory allocated by an LDAP API function call

`ldap_msgfree()` Free the memory allocated for search results or other LDAP operation results

`ldap_value_free()` Free the memory allocated for the string values of an attribute

`ldap_value_free_len()` Free the memory allocated for the binary values of an attribute

`ber_free()` Free the memory allocated for a BerElement structure

## Sample C API Usage

The following examples show how to use the API both with and without SSL. More complete examples are given in RFC 1823. The sample code for the command line tool to perform LDAP search also demonstrates usage of the API in two modes.

This section contains these topics:

- [API Usage with SSL](#)
- [API Usage Without SSL](#)
- [Source Code for the Sample Command Line Search Tool](#)

## API Usage with SSL

```
#include <stdio.h>
#include <string.h>
#include <ctype.h>
#include <netdb.h>
#include <gslc.h>
#include <gsld.h>
#include "gslcc.h"

main()
{
    LDAP      *ld;
    int        ret = 0;
    ....
    /* open a connection */
    if ( (ld = ldap_open( "MyHost", 636 )) == NULL )
        exit( 1 );

    /* SSL initialization */
    ret = ldap_init_SSL(&ld->ld_sb, "file:/sslwallet", "welcome",
                       GSLC_SSL_ONEWAY_AUTH );
    if(ret != 0)
    {
        printf(" %s \n", ldap_err2string(ret));
        exit(1);
    }

    /* authenticate as nobody */
    if ( ldap_bind_s( ld, NULL, NULL ) != LDAP_SUCCESS ) {
        ldap_perror( ld, "ldap_bind_s" );
        exit( 1 );
    }

    ....
    ....
}
```

Because the user is making the `ldap_init_SSL` call, the client-to-server communication in the above example is secured by using SSL.

## API Usage Without SSL

```
#include <stdio.h>
#include <string.h>
#include <ctype.h>
#include <netdb.h>
#include <gsl.h>
#include <gslc.h>
#include <gsld.h>
#include "gslcc.h"

main()
{
    LDAP      *ld;
    int        ret = 0;
    ....

    /* open a connection */
    if ( (ld = ldap_open( "MyHost", LDAP_PORT )) == NULL )
        exit( 1 );

    /* authenticate as nobody */
    if ( ldap_bind_s( ld, NULL, NULL ) != LDAP_SUCCESS ) {
        ldap_perror( ld, "ldap_bind_s" );
        exit( 1 );
    }
    ....
    ....
}
```

In the above example, the user is not making the `ldap_init_SSL` call, and the client-to-server communication is therefore not secure.

## Building Applications with the C API

This section contains these topics:

- [Required Header Files and Libraries](#)
- [Building a Sample Search Tool](#)

### Required Header Files and Libraries

To build applications with the C API, you need:

- The header files located at `$ORACLE_HOME/ldap/public/ldap.h`.
- The libraries located at `$ORACLE_HOME/lib/libldapclnt8.a`

### Building a Sample Search Tool

The Oracle Internet Directory SDK Release 2.0.6 provides a sample program for a command line search tool, `samplesearch`, that demonstrates how to use the C API to build applications. You can use `samplesearch` to perform LDAP searches in either SSL or non-SSL mode.

You can find the source file (`samplesearch.c`) and the make file (`demo_ldap.mk`) in the following directory: `ORACLE_HOME/ldap/demo`.

To build the sample search tool, enter the following command:

```
make -f demo_ldap.mk build EXE=samplesearch OBJS=samplesearch.o
```

---

---

**Note:** You can use this make file to build other client applications by using the C API. Replace `samplesearch` with the name of the binary you want to build, and `samplesearch.o` with your own object file.

---

---

## Source Code for the Sample Command Line Search Tool

The sample code for ldapsearch is:

```

/*
    NAME
        s0gslldsearch.c - <one-line expansion of the name>
    DESCRIPTION
        <short description of component this file declares/defines>
    PUBLIC FUNCTION(S)
        <list of external functions declared/defined - with one-line descriptions>
    PRIVATE FUNCTION(S)
        <list of static functions defined in .c file - with one-line descriptions>
    RETURNS
        <function return values, for .c file with single function>
    NOTES
        <other useful comments, qualifications, etc.>
*/
#include <stdio.h>

## Dependencies and Limitations

This API can work against any release of Oracle Internet Directory server or a third party LDAP server.

To use the different authentication modes in SSL, the directory server requires corresponding configuration settings.

**See Also:** *Oracle Internet Directory Administrator's Guide* for details on how to set the Oracle directory server in various SSL authentication modes

Oracle Wallet Manager is required for creating wallets if you are using the C API in SSL mode.

TCP/IP Socket Library is required.

The following Oracle libraries are required:

- Oracle SSL-related libraries
- Oracle system libraries

Sample libraries are included in the release for the sample command line tool. You should replace these libraries with your own versions of the libraries.

The product supports only those authentication mechanisms described in LDAP SDK specifications (RFC 1823).

---

## Command Line Tools Syntax

This chapter provides syntax, usage notes, and examples for using LDAP Data Interchange Format (LDIF) and LDAP command line tools. It contains these topics:

- [Command Line Tools Syntax](#)
- [LDAP Data Interchange Format \(LDIF\) Syntax](#)
- [Catalog Management Tool Syntax](#)

## Command Line Tools Syntax

This section tells you how to use the following tools:

- [ldapadd Syntax](#)
- [ldapaddmt Syntax](#)
- [ldapbind Syntax](#)
- [ldapcompare Syntax](#)
- [ldapdelete Syntax](#)
- [ldapmoddn Syntax](#)
- [ldapmodify Syntax](#)
- [ldapmodifymt Syntax](#)
- [ldapsearch Syntax](#)

### ldapadd Syntax

The `ldapadd` command line tool enables you to add entries, their object classes, attributes, and values to the directory. To add attributes to an existing entry, use the `ldapmodify` command, explained in "[ldapmodify Syntax](#)" on page 3-11.

`ldapadd` uses this syntax:

```
ldapadd [arguments] -f filename
```

where *filename* is the name of an LDIF file written with the specifications explained in the section "[LDAP Data Interchange Format \(LDIF\) Syntax](#)" on page 3-21.

The following example adds the entry specified in the LDIF file `my_ldif_file.ldi`:

```
ldapadd -p 389 -h myhost -f my_ldif_file.ldi
```

| Optional Arguments          | Descriptions                                                                                                                                                                                                              |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -b                          | Specifies that you have included binary file names in the file, which are preceded by a forward slash character. The tool retrieves the actual values from the file referenced.                                           |
| -c                          | Tells ldapadd to proceed in spite of errors. The errors will be reported. (If you do not use this option, ldapadd stops when it encounters an error.)                                                                     |
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry specified in <i>binddn</i> . Use this with the <i>-w password</i> option.                                                                           |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                     |
| -f <i>filename</i>          | Specifies the input name of the LDIF format import data file. For a detailed explanation of how to format an LDIF file, see " <a href="#">LDAP Data Interchange Format (LDIF) Syntax</a> " on page 3-21.                  |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                     |
| -K                          | Same as <i>-k</i> , but performs only the first step of the Kerberos bind                                                                                                                                                 |
| -k                          | Authenticates using Kerberos authentication instead of simple authentication. To enable this option, you must compile with KERBEROS defined.<br><br>You must already have a valid ticket granting ticket.                 |
| -n                          | Shows what would occur without actually performing the operation                                                                                                                                                          |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                                   |
| -P <i>wallet_password</i>   | Specifies wallet password required for one-way or two-way SSL connections                                                                                                                                                 |
| -U <i>SSLAuth</i>           | Specifies SSL authentication mode: <ul style="list-style-type: none"> <li>■ 1 for no authentication required</li> <li>■ 2 for one way authentication required</li> <li>■ 3 for two way authentication required</li> </ul> |
| -v                          | Specifies verbose mode                                                                                                                                                                                                    |
| -w <i>password</i>          | Provides the password required to connect                                                                                                                                                                                 |
| -W <i>wallet_location</i>   | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                                 |

## ldapaddmt Syntax

ldapaddmt is like ldapadd: it enables you to add entries, their object classes, attributes, and values to the directory. It is unlike ldapadd in that it supports multiple threads for adding entries concurrently.

While it is processing LDIF entries, ldapaddmt logs errors in the `add.log` file in the current directory.

ldapaddmt uses this syntax:

```
ldapaddmt -T number_of_threads -h host -p port -f filename
```

where *filename* is the name of an LDIF file written with the specifications explained in the section ["LDAP Data Interchange Format \(LDIF\) Syntax"](#) on page 3-21.

The following example uses five concurrent threads to process the entries in the file `myentries.ldif`.

```
ldapaddmt -T 5 -h node1 -p 3000 -f myentries.ldif
```

---

---

**Note:** Increasing the number of concurrent threads improves the rate at which LDIF entries are created, but consumes more system resources.

---

---

| Optional Arguments          | Descriptions                                                                                                                                                                                                              |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -b                          | Specifies that you have included binary file names in the data file, which are preceded by a forward slash character. The tool retrieves the actual values from the file referenced.                                      |
| -c                          | Tells the tool to proceed in spite of errors. The errors will be reported. (If you do not use this option, the tool stops when it encounters an error.)                                                                   |
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry is specified in <i>binddn</i> . Use this with the <i>-w password</i> option.                                                                        |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i>                                                                                                                       |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                     |
| -K                          | Same as -k, but performs only the first step of the kerberos bind                                                                                                                                                         |
| -k                          | Authenticates using Kerberos authentication instead of simple authentication. To enable this option, you must compile with KERBEROS defined.<br><br>You must already have a valid ticket granting ticket.                 |
| -n                          | Shows what would occur without actually performing the operation.                                                                                                                                                         |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                                   |
| -P <i>wallet_password</i>   | Specifies wallet password required for one-way or two-way SSL connections                                                                                                                                                 |
| -T                          | Sets the number of threads for concurrently processing entries                                                                                                                                                            |
| -U <i>SSLAuth</i>           | Specifies SSL Authentication Mode: <ul style="list-style-type: none"> <li>■ 1 for no authentication required</li> <li>■ 2 for one way authentication required</li> <li>■ 3 for two way authentication required</li> </ul> |
| -v                          | Specifies verbose mode                                                                                                                                                                                                    |
| -w <i>password</i>          | Provides the password required to connect                                                                                                                                                                                 |
| -W <i>wallet_location</i>   | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                                 |

## Idapbind Syntax

The Idapbind command line tool enables you to see whether you can authenticate a client to a server.

Idapbind uses this syntax:

Idapbind [*arguments*]

| Optional Arguments          | Descriptions                                                                                                                                                                                                          |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry specified in <i>binddn</i> . Use this with the <i>-w password</i> option.                                                                       |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                 |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                 |
| -n                          | Shows what would occur without actually performing the operation                                                                                                                                                      |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                               |
| -P <i>wallet_password</i>   | Specifies the wallet password required for one-way or two-way SSL connections                                                                                                                                         |
| -U <i>SSLAuth</i>           | Specifies SSL authentication mode: <ul style="list-style-type: none"><li>■ 1 for no authentication required</li><li>■ 2 for one way authentication required</li><li>■ 3 for two way authentication required</li></ul> |
| -w <i>password</i>          | Provides the password required to connect                                                                                                                                                                             |
| -W <i>wallet_location</i>   | Specifies wallet location (required for one-way or two-way SSL connections)                                                                                                                                           |

## ldapcompare Syntax

The ldapcompare command line tool enables you to match attribute values you specify in the command line with the attribute values in the directory entry.

ldapcompare uses this syntax:

ldapcompare [*arguments*]

The following example tells you whether Person Nine’s title is associate.

```
ldapcompare -p 389 -h myhost -b "cn=Person Nine, ou=EuroSInet Suite, o=IMC, c=US" -a title -v associate
```

| Mandatory Arguments       | Descriptions                                                                  |
|---------------------------|-------------------------------------------------------------------------------|
| -a <i>attribute name</i>  | Specifies the attribute on which to perform the compare                       |
| -b <i>basedn</i>          | Specifies the distinguished name of the entry on which to perform the compare |
| -v <i>attribute value</i> | Specifies the attribute value to compare                                      |

| Optional Arguments          | Descriptions                                                                                                                                          |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry is specified in <i>binddn</i> . Use this with the -w <i>password</i> option.    |
| -d <i>debug-level</i>       | Sets the debugging level. See <i>Oracle Internet Directory Administrator’s Guide</i> .                                                                |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator’s Guide</i> .                                                 |
| -f <i>filename</i>          | Specifies the input filename                                                                                                                          |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address. |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).               |
| -P <i>wallet_password</i>   | Specifies wallet password (required for one-way or two-way SSL connections)                                                                           |

| Optional Arguments                     | Descriptions                                                                                                                                                                                                          |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-U <i>SSLAuth</i></code>         | Specifies SSL authentication mode: <ul style="list-style-type: none"><li>▪ 1 for no authentication required</li><li>▪ 2 for one way authentication required</li><li>▪ 3 for two way authentication required</li></ul> |
| <code>-w <i>password</i></code>        | Provides the password required to connect                                                                                                                                                                             |
| <code>-W <i>wallet_location</i></code> | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                             |

## ldapdelete Syntax

The ldapdelete command line tool enables you to remove entire entries from the directory that you specify in the command line.

ldapdelete uses this syntax:

```
ldapdelete [arguments] "entry_DN"
```

The following example uses port 389 on a host named myhost.

```
ldapdelete -p 389 -h myhost ou=EuroSInet Suite, o=IMC, c=US"
```

| Optional Arguments              | Descriptions                                                                                                                                                                                                              |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-D binddn</code>          | When authenticating to the directory, uses a full DN for the <i>binddn</i> parameter; typically used with the <code>-w password</code> option.                                                                            |
| <code>-d debug-level</code>     | Sets the debugging level. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                                    |
| <code>-E "character_set"</code> | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                     |
| <code>-f filename</code>        | Specifies the input filename                                                                                                                                                                                              |
| <code>-h ldaphost</code>        | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                     |
| <code>-k</code>                 | Authenticates using authentication instead of simple authentication. To enable this option, you must compile with Kerberos defined.<br><br>You must already have a valid ticket granting ticket.                          |
| <code>-n</code>                 | Shows what would be done, but doesn't actually delete                                                                                                                                                                     |
| <code>-p ldapport</code>        | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                                   |
| <code>-P wallet_password</code> | Specifies wallet password required for one-way or two-way SSL connections                                                                                                                                                 |
| <code>-U SSLAuth</code>         | Specifies SSL authentication mode: <ul style="list-style-type: none"> <li>■ 1 for no authentication required</li> <li>■ 2 for one way authentication required</li> <li>■ 3 for two way authentication required</li> </ul> |
| <code>-v</code>                 | Specifies verbose mode                                                                                                                                                                                                    |
| <code>-w password</code>        | Provides the password required to connect.                                                                                                                                                                                |
| <code>-W wallet_location</code> | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                                 |

## ldapmoddn Syntax

The ldapmoddn command line tool enables you to modify the DN or RDN of an entry.

ldapmoddn uses this syntax:

ldapmoddn [arguments]

The following example uses ldapmoddn to modify the RDN component of a DN from "cn=dcpl" to "cn=thanh mai". It uses port 389, and a host named myhost.

```
ldapmoddn -p 389 -h myhost -b "cn=dcpl,dc=Americas,dc=imc,dc=com" -R "cn=thanh mai"
```

| Mandatory Argument | Description                           |
|--------------------|---------------------------------------|
| -b <i>basedn</i>   | Specifies DN of the entry to be moved |

| Optional Arguments          | Descriptions                                                                                                                                                                  |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -D <i>binddn</i>            | When authenticating to the directory, do so as the entry is specified in <i>binddn</i> . Use this with the -w <i>password</i> option.                                         |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                         |
| -f <i>filename</i>          | Specifies the input filename                                                                                                                                                  |
| -h <i>ldaphost</i>          | Specifies name of the host node of the directory server                                                                                                                       |
| -l <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                         |
| -N <i>newparent</i>         | Specifies new parent of the RDN                                                                                                                                               |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                       |
| -P <i>wallet_password</i>   | Specifies wallet password required for one-way or two-way SSL connections                                                                                                     |
| -r                          | Specifies that the old RDN is not retained as a value in the modified entry. If this argument is not included, the old RDN is retained as an attribute in the modified entry. |
| -R <i>newrdn</i>            | Specifies new RDN                                                                                                                                                             |

| Optional Arguments                     | Descriptions                                                                                                                                                                                                          |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-U <i>SSLAUTH</i></code>         | Specifies SSL authentication mode: <ul style="list-style-type: none"><li>▪ 1 for no authentication required</li><li>▪ 2 for one way authentication required</li><li>▪ 3 for two way authentication required</li></ul> |
| <code>-w <i>password</i></code>        | Provides the password required to connect.                                                                                                                                                                            |
| <code>-W <i>wallet_location</i></code> | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                             |

## ldapmodify Syntax

The ldapmodify tool enables you to act on attributes.

ldapmodify uses this syntax:

```
ldapmodify [arguments] -f filename
```

where *filename* is the name of an LDIF file written with the specifications explained the section ["LDAP Data Interchange Format \(LDIF\) Syntax"](#) on page 3-21.

The list of arguments in the following table is not exhaustive.

| Optional Arguments          | Description                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -a                          | Denotes that entries are to be added, and that the input file is in LDIF format.                                                                                                                                      |
| -b                          | Specifies that you have included binary file names in the data file, which are preceded by a forward slash character.                                                                                                 |
| -c                          | Tells ldapmodify to proceed in spite of errors. The errors will be reported. (If you do not use this option, ldapmodify stops when it encounters an error.)                                                           |
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry is specified in <i>binddn</i> . Use this with the <i>-w password</i> option.                                                                    |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                 |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                 |
| -n                          | Shows what would occur without actually performing the operation.                                                                                                                                                     |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                               |
| -P <i>wallet_password</i>   | Specifies wallet password required for one-way or two-way SSL connections                                                                                                                                             |
| -U <i>SSLAuth</i>           | Specifies SSL authentication mode: <ul style="list-style-type: none"><li>■ 1 for no authentication required</li><li>■ 2 for one way authentication required</li><li>■ 3 for two way authentication required</li></ul> |
| -v                          | Specifies verbose mode                                                                                                                                                                                                |
| -w <i>password</i>          | Overrides the default, unauthenticated, null bind. To force authentication, use this option with the <i>-D</i> option.                                                                                                |
| -W <i>wallet_location</i>   | Specifies wallet location (required for one-way or two-way SSL connections)                                                                                                                                           |

To run `modify`, `delete`, and `modifyrdn` operations using the `-f` flag, use LDIF for the input file format (see ["LDAP Data Interchange Format \(LDIF\) Syntax"](#) on page 3-21) with the specifications noted below:

Always separate entries with a blank line.

Unnecessary space characters in the LDIF input file, such as a space at the end of an attribute value, will cause the LDAP operations to fail.

**Line 1:** Every change record has, as its first line, the literal `dn:` followed by the DN value for the entry, for example:

```
dn:cn=Barbara Fritchey,ou=Sales,o=Oracle,c=US
```

**Line 2:** Every change record has, as its second line, the literal `changetype:` followed by the type of change (add, delete, modify, modrdn), for example:

```
changetype:modify
```

or

```
changetype:modrdn
```

Format the remainder of each record according to the following requirements for each type of change:

- `changetype:add`

Uses LDIF format (see ["LDAP Data Interchange Format \(LDIF\) Syntax"](#) on page 3-21).

- `changetype:modify`

The lines that follow this `changetype` consist of changes to attributes belonging to the entry that you identified in Line 1 above. You can specify three different types of attribute modifications—add, delete, and replace—which are explained next:

- **Add attribute values.** This option to `changetype modify` adds more values to an existing multi-valued attribute. If the attribute does not exist, it adds the new attribute with the specified values:

```
add: attribute name
attribute name: value1
attribute name: value2...
```

For example:

```
dn:cn=Barbara Fritchey,ou=Sales,o=Oracle,c=US
changetype:modify
add: work-phone
work-phone:510/506-7000
work-phone:510/506-7001
```

- **Delete values.** If you supply only the “delete” line, all the values for the specified attribute are deleted. Otherwise, if you specify an attribute line, you can delete specific values from the attribute:

```
delete: attribute name
[attribute name: value1]
```

For example:

```
dn:cn=Barbara Fritchey,ou=Sales,o=Oracle,c=US
changetype:delete
delete: home-fax
```

- **Replace values.** Use this option to replace all the values belonging to an attribute with the new, specified set:

```
replace:attribute name
[attribute name:value1 ...]
```

If you do not provide any attributes with "replace," the directory adds an empty set. It then interprets the empty set as a delete request, and complies by deleting the attribute from the entry. This is useful if you want to delete attributes that may or may not exist.

For example:

```
dn:cn=Barbara Fritchey,ou=Sales,o=Oracle,c=US
changetype:modify
replace: work-phone
work-phone:510/506-7002
```

- **changetype:delete**

This change type deletes entries. It requires no further input, since you identified the entry in Line 1 and specified a changetype of delete in Line 2.

For example:

```
dn:cn=Barbara Fritchey,ou=Sales,o=Oracle,c=US
changetype:delete
```

- **changetype:modrdn**

The line following the change type provides the new relative distinguished name using this format:

```
newrdn: RDN
```

For example:

```
dn:cn=Barbara Fritch,ou=Sales,o=Oracle,c=US
changetype:modrdn
newrdn: cn=Barbara Fritch-Blomberg
```

## ldapmodifymt Syntax

The `ldapmodifymt` command line tool enables you to modify several entries concurrently.

`ldapmodifymt` uses this syntax:

```
ldapmodifymt -T number_of_threads [arguments] -f filename
```

where *filename* is the name of an LDIF file written with the specifications explained in the section ["LDAP Data Interchange Format \(LDIF\) Syntax"](#) on page 3-21.

**See Also:** ["ldapmodify Syntax"](#) on page 3-11 for additional formatting specifications used by `ldapmodifymt`

For example:

```
ldapmodifymt -T 5 -h node1 -p 3000 -f myentries.ldif
```

| Optional Arguments          | Descriptions                                                                                                                                                                                                              |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -a                          | Denotes that entries are to be added, and that the input file is in LDIF format. (If you are running <code>ldapadd</code> , this flag is not required.)                                                                   |
| -b                          | Specifies that you have included binary file names in the data file, which are preceded by a forward slash character.                                                                                                     |
| -c                          | Tells <code>ldapmodify</code> to proceed in spite of errors. The errors will be reported. (If you do not use this option, <code>ldapmodify</code> stops when it encounters an error.)                                     |
| -D <i>binddn</i>            | When authenticating to the directory, specifies doing so as the entry is specified in <i>binddn</i> . Use this with the <code>-w password</code> option.                                                                  |
| -E " <i>character_set</i> " | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                                                                                     |
| -h <i>ldaphost</i>          | Tells <code>ldapmodify</code> to connect to <i>ldaphost</i> , rather than to the default directory. <i>ldaphost</i> can be an IP address.                                                                                 |
| -h <i>ldaphost</i>          | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address.                                                                     |
| -n                          | Shows what would occur without actually performing the operation.                                                                                                                                                         |
| -p <i>ldapport</i>          | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                                   |
| -P <i>wallet_password</i>   | Specifies wallet password required for one-way or two-way SSL connections                                                                                                                                                 |
| -T                          | Sets the number of threads for concurrently processing entries                                                                                                                                                            |
| -U <i>SSLAuth</i>           | Specifies SSL authentication mode: <ul style="list-style-type: none"> <li>■ 1 for no authentication required</li> <li>■ 2 for one way authentication required</li> <li>■ 3 for two way authentication required</li> </ul> |
| -v                          | Specifies verbose mode                                                                                                                                                                                                    |
| -w <i>password</i>          | Overrides the default, unauthenticated, null bind. To force authentication, use this option with the <code>-D</code> option.                                                                                              |
| -W <i>wallet_location</i>   | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                                 |

## ldapsearch Syntax

The `ldapsearch` command line tool enables you to search for and retrieve specific entries in the directory.

`ldapsearch` uses this syntax:

```
ldapsearch [arguments] filter [attributes]
```

The *filter* format must be compliant with RFC-2254. For further information about this standard, search for the standard at: <http://www.ietf.org/rfc/rfc2254.txt>

Separate attributes with a space. If you do not list any attributes, all attributes are retrieved.

| Mandatory Arguments    | Descriptions                               |
|------------------------|--------------------------------------------|
| <code>-b basedn</code> | Specifies base dn for search               |
| <code>-s scope</code>  | Specifies search scope: base, one, or sub. |

| Optional Arguments              | Descriptions                                                                                                                                          |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-A</code>                 | Retrieves attribute names only (no values)                                                                                                            |
| <code>-a deref</code>           | Specifies alias dereferencing: never, always, search, or find                                                                                         |
| <code>-B</code>                 | Allows printing of non-ASCII values                                                                                                                   |
| <code>-D binddn</code>          | When authenticating to the directory, specifies doing so as the entry specified in <i>binddn</i> . Use this with the <code>-w password</code> option. |
| <code>-d debug level</code>     | Sets debugging level to the level specified. See <i>Oracle Internet Directory Administrator's Guide</i>                                               |
| <code>-E "character_set"</code> | Specifies native character set encoding. See <i>Oracle Internet Directory Administrator's Guide</i> .                                                 |
| <code>-f file</code>            | Performs sequence of searches listed in <i>file</i>                                                                                                   |
| <code>-F sep</code>             | Prints 'sep' instead of '=' between attribute names and values                                                                                        |
| <code>-h ldaphost</code>        | Connects to <i>ldaphost</i> , rather than to the default host, that is, your local computer. <i>ldaphost</i> can be a computer name or an IP address. |
| <code>-L</code>                 | Prints entries in LDIF format ( <code>-B</code> is implied)                                                                                           |
| <code>-l timelimit</code>       | Specifies maximum time (in seconds) to wait for <code>ldapsearch</code> command to complete                                                           |

| Optional Arguments        | Descriptions                                                                                                                                                                                                              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -n                        | Shows what would be done without actually searching                                                                                                                                                                       |
| -p <i>ldapport</i>        | Connects to the directory on TCP port <i>ldapport</i> . If you do not specify this option, the tool connects to the default port (389).                                                                                   |
| -P <i>wallet_password</i> | Specifies wallet password (required for one-way or two-way SSL connections)                                                                                                                                               |
| -S <i>attr</i>            | Sorts the results by attribute <i>attr</i>                                                                                                                                                                                |
| -t                        | Writes to files in /tmp                                                                                                                                                                                                   |
| -u                        | Includes user friendly entry names in the output                                                                                                                                                                          |
| -U <i>SSLAuth</i>         | Specifies the SSL authentication mode: <ul style="list-style-type: none"><li>▪ 1 for no authentication required</li><li>▪ 2 for one way authentication required</li><li>▪ 3 for two way authentication required</li></ul> |
| -v                        | Specifies verbose mode                                                                                                                                                                                                    |
| -w <i>passwd</i>          | Specifies bind passwd for simple authentication                                                                                                                                                                           |
| -W <i>wallet_location</i> | Specifies wallet location required for one-way or two-way SSL connections                                                                                                                                                 |
| -z <i>sizelimit</i>       | Specifies maximum number of entries to retrieve                                                                                                                                                                           |

## Examples of ldapsearch Filters

Study the following examples to see how to build your own search commands.

### Example 1: Base Object Search

The following example performs a base-level search on the directory from the root.

```
ldapsearch -p 389 -h myhost -b "" -s base -v "objectclass=*
```

- -b specifies base dn for search, root in this case.
- -s specifies whether the search is a base search (base), one level search (one) or subtree search (sub).
- "objectclass=\*" specifies the filter for search.

**Example 2: One-Level Search**

The following example performs a one level search starting at "ou=HR, ou=Americas, o=IMC, c=US".

```
ldapsearch -p 389 -h myhost -b "ou=HR, ou=Americas, o=IMC, c=US" -s one -v "objectclass=*"
```

**Example 3: Sub-Tree Search**

The following example performs a sub-tree search and returns all entries having a DN starting with "cn=Person".

```
ldapsearch -p 389 -h myhost -b "c=US" -s sub -v "cn=Person*"
```

**Example 4: Search Using Size Limit**

The following example actually retrieves only two entries, even if there are more than two matches.

```
ldapsearch -h myhost -p 389 -z 2 -b "ou=Benefits,ou=HR,ou=Americas,o=IMC,c=US" -s one "objectclass=*"
```

**Example 5: Search with Required Attributes**

The following example returns only the dn attribute values of the matching entries.

```
ldapsearch -p 389 -h myhost -b "c=US" -s sub -v "objectclass=*" dn
```

The following example retrieves only the distinguished name (dn) along with the surname (sn) and description (description) attribute values.

```
ldapsearch -p 389 -h myhost -b "c=US" -s sub -v "cn=Person*" dn sn description
```

**Other Examples:** Each of the following examples searches on port 389 of host sun1, and searches the whole subtree starting from the DN "ou=hr, o=acme, c=us".

The following example searches for all entries with any value for the objectclass attribute.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree "objectclass=*"
```

The following example searches for all entries that have `orcle` at the beginning of the value for the `objectclass` attribute.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree  
"objectclass=orcle"
```

The following example searches for entries where the `objectclass` attribute begins with `orcle` and `cn` begins with `foo`.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree  
"(&(objectclass=orcle*)(cn=foo*))"
```

The following example searches for entries in which the common name (`cn`) is not `foo`.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree "!(cn=foo)"
```

The following example searches for entries in which `cn` begins with `foo` or `sn` begins with `bar`.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree  
"(|(cn=foo*)(sn=bar*))"
```

The following example searches for entries in which `employeenumber` is less than or equal to 10000.

```
ldapsearch -p 389 -h sun1 -b "ou=hr, o=acme, c=us" -s subtree  
"employeenumber<=10000"
```

## LDAP Data Interchange Format (LDIF) Syntax

The standardized file format for directory entries is as follows:

| Property          | Value                     | Description                                                                                                   |
|-------------------|---------------------------|---------------------------------------------------------------------------------------------------------------|
| dn:               | <i>RDN,RDN,RDN, ...</i>   | Separate RDNs with commas.                                                                                    |
| <i>attribute:</i> | <i>attribute_value</i>    | This line repeats for every attribute in the entry, and for every attribute value in multi-valued attributes. |
| objectClass:      | <i>object_class_value</i> | This line repeats for every object class.                                                                     |

The following example shows a file entry for an employee. In this example, the first line contains the DN. The lines that follow the DN begin with the mnemonic for an attribute, followed by the value to be associated with that attribute. Note that each entry ends with lines defining the object classes for the entry.

```
dn: cn=Suzie Smith,ou=Server Technology,o=Acme, c=US
cn: Suzie Smith
cn: SuzieS
sn: Smith
email: ssmith@us.Acme.com
telephoneNumber: 69332
photo:/ORACLE_HOME/empdir/photog/ssmith.jpg
objectClass: organizational person
objectClass: person
objectClass: top
```

The next example shows a file entry for an organization.

```
dn: o=Acme,c=US
o: Oracle
ou: Financial Applications
objectClass: organization
objectClass: top
```

## LDIF Formatting Notes

A list of formatting rules follows. This list is not exhaustive.

- All mandatory attributes belonging to an entry being added must be included with non-null values in the LDIF file.

**Tip:** To see the mandatory and optional attribute types for an object class, use Oracle Directory Manager. See *Oracle Internet Directory Administrator's Guide* for details.

- Non-printing characters and tabs are represented in attribute values by base-64 encoding.
- The entries in your file must be separated from each other by a blank line.
- A file must contain at least one entry.
- Lines can be continued to the next line by beginning the continuation line with a space or a tab.
- Add a blank line between separate entries.
- Reference binary files, such as photographs, with the absolute address of the file, preceded by a forward slash ("/").
- The DN contains the full, unique directory address for the object.
- The lines listed after the DN contain both the attributes and their values. DNs and attributes used in the input file must match the existing structure of the DIT. Do not use attributes in the input file that you have not implemented in your DIT.
- Sequence the entries in an LDIF file so that the DIT is created from the top down. If an entry relies on an earlier entry for its DN, make sure that the earlier entry is added before its child entry.
- When you define schema within an LDIF file, insert a white space between the opening parenthesis and the beginning of the text, and between the end of the text and the ending parenthesis.

## Catalog Management Tool Syntax

Oracle Internet Directory uses indexes to make attributes available for searches. When Oracle Internet Directory is installed, the entry `cn=catalogs` lists available attributes that can be used in a search. Only those attributes that have an equality matching rule can be indexed.

If you want to use additional attributes in search filters, you must add them to the catalog entry. You can do this at the time you create the attribute by using Oracle Directory Manager. However, if the attribute already exists, then you can index it only by using the Catalog Management tool.

Before running the Catalog Management tool, unset the `LANG` variable. After you finish running Catalog Management tool, set the `LANG` variable back to its original value.

To unset `LANG`:

- Using Korn shell:

```
UNSET LANG
```

- Using C shell:

```
UNSETENV LANG
```

The Catalog Management tool uses this syntax:

```
catalog.sh -connect net_service_name {add|delete} {-attr attr_name| -file filename}
```

| Mandatory Argument                                 | Description                                                         |
|----------------------------------------------------|---------------------------------------------------------------------|
| - connect <i>net_service_name</i>                  | Specifies the net service name to connect to the directory database |
| <b>See Also:</b> <i>Net8 Administrator's Guide</i> |                                                                     |

| Optional Arguments              | Descriptions                                                |
|---------------------------------|-------------------------------------------------------------|
| - add -attr <i>attr_name</i>    | Indexes the specified attribute                             |
| - delete -attr <i>attr_name</i> | Drops the index from the specified attribute                |
| - add -file <i>filename</i>     | Indexes attributes (one per line) in the specified file     |
| -delete -file <i>filename</i>   | Drops the indexes from the attributes in the specified file |

When you enter the `catalog.sh` command, the following message appears:

```
This tool can only be executed if you know the OiD user password.  
Enter OiD password:
```

If you enter the correct password, the command is executed. If you give an incorrect password, the following message is displayed:

```
Cannot execute this tool
```

After you finish running the Catalog Management tool, set the `LANG` variable back to its original value.

To set `LANG`:

- Using Korn shell:

```
SET LANG=appropriate_language, EXPORT LANG
```

- Using C shell:

```
SETENV LANG appropriate_language
```

To effect the changes after running the Catalog Management tool, stop, then restart, the Oracle directory server.

**See Also:** *Oracle Internet Directory Administrator's Guide* for instructions on starting and restarting directory servers

## I

---

- interface calls, SSL, 2-3

## J

---

- Java, 1-2
- JNDI, 1-2
- JPEG images, adding with `ldapadd`, 3-4

## K

---

- Kerberos authentication, 3-3, 3-5, 3-9
- Kosiur, Dave, viii

## L

---

### LDAP

- search filters, IETF-compliant, 3-17
- LDAP Interchange Format (LDIF), 3-21
- LDAP server, third party, 2-23
- LDAP Version 2 C API, 2-2
- `ldap_init_SSL` call, 2-3
- `ldapadd`, 3-2
  - adding entries, 3-2
  - adding JPEG images, 3-4
  - syntax, 3-2
- `ldapaddmt`, 3-4
  - adding entries concurrently, 3-4
  - log, 3-4
  - syntax, 3-4
- `ldapbind`, 3-6
  - syntax, 3-6
- `ldapcompare`, 3-7
  - syntax, 3-7
- `ldapdelete`, 3-8
  - deleting entries, 3-8
  - syntax, 3-8
- `ldapmoddn`, 3-10
  - syntax, 3-10
- `ldapmodify`, 3-11
  - adding values to multiple-valued attributes, 3-13
  - change types, 3-13
  - creating group entries, 3-13
  - deleting entries, 3-14
  - LDIF files in, 3-2, 3-4, 3-11, 3-15
  - replacing attribute values, 3-14
  - syntax, 3-11
- `ldapmodifymt`
  - multithreaded processing, 3-16
  - syntax, 3-15
  - using, 3-15
- `ldapsearch`, 2-10, 3-17
  - filters, 3-18
  - syntax, 3-17
- LDIF
  - files, in `ldapmodify` commands, 3-2, 3-4, 3-11, 3-15
  - formatting notes, 3-22

- formatting rules, 3-22
- syntax, 3-21
- using, 3-21

## M

---

- modifying
  - entries
    - by using ldapmodify, 3-11
    - concurrently, using ldapmodifymt, 3-15
- multiple threads, 3-16
  - in ldapaddmt, 3-4
  - increasing the number of, 3-4
- multiple-valued attributes
  - adding values to, using ldapmodify, 3-13
- multithreaded command line tools
  - ldapaddmt, 3-4
  - ldapmodifymt, 3-16

## O

---

- object classes
  - adding
    - concurrently, using ldapaddmt, 3-4
    - in LDIF files, 3-21
- one-way SSL authentication, 2-2
- Oracle Directory Manager, 1-2
- Oracle Directory Manager, listing attribute types, 3-22
- Oracle directory replication server, 1-2
- Oracle directory server, 1-2
- Oracle extensions to support SSL, 2-2
- Oracle Internet Directory
  - components of, 1-2
- Oracle SSL call interface, 2-2
- Oracle SSL extensions, 2-2
- Oracle SSL-related libraries, 2-24
- Oracle system libraries, 2-24
- Oracle Wallet, 2-3
- Oracle Wallet Manager, 2-3
  - required for creating wallets, 2-23

## P

---

- performance, using multiple threads, 3-4

- platforms supported by Oracle Internet Directory, 1-2

## R

---

- Radicati, Sara, viii
- Relative Distinguished Names (RDNs)
  - modifying, using ldapmodify, 3-14
- removing
  - objects
    - using command line tools, 3-8, 3-11
- replacing attribute values, using ldapmodify, 3-14
- RFC 1823, 2-24
- rules
  - LDIF, 3-22

## S

---

- SDK components, 1-2
- search filters
  - IETF-compliant, 3-17
  - ldapsearch, 3-18
- searching
  - entries
    - using ldapsearch, 3-17
- SSL
  - authentication modes, 2-2
  - enabling, 3-3, 3-5, 3-6, 3-12, 3-16
  - handshake, 2-3
  - interface calls, 2-3
  - Oracle extensions, 2-2
    - provide encryption and decryption, 2-2
  - Oracle extensions to support, 2-2
  - wallets, 2-3
- syntax
  - command line tools, 3-2
  - ldapadd, 3-2
  - ldapaddmt, 3-4
  - ldapbind, 3-6
  - ldapcompare, 3-7
  - ldapdelete, 3-8
  - ldapmoddn, 3-10
  - ldapmodify, 3-11, 3-15
  - ldapsearch, 3-17
  - LDIF, 3-21

## syntaxes

catalog management tool, 3-23

ldapaddmt, 3-4

ldapcompare, 3-7

ldapdelete, 3-8

ldapmodify, 3-11

ldapsearch, 3-17

## T

---

TCP/IP Socket Library, 2-23

two-way authentication, SSL, 2-2

## W

---

wallets, SSL, 2-3
