An indexed table implicitly allocates memory to store values assigned to the indexed table’s elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user’s login (lifetime of a user’s session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, “empty” indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user’s session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table’s scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure FREE UNUSED_USER_MEMORY.

CREATE PACKAGE foobar
    type number_idx_tbl is table of number indexed by binary_integer;

store1_table number_idx_tbl; -- PL/SQL indexed table
store2_table number_idx_tbl; -- PL/SQL indexed table
store3_table number_idx_tbl;     -- PL/SQL indexed table

END;            -- end of foobar

DECLARE
...
empty_table   number_idx_tbl;     -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;           -- load data
  END LOOP;

  store1_table := empty_table;      -- "truncate" the indexed table

  dbms_session.free_unused_user_memory;  -- give memory back to system

  store1_table(1) := 100;           -- index tables still declared;
  store2_table(2) := 200;           -- but truncated.
...
END;
IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

```sql
DBMS_SESSION.IS_ROLE_ENABLED (    rolename VARCHAR2)    RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rolename</td>
<td>Name of the role.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_role_enabled</td>
<td>TRUE or FALSE, depending on whether the role is enabled.</td>
</tr>
</tbody>
</table>
IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```sql
DBMS_SESSION.IS_SESSION_ALIVE (uniqueid VARCHAR2) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uniqueid</td>
<td>Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_session_alive</td>
<td>TRUE or FALSE, depending on whether the session is active.</td>
</tr>
</tbody>
</table>
This procedure returns a list of active namespaces and contexts for the current session.

**Syntax**

```sql
TYPE AppCtxRecTyp IS RECORD (
   namespace VARCHAR2(30),
   attribute VARCHAR2(30),
   value     VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
   list OUT AppCtxTabTyp,
   size OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Buffer to store a list of application context set in the current session.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list of (namespace, attribute, values) set in current session.</td>
</tr>
<tr>
<td>size</td>
<td>Returns the number of entries in the buffer returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The context information in the list appears as a series of `<namespace> <attribute> <value>`. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.
MODIFY_PACKAGE_STATE Procedure

This procedure can be used to perform various actions (as specified by the action_flags parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the DBMS_SESSION constants listed in Table 86–12.

Syntax

```sql
DBMS_SESSION.MODIFY_PACKAGE_STATE(
    action_flags IN PLS_INTEGER);
```
### Parameters

Table 86–11  MODIFY_PACKAGE_STATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| action_flags  | Bit flags that determine the action taken on PL/SQL program units:  

- `DBMS_SESSION.FREE_ALL_RESOURCES` (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking `MODIFY_PACKAGE_STATE` with the `DBMS_SESSION.FREE_ALL_RESOURCES` parameter provides functionality identical to the `DBMS_SESSION.RESET_PACKAGE()` interface.  

- `DBMS_SESSION.REINITIALIZE` (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the `DBMS_SESSION.REINITIALIZE` flag is similar to the `DBMS_SESSION.FREE_ALL_RESOURCES` flag in that both have the effect of reinitializing all packages. However, `DBMS_SESSION.REINITIALIZE` should exhibit better performance than the `DBMS_SESSION.FREE_ALL_RESOURCES` option because:  

  - Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused.  

  - Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use.  

  - The session memory for PL/SQL modules without global state (such as types, stored-procedures) will not be freed and recreated. |
Usage Notes

See the parameter descriptions in Table 86–11 for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 86–12  Action_flags Constants for MODIFY_PACKAGE_STATE

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREE_ALL_RESOURCES</td>
<td>PLS_INTEGER := 1</td>
</tr>
<tr>
<td>REINITIALIZE</td>
<td>PLS_INTEGER := 2</td>
</tr>
</tbody>
</table>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```plsql
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/

package body P is
  v varchar2(20) := 'hello';
  procedure bar is
    begin
      ...
    end;
  procedure init_pkg is
    begin
      ....
    end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:
MODIFY_PACKAGE_STATE Procedure

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body

The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.

- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.

- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages will remain until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).

- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use DBMS_SESSION.MODIFY_PACKAGE_STATE(2) on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_
SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
    begin
      dbms_output.put_line('P.cnt = ' || cnt);
      if c%ISOPEN then
        dbms_output.put_line('P.c is OPEN');
      else
        dbms_output.put_line('P.c is CLOSED');
      end if;
    end;
end P;
/
show errors;
```

```
SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
  4   P.print_status;
  5 end;
  6 /
P.cnt = 111
P.c is OPEN
PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3 end;
  4 /
PL/SQL procedure successfully completed.
```
MODIFY_PACKAGE_STATE Procedure

```
SQL> set serveroutput on;
SQL>
SQL> begin
  2  P.print_status;
  3  end;
  4  /
P.cnt = 0
P.c is CLOSED

PL/SQL procedure successfully completed.
```
RESET_PACKAGE Procedure

This procedure deinstantiates all packages in this session. It frees the package state.

---

**Note:** See "MODIFY_PACKAGE_STATE Procedure" on page 86-15. The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

---

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to RESET_PACKAGE frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

RESET_PACKAGE can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. RESET_PACKAGE guarantees that all package variables are reset to their initial values.

**Syntax**

```
DBMS_SESSION.RESET_PACKAGE;
```

**Usage Notes**

Because the amount of memory consumed by all executed PL/SQL can become large, you might use RESET_PACKAGE to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values will not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

RESET_PACKAGE does not free the memory, cursors, and package variables immediately when called.
For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

**Examples**

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn’t need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

**SET_CONTEXT Procedure**

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

**Syntax**

```sql
DBMS_SESSION.SET_CONTEXT (  
  namespace VARCHAR2,  
  attribute VARCHAR2,  
  value VARCHAR2,  
  username VARCHAR2,  
  client_id VARCHAR2 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>The namespace of the application context to be set, limited to 30 bytes.</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute of the application context to be set, limited to 30 bytes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the application context to be set, limited to 4 kilobytes.</td>
</tr>
<tr>
<td>username</td>
<td>The database username attribute of the application context. Default: NULL</td>
</tr>
<tr>
<td>client_id</td>
<td>The application-specific client_id attribute of the application context (64-byte maximum). Default: NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

Note the following:

- For 8i compatibility, only the first three parameters are used.
- The first three parameters are required for all types of context.
The **username** parameter must be a valid SQL identifier

The **client_id** parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for **set_identifier**.

If the namespace parameter is a global context namespace, then the **username** parameter is matched against the current database user name in the session, and the **client_id** parameter will be matched against the current **client_id** in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.

This procedure must be invoked directly or indirectly by the trusted package.

The caller of **SET_CONTEXT** must be in the calling stack of a procedure that has been associated to the context namespace through a **CREATE CONTEXT** statement. The checking of the calling stack does not cross a DBMS boundary.

No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
**SET_IDENTIFIER**

This procedure sets the client ID in the session.

**Syntax**

```sql
DBMS_SESSION.SET_IDENTIFIER (client_id VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>The application-specific identifier of the current database session.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Note the following:

- `SET_IDENTIFIER` initializes the current session with a client identifier to identify the associated global application context
- `client_id` is case sensitive; it must match the `client_id` parameter in the `set_context` command
- This procedure is executable by public
SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```
ALTER SESSION SET <nls_parameter> = <value>
```

**Syntax**

```
DBMS_SESSION.SET_NLS (
    param VARCHAR2,
    value VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param</td>
<td>Globalization Support parameter. The parameter name must begin with 'NLS'.</td>
</tr>
<tr>
<td>value</td>
<td>Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, 'set_nls('nls_date_format','&quot;DD-MON-YY&quot;)'.</td>
</tr>
</tbody>
</table>
**SET_ROLE Procedure**

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

**Syntax**

```sql
DBMS_SESSION.SET_ROLE (role_cmd VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_cmd</td>
<td>This text is appended to &quot;set role&quot; and then run as SQL.</td>
</tr>
</tbody>
</table>
SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (sql_trace boolean);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_trace</td>
<td>TRUE turns tracing on, FALSE turns tracing off.</td>
</tr>
</tbody>
</table>
### SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user’s current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

**Syntax**

```sql
DBMS_SESSION.switch_current_consumer_group (
  new_consumer_group     IN  VARCHAR2,
  old_consumer_group     OUT VARCHAR2,
  initial_group_on_error IN  BOOLEAN);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_consumer_group</td>
<td>Name of consumer group to which you want to switch.</td>
</tr>
<tr>
<td>old_consumer_group</td>
<td>Name of the consumer group from which you just switched out.</td>
</tr>
<tr>
<td>initial_group_on_error</td>
<td>If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error.</td>
</tr>
</tbody>
</table>

**Return Values**

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

**Note:** You can switch back to the old consumer group later using the value returned in `old_consumer_group`. 
UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```sql
DBMS_SESSION.UNIQUE_SESSION_ID
RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unique_session_id</td>
<td>Returns up to 24 bytes.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>29368</td>
<td>Non-existent consumer group.</td>
</tr>
<tr>
<td>1031</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>29396</td>
<td>Cannot switch to OTHER_GROUPS consumer group.</td>
</tr>
</tbody>
</table>

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (old_consumer_group) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting initial_group_on_error to TRUE, SWITCH_CURRENT_CONSUMER_GROUP puts the current session into the default group, if it can’t put it into the group.
designated by new_consumer_group. The error associated with the attempt to move a session into new_consumer_group is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error will be thrown, but the consumer group will not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrpl', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

    EXCEPTION
      WHEN OTHERS THEN
        -- It is possible that the procedure owner does not have privileges
        -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
        -- that the user is moved out of the privileged group in such a
        -- situation

        dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
        RAISE;
        END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task; /
UNIQUE_SESSION_ID Function
The DBMS_SHARED_POOL package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. DBMS_SHARED_POOL enables you to display the sizes of objects in the shared pool, and mark them for keeping or unkeeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- Using DBMS_SHARED_POOL
  - Overview
  - Operational Notes
- Summary of DBMS_SHARED_POOL Subprograms
Using DBMS_SHARED_POOL

- Overview
- Operational Notes

Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

Operational Notes

To create DBMS_SHARED_POOL, run the DBMSPool.SQL script. The PRVTPool.PLB script is automatically executed after DBMSPool.SQL runs. These scripts are not run by CATPROC.SQL.
### Summary of DBMS_SHARED_POOL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED_REQUEST_THRESHOLD Procedure on page 87-4</td>
<td>Sets the aborted request threshold for the shared pool</td>
</tr>
<tr>
<td>KEEP Procedure on page 87-5</td>
<td>Keeps an object in the shared pool</td>
</tr>
<tr>
<td>SIZES Procedure on page 87-7</td>
<td>Shows objects in the shared pool that are larger than the specified size</td>
</tr>
<tr>
<td>UNKEEP Procedure on page 87-8</td>
<td>Unkeeps the named object</td>
</tr>
</tbody>
</table>
ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
    threshold_size NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold_size</td>
<td>Size, in bytes, of a request which does not try to free unpinned (not &quot;unkeep-ed&quot;) memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.</td>
</tr>
</tbody>
</table>

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than threshold_size. This user gets the ‘out of memory’ error without attempting to search the LRU list.
**KEEP Procedure**

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

**Syntax**

```sql
DBMS_SHARED_POOL.KEEP (
    name VARCHAR2,
    flag CHAR     DEFAULT 'P');
```

**Parameters**

- **name**
  - Name of the object to keep.
  - The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure.
  - Currently, TABLE and VIEW objects may not be kept.

- **flag**
  - (Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name.
  - Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function.
  - Set to 'T' or 't' to specify that the input is the name of a type.
  - Set to 'R' or 'r' to specify that the input is the name of a trigger.
  - Set to 'Q' or 'q' to specify that the input is the name of a sequence.
  - In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.

**Exceptions**

An exception is raised if the named object cannot be found.
Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```sql
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871')`. The complete hexadecimal address must be in the first 8 characters.
SIZES Procedure

This procedure shows objects in the shared_pool that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the KEEP or UNKEEP calls.

Syntax

```sql
DBMS_SHARED_POOL.SIZES {
  minsize NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minsize</td>
<td>Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.</td>
</tr>
</tbody>
</table>

Usage Notes

Issue the SQLDBA or SQLPLUS 'SET SERVEROUTPUT ON SIZE XXXXX' command prior to using this procedure so that the results are displayed.
UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (  
    name VARCHAR2,  
    flag CHAR DEFAULT 'P');
```

**Caution:** This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

**Table 87–5  UNKEEP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object to unkeep. See description of the name object for the KEEP procedure.</td>
</tr>
<tr>
<td>flag</td>
<td>See description of the flag parameter for the KEEP procedure.</td>
</tr>
</tbody>
</table>

Exceptions

An exception is raised if the named object cannot be found.
The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Using `DBMS_SPACE`
  - Security Model
- Summary of `DBMS_SPACE` Subprograms
Using DBMS_SPACE

Security Model

This package runs with SYS privileges. The execution privilege is granted to PUBLIC. Subprograms in this package run under the caller security. The user must have ANALYZE privilege on the object.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_INDEX_COST Procedure on page 88-4</td>
<td>Determines the cost of creating an index on an existing table</td>
</tr>
<tr>
<td>CREATE_TABLE_COST Procedures on page 88-5</td>
<td>Determines the size of the table given various attributes.</td>
</tr>
<tr>
<td>FREE_BLOCKS Procedure on page 88-7</td>
<td>Returns information about free blocks in an object (table, index, or cluster)</td>
</tr>
<tr>
<td>OBJECT_DEPENDENT_SEGMENTS Function on page 88-10</td>
<td>Returns the list of segments that are associated with the object</td>
</tr>
<tr>
<td>OBJECT_GROWTH_TREND Function on page 88-13</td>
<td>A table function where each row describes the space usage of the object at a specific point in time</td>

<td>Returns information about free blocks in a auto segment space managed segment</td>
</tr>
<tr>
<td>UNUSED_SPACE Procedure on page 88-18</td>
<td>Returns information about unused space in an object (table, index, or cluster)</td>
</tr>
</tbody>
</table>
CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (  
    ddl IN VARCHAR2,  
    used_bytes OUT NUMBER,  
    alloc_bytes OUT NUMBER,  
    plan_table IN VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 88–2 CREATE_INDEX_COST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl</td>
<td>The create index DDL statement</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The number of bytes representing the actual index data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>Size of the index when created in the tablespace</td>
</tr>
<tr>
<td>plan_table</td>
<td>Which plan table to use, default NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.
CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given
various attributes. The size of the object can vary widely based on the tablespace
storage attributes, tablespace block size, and so on. There are two overloads of this
procedure.

- The first version takes the column information of the table as argument and
  output the table size.
- The second version takes the average row size of the table and outputs the table
  size.

This procedure can be used on tablespace of dictionary managed and locally
managed extent management as well as manual and auto segment space management.

Syntax

DBMS_SPACE.CREATE_TABLE_COST (   
tablespace_name    IN VARCHAR2,
avg_row_size       IN NUMBER,
row_count          IN NUMBER,
pct_free           IN NUMBER,
used_bytes         OUT NUMBER,
alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (   
tablespace_name    IN VARCHAR2,
colinfos           IN CREATE_TABLE_COST_COLUMNS,
row_count          IN NUMBER,
pct_free           IN NUMBER,
used_bytes         OUT NUMBER,
alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (   
COL_TYPE   VARCHAR2(200),
COL_SIZE   NUMBER);
CREATE_TABLE_COST Procedures

Parameters

Table 88–3  FREE_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace in which the object will be created. The default is SYSTEM tablespace.</td>
</tr>
<tr>
<td>avg_row_size</td>
<td>The anticipated average row size in the table.</td>
</tr>
<tr>
<td>colinfos</td>
<td>The description of the columns.</td>
</tr>
<tr>
<td>row_count</td>
<td>The anticipated number of rows in the table.</td>
</tr>
<tr>
<td>pct_free</td>
<td>The percentage of free space in each block for future expansion of existing rows due to updates.</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The space used by user data.</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>The size of the object taking into account the tablespace extent characteristics.</td>
</tr>
</tbody>
</table>

Usage Notes

- The **used_bytes** represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The **alloc_bytes** represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.
FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See "SPACE_USAGE Procedure" for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (  
    segment_owner     IN  VARCHAR2,  
    segment_name      IN  VARCHAR2,  
    segment_type      IN  VARCHAR2,  
    freelist_group_id IN  NUMBER,  
    free_blks         OUT NUMBER,  
    scan_limit        IN  NUMBER DEFAULT NULL,  
    partition_name    IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

```
Table 88–4  FREE_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed.</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed.</td>
</tr>
</tbody>
</table>
```
Examples

Example 1
The following declares the necessary bind variables and executes.

```plsql
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
  :total_bytes,:unused_blocks, :unused_bytes, :lastextf,
  :last_extb, :lastusedblock);
```

This fills the unused space information for bind variables in EMP table in SCOTT schema.
Example 2
The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);

---

**Note:** An error is raised if scan_limit is not a positive number.
OBJECT_DEPENDENT_SEGMENT Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```sql
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
    objowner    IN     VARCHAR2,
    objname     IN     VARCHAR2,
    partname    IN     VARCHAR2,
    objtype     IN     NUMBER
) RETURN dependent_segments_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objowner</td>
<td>The schema containing the object.</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>partname</td>
<td>The name of the partition.</td>
</tr>
</tbody>
</table>
Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD {
    segment_owner VARCHAR2(100),
    segment_name  VARCHAR2(100),
    segment_type  VARCHAR2(100),
    tablespace_name  VARCHAR2(100),
    partition_name  VARCHAR2(100));
```

Table 88–6  OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>The schema containing the segment.</td>
</tr>
<tr>
<td>segment_name</td>
<td>The name of the segment.</td>
</tr>
</tbody>
</table>
Table 88–6 (Cont.) OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_type</td>
<td>The type of the segment, such as table, index or LOB.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition, if any.</td>
</tr>
</tbody>
</table>
OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```sql
DBMS_SPACE.OBJECT_GROWTH_TREND (
    object_owner IN VARCHAR2,
    object_name IN VARCHAR2,
    object_type IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    start_time IN TIMESTAMP DEFAULT NULL,
    end_time IN TIMESTAMP DEFAULT NULL,
    interval IN DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
    skip_interpolated IN VARCHAR2 DEFAULT 'FALSE',
    timeout_seconds IN NUMBER DEFAULT NULL,
    single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema containing the object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>object_type</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition.</td>
</tr>
<tr>
<td>start_time</td>
<td>Statistics generated after this time will be used in regenerating the growth trend.</td>
</tr>
<tr>
<td>end_time</td>
<td>Statistics generated until this time will be used in generating the growth trend.</td>
</tr>
<tr>
<td>interval</td>
<td>The interval at which to sample.</td>
</tr>
<tr>
<td>skip_interpolated</td>
<td>Whether interpolation of missing values should be skipped.</td>
</tr>
</tbody>
</table>
OBJECT_GROWTH_TREND Function

Return Values

The object_growth_trend_row and object_growth_trend_table are used by the OBJECT_GROWTH_TREND table function to describe its output.

Table 88–7  (Cont.) OBJECT_GROWTH_TREND Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout_seconds</td>
<td>The timeout value for the function in seconds.</td>
</tr>
<tr>
<td>single_data_point_flag</td>
<td>Whether in the absence of statistics the segment should be sampled.</td>
</tr>
</tbody>
</table>

Table 88–8  OBJECT_GROWTH_TREND_ROW Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timepoint</td>
<td>The time at which the statistic was recorded.</td>
</tr>
<tr>
<td>space_usage</td>
<td>The size of the segment including overhead and unused space.</td>
</tr>
<tr>
<td>space_alloc</td>
<td>The space used by data.</td>
</tr>
<tr>
<td>quality</td>
<td>The quality of result: &quot;GOOD&quot;, &quot;INTERPOLATED&quot;, &quot;PROJECTION&quot;.</td>
</tr>
</tbody>
</table>

TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
**SPACE_USAGE Procedure**

This procedure shows the space usage of data blocks under the segment High Water Mark. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. This procedure can only be used on tablespaces that are created with auto segment space management.

**Syntax**

```sql
DBMS_SPACE.SPACE_USAGE(
    segment_owner IN VARCHAR2,
    segment_name IN VARCHAR2,
    segment_type IN VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes OUT NUMBER,
    fs1_blocks OUT NUMBER,
    fs1_bytes OUT NUMBER,
    fs2_blocks OUT NUMBER,
    fs2_bytes OUT NUMBER,
    fs3_blocks OUT NUMBER,
    fs3_bytes OUT NUMBER,
    fs4_blocks OUT NUMBER,
    fs4_bytes OUT NUMBER,
    full_blocks OUT NUMBER,
    full_bytes OUT NUMBER,
    partition_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Table 88–9</th>
<th>SPACE_USAGE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the segment to be analyzed</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER)</td>
</tr>
<tr>
<td>unformatted_blocks</td>
<td>Total number of blocks that are unformatted</td>
</tr>
<tr>
<td>unformatted_bytes</td>
<td>Total number of bytes that are unformatted</td>
</tr>
</tbody>
</table>
SPACE_USAGE Procedure

Table 88–9 (Cont.) SPACE_USAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fs1_blocks</td>
<td>Number of blocks that has at least 0 to 25% free space</td>
</tr>
<tr>
<td>fs1_bytes</td>
<td>Number of bytes that has at least 0 to 25% free space</td>
</tr>
<tr>
<td>fs2_blocks</td>
<td>Number of blocks that has at least 25 to 50% free space</td>
</tr>
<tr>
<td>fs2_bytes</td>
<td>Number of bytes that has at least 25 to 50% free space</td>
</tr>
<tr>
<td>fs3_blocks</td>
<td>Number of blocks that has at least 50 to 75% free space</td>
</tr>
<tr>
<td>fs3_bytes</td>
<td>Number of bytes that has at least 50 to 75% free space</td>
</tr>
<tr>
<td>fs4_blocks</td>
<td>Number of blocks that has at least 75 to 100% free space</td>
</tr>
<tr>
<td>fs4_bytes</td>
<td>Number of bytes that has at least 75 to 100% free space</td>
</tr>
<tr>
<td>full_blocks</td>
<td>Total number of blocks that are full in the segment</td>
</tr>
<tr>
<td>full_bytes</td>
<td>Total number of bytes that are full in the segment</td>
</tr>
</tbody>
</table>

Examples

```sql
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
  dbms_space.space_usage('U1','T',
    'TABLE',
    :unf, :unfb,
    :fs1, :fs1b,
    :fs2, :fs2b,
    :fs3, :fs3b,
    :fs4, :fs4b,
    :full, :fullb);
end;
/
```
print unf ;
print unfb ;
print fs4 ;
print fs4b ;
print fs3 ;
print fs3b ;
print fs2 ;
print fs2b ;
print fs1 ;
print fs1b ;
print full ;
print fullb ;
This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```sql
DBMS_SPACE.UNUSED_SPACE (  
    segment_owner              IN  VARCHAR2,  
    segment_name               IN  VARCHAR2,  
    segment_type               IN  VARCHAR2,  
    total_blocks               OUT NUMBER,  
    total_bytes                OUT NUMBER,  
    unused_blocks              OUT NUMBER,  
    unused_bytes               OUT NUMBER,  
    last_used_extent_file_id   OUT NUMBER,  
    last_used_extent_block_id  OUT NUMBER,  
    last_used_block            OUT NUMBER,  
    partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed.</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed.</td>
</tr>
</tbody>
</table>
Table 88–10  UNUSED_SPACE Procedure Parameters

</tr>
</tbody>
</table>
UNUSED_SPACE Procedure
The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

**See Also:** Oracle Database Administrator’s Guide for an example and description of using DBMS_SPACE_ADMIN.

This chapter contains the following topics:

- Using DBMS_SPACE_ADMIN
  - Security Model
  - Constants
  - Operational Notes
- Summary of DBMS_SPACE_ADMIN Subprograms
Using DBMS_SPACE_ADMIN

Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_VERIFY Procedure</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used.</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_EXTENTSGLOBAL</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it.</td>
</tr>
<tr>
<td>SEGMENT_MARK_CORRUPT</td>
<td>Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation).</td>
</tr>
<tr>
<td>SEGMENT_MARK_VALID</td>
<td>Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.</td>
</tr>
<tr>
<td>SEGMENT_DUMP_EXTENT_MAP</td>
<td>Dumps the extent map for a given segment.</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY_BITMAP</td>
<td>Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent.</td>
</tr>
</tbody>
</table>
Operational Notes

Before you migrate the SYSTEM tablespace, you should migrate any dictionary-managed tablespaces that you may want to use in read/write mode to locally managed. After the SYSTEM tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

See Also:
- Oracle Database Administrator’s Guide
- "TABLESPACE_MIGRATE_TO_LOCAL Procedure" on page 89-13

Before migrating the SYSTEM tablespace, the following conditions must be met. These conditions are enforced by the TABLESPACE_MIGRATE_TO_LOCAL procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not SYSTEM.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

<td>TABLESPACE_REBUILD QUOTAS Procedure on page 89-16</td>
<td>Rebuilds quotas for given tablespace</td>
</tr>
<tr>
<td>TABLESPACE_RELOCATE_BITMAPS Procedure on page 89-17</td>
<td>Relocates the bitmaps to the destination specified</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY Procedure on page 89-19</td>
<td>Verifies that the bitmaps and extent maps for the segments in the tablespace are in sync</td>
</tr>
</tbody>
</table>
SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
    tablespace_name IN VARCHAR2,
    header_relative_file IN POSITIVE,
    header_block IN POSITIVE,
    corrupt_option IN POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides.</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header.</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header.</td>
</tr>
<tr>
<td>corrupt_option</td>
<td>SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID.</td>
</tr>
</tbody>
</table>

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 3);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 4);
```
SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment should have been marked temporary. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
    tablespace_name         IN    VARCHAR2,
    header_relative_file    IN    POSITIVE,
    header_block            IN    POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides.</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header.</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header.</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure cannot be used on the SYSTEM tablespace.

The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```
SEGMENT_DUMP Procedure

This procedure dumps the segment header and extent map blocks of the given segment.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    POSITIVE,
    dump_option          IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides.</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header.</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header.</td>
</tr>
<tr>
<td>dump_option</td>
<td>SEGMENT_DUMP_EXTENT_MAP.</td>
</tr>
</tbody>
</table>

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```
SEGMENT_VERIFY Procedure

This procedure verifies that the extent map of the segment is consistent with the bitmap.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (  
  tablespace_name    IN    VARCHAR2,  
  header_relative_file IN    POSITIVE,  
  header_block       IN    POSITIVE,  
  verify_option      IN    POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides.</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header.</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header.</td>
</tr>
<tr>
<td>verify_option</td>
<td>What kind of check to do: SEGMENT_VERIFY_EXTENTS or SERMENT_VERIFY_EXTENTS_GLOBAL.</td>
</tr>
</tbody>
</table>

Usage Notes

Anomalies are output as dba-range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all dba-ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps in sync.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, 1);
```
Note: All DBMS_SPACE_ADMIN package examples use the tablespace USERS which contains SCOTT.EMP.
TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate DBA range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (  
    tablespace_name         IN    VARCHAR2,  
    dbarange_relative_file  IN    POSITIVE,  
    dbarange_begin_block    IN    POSITIVE,  
    dbarange_end_block      IN    POSITIVE,  
    fix_option              IN    POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace.</td>
</tr>
<tr>
<td>dbarange_relative_file</td>
<td>Relative file number of DBA range (extent).</td>
</tr>
<tr>
<td>dbarange_begin_block</td>
<td>Block number of beginning of extent.</td>
</tr>
<tr>
<td>dbarange_end_block</td>
<td>Block number (inclusive) of end of extent.</td>
</tr>
<tr>
<td>fix_option</td>
<td>TABLESPACE_EXTENT_MAKE_FREE or TABLESPACE_EXTENT_MAKE_USED.</td>
</tr>
</tbody>
</table>

Examples

The following example marks bits for 50 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, 7);
```

Alternately, specifying an option of 8 marks the bits FREE in bitmaps. The BEGIN and END blocks should be in extent boundary and should be extent multiple. Otherwise, an error is raised.
TABLESPACE_FIX_SEGMENT_STATES Procedure

Use this procedure to fix the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, the segment states are corrected by SMON when event 10906 is set. Database with segments is such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (tablespace_name IN VARCHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace whose segments need to be fixed.</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```
TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally-managed tablespace to a dictionary-managed tablespace. You cannot use this procedure for SYSTEM tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (tablespace_name IN VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace.</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```
**TABLESPACE_MIGRATE_TO_LOCAL Procedure**

Use this procedure to migrate the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

**Syntax**

```sql
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name     IN     VARCHAR,
    allocation_unit     IN     INTEGER,
    relative_fno        IN     INTGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to be migrated.</td>
</tr>
<tr>
<td>allocation_unit</td>
<td>Unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace.</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative File Number of the file where the bitmap blocks should be placed (optional).</td>
</tr>
</tbody>
</table>

**Usage Notes**

- **Note:** Do not migrate the SYSTEM tablespace without a clear understanding of the conditions that must be met. Refer to Operational Notes on page 89-3.

The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the MINIMUM EXTENT for the tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every file will be ignored for GCD calculation. If you specify the unit size, it has to be a
TABLESPACE_MIGRATE_TO_LOCAL Procedure

factor of the UNIT size calculated by the system, otherwise an error message is returned.

The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, an error is issued. The datafile specified should be part of the tablespace being migrated. If the datafile is not specified then the system will choose a datafile in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, an error will be raised.

Examples

To migrate a tablespace 'TS1' with minimum extent size 1m, use

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);

The bitmaps will be placed in file with relative file number 2.
TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block DBA is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
  tablespace_name         IN    VARCHAR2,
  bitmap_relative_file    IN    POSITIVE   DEFAULT NULL,
  bitmap_block            IN    POSITIVE   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace.</td>
</tr>
<tr>
<td>bitmap_relative_file</td>
<td>Relative file number of bitmap block to rebuild.</td>
</tr>
<tr>
<td>bitmap_block</td>
<td>Block number of bitmap block to rebuild.</td>
</tr>
</tbody>
</table>

Usage Notes

**Note:** Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```
TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
    tablespace_name    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace.</td>
</tr>
</tbody>
</table>

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```
TABLESPACE_RELOCATE_BITMAPS Procedure

Use this procedure to relocate the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (  
    tablespace_name    IN      VARCHAR,
    relative_fno       IN      NUMBER,
    block_number       IN      NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of Tablespace.</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative File Number of the destination file.</td>
</tr>
<tr>
<td>block_number</td>
<td>Block Number of the destination dba.</td>
</tr>
</tbody>
</table>

Usage Notes

Migration of a tablespace from dictionary managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If the user wishes to explicitly resize a file at or below the space header segment, an error is issued. Use the `tablespace_relocate_bitmaps` command to move the control information to a different destination and then resize the file.

This procedure cannot be used on the SYSTEM tablespace.

The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.
Note: The source and the destination addresses should not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location an error is raised.
TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are in sync.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
tablespace_name IN VARCHAR2,  
verify_option IN POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace.</td>
</tr>
<tr>
<td>verify_option</td>
<td>TABLESPACE_VERIFY_BITMAP.</td>
</tr>
</tbody>
</table>

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```
The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE procedure supplied with the DBMS_SQL package.

See Also: For more information on native dynamic SQL, see PL/SQL User’s Guide and Reference.

For a comparison of DBMS_SQL and native dynamic SQL, see Oracle Database Application Developer’s Guide - Fundamentals.

This chapter contains the following topics:

- Using DBMS_SQL
  - Overview
  - Security Model
  - Constants
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_SQL Subprograms
Overview

Oracle lets you to write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, native dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, there are some tasks that can only be performed using `DBMS_SQL`.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

**See Also:** *Oracle Call Interface Programmer’s Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI uses bind by address, while the `DBMS_SQL` package uses bind by value.
With DBMS_SQL you must call VARIABLE_VALUE to retrieve the value of an OUT parameter for an anonymous block, and you must call COLUMN_VALUE after fetching rows to actually retrieve the values of the columns in the rows into your program.

The current release of the DBMS_SQL package does not provide CANCEL cursor procedures.

Indicator variables are not required, because NULLs are fully supported as values of a PL/SQL variable.

A sample usage of the DBMS_SQL package follows. For users of the Oracle Call Interfaces, this code should seem fairly straightforward.

Security Model

DBMS_SQL is compiled with AUTHID CURRENT_USER.

Any DBMS_SQL subprograms called from an anonymous PL/SQL block are run using the privileges of the current user.

See Also: For more information about invoking subprograms using either Invoker or Definer Rights, see PL/SQL User’s Guide and Reference

Constants

v6 constant INTEGER := 0;
native constant INTEGER := 1;
v7 constant INTEGER := 2;

Types

General Types

- DESC_REC, DESC_TAB
- VARCHAR2A, DESC_REC2
- VARCHAR2_TABLE

Bulk SQL Types

- BFILE_TABLE
Types

- BINARY_DOUBLE_TABLE
- BLOB_TABLE
- CLOB_TABLE
- DATE_TABLE
- INTERVAL_DAY_TO_SECOND_TABLE
- INTERVAL_YEAR_TO_MONTH_TABLE
- NUMBER_TABLE
- TIME_TABLE
- TIME_WITH_TIME_ZONE_TABLE
- TIMESTAMP_TABLE
- TIMESTAMP_WITH_LTZ_TABLE
- UROWID_TABLE
- VARCHAR2_TABLE

BFILE_TABLE

    col_charsetid       binary_integer := 0,
    col_charsetform     binary_integer := 0,
    col_null_ok         boolean        := TRUE);

TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;

VARCHAR2S

TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;

Exceptions

inconsistent_type EXCEPTION;
pragma exception_init(inconsistent_type, -6562);

This exception is raised by the COLUMN_VALUE Procedure or the VARIABLEVALUE Procedures when the type of the given OUT parameter (for where to put the requested value) is different from the type of the value.
Operational Notes

Execution Flow

**OPEN_CURSOR**
To process a SQL statement, you must have an open cursor. When you call
the OPEN_CURSOR function, you receive a cursor ID number for the data
structure representing a valid cursor maintained by Oracle. These cursors are
distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are
used only by the DBMS_SQL package.

**PARSE**
Every SQL statement must be parsed by calling the PARSE Procedure. Parsing the
statement checks the statement's syntax and associates it with the cursor in your
program.

You can parse any DML or DDL statement. DDL statements are run on the parse,
which performs the implied commit.

---

**Note:** When parsing a DDL statement to drop a package or a
procedure, a deadlock can occur if you're still using a procedure in
the package. After a call to a procedure, that procedure is
considered to be in use until execution has returned to the user
side. Any such deadlock timeouts after five minutes.

---

The execution flow of DBMS_SQL is shown in Figure 90–1.

BIND_VARIABLE or BIND_ARRAY
Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures, the BIND_ARRAY Procedures on page 90-27 or the BIND_VARIABLE Procedures on page 90-30, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.

DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

EXECUTE
Call the EXECUTE function to run your SQL statement.

FETCH_ROWS or EXECUTE_AND_FETCH
The FETCH_ROWS function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling EXECUTE and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH if you are calling EXECUTE for a single execution.
**VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG**

For queries, call `COLUMN_VALUE` to determine the value of a column retrieved by the `FETCH_ROWS` call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with `returning` clause, call `VARIABLE_VALUE` to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a LONG database column (which can be up to two gigabytes in size), use the `COLUMN_VALUE_LONG` procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

**CLOSE_CURSOR**

When you no longer need a cursor for a session, close the cursor by calling `CLOSE_CURSOR`. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your Oracle Open Gateway documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

**Processing Queries**

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the `DEFINE_COLUMN` Procedure, the `DEFINE_COLUMN_LONG` Procedure, or the `DEFINE_ARRAY` Procedure.
2. Run your `SELECT` statement by calling the `EXECUTE` Function.
3. Call the `FETCH_ROWS` Function (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call `COLUMN_VALUE Procedure` or `COLUMN_VALUE_LONG Procedure` to determine the value of a column retrieved by the `FETCH_ROWS` Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the `VARIABLE_VALUE Procedures` to retrieve the values assigned to the output variables of these procedures.

**Processing Updates, Inserts, and Deletes**

If you are using dynamic SQL to process an INSERT, UPDATE, or DELETE, then you must perform the following steps:

1. You must first run your INSERT, UPDATE, or DELETE statement by calling the `EXECUTE` Function.
2. If statements have the `returning` clause, then you must call the `VARIABLE_VALUE Procedures` to retrieve the values assigned to the output variables.

**Locating Errors**

There are additional functions in the DBMS_SQL package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain DBMS_SQL calls. For example, you call the `LAST_ERROR_POSITION Function` immediately after a `PARSE`.

**Examples**

This section provides example procedures that make use of the DBMS_SQL package.

**Example 1**

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrate the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```sql
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
  cursor_name INTEGER;
  rows_processed INTEGER;
BEGIN
  cursor_name := dbms_sql.open_cursor;
  DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                 dbms_sql.native);
  DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
  rows_processed := dbms_sql.execute(cursor_name);
  DBMS_SQL.close_cursor(cursor_name);
EXCEPTION
  WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

**Example 2**

The following sample procedure is passed a SQL statement, which it then parses and runs:

```sql
```

`DBMS_SQL`
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
    cursor_name := DBMS_SQL.OPEN_CURSOR;

    DDL statements are run by the parse call, which performs the implied commit.

    DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.native);
    ret := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

exec('create table acct(c1 integer)');

You could even call this procedure remotely, as shown in the following example.
This lets you perform remote DDL.

exec@hq.com('CREATE TABLE acct(c1 INTEGER)');

**Example 3**
The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>of type NUMBER</td>
</tr>
<tr>
<td>name</td>
<td>of type VARCHAR2(30)</td>
</tr>
<tr>
<td>birthdate</td>
<td>of type DATE</td>
</tr>
</tbody>
</table>

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

CREATE OR REPLACE PROCEDURE copy (source IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var NUMBER;
    name_var VARCHAR2(30);
birthdate_var DATE;
source_cursor INTEGER;
destination_cursor INTEGER;
ignore INTEGER;
BEGIN

-- Prepare a cursor to select from the source table:
source_cursor := dbms_sql.open_cursor;
DBMS_SQL.PARSE(source_cursor,
'SELECT id, name, birthdate FROM ' || source,
DBMS_SQL.native);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
ignore := DBMS_SQL.EXECUTE(source_cursor);

-- Prepare a cursor to insert into the destination table:
destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
'INSERT INTO ' || destination ||
' VALUES (:id_bind, :name_bind, :birthdate_bind)',
DBMS_SQL.native);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
  IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
      birthdate_var);
    ignore := DBMS_SQL.EXECUTE(destination_cursor);
  ELSE
    -- No more rows to copy:
    EXIT;
  END IF;
END LOOP;
Examples

-- Commit and close all cursors:
   COMMIT;
   DBMS_SQL.CLOSE_CURSOR(source_cursor);
   DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
   WHEN OTHERS THEN
     IF DBMS_SQL.IS_OPEN(source_cursor) THEN
       DBMS_SQL.CLOSE_CURSOR(source_cursor);
     END IF;
     IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
       DBMS_SQL.CLOSE_CURSOR(destination_cursor);
     END IF;
     RAISE;
END;
/

Examples 3, 4, and 5: Bulk DML
This series of examples shows how to use bulk array binds (table items) in the SQL
DML statements DELETE, INSERT, and UPDATE.

In a DELETE statement, for example, you could bind in an array in the WHERE clause
and have the statement be run for each element in the array:

declare
   stmt varchar2(200);
   dept_no_array dbms_sql.Number_Table;
   c number;
   dummy number;
begin
   dept_no_array(1) := 10; dept_no_array(2) := 20;
   dept_no_array(3) := 30; dept_no_array(4) := 40;
   dept_no_array(5) := 30; dept_no_array(6) := 40;
   stmt := 'delete from emp where deptno = :dept_array';
   c := dbms_sql.open_cursor;
   dbms_sql.parse(c, stmt, dbms_sql.native);
   dbms_sql.bind_array(c, ':dept_array', dept_no_array, 1, 4);
   dummy := dbms_sql.execute(c);
   dbms_sql.close_cursor(c);
exception when others then
   if dbms_sql.is_open(c) then
     dbms_sql.close_cursor(c);
   end if;
   raise;

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

Here is an example of a bulk INSERT statement:

```sql
declare
    stmt varchar2(200);
    empno_array dbms_sql.Number_Table;
    empname_array dbms_sql.Varchar2_Table;
    c number;
    dummy number;
begin
    for i in 0..9 loop
        empno_array(i) := 1000 + i;
        empname_array(i) := get_name(i);
    end loop;
    stmt := 'insert into emp values(:num_array, :name_array)';
    c := dbms_sql.open_cursor;
    dbms_sql.parse(c, stmt, dbms_sql.native);
    dbms_sql.bind_array(c, ':num_array', empno_array);
    dbms_sql.bind_array(c, ':name_array', empname_array);
    dummy := dbms_sql.execute(c);
    dbms_sql.close_cursor(c);
exception when others then
    if dbms_sql.is_open(c) then
        dbms_sql.close_cursor(c);
    end if;
    raise;
end;
/
```

When the execute takes place, all 10 of the employees are inserted into the table.

Finally, here is an example of a bulk UPDATE statement.

```sql
declare
    stmt varchar2(200);
    emp_no_array dbms_sql.Number_Table;
    emp_addr_array dbms_sql.Varchar2_Table;
    c number;
    dummy number;
```
begin
    for i in 0..9 loop
        emp_no_array(i) := 1000 + i;
        emp_addr_array(I) := get_new_addr(i);
    end loop;
    stmt := 'update emp set ename = :name_array
            where empno = :num_array';
    c := dbms_sql.open_cursor;
    dbms_sql.parse(c, stmt, dbms_sql.native);
    dbms_sql.bind_array(c, ':num_array', empno_array);
    dbms_sql.bind_array(c, ':name_array', empname_array);
    dummy := dbms_sql.execute(c);
    dbms_sql.close_cursor(c);
exception when others then
    if dbms_sql.is_open(c) then
        dbms_sql.close_cursor(c);
    end if;
    raise;
end;
/

When the EXECUTE Function call happens, the addresses of all employees are updated at once. The two collections are always stepped in unison. If the WHERE clause returns more than one row, then all those employees get the address the addr_array happens to be pointing to at that time.

Examples 6 and 7: Defining an Array

The following examples show how to use the DEFINE_ARRAY procedure:

declare
    c       number;
    d       number;
    n_tab   dbms_sql.Number_Table;
    indx    number := -10;
begin
    c := dbms_sql.open_cursor;
    dbms_sql.parse(c, 'select n from t order by 1', dbms_sql);
    dbms_sql.define_array(c, 1, n_tab, 10, indx);
    d := dbms_sql.execute(c);
    loop
        d := dbms_sql.fetch_rows(c);
end;
Using DBMS_SQL

```
   dbms_sql.column_value(c, 1, n_tab);

   exit when d != 10;
end loop;

   dbms_sql.close_cursor(c);

   exception when others then
      if dbms_sql.is_open(c) then
         dbms_sql.close_cursor(c);
      end if;
      raise;
   end if;
end;
/
```

Each time the preceding example does a FETCH_ROWS Function call, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure call is run, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE and keeps getting updated every time a COLUMN_VALUE call is made. If you reexecute at any point, then the current index for each DEFINE is re-initialized to "indx".

In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```
create table multi_tab (num number,
   dat1 date,
   var varchar2(24),
   dat2 date)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
declare
   c   number;
   d   number;
```
n_tab  dbms_sql.Number_Table;
d_tab1 dbms_sql.Date_Table;
v_tab  dbms_sql.Varchar2_Table;
d_tab2 dbms_sql.Date_Table;
indx number := 10;
begin
  c := dbms_sql.open_cursor;
  dbms_sql.parse(c, 'select * from multi_tab order by 1', dbms_sql);
  dbms_sql.define_array(c, 1, n_tab, 5, indx);
  dbms_sql.define_array(c, 2, d_tab1, 5, indx);
  dbms_sql.define_array(c, 3, v_tab, 5, indx);
  dbms_sql.define_array(c, 4, d_tab2, 5, indx);
  d := dbms_sql.execute(c);
  loop
    d := dbms_sql.fetch_rows(c);
    dbms_sql.column_value(c, 1, n_tab);
    dbms_sql.column_value(c, 2, d_tab1);
    dbms_sql.column_value(c, 3, v_tab);
    dbms_sql.column_value(c, 4, d_tab2);
    exit when d != 5;
  end loop;
  dbms_sql.close_cursor(c);
/

The four tables can be used for anything. One usage might be to use BIND_ARRAY to move the rows to another table by using a query such as 'INSERT into SOME_T values (:a, :b, :c, :d);

*/

exception when others then
  if dbms_sql.is_open(c) then
    dbms_sql.close_cursor(c);
  end if;
  raise;
end;
Example 8: Describe Columns
This can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT *
query on the table that you want to describe.

```
declare
c    number;
d    number;
col_cnt  integer;
f    boolean;
rec_tab  dbms_sql.desc_tab;
col_num   number;
procedure print_rec(rec in dbms_sql.desc_rec) is
begin
    dbms_output.new_line;
    dbms_output.put_line('col_type            =    ' || rec.col_type);
    dbms_output.put_line('col_maxlen          =    ' || rec.col_max_len);
    dbms_output.put_line('col_name            =    ' || rec.col_name);
    dbms_output.put_line('col_name_len        =    ' || rec.col_name_len);
    dbms_output.put_line('col_schema_name     =    ' || rec.col_schema_name);
    dbms_output.put_line('col_schema_name_len =    ' || rec.col_schema_name_len);
    dbms_output.put_line('col_precision       =    ' || rec.col_precision);
    dbms_output.put_line('col_scale           =    ' || rec.col_scale);
    dbms_output.put_line('col_null_ok         =    ');
    if (rec.col_null_ok) then
        dbms_output.put_line('true');
    else
        dbms_output.put_line('false');
    end if;
end;
begin
    c := dbms_sql.open_cursor;
    dbms_sql.parse(c, 'select * from scott.bonus', dbms_sql);
    d := dbms_sql.execute(c);
    dbms_sql.describe_columns(c, col_cnt, rec_tab);
```
Examples

/
* Following loop could simply be for j in 1..col_cnt loop.
* Here we are simply illustrating some of the PL/SQL table
* features.
*/
col_num := rec_tab.first;
if (col_num is not null) then
    loop
        print_rec(rec_tab(col_num));
        col_num := rec_tab.next(col_num);
        exit when (col_num is null);
    end loop;
end if;
dbms_sql.close_cursor(c);
end;
/

Example 9: RETURNING clause The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS_SQL.BIND_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS_SQL.BIND_ARRAY is used. DBMS_SQL.VARIABLE_VALUE must be called to get the values in these bind variables.

Note: This is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS_SQL.

i) Single row insert

create or replace procedure single_Row_insert
    (c1 number, c2 number, r out number) is
    c number;
n number;
begins
    c := dbms_sql.open_cursor;
dbms_sql.parse(c, 'insert into tab values (:bnd1, :bnd2) ' ||
        'returning c1*c2 into :bnd3', 2);
Using DBMS_SQL

```sql
dbms_sql.bind_variable(c, 'bnd1', c1);
dbms_sql.bind_variable(c, 'bnd2', c2);
dbms_sql.bind_variable(c, 'bnd3', r);
n := dbms_sql.execute(c);
dbms_sql.variable_value(c, 'bnd3', r); -- get value of outbind variable
dbms_sql.close_Cursor(c);
end;
/

ii) Single row update

create or replace procedure single_Row_update
  (c1 number, c2 number, r out number) is
  c number;
  n number;
begin
  c := dbms_sql.open_cursor;
  dbms_sql.parse(c, 'update tab set c1 = :bnd1, c2 = :bnd2 ' ||
                  'where rownum < 2' ||
                  'returning c1*c2 into :bnd3', 2);
  dbms_sql.bind_variable(c, 'bnd1', c1);
  dbms_sql.bind_variable(c, 'bnd2', c2);
  dbms_sql.bind_variable(c, 'bnd3', r);
  n := dbms_sql.execute(c);
  dbms_sql.variable_value(c, 'bnd3', r);-- get value of outbind variable
  dbms_sql.close_Cursor(c);
end;
/

iii) Single row delete

create or replace procedure single_Row_Delete
  (c1 number, c2 number, r out number) is
  c number;
  n number;
begin
  c := dbms_sql.open_cursor;
  dbms_sql.parse(c, 'delete from tab ' ||
                  'where rownum < 2 ' ||
                  'returning c1*c2 into :bnd3', 2);
  dbms_sql.bind_variable(c, 'bnd1', c1);
  dbms_sql.bind_variable(c, 'bnd2', c2);
  dbms_sql.bind_variable(c, 'bnd3', r);
  n := dbms_sql.execute(c);
  dbms_sql.variable_value(c, 'bnd3', r);-- get value of outbind variable
  dbms_sql.close_Cursor(c);
```

DBMS_SQL  90-21
iv) Multi-row insert

create or replace procedure multi_Row_insert
    (c1 dbms_sql.number_table, c2 dbms_sql.number_table,
     r out dbms_sql.number_table) is
    c number;
    n number;
    begin
        c := dbms_sql.open_cursor;
        dbms_sql.parse(c, 'insert into tab values (:bnd1, :bnd2) ' ||
            'returning c1*c2 into :bnd3', 2);
        dbms_sql.bind_array(c, 'bnd1', c1);
        dbms_sql.bind_array(c, 'bnd2', c2);
        dbms_sql.bind_array(c, 'bnd3', r);
        n := dbms_sql.execute(c);
        dbms_sql.variable_value(c, 'bnd3', r);-- get value of outbind variable
        dbms_Sql.close_Cursor(c);
    end;
/

v) Multi-row Update.

create or replace procedure multi_Row_update
    (c1 number, c2 number, r out dbms_Sql.number_table) is
    c number;
    n number;
    begin
        c := dbms_sql.open_cursor;
        dbms_sql.parse(c, 'update tab set c1 = :bnd1 where c2 = :bnd2 ' ||
            'returning c1*c2 into :bnd3', 2);
        dbms_sql.bind_variable(c, 'bnd1', c1);
        dbms_sql.bind_variable(c, 'bnd2', c2);
        dbms_sql.bind_array(c, 'bnd3', r);
        n := dbms_sql.execute(c);
        dbms_sql.variable_value(c, 'bnd3', r);-- get value of outbind variable
        dbms_Sql.close_Cursor(c);
    end;
/
vi) Multi-row delete

create or replace procedure multi_row_delete
   (c1 dbms_Sql.number_table,
    r out dbms_sql.number_table) is
   c number;
   n number;
begin
   c := dbms_sql.open_cursor;
   dbms_sql.parse(c, 'delete from tab where c1 = :bnd1' ||
      'returning c1*c2 into :bnd2', 2);
   dbms_sql.bind_array(c, 'bnd1', c1);
   dbms_sql.bind_array(c, 'bnd2', r);
   n := dbms_sql.execute(c);
   dbms_sql.variable_value(c, 'bnd2', r);-- get value of outbind variable
   dbms_Sql.close_Cursor(c);
end;
/

vii) Out-bind in bulk PL/SQL

create or replace foo (n number, square out number) is
begin square := n * n; end;/

create or replace procedure bulk_plsql
   (n dbms_sql.number_Table, square out dbms_sql.number_table) is
   c number;
   r number;
begin
   c := dbms_sql.open_cursor;
   dbms_sql.parse(c, 'begin foo(:bnd1, :bnd2); end;', 2);
   dbms_sql.bind_array(c, 'bnd1', n);
   dbms_sql.bind_array(c, 'bnd2', square);
   r := dbms_sql.execute(c);
   dbms_SQL.variable_Value(c, 'bnd2', square);
end;
/

Note:  bnd1 and bnd2 can be array as well. The value of the
expression for all the rows updated will be in bnd3. There is no way
of differentiating which rows got updated of each value of bnd1
and bnd2.
Examples

Note: DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.
Summary of DBMS_SQL Subprograms

Table 90–1  DBMS_SQL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_ARRAY Procedures on page 90-27</td>
<td>Binds a given value to a given collection</td>
</tr>
<tr>
<td>BIND_VARIABLE Procedures on page 90-30</td>
<td>Binds a given value to a given variable</td>
</tr>
<tr>
<td>CLOSE_CURSOR Procedure on page 90-35</td>
<td>Closes given cursor and frees memory</td>
</tr>
<tr>
<td>COLUMN_VALUE Procedure on page 90-36</td>
<td>Returns value of the cursor element for a given position in a cursor</td>
</tr>
<tr>
<td>COLUMN_VALUE_LONG Procedure on page 90-39</td>
<td>Returns a selected part of a LONG column, that has been defined using DEFINE_COLUMN_LONG</td>
</tr>
<tr>
<td>DEFINE_ARRAY Procedure on page 90-40</td>
<td>Defines a collection to be selected from the given cursor, used only with SELECT statements</td>
</tr>
<tr>
<td>DEFINE_COLUMN Procedure on page 90-43</td>
<td>Defines a column to be selected from the given cursor, used only with SELECT statements</td>
</tr>
<tr>
<td>DEFINE_COLUMN_LONG Procedure on page 90-45</td>
<td>Defines a LONG column to be selected from the given cursor, used only with SELECT statements</td>

<tr>
<td>VARIABLE_VALUE Procedures on page 90-60</td>
<td>Returns value of named variable for given cursor</td>
</tr>
</tbody>
</table>
BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```sql
DBMS_SQL.BIND_ARRAY (  
c                   IN INTEGER,  
name                IN VARCHAR2,  
<table_variable>    IN <datatype>  
[,index1              IN INTEGER,  
index2              IN INTEGER])))
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs:

- `<clob_tab>` Clob_Table
- `<bflt_tab>` Binary_Float_Table
- `<bdbl_tab>` Binary_Double_Table
- `<blob_tab>` Blob_Table
- `<bfile_tab>` Bfile_Table
- `<date_tab>` Date_Table
- `<num_tab>` Number_Table
- `<urowid_tab>` Urowid_Table
- `<vchr2_tab>` Varchar2_Table

Notice that the BIND_ARRAY procedure is overloaded to accept different datatypes.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the collection in the statement.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as <code>&lt;datatype&gt;</code>.</td>
</tr>
<tr>
<td>index1</td>
<td>Index for the table element that marks the lower bound of the range.</td>
</tr>
<tr>
<td>index2</td>
<td>Index for the table element that marks the upper bound of the range.</td>
</tr>
</tbody>
</table>
Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

See Also: "Examples 3, 4, and 5: Bulk DML" on page 90-14 for examples of how to bind collections.

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS_SQL package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.
Types for Scalar and LOB Collections
You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```sql
TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
    IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
    IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;

TYPE urowid_table
    IS TABLE OF UROWID INDEX BY BINARY_INTEGER;

TYPE varchar2_table
    IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>  Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tsz_tab>  Timestamp_With_ltz_Table;
<stsz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
```
**BIND_VARIABLE Procedures**

This procedures binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

**Syntax**

```sql
DBMS_SQL.BIND_VARIABLE (
    c              IN INTEGER,
    name           IN VARCHAR2,
    value          IN <datatype>)
```

Where `<datatype>` can be any one of the following types:

- `BINARY_DOUBLE`
- `BINARY_FLOAT`
- `BFILE`
- `BLOB`
- `CLOB CHARACTER SET ANY_CS`
- `DATE`
- `DSINTERVAL_UNCONSTRAINED`
- `NUMBER`
- `TIME_UNCONSTRAINED`
- `TIME_TZ_UNCONSTRAINED`
- `TIMESTAMP_LTZ_UNCONSTRAINED`
- `TIMESTAMP_TZ_UNCONSTRAINED`
- `TIMESTAMP_UNCONSTRAINED`
- `UROWID`
- `VARCHAR2 CHARACTER SET ANY_CS`
- `YMINTERVAL_UNCONSTRAINED`

Notice that `BIND_VARIABLE` is overloaded to accept different datatypes.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` function.

```sql
DBMS_SQL.BIND_VARIABLE (
    c              IN INTEGER,
    name           IN VARCHAR2,
    value          IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER])
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:
DBMS_SQL.BIND_VARIABLE_CHAR (
  c IN INTEGER,
  name IN VARCHAR2,
  value IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_RAW (
  c IN INTEGER,
  name IN VARCHAR2,
  value IN RAW [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_ROWID (
  c IN INTEGER,
  name IN VARCHAR2,
  value IN ROWID);

See Also: Oracle Database Application Developer’s Guide - Large Objects

Pragmas

pragma restrict_references(bind_variable,WNDS);

Parameters

Table 90–3  BIND_VARIABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable in the statement.</td>
</tr>
<tr>
<td>value</td>
<td>Value that you want to bind to the variable in the cursor.</td>
</tr>
<tr>
<td></td>
<td>For IN and IN/OUT variables, the value has the same type as the type of</td>
</tr>
<tr>
<td></td>
<td>the value being passed in for this parameter.</td>
</tr>
<tr>
<td>out_value_size</td>
<td>Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW,</td>
</tr>
<tr>
<td></td>
<td>CHAR OUT or IN/OUT variable.</td>
</tr>
<tr>
<td></td>
<td>If no size is given, then the length of the current value is used. This</td>
</tr>
<tr>
<td></td>
<td>parameter must be specified if the value parameter is not initialized.</td>
</tr>
</tbody>
</table>

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.
The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

The length of the bind variable name should be ≤30 bytes.

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `Index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

**See Also:** "Examples 3, 4, and 5: Bulk DML" on page 90-14 for examples of how to bind collections.

**Bulk Array Binds**

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

*Table items* are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or
parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```sql
TYPE binary_double_table
  IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;

TYPE binary_float_table
  IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;

TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;

TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;

TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;

TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
  IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
  IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;

TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;

TYPE time_table     IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
  IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;

TYPE timestamp_table
  IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_Table
  IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
```
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
        INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID        INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>  Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

DBMS_SQL.CLOSE_CURSOR (  
    c   IN OUT INTEGER);  

Pragmas

pragma restrict_references(close_cursor,RNDS,WNDS);

Parameters

Table 90–4  CLOSE_CURSOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>IN</td>
<td>ID number of the cursor that you want to close.</td>
</tr>
</tbody>
</table>
| c         | OUT  | Cursor is set to null.  
|           |      | After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor. |
**COLUMN_VALUE Procedure**

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ ROWS`.

**Syntax**

```sql
DBMS_SQL.COLUMN_VALUE ( 
  c                 IN  INTEGER,
  position          IN  INTEGER,
  value             OUT <datatype> 
[,column_error      OUT NUMBER]
[,actual_length     OUT INTEGER]);
```

Where `<datatype>` can be any one of the following types:

- `BINARY_DOUBLE`
- `BINARY_FLOAT`
- `BFILE`
- `BLOB`
- `CLOB CHARACTER SET ANY_CS`
- `DATE`
- `DSINTERVAL_UNCONSTRAINED`
- `NUMBER`
- `TIME_TZ_UNCONSTRAINED`
- `TIME_UNCONSTRAINED`
- `TIMESTAMP_LTZ_UNCONSTRAINED`
- `TIMESTAMP_TZ_UNCONSTRAINED`
- `TIMESTAMP_UNCONSTRAINED`
- `UROWID`
- `VARCHAR2 CHARACTER SET ANY_CS`
- `YMINTERVAL_UNCONSTRAINED`

Where `<tm_tab>` can be any of the following:

- `<tm_tab>` `Time_Table`
- `<ttz_tab>` `Time_With_Time_Zone_Table`
- `<tms_tab>` `Timestamp_Table`
- `<tstz_tab>` `Timestamp_With_Ltz_Table`
- `<tstz_tab>` `Timestamp_With_Time_Zone_Table`
- `<ids_tab>` `Interval_Day_To_Second_Table`
- `<iym_tab>` `Interval_Year_To_Month_Table`

**Note:** The square brackets `[ ]` indicate optional parameters.
Pragmas

```
pragma restrict_references(column_value,RNDS,WDNS);
```

The following syntax is also supported for the `COLUMN_VALUE` procedure:

```
DBMS_SQL.COLUMN_VALUE(
  c                 IN  INTEGER,
  position          IN  INTEGER,
  <table_variable>  IN  <datatype>);
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of these matching pairs:

- `<bdbl_tab>` Binary_Double_Table
- `<bflt_tab>` Binary_Float_Table
- `<bfile_tab>` Bfile_Table
- `<blob_tab>` Blob_Table
- `<clob_tab>` Clob_Table
- `<date_tab>` Date_Table
- `<ids_tab>` Interval_Day_To_Second_Table
- `<iym_tab>` Interval_Year_To_Month_Table
- `<num_tab>` Number_Table
- `<tm_tab>` Time_Table
- `<ttz_tab>` Time_With_Time_Zone_Table
- `<tms_tab>` Timestamp_Table
- `<ttztab>` Timestamp_With_Time_Zone_Table
- `<urowid_tab>` Urowid_Table
- `<vchr2_tab>` Varchar2_Table

For columns containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
  c               IN  INTEGER,
  position        IN  INTEGER,
  value           OUT CHAR CHARACTER SET ANY_CS
[,column_error    OUT NUMBER]
[,actual_length   OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
  c               IN  INTEGER,
```

See Also: Oracle Database Application Developer’s Guide - Large Objects
COLUMN_VALUE Procedure

```sql
position IN INTEGER,
value OUT RAW
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER});
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (  
  c        IN INTEGER,
  position IN INTEGER,
  value    OUT ROWID
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER});
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which you are fetching the values.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the cursor.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>value</td>
<td>Returns the value at the specified column and row.</td>
</tr>
<tr>
<td></td>
<td>If the row number specified is greater than the total number of rows</td>
</tr>
<tr>
<td></td>
<td>fetched, then you receive an error message.</td>
</tr>
<tr>
<td></td>
<td>Oracle raises exception ORA-06562, inconsistent_type, if the type</td>
</tr>
<tr>
<td></td>
<td>of this output parameter differs from the actual type of the value, as</td>
</tr>
<tr>
<td></td>
<td>defined by the call to DEFINE_COLUMN.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared &lt;datatype&gt;.</td>
</tr>
<tr>
<td>column_error</td>
<td>Returns any error code for the specified column value.</td>
</tr>
<tr>
<td>actual_length</td>
<td>The actual length, before any truncation, of the value in the specified</td>
</tr>
<tr>
<td></td>
<td>column.</td>
</tr>
</tbody>
</table>

**Exceptions**

`inconsistent_type (ORA-06562)` is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

90-38   PL/SQL Packages and Types Reference
**COLUMN_VALUE_LONG Procedure**

This procedure gets part of the value of a long column.

**Syntax**

```sql
DBMS_SQL.COLUMN_VALUE_LONG (  
c            IN  INTEGER,  
position     IN  INTEGER,  
length       IN  INTEGER,  
offset       IN  INTEGER,  
value        OUT VARCHAR2,  
value_length OUT INTEGER);
```

**Pragmas**

```sql
pragma restrict_references(column_value_long,RNDS,WNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor from which to get the value.</td>
</tr>
<tr>
<td>position</td>
<td>Position of the column of which to get the value.</td>
</tr>
<tr>
<td>length</td>
<td>Number of bytes of the long value to fetch.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the long field for start of fetch.</td>
</tr>
<tr>
<td>value</td>
<td>Value of the column as a VARCHAR2.</td>
</tr>
<tr>
<td>value_length</td>
<td>Number of bytes actually returned in value.</td>
</tr>
</tbody>
</table>
DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```sql
TYPE binary_double_table
  IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
  IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
  IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
  IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
  IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
  IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
  IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
  IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
  IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
  IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
  IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_table
  IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_Table
  IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table
```
IS TABLE OF timestamp_tz_unconstrained
INDEX BY BINARY_INTEGER;

TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>   Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tsz_tab>  Timestamp_With_ltz_Table;
<tsz_tab>  Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table

Syntax

DBMS_SQL.DEFINE_ARRAY (  
  c           IN INTEGER,  
  position    IN INTEGER,  
  <table_variable>    IN <datatype>  
  cnt         IN INTEGER,  
  lower_bnd   IN INTEGER);  

Where <table_variable> and its corresponding <datatype> can be any one of 
the following matching pairs:

<clob_tab>     Clob_Table  
<bflt_tab>     Binary_Float_Table  
<bdbl_tab>     Binary_Double_Table  
<blob_tab>     Blob_Table  
<bfile_tab>    Bfile_Table  
<date_tab>     Date_Table  
<num_tab>      Number_Table  
<urowid_tab>   Urowid_Table  
<vchr2_tab>    Varchar2_Table

Notice that DEFINE_ARRAY is overloaded to accept different datatypes.

Pragmas

pragma restrict_references(define_array,RNDS,WNDS);

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE 
call is made, these rows are placed in positions indx, indx+1, indx+2, and so on. 
While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_
DEFINE_ARRAY Procedure

VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cID number of the cursor to which you want to bind an array.</td>
<td></td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the array being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as &lt;datatype&gt;.</td>
</tr>
<tr>
<td>cnt</td>
<td>Number of rows that must be fetched.</td>
</tr>
<tr>
<td>lower_bnd</td>
<td>Results are copied into the collection, starting at this lower bound index.</td>
</tr>
</tbody>
</table>

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The indx can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

See Also: "Examples 6 and 7: Defining an Array" on page 90-16 for examples of how to define collections.
DEFINE_COLUMN Procedure

This procedure defines a column to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

Syntax

```sql
DBMS_SQL.DEFINE_COLUMN (c IN INTEGER,
  position IN INTEGER,
  column IN <datatype>)
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_UNCONSTRAINED
- TIME_TZ_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED

Notice that DEFINE_COLUMN is overloaded to accept different datatypes.

See Also: Oracle Database Application Developer’s Guide - Large Objects

Pragmas

```sql
pragma restrict_references(define_column,RNDS,WNDS);
```
The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```plsql
DBMS_SQL.DEFINE_COLUMN (
  c              IN INTEGER,
  position       IN INTEGER,
  column         IN VARCHAR2 CHARACTER SET ANY_CS,
  column_size    IN INTEGER),
  urowid         IN INTEGER;
```

To define columns with `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the procedure syntax:

```plsql
DBMS_SQL.DEFINE_COLUMN_CHAR (
  c              IN INTEGER,
  position       IN INTEGER,
  column         IN CHAR CHARACTER SET ANY_CS,
  column_size    IN INTEGER);
```

```plsql
DBMS_SQL.DEFINE_COLUMN_RAW (
  c              IN INTEGER,
  position       IN INTEGER,
  column         IN RAW,
  column_size    IN INTEGER);
```

```plsql
DBMS_SQL.DEFINE_COLUMN_ROWID (
  c              IN INTEGER,
  position       IN INTEGER,
  column         IN ROWID);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined.</td>
</tr>
<tr>
<td></td>
<td>The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value, in bytes, for columns of type</td>
</tr>
<tr>
<td></td>
<td><code>VARCHAR2</code>, <code>CHAR</code>, and <code>RAW</code>.</td>
</tr>
</tbody>
</table>
DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

Syntax

DBMS_SQL.DEFINE_COLUMN_LONG (c, position);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
</tbody>
</table>
DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```sql
DBMS_SQL.DESCRIBE_COLUMNS (  
c              IN  INTEGER,  
col_cnt        OUT INTEGER,  
desc_t         OUT DESC_TAB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>c</code></td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td><code>col_cnt</code></td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td><code>desc_t</code></td>
<td>Table of DESC_REC, each DESC_REC describing a column in the query.</td>
</tr>
</tbody>
</table>

See Also: "Example 8: Describe Columns" on page 90-19 illustrates how to use DESCRIBE_COLUMNS.
DESCRIBE_COLUMNS2 Procedure

This function describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (  
  c              IN  INTEGER,  
  col_cnt        OUT INTEGER,  
  desc_tab2      OUT DESC_TAB);  
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_tab2</td>
<td>The describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>
EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

Syntax

```sql
DBMS_SQL.EXECUTE (  
    c IN INTEGER)  
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to execute.</td>
</tr>
</tbody>
</table>
EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```sql
DBMS_SQL.EXECUTE_AND_FETCH (  
c              IN INTEGER,  
exact          IN BOOLEAN DEFAULT FALSE)  
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to execute and fetch.</td>
</tr>
<tr>
<td>exact</td>
<td>Set to TRUE to raise an exception if the number of rows actually matching the query differs from one.</td>
</tr>
<tr>
<td></td>
<td>Note: Oracle does not support the exact fetch TRUE option with LONG columns.</td>
</tr>
<tr>
<td></td>
<td>Even if an exception is raised, the rows are still fetched and available.</td>
</tr>
</tbody>
</table>
FETCH_ROWS Function

This function fetches a row from a given cursor. You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (  
c IN INTEGER)  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number.</td>
</tr>
</tbody>
</table>
IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```sql
DBMS_SQL.IS_OPEN (  
    c        IN INTEGER)  
RETURN BOOLEAN;
```

Pragmas

```sql
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to check.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Given cursor is currently open.</td>
</tr>
<tr>
<td>FALSE</td>
<td>Given cursor is currently not open.</td>
</tr>
</tbody>
</table>
LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```plsql
DBMS_SQL.LAST_ERROR_POSITION
    RETURN INTEGER;
```

Pragmas

```plsql
pragma restrict_references(last_error_position, RNDS, WND);}
```

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.
LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```sql
DBMS_SQL.LAST_ROW_COUNT
    RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.
LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```sql
DBMS_SQL.LAST_ROW_ID
RETURN ROWID;
```

Pragmas

```sql
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.
**LAST_SQL_FUNCTION_CODE Function**

This function returns the SQL function code for the statement. These codes are listed in the *Oracle Call Interface Programmer’s Guide*.

**Syntax**

```sql
DBMS_SQL.LAST_SQL_FUNCTION_CODE
    RETURN INTEGER;
```

**Pragmas**

```sql
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

**Usage Notes**

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.
OPEN_CURSOR Function

This procedure opens a new cursor. When you no longer need this cursor, you must close it explicitly by calling CLOSE_CURSOR.

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

Syntax

```sql
DBMS_SQL.OPEN_CURSOR
    RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

This function returns the cursor ID number of the new cursor.
PARSE Procedure

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are two versions of the PARSE procedure: one uses a VARCHAR2 statement as an argument, and the other uses a VARCHAR2S (table of VARCHAR2) as an argument.

Syntax

```sql
DBMS_SQL.PARSE (  
c                  IN   INTEGER,  
statement          IN   VARCHAR2,  
language_flag      IN   INTEGER);  

DBMS_SQL.PARSE (  
c                  IN   INTEGER,  
statement          IN   VARCHAR2A,  
lb                 IN   INTEGER,  
ub                 IN   INTEGER,  
lfflg              IN   BOOLEAN,  
language_flag      IN   INTEGER);  

DBMS_SQL.PARSE (  
c                  IN   INTEGER,  
statement          IN   VARCHAR2S,  
lb                 IN   INTEGER,  
ub                 IN   INTEGER,  
lfflg              IN   BOOLEAN,  
language_flag      IN   INTEGER);  
```

**Note:** The procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>c</code></td>
<td>ID number of the cursor in which to parse the statement.</td>
</tr>
<tr>
<td><code>statement</code></td>
<td>SQL statement to be parsed.</td>
</tr>
<tr>
<td></td>
<td>Unlike PL/SQL statements, your SQL statement should not include</td>
</tr>
<tr>
<td></td>
<td>a final semicolon. For example:</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab values(1)', 2);</td>
</tr>
<tr>
<td><code>lb</code></td>
<td>Lower bound for elements in the statement.</td>
</tr>
<tr>
<td><code>ub</code></td>
<td>Upper bound for elements in the statement.</td>
</tr>
<tr>
<td><code>lfflg</code></td>
<td>If TRUE, then insert a linefeed after each element on concatenation.</td>
</tr>
<tr>
<td><code>language_flag</code></td>
<td>Determines how Oracle handles the SQL statement. The following options are</td>
</tr>
</tbody>
</table>
### Examples

To parse SQL statements larger than 32 KB, `DBMS_SQL` makes use of PL/SQL tables to pass a table of strings to the `PARSE` procedure. These strings are concatenated and then passed on to the Oracle server.

You can declare a local variable as the `VARCHAR2S` table-item type, and then use the `PARSE` procedure to parse a large SQL statement as `VARCHAR2S`.

The definition of the `VARCHAR2S` datatype is:

```sql
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

### Exceptions

If you create a type/procedure/function/package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the procedure is still created.

---

**Note:** Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, dbms_sql.V7); -- uses constant dbms_sql.V7
```

The following code works on the client, because the argument is explicitly provided:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, 2); -- compiles on the client
```
VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

Syntax

```
DBMS_SQL.VARIABLE_VALUE (
    c               IN  INTEGER,
    name            IN  VARCHAR2,
    value           OUT <datatype>);
```

Where <datatype> can be any one of the following types:

Binary_Double
Binary_Float
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED

The following syntax is also supported for the VARIABLE_VALUE procedure:

```
DBMS_SQL.VARIABLE_VALUE (
    c               IN  INTEGER,
    name            IN  VARCHAR2,
    <table_variable>  IN  <datatype>);
```

Where the <table_variable> and its corresponding <datatype> can be any one of these matching pairs:

```
<bdbl_tab>     Binary_Double_Table
<bflt_tab>     Binary_Float_Table
<bfile_tab>    Bfile_Table
```
<blob_tab> Blob_Table
<clob_tab> Clob_Table
<date_tab> Date_Table
<ids_tab> Interval_Day_To_Second_Table
<iym_tab> Interval_Year_To_Month_Table
<num_tab> Number_Table
<tm_tab> Time_Table
<ttz_tab> Time_With_Time_Zone_Table
<tms_tab> Timestamp_Table
<tstz_tab> Timestamp_With_Time_Zone_Table
<urowid_tab> Urowid_Table
<vchr2_tab> Varchar2_Table

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

DBMS_SQL.VARIABLE_VALUE_CHAR (  
    c           IN  INTEGER,  
    name        IN  VARCHAR2,  
    value       OUT CHAR CHARACTER SET ANY_CS);

DBMS_SQL.VARIABLE_VALUE_RAW (  
    c           IN  INTEGER,  
    name        IN  VARCHAR2,  
    value       OUT RAW);

DBMS_SQL.VARIABLE_VALUE_ROWID (  
    c           IN  INTEGER,  
    name        IN  VARCHAR2,  
    value       OUT ROWID);

Pragmas

pragma restrict_references(variable_value,RNDS,WNDS);
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>c</code></td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td><code>name</code></td>
<td>Name of the variable for which you are retrieving the value.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Returns the value of the variable for the specified position. Oracle raises exception ORA-06562, <code>inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>.</td>
</tr>
<tr>
<td><code>position</code></td>
<td>Relative position of the column in the cursor. The first column in a statement has position 1.</td>
</tr>
</tbody>
</table>
The DBMS_SQLTUNE package provides the interface to tune SQL statements.

The chapter contains the following topics:

- Using DBMS.SqlTune
  - Overview
  - Types
  - Operational Notes
- Summary of DBMS.SqlTune Subprograms
Overview

SQL Tuning Sets is a new object for capturing SQL workload information. SQL Tuning Sets provide a common infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL Tuning Sets store SQL statements along with:
- The execution context, such as the parsing schema name and bind values.
- Execution statistics such as average elapsed time and execution count.

SQL Tuning Sets can be created by filtering or ranking SQL statements from several sources:
- The cursor cache.
- AWR selecting top SQL statements executed during some prior interval
- A user-defined workload.
- Other SQL Tuning Sets.

Types

SqlSet_cursor

This defines a cursor type for SQL statements with their related data. This type is mainly used by the LOAD_SQLSET procedure as an argument to populate a SqlSet from a possible data source. See the LOAD_SQLSET Procedure on page 91-21 for more details.

It is important to keep in mind that this cursor is weakly defined.
Operational Notes

Under normal mode, the Cost Based Optimizer (CBO) produces the best possible execution plan with whatever information is currently available for the query. It does not have time to gather additional information that might improve the plan because the CBO has to generate an execution plan in a fraction of a second under normal mode. However, in the Plan Tuning Analysis mode, the CBO has time to gather additional information for the query, in the form of a SQL Profile, and this profile allows the generation of a superior execution plan that is well tuned.

In the Plan Tuning Analysis mode, the CBO collects the SQL Profile for the query automatically and the DBA can then decide whether to activate the profile or not. Once activated, the CBO uses the SQL Profile under normal mode to generate the well-tuned plan, that is superior to the original.

Note that SQL Profile is stored persistently in data dictionary, and hence this form of tuning does not require any application code changes.
### Summary of DBMS_SQLTUNE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT_SQL_PROFILE Procedure on page 91-6</td>
<td>Create a SQL Profile for the specified tuning task</td>
</tr>
<tr>
<td>ADD_SQLSET_REFERENCE Function on page 91-8</td>
<td>Adds a new reference to an existing SqlSet to indicate its use by a client</td>
</tr>
<tr>
<td>ALTER_SQL_PROFILE Procedure on page 91-9</td>
<td>Alters specific attributes of an existing SQL Profile object</td>
</tr>
<tr>
<td>CANCEL_TUNING_TASK Procedure on page 91-10</td>
<td>Cancels the currently executing tuning task</td>
</tr>
<tr>
<td>CREATE_SQLSET Procedure on page 91-11</td>
<td>Creates a SqlSet object in the database</td>
</tr>
<tr>
<td>CREATE_TUNING_TASK Functions on page 91-12</td>
<td>Prepares the tuning of a single statement or SqlSet</td>
</tr>
<tr>
<td>DELETE_SQLSET Procedure on page 91-15</td>
<td>Deletes a set of SQL statements from a SqlSet</td>
</tr>
<tr>
<td>DROP_SQL_PROFILE Procedure on page 91-16</td>
<td>Drops the named SQL Profile from the database</td>
</tr>
<tr>
<td>DROP_SQLSET Procedure on page 91-17</td>
<td>Drops a SqlSet if it is not active</td>

</tr>
<tr>
<td>SELECT_WORKLOAD_REPOSITORY Functions on page 91-27</td>
<td>Collects SQL statements from workload repository</td>
</tr>
<tr>
<td>UPDATE_SQLSET Procedures on page 91-29</td>
<td>Updates whether selected string fields for a SQL statement in a SqlSet or the set numerical attributes of a SQL in a SqlSet</td>
</tr>
</tbody>
</table>
ACCEPT_SQL_PROFILE Procedure

This procedure accepts a SQL Profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn’t exist, an error is reported.

Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (  
    task_name    IN  VARCHAR2,  
    object_id    IN  NUMBER   := NULL,  
    name         IN  VARCHAR2 := NULL,  
    description  IN  VARCHAR2 := NULL,  
    category     IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The (mandatory) name of the SQL tuning task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The (optional) identifier of the framework object representing the SQL statement associated with the tuning task.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the SQL Profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL Profile.</td>
</tr>
<tr>
<td>description</td>
<td>A user specified string describing the purpose of the SQL Profile. The maximum size is 500 characters.</td>
</tr>
<tr>
<td>category</td>
<td>This is the category name which must match the value of the SQLTUNECATEGORY parameter in a session for the session to use this SQL Profile. It defaults to the value &quot;DEFAULT&quot;. This is also the default of the SQLTUNECATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a SQL Profile. An ACCEPT_SQLPROFILE will fail if this combination is duplicated.</td>
</tr>
</tbody>
</table>
Usage Notes

The "CREATE ANY SQL PROFILE" privilege is required.
ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SqlSet to indicate its use by a client.

Syntax

```sql
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>description</td>
<td>The description of the usage of SqlSet.</td>
</tr>
</tbody>
</table>

Return Values

The identifier of the added reference.
ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL Profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

Syntax

```sql
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
    name                 IN  VARCHAR2,
    attribute_name       IN  VARCHAR2,
    value                IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of the existing SQL Profile to alter</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The (mandatory) attribute name to alter (case insensitive) using valid attribute names.</td>
</tr>
<tr>
<td>value</td>
<td>The (mandatory) new value of the attribute using valid attribute values.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the "ALTER ANY SQL PROFILE" privilege.
CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK(
    task_name      IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the task to execute.</td>
</tr>
</tbody>
</table>
CREATE_SQLSET Procedure

This procedure creates a SqlSet object in the database.

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>description</td>
<td>The description of the SqlSet.</td>
</tr>
</tbody>
</table>
CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Prepare the tuning of a single statement given its text.
- Prepare the tuning of a single statement from the Cursor Cache given its identifier.
- Prepare the tuning of a single statement from the workload repository given a range of snapshot identifiers.
- Prepare the tuning of a SqlSet.

In all cases, the function mainly creates an advisor task and sets its parameters.

Syntax

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sql_text         IN CLOB,
    bind_list        IN sql_binds := NULL,
    user_name        IN VARCHAR2  := NULL,
    scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
    task_name        IN VARCHAR2  := NULL,
    description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;

DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sql_id           IN VARCHAR2,
    plan_hash_value  IN NUMBER   := NULL,
    scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
    task_name        IN VARCHAR2 := NULL,
    description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;

DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER   := NULL,
    scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit      IN NUMBER   := TIME_LIMIT_DEFAULT,
    task_name       IN VARCHAR2 := NULL,
    description     IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```
RETURN VARCHAR2;

DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    rank1             IN VARCHAR2 := NULL,
    rank2             IN VARCHAR2 := NULL,
    rank3             IN VARCHAR2 := NULL,
    result_percentage IN NUMBER   := NULL,
    result_limit      IN NUMBER   := NULL,
    scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 := NULL,
    description       IN VARCHAR2 := NULL)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>The text of a SQL statement.</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier.</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The identifier of a SQL statement.</td>
</tr>
<tr>
<td>bind_list</td>
<td>A a set of bind values.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>The hash value of the SQL execution plan.</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the STS.</td>
</tr>
<tr>
<td>object_filter</td>
<td>The object filter.</td>
</tr>
<tr>
<td>rankn</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered/ranked) SQL.</td>
</tr>
<tr>
<td>user_name</td>
<td>The username for whom the statement or SQL set is to be tuned.</td>
</tr>
<tr>
<td>scope</td>
<td>Tuning scope (limited/comprehensive).</td>
</tr>
</tbody>
</table>
CREATE_TUNING_TASK Functions

Table 91–7 (Cont.) CREATE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_limit</td>
<td>The maximum duration in seconds for the tuning session.</td>
</tr>
<tr>
<td>task_name</td>
<td>An optional tuning task name.</td>
</tr>
<tr>
<td>description</td>
<td>A description of the SQL tuning session to a maximum of 256 characters.</td>
</tr>
</tbody>
</table>

Return Values

A SQL tune task identifier.
DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SqlSet.

Syntax

```sql
DBMS_SQLTUNE.DELETE_SQLSET (  
    sqlset_name   IN  VARCHAR2,  
    basic_filter  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The QL predicate to filter the SQL from the SqlSet. This basic filter is used as a where clause on the SqlSet content to select a desired subset of SQL from the Tuning Set.</td>
</tr>
</tbody>
</table>
DROP_SQL_PROFILE Procedure

This procedure drops the named SQL Profile from the database.

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (  
    name      IN  VARCHAR2,  
    ignore    IN  BOOLEAN  := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of SQL Profile to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignores errors due to object not existing.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the "DROP ANY SQL PROFILE" privilege.
**DROP_SQLSET Procedure**

This procedure drops a SqlSet if it is not active.

**Syntax**

```sql
DBMS_SQLTUNE.DROP_SQLSET (
    sqlset_name   IN  VARCHAR2;
)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name</td>
</tr>
</tbody>
</table>

**Usage Notes**

You cannot drop a SqlSet when it is referenced by one or more clients (for example, SQL tune advisor).
DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

Syntax

DBMS_SQLTUNE.DROP_TUNING_TASK(
    task_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the current task.</td>
</tr>
</tbody>
</table>
EXECUTE_TUNING_TASK Procedure

This procedure executes a previously created tuning task.

Syntax

```sql
DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
    task_name    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the task to execute.</td>
</tr>
</tbody>
</table>
INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task and access intermediate result data.

Syntax

```sql
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(
    task_name    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the current task.</td>
</tr>
</tbody>
</table>
LOAD_SQLSET Procedure

This procedure populates the SqlSet with a set of selected SQL.

Syntax

DBMS_SQLTUNE.LOAD_SQLSET (  
    sqlset_name      IN  VARCHAR2,  
    populate_cursor  IN  SqlSet_cursor);  

Parameters

Table 91–14  LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>populate_cursor</td>
<td>The cursor reference from which to populate.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure returns an error when sqlset_name is invalid, or a corresponding SqlSet does not exist, or the populate_cursor is incorrect and cannot be executed.
This procedure deactivates a SqlSet to indicate it is no longer used by the client.

**Syntax**

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
    sqlset_name IN VARCHAR2,
    reference_id IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>reference_id</td>
<td>The identifier of the reference to remove.</td>
</tr>
</tbody>
</table>
REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
    task_name     IN  VARCHAR2 := NULL,
    object_id     IN  NUMBER   := NULL,
    result_limit  IN  NUMBER   := NULL,
    plan_format   IN  VARCHAR2 := FORMAT_TYPICAL,
    rec_format    IN  VARCHAR2 := FORMAT_TYPICAL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the task to report. If the task ID is not given by the caller, the function will generate a report for the results of the last tuning task run by the user.</td>
</tr>
<tr>
<td>object_id</td>
<td>The identifier of the advisor framework object that represents a given statement in the SqlSet.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The number of statements in a SqlSet for which a report is generated.</td>
</tr>
<tr>
<td>plan_format</td>
<td>The format of the explain plans displayed in the report. Possible values are TYPICAL, BASIC, ALL and SERIAL.</td>
</tr>
<tr>
<td>rec_format</td>
<td>The format of the recommendations displayed in the report. Possible values are TYPICAL and BASIC.</td>
</tr>
</tbody>
</table>

Return Values

A text report.
This procedure resets the currently executing tuning task to its initial state. All intermediate result data is deleted.

Syntax

```plsql
DBMS_SQLTUNE.RESET_TUNING_TASK(
  task_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the current task.</td>
</tr>
</tbody>
</table>
RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted tuning task.

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
    task_name    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The identifier of the current task.</td>
</tr>
</tbody>
</table>
SELECT_SQLSET Function

This function collects SQL statements from the cursor cache.

Syntax

DBMS_SQLTUNE.SELECT_SQLSET (  
sq1set_name IN VARCHAR2,  
basic_filter IN VARCHAR2 := NULL,  
object_filter IN VARCHAR2 := NULL,  
ranking_measure1 IN VARCHAR2 := NULL,  
ranking_measure2 IN VARCHAR2 := NULL,  
ranking_measure3 IN VARCHAR2 := NULL,  
result_percentage IN NUMBER := 1,  
result_limit IN NUMBER := NULL)  
RETURN sys.sqlset PIPELINED;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sq1set_name</td>
<td>The Sq1Set name.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the cursor cache.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Specifies the objects that should exist in the object list of selected SQL from the cursor cache.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A percentage on the sum of a ranking measure.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered) source ranked by the ranking measure.</td>
</tr>
</tbody>
</table>

Return Values

This function returns a sqlset object.
SELECT_WORKLOAD_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:
- Collect SQL statements from all snapshots between begin_snap and end_snap.
- Collect SQL statements from a workload repository baseline.

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (begin_snap IN NUMBER, end_snap IN NUMBER, basic_filter IN VARCHAR2 := NULL, object_filter IN VARCHAR2 := NULL, ranking_measure1 IN VARCHAR2 := NULL, ranking_measure2 IN VARCHAR2 := NULL, ranking_measure3 IN VARCHAR2 := NULL, result_percentage IN NUMBER := 1, result_limit IN NUMBER := NULL) RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>Begin snapshot.</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot.</td>
</tr>
</tbody>
</table>
Table 91–20 (Cont.) SELECT_WORKLOAD_REPOSITORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>The name of the baseline period.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the serf.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Specifies the objects that should exist in the object list of selected SQL from the swrf.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A percentage on the sum of a ranking measure.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered) source ranked by the ranking measure.</td>
</tr>
</tbody>
</table>

Return Values

This function returns a sqlset object.
**UPDATE_SQLSET Procedures**

There are two forms of this procedure:

- You use the first form of the procedure to update selected string fields for a SQL statement in a SqlSet, specifically to update the MODULE and ACTION fields.
- You use the second form of the procedure to update the set numerical attributes of a SQL in a SqlSet, specifically PRIORITY and PARSING_SCHEMA_ID.

**Syntax**

```sql
DBMS_SQLTUNE.UPDATE_SQLSET (
    sqlset_name IN VARCHAR2,
    sql_id IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
    sqlset_name IN VARCHAR2,
    sql_id IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN NUMBER := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SqlSet name.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The identifier of the statement to update.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to modify.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>The new value of the attribute.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```sql
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    lambda       IN    NUMBER,
    mu           IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```sql
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (    ownername IN VARCHAR2,
    tablename IN VARCHAR2,
    columnname IN VARCHAR2,
    test_type IN VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
    mean IN NUMBER,
    stdev IN NUMBER,
    sig OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.</td>
</tr>
<tr>
<td>mean</td>
<td>The mean of the distribution against which to compare.</td>
</tr>
<tr>
<td>stdev</td>
<td>The standard deviation of the distribution against which to compare.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
**POISSON_DIST_FIT Procedure**

This procedure tests how well a sample of values fits a Poisson distribution.

**Syntax**

```sql
DBMS_STAT_FUNCS.POISSON_DIST_FIT (  
    ownername    IN    VARCHAR2,  
    tablename    IN    VARCHAR2,  
    columnname   IN    VARCHAR2,  
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    lambda       IN    NUMBER,  
    sig          OUT   NUMBER);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The lambda parameter is the shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of SUMMARY can be obtained with currently available SQL.

Syntax

```sql
DBMS_STAT_FUNCS.SUMMARY (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    sigma_value  IN    NUMBER DEFAULT 3,
    s           OUT    SummaryType);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table to be summarized.</td>
</tr>
<tr>
<td>sigma_value</td>
<td>The number of sigmas for the set of extreme values, defaults to 3.</td>
</tr>
<tr>
<td>s</td>
<td>The Record containing summary information about given column.</td>
</tr>
</tbody>
</table>

Definition of SummaryType

```sql
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (    count           NUMBER,
    min             NUMBER,
    max             NUMBER,
    range           NUMBER,
    mean            NUMBER,
    cmode           num_table,
    variance        NUMBER,
    stddev)         NUMBER,

92-6  PL/SQL Packages and Types Reference
quantile_5       NUMBER,
quantile_25      NUMBER,
median           NUMBER,
quantile_75      NUMBER,
quantile_95      NUMBER,
plus_x_sigma     NUMBER,
minus_x_sigma    NUMBER,
extreme_values   num_table,
top_5_values     n_arr,
bottom_5_values  n_arr);
UNIFORM_DIST_FIT Procedure

This procedure tests whether a sample of values fits a uniform distribution.

Syntax

```sql
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    paramA       IN    NUMBER,
    paramB       IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>var_type</td>
<td>The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>paramA</td>
<td>Parameter A estimated from the sample (the location parameter).</td>
</tr>
<tr>
<td>paramB</td>
<td>Parameter B estimated from the sample (the scale parameter).</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a</td>
</tr>
<tr>
<td></td>
<td>significant difference between the sample and the uniform distribution. A</td>
</tr>
<tr>
<td></td>
<td>number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
**WEIBULL_DIST_FIT Procedure**

This procedure tests how well a sample of values fits a Weibull distribution.

**Syntax**

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (  
    ownername    IN    VARCHAR2,  
    tablename    IN    VARCHAR2,  
    columnname   IN    VARCHAR2,  
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    alpha        IN    NUMBER,  
    mu           IN    NUMBER,  
    beta         IN    NUMBER,  
    sig          OUT   NUMBER);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>alpha</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>beta</td>
<td>The slope/shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.</td>
</tr>

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

This chapter contains the following topics:

- **Using DBMS_STATS**
  - Overview
  - Types
  - Constants
  - Operational Notes
  - Deprecated Subprograms
  - Examples
- Summary of `DBMS_STATS` Subprograms
Using DBMS_STATS

Overview

The statistics to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if the DELETE_COLUMN_STATS procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use DBMS_STATS to gather statistics in parallel.

Types

Types for the minimum and maximum values and histogram endpoints include:

```sql
TYPE numarray  IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;

TYPE StatRec IS RECORD (  
  epc    NUMBER,  
  minval RAW(2000),  
  maxval RAW(2000),  
  bkvals NUMARRAY,  
  novals NUMARRAY);  
```

93-2  PL/SQL Packages and Types Reference
Using DBMS_STATS

Types for listing stale tables include:

```plsql
TYPE ObjectElem IS RECORD (
    ownname     VARCHAR2(30), -- owner
    objtype     VARCHAR2(6), -- 'TABLE' or 'INDEX'
    objname     VARCHAR2(30), -- table/index
    partname    VARCHAR2(30), -- partition
    subpartname VARCHAR2(30), -- subpartition
    confidence  NUMBER); -- not used

type ObjectTab is TABLE of ObjectElem;
```

Constants

Use the following constant to indicate that auto-sample size algorithms should be used:

```plsql
AUTO_SAMPLE_SIZE CONSTANT NUMBER;
```

The constant used to determine the system default degree of parallelism, based on the initialization parameters, is:

```plsql
DEFAULT_DEGREE CONSTANT NUMBER;
```

Use the following constant to let Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters:

```plsql
AUTO_DEGREE CONSTANT NUMBER;
```

Use the following constant to let Oracle decide whether to collect statistics for indexes or not:

```plsql
AUTO_CASCADE CONSTANT BOOLEAN;
```

Use the following constant to let Oracle decide when to invalidate dependent cursors.

```plsql
AUTO_INVALIDATE CONSTANT BOOLEAN;
```

Operational Notes

The DBMS_STATS subprograms perform the following general operations:

- Setting, Getting or Deleting Statistics
Deleting Statistics

Transferring Statistics

Gathering Optimizer Statistics

Locking or Unlocking Statistics

Restoring and Purging Statistics History

Setting, Getting or Deleting Statistics

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_PARAM Procedure.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Setting, Getting or Deleting Statistics

When a DBMS_STATS subprogram modifies or deletes the statistics for an object, all the dependent cursors are invalidated by default and corresponding statements are subject to recompilation next time so that the new statistics have immediate effects. This behavior can be altered with the no_invalidate argument.

Use the following procedures to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES
In the special versions of the SET_* STATS procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (ext.stats)
- The statistics type schema name (statsschema)
- The statistics type name (statsname)

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the GET_* STATS procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

**Deleting Statistics**

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.
Transferring Statistics

Use the following procedures to transfer statistics from the dictionary to a user statistics table (`export_*`) and from a user statistics table to the dictionary (`import_*`):

```sql
CREATE_STAT_TABLE
DROP_STAT_TABLE
```

`CREATE_STAT_TABLE` can hold user-defined statistics and the statistics type object number.

```sql
EXPORT_COLUMN_STATS
EXPORT_DATABASE_STATS
EXPORT_DICTIONARY_STATS
EXPORT_FIXED_OBJECTS_STATS
EXPORT_INDEX_STATS
EXPORT_SCHEMA_STATS
EXPORT_SYSTEM_STATS
EXPORT_TABLE_STATS
```

```sql
IMPORT_COLUMN_STATS
IMPORT_DICTIONARY_STATS
IMPORT_FIXED_OBJECTS_STATS
IMPORT_INDEX_STATS
IMPORT_SCHEMA_STATS
IMPORT_SYSTEM_STATS
IMPORT_TABLE_STATS
```

The `IMPORT_*` procedures retrieve statistics, including user-defined statistics, from the `stattab` table and store them in the dictionary. Because the `SET_*_STATS` and `GET_*_STATS` interfaces are supported for user-defined statistics, user-defined statistics can be copied to another database using this interface.

Gathering Optimizer Statistics

Use the following procedures to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

```sql
GATHER_DATABASE_STATS
GATHER_DICTIONARY_STATS
GATHER_FIXED_OBJECTS_STATS
GATHER_INDEX_STATS
GATHER_SCHEMA_STATS
GATHER_SYSTEM_STATS
GATHER_TABLE_STATS
```
The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_TABLE_STATS
LOCK_SCHEMA_STATS

UNLOCK_TABLE_STATS
UNLOCK_SCHEMA_STATS

The LOCK* procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected). When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESTORE_TABLE_STATS
RESTORE_SCHEMA_STATS
RESTORE_DATABASE_STATS
RESTORE_FIXED_OBJECTS_STATS
RESTORE_DICTIONARY_STATS
RESTORE_SYSTEM_STATS

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of the recent analysis of the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION procedure.
The other DBMS_STATS procedures related to restoring statistics are:

- **PURGE_STATS**: This procedure lets you manually purge old versions beyond a time stamp.
- **GET_STATS_HISTORY_RETENTION**: This function gets the current statistics history retention value.
- **GET_STATS_HISTORY_AVAILABILITY**: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

**User-Defined Statistics**

DBMS_STATS supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the `GATHER_INDEX_STATS` interface invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET` and `GET` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

** Deprecated Subprograms**

The following subprograms are obsolete with Release 10g:

- **ALTER_DATABASE_TAB_MONITORING Procedure**
- **ALTER_SCHEMA_TAB_MONITORING Procedure**

In earlier releases, you could use these subprograms to operate on statistics. These subprograms are now non-operational because Oracle performs their functions automatically.

**Examples**

- **Saving Original Statistics and Gathering New Statistics**
- **Gathering Daytime System Statistics**
Saving Original Statistics and Gathering New Statistics

Assume many modifications have been made to the employees table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

BEGIN
    DBMS_STATS.CREATE_STAT_TABLE ('hr', 'savestats');
    DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees', stattab => 'savestats');
END;

This operation gathers new statistics on the employees table, but first saves the original statistics in a user statistics table: hr.savestats.

If the user believes that the new statistics are causing the optimizer to generate poor plans, then the original statistics can be restored as follows:

BEGIN
    DBMS_STATS.DELETE_TABLE_STATS ('hr', 'employees');
    DBMS_STATS.IMPORT_TABLE_STATS ('hr', 'employees', stattab => 'savestats');
END;

Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (interval => 720,
                                      stattab => 'mystats',
                                      statid => 'OLTP');
END;

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (interval => 720,
                                      stattab => 'mystats',
                                      statid => 'OLAP');
END;
Update the dictionary with the gathered statistics.

```sql
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS (''mystats'',''OLTP'');'
                               sysdate, 'sysdate + 1');
  COMMIT;
END;

BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS (''mystats'',''OLAP'');'
                               sysdate + 0.5, 'sysdate + 1');
  COMMIT;
END;
```
### Summary of DBMS_STATS Subprograms

#### Table 93–1 DBMS_STATS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_DATABASE_TAB_MONITORING Procedure on page 93-16</td>
<td>Enables or disables the DML monitoring feature of all tables in the database, except for snapshot logs and the tables, which monitoring does not support [See Deprecated Subprograms on page 93-8]</td>
</tr>
<tr>
<td>ALTER_SCHEMA_TAB_MONITORING Procedure on page 93-17</td>
<td>Enables or disables the DML monitoring feature of all tables in the schema, except for snapshot logs and the tables, which monitoring does not support [See Deprecated Subprograms on page 93-8]</td>

<tr>
<td>UNLOCK_SCHEMA_STATS Procedure on page 93-132</td>
<td>Unlocks the statistics on all the table in a schema</td>
</tr>
<tr>
<td>UNLOCK_TABLE_STATS Procedure on page 93-133</td>
<td>Un locks the statistics on the table</td>
</tr>
<tr>
<td>UPGRADE_STAT_TABLE Procedure on page 93-134</td>
<td>Upgrades user statistics on an older table</td>
</tr>
</tbody>
</table>
ALTER_DATABASE_TAB_MONITORING Procedure

This procedure enables or disables the DML monitoring feature of all the tables in the schema, except for snapshot logs and the tables, which monitoring does not support. Using this procedure is equivalent to issuing ALTER TABLE...MONITORING (or NOMONITORING) individually.

Syntax

DBMS_STATS.ALTER_DATABASE_TAB_MONITORING (  
    monitoring BOOLEAN DEFAULT TRUE,  
    sysobjs    BOOLEAN DEFAULT FALSE);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>monitoring</td>
<td>Enables monitoring if true, and disables monitoring if false.</td>
<td></td>
</tr>
<tr>
<td>sysobjs</td>
<td>If true, changes monitoring on the dictionary objects.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

Exceptions

ORA-20000: Insufficient privileges.
**ALTER_SCHEMA_TAB_MONITORING Procedure**

*Note:* See [Deprecated Subprograms](#) on page 93-8.

This procedure enables or disables the DML monitoring feature of all the tables in the schema, except for snapshot logs and the tables, which monitoring does not support. Using this procedure is equivalent to issuing `ALTER TABLE ... MONITORING` (or `NOMONITORING`) individually.

**Syntax**

```sql
DBMS_STATS.ALTER_SCHEMA_TAB_MONITORING (
    ownname    VARCHAR2 DEFAULT NULL,
    monitoring BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema. (NULL means the current schema.)</td>
</tr>
<tr>
<td>monitoring</td>
<td>Enables monitoring if true, and disables monitoring if false.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You should enable monitoring if you use `GATHER_DATABASE_STATS` or `GATHER_SCHEMA_STATS` with the `GATHER AUTO` or `GATHER STALE` options.

**Exceptions**

ORA-20000: Insufficient privileges.
ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention       IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</td>
</tr>
<tr>
<td></td>
<td>- 0 - old statistics are never saved. The automatic purge will delete all statistics history</td>
</tr>
<tr>
<td></td>
<td>- 1 - statistics history is never purged by automatic purge.</td>
</tr>
<tr>
<td></td>
<td>- NULL - change statistics history retention to default value</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges.
CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

DBMS_STATS.CONVERT_RAW_VALUE (  
    rawval   RAW,  
    resval OUT BINARY_FLOAT);  

DBMS_STATS.CONVERT_RAW_VALUE (  
    rawval   RAW,  
    resval OUT BINARY_DOUBLE);  

DBMS_STATS.CONVERT_RAW_VALUE (  
    rawval   RAW,  
    resval OUT DATE);  

DBMS_STATS.CONVERT_RAW_VALUE (  
    rawval   RAW,  
    resval OUT NUMBER);  

DBMS_STATS.CONVERT_RAW_VALUE (  
    rawval   RAW,  
    resval OUT VARCHAR2);  

Pragmas

pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters.</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value.</td>
</tr>
</tbody>
</table>
CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
  rawval    RAW,
  resval    OUT NVARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters.</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value.</td>
</tr>
</tbody>
</table>
```
CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval  RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters.</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value.</td>
</tr>
</tbody>
</table>
```
CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```sql
DBMS_STATS.CREATE_STAT_TABLE (  
  ownname  VARCHAR2,  
  stattab  VARCHAR2,  
  tblspace VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ownname</code></td>
<td>Name of the schema.</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.</td>
</tr>
<tr>
<td><code>tblspace</code></td>
<td>Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Table already exists or insufficient privileges.
- ORA-20001: Tablespace does not exist.
DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_COLUMN_STATS (    ownname VARCHAR2,    tabname VARCHAR2,    colname VARCHAR2,    partname VARCHAR2 DEFAULT NULL,    stattab VARCHAR2 DEFAULT NULL,    statid VARCHAR2 DEFAULT NULL,    cascade_parts BOOLEAN  DEFAULT TRUE,    statown VARCHAR2 DEFAULT NULL,    no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (        get_param('NO_INVALIDATE'))),    force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>
DELETE_COLUMN_STATS Procedure

Table 93–9 (Cont.) DELETE_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes column statistics even if locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA–20000: Object does not exist or insufficient privileges.

ORA–20005: Object statistics are locked.
DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_STATS (  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE'))),  
  force            BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If <code>stattab</code> is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not NULL).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code>. If <code>stattab</code> is not NULL and if <code>statown</code> is NULL, then it is assumed that every schema in the database contains a user statistics table with the name <code>stattab</code>.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use <code>DBMS_STATS.AUTO_IN_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_PARAM</code> Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```sql
DBMS_STATS.DELETE_DICTIONARY_STATS (  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab. If stattab is not NULL and if statown is NULL, then it is assumed that every schema in the database contains a user statistics table with the name stattab.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalided.)Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked.</td>
</tr>
</tbody>
</table>
Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20002: Bad user statistics table, may need to upgrade it.
DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```sql
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
  stattab    VARCHAR2 DEFAULT NULL,
  statid     VARCHAR2 DEFAULT NULL,
  statown    VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
  force      BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab (if different from ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Ignores the statistics lock on objects and deletes the statistics if set to TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.
ORA-20002: Bad user statistics table, may need to upgrade it.
DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_INDEX_STATS (  
    ownname          VARCHAR2,  
    indname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    cascade_parts    BOOLEAN  DEFAULT TRUE,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),  
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>
### DELETE_INDEX_STATS Procedure

#### Table 93–13 (Cont.) DELETE_INDEX_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes index statistics even if locked.</td>
</tr>
</tbody>
</table>

#### Exceptions

ORA–20000: Object does not exist or insufficient privileges.

ORA–20005: Object statistics are locked.
DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```sql
DBMS_STATS.DELETE_SCHEMA_STATS (  
    ownername      VARCHAR2,  
    stattab        VARCHAR2 DEFAULT NULL,  
    statid         VARCHAR2 DEFAULT NULL,  
    statown        VARCHAR2 DEFAULT NULL,  
    no_invalidate  BOOLEAN DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')
    ),  
    force          BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownername).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes statistics of tables in a schema even if locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS(
    stattab VARCHAR2 DEFAULT NULL,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be saved.</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab, if different from the user's schema.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.
DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_TABLE_STATS (  
  ownname VARCHAR2,  
  tabname VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  cascade_parts BOOLEAN  DEFAULT TRUE,  
  cascade_columns BOOLEAN  DEFAULT TRUE,  
  cascade_indexes BOOLEAN  DEFAULT TRUE,  
  statown VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well.</td>
</tr>
<tr>
<td>cascade_columns</td>
<td>Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter).</td>
</tr>
</tbody>
</table>
DELETE_TABLE_STATS Procedure

Table 93–16  (Cont.) DELETE_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade_index</td>
<td>Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing statab (if different than ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes table statistics even if locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA–20000: Object does not exist or insufficient privileges.

ORA–20005: Object statistics are locked.
**DROP_STAT_TABLE Procedure**

This procedure drops a user statistics table.

**Syntax**

```sql
DBMS_STATS.DROP_STAT_TABLE (
    ownname VARCHAR2,
    stattab VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Table does not exist or insufficient privileges.
EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_COLUMN_STATS ( 
  ownname VARCHAR2,
  tabname VARCHAR2,
  colname VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab VARCHAR2,
  statid VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is NULL, then global and partition column statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code>.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>).</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
**EXPORT_DATABASE_STATS Procedure**

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by statown.stattab.

**Syntax**

```sql
DBMS_STATS.EXPORT_DATABASE_STATS(
    stattab VARCHAR2,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab. If statown is NULL, then it is assumed that every schema in the database contains a user statistics table with the name stattab.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges.
EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (  
  stattab VARCHAR2,  
  statid VARCHAR2 DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab. If statown is NULL, then it is assumed that every schema in the database contains a user statistics table with the name stattab.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20002: Bad user statistics table, may need to upgrade it.
**EXPORT_FIXED_OBJECTS_STATS Procedure**

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code>.</td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from <code>ownname</code>).</td>
</tr>
</tbody>
</table>

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges.
- **ORA-20002**: Bad user statistics table, may need to upgrade it.
EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_INDEX_STATS (
    ownname VARCHAR2,
    indname VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab VARCHAR2,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 93–22 EXPORT_INDEX_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code>, then global and partition index statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code>.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>).</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
**EXPORT_SCHEMA_STATS Procedure**

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_SCHEMA_STATS (
    ownname VARCHAR2,
    stattab VARCHAR2,
    statid  VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code>.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>).</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges.
**EXPORT_SYSTEM_STATS Procedure**

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_SYSTEM_STATS (  
  stattab       VARCHAR2,  
  statid        VARCHAR2 DEFAULT NULL,  
  statown       VARCHAR2 DEFAULT NULL);
```

**Parameters**

*Table 93–24  EXPORT_SYSTEM_STATS Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table that describes where the statistics will be stored.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics stored from the <code>stattab</code>.</td>
</tr>
<tr>
<td><code>statown</code></td>
<td>The schema containing <code>stattab</code>, if different from the user's schema.</td>
</tr>
</tbody>
</table>

**Exceptions**

- ORA–20000: Object does not exist or insufficient privileges.
- ORA–20002: Bad user statistics table; may need to be upgraded.
- ORA–20003: Unable to export system statistics.
EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index and column statistics associated with the specified table being exported as well.

Syntax

DBMS_STATS.EXPORT_TABLE_STATS (  
  ownname  VARCHAR2,  
  tabname  VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2,  
  statid   VARCHAR2 DEFAULT NULL,  
  cascade  BOOLEAN DEFAULT TRUE,  
  statown  VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then column and index statistics for this table are also exported.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;

Exceptions

ORA-20000: Insufficient privileges.
GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```sql
DBMS_STATS.GATHER_DATABASE_STATS (  
estimate_percent NUMBER DEFAULT to_estimate_percent_type  
  {get_param('ESTIMATE_PERCENT')},  
  block_sample BOOLEAN DEFAULT FALSE,  
  method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity VARCHAR2 DEFAULT 'AUTO',  
cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
options VARCHAR2 DEFAULT 'GATHER',  
objlist OUT ObjectTab,  
statown VARCHAR2 DEFAULT NULL,  
gather_sys BOOLEAN DEFAULT FALSE,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (  
  get_param('NO_INVALIDATE')));
```
Parameters

Table 93–26  GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Accepts:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>• FOR COLUMNS [size clause] column</td>
</tr>
<tr>
<td></td>
<td>• integer—Number of histogram buckets. Must be in the range [1,254].</td>
</tr>
<tr>
<td></td>
<td>• REPEAT—Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>• AUTO—Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>• SKEWONLY—Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
</tr>
</tbody>
</table>

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.
Degree of parallelism. The default for \texttt{degree} is \texttt{NULL}. The default value can be changed using the \texttt{SET\_PARAM Procedure}. \texttt{NULL} means use the table default value specified by the \texttt{DEGREE} clause in the \texttt{CREATE TABLE} or \texttt{ALTER TABLE} statement. Use the constant \texttt{DBMS\_STATS.DEFAULT\_DEGREE} to specify the default value based on the initialization parameters. The \texttt{AUTO\_DEGREE} value determines the degree of parallelism automatically. This is either 1 (serial execution) or \texttt{DEFAULT\_DEGREE} (the system default value based on number of CPUs and initialization parameters) according to size of the object.

Granularity of statistics to collect (only pertinent if the table is partitioned).

- \texttt{'ALL'} - gathers all (subpartition, partition, and global) statistics
- \texttt{'AUTO'} - determines the granularity based on the partitioning type, and collects the global, partition level and subpartition level statistics if the subpartitioning method is \texttt{LIST}, and the global and partition level only otherwise. This is the default value.
- \texttt{'DEFAULT'} - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the \texttt{GLOBAL AND PARTITION} for this functionality. Note that the default value is now \texttt{AUTO}.
- \texttt{'GLOBAL'} - gathers global statistics
- \texttt{'GLOBAL AND PARTITION'} - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- \texttt{'PARTITION'} - gathers partition-level statistics
- \texttt{'SUBPARTITION'} - gathers subpartition-level statistics.

Gather statistics on the indexes as well. Index statistics gathering is not parallelized. Using this option is equivalent to running the \texttt{GATHER\_INDEX\_STATS Procedure} on each of the indexes in the database in addition to gathering table and column statistics. Use the constant \texttt{DBMS\_STATS.AUTO\_CASCADE} to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the \texttt{SET\_PARAM Procedure}.
User statistics table identifier describing where to save the current statistics.

The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.

Identifier (optional) to associate with these statistics within `stattab`.

Further specification of which objects to gather statistics for:

- **GATHER**: Gathers statistics on all objects in the schema.
- **GATHER AUTO**: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When `GATHER AUTO` is specified, the only additional valid parameters are `stattab, statid, objlist` and `statown`; all other parameter settings are ignored. Returns a list of processed objects.
- **GATHER STALE**: Gathers statistics on stale objects as determined by looking at the `*_tab_modifications` views. Also, return a list of objects found to be stale.
- **GATHER EMPTY**: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.
- **LIST AUTO**: Returns a list of objects to be processed with `GATHER AUTO`.
- **LIST STALE**: Returns a list of stale objects as determined by looking at the `*_tab_modifications` views.
- **LIST EMPTY**: Returns a list of objects which currently have no statistics.

List of objects found to be stale or empty.

Schema containing `stattab` (if different than `ownname`).

Gathers statistics on the objects owned by the 'SYS' user.

<table>

</tbody>
</table>
Statistics for external tables are not collected by this procedure.

**Exceptions**

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.
GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```sql
DBMS_STATS.GATHER_DICTIONARY_STATS (comp_id          VARCHAR2 DEFAULT NULL,
estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                             (get_param('ESTIMATE_PERCENT'))),
block_sample     BOOLEAN  DEFAULT FALSE,
method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE'))),
granularity      VARCHAR2 DEFAULT 'AUTO',
cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE'))),
stattab          VARCHAR2 DEFAULT NULL,
statid           VARCHAR2 DEFAULT NULL,
options          VARCHAR2 DEFAULT 'GATHER AUTO',
objlist        OUT   ObjectTab,
statown          VARCHAR2 DEFAULT NULL,
no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_id</td>
<td>The component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components). Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure.</td>
</tr>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block_sample</td>
<td>Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>The method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>size_clause := SIZE [integer</td>
</tr>
<tr>
<td></td>
<td>where integer is between 1 and 254 FOR ALL [INDEXED</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure. NULL means use of table default value that was specified by the DEGREE clause in the CREATE or ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</td>
</tr>
</tbody>
</table>
**GATHER_DICTIONARY_STATS Procedure**

**Table 93–27  (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>

  'ALL' - gathers all (subpartition, partition, and global) statistics<br>

  'AUTO' - determines the granularity based on the partitioning type, and collects the global, partition level and subpartition level statistics if the subpartitioning method is LIST, and the global and partition level only otherwise. This is the default value.<br>

  'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>

  'GLOBAL' - gathers global statistics<br>

  'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>

  'PARTITION' - gathers partition-level statistics<br>

  'SUBPARTITION' - gathers subpartition-level statistics. |
| cascade | Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant `DBMS_STATS.AUTO_CASCADE` to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure. |
| stattab | User statistics table identifier describing where to save the current statistics. |
| statid | The (optional) identifier to associate with these statistics within stattab. |
Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges.
ORA-20001: Bad input value.
ORA-20002: Bad user statistics table, may need to upgrade it.
GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
    stattab        VARCHAR2 DEFAULT NULL,
    statid         VARCHAR2 DEFAULT NULL,
    statown        VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type {
        get_param('NO_INVALIDATE');
    };
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing where to save the current statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab (if different from ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.
ORA-20001: Bad input value.
ORA-20002: Bad user statistics table, may need to upgrade it.
This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The granularity and no_invalidate arguments are not relevant to these types of indexes.

### Syntax

```sql
DBMS_STATS.GATHER_INDEX_STATS (  
  ownname          VARCHAR2,  
  indname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
                (get_param('ESTIMATE_PERCENT')),  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE'))),  
  granularity      VARCHAR2 DEFAULT 'AUTO',  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type  
                (get_param('NO_INVALIDATE'));
```

</table>
Exceptions

ORA-20000: Index does not exist or insufficient privileges.
ORA-20001: Bad input value.
GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```sql
DBMS_STATS.GATHER_SCHEMA_STATS (  
    ownname          VARCHAR2,  
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
        (get_param('ESTIMATE_PERCENT')),  
    block_sample     BOOLEAN  DEFAULT FALSE,  
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
    granularity      VARCHAR2 DEFAULT 'AUTO',  
    cascade          VARCHAR2 DEFAULT to_cascade_type(get_param('CASCADE')),  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    options          VARCHAR2 DEFAULT 'GATHER',  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE'));
```
Parameters

Table 93–30  GATHER_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema to analyze (NULL means current schema).</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Accepts: FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>FOR COLUMNS [size clause] column</td>
</tr>
<tr>
<td></td>
<td>integer—Number of histogram buckets. Must be in the range [1,254].</td>
</tr>
<tr>
<td></td>
<td>REPEAT—Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>AUTO—Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>SKEWONLY—Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
</tr>
</tbody>
</table>

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.
Degree of parallelism. The default for `degree` is `NULL`. The default value can be changed using the `SET_PARAM Procedure`. `NULL` means use the table default value specified by the `DEGREE` clause in the `CREATE TABLE` or `ALTER TABLE` statement. Use the constant `DBMS_STATS.DEFAULT_DEGREE` to specify the default value based on the initialization parameters. The `AUTO_DEGREE` value determines the degree of parallelism automatically. This is either 1 (serial execution) or `DEFAULT_DEGREE` (the system default value based on number of CPUs and initialization parameters) according to size of the object.

Granularity of statistics to collect (only pertinent if the table is partitioned).

- `'ALL'` - gathers all (subpartition, partition, and global) statistics
- `'AUTO'` - determines the granularity based on the partitioning type, and collects the global, partition level and subpartition level statistics if the subpartitioning method is `LIST`, and the global and partition level only otherwise. This is the default value.
- `'DEFAULT'` - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the `'GLOBAL AND PARTITION'` for this functionality. Note that the default value is now `'AUTO'`.
- `'GLOBAL'` - gathers global statistics
- `'GLOBAL AND PARTITION'` - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- `'PARTITION'` - gathers partition-level statistics
- `'SUBPARTITION'` - gathers subpartition-level statistics.

Gather statistics on the indexes as well. Index statistics gathering is not parallelized. Using this option is equivalent to running the `GATHER_INDEX_STATS Procedure` on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant `DBMS_STATS.AUTO_CASCADE` to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the `SET_PARAM Procedure`.

<table>
<thead>
<tr>

<tr>
<td></td>
<td>LIST EMPTY: Returns list of objects which currently have no statistics.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the objects for which statistics are being gathered. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Cannot be used with the cascade option because GATHER_INDEX_STATS does not support the cascade option. This option has no effect when an index is picked up as a target because GATHER_INDEX_STATS does not support this option. Use DBMS_STATS.AUTO_INVALIDATE, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
</tbody>
</table>
Usage Notes

DBMS_STATS.GATHER_SCHEMA_STATS generates differing sampling rates on partitioned tables when you use the auto_sample_size constant. DBMS_STATS tries to determine an adequate sample size for each type of statistic, which is different for each table or column (and each partition, if partitioned). It starts with a sampling rate to get approximately 5000 rows and examines the result based on statistical equations. This process is repeated with increased sampling rate for unsatisfactory results.

In general, the number of distinct values column statistics requires the highest sampling rate among the others, especially when each distinct value repeats a small number of times.

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges.
ORA-20001: Bad input value.
GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (  
gathering_mode VARCHAR2 DEFAULT 'NOWORKLOAD',  
interval INTEGER DEFAULT NULL,  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gathering_mode</code></td>
<td>Mode values are:</td>
</tr>
<tr>
<td></td>
<td>- NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for all workloads. Oracle recommends to run <code>GATHER_SYSTEM_STATS('noworkload')</code> after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: cpuspeednw, ioseektim, iotfrspeed.</td>
</tr>
<tr>
<td></td>
<td>- INTERVAL: Captures system activity during a specified interval. This works in combination with the <code>interval</code> parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or <code>stattab</code>. You can use <code>GATHER_SYSTEM_STATS(gathering_mode=&gt;'STOP')</code> to stop gathering earlier than scheduled. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc.</td>
</tr>
<tr>
<td></td>
<td>- START</td>
</tr>
<tr>
<td><code>interval</code></td>
<td>Time, in minutes, to gather statistics. This parameter applies only when <code>gathering_mode='INTERVAL'</code>.</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table where the statistics will be saved.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics saved in the <code>stattab</code>.</td>
</tr>
<tr>
<td><code>statown</code></td>
<td>The schema containing <code>stattab</code>, if different from the user's schema.</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid input value.
ORA-20002: Bad user statistics table; may need to be upgraded.
ORA-20003: Unable to gather system statistics.
ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0.
GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```sql
DBMS_STATS.GATHER_TABLE_STATS (  
  ownname          VARCHAR2,  
  tabname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
    {get_param('ESTIMATE_PERCENT')},  
  block_sample     BOOLEAN  DEFAULT FALSE,  
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity      VARCHAR2 DEFAULT 'AUTO',  
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE') ));
```

This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

Table 93–32 (Cont.) GATHER_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).

'ALL' - gathers all (subpartition, partition, and global) statistics

'AUTO' - determines the granularity based on the partitioning type, and collects the global, partition level and subpartition level statistics if the subpartitioning method is LIST, and the global and partition level only otherwise. This is the default value.

'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.

'GLOBAL' - gathers global statistics

'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.

'PARTITION' - gathers partition-level statistics

'SUBPARTITION' - gathers subpartition-level statistics.

cascade | Gather statistics on the indexes for this table. Index statistics gathering is not parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table’s indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.

stattab | User statistics table identifier describing where to save the current statistics.

statid | Identifier (optional) to associate with these statistics within stattab.

statown | Schema containing stattab (if different than ownname).
GATHER_TABLE_STATS Procedure

**Usage Notes**

This operation does not parallelize if the user does not have select privilege on the table being analyzed.

**Exceptions**

ORA-20000: Table does not exist or insufficient privileges.

ORA-20001: Bad input value.

---

**Table 93–32 (Cont.) GATHER_TABLE_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Cannot be used with the cascade option because GATHER_INDEX_STATS does not support the cascade option. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
</tbody>
</table>
**GENERATE_STATS** Procedure

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

**Syntax**

```
DBMS_STATS.GENERATE_STATS (    
  ownname   VARCHAR2,      
  objname   VARCHAR2,      
  organized NUMBER DEFAULT 7);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of object.</td>
</tr>
<tr>
<td>objname</td>
<td>Name of object.</td>
</tr>
<tr>
<td>organized</td>
<td>Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.</td>
</tr>
</tbody>
</table>

**Usage Notes**

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

**Exceptions**

- ORA-20000: Unsupported object type of object does not exist.
- ORA-20001: Invalid option or invalid statistics.
GET_COLUMN_STATS Procedures

These procedures get all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```sql
DBMS_STATS.GET_COLUMN_STATS (  
  ownname     VARCHAR2,  
  tabname     VARCHAR2,  
  colname     VARCHAR2,  
  partname    VARCHAR2 DEFAULT NULL,  
  stattab     VARCHAR2 DEFAULT NULL,  
  statid      VARCHAR2 DEFAULT NULL,  
  distcnt OUT NUMBER,  
  density OUT NUMBER,  
  nullcnt OUT NUMBER,  
  srec OUT StatRec,  
  avgclen OUT NUMBER,  
  statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.GET_COLUMN_STATS (  
  ownname          VARCHAR2,  
  tabname          VARCHAR2,  
  colname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  ext_stats   OUT  RAW,  
  stattypown  OUT  VARCHAR2 DEFAULT NULL,  
  stattypname OUT  VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

### Table 93–34 (Cont.) GET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colname</td>
<td>Name of the column.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics.</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type.</td>
</tr>
<tr>
<td>stattypname</td>
<td>Name of the statistics type.</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values.</td>
</tr>
<tr>
<td>density</td>
<td>Column density.</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs.</td>
</tr>
<tr>
<td>srec</td>
<td>Structure holding internal representation of column minimum, maximum, and histogram values.</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length of the column (in bytes).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.
These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

**Syntax**

```sql
DBMS_STATS.GET_INDEX_STATS (  
    ownname VARCHAR2,  
    indname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    numrows OUT NUMBER,  
    numlblks OUT NUMBER,  
    numdist OUT NUMBER,  
    avgblk OUT NUMBER,  
    avgdblk OUT NUMBER,  
    clstfct OUT NUMBER,  
    indlevel OUT NUMBER,  
    statown VARCHAR2 DEFAULT NULL,  
    cachedblk OUT NUMBER,  
    cachehit OUT NUMBER);  

DBMS_STATS.GET_INDEX_STATS (  
    ownname VARCHAR2,  
    indname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    numrows OUT NUMBER,  
    numlblks OUT NUMBER,  
    numdist OUT NUMBER,  
    avgblk OUT NUMBER,  
    avgdblk OUT NUMBER,  
    clstfct OUT NUMBER,  
    indlevel OUT NUMBER,  
    statown VARCHAR2 DEFAULT NULL,  
    guessq OUT NUMBER,  
    cachedblk OUT NUMBER,  
    cachehit OUT NUMBER);  
```

Use the following for user-defined statistics:
```sql
DBMS_STATS.GET_INDEX_STATS:

ownname VARCHAR2,
indname VARCHAR2,
partname VARCHAR2 DEFAULT NULL,
stattab VARCHAR2 DEFAULT NULL,
statid VARCHAR2 DEFAULT NULL,
ext_stats OUT RAW,
stattypown OUT VARCHAR2 DEFAULT NULL,
stattypname OUT VARCHAR2 DEFAULT NULL,
statown VARCHAR2 DEFAULT NULL,
cachedblk OUT NUMBER,
cachehit OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics.</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type.</td>
</tr>
<tr>
<td>stattypname</td>
<td>Name of the statistics type.</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the index (partition).</td>
</tr>
<tr>
<td>numlblks</td>
<td>Number of leaf blocks in the index (partition).</td>
</tr>
<tr>
<td>numdist</td>
<td>Number of distinct keys in the index (partition).</td>
</tr>
<tr>
<td>avglblk</td>
<td>Average integral number of leaf blocks in which each distinct key appears for this index (partition).</td>
</tr>
<tr>
<td>avgdblk</td>
<td>Average integral number of data blocks in the table pointed to by a distinct key for this index (partition).</td>
</tr>
</tbody>
</table>
The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHMMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a ‘confidence factor’ for each cachehit and a cachedblk for each object. If the ‘confidence factor’ for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other “minor” workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations

- When not enough data has been analyzed, such as when an object has been recently create

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clstfct</td>
<td>Clustering factor for the index (partition).</td>
</tr>
<tr>
<td>indlevel</td>
<td>Height of the index (partition).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
<tr>
<td>guessq</td>
<td>Guess quality for the index (partition).</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition).</td>
</tr>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition).</td>
</tr>
</tbody>
</table>
When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.
GET PARAM Function

This function returns the default value of parameters of DBMS_STATS procedures.

Syntax

```
DBMS_STATS.GET_PARAM (  
    pname IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid input values
GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
RETURN TIMESTAMP WITH TIMEZONE;
GET_STATS_HISTORY_RETENTION Function

This function returns the current retention value.

Syntax

```sql
DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
```
GET_SYSTEM_STATS Procedure

This procedure gets system statistics from stattab, or from the dictionary if stattab is NULL.

Syntax

```sql
DBMS_STATS.GET_SYSTEM_STATS (    status OUT VARCHAR2,    dstart OUT DATE,    dstop OUT DATE,    pname OUT VARCHAR2,    pvalue OUT NUMBER,    stattab IN VARCHAR2 DEFAULT NULL,    statid IN VARCHAR2 DEFAULT NULL,    statown IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| status | Output is one of the following:  
  - COMPLETED:  
  - AUTOGATHERING:  
  - MANUALGATHERING:  
  - BADSTATS: |
| dstart | Date when statistics gathering started.  
  - If status = MANUALGATHERING, the start date is returned. |
| dstop | Date when statistics gathering stopped.  
  - If status = COMPLETE, the finish date is returned.  
  - If status = AUTOGATHERING, the future finish date is returned.  
  - If status = BADSTATS, the must-finished-by date is returned. |
GET_SYSTEM_STATS Procedure

Table 93–37 (Cont.) GET_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• iotfrspeed - I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>• ioseektim - seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• sreadtim - average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</td>
</tr>
<tr>
<td></td>
<td>• cpuspeednw - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option)</td>
</tr>
<tr>
<td></td>
<td>• mbrc - average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>• maxthr - maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>• slavethr - average slave I/O throughput, in bytes/second</td>
</tr>
<tr>
<td>pvalue</td>
<td>The parameter value to get.</td>
</tr>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab, if different from the user's schema.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.
ORA-20003: Unable to gather system statistics.
ORA-20004: Parameter does not exist.
GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```sql
DBMS_STATS.GET_TABLE_STATS (
    ownname VARCHAR2,
    tabname VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab VARCHAR2 DEFAULT NULL,
    statid VARCHAR2 DEFAULT NULL,
    numRows OUT NUMBER,
    numblks OUT NUMBER,
    avgrlen OUT NUMBER,
    statown VARCHAR2 DEFAULT NULL,
    cachedblk OUT NUMBER,
    cachehit OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>numRows</td>
<td>Number of rows in the table (partition).</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies.</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table (partition).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>
Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object
IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname       VARCHAR2,
    tabname       VARCHAR2,
    colname       VARCHAR2,
    partname      VARCHAR2 DEFAULT NULL,
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>The name of the column.</td>
</tr>
<tr>
<td>partname</td>
<td>The name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab (if different than ownname).</td>
</tr>
</tbody>
</table>
Table 93–39  (Cont.) IMPORT_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>If set to FALSE, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they expire or are invalidated.) Use DBMS_STATS.AUTO_INVALIDATE, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>If set to TRUE, imports statistics even if statistics are locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA–20000: Object does not exist or insufficient privileges.

ORA–20001: Invalid or inconsistent values in the user statistics table.

ORA–20005: Object statistics are locked.
IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```plsql
DBMS_STATS.IMPORT_DATABASE_STATS (
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE'),
    ),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab. If statown is NULL, then it is assumed that every schema in the database contains a user statistics table with the name stattab.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the objects to which the statistics are being imported. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>• TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>• FALSE - The statistics will be imported only if they are not locked.</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values in the user statistics table.
IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_DICTIONARY_STATS (  
  stattab     VARCHAR2,  
  statid      VARCHAR2 DEFAULT NULL,  
  statown     VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
    get_param('NO_INVALIDATE'))),  
  force       BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab (if different from current schema).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Do not invalidate the dependent cursors if set to TRUE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>- TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>- FALSE - The statistics will be imported only if there is no lock.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values in the user statistics table.
ORA-20002: Bad user statistics table, may need to upgrade it.
IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE'),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab. If statown is NULL, then it is assumed that every schema in the database contains a user statistics table with the name stattab.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the objects to which the statistics are being imported. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock:</td>
</tr>
<tr>
<td></td>
<td>- TRUE - Ignores the statistics lock and imports the statistics</td>
</tr>
<tr>
<td></td>
<td>- FALSE - The statistics will be imported only if there is no lock</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values in the user statistics table.
ORA-20002: Bad user statistics table, may need to upgrade it.
**IMPORT_INDEX_STATS Procedure**

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

**Syntax**

```sql
DBMS_STATS.IMPORT_INDEX_STATS (
    ownname   VARCHAR2,
    indname   VARCHAR2,
    partname  VARCHAR2 DEFAULT NULL,
    stattab   VARCHAR2,
    statid    VARCHAR2 DEFAULT NULL,
    statown   VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force     BOOLEAN DEFAULT FALSE);
```

**Parameters**

**Table 93-43 IMPORT_INDEX_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
<tr>

ORA–20005: Object statistics are locked.
IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_SCHEMA_STATS (
    ownname        VARCHAR2,
    stattab        VARCHAR2,
    statid         VARCHAR2 DEFAULT NULL,
    statown        VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN DEFAULT to_no_invalidate_type(
                        get_param('NO_INVALIDATE')),
    force          BOOLEAN DEFAULT FALSE);
```

Parameters

<table>

</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.
IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by stattab, and stores the statistics in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_SYSTEM_STATS (  
    stattab VARCHAR2,  
    statid  VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be retrieved.</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics retrieved from the stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>The schema containing stattab, if different from the user’s schema.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values in the user statistics table.
ORA-20002: Bad user statistics table; may need to be upgraded.
ORA-20003: Unable to import system statistics.
IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index and column statistics associated with the specified table being imported as well.

Syntax

```sql
DBMS_STATS.IMPORT_TABLE_STATS (  
  ownname       VARCHAR2,  
  tabname       VARCHAR2,  
  partname      VARCHAR2 DEFAULT NULL,  
  stattab       VARCHAR2,  
  statid        VARCHAR2 DEFAULT NULL,  
  cascade       BOOLEAN  DEFAULT TRUE,  
  statown       VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
      get_param('NO_INVALIDATE')),  
  force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code>, then global and partition table statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code>.</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then column and index statistics for this table are also imported.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>).</td>
</tr>
</tbody>
</table>
Table 93–46  (Cont.) IMPORT_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if table statistics are locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.
LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

DBMS_STATS.LOCK_SCHEMA_STATS ( 
    ownname   VARCHAR2); 

Parameters

Table 93–47  LOCK_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema to lock.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Usage Notes" for LOCK_TABLE_STATS Procedure.
LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```sql
DBMS_STATS.LOCK_TABLE_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table.</td>
</tr>
</tbody>
</table>

Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.
**PREPARE_COLUMN_VALUES Procedures**

These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

**Syntax**

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                    charvals CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                    datevals DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                    dblvals DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                   fltvals FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                    numvals NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec    IN OUT StatRec,
                                    rawvals RAWARRAY);
```

**Pragmas**

```sql
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```
Parameters

**Table 93–49  PREPARE_COLUMN_VALUES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.epc</td>
<td>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.bkvals</td>
<td>If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</td>
</tr>
</tbody>
</table>

Datatype-specific input parameters (use one) are shown in **Table 93–50**.

**Table 93–50  Datatype-Specific Input Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charvals</td>
<td>The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>datevals</td>
<td>The array of values when the column type is date-based.</td>
</tr>
<tr>
<td>dblvals</td>
<td>The array of values when the column type is double-based.</td>
</tr>
<tr>
<td>fltvals</td>
<td>The array of values when the column type is float-based.</td>
</tr>
<tr>
<td>numvals</td>
<td>The array of values when the column type is numeric-based.</td>
</tr>
</tbody>
</table>
Output Parameters

Table 93–51  PREPARE_COLUMN_VALUES Procedure Output Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.minval</td>
<td>Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.maxval</td>
<td>Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.bkvals</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.novals</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid or inconsistent input values.
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (  
    srec     IN OUT StatRec,  
    nvmin           NVARCHAR2,  
    nvmax           NVARCHAR2);  
```

Pragmas

```sql
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS, RNPS);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>srec.epc</code></td>
<td>Number of values specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (<code>nvarchar</code> and <code>rowid</code>). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td><code>srec.bkvals</code></td>
<td>If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.</td>
</tr>
</tbody>
</table>

Datatype-specific input parameters (use one) are shown in Table 93–50.

Exceptions

ORA-20001: Invalid or inconsistent input values.
PREPARE_COLUMN_VALUES_ROWID Procedure

PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
    srec  IN OUT StatRec,
    rwmin        ROWID,
    rwmax        ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```

<td>Array suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid or inconsistent input values.
PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```sql
DBMS_STATS.PURGE_STATS(
    before_timestamp  TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.
**RESTORE_DATABASE_STATS Procedure**

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

**Syntax**

```sql
DBMS_STATS.RESTORE_DATABASE_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics.</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked.</td>
</tr>
</tbody>
</table>

**Exceptions**

- ORA-20000: Object does not exist or insufficient privileges.
- ORA-20001: Invalid or inconsistent values.
- ORA-20006: Unable to restore statistics, statistics history not available.
RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_DICTIONARY_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics.</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values.
ORA-20006: Unable to restore statistics, statistics history not available.
RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```sql
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
    as_of_timestamp    TIMESTAMP WITH TIME ZONE,
    force              BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>as_of_timestamp</code></td>
<td>The timestamp to which to restore statistics.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>Restores statistics even if their statistics are locked.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges.
- ORA-20001: Invalid or inconsistent values.
- ORA-20006: Unable to restore statistics, statistics history not available.
RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
    ownname                VARCHAR2,
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The schema of the tables for which the statistics are to be restored.</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics.</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values.
ORA-20006: Unable to restore statistics, statistics history not available.
RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as of timestamp).

Syntax

DBMS_STATS.RESTORE_SCHEMA_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent values.
ORA-20006: Unable to restore statistics, statistics history not available.
RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (`as_of_timestamp`). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```sql
DBMS_STATS.RESTORE_TABLE_STATS (  
    ownname                   VARCHAR2,
    tabname                   VARCHAR2,
    as_of_timestamp           TIMESTAMP WITH TIME ZONE,
    restore_cluster_index     BOOLEAN DEFAULT FALSE,
    force                     BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The schema of the table for which the statistics are to be restored.</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name.</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics.</td>
</tr>
<tr>
<td>restore_cluster_index</td>
<td>If the table is part of a cluster, restore statistics of the cluster index if set to TRUE.</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges.
- ORA-20001: Invalid or inconsistent values.
- ORA-20006: Unable to restore statistics, statistics history not available.
SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```sql
DBMS_STATS.SET_COLUMN_STATS (  
onwname VARCHAR2,  
tabname VARCHAR2,  
colname VARCHAR2,  
partname VARCHAR2 DEFAULT NULL,  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
distcnt NUMBER DEFAULT NULL,  
density NUMBER DEFAULT NULL,  
nullcnt NUMBER DEFAULT NULL,  
srec StatRec DEFAULT NULL,  
avgclen NUMBER DEFAULT NULL,  
flags NUMBER DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(    get_param('NO_INVALIDATE')),  
force BOOLEAN DEFAULT FALSE);  
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.SET_COLUMN_STATS (  
onwname VARCHAR2,  
tabname VARCHAR2,  
colname VARCHAR2,  
partname VARCHAR2 DEFAULT NULL,  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
ext_stats RAW,  
stattypown VARCHAR2 DEFAULT NULL,  
stattypname VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(    get_param('NO_INVALIDATE')),  
force BOOLEAN DEFAULT FALSE);  
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics.</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type.</td>
</tr>
<tr>
<td>stattypename</td>
<td>Name of the statistics type.</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values.</td>
</tr>
<tr>
<td>density</td>
<td>Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs.</td>
</tr>
<tr>
<td>srec</td>
<td>StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS.</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length for the column (in bytes).</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL).</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>If set to the default, does not invalidate the shared cursors dependent on the table. (The statements corresponding to those cursors are not recompiled until they are gone or invalidated.) Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Sets the values even if statistics of the column are locked.</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or inconsistent input values.
ORA-20005: Object statistics are locked.
These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

**Syntax**

```
DBMS_STATS.SET_INDEX_STATS (  
  ownname  VARCHAR2,  
  indname  VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab  VARCHAR2 DEFAULT NULL,  
  statid   VARCHAR2 DEFAULT NULL,  
  numrows  NUMBER DEFAULT NULL,  
  numblks  NUMBER DEFAULT NULL,  
  numdist  NUMBER DEFAULT NULL,  
  avglblk  NUMBER DEFAULT NULL,  
  avgdblk  NUMBER DEFAULT NULL,  
  clstfct  NUMBER DEFAULT NULL,  
  indlevel NUMBER DEFAULT NULL,  
  flags    NUMBER DEFAULT NULL,  
  statown  VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
    get_param('NO_INVALIDATE')),  
  guessq   NUMBER DEFAULT NULL,  
  cachedblk NUMBER DEFAULT NULL,  
  cachehit NUMBER DEFAULT NULL,  
  force    BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (  
  ownname  VARCHAR2,  
  indname  VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab  VARCHAR2 DEFAULT NULL,  
  statid   VARCHAR2 DEFAULT NULL,  
  ext_stats RAW,  
  stattypown VARCHAR2 DEFAULT NULL,  
  stattypname VARCHAR2 DEFAULT NULL,  
  statown  VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
```
get_param('NO_INVALIDATE'),
cachedblk NUMBER DEFAULT NULL,
cachehit NUMBER DEFAULT NULL,
force BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

</table>
The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a ‘confidence factor’ for each `cachehit` and a `cachedblk` for each object. If the ‘confidence factor’ for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations:

- When not enough data has been analyzed, such as when an object has been recently created.
- When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions:

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid input value.
ORA-20005: Object statistics are locked.
SET_PARAM Procedure

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
    pname IN VARCHAR2,
    pval IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name. The default value for following parameters can be set.</td>
</tr>
<tr>
<td></td>
<td>- CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures. It is used only by gather procedures.</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td>pval</td>
<td>The parameter value. If NULL is specified, it will set the oracle default value.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid or illegal input value.
Examples

dbms_stats.set_param('CASCADE','DBMS_STATS.AUTOCASCADE');
dbms_stats.set_param('ESTIMATE_PERCENT','5');
dbms_stats.set_param('DEGREE','NULL');
SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```plsql
DBMS_STATS.SET_SYSTEM_STATS (  
  pname    VARCHAR2,  
  pvalue   NUMBER,  
  stattab IN VARCHAR2 DEFAULT NULL,  
  statid IN VARCHAR2 DEFAULT NULL,  
  statown IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- iotfrspeed—I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>- ioseektim—seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- sreadtim—average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- mreadtim—average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- cpuspeed—average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</td>
</tr>
<tr>
<td></td>
<td>- cpuspeednw—average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option)</td>
</tr>
<tr>
<td></td>
<td>- mbrc—average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>- maxthr—maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>- slavethr—average slave I/O throughput, in bytes/second</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

**Usage Notes**

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_ [TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations

**Table 93–68 (Cont.) SET_SYSTEM_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pvalue</code></td>
<td>Parameter value to get.</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table where the statistics will be obtained. If <code>stattab</code> is null, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics saved in the <code>stattab</code>.</td>
</tr>
<tr>
<td><code>statown</code></td>
<td>The schema containing <code>stattab</code>, if different from the user’s schema.</td>
</tr>
<tr>
<td><code>cachedblk</code></td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition).</td>
</tr>
<tr>
<td><code>cachehit</code></td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition).</td>
</tr>
</tbody>
</table>
SET_SYSTEM_STATS Procedure

- When not enough data has been analyzed, such as when an object has been recently created
- When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.
ORA-20001: Invalid input value.
ORA-20002: Bad user statistics table; may need to be upgraded.
ORA-20003: Unable to set system statistics.
ORA-20004: Parameter does not exist.
SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (  
    ownname       VARCHAR2,  
    tabname       VARCHAR2,  
    partname      VARCHAR2 DEFAULT NULL,  
    stattab       VARCHAR2 DEFAULT NULL,  
    statid        VARCHAR2 DEFAULT NULL,  
    numrows       NUMBER   DEFAULT NULL,  
    numblks       NUMBER   DEFAULT NULL,  
    avgrlen       NUMBER   DEFAULT NULL,  
    flags         NUMBER   DEFAULT NULL,  
    statown       VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),  
    cachedblk     NUMBER    DEFAULT NULL,  
    cachehit      NUMBER    DEFUALT NULL,  
    force         BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table (partition).</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies.</td>
</tr>
</tbody>
</table>
Usage Notes

The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the default will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values.

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges.
- **ORA-20001**: Invalid input value.
- **ORA-20005**: Object statistics are locked.
UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```sql
DBMS_STATS.UNLOCK_SCHEMA_STATS (  
    ownname   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema.</td>
</tr>
</tbody>
</table>

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
**UNLOCK_TABLE_STATS Procedure**

This procedure unlocks the statistics on the table.

**Syntax**

```sql
DBMS_STATS.UNLOCK_TABLE_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.

- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Unable to upgrade table.
With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle
background process FMON to invoke mapping operations that populate mapping
views. FMON communicates with operating and storage system vendor-supplied
mapping libraries.

This chapter contains the following topics:

- Using `DBMS_STORAGE_MAP`
  - Overview
  - Operational Notes
- Summary of `DBMS_STORAGE_MAP` Subprograms
Using DBMS_STORAGE_MAP

Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- **Mapping libraries**
  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- **Mapping files**
  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- **Mapping elements and sub-elements**
  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack.

- **Mapping file extents**
  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.
Operational Notes

For MAP_ELEMENT, MAP_FILE, and MAP_ALL: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

See Also: Oracle Database Administrator’s Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.
Summary of DBMS_STORAGE_MAP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>UNLOCK_MAP Procedure on page 94-16</td>
<td>Unlocks the mapping information in the shared memory of the instance.</td>
</tr>
</tbody>
</table>
DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```sql
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
DROP_ELEMENT Function

This function drops the mapping information for the element defined by elemname.

Syntax

```sql
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname      IN VARCHAR2,
    cascade       IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elemname</td>
<td>The element for which mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
DROP_FILE Function

This function drops the file mapping information defined by filename.

Syntax

```sql
DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which file mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

DBMS_STORAGE_MAP.LOCK_MAP;
MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
    max_num_fileext   IN NUMBER DEFAULT 100,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_num_fileext</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.
MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>elemname</code></td>
<td>The element for which mapping information is built.</td>
</tr>
<tr>
<td><code>cascade</code></td>
<td>If <code>TRUE</code>, all elements within the <code>elemname</code> I/O stack DAG are mapped.</td>
</tr>
<tr>
<td><code>dictionary_update</code></td>
<td>If <code>TRUE</code>, mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code>; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>

Table 94–6  MAP_ELEMENT Function Parameters
MAP_FILE Function

This function builds mapping information for the file identified by filename. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
  filename           IN VARCHAR2,
  filetype           IN VARCHAR2,
  cascade            IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which mapping information is built.</td>
</tr>
<tr>
<td>filetype</td>
<td>Defines the type of the file to be mapped. It can be &quot;DATAFILE&quot;, &quot;SPFILE&quot;, &quot;TEMPFILE&quot;, &quot;CONTROLFILE&quot;, &quot;LOGFILE&quot;, or &quot;ARCHIVEFILE&quot;.</td>
</tr>
<tr>
<td>cascade</td>
<td>Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.</td>
</tr>
<tr>
<td>max_num_fileextent</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.
MAP OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_OBJECT(
    objname  IN  VARCHAR2,
    owner    IN  VARCHAR2,
    objtype  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objname</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>objtype</td>
<td>The type of the object.</td>
</tr>
</tbody>
</table>
RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```
SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```sql
DBMS_STORAGE_MAP.SAVE;
```
UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```sql
DBMS_STORAGE_MAP.UNLOCK_MAP;
```
The DBMS_STREAMS package, one of a set of Streams packages, provides interfaces to convert SYS.AnyData objects into logical change record (LCR) objects, to return information about Streams attributes and Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Streams

This chapter contains the following topics:

- Using DBMS_STREAMS
  - Security Model
- Summary of DBMS_STREAMS Subprograms
Using DBMS_STREAMS

Security Model

PUBLIC is granted EXECUTE privilege on this package.
### Summary of DBMS_STREAMS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPATIBLE_10_1 Function on page 95-4</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_10_1 constant</td>

<tr>
<td>GET_STREAMS_TYPE Function on page 95-10</td>
<td>Returns the type of the invoker</td>
</tr>
<tr>
<td>GET_TAG Function on page 95-11</td>
<td>Gets the binary tag for all redo entries generated by the current session</td>
</tr>
<tr>
<td>SET_TAG Procedure on page 95-12</td>
<td>Sets the binary tag for all redo entries subsequently generated by the current session</td>
</tr>
</tbody>
</table>
COMPATIBLE_10_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for LCRs to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- "GET_COMPATIBLE Member Function" on page 174-35

- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;

Usage Notes

You may use this function with the GET_COMPATIBLE member function for LCRs to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:
- "GET_COMPATIBLE Member Function" on page 174-35
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a SYS.AnyData object into a SYS.LCR$_DDL_RECORD object.

Syntax

DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
    source IN SYS.AnyData
) RETURN SYS.LCR$_DDL_RECORD;

Parameters

Table 95–2 CONVERT_ANYDATA_TO_LCR_DDL Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The SYS.AnyData object to be converted. If this object is not a DDL LCR, then an exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a SYS.AnyData queue to a SYS.LCR$_DDL_RECORD typed queue.

See Also: Oracle Streams Concepts and Administration for more information about this function
CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a SYS.AnyData object into a SYS.LCR$_ROW_RECORD object.

Syntax

```sql
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
    source IN SYS.AnyData)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The SYS.AnyData object to be converted. If this object is not a row LCR, then an exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a SYS.AnyData queue to a SYS.LCR$_ROW_RECORD typed queue.

See Also: Oracle Streams Concepts and Administration for more information about this function
**GET_INFORMATION Function**

This function returns information about various Streams attributes.

**Syntax**

```sql
DBMS_STREAMS.GET_INFORMATION(
    name  IN  VARCHAR2)
RETURN SYS.AnyData;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The type of information you want to retrieve. Currently, the following names are available:</td>
</tr>
<tr>
<td></td>
<td>- <strong>SENDER</strong>: Returns the name of the sender for the current LCR (from its AQ message properties). This function is called inside an apply handler. An apply handler is a DML handler, a DDL handler, an error handler, or a message handler. Returns <strong>NULL</strong> if called outside of an apply handler. The return value is to be interpreted as a <strong>VARCHAR2</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>CONSTRAINT_NAME</strong>: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a DML handler or error handler for an apply process. Returns <strong>NULL</strong> if called outside of a DML handler or error handler. The return value is to be interpreted as a <strong>VARCHAR2</strong>.</td>
</tr>
</tbody>
</table>
GET_STREAMS_NAME Function

This function gets the Streams name of the invoker if the invoker is one of the following Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```sql
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.
GET_STREAMS_TYPE Function

This function gets the Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```sql
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a DML handler to operate differently if it is processing events from the error queue (ERROR_EXECUTION type) instead of the apply process queue (APPLY type).
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
DBMS_STREAMS.GET_TAG()
RETURN RAW;
```

Examples

The following example illustrates how to display the current LCR tag as output:

```
SET SERVEROUTPUT ON
DECLARE
  raw_tag RAW(2000);
BEGIN
  raw_tag := DBMS_STREAMS.GET_TAG();
  DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

**Note:** This procedure is not transactional. That is, the effects of `SET_TAG` cannot be rolled back.

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags

### Syntax

```sql
DBMS_STREAMS.SET_TAG(
    tag  IN RAW  DEFAULT NULL);
```

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tag</code></td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

### Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```sql
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```
The DBMS_STREAMS_ADM package, one of a set of Streams packages, provides administrative interfaces for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level.

See Also:

- Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator's Guide for more information about this package and Streams
- Chapter 82, "DBMS_RULE_ADM"

This chapter contains the following topics:

- Using DBMS_STREAMS_ADM
  - Overview
  - Rules
  - Users
- Summary of DBMS_STREAMS_ADM Subprograms
Using DBMS_STREAMS_ADM

Overview

The DBMS_STREAMS_ADM package, one of a set of Streams packages, provides administrative interfaces for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues and for managing Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then you can use the DBMS_RULE_ADM package.

Rules

Streams clients include capture processes, propagations, apply processes, and messaging clients. Some of the procedures in the DBMS_STREAMS_ADM package add rules to the rule sets of Streams clients. The rules may pertain to changes in the redo log, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a data manipulation language (DML) change or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs either may represent changes in the redo record that were captured by a capture process, or they may represent changes created by a user or application. User messages are custom messages that are based on a user-defined types and created by users or applications.

For all of the procedures except the ones that create subset rules, you use the inclusion_rule parameter to specify the type of rule set (either positive or negative) for the created rules. If the Streams client does not have a rule set of the
specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the Streams client are not affected. Additional rules can be added to a rule set using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If a Streams client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages

See Also: Oracle Streams Concepts and Administration for more information about how rules are used in Streams

Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify capture for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all changes made to a source database. See "ADD_GLOBAL_RULES Procedures" on page 96-19.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for changes made to a specified schema. See "ADD_SCHEMA_RULES Procedures" on page 96-39.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedures" on page 96-52.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for changes made to a specified table. See "ADD_TABLE_RULES Procedures" on page 96-63.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or
DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute this procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

See Also: “Summary of DBMS_CAPTURE_ADM Subprograms” on page 19-2 for more information about the `CREATE_CAPTURE` procedure and the procedures that prepare database objects for instantiation

Propagation Rules for LCRs

The following procedures add propagation rules to a rule set of a propagation:

---

96-4  PL/SQL Packages and Types Reference
The **ADD_GLOBAL_PROPAGATION_RULES** procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in a source queue. See "ADD_GLOBAL_PROPAGATION_RULES Procedures" on page 96-14.

The **ADD_SCHEMA_PROPAGATION_RULES** procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See "ADD_SCHEMA_PROPAGATION_RULES Procedures" on page 96-34.

The **ADD_SUBSET_PROPAGATION_RULES** procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedures" on page 96-46.

The **ADD_TABLE_PROPAGATION_RULES** procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 96-58.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the `source_databse` parameter, then the rules include conditions for the specified source database.

### Propagation Rules for User Messages

The **ADD_MESSAGE_PROPAGATION_RULE** procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user-enqueued messages of a specific message type that evaluate to `TRUE` for the rule condition in a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user-enqueued messages of a specific message type that evaluate to `TRUE` for the rule condition in a source queue. This procedure generates a rule name for the rule.

**See Also:** "ADD_MESSAGE_PROPAGATION_RULE Procedures" on page 96-26
Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify apply for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the apply process queue. See "ADD_GLOBAL_RULES Procedures" on page 96-19.

- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedures" on page 96-39.

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the apply process queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedures" on page 96-52.

- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedures" on page 96-63.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the source_database parameter. If the source_database parameter is NULL, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which events are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the source_database parameter cannot be different than the source database for the apply process. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.
Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the apply process is created, if necessary.

An apply process created by one of these procedures can apply events only at the local database and can apply only captured events. To create an apply process that applies events at a remote database or an apply process that applies user-enqueued events, use the CREATE_APPLY procedure in the DBMS_APPLY_ADM package.

You also can use the DBMS_APPLY_ADM.CREATE_APPLY procedure to specify nondefault values for the apply_captured, apply_user, apply_database_link, and apply_tag parameters when you run that procedure. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the apply process after you create it.

See Also: "ALTER_APPLY Procedure" on page 15-4 and "CREATE_APPLY Procedure" on page 15-14

Apply Process Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of an apply process when you specify apply for the streams_type parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user-enqueued messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user-enqueued messages of a specific message type that satisfy the apply process rule.

See Also:

- "ADD_MESSAGE_RULE Procedures" on page 96-30
- "ALTER_APPLY Procedure" on page 15-4

Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify dequeue for the streams_type parameter:
The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the messaging client queue. See "ADD_GLOBAL_RULES Procedures" on page 96-19.

The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedures" on page 96-39.

The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the messaging client queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedures" on page 96-52.

The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedures" on page 96-63.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue user-enqueued row LCRs, or DDL LCRs, or both that originated at the source database matching the `source_database` parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards user-enqueued row LCRs, or DDL LCRs, or both that originated at the source database matching the `source_database` parameter. You should execute these procedures at the database where you want to dequeue the events with the messaging client.

**Messaging Client Rules for User Messages**

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user-enqueued messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user-enqueued messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedures" on page 96-30

**Users**

A user is associated with each Streams client. The following sections describe these users.
Capture User

The following procedures can create a capture process:

- ADD_GLOBAL_RULES Procedures
- ADD_SCHEMA_RULES Procedures
- ADD_SUBSET_RULES Procedures
- ADD_TABLE_RULES Procedures

If one of these procedures creates a capture process, then it configures the current user as the **capture_user**. This user captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. The procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

**See Also:** "CREATE_CAPTURE Procedure" on page 19-16 for information about the privileges required to capture changes

Propagation User

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedures
- ADD_MESSAGE_PROPAGATION_RULE Procedures
- ADD_SCHEMA_PROPAGATION_RULES Procedures
- ADD_SUBSET_PROPAGATION_RULES Procedures
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job is created also if one does not exist for the database link used by the propagation. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job.

**Note:** The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users may or may not be the same.

**See Also:** "CREATE_PROPAGATION Procedure" on page 65-6 for more information about the required privileges
Apply User

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedures
- ADD_MESSAGE_RULE Procedures
- ADD_SCHEMA_RULES Procedures
- ADD_SUBSET_RULES Procedures
- ADD_TABLE_RULES Procedures

If one of these procedures creates an apply process, then it configures the current user as the apply_user. This user applies changes that satisfy the apply process rule sets and runs user-defined apply handlers. This user must have the necessary privileges to apply changes. The procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

See Also: "CREATE_APPLY Procedure" on page 15-14 for information about the privileges required to apply changes (refer to the apply_user parameter)

Messaging Client User

The following procedures can create a messaging client:

- ADD_GLOBAL_RULES Procedures
- ADD_MESSAGE_RULE Procedures
- ADD_SCHEMA_RULES Procedures
- ADD_SUBSET_RULES Procedures
- ADD_TABLE_RULES Procedures

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

ADD_GLOBAL_PROPAGATION_RULES Procedures

ADD_GLOBAL_PROPAGATION_RULES Procedures

These procedures either add global rules to the positive rule set for a propagation, or add global rules to the negative rule set for a propagation, and create the specified propagation if it does not exist.

Note: This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

DBMS_STREAMS_ADM.ADD GLOBAL_PROPAGATION RULES(
    streams_name IN VARCHAR2 DEFAULT NULL,
    source_queue_name IN VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml IN BOOLEAN DEFAULT true,
    include_ddl IN BOOLEAN DEFAULT false,
    include_tagged_lcr IN BOOLEAN DEFAULT false,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT true,
    and_condition IN VARCHAR2 DEFAULT NULL);

Parameters

Table 96–2  ADD GLOBAL_PROPAGATION RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified propagation does not exist, then it is created automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then this propagation is used.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then a propagation is created automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
**Table 96-2 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be SYS.AnyData type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be SYS.AnyData type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the global name of the current database is used, and the source queue and destination queue must be in the same database. <strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If true, then creates a rule for DML changes. If false, then does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If true, then creates a rule for DDL changes. If false, then does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
If `true`, then no condition regarding Streams tags is added to the generated rules. Therefore, these rules can evaluate to `TRUE` regardless of whether an LCR has a non-`NULL` tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-`NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `true` is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the LCR’s tag.

If `false`, then adds a condition to each generated rule that causes the rule to evaluate to `TRUE` only if an LCR has a `NULL` Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a `NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `false` may be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a `NULL` tag.

In most cases, specify `true` for this parameter if the `inclusion_rule` parameter is set to `false`.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

**source_database**

The global name of the source database. The source database is where the changes originated. If `NULL`, then no condition regarding the source database is added to the generated rules.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify `DBS1` and the domain is `.NET`, then `DBS1.NET` is specified automatically.

Oracle recommends that you specify a source database for propagation rules.

**dml_rule_name**

If `include_dml` is `true`, then contains the DML rule name.

If `include_dml` is `false`, then contains a `NULL`.

Summary of DBMS_STREAMS_ADM Subprograms

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. A system-generated rule name is

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is true, then contains the DDL rule name.</td>
</tr>
<tr>
<td></td>
<td>If include_ddl is false, then contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is true, then the rules are added to the positive rule set for the propagation.</td>
</tr>
<tr>
<td></td>
<td>If inclusion_rule is false, then the rules are added to the negative rule set for the propagation.</td>
</tr>
<tr>
<td></td>
<td>In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</td>
</tr>
<tr>
<td></td>
<td>(system_condition) AND (and_condition)</td>
</tr>
</tbody>
</table>

The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to true only if the Streams tag is the hexadecimal equivalent of '02', specify the following condition:

:lcr.get_tag() = HEXTORAW('02')

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify true for the include_dml parameter and false for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify false for the include_dml parameter and true for the include_ddl parameter.

See Also: Chapter 174, "Logical Change Record TYPES"
the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. The overloaded `ADD_GLOBAL_PROPAGATION_RULES` procedure generates the rule names for DML and DDL changes. A propagation uses the rules created for filtering.

If no propagation job exists for the database link specified in the `destination_queue_name` parameter when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job already exists for the specified database link, then the propagation uses the existing propagation job.

This procedure also configures propagation using the current user, and establish a default propagation schedule. Only one propagation is allowed between the source queue and destination queue.

---

**Note:**

- Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.

- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate events.

---

**See Also:**

- "Rules" on page 96-2 and "Propagation Rules for LCRs" on page 96-4 for more information about the rules created by this procedure

- "Propagation User" on page 96-9

**Examples**

The following is an example of a global rule condition that may be created for DML changes:

```sql
:dml.get_source_database_name() = 'DBS1.NET' AND :dml.is_null_tag() = 'Y'
```
ADD_GLOBAL_RULES Procedures

These procedures add rules to a rule set of one of the following types of Streams clients:

- Capture process rules for capturing changes to an entire database when the `streams_type` parameter is set to `capture`. See "Capture Process Rules for Changes in the Redo Log" on page 96-3 for more information about these rules.

- Apply process rules for applying all logical change records (LCRs) in a queue when the `streams_type` parameter is set to `apply`. The rules may specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 96-6 for more information about these rules.

- Messaging client rules for dequeuing all user-enqueued LCRs from a queue when the `streams_type` parameter is set to `dequeue`. The rules may specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 96-7 for more information about these rules.

**Note:** This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
    streams_type        IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN   DEFAULT true,
    include_ddl         IN   BOOLEAN   DEFAULT false,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT false,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN   DEFAULT true,
    and_condition       IN   VARCHAR2  DEFAULT NULL);
```
### Parameters

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_type</td>
<td>The type of Streams client:</td>
</tr>
<tr>
<td></td>
<td>- Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>- Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, apply process, or messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified Streams client does not exist, then it is created automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Streams client is used. If no relevant Streams client exists for the queue, then a Streams client is created automatically with a system-generated name. If NULL and multiple Streams clients of the specified streams_type for the queue exist, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If NULL, if streams_type is apply, and if one relevant apply process exists, then the relevant apply process is used. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>- If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then this apply process is used.</td>
</tr>
<tr>
<td></td>
<td>- If source_database is NULL and one existing apply process is using the queue specified in queue_name, then this apply process is used.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no relevant apply process exists, then an apply process is created automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then an error is raised.</td>
</tr>
</tbody>
</table>

An apply process and a messaging client cannot have the same name.
Table 96–3  (Cont.) ADD_GLOBALRULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name]queue_name. The current database must contain the queue, and the queue must be SYS.AnyData type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues events. For apply process rules, this is the queue from which an apply process dequeues events. For messaging client rules, this is the queue from which a messaging client dequeues events.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If true, then creates a rule for DML changes. If false, then does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If true, then creates a rule for DDL changes. If false, then does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
include_tagged_lcr

If true, then no condition regarding Streams tags is added to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to true is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

If false, then adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to false may be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.

In most cases, specify true for this parameter if the inclusion_rule parameter is set to false.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.
**source_database**
The global name of the source database. If NULL, then no condition regarding the source database is added to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are creating a capture process at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured events, then the apply process can apply events from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs may or may not have this information.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

dml_rule_name
If include_dml is true, then contains the DML rule name.
If include_dml is false, then contains a NULL.

ddl_rule_name
If include_ddl is true, then contains the DDL rule name.
If include_ddl is false, then contains a NULL.

inclusion_rule
If inclusion_rule is true, then the rules are added to the positive rule set for the Streams client.
If inclusion_rule is false, then the rules are added to the negative rule set for the Streams client.
In either case, the system creates the rule set if it does not exist.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify true for the include\_dml parameter and false for the include\_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify false for the include\_dml parameter and true for the include\_ddl parameter.}  

See Also: Chapter 174, "Logical Change Record TYPEs"

### Usage Notes

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. A system-generated rule name is the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. The overloaded ADD_GLOBAL_RULES procedure generates the rule names for DML and DDL changes. A capture process, apply process, or messaging client uses the rules created for filtering.
See Also:

- "Rules" on page 96-2
- "Users" on page 96-8

Examples

The following is an example of a global rule condition that may be created for DML changes:

:dml.get_source_database_name() = 'DBS1.NET' AND :dml.is_null_tag() = 'Y'
ADD_MESSAGE_PROPAGATION_RULE Procedures

These procedures add a message rule to the positive rule set for a propagation, or add a message rule to the negative rule set for a propagation, and create the specified propagation if it does not exist.

Note: This procedure is overloaded. One version of this procedure contains the OUT parameter rule_name, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
    message_type            IN   VARCHAR2,
    rule_condition          IN   VARCHAR2,

<tr>
<td><strong>Note:</strong></td>
<td>Connection qualifiers are not allowed.</td>
</tr>
</tbody>
</table>
ADD_MESSAGE_PROPAGATION_RULE Procedures

**Usage Notes**

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

If no propagation job exists for the database link specified in the `destination_queue_name` parameter when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job already exists for the specified database link, then the propagation uses the existing propagation job.

This procedure also configures propagation using the current user, and establishes a default propagation schedule. Only one propagation is allowed between the source queue and destination queue.

**Note:**

- Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.

- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate events.
Examples

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition may be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' ||
':msg.name = ''EMPLOYEES''
```

**Note:** The quotation marks in the preceding example are all single quotation marks.

This rule condition evaluates to `TRUE` if a user-enqueued message of type `usr_msg` has `dbsl.net` for its `source_dbname` attribute, `hr` for its `owner` attribute, and `employees` for its `name` attribute.
ADD_MESSAGE_RULE Procedures

These procedures add a message rule to a rule set of one of the following types of Streams clients:

- Apply process rule for dequeuing user-enqueued messages of a specific message type from a queue when the `streams_type` parameter is set to `apply`. See “Apply Process Rules for User Messages” on page 96-7 for more information about such rules.

- Messaging client rule dequeuing user-enqueued messages of a specific message type from a queue when the `streams_type` parameter is set to `dequeue`. See “Messaging Client Rules for User Messages” on page 96-8 for more information about such rules.

**Note:** This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
    message_type    IN   VARCHAR2,
    rule_condition  IN   VARCHAR2,
    streams_type    IN   VARCHAR2,
    streams_name    IN   VARCHAR2  DEFAULT NULL,
    queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
    inclusion_rule  IN   BOOLEAN   DEFAULT true,
    rule_name       OUT  VARCHAR2);
```
Parameters

Table 96–5 ADD_MESSAGE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_type</td>
<td>The type of the message. If the type is not an Oracle built-in type, then specified as [schema_name.]type_name. If the schema is not specified, then the current user is the default. For example, to specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter.</td>
</tr>
<tr>
<td>rule_condition</td>
<td>The rule condition for the message type. The rule variable name specified in the rule condition must be the following: :msg</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of message consumer, either apply for apply process or dequeue for messaging client</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then it is created automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the relevant apply process or messaging client is used. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then an error is raised. If NULL and no Streams client of the specified streams_type exists for the queue, then an apply process or messaging client is created automatically with a system-generated name. An apply process and a messaging client cannot have the same name.</td>
</tr>
</tbody>
</table>
If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user-enqueued messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Rules" on page 96-2
- "Users" on page 96-8
- "ALTER_APPLY Procedure" on page 15-4 for more information about setting a message handler for an apply process
Examples

You specify the condition for this rule using the rule_condition parameter. For example, suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition may be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' ||
':msg.name = ''EMPLOYEES''
```

**Note:** The quotation marks in the preceding example are all single quotation marks.
These procedures either add schema rules to the positive rule set for a propagation, or add schema rules to the negative rule set for a propagation, and create the specified propagation if it does not exist.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name             IN   VARCHAR2,
    streams_name            IN   VARCHAR2 DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN  DEFAULT true,
    include_ddl             IN   BOOLEAN  DEFAULT false,
    include_tagged_lcr      IN   BOOLEAN  DEFAULT false,
    source_database         IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT true,
    and_condition           IN   VARCHAR2  DEFAULT NULL);
```

</tr>
</tbody>
</table>
used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. For the overloaded ADD_SCHEMA_PROPAGATION_RULES procedure this generates the rule names for DML and DDL changes. A propagation uses the rules created for filtering.

If no propagation job exists for the database link specified in the destination_queue_name parameter when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job already exists for the specified database link, then the propagation uses the existing propagation job.

This procedure also configures propagation using the current user, and establishes a default propagation schedule. Only one propagation is allowed between the source queue and the destination queue.

---

**Note:**

- Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate events.

See Also:

- "Rules" on page 96-2 and "Propagation Rules for LCRs" on page 96-4 for more information about the rules created by this procedure
- "Propagation User" on page 96-9

**Examples**

The following is an example of a schema rule condition that may be created for DML changes:

```plaintext
:dml.get_object_owner() = 'HR' AND :dml.is_null_tag() = 'Y'
AND :dml.get_source_database_name() = 'DBS1.NET'
```
ADD_SCHEMA_RULES Procedures

These procedures add rules to a rule set of one of the following types of Streams clients:

- Capture process rules for capturing changes to a specified schema when the streams_type parameter is set to capture. See "Capture Process Rules for Changes in the Redo Log" on page 96-3 for more information about these rules.

- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema when the streams_type parameter is set to apply. The rules may specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 96-6 for more information about these rules.

- Messaging client rules for dequeuing user-enqueued LCRs from a queue that contain changes to a specified schema when the streams_type parameter is set to dequeue. The rules may specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 96-7 for more information about these rules.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name IN VARCHAR2,
   streams_type IN VARCHAR2,
   streams_name IN VARCHAR2 DEFAULT NULL,
   queue_name IN VARCHAR2 DEFAULT 'streams_queue',
   include_dml IN BOOLEAN DEFAULT true,
   include_ddl IN BOOLEAN DEFAULT false,
   include_tagged_lcr IN BOOLEAN DEFAULT false,
   source_database IN VARCHAR2 DEFAULT NULL,
   dml_rule_name OUT VARCHAR2,
   ddl_rule_name OUT VARCHAR2,
   inclusion_rule IN BOOLEAN DEFAULT true,
   and_condition IN VARCHAR2 DEFAULT NULL);
```

**Note:** This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Streams does not validate the existence of the schema.</td>
</tr>
</tbody>
</table>
| streams_type | The type of Streams client:  
- Specify capture for a capture process.  
- Specify apply for an apply process.  
- Specify dequeue for a messaging client. |
| streams_name | The name of the capture process, apply process, or messaging client. Do not specify an owner. If the specified Streams client does not exist, then it is created automatically.  
If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Streams client is used. If no relevant Streams client exists for the queue, then a Streams client is created automatically with a system-generated name. If NULL and multiple Streams clients of the specified streams_type for the queue exist, then an error is raised.  
If NULL, if streams_type is apply, and if one relevant apply process exists, then the relevant apply process is used. The relevant apply process is identified in one of the following ways:  
- If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then this apply process is used.  
- If source_database is NULL and one existing apply process is using the queue specified in queue_name, then this apply process is used.  
If NULL and no relevant apply process exists, then an apply process is created automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then an error is raised.  
An apply process and a messaging client cannot have the same name. |
queue_name

The name of the local queue, specified as [schema_name.queue_name]. The current database must contain the queue, and the queue must be SYS.AnyData type.

For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

For capture process rules, this is the queue into which a capture process enqueues events. For apply process rules, this is the queue from which an apply process dequeues events. For messaging client rules, this is the queue from which a messaging client dequeues events.

include_dml

If true, then creates a rule for DML changes. If false, then does not create a DML rule. NULL is not permitted.

include_ddl

If true, then creates a rule for DDL changes. If false, then does not create a DDL rule. NULL is not permitted.
Table 96–7  (Cont.) ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If true, then no condition regarding Streams tags is added to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NUL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NUL tag. If the rules are added to a positive rule set, then setting this parameter to true is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If false, then adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NUL Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to false may be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify true for this parameter if the inclusion_rule parameter is set to false.</td>
</tr>
</tbody>
</table>

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.
Table 96-7  (Cont.)  ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_database   | The global name of the source database. If NULL, then no condition regarding the source database is added to the generated rules.  
For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are creating a capture process at a downstream database, then specify the source database of the changes that will be captured.
For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured events, then the apply process can apply events from only one capture process at one source database.
For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs may or may not have this information.
If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically. |
| dml_rule_name     | If include_dml is true, then contains the DML rule name.  
If include_dml is false, then contains a NULL. |
| ddl_rule_name     | If include_ddl is true, then contains the DDL rule name.  
If include_ddl is false, then contains a NULL. |
| inclusion_rule    | If inclusion_rule is true, then the rules are added to the positive rule set for the Streams client.  
If inclusion_rule is false, then the rules are added to the negative rule set for the Streams client.  
In either case, the system creates the rule set if it does not exist. |
This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. A system-generated rule name is the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. The overloaded `ADD_SCHEMA_RULES` procedure generates the rule names for DML and DDL changes. A capture process, apply process, or messaging client uses the rules created for filtering.

**Usage Notes**

If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:

\[(system\_condition) \text{ AND (and\_condition)}\]

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to `true` only if the Streams tag is the hexadecimal equivalent of '02', specify the following condition:

`:lcr.get_tag() = HEXTORAW('02')`

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify `true` for the `include_ddl` parameter and `false` for the `include_dml` parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify `false` for the `include_dml` parameter and `true` for the `include_ddl` parameter.

See Also: Chapter 174, "Logical Change Record TYPEs"
Examples

The following is an example of a schema rule condition that may be created for DML changes:

:dml.get_object_owner() = 'HR' AND :dml.is_null_tag() = 'Y'

See Also:
- "Rules" on page 96-2
- "Users" on page 96-8
ADD_SUBSET_PROPAGATION_RULES Procedures

These procedures add propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist. They also configure propagation using the current user and establishes a default propagation schedule. The procedures enables propagation of LCRs for the specified table, subject to filtering conditions.

Note: This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name               IN   VARCHAR2,
  dml_condition            IN   VARCHAR2,
  streams_name             IN   VARCHAR2 DEFAULT NULL,
  source_queue_name        IN   VARCHAR2,
  destination_queue_name   IN   VARCHAR2,
  include_tagged_lcr       IN   BOOLEAN  DEFAULT false,
  source_database          IN   VARCHAR2 DEFAULT NULL,
  insert_rule_name         OUT  VARCHAR2,
  update_rule_name         OUT  VARCHAR2,
  delete_rule_name         OUT  VARCHAR2);

Parameters

Table 96-8 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.object_name]. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</td>
</tr>
</tbody>
</table>
The subset condition. You specify this condition similar to the way you specify conditions in a \textit{WHERE} clause in SQL.

For example, to specify rows in the \texttt{hr.employees} table where the \texttt{salary} is greater than 4000 and the \texttt{job_id} is \texttt{SA\_MAN}, enter the following as the condition:

\begin{verbatim}
' salary > 4000 and job_id = 'SA\_MAN''
\end{verbatim}

\textbf{Note:} The quotation marks in the preceding example are all single quotation marks.

The name of the propagation. Do not specify an owner.

If the specified propagation does not exist, then it is created automatically.

If \texttt{NULL} and a propagation exists for the same source queue and destination queue (including database link), then this propagation is used.

If \texttt{NULL} and no propagation exists for the same source queue and destination queue (including database link), then a propagation is created automatically with a system-generated name.

The name of the source queue, specified as [\texttt{schema\_name}.] \texttt{queue\_name}. The current database must contain the source queue, and the queue must be \texttt{SYS.AnyData} type.

For example, to specify a source queue named \texttt{streams\_queue} in the \texttt{strmadmin} schema, enter \texttt{strmadmin.streams\_queue} for this parameter.

If the schema is not specified, then the current user is the default.

\begin{table}[h]
\centering
\begin{tabular}{|l|p{0.7\textwidth}|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
\textit{dml\_condition} & The subset condition. You specify this condition similar to the way you specify conditions in a \textit{WHERE} clause in SQL. For example, to specify rows in the \texttt{hr.employees} table where the \texttt{salary} is greater than 4000 and the \texttt{job\_id} is \texttt{SA\_MAN}, enter the following as the condition: \begin{verbatim}
' salary > 4000 and job\_id = 'SA\_MAN''
\end{verbatim} \textbf{Note:} The quotation marks in the preceding example are all single quotation marks. \\
\hline
\textit{streams\_name} & The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then it is created automatically. If \texttt{NULL} and a propagation exists for the same source queue and destination queue (including database link), then this propagation is used. If \texttt{NULL} and no propagation exists for the same source queue and destination queue (including database link), then a propagation is created automatically with a system-generated name. \\
\hline
\textit{source\_queue\_name} & The name of the source queue, specified as [\texttt{schema\_name}.] \texttt{queue\_name}. The current database must contain the source queue, and the queue must be \texttt{SYS.AnyData} type. For example, to specify a source queue named \texttt{streams\_queue} in the \texttt{strmadmin} schema, enter \texttt{strmadmin.streams\_queue} for this parameter. If the schema is not specified, then the current user is the default. \\
\hline
\end{tabular}
\caption{(Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters}
\end{table}
destination_queue_name

The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be SYS.AnyData type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the global name of the current database is used, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

include_tagged_lcr

If true, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.

If false, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of false is often specified in update-anywhere configurations to avoid sending a change back to its source database.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database

The global name of the source database. The source database is where the change originated. If NULL, then no condition regarding the source database is added to the generated rules.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

Oracle recommends that you specify a source database for propagation rules.

insert_rule_name

Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
Usage Notes

Only one propagation is allowed between the source queue and the destination queue.

Running this procedure generates three rules for the specified propagation: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules created for filtering. If the propagation does not have a positive rule set, then a positive rule set is created automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name.

---

Table 96–8 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes, as well as updates that must be converted into deletes.</td>
</tr>
</tbody>
</table>
The system-generated rule name is the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate events.

If no propagation job exists for the database link specified in the destination_queue_name parameter when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job already exists for the specified database link, then the propagation uses the existing propagation job.

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so may have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

**Note:** Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.

**See Also:**

- "Rules" on page 96-2 and "Propagation Rules for LCRs" on page 96-4 for more information about the rules created by this procedure
- "Propagation User" on page 96-9
Examples

The following is an example of a rule condition that may be created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2` and the `table_name` is `hr.regions`:

```sql
:dml.get_object_owner() = 'HR' AND :dml.get_object_name() = 'REGIONS' AND
:dml.is_null_tag() = 'Y' AND :dml.get_command_type() = 'UPDATE' AND (:dml.get_value('NEW', '"REGION_ID"') IS NOT NULL) AND (:dml.get_value('OLD', '"REGION_ID"') IS NOT NULL) AND (:dml.get_value('OLD', '"REGION_ID"').AccessNumber()=2) AND
(:dml.get_value('NEW', '"REGION_ID"').AccessNumber()=2)
```
ADD_SUBSET_RULES Procedures

These procedures add rules to a rule set of one of the following types of Streams clients:

- Capture process rules for capturing changes to a subset of rows in a specified table when the streams_type parameter is set to capture. See "Capture Process Rules for Changes in the Redo Log" on page 96-3 for more information about these rules.

- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table when the streams_type parameter is set to apply. The rules may specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 96-6 for more information about these rules.

- Messaging client rules for dequeuing user-enqueued LCRs from a queue that contain changes to a subset of rows in a specified table when the streams_type parameter is set to dequeue. The rules may specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 96-7 for more information about these rules.

**Note:** This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT false,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    insert_rule_name    OUT  VARCHAR2,
    update_rule_name    OUT  VARCHAR2,
    delete_rule_name    OUT  VARCHAR2);
```
Parameters

Table 96–9  ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. You specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary &gt; 4000 and job_id = ''SA_MAN'' '</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Streams client: Specify capture for a capture process. Specify apply for an apply process. Specify dequeue for a messaging client.</td>
</tr>
</tbody>
</table>
Table 96–9 (Cont.) ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the capture process, apply process, or messaging client. Do not specify an owner. If the specified Streams client does not exist, then it is created automatically. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Streams client is used. If no relevant Streams client exists for the queue, then a Streams client is created automatically with a system-generated name. If NULL and multiple Streams clients of the specified streams_type for the queue exist, then an error is raised. If NULL, if streams_type is apply, and if one relevant apply process exists, then the relevant apply process is used. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>- If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then this apply process is used.</td>
</tr>
<tr>
<td></td>
<td>- If source_database is NULL and one existing apply process is using the queue specified in queue_name, then this apply process is used.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no relevant apply process exists, then an apply process is created automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then an error is raised. An apply process and a messaging client cannot have the same name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be SYS.AnyData type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues events. For apply process rules, this is the queue from which an apply process dequeues events. For messaging client rules, this is the queue from which a messaging client dequeues events.</td>
</tr>
</tbody>
</table>
include_tagged_lcr

If true, then a redo entry is always considered for capture and an LCR is always considered for apply or dequeue, regardless of whether redo entry or LCR has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.

If false, then a redo entry is considered for capture and an LCR is considered for apply or dequeue only when the redo entry or the LCR contains a NULL tag. A setting of false is often specified in update-anywhere configurations to avoid sending a change back to its source database.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.

source_database

The global name of the source database. If NULL, then no condition regarding the source database is added to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are creating a capture process at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured events, then the apply process can apply events from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs may or may not have this information.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

insert_rule_name

Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

Running this procedure generates three rules for the specified capture process, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, apply process, or messaging client uses the rules created for filtering. If the Streams client does not have a positive rule set, then a positive rule set is created automatically, and the rules for the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name.
The system-generated rule name is the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so may have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

**See Also:**
- "Rules" on page 96-2
- "Users" on page 96-8

**Examples**

The following is an example of a rule condition that may be created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2` and the `table_name` is `hr.regions`:

```sql
:dml.get_object_owner() = 'HR' AND :dml.get_object_name() = 'REGIONS' AND
:dml.is_null_tag() = 'Y' AND :dml.get_command_type() = 'UPDATE' AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL) AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2) AND
```

```sql
(:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```
ADD_TABLE_PROPAGATION_RULES Procedure

These procedures add table rules to the positive rule set for a propagation, or add table rules to the negative rule set for a propagation, and create the specified propagation if it does not exist.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
  table_name              IN   VARCHAR2,
  streams_name            IN   VARCHAR2  DEFAULT NULL,
  source_queue_name       IN   VARCHAR2,
  destination_queue_name  IN   VARCHAR2,
  include_dml             IN   BOOLEAN   DEFAULT true,
  include_ddl             IN   BOOLEAN   DEFAULT false,
  include_tagged_lcr      IN   BOOLEAN   DEFAULT false,
  source_database         IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name           OUT  VARCHAR2,
  ddl_rule_name           OUT  VARCHAR2,
  inclusion_rule          IN   BOOLEAN   DEFAULT true,
  and_condition           IN   VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
### Table 96-10 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `streams_name`       | The name of the propagation. Do not specify an owner.  
If the specified propagation does not exist, then it is created automatically.  
If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then this propagation is used.  
If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then a propagation is created automatically with a system-generated name. |
| `source_queue_name`  | The name of the source queue, specified as `[schema_name.]queue_name`. The current database must contain the source queue, and the queue must be SYS.AnyData type.  
For example, to specify a source queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter.  
If the schema is not specified, then the current user is the default. |
| `destination_queue_name` | The name of the destination queue, including a database link, specified as `[schema_name.]queue_name[@dblink_name]`, if the destination queue is in a remote database. The queue must be SYS.AnyData type.  
For example, to specify a destination queue named `streams_queue` in the `strmadmin` schema and use a database link named `dbs2.net`, enter `strmadmin.streams_queue@dbs2.net` for this parameter.  
If the schema is not specified, then the current user is the default.  
If the database link is omitted, then the global name of the current database is used, and the source queue and destination queue must be in the same database.  
**Note:** Connection qualifiers are not allowed. |
| `include_dml`        | If `true`, then creates a rule for DML changes. If `false`, then does not create a DML rule. `NULL` is not permitted. |
| `include_ddl`        | If `true`, then creates a rule for DDL changes. If `false`, then does not create a DDL rule. `NULL` is not permitted. |
ADD_TABLE_PROPAGATION_RULES Procedure

### Table 96–10 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| include_tagged_lcr | If true, then no condition regarding Streams tags is added to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether an LCR has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to true is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the LCR’s tag. If false, then adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to false may be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.*

In most cases, specify true for this parameter if the *inclusion_rule* parameter is set to false.  

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags |
| source_database    | The global name of the source database. The source database is where the change originated. If NULL, then no condition regarding the source database is added to the generated rules. If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically. Oracle recommends that you specify a source database for propagation rules. |
| dml_rule_name      | If include_dml is true, then contains the DML rule name. If include_dml is false, then contains a NULL. |
### Table 96–10 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is true, then contains the DDL rule name. If include_ddl is false, then contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is true, then the rules are added to the positive rule set for the propagation. If inclusion_rule is false, then the rules are added to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition   | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: 

\[
\text{system_condition} \text{ AND (and_condition)}
\]

The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to true only if the Streams tag is the hexadecimal equivalent of '02', specify the following condition:

\[
: \text{lcr.get_tag()} = \text{HEXTORAW('02')}
\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify true for the include_dml parameter and false for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify false for the include_dml parameter and true for the include_ddl parameter.  

**See Also:** Chapter 174, "Logical Change Record TYPEs"
used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The overloaded ADD_TABLE_PROPAGATION_RULES procedure generates the rule names for DML and DDL changes. A propagation uses the rules created for filtering.

If no propagation job exists for the database link specified in the destination_queue_name parameter when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job already exists for the specified database link, then the propagation uses the existing propagation job.

This procedure also configures propagation using the current user, and establishes a default propagation schedule. Only one propagation is allowed between the source queue and the destination queue.

---

**Note:**

- Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate events.

---

**See Also:**

- "Rules" on page 96-2 and "Propagation Rules for LCRs" on page 96-4 for more information about the rules created by this procedure
- "Users" on page 96-8

**Examples**

The following is an example of a table rule condition that may be created for filtering DML statements:

```plaintext
:dml.get_object_owner() = 'HR' AND :dml.get_object_name() = 'LOCATIONS'
AND :dml.is_null_tag() = 'Y' AND :dml.get_source_database_name() = 'DBS1.NET'
```
ADD_TABLE_RULES Procedures

These procedures add rules to a rule set of one of the following types of Streams clients:

- Capture process rules for capturing changes to a specified table when the streams_type parameter is set to capture. See "Capture Process Rules for Changes in the Redo Log" on page 96-3 for more information about these rules.

- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table when the streams_type parameter is set to apply. The rules may specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 96-6 for more information about these rules.

- Messaging client rules for dequeuing user-enqueued LCRs from a queue that contain changes to a specified table when the streams_type parameter is set to dequeue. The rules may specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 96-7 for more information about these rules.

**Note:** This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
    table_name          IN   VARCHAR2,
    streams_type        IN   VARCHAR2,
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN  DEFAULT true,
    include_ddl         IN   BOOLEAN  DEFAULT false,
    include_tagged_lcr  IN   BOOLEAN  DEFAULT false,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN   DEFAULT true,
    and_condition       IN   VARCHAR2 DEFAULT NULL);
```
### Parameters

**Table 96–11  ADD_TABLE_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_name</code></td>
<td>The name of the table specified as <code>[schema_name.object_name]</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Streams does not validate the existence of the table.</td>
</tr>
</tbody>
</table>
| `streams_type` | The type of Streams client:  
- Specify `capture` for a capture process.  
- Specify `apply` for an apply process.  
- Specify `dequeue` for a messaging client. |
| `streams_name` | The name of the capture process, apply process, or messaging client. Do not specify an owner.  
If the specified Streams client does not exist, then it is created automatically.  
If `NULL`, if `streams_type` is `capture` or `dequeue`, and if one relevant capture process or messaging client for the queue exists, then the relevant Streams client is used. If no relevant Streams client exists for the queue, then a Streams client is created automatically with a system-generated name. If `NULL` and multiple Streams clients of the specified `streams_type` for the queue exist, then an error is raised.  
If `NULL`, if `streams_type` is `apply`, and if one relevant apply process exists, then the relevant apply process is used. The relevant apply process is identified in one of the following ways:  
- If one existing apply process has the source database specified in `source_database` and uses the queue specified in `queue_name`, then this apply process is used.  
- If `source_database` is `NULL` and one existing apply process is using the queue specified in `queue_name`, then this apply process is used.  
If `NULL` and no relevant apply process exists, then an apply process is created automatically with a system-generated name. If `NULL` and multiple relevant apply processes exist, then an error is raised.  
An apply process and a messaging client cannot have the same name. |
### Table 96–11 (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as ([\text{schema}_\text{name}.]queue_name). The current database must contain the queue, and the queue must be SYS.AnyData type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>For capture process rules, this is the queue into which a capture process enqueues events. For apply process rules, this is the queue from which an apply process dequeues events. For messaging client rules, this is the queue from which a messaging client dequeues events.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If true, then creates a DML rule for DML changes. If false, then does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If true, then creates a DDL rule for DDL changes. If false, then does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
If `true`, then no condition regarding Streams tags is added to the generated rules. Therefore, these rules can evaluate to `TRUE` regardless of whether a redo entry or LCR has a non-`NULL` tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-`NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `true` is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

If `false`, then adds a condition to each generated rule that causes the rule to evaluate to `TRUE` only if a redo entry or LCR has a `NULL` Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a `NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `false` may be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a `NULL` tag.

In most cases, specify `true` for this parameter if the inclusion_rule parameter is set to `false`.

**See Also:** Oracle Streams Replication Administrator's Guide for more information about tags.
source_database

The global name of the source database. If NULL, then no condition regarding the source database is added to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are creating a capture process at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured events, then the apply process can apply events from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs may or may not have this information.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

dml_rule_name

If include_dml is true, then contains the DML rule name.

If include_dml is false, then contains a NULL.

ddl_rule_name

If include_ddl is true, then contains the DDL rule name.

If include_ddl is false, then contains a NULL.

inclusion_rule

If inclusion_rule is true, then the rules are added to the positive rule set for the Streams client.

If inclusion_rule is false, then the rules are added to the negative rule set for the Streams client.

In either case, the system creates the rule set if it does not exist.
This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. A system-generated rule name is the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The overloaded ADD_TABLE_RULES procedure generates the rule names for DML and DDL changes. A capture process, apply process, or messaging client uses the rules created for filtering.

GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Streams capture and apply processes in a Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in a Streams single source replication environment

See Also: Oracle Streams Replication Administrator’s Guide for information about point-in-time recovery and flashback queries in a Streams replication environment

Syntax

```sql
DBMS_STREAMS_ADM.GET_SCN_MAPPING(  
  apply_name             IN  VARCHAR2,  
  src_pit_scn            IN  NUMBER,  
  dest_instantiation_scn OUT NUMBER,  
  dest_start_scn         OUT NUMBER,  
  dest_skip_txn_ids      OUT DBMS_UTILITY.NAME_ARRAY);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>Name of the apply process which applies LCRs from the source database. An error is raised if the specified apply process does not exist.</td>
</tr>
<tr>
<td>src_pit_scn</td>
<td>The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.</td>
</tr>
</tbody>
</table>
### Table 96–12 (Cont.) GET_SCN_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_instantiation_scn</td>
<td>The SCN at the destination database that corresponds to the specified src_pit_scn at the source database.</td>
</tr>
<tr>
<td></td>
<td>For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.</td>
</tr>
<tr>
<td>dest_start_scn</td>
<td>For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.</td>
</tr>
<tr>
<td>dest_skip_txn_ids</td>
<td>Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying non-dependent transactions out of order.</td>
</tr>
<tr>
<td></td>
<td>For point in time recovery, these transaction IDs should be ignored by the recovery apply process.</td>
</tr>
<tr>
<td></td>
<td>This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to none, and the transactions were applied out of order.</td>
</tr>
</tbody>
</table>
MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Streams to maintain this tablespace at both databases. This procedure either can perform these actions directly, or it can generate a script that performs these actions.

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
    tablespace_name IN VARCHAR2,
    source_directory_object IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database IN VARCHAR2,
    setup_streams IN BOOLEAN DEFAULT true,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    bi_directional IN BOOLEAN DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The local simple tablespace to be cloned at the destination database and maintained by Streams. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. If NULL, then an error is raised.</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If NULL, then an error is raised.</td>
</tr>
</tbody>
</table>
destination_directory_object

The directory on the computer system running the destination database into which the generated Data Pump dump file and the datafile for the cloned tablespace are transferred.

If NULL, then an error is raised.

destination_database

The global name of the destination database. A database link from the source database to the destination database with the same name must exist.

If NULL, then an error is raised.

setup_streams

If true, then the MAINTAIN_SIMPLE_TABLESPACE procedure performs the necessary actions to maintain the tablespace directly.

If false, then the MAINTAIN_SIMPLE_TABLESPACE procedure does not perform the necessary actions to maintain the tablespace directly.

You specify false when this procedure is generating a file that you will edit and then run. An error is raised if you specify false and either of the following parameters is NULL:

- script_name
- script_directory_object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_directory_object | The directory on the computer system running the destination database into which the generated Data Pump dump file and the datafile for the cloned tablespace are transferred.  
If NULL, then an error is raised.                                                                 |
| destination_database         | The global name of the destination database. A database link from the source database to the destination database with the same name must exist.  
If NULL, then an error is raised.                                                                 |
| setup_streams              | If true, then the MAINTAIN_SIMPLE_TABLESPACE procedure performs the necessary actions to maintain the tablespace directly.  
If false, then the MAINTAIN_SIMPLE_TABLESPACE procedure does not perform the necessary actions to maintain the tablespace directly.  
You specify false when this procedure is generating a file that you will edit and then run. An error is raised if you specify false and either of the following parameters is NULL:  
- script_name  
- script_directory_object |
MAINTAIN_SIMPLE_TABLESPACE Procedure

Table 96–13  (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the setup_streams parameter is false, then the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified file name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the setup_streams parameter is true, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is true, then this procedure does not generate a file and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is false, then an error is raised.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a file. If NULL and the script_name parameter is non-NULL, then an error is raised.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify true to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, and propagations are configured between the databases to propagate events. Specify false to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate events from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
</tbody>
</table>
Usage Notes

Single Source and Bi-Directional Configurations
This procedure either sets up a single source Streams configuration with the local database as the source database, or it sets up a bi-directional Streams configuration with both databases acting as source and destination databases. The bi_directional parameter controls whether the Streams configuration is single source or bi-directional. The information about single source, bi-directional, and multi-directional Streams environments in the description for the MAINTAIN_TABLESPACES procedure also applies to this procedure.

Change Cycling and the MAINTAIN_SIMPLE_TABLESPACE Procedure
If the bi_directional is set to true, then this procedure configures bi-directional replication, but this procedure cannot be used to configure multi-directional replication where changes may be cycled back to a source database by a third database in the environment. The information about change cycling in the description for the MAINTAIN_TABLESPACES procedure also applies to this procedure.

DDL Changes Not Maintained
This procedure does not configure the Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You may configure the Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Privileges and Database Links Required by the MAINTAIN_SIMPLE_TABLESPACE Procedure
The user who runs the MAINTAIN_SIMPLE_TABLESPACE procedure should have DBA role. This user must have the necessary privileges to complete the following actions:

- Create SYS.AnyData queues, capture processes, propagations, and apply processes.
- Specify supplemental logging
- Run subprograms in the DBMS_STREAMS_ADM, DBMS_STREAMS_TABLESPACES_ADM, DBMS_FILE_TRANSFER, and DBMS_AQADM packages
The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 99-11 for the list of required privileges.

The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 99-6 for the list of required privileges.

Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.

In addition, if the bi_directional parameter is set to true, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs this procedure has the necessary privileges, Oracle recommends that you configure a Streams administrator at each database. In this case, each database link should be should be created in the Streams administrator's schema.

See Also: Oracle Streams Concepts and Administration for information about configuring a Streams administrator

Actions Performed by the MAINTAIN_SIMPLE_TABLESPACE Procedure

The actions performed by this procedure are the same as the actions performed by the MAINTAIN_TABLESPACES procedure, except that this procedure only can be used for a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

This procedure uses the default values for the parameters in the MAINTAIN_TABLESPACES procedure that do not exist in the MAINTAIN_SIMPLE_TABLESPACES procedure. For example, this procedure creates a capture process at the source database named capture, because that is the default value for the capture_name parameter in the MAINTAIN_TABLESPACES procedure.
Note:
- To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the `MAINTAIN_SIMPLE_TABLESPACE` procedure must have `READ` and `WRITE` privilege on each one.
- If the source and destination databases are running on different platforms, then this procedure, or the script generated by this procedure, converts transferred datafile to the appropriate platform automatically.

See Also:
- `MAINTAIN_TABLESPACES Procedure` on page 96-78
- `Using DBMS_STREAMS_TABLESPACE_ADM` on page 99-2 and `Oracle Database Administrator’s Guide` for more information about simple tablespaces and self-contained tablespace sets
- `Oracle Streams Concepts and Administration` for information about configuring a Streams administrator
MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Streams to maintain these tablespaces at both databases. This procedure either can perform these actions directly, or it can generate a script that performs these actions.

Syntax

DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
    tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database         IN VARCHAR2,
    setup_streams                IN BOOLEAN   DEFAULT true,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    source_queue_table           IN VARCHAR2  DEFAULT 'streams_queue_table',
    source_queue_name            IN VARCHAR2  DEFAULT 'streams_queue',
    source_queue_user            IN VARCHAR2  DEFAULT NULL,
    destination_queue_table      IN VARCHAR2  DEFAULT 'streams_queue_table',
    destination_queue_name       IN VARCHAR2  DEFAULT 'streams_queue',
    destination_queue_user       IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT 'capture',
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                    IN VARCHAR2  DEFAULT NULL,
    log_file                      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT false);

| setup_streams   | If true, then the MAINTAIN_TABLESPACES procedure performs the necessary actions to maintain the tablespaces directly. If false, then the MAINTAIN_TABLESPACES procedure does not perform the necessary actions to maintain the tablespaces directly. You specify false when this procedure is generating a file that you will edit and then run. An error is raised if you specify false and either of the following parameters is NULL:  
  ■ script_name  
  ■ script_directory_object |
| script_name     | If non-NULL and the setup_streams parameter is false, then the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified file name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the setup_streams parameter is true, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is true, then this procedure does not generate a file and performs the actions to maintain the specified tablespace set directly. If NULL and the setup_streams parameter is false, then an error is raised. |
| script_directory_object | The directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a file. If NULL and the script_name parameter is non-NULL, then an error is raised. |
Summary of DBMS_STREAMS_ADM Subprograms

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then an error is raised. If NULL, then the dump file name is generated by the system. In this case, the dump file name is expat.nn.dmp, where nn is a sequence number. The sequence number is incremented to produce a dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>source_queue_table</td>
<td>The name of the queue table for the queue at the source database, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the user who runs this procedure is automatically specified as the queue table owner.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the queue at the source database that will function as the SYS.AnyData queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then it defaults to the queue table owner. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td>source_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user is also configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then no privileges are granted. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
</tbody>
</table>
### MAINTAIN_TABLESPACES Procedure Parameters

<table>

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_queue_table</td>
<td>The name of the queue table for the queue at the destination database, specified as <code>[schema_name.]queue_table_name</code>. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the queue table owner is not specified, then the user who runs this procedure is automatically specified as the queue table owner.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the queue at the destination database that will function as the SYS.AnyData queue, specified as <code>[schema_name.]queue_name</code>. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then it defaults to the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified for this parameter, and the queue table owner is not specified in destination_queue_table, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is also configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then no privileges are granted. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
</tbody>
</table>
**Table 96–14 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process configured to capture DML changes to the tables in the tables in the tablespace set at the source database. Do not specify an owner. If the specified name matches the name of an existing capture process at the source database, then the existing capture process is used, and the rules for DML changes to the tables in the tablespaces are added to the positive capture process rule set. <strong>Note:</strong> The capture_name setting cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation configured to propagate DML changes to the tables in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing propagation at the source database, then the existing propagation is used, and the rules for DML changes to the tables in the tablespaces are added to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. <strong>Note:</strong> The propagation_name setting cannot be altered after the propagation is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply process configured to apply DML changes to the tables in the tablespace set at the destination database. Do not specify an owner. If the specified name matches the name of an existing apply process at the destination database, then the existing apply process is used, and the for DML changes to the tables in the tablespaces are added to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. <strong>Note:</strong> The apply_name setting cannot be altered after the apply process is created.</td>
</tr>
</tbody>
</table>
Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

Single Source and Bi-Directional Configurations

This procedure either sets up a single source Streams configuration with the local database as the source database, or it sets up a bi-directional Streams configuration with both databases acting as source and destination databases. The `bi_directional` parameter controls whether the Streams configuration is single source or bi-directional. If `bi_directional` is `false`, then a capture process at the local database captures DML changes to the tables in the specified tablespace set, a propagation propagates these changes to the destination database, and an apply process at the destination database applies these changes. If `bi_directional` is `true`, then each database captures changes and propagates them to the other database, and each database applies changes from the other database.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If <code>NULL</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify <code>true</code> to configure bi-directional replication between the current database and the database specified in <code>destination_database</code>. Both databases are configured as source and destination databases, and propagations are configured between the databases to propagate events. Specify <code>false</code> to configure one way replication from the current database to the database specified in <code>destination_database</code>. A capture process is configured at the current database, a propagation is configured to propagate events from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
</tbody>
</table>
If bi_directional is set to false, then this procedure does not configure bi-directional information sharing. Therefore, changes made to the tables in the tablespace set at the destination database are not shared with the source database, and the tablespaces are not kept in sync at the two databases, unless no changes are made to the tablespace objects at the destination database. However, if bi_directional is set to true, then Streams is configured to keep the tablespaces in sync at the two databases, even if both databases allow DML changes to the tablespace objects.

Both databases must be open when the actions are performed. Meet the following requirements when you use this procedure:

- Run this procedure at the intended source database. If bi_directional is set to true, then run this procedure at the database that contains the tablespace set to be cloned.
- If this procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run this procedure, but both databases must be open when you run the generated script.

---

**Note:** You may need to configure conflict resolution if this procedure configures bi-directional replication.

---

**See Also:**

- SET_UPDATE_CONFLICT_HANDLER Procedure on page 15-54
- Oracle Streams Replication Administrator’s Guide for more information about conflict resolution

**Change Cycling and the MAINTAIN_TABLESPACES Procedure**

If the bi_directional is set to true, then this procedure configures bi-directional replication, but this procedure cannot be used to configure multi-directional replication where changes may be cycled back to a source database by a third database in the environment. For example, this procedure cannot be used to configure a Streams replication environment with three databases where each database shares changes with the other two databases in the environment. If this procedure is used to configure a three way replication environment such as this, then changes made at a source database would be cycled
back to the same source database. In a valid three way replication environment, a particular change is made only once at each database.

To prevent change cycling in a bi-directional Streams replication environment, this procedure configures the environment in the following way:

- The apply process at each database applies changes with an apply tag that is unique to the environment. An apply tag is a Streams tag that is part of each redo record created by the apply process. For example, if this procedure configures databases sfdb.net and nydb.net for bi-directional replication, then assume that the apply tag for the apply process at sfdb.net is the hexadecimal equivalent of '1', and assume that the apply tag for the apply process at nydb.net is the hexadecimal equivalent of '2'.

- The capture process at each database captures all DML changes to the supported tables in the tablespace set, regardless of tags in the redo records for the changes.

- Each propagation propagates all DML changes to the supported tables in the tablespace set to the other database in the bi-directional replication environment, except for changes that originated at the other database. Continuing the example, the propagation at sfdb.net propagates all changes to nydb.net, except for changes with a tag value that is the hexadecimal equivalent of '1', because these changes originated at nydb.net. Similarly, the propagation at nydb.net propagates all changes to sfdb.net, except for changes with a tag value that is the hexadecimal equivalent of '2'.

This procedure can be used to configure a Streams replication environment that includes more than two databases, as long as changes made at a source database cannot cycle back to the same source database. For example, this procedure can be run multiple times to configure an environment in which a primary database shares changes with multiple secondary databases. Such an environment is sometimes called a "hub and spoke" environment.

You may configure the Streams environment manually to replicate changes in a multiple source environment where each source database shares changes with the other source databases, or you may modify generated scripts to achieve this.

**See Also:** Oracle Streams Replication Administrator’s Guide for an example of a hub and spoke environment and for information about configuring a multiple source environment manually.
DDL Changes Not Maintained
This procedure does not configure the Streams environment to maintain DDL changes to the tablespace set nor to the database objects in the tablespace set. For example, the Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You may configure the Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Privileges and Database Links Required by the MAINTAIN_TABLESPACES Procedure
The user who runs the MAINTAIN_TABLESPACES procedure should have DBA role. This user must have the necessary privileges to complete the following actions:

- Create SYS.AnyData queues, capture processes, propagations, and apply processes.
- Specify supplemental logging
- Run subprograms in the DBMS_STREAMS_ADM, DBMS_STREAMS_TABLESPACES_ADM, DBMS_FILE_TRANSFER, and DBMS_AQADM packages
- The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_TABLESPACES Procedure on page 99-14 for the list of required privileges.
- The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_TABLESPACES Procedure on page 99-8 for the list of required privileges.
- Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.

In addition, if the bi_directional parameter is set to true, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs this procedure has the necessary privileges, Oracle recommends that you configure a Streams administrator at each database. In this case, each database link should be created in the Streams administrator's schema.
MAINTAIN_TABLESPACES Procedure

See Also: Oracle Streams Concepts and Administration for information about configuring a Streams administrator

Actions Performed by the MAINTAIN_TABLESPACES Procedure

This section describes the specific actions performed by this procedure. In the description, the source database is the database where the MAINTAIN_TABLESPACES procedure is run, and the destination database is the database specified in the destination_database parameter.

First, at the source database, this procedure performs the following actions:

1. Adds supplemental log groups for all tables supported by Streams in the tablespace set
2. Configures a SYS.AnyData queue as a source queue that will stage changes to the database objects in the tablespace set

Next, if the bi_directional parameter is set to true, then this procedure performs the following actions at the source database (If the bi_directional parameter is set to false, then these actions are not performed, and the procedure continues at Step 5):

3. Configures a local apply process and adds rules to its positive rule set that instruct the apply process to apply DML changes to tables that are supported by Streams in the tablespace set. The apply process is configured to mark redo records with a tag value that is unique to the destination database, which is the source database of the changes.
4. Sets the key columns for tables that do not have a primary key using the SET_KEY_COLUMNS procedure in the DBMS_APPLY_ADM package

Next, this procedure performs the following actions at the source database:

5. Configures a propagation, and configures its rule sets to instruct the propagation to propagate changes from the source database to the destination database. If the bi_directional parameter is set to true, then the rule sets filter out changes that originated at the destination database.
6. Disables the propagation schedule for the propagation created in Step 5
7. Configures a local capture process and adds rules to its positive rule set that instruct the capture process to capture DML changes to tables that are supported by Streams in the tablespace set
8. Makes the specified tablespace set read-only
9. Clones the specified tablespace set using the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACE_ADM package. The Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed in the specified source directory as part of the clone tablespaces operation.

10. Makes the specified tablespace set read/write. Users and applications can resume operations on the tablespace set.

11. Starts the capture process configured in Step 7

Next, if the bi_directional parameter is set to true, then this procedure performs the following action at the source database (If the bi_directional parameter is set to false, then this action is not performed, and the procedure continues at Step 13):

12. Starts the apply process configured in Step 3

Next, this procedure performs the following action at the source database:

13. Uses the DBMS_FILE_TRANSFER package to copy the Data Pump export dump file and the datafiles for the tablespace set to the specified destination directory at the computer system running the destination database.

Next, this procedure performs the following actions at the destination database:

14. Attaches the tablespace set using the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACE_ADM package.

15. Configures a local apply process and adds rules to its positive rule set that instruct the apply process to apply DML changes to tables that are supported by Streams in the tablespace set. The apply process is configured to mark redo records with a tag value that is unique to the source database of the changes.

16. Sets the key columns for tables that do not have a primary key using the SET_KEY_COLUMNS procedure in the DBMS_APPLY_ADM package.

17. Configures a SYS.AnyData queue as a destination queue that will stage propagated DML changes to the tables in the tablespace set.

Next, if the bi_directional parameter is set to true, then this procedure performs the following actions at the destination database (If the bi_directional parameter is set to false, then these actions are not performed, and the procedure continues at Step 24):

18. Adds supplemental log groups for all tables supported by Streams in the tablespace set.
19. Configures a propagation, and configures its rule sets to instruct the propagation to propagate changes from this database to the source database. The rule sets filter out changes that originated at the source database.

20. Disables the propagation schedule for the propagation created in Step 19

21. Configures a local capture process and adds rules to its positive rule set that instruct the capture process to capture DML changes to tables that are supported by Streams in the tablespace set.

22. Records the value of the current database SCN, and uses this value to set the instantiation SCNs of the objects in the tablespace set at the source database.

23. Starts the capture process created in Step 21

Next, this procedure performs the following actions at the destination database:

24. Starts the apply process created in Step 15

25. Makes the tablespace set read/write

Next, if the bi_directional parameter is set to true, then this procedure performs the following action at the destination database (If the bi_directional parameter is set to false, then this action is not performed, and the procedure continues at Step 24):

26. Enables the propagation schedule for the propagation created in Step 19

Next, this procedure performs the final action at the source database:

27. Enables the propagation schedule for the propagation created in Step 5

To monitor the progress of the configuration, query the V$SESSION_LONGOPS dynamic performance view at the source database.
Note:

- To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the `MAINTAIN_TABLESPACES` procedure must have `READ` and `WRITE` privilege on each one.

- If the source and destination databases are running on different platforms, then this procedure, or the script generated by this procedure, converts transferred datafiles to the appropriate platform automatically.

See Also: *Oracle Database Administrator’s Guide* for more information about self-contained tablespace sets
This procedure removes all Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```sql
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
    source_database     IN  VARCHAR2,
    source_object_name  IN  VARCHAR2,
    source_object_type  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database containing the object. If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.</td>
</tr>
<tr>
<td>source_object_name</td>
<td>The name of the object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>source_object_type</td>
<td>Type of the object. Currently, TABLE is the only possible object type.</td>
</tr>
</tbody>
</table>

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then data dictionary information about the object is removed at the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for
this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions are true:

- LCRs captured by the capture process for the object are or may be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or may be forwarded by the database without reinstantiating the object.

---

**Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.
**REMOVE_QUEUE Procedure**

This procedure removes the specified SYS.AnyData queue.

Specifically, this procedure performs the following actions:
1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to true, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to true, then drops all of the Streams clients that are using the queue.

**Note:** The specified queue must be a SYS.AnyData queue.

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
    cascade                  IN  BOOLEAN  DEFAULT false,
    drop_unused_queue_table  IN  BOOLEAN  DEFAULT true);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then drops any Streams clients that use the queue. If false, then raises an error if there are any Streams clients that use the queue. Before you run this procedure with the cascade parameter set to false, make sure no Streams clients are using the queue currently.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

### Table 96–16  REMOVE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop_unused_queue_table</td>
<td>If true and the queue table for the queue is empty, then the queue table is dropped. The queue table is not dropped if it contains any messages or if it is used by another queue. If false, then the queue table is not dropped.</td>
</tr>
</tbody>
</table>
REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the messaging client is dropped automatically.

---

**Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule may remain.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_RULE(
    rule_name         IN  VARCHAR2,
    streams_type      IN  VARCHAR2,
    streams_name      IN  VARCHAR2,
    drop_unused_rule  IN  BOOLEAN  DEFAULT true,
    inclusion_rule    IN  BOOLEAN  DEFAULT true);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>The name of the rule to remove, specified as <code>[schema_name.]rule_name</code>. If <code>NULL</code>, then removes all rules from the specified capture process, apply process, propagation, or messaging client rule set. For example, to specify a rule in the hr schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>streams_type</code></td>
<td>The type of Streams client, either <code>capture</code> for a capture process, <code>apply</code> for an apply process, <code>propagation</code> for a propagation, or <code>dequeue</code> for a messaging client</td>
</tr>
<tr>
<td><code>streams_name</code></td>
<td></td>
</tr>
<tr>
<td><code>drop_unused_rule</code></td>
<td></td>
</tr>
<tr>
<td><code>inclusion_rule</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Streams client, which may be a capture process, apply process, propagation, or messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the metadata is removed.</td>
</tr>
<tr>
<td></td>
<td>If the specified Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then an error is raised.</td>
</tr>
<tr>
<td>drop_unused_rule</td>
<td>If false, then the rule is not dropped from the database.</td>
</tr>
<tr>
<td></td>
<td>If true and the rule is not in any rule set, then the rule is dropped from the database.</td>
</tr>
<tr>
<td></td>
<td>If true and the rule exists in any rule set, then the rule is not dropped from the database.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is true, then the rule is removed from the positive rule set for the Streams client.</td>
</tr>
<tr>
<td></td>
<td>If inclusion_rule is false, then the rule is removed from the negative rule set for the Streams client.</td>
</tr>
</tbody>
</table>
REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Streams configuration at the local database.

Syntax

```sql
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
Summary of DBMS_STREAMS_ADM Subprograms

- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the SET_MESSAGE_NOTIFICATION procedure in the DBMS_STREAMS_ADM package
- Removes specifications for DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rules that were created using the DBMS_STREAMS_ADM package. Does not drop rules that were created using the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

---

**Attention:** Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Streams configuration at a database.

---

**Note:**
- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

---

**See Also:**
- STOP_CAPTURE Procedure on page 19-34 in the DBMS_CAPTURE_ADM package
- STOP_APPLY Procedure on page 15-59 in the DBMS_APPLY_ADM package
- REMOVE_RULE Procedure on page 96-96 in the DBMS_STREAMS_ADM package
SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

**Syntax**

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
    streams_name          IN  VARCHAR2,
    notification_action   IN  VARCHAR2,
    notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
    notification_context  IN  SYS.AnyData  DEFAULT NULL,
    include_notification  IN  BOOLEAN      DEFAULT true,
    queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Streams messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>For example, if the user strmadmin is the messaging client, then specify strmadmin.</td>
</tr>
</tbody>
</table>
The action to be performed on message notification. Specify one of the following:

- For URL notifications, specify a URL without the prefix http://.
  For example, to specify the URL http://www.company.com:8080, enter the following:
  www.company.com:8080

- For email notifications, specify an email address.
  For example, to specify an the email address xyz@company.com, enter the following:
  xyz@company.com

- For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [schema_name].procedure_name. If the schema_name is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure.
  For example, to specify a procedure named notify_orders in the oe schema, enter the following:
  oe.notify_orders

See Also: Examples on page 96-103 for more information about message notification procedures

The type of notification. Specify one of the following:

- HTTP if you specified a URL for notification_action
- MAIL if you specified an email address for notification_action
- PROCEDURE if you specified a user-defined procedure for notification_action

The type must match the specification for the notification_action parameter.
Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.

- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure may dequeue the message.
An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the `DBMS_AQELM` package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you may want to use the `DBMS_AQELM` package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an `AQXmlNotification`, which includes the following:

- `notification_options`, which includes the following:
  - `destination` - The destination queue from which the message was dequeued
  - `consumer_name` - The name of the messaging client that dequeued the message

- `message_set` - The set of message properties

See Also:

- The documentation for the `DBMS_AQELM` package for more information on email notifications and HTTP notifications
- *Oracle Streams Concepts and Administration* for more information about setting message notifications
- *Oracle Streams Advanced Queuing User’s Guide and Reference* and *Oracle XML DB Developer’s Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:
SET_MESSAGE_NOTIFICATION Procedure

PROCEDURE procedure_name(
  context  IN  SYS.AnyData,
  reginfo  IN  SYS.AQ$$_REG_INFO,
  descr    IN  SYS.AQ$$_DESCRIPTOR);

Here, procedure_name stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type oe.user_msg using the message identifier and consumer name sent by the notification:

CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
  context  SYS.AnyData,
  reginfo  SYS.AQ$$_REG_INFO,
  descr    SYS.AQ$$_DESCRIPTOR)
AS
  dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
  message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
  message_handle      RAW(16);
  message             oe.user_msg;
BEGIN
  -- Get the message identifier and consumer name from the descriptor
  dequeue_options.msgid := descr.msg_id;
  dequeue_options.consumer_name := descr.consumer_name;
  -- Dequeue the message
  DBMS_AQ.DEQUEUE(
    queue_name => descr.queue_name,
    dequeue_options => dequeue_options,
    message_properties => message_properties,
    payload => message,
    msgid => message_handle);
  COMMIT;
END;
/

See Also: PL/SQL Packages and Types Reference for more information about PLSQLCALLBACK data structures
### SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a rule-based transformation.

#### Syntax

```sql
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
    rule_name       IN  VARCHAR2,
    transform_function  IN  VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule whose rule-based transformation function you are setting or removing, specified as [schema_name.]rule_name. For example, to specify a rule in the hr schema namedprop_rulei, enter hr.prop_rulei. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| transform_function | Either the name of the transformation function to be used in the rule-based transformation for the rule or NULL. If you specify a transformation function name, then you must specify an existing function in one of the following forms:  

- [schema_name.]function_name  
- [schema_name.]package_name.function_name  

If the function is in a package, then the package_name must be specified. For example, to specify a function in the transform_pkg package in the hr schema named executive_to_management, enter hr.transform_pkg.executive_to_management. An error is returned if the specified procedure does not exist.  
If the schema_name is not specified, then the user who invokes the rule-based transformation function is the default.  
If you specify NULL, then removes the current rule-based transformation from the rule. |
Usage Notes

This procedure modifies the specified rule's action context to specify the transformation. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for an event. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Streams. The Streams clients include capture processes, propagations, apply processes, and messaging clients. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A rule-based transformation in Streams always consists of the following name-value pair in an action context:

- The name is `STREAMS$_TRANSFORM_FUNCTION`.
- The value is a `SYS.AnyData` instance containing a PL/SQL function name specified as a `VARCHAR2`. This function performs the transformation.

The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

**Note:** This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when a Streams client tries to invoke the transformation function.
SET_UP_QUEUE Procedure

This procedure creates a queue table and a SYS.AnyData queue for use with the capture, propagate, and apply functionality of Streams.

Syntax

```
DBMS STREAMS_ADM.SET_UP_QUEUE(
    queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
    storage_clause  IN  VARCHAR2  DEFAULT NULL,
    queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
    queue_user      IN  VARCHAR2  DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the user who runs this procedure is automatically specified as the queue table owner.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table</td>
</tr>
<tr>
<td></td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</td>
</tr>
<tr>
<td></td>
<td>If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then Oracle uses the storage characteristics of the tablespace in which the queue table is created.</td>
</tr>
</tbody>
</table>

See Also: Oracle Database SQL Reference for more information about storage clauses
Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause.

- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.

- This procedure starts the queue.

- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuuing agent with the same name as the user name, if one does not already exist. If an agent with this name already exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_
ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

This procedure creates a SYS.AnyData queue that is both a secure queue and a transactional queue.

---

**Note:**

- To enqueue events into and dequeue events from a queue, a queue user must have EXECUTE privilege on the DBMS_STREAMS_MESSAGING package or the DBMS_AQ package. The SET_UP_QUEUE procedure does not grant this privilege.

- If the agent that SET_UP_QUEUE tries to create already exists and is associated with a user other than the user specified by queue_user, then an error is raised. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

- Queue names and queue table names can be a maximum of 24 bytes.

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about secure queue users
SET_UP_QUEUE Procedure
The DBMS_STREAMS_AUTH package, one of a set of Streams packages, provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators.

See Also: Oracle Streams Concepts and Administration for more information about this package and Streams administrators

This chapter contains the following topic:

- Summary of DBMS_STREAMS_AUTH Subprograms
Summary of DBMS_STREAMS_AUTH Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_ADMIN_PRIVILEGE Procedure on page 97-3</td>
<td>Either grants the privileges needed by a user to be a Streams administrator directly, or generates a script that can be used to grant these privileges</td>
</tr>
<tr>
<td>GRANT_REMOTE_ADMIN_ACCESS Procedure on page 97-6</td>
<td>Enables a remote Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link</td>
</tr>
<tr>
<td>REVOKE_ADMIN_PRIVILEGE Procedure on page 97-7</td>
<td>Either revokes Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges</td>
</tr>
<tr>
<td>REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 97-9</td>
<td>Disables a remote Streams administrator from performing administrative actions by connecting to the grantee using a database link</td>
</tr>
</tbody>
</table>
GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be a Streams administrator directly, or generates a script that can be used to grant these privileges.

Syntax

```sql
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
    grantee           IN  VARCHAR2,
    grant_privileges  IN  BOOLEAN   DEFAULT true,
    file_name         IN  VARCHAR2  DEFAULT NULL,
    directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
<tr>
<td>grant_privileges</td>
<td>If true, then the GRANT_ADMIN_PRIVILEGE procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then this procedure does not make another entry, and no error is raised. If true and any of the grant statements fail, then an error is raised. If false, then the GRANT_ADMIN_PRIVILEGE procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify false when this procedure is generating a file that you will edit and then run. If you specify false and either the file_name or directory_name parameter is NULL, then an error is raised.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then this procedure does not generate a file.</td>
</tr>
</tbody>
</table>
GRANT_ADMIN_PRIVILEGE Procedure

Usage Notes

The user who runs this procedure must be an administrative user who can grant privileges to other users.

Specifically, this procedure grants the following privileges to the specified user:

- The **RESTRICTED SESSION** system privilege
- **EXECUTE** on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM
- Privileges to enqueue events into and dequeue events from any queue

Table 97–2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes this procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then an error is raised.</td>
</tr>
</tbody>
</table>
Privileges to manage any queue

- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee has the ability to grant these privileges to other users.

- SELECT privilege on data dictionary views related to Streams

- The ability to allow a remote Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

---

**Note:**

- To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer a Streams environment. You may grant more privileges to the grantee if necessary.

---

**See Also:**

- "GRANT_REMOTE_ADMIN_ACCESS Procedure" on page 97-6
- *Oracle Streams Concepts and Administration* for more information about configuring a Streams administrator
GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```sql
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then this procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

Usage Notes

Typically, you run this procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Streams administrator at a downstream capture database administers the source database using this connection. You may also run this procedure at a database running an apply process so that a remote Streams administrator can set instantiation SCNs at the local database.

**Note:** The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

**See Also:** "GRANT_ADMIN_PRIVILEGE Procedure" on page 97-3
REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.

Syntax

DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
    grantee            IN  VARCHAR2,
    revoke_privileges  IN  BOOLEAN   DEFAULT true,
    file_name          IN  VARCHAR2  DEFAULT NULL,
    directory_name     IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 97–4  REVOKE_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>revoke_privileges</td>
<td>If true, then the REVOKE_ADMIN_PRIVILEGE procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then this procedure does not remove a record from the view, and no error is raised. If true and any of the revoke statements fail, then an error is raised. A revoke statement will fail if the user is not granted the privilege that is being revoked. If false, then the REVOKE_ADMIN_PRIVILEGE procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify false when this procedure is generating a file that you will edit and then run. If you specify false and either the file_name or directory_name parameter is NULL, then an error is raised.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then this procedure does not generate a file.</td>
</tr>
</tbody>
</table>
REVOKE_ADMIN_PRIVILEGE Procedure

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 97-3
REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Streams administrator from performing administrative actions by connecting to the grantee using a database link.

---

**Note:** The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

---

**See Also:** "REVOKE_ADMIN_PRIVILEGE Procedure" on page 97-7

**Syntax**

```sql
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote Streams administrator is disabled.</td>
</tr>
</tbody>
</table>

If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then this procedure removes the grantee from the view.

If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.
The DBMS_STREAMS_MESSAGING package, one of a set of Streams packages, provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue.

See Also:

## Summary of DBMS_STREAMS_MESSAGING Subprograms

### Table 98–1  DBMS_STREAMS_MESSAGING Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEQUEUE Procedures on page 98-3</td>
<td>Uses the specified Streams messaging client to dequeue a message from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedures on page 98-6</td>
<td>The current user enqueues a message into the specified queue</td>
</tr>
</tbody>
</table>
DEQUEUE Procedures

These procedures use the specified Streams messaging client to dequeue a message from the specified queue.

**Note:** This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_MESSAGING.DEQUEUE(
    queue_name    IN   VARCHAR2,
    streams_name  IN   VARCHAR2,
    payload       OUT  SYS.AnyData,
    dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
    navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
    wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
    msgid         OUT  RAW);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be a secure queue of SYS.AnyData type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Streams messaging client. For example, if the user <code>strmadmin</code> is the messaging client, then specify <code>strmadmin</code>. If <code>NULL</code> and a relevant messaging client for the queue exists, then the relevant messaging client is used. If <code>NULL</code> and multiple relevant messaging clients for the queue exist, then an error is raised.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is dequeued</td>
</tr>
</tbody>
</table>
### Table 98–2  (Cont.) DEQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| dequeue_mode | Specify one of the following settings:  
- REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.  
- LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.  
- BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. |
| navigation | Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved.  
Specify one of the following settings:  
- NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default.  
- NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue.  
- FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.  
Note: Each message group contains the messages in a single transaction.  
See Also: Oracle Streams Advanced Queuing User’s Guide and Reference for more information about dequeue options |
| wait | Either FOREVER or NO_WAIT  
If FOREVER, then the dequeue call is blocked without a time out until a message is available in the queue.  
If NO_WAIT, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue. |
|msgid | Specifies the message identifier of the message that is dequeued |
Exceptions

Table 98–3  DEQUEUE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENDOFCURTRANS</td>
<td>Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:</td>
</tr>
<tr>
<td></td>
<td>SYS.DBMS_STREAMS_MESSAGING.ENDOFCKURTRANS</td>
</tr>
<tr>
<td></td>
<td>Every dequeue procedure should include an exception handler that handles this exception.</td>
</tr>
<tr>
<td>NOMOREMSGS</td>
<td>There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:</td>
</tr>
<tr>
<td></td>
<td>SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS</td>
</tr>
<tr>
<td></td>
<td>A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception.</td>
</tr>
</tbody>
</table>
ENQUEUE Procedures

These procedures enable the current user to enqueue a message into the specified queue.

Note: This procedure is overloaded. One version of this procedure contains the msgid OUT parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   SYS.AnyData,
   msgid       OUT  RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue into which messages will be enqueued, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be a secure queue of SYS.AnyData type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is enqueued</td>
</tr>
<tr>
<td>msgid</td>
<td>Specifies the message identifier of the message that is enqueued</td>
</tr>
</tbody>
</table>

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.
Summary of DBMS_STREAMS_MESSAGING Subprograms

See Also: "SET_UP_QUEUE Procedure" on page 96-107
The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, and the DBMS_FILE_TRANSFER package.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Streams.

This chapter contains the following topics:

- Using DBMS_STREAMS_TABLESPACE_ADM
  - Overview
  - Types
  - Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms
Using DBMS_STREAMS_TABLESPACE_ADM

Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the TRANSPORT_SET_CHECK procedure in the Oracle supplied package DBMS_TTS.

**See Also:** Oracle Database Administrator’s Guide for more information about self-contained tablespaces and tablespace sets
Types

This package contains the PL/SQL types listed in Table 99–1.

Table 99–1  DBMS_STREAMS_TABLESPACE_ADM Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIRECTORY_OBJECT_SET Type</td>
<td>Contains the names of one or more directory objects</td>
</tr>
<tr>
<td>FILE Type</td>
<td>Contains the directory object associated with a directory and the name of the file in the directory</td>
</tr>
<tr>
<td>FILE_SET Type</td>
<td>Contains one or more files</td>
</tr>
<tr>
<td>TABLESPACE_SET Type</td>
<td>Contains the names of one or more tablespaces</td>
</tr>
</tbody>
</table>

DIRECTORY_OBJECT_SET Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement CREATE DIRECTORY.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
  INDEX BY BINARY_INTEGER;
```

FILE Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
  directory_object  VARCHAR2(32),
  file_name         VARCHAR2(4000));
```

Attributes

Table 99–2  FILE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The name of a directory object. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
</tbody>
</table>
FILE/Set Type
Contains one or more files.

Syntax
```
TYPE FILE_SET IS TABLE OF FILE
    INDEX BY BINARY_INTEGER;
```

TABLESPACE_SET Type
Contains the names of one or more tablespaces.

Syntax
```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
    INDEX BY BINARY_INTEGER;
```
## Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ATTACH_SIMPLE_TABLESPACE</strong> Procedure on page 99-6</td>
<td>Uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export</td>
</tr>
<tr>
<td><strong>ATTACH_TABLESPACES</strong> Procedure on page 99-8</td>
<td>Uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export</td>
</tr>
<tr>
<td><strong>CLONE_SIMPLE_TABLESPACE</strong> Procedure on page 99-11</td>
<td>Clones a simple tablespace. The tablespace can later be attached to a database.</td>
</tr>
<tr>
<td><strong>CLONE_TABLESPACES</strong> Procedure on page 99-14</td>
<td>Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.</td>
</tr>
<tr>
<td><strong>DETACH_SIMPLE_TABLESPACE</strong> Procedure on page 99-17</td>
<td>Detaches a simple tablespace. The tablespace can later be attached to a database.</td>
</tr>
<tr>
<td><strong>DETACH_TABLESPACES</strong> Procedure on page 99-19</td>
<td>Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.</td>
</tr>
<tr>
<td><strong>PULL_SIMPLE_TABLESPACE</strong> Procedure on page 99-22</td>
<td>Copies a simple tablespace from a remote database and attaches it to the current database.</td>
</tr>
<tr>
<td><strong>PULL_TABLESPACES</strong> Procedure on page 99-25</td>
<td>Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database.</td>
</tr>
</tbody>
</table>
ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
    directory_object      IN  VARCHAR2,
    tablespace_file_name  IN  VARCHAR2,
    converted_file_name   IN  VARCHAR2  DEFAULT NULL,
    datafile_platform     IN  VARCHAR2  DEFAULT NULL,
    tablespace_name       OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file must be the same as the datafile name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion. The Data Pump import log file is written to this directory. The name of the log file is the same as the datafile name for the tablespace, except with an .alg extension. If a file already exists with the same name as the log file in the directory, then the file is overwritten. If NULL, then an error is raised.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>The name of the datafile for the tablespace being imported. If NULL, then an error is raised.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

See Also: Overview on page 99-2
ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the \texttt{DBMS_STREAMS_TABLESPACE_ADM} package or Data Pump export.

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the export database is different than the local database platform.

Syntax

\begin{verbatim}
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
    datapump_job_name IN OUT VARCHAR2,
    dump_file          IN     FILE,
    tablespace_files   IN     FILE_SET,
    converted_files    IN     FILE_SET,
    datafiles_platform IN     VARCHAR2  DEFAULT NULL,
    log_file           IN     FILE      DEFAULT NULL,
    tablespace_names   OUT    TABLESPACE_SET);
\end{verbatim}

Parameters

\begin{table}[ht]
\centering
\caption{ATTACH_TABLESPACES Procedure Parameters}
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
\texttt{datapump_job_name} & The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If \texttt{NULL}, then the system generates a Data Pump job name. \\
\texttt{dump_file} & The file name of the Data Pump dump file to import. If \texttt{NULL} or if a file attribute is \texttt{NULL}, then an error is raised. \\
\texttt{tablespace_files} & The file set that contains the datafiles for the tablespace set being imported. If \texttt{NULL}, then an error is raised. \\
\hline
\end{tabular}
\end{table}
Table 99–5  (Cont.) ATTACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>converted_files</td>
<td>If the datafiles_platform parameter is non-NULL and is not the same as the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then this parameter is ignored. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then this parameter is ignored. If NULL and the datafiles_platform parameter is non-NULL, then an error is raised.</td>
</tr>
<tr>
<td>datafiles_platform</td>
<td>Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file already exists with the same name as the log file in the directory, then the file is overwritten.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>Contains the names of the attached tablespaces. The attached tablespace is read-only. You can use the names in this parameter in an ALTER TABLESPACE statement to make them read/write if necessary.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
ATTACH_TABLESPACES Procedure

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file parameter and the tablespace_files parameter, respectively.

- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter if it is non-NULL.

- Have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

See Also:

- Overview on page 99-2
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms on page 99-5
CLONE_SIMPLE_TABLESPACE Procedure

Clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the directory_object parameter

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH_SIMPLE_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH_SIMPLE_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method.
CLONE_SIMPLE_TABLESPACE Procedure

See Also:
- Overview on page 99-2

Syntax

```plsql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
    tablespace_name      IN  VARCHAR2,
    directory_object     IN  VARCHAR2,
    destination_platform IN  VARCHAR2  DEFAULT NULL,
    tablespace_file_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace to be cloned.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then an error is raised.</td>
</tr>
<tr>
<td>directory_object</td>
<td>The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file is the same as the datafile name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then an error is raised. The name of the log file is the same as the datafile name for the tablespace, except with a .clg extension. If a file already exists with the same name as the log file in the directory, then the file is overwritten. If NULL, then an error is raised.</td>
</tr>
</tbody>
</table>
### Table 99–6 (Cont.) CLONE_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_platform | Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database.
|                      | You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces. |
| tablespace_file_name | Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter directory_object. |
CLONE_TABLESPACES Procedure

Clones a set of self-contained tablespaces. All of the tablespaces in the specified
tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
   and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified
directory
4. If this procedure made a tablespace read-only, then makes the tablespace
   read/write

In addition, this procedure optionally can create datafiles for the tablespace set that
can be used with a platform that is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
  datapump_job_name            IN OUT VARCHAR2,
  tablespace_names             IN     TABLESPACE_SET,
  dump_file                    IN     FILE,
  tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
  destination_platform         IN     VARCHAR2  DEFAULT NULL,
  log_file                     IN     FILE      DEFAULT NULL,
  tablespace_files             OUT    FILE_SET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be cloned. If NULL, then an error is raised.</td>
</tr>
</tbody>
</table>
**Table 99–7 (Cont.) CLONE_TABLESPACES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then an error is raised. If the specified file already exists, then an error is raised.</td>
</tr>
<tr>
<td>tablespace_directory_objects</td>
<td>The set of directory objects into which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then a datafile is copied to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then datafiles for the tablespace set are copied to the dump file directory.</td>
</tr>
<tr>
<td>destination_platform</td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the file is overwritten.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter tablespace_directory_objects.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter
- Have `WRITE` privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter if non-NULL
- Have `WRITE` privilege on the directory object that will contain the Data Pump export log file, specified by the `log_file` parameter if non-NULL

After cloning a tablespace set using this procedure, you can add the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure. If the database is a remote database and you want to use the `ATTACH_TABLESPACES` procedure, then you can transfer the dump file and datafiles to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

DETACH_SIMPLE_TABLESPACE Procedure

Detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
    tablespace_name      IN  VARCHAR2,
    directory_object     OUT VARCHAR2,
    tablespace_file_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>directory_object</td>
<td>Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement <code>CREATE DIRECTORY</code> exists for this directory. The name of the Data Pump export dump file is the same as the datafile name for the tablespace, except with a <code>.dmp</code> extension. If a file already exists with the same name as the dump file in the directory, then an error is raised. The name of the log file is the same as the datafile name for the tablespace, except with a <code>.dlg</code> extension. If a file already exists with the same name as the log file in the directory, then the file is overwritten.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>Contains the name of the detached tablespace datafile.</td>
</tr>
</tbody>
</table>
DETACH_SIMPLE_TABLESPACE Procedure

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ and WRITE privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH_SIMPLE_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH_SIMPLE_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You may use the two OUT parameters in this procedure to accomplish the attach or pull operation.

Note: Do not use the DETACH_SIMPLE_TABLESPACE procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

See Also:
- Overview on page 99-2
- ATTACH_SIMPLE_TABLESPACE Procedure on page 99-6 and PULL_SIMPLE_TABLESPACE Procedure on page 99-22
- Oracle Database Administrator’s Guide for more information about the Oracle-managed files feature
**DETACH_TABLESPACES Procedure**

Detaches a set of self-contained tablespaces. All of the tablespaces in the specified
tablespace set must be online and any table partitions must not span tablespaces in
the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the
dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the
database

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about
  the tablespaces. These views include `DBA_TABLESPACES` and
  `USER_TABLESPACES`.
- Have `DROP TABLESPACE` privilege
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the
  tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the
datafiles for the tablespace set. The names of these tablespaces are specified by
  the `tablespace_name` parameter. If a directory object does not exist for one or
  more of these directories, then create the directory objects and grant the
  necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the
  Data Pump export dump file, specified by the `dump_file` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump
  export the log file, specified by the `log_file` parameter if non-NULL

After detaching a tablespace set using this procedure, you can add the tablespaces
in the set to a different database using the `ATTACH_TABLESPACES` procedure. If the
database is a remote database and you want to use the `ATTACH_TABLESPACES`
procedure, then you can transfer the dump file and datafiles to the remote system
using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.
DETACH_TABLESPACES Procedure

Note: Do not use the DETACH_TABLESPACES procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

- ATTACH_TABLESPACES Procedure on page 99-8
- PULL_TABLESPACES Procedure on page 99-25
- Oracle Database Administrator’s Guide for more information about the Oracle-managed files feature

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
    datapump_job_name IN OUT VARCHAR2,
    tablespace_names  IN     TABLESPACE_SET,
    dump_file         IN     FILE,
    log_file          IN     FILE DEFAULT NULL,
    tablespace_files  OUT    FILE_SET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be detached. If NULL, then an error is raised.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then an error is raised. If the specified file already exists, then an error is raised.</td>
</tr>
</tbody>
</table>
log_file

Specify the log file name for the Data Pump export.

If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory.

If a file already exists with the same name as the log file in the directory, then the file is overwritten.

tablespace_files

Contains the names of the datafiles for the detached tablespace set.
**PULL_SIMPLE_TABLESPACE Procedure**

Copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the at the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
    tablespace_name      IN VARCHAR2,
    database_link        IN VARCHAR2,
    directory_object     IN VARCHAR2  DEFAULT NULL,
    conversion_extension IN VARCHAR2  DEFAULT NULL);
```

**Parameters**

PULL_SIMPLE_TABLESPACE Procedure

tablespace_name parameter. If a directory object does not exist for this
directory, then create the directory object and grant the necessary privileges
before you run this procedure.

To run this procedure, a user must meet the following requirements on the local
database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump
  export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory object that will hold the datafile for the
tablespace, specified by the directory_object parameter

See Also: Overview on page 99-2
**PULL_TABLESPACES Procedure**

Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
  datapump_job_name            IN OUT VARCHAR2,
  database_link                IN     VARCHAR2,
  tablespace_names             IN     TABLESPACE_SET,
  tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
  log_file                     IN     FILE,
  conversion_extension         IN     VARCHAR2  DEFAULT NULL);
```

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Using `DBMS_TRACE`
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Operational Notes
- Summary of `DBMS_TRACE` Subprograms
Using DBMS_TRACE

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes

Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:
- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under SYS.

Constants

DBMS_TRACE uses these constants:

```plaintext
trace_all_calls  constant INTEGER := 1;
trace_enabled_calls constant INTEGER := 2;
trace_all_exceptions constant INTEGER := 4;
trace_enabled_exceptions constant INTEGER := 8;
trace_all_sql     constant INTEGER := 32;
trace_enabled_sql constant INTEGER := 64;
trace_all_lines   constant INTEGER := 128;
trace_enabled_lines constant INTEGER := 256;
```
trace_stop               constant INTEGER := 16384;
trace_pause              constant INTEGER := 4096;
trace_resume             constant INTEGER := 8192;
trace_limit              constant INTEGER := 16;
trace_major_version      constant BINARY_INTEGER := 1;
trace_minor_version      constant BINARY_INTEGER := 0;

Oracle recommends using the symbolic form for all these constants.

Restrictions

You cannot use PL/SQL tracing in a shared server environment.

Operational Notes

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by enabling specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

**Note:** You cannot use the second method for anonymous blocks.
You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

### Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

### Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- **Tracing Calls**
- **Tracing Exceptions**
- **Tracing SQL**
- **Tracing Lines**

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

#### Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `trace_all_calls`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `trace_enabled_calls`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

#### Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `trace_all_exceptions`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `trace_enabled_exceptions`.

#### Tracing SQL

Two levels of SQL tracing are available:
Using DBMS_TRACE

- Level 1: Trace all SQL. This corresponds to the constant `trace_all_sql`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `trace_enabled_sql`.

**Tracing Lines**
Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `trace_all_lines`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `trace_enabled_lines`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

---

**Note:** For both all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

---

**Collected Data**
If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.
Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated.
Summary of DBMS_TRACE Subprograms

</tr>
<tr>
<td>SET_PLSQL_TRACE Procedure</td>
<td>Starts tracing in the current session</td>
</tr>
</tbody>
</table>
CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

DBMS_TRACE.CLEAR_PLSQL_TRACE;
PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number of DBMS_TRACE.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number of DBMS_TRACE.</td>
</tr>
</tbody>
</table>
SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```plsql
DBMS_TRACE.SET_PLSQL_TRACE (
    trace_level INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>You must supply one or more of the constants as listed on page 100-2. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants &quot;trace_pause&quot;, &quot;trace_resume&quot; and &quot;trace_stop&quot; should not be used in combination with other constants. Also see &quot;Collecting Trace Data&quot; on page 100-4 for more information.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
``` 

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```
ADVISE NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```
ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```
BEGIN_DISCRETE_TRANSACTION Procedure

This procedure sets "discrete transaction mode" for this transaction.

Syntax

DBMS_TRANSACTION.BEGIN_DISCRETE_TRANSACTION;

Exceptions

Table 101–2 BEGIN_DISCRETE_TRANSACTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-08175</td>
<td>A transaction attempted an operation which cannot be performed as a discrete transaction. If this exception is encountered, then rollback and retry the transaction.</td>
</tr>
<tr>
<td>ORA-08176</td>
<td>A transaction encountered data changed by an operation that does not generate rollback data: create index, direct load or discrete transaction. If this exception is encountered, then retry the operation that received the exception.</td>
</tr>
</tbody>
</table>

Examples

DISCRETE_TRANSACTION_FAILED exception;
   pragma exception_init(DISCRETE_TRANSACTION_FAILED, -8175);
CONSISTENT_READ_FAILURE exception;
   pragma exception_init(CONSISTENT_READ_FAILURE, -8176);
COMMIT Procedure

This procedure is equivalent to the SQL statement:

COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.COMMIT;
COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```sql
COMMIT COMMENT <text>
```

Syntax

```sql
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmnt VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmnt</td>
<td>Comment to associate with this commit.</td>
</tr>
</tbody>
</table>
COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (xid VARCHAR2,
                                scn VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
<tr>
<td>scn</td>
<td>System change number.</td>
</tr>
</tbody>
</table>
LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (create_transaction BOOLEAN := FALSE) RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_transaction</td>
<td>If true, then start a transaction if one is not currently active.</td>
</tr>
</tbody>
</table>
PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.</td>
</tr>
</tbody>
</table>

Usage Notes

**WARNING:** PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

---

DBMS_TRANSACTION 101-13
However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure **PURGE_LOST_DB_ENTRY** to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

<table>
<thead>
<tr>
<th>State of Column</th>
<th>State of Global Transaction</th>
<th>State of Local Transaction</th>
<th>Normal DBA Action</th>
<th>Alternative DBA Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collecting</td>
<td>Rolled back</td>
<td>Rolled back</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(See Note 1)</td>
</tr>
<tr>
<td>Committed</td>
<td>Committed</td>
<td>Committed</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(See Note 1)</td>
</tr>
<tr>
<td>Prepared</td>
<td>Unknown</td>
<td>Prepared</td>
<td>None</td>
<td>FORCE COMMIT or ROLLBACK</td>
</tr>
<tr>
<td>Forced commit</td>

<td>PURGE_LOST_DB_ENTRY</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(See Note 1)</td>
</tr>
<tr>
<td>Forced rollback</td>
<td>Unknown</td>
<td>Rolled back</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>(See Note 1)</td>
</tr>
<tr>
<td>Forced commit</td>
<td>Mixed</td>
<td>Committed</td>
<td>(See Note 2)</td>
<td></td>
</tr>
<tr>
<td>(mixed)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Forced rollback</td>
<td>Mixed</td>
<td>Rolled back</td>
<td>(See Note 2)</td>
<td></td>
</tr>
<tr>
<td>(mixed)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NOTE 1:** Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.
NOTE 2: Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.
PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in DBA_2PC_PENDING by setting the MIXED column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```sql
DBMS_TRANSACTION.PURGE_MIXED ( 
    xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.</td>
</tr>
</tbody>
</table>
READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

SET TRANSACTION READ ONLY

Syntax

DBMS_TRANSACTION.READ_ONLY;
READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

SET TRANSACTION READ WRITE

Syntax

DBMS_TRANSACTION.READ_WRITE;
**ROLLBACK Procedure**

This procedure is equivalent to the SQL statement:

ROLLBACK

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

**Syntax**

DBMS_TRANSACTION.ROLLBACK;
ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
    xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
</tbody>
</table>
ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

ROLLBACK TO SAVEPOINT <savepoint_name>

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
  savept VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (savept VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```
USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>

Syntax

DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
    rb_name VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rb_name</td>
<td>Name of rollback segment to use.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

See Also: Oracle Streams Advanced Queuing User's Guide and Reference for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms
### Summary of DBMS_TRANSFORM Subprograms

**Table 102–1  DBMS_TRANSFORM Package Subprograms**

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TRANSFORMATION Procedure</td>
<td>Creates a transformation that maps an object of the source type to an object of the destination type</td>
</tr>
<tr>
<td>DROP_TRANSFORMATION Procedure</td>
<td>Drops the given transformation</td>
</tr>
<tr>
<td>MODIFY_TRANSFORMATION Procedure</td>
<td>Modifies an existing transformation</td>
</tr>
</tbody>
</table>
CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema       VARCHAR2(30),
    name         VARCHAR2(30),
    from_schema  VARCHAR2(30),
    from_type    VARCHAR2(30),
    to_schema    VARCHAR2(30),
    to_type      VARCHAR2(30),
    transformation VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>from_schema</td>
<td>Specifies the schema of the source type.</td>
</tr>
<tr>
<td>from_type</td>
<td>Specifies the source type.</td>
</tr>
<tr>
<td>to_schema</td>
<td>Specifies the target type schema.</td>
</tr>
<tr>
<td>to_type</td>
<td>Specifies the target type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.</td>
</tr>
</tbody>
</table>

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.

The transformation cannot write database state (perform DML) or commit or rollback the current transaction.

The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.

Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.
**DROP_TRANSFORMATION Procedure**

This procedure drops the given transformation.

**Syntax**

```sql
DBMS_TRANSFORM.DROP_TRANSFORMATION (
    schema VARCHAR2(30),
    name VARCHAR2(30));
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
</tbody>
</table>
MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```sql
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (  
    schema VARCHAR2(30),  
    name VARCHAR2(30),  
    attribute_number INTEGER,  
    transformation VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>attribute_number</td>
<td>The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.</td>
</tr>
<tr>
<td>transformation</td>
<td>The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left
unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.
The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Using DBMS_TYPES
  - Constants
  - Exceptions
Constants

The following table lists the constants in the DBMS_TYPES package.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_DATA</td>
<td>Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>The operation succeeded</td>
</tr>
<tr>
<td>TYPECODE_BDOUBLE</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BFILE</td>
<td>A BFILE type</td>
</tr>
<tr>
<td>TYPECODE_BFLOAT</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BLOB</td>
<td>A BLOB type</td>
</tr>
<tr>
<td>TYPECODE_CFILE</td>
<td>A CFILE type</td>
</tr>
<tr>
<td>TYPECODE_CHAR</td>
<td>A CHAR type</td>
</tr>
<tr>
<td>TYPECODE_CLOB</td>
<td>A CLOB type</td>
</tr>
<tr>
<td>TYPECODE_DATE</td>
<td>A DATE type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_DS</td>
<td>An INTERVAL_DS type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_YM</td>
<td>A INTERVAL_YM type</td>
</tr>
<tr>
<td>TYPECODE_MLSLABEL</td>
<td>An MLSLABEL type</td>
</tr>
<tr>
<td>TYPECODE NAMEDCOLLECTION</td>
<td>A named collection (VARRAY/nested table) type</td>
</tr>
<tr>
<td>TYPECODE_NUMBER</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_OBJECT</td>
<td>An OBJECT type</td>
</tr>
<tr>
<td>TYPECODE_OPAQUE</td>
<td>An OPAQUE type</td>
</tr>
<tr>
<td>TYPECODE_RAW</td>
<td>A RAW type</td>
</tr>
<tr>
<td>TYPECODE_REF</td>
<td>A REF type</td>
</tr>
<tr>
<td>TYPECODE_TABLE</td>
<td>A nested table collection type</td>
</tr>
</tbody>
</table>
### DBMS_TYPES Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPECODE_TIMESTAMP</td>
<td>A TIMESTAMP type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_LTZ</td>
<td>A TIMESTAMP_LTZ type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_TZ</td>
<td>A TIMESTAMP_TZ type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR2</td>
<td>A VARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR</td>
<td>A VARCHAR type</td>
</tr>
<tr>
<td>TYPECODE_VARRAY</td>
<td>A VARRAY collection type</td>
</tr>
</tbody>
</table>

#### Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH
The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- **Using DBMS_UTILITY**
  - Security Model
  - Types
  - Deprecated Subprograms
- **Summary of DBMS_UTILITY Subprograms**
Using DBMS_UTILITY

- Security Model
- Types
- Deprecated Subprograms

Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE Procedure, the COMPIL\_SCHEMA Procedure, and the ANALYZE\_SCHEMA Procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Types

- dblink_array
- index_table_type
- instance_record
- lname_array
- name_array
- number_array
- uncl_array

dblink_array

TYPE dblink_array IS TABLE OF VARCHAR2(128) INDEX BY BINARY\_INTEGER;

Lists of database links should be stored here.

index_table_type

TYPE index_table_type IS TABLE OF BINARY\_INTEGER INDEX BY BINARY\_INTEGER;

The order in which objects should be generated is returned here.
instance_record

```plsql
TYPE instance_record IS RECORD {
    inst_number   NUMBER,
    inst_name     VARCHAR2(60));
```

The list of active instance number and instance name.

The starting index of instance_table is 1; instance_table is dense.

lname_array

```plsql
TYPE lname_array IS TABLE OF VARCHAR2(4000) index by BINARY_INTEGER;
```

Lists of Long NAME should be stored here, it includes fully qualified attribute names.

name_array

```plsql
TYPE name_array IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

Lists of NAME should be stored here.

number_array

```plsql
TYPE number_array IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

The order in which objects should be generated is returned here for users.

uncl_array

```plsql
TYPE uncl_array IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

Lists of "USER"."NAME"."COLUMN"@LINK should be stored here.

Deprecated Subprograms

Obsolete with Oracle Database Release 10g:

- ANALYZE_DATABASE Procedure
- ANALYZE_SCHEMA Procedure
## Summary of DBMS_UTILITY Subprograms

</table>
ANALYZE_DATABASE Procedure

This procedure runs the ANALYZE command on all the tables, clusters, and indexes in a database. Use this procedure to collect nonoptimizer statistics. For optimizer statistics, use the DBMS_STATS.GATHER_DATABASE_STATS procedure.

Syntax

DBMS_UTILITY.ANALYZE_DATABASE (method VARCHAR2, estimate_rows NUMBER DEFAULT NULL, estimate_percent NUMBER DEFAULT NULL, method_opt VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. For ESTIMATE, either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS ] [SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>
Exceptions

Table 104–3  ANALYZE_DATABASE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this database.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to collect nonoptimizer statistics. For optimizer statistics, use the DBMS_STATS.GATHER_TABLE_STATS or DBMS_STATS.GATHER_INDEX_STATS procedure.
ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```sql
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table   OUT INSTANCE_TABLE,
    instance_count   OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_table</td>
<td>Contains a list of the active instance numbers and names. When no instance is up, the list is empty.</td>
</tr>
<tr>
<td>instance_count</td>
<td>Number of active instances.</td>
</tr>
</tbody>
</table>
ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:
```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]
```

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (  
    schema        IN VARCHAR2 DEFAULT NULL,  
    object_name   IN VARCHAR2 DEFAULT NULL,  
    object_type   IN CHAR     DEFAULT 'T',  
    command_type  IN CHAR     DEFAULT 'E',  
    command_opt   IN VARCHAR2 DEFAULT NULL,  
    sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Schema of the object_name.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of object to be analyzed, must be partitioned.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of object, must be T (table) or I (index).</td>
</tr>
<tr>
<td>command_type</td>
<td>Must be V (validate structure)</td>
</tr>
<tr>
<td>command_opt</td>
<td>Other options for the command type.</td>
</tr>
<tr>
<td></td>
<td>For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns</td>
</tr>
<tr>
<td></td>
<td>or combination of some of the 'for' options of analyze statistics</td>
</tr>
<tr>
<td></td>
<td>(table). For V, it can be CASCADE when object_type is T.</td>
</tr>
<tr>
<td>sample_clause</td>
<td>The sample clause to use when command_type is 'E'.</td>
</tr>
</tbody>
</table>

Usage Notes

For each partition of the object, run in parallel using job queues.
This procedure runs the ANALYZE command on all the tables, clusters, and indexes in a schema. Use this procedure to collect nonoptimizer statistics. For optimizer statistics, use the DBMS_STATS.GATHER_SCHEMA_STATS procedure.

**Syntax**

```sql
DBMS_UTILITY.ANALYZE_SCHEMA (  
  schema           VARCHAR2,  
  method           VARCHAR2,  
  estimate_rows    NUMBER   DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT NULL,  
  method_opt       VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE.</td>
</tr>
<tr>
<td></td>
<td>If ESTIMATE, then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate.</td>
</tr>
<tr>
<td></td>
<td>If estimate_rows is specified, then ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>
Exceptions

Table 104–7  ANALYZE_SCHEMA Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this schema.</td>
</tr>
</tbody>
</table>
CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
    name        IN    VARCHAR2,
    canon_name  OUT   VARCHAR2,
    canon_len   IN    BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The string to be canonicalized.</td>
</tr>
<tr>
<td>canon_name</td>
<td>The canonicalized string</td>
</tr>
<tr>
<td>canon_len</td>
<td>The length of the string (in bytes) to canonicalize.</td>
</tr>
</tbody>
</table>

Return Values

Returns the first `canon_len` bytes in `canon_name`.

Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
Any other character after a[b]* will be ignored.
The procedure does not handle cases like 'A B.'

**Examples**

- a becomes A
- "a" becomes a
- "a\".b becomes "a"."B"
- "a\".b,c.f becomes "a\"."B with\", c.f" ignored.
COMMA_TO_TABLE Procedures

These procedures converts a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list   IN  VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
  list   IN  VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab    OUT lname_array);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Comma separated list of tables.</td>
</tr>
<tr>
<td>tablen</td>
<td>Number of tables in the PL/SQL table.</td>
</tr>
<tr>
<td>tab</td>
<td>PL/SQL table which contains list of table names.</td>
</tr>
</tbody>
</table>

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.

Entries in the comma-delimited list cannot include multibyte characters such as hyphens (-).

The values in tab are cut from the original list, with no transformations.
COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, and triggers in the specified schema. After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.

To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
    schema VARCHAR2,
    compile_all BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this schema.</td>
</tr>
</tbody>
</table>
CREATE ALTER TYPE ERROR TABLE Procedure

This procedure creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
    schema_name IN VARCHAR2,
    table_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table created.</td>
</tr>
</tbody>
</table>

Exceptions

An error is returned if the table already exists.
CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
RETURN NUMBER;
```
DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
    dba NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address.</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_reference(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block</td>
<td>Block offset of the block.</td>
</tr>
</tbody>
</table>

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```sql
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (dba NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address.</td>
</tr>
</tbody>
</table>

Pragmas

```sql
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File that contains the block.</td>
</tr>
</tbody>
</table>

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```sql
DBMS_UTILITY.DB_VERSION (  
    version       OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.</td>
</tr>
<tr>
<td>compatibility</td>
<td>The compatibility setting of the database determined by the &quot;compatible&quot; init.ora parameter. If the parameter is not specified in the init.ora file, then NULL is returned.</td>
</tr>
</tbody>
</table>
EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in parse_string.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
    parse_string IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parse_string</td>
<td>DDL statement to be executed.</td>
</tr>
</tbody>
</table>
FORMAT_ERROR_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```sql
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```sql
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
    BEGIN
      g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );
      CASE g_end_pos > 0
        WHEN true THEN
          DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
            g_end_pos-g_start_pos ) );
          g_start_pos := g_end_pos+1;
          RETURN TRUE;
        WHEN FALSE THEN
          DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
            (Length(i_buff)-g_start_pos)+1 ) );
          RETURN FALSE;
        END CASE;
      END Output_One_Line;

  BEGIN
    WHILE Output_One_Line() LOOP NULL;
    END LOOP;
  END Log_Errors;
```

*/
FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```sql
DBMS_UTILITY.FORMAT_ERROR_STACK
   RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

Return Values

See FORMAT_ERROR_BACKTRACE Function on page 104-22.
FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

\[
\text{DBMS\_UTILITY.FORMAT\_CALL\_STACK} \\
\text{RETURN VARCHAR2;}
\]

Pragmas

\[
\text{pragma restrict\_references(format\_call\_stack,\text{WNDS});}
\]

Return Values

This returns the call stack, up to 2000 bytes.
GET_CPU_TIME Function

This function returns the current CPU time in 100th's of a second. The returned CPU time is the number of 100th's of a second from some arbitrary epoch.

Syntax

```sql
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.
GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
    type  IN  VARCHAR2,
    schema  IN  VARCHAR2,
    name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>The type of the object, for example if the object is a table give the type as 'TABLE'.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema name of the object.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>
GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```sql
DBMS_UTILITY.GET_HASH_VALUE (
    name      VARCHAR2,
    base      NUMBER,
    hash_size NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed.</td>
</tr>
<tr>
<td>base</td>
<td>Base value for the returned hash value to start at.</td>
</tr>
<tr>
<td>hash_size</td>
<td>Desired size of the hash table.</td>
</tr>
</tbody>
</table>

Pragmas

```sql
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.
**GET_PARAMETER_VALUE Function**

This function gets the value of specified `init.ora` parameter.

**Syntax**

```sql
DBMS_UTILITY.GET_PARAMETER_VALUE (  
    parnam IN VARCHAR2,  
    intval IN OUT BINARY_INTEGER,  
    strval IN OUT VARCHAR2)  
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parnam</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>intval</td>
<td>Value of an integer parameter or the value length of a string parameter.</td>
</tr>
<tr>
<td>strval</td>
<td>Value of a string parameter.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partyp</td>
<td>Parameter type:</td>
</tr>
<tr>
<td></td>
<td>0 if parameter is an integer/boolean parameter</td>
</tr>
<tr>
<td></td>
<td>1 if parameter is a string/file parameter</td>
</tr>
</tbody>
</table>

**Usage Notes**

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```
utl_file_dir = /dir1
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:
GET_PARAMETER_VALUE Function

utl_file_dir = /dir1, /dir2

Examples

DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
Summary of DBMS_UTILITY Subprograms

GET_TIME Function

This function finds out the current time in 100th's of a second. It is primarily useful for determining elapsed time.

Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.
IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```sql
DBMS_UTILITY.IS_CLUSTER_DATABASE
    RETURN BOOLEAN;
```

Return Values

This function returns **TRUE** if this instance was started in cluster database mode; **FALSE** otherwise.
MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (  
    file  NUMBER,  
    block NUMBER)  
RETURN NUMBER;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File that contains the block.</td>
</tr>
<tr>
<td>block</td>
<td>Offset of the block within the file in terms of block increments.</td>
</tr>
</tbody>
</table>
```

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

```
<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address.</td>
</tr>
</tbody>
</table>
```
NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
    name          IN  VARCHAR2,
    context       IN  NUMBER,
    schema        OUT VARCHAR2,
    part1         OUT VARCHAR2,
    part2         OUT VARCHAR2,
    dblink        OUT VARCHAR2,
    part1_type    OUT NUMBER,
    object_number OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</td>
</tr>
<tr>
<td>context</td>
<td>Must be an integer between 0 and 8.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema of the object c. If no schema is specified in name, then the schema is determined by resolving the name.</td>
</tr>
<tr>
<td>part1</td>
<td>First part of the name. The type of this name is specified part1_type (synonym, procedure or package).</td>
</tr>
<tr>
<td>part2</td>
<td>If this is non-NULL, then this is a procedure name within the package indicated by part1.</td>
</tr>
</tbody>
</table>
Summary of DBMS_UTILITY Subprograms

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax errors that are possible when specifying object names.

Table 104–25  NAME_RESOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this later case, part1_type indicates a synonym.</td>
</tr>
<tr>
<td>part1_type</td>
<td>Type of part1 is:</td>
</tr>
<tr>
<td></td>
<td>5 - synonym</td>
</tr>
<tr>
<td></td>
<td>7 - procedure (top level)</td>
</tr>
<tr>
<td></td>
<td>8 - function (top level)</td>
</tr>
<tr>
<td></td>
<td>9 - package</td>
</tr>
<tr>
<td></td>
<td>If a synonym, then it means that name is a synonym that translates to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.</td>
</tr>
<tr>
<td>object_number</td>
<td>Object identifier</td>
</tr>
</tbody>
</table>
NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c ]]@dblink ". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```sql
DBMS_UTILITY.NAME_TOKENIZE (   
    name   IN  VARCHAR2,   
    a       OUT VARCHAR2,   
    b       OUT VARCHAR2,   
    c       OUT VARCHAR2,   
    dblink  OUT VARCHAR2,   
    nextpos OUT BINARY_INTEGER);
```

Parameters

For each of a, b, c, dblink, tell where the following token starts in anext, bnext, cnext, dnext respectively.
PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK
PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"
The maximum length is port-specific.

Syntax

```sql
DBMS_UTILITY.PORT_STRING
    RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```
These procedures convert a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, \(1 \ldots n\), terminated with \(n+1\) null. The second version supports fully-qualified attribute names.

**Syntax**

```sql
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN  UNCL_ARRAY,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

```sql
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN  lname_array,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tab</code></td>
<td>PL/SQL table which contains list of table names.</td>
</tr>
<tr>
<td><code>tablen</code></td>
<td>Number of tables in the PL/SQL table.</td>
</tr>
<tr>
<td><code>list</code></td>
<td>Comma separated list of tables.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a comma-delimited list and the number of elements found in the table.
VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>The ID number of object to be validated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS.</td>
</tr>
</tbody>
</table>

Usage Notes

No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Using `DBMS_WARNING`
  - Security Model
- Summary of `DBMS_WARNING` Subprograms
Using DBMS_WARNING

- Security Model

Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.
### Summary of DBMS_WARNING Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_WARNING_SETTING_CAT Procedure</td>
<td>Modifies the current session or system warning settings of the warning_category previously supplied</td>
</tr>
<tr>
<td>ADD_WARNING_SETTING_NUM Procedure</td>
<td>Modifies the current session or system warning settings of the warning_number previously supplied</td>
</tr>
<tr>
<td>GET_CATEGORY Function</td>
<td>Returns the category name, given the message number</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_CAT Function</td>
<td>Returns the specific warning category in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_NUM Function</td>
<td>Returns the specific warning number in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_STRING Function</td>
<td>Returns the entire warning string for the current session</td>
</tr>
<tr>
<td>SET_WARNING_SETTING_STRING Procedure</td>
<td>Replaces previous settings with the new value</td>
</tr>
</tbody>
</table>
ADD_WARNING_SETTING_CAT Procedure

ADD_WARNING_SETTING_CAT Procedure

You can modify the current session’s or system’s warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

Syntax

```sql
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category IN VARCHAR2,
    warning_value IN VARCHAR2,
    scope IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>warning_category</code></td>
<td>Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.</td>
</tr>
<tr>
<td><code>warning_value</code></td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td><code>scope</code></td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
ADD_WARNING_SETTING_NUM Procedure

You can modify the current session or system warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE / DISABLE / ERROR) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (  
   warning_number      IN    NUMBER,  
   warning_value       IN    VARCHAR2,  
   scope               IN    VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning number. Allowed values are all valid warning numbers.</td>
</tr>
<tr>
<td>warning_value</td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```sql
DBMS_WARNING.GET_CATEGORY (
    warning_number IN pls_integer)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning message number.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```sql
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category    IN    VARCHAR2)  
RETURN warning_value;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_category</td>
<td>Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```sql
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number IN NUMBER)  
RETURN warning_value;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>Warning number. Allowed values are all valid warning numbers.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

DBMS_WARNING.GET_WARNING_SETTING_STRING
RETURN pls_integer;

Usage Notes

Use this function when you do not have SELECT privilege on v$parameter or v$parameter2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.
SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of ‘=’ when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION OR ALTER SYSTEM command.

Syntax

```sql
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value   IN   VARCHAR2,  
    scope           IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Table 105-7</th>
<th>SET_WARNING_SETTING_STRING Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------</td>
</tr>
<tr>
<td>warning_value</td>
<td>The new string that will constitute the new value.</td>
</tr>
<tr>
<td>scope</td>
<td>This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

The chapter contains the following topic:

- **Summary of DBMS_WORKLOAD_REPOSITORY Subprograms**
### Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWR_REPORT_HTML Function on page 106-3</td>
<td>Displays the AWR report in HTML</td>
</tr>
<tr>
<td>AWR_REPORT_TEXT Function on page 106-4</td>
<td>Displays the AWR report in text</td>
</tr>
<tr>
<td>CREATE_BASELINE Function and Procedure on page 106-5</td>
<td>Creates a single baseline</td>
</tr>
<tr>
<td>CREATE_SNAPSHOT Function and Procedure on page 106-6</td>
<td>Creates a manual snapshot immediately</td>
</tr>
<tr>
<td>DROP_BASELINE Procedure on page 106-7</td>
<td>Drops a range of snapshots</td>
</tr>
<tr>
<td>DROP_SNAPSHOT_RANGE Procedure on page 106-8</td>
<td>Activates service</td>
</tr>
<tr>
<td>MODIFY_SNAPSHOT_SETTINGS Procedure on page 106-9</td>
<td>Modifies the snapshot settings.</td>
</tr>
</tbody>
</table>
**AWR_REPORT_HTML Function**

This table function displays the AWR report in HTML.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
  l_eid        IN    NUMBER,
  l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

**Parameters**

**Table 106–2 AWR_REPORT_HTML Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>The database identifier.</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>The instance number.</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' Id</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' Id</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>• l_options = 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, PGA Target Advice, and Wait Class sections.</td>
</tr>
</tbody>
</table>

**Return Values**

The output will be one column of VARCHAR2(150).

**Usage Notes**

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
  l_eid        IN    NUMBER,
  l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>The database identifier.</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>The instance number.</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' Id</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' Id</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>- l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, PGA Target Advice, and Wait Class sections.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
CREATE_BASELINE Function and Procedure

This function and procedure creates a baseline.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_snap_id</td>
<td>The start snapshot sequence number.</td>
</tr>
<tr>
<td>end_snap_id</td>
<td>The end snapshot sequence number.</td>
</tr>
<tr>
<td>baseline_name</td>
<td>The name of baseline.</td>
</tr>
<tr>
<td>dbid</td>
<td>The database id (default to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
    end_snap_id => 107,
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the Create Baseline action, you will see the newly created baseline in the Workload Repository.
CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL');
```

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_level</td>
<td>The flush level for the snapshot is either 'TYPICAL' or 'ALL'</td>
</tr>
</tbody>
</table>

Examples

This example creates a manual snapshot at the TYPICAL level:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.
DROP_BASELINE Procedure

This procedure drops a baseline.

Syntax

DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade        IN BOOLEAN DEFAULT false,
    dbid           IN NUMBER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>The name of baseline.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.</td>
</tr>
<tr>
<td>dbid</td>
<td>The (optional) database id (default to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBS_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.
DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```plsql
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
    low_snap_id    IN  NUMBER,
    high_snap_id   IN  NUMBER,
    dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low_snap_id</td>
<td>The low snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>high_snap_id</td>
<td>The high snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>dbid</td>
<td>The database id (default to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```plsql
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.
MODIFY_SNAPSHOT_SETTINGS Procedure

This procedure controls two aspects of snapshot generation. The INTERVAL setting affects how often snapshots are automatically captured while the RETENTION setting affects how long snapshots are retained in the Workload Repository.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS({
    retention IN NUMBER DEFAULT NULL,
    interval IN NUMBER DEFAULT NULL,
    dbid IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>The new retention time (in minutes). The specified value must be in the range of 1 day to 100 years. If ZERO is specified, the maximum value of 100 years will be used. If NULL is specified, the old value for retention is preserved.</td>
</tr>
<tr>
<td>interval</td>
<td>The new interval setting between each snapshot, in units of minutes. The specified value must be in the range between 10 minutes to 1 year. If ZERO is specified, the maximum value of 1 year will be used. If NULL is specified, the current value is preserved.</td>
</tr>
<tr>
<td>dbid</td>
<td>The database id (default to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```sql
execute dbms_workload_repository.modify_snapshot_settings(interval => 60, retention => 20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.
MODIFY_SNAPSHOT_SETTINGS Procedure
The DBMS_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- Documentation of DBMS_WM
Documentation of DBMS_WM

For a complete description of this package, see DBMS_WM in Oracle Database Application Developer’s Guide - Workspace Manager.
The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

**See Also:**
- *Oracle XML DB Developer’s Guide*
- *Oracle Database New Features*

This chapter contains the following topics:

- **Using DBMS_XDB**
  - Overview
  - Constants
  - Summary of DBMS_XDB Subprograms
Using DBMS_XDB

Overview

The DBMS_XDB package supports the following features:

- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Procedure, CHANGEPRIVILEGES Function and GETPRIVILEGES Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle’s ACL-based Security mechanism without storing objects in the Hierarchy.

- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure methods.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction.
## Constants

Table 108–1  Defined Constants for DBMS_XDB

<table>
<thead>
<tr>
<th>Constant</th>
<th>Definition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESOURCE</td>
<td>CONSTANT NUMBER := 1</td>
<td>Deletes a resource; fails if the resource has children.</td>
</tr>
<tr>
<td>DELETE_RECURSIVE</td>
<td>CONSTANT NUMBER := 2</td>
<td>Deletes a resource and its children, if any.</td>
</tr>
<tr>
<td>DELETE_FORCE</td>
<td>CONSTANT NUMBER := 3</td>
<td>Deletes the resource, even if the object it contains is invalid.</td>
</tr>
<tr>
<td>DELETE_RECURSIVE_FORCE</td>
<td>CONSTANT NUMBER := 4</td>
<td>Deletes a resource and its children, if any, even if the object it contains is invalid.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XDB Subprograms

### Table 108–2  DBMS_XDB Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACLECHECKPRIVILEGES Function on page 108-6</td>
<td>Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.</td>

</tbody>
</table>
ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL
document by the OWNER of the resource. Returns positive integer if all privileges are
granted.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
    acl_path  IN  VARCHAR2,
    owner     IN  VARCHAR2,
    privs     IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document.</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user &quot;DAV:owner&quot; is replaced by this user during ACL privilege resolution.</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>
CFG_GET Function

This function retrieves the session's configuration information as an XMLType instance.

Syntax

DBMS_XDB.CFG_GET
RETURN SYS.XMLType;
CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```sql
DBMS_XDB.CFG_REFRESH;
```
CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB.CFG_UPDATE(
    xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdbconfig</td>
<td>The new configuration data.</td>
</tr>
</tbody>
</table>
CHANGEPRIVILEGES Function

This function adds the given ACE to the given resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
    res_path   IN    VARCHAR2,
    ace        IN    xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 108–5 CHANGEPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed.</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code>, the operation <code>&lt;grant&gt;</code> and the list of privileges.</td>
</tr>
</tbody>
</table>

Return Values

It returns a positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.
CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```sql
DBMS_XDB.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource.</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges.</td>
</tr>
</tbody>
</table>

Return Values

Returns positive integer if all requested privileges granted.
CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB.CREATEFOLDER(
    path   IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.
**CREATEOIDPATH Function**

This function creates a virtual path to the resource based on object ID.

**Syntax**

```plaintext
DBMS_XDB.CREATEOIDPATH(
    oid    IN   RAW)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource.</td>
</tr>
</tbody>
</table>
The functions create a new resource. The description of the overload options precede each version of the syntax.

Syntax

Creates a new resource with the given string as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
    path IN VARCHAR2,
    data IN VARCHAR2
) RETURN BOOLEAN;
```

Creates a new resource with the given XMLType data as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
    path IN VARCHAR2,
    data IN SYS.XMLTYPE
) RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```sql
DBMS_XDB.CREATERESOURCE(
    path IN VARCHAR2,
    datarow IN REF SYS.XMLTYPE
) RETURN BOOLEAN;
```

Creates a resource with the given BLOB as its contents, and specifies character set of the source BLOB:

```sql
DBMS_XDB.CREATERESOURCE(
    path IN VARCHAR2,
    data IN BLOB,
    csid IN NUMBER :=0
) RETURN BOOLEAN;
```
Creates a resource with the given BFILE as its contents, and specifies character set of the source BFILE:

DBMS_XDB.CREATERESOURCE(
    path    IN  VARCHAR2,
    data    IN  BFILE,
    csid    IN  NUMBER :=0)
RETURN BOOLEAN;

Creates a resource with the given CLOB as its contents:

DBMS_XDB.CREATERESOURCE(
    path    IN  VARCHAR2,
    data    IN  CLOB)
RETURN BOOLEAN;

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to create. The path name’s parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>The new resource’s contents. The data will be parsed to check if it contains a schema-based XML document, and the contents will be stored as schema-based in the schema’s default table. Otherwise, it will be saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an XMLType row to be used as the contents.</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the document. Must be a valid Oracle id; otherwise returns an error.</td>
</tr>
</tbody>
</table>

If a zero CSID is specified then the data is defaulted to the database character set. Otherwise, the encoding of the data is determined as follows:

- From the path extension, determine the resource’s MIME type.
- If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; otherwise, it is defaulted to the database character set.
Return Values

Returns TRUE if operation successful; FALSE, otherwise.
DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB.DELETERESOURCE(
    path          IN      VARCHAR2,
    delete_option IN      PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete.</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted; defined in Table 108-1</td>
</tr>
<tr>
<td></td>
<td>on page 108-3:</td>
</tr>
<tr>
<td></td>
<td>■ DELETERESOURCE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RECURSIVE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_FORCE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>
**EXISTSRESOURCE Function**

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

**Syntax**

```sql
DBMS_XDB.EXISTSRESOURCE(  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns **TRUE** if the resource is found.
GETACLDOCUMENT Procedure

This procedure retrieves ACL document that protects resource given its path name.

Syntax

DBMS_XDB.GETACLDOCUMENT(
   abspath   IN   VARCHAR2)
RETURN sys.xmltype;

Parameters

Table 108–12 GETACLDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required.</td>
</tr>
</tbody>
</table>

Return Values

Returns the XMLType for ACL document.
GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```sql
DBMS_XDB.GETLOCKTOKEN(
    path         IN      VARCHAR2,
    locktoken    OUT     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource.</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user's lock token for the resource.</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.
**GETPRIVILEGES Function**

This function gets all privileges granted to the current user on the given resource.

**Syntax**

```sql
DBMS_XDB.GETPRIVILEGES(
    res_path    IN     VARCHAR2)
RETURN sys.xmltype;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns an XMLType instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.
GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```sql
DBMS_XDB.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource.</td>
</tr>
</tbody>
</table>

Return Values

Returns NULL if the resource is not present.
GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```
LINK Procedure

This procedure creates a link to an existing resource.

Syntax

```sql
DBMS_XDB.LINK(
    srcpath    IN  VARCHAR2,
    linkfolder IN  VARCHAR2,
    linkname   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is made</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed.</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link.</td>
</tr>
</tbody>
</table>

LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
    path IN VARCHAR2,
    depthzero IN BOOLEAN,
    shared IN boolean)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>NOT SUPPORTED. Only given resource is locked. In future releases, passing FALSE will obtain an infinite-depth lock.</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE will obtain a shared write lock.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.
MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```sql
DBMS_XDB.MOVEXDB_TABLESPACE(
    new_tablespace IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>Name of the tablespace where the XDB will be moved.</td>
</tr>
</tbody>
</table>

Usage Notes

This operation waits for all concurrent XDB sessions to exit.
REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

DBMS_XDB.REBUILDHIERARCHICALINDEX;
RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```plsql
DBMS_XDB.RENAMERESOURCE(
    srcpath IN VARCHAR2,
    destfolder IN VARCHAR2,
    newname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Absolute path in the Hierarchy for the source resource destination folder.</td>
</tr>
<tr>
<td>destfolder</td>
<td>Absolute path in the Hierarchy for the destination folder.</td>
</tr>
<tr>
<td>newname</td>
<td>Name of the child in the destination folder.</td>
</tr>
</tbody>
</table>
**SETACL Procedure**

Sets the ACL on the given resource to be the ACL specified by path.

**Syntax**

```sql
DBMS_XDB.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource.</td>
</tr>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The user must have `<write-acl>` privileges on the resource.
UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```sql
DBMS_XDB.UNLOCKRESOURCE(
    path     IN  VARCHAR2,
    deltoken IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource.</td>
</tr>
<tr>
<td>deltoken</td>
<td>Lock token to be removed.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if operation successful.

Usage Notes

The user must have **UPDATE** privileges on the resource.
Oracle XML DB versioning APIs are found in the DBMS_XDB_VERSION package. Functions and procedures of DBMS_XDB_VERSION help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- **Summary of DBMS_XDB_VERSION Subprograms**

**See Also:** *Oracle XML DB Developer’s Guide*
### Summary of DBMS_XDB_VERSION Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKIN Function on page 109-3</td>
<td>Checks in a checked-out VCR and returns the resource id of the newly-created version</td>
</tr>
<tr>
<td>CHECKOUT Procedure on page 109-4</td>
<td>Checks out a VCR before updating or deleting it</td>
</tr>
<tr>
<td>GETCONTENTSBLOBBYRES ID Function on page 109-5</td>
<td>Obtain contents as a BLOB</td>
</tr>
<tr>
<td>GETCONTENTSCLOBBYRES ID Function on page 109-6</td>
<td>Obtain contents as a CLOB</td>
</tr>
<tr>
<td>GETCONTENTSXMLBYRESID Function on page 109-7</td>
<td>Obtain contents as an XMLType</td>
</tr>
<tr>
<td>GETPREDECESSORS Function on page 109-8</td>
<td>Retrieves the list of predecessors by path name</td>
</tr>
<tr>
<td>GETPREDSBYRESID Function on page 109-9</td>
<td>Retrieves the list of predecessors by resource id</td>
</tr>
<tr>
<td>GETRESOURCEBYRESID Function on page 109-9</td>
<td>Obtains the resource as an XMLType, given the resource object ID</td>
</tr>
<tr>
<td>GETSUCCS Function on page 109-9</td>
<td>Retrieves the list of successors by path name</td>
</tr>
<tr>
<td>GETSUCCSBYRESID Function on page 109-12</td>
<td>Retrieves the list of successors by resource id</td>
</tr>
<tr>
<td>MAKEVERSIONED Function on page 109-13</td>
<td>Turns a regular resource whose path name is given into a version-controlled resource</td>
</tr>
<tr>
<td>UNCHECKOUT Function on page 109-14</td>
<td>Checks in a checked-out resource, returns the resource id of the version before the resource is checked out</td>
</tr>
</tbody>
</table>
CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```sql
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.
CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```sql
DBMS_XDB_VERSION.CHECKOUT(
    pathname   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the VCR to be checked out.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.
GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```sql
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTS_CLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```sql
DBMS_XDB_VERSION.GETCONTENTS_CLOBBYRESID(
    resid     DBMS_XDB.resid_type
) RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN XMLType;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Return Values

If the contents are not valid XML, returns NULL.
GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname     VARCHAR2)
RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Return Values

An exception is raised if PATHNAME is illegal.
GETPREDByRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```sql
DBMS_XDB_VERSION.GETPREDByRESID(
    resid resid_type
) RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting predecessors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the RESID is illegal.
GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system will not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```sql
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
    resid resid_type
) RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

DBMS_XDB_VERSION.GETSUCCESSORS(
    pathname VARCHAR2)
RETURN resid_list_type;

Parameters

Table 109–10  GETSUCCESSORS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.
GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```plsql
DBMS_XDB_VERSION.GETSUCCSBYRESID(
    resid resid_type
) RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.
**MAKEVERSIONED Function**

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

**Syntax**

```sql
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname   VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource to be put under version control.</td>
</tr>
</tbody>
</table>

**Return Values**

This function returns the resource ID of the first version, or root, of the VCR.

**Usage Notes**

If two or more path names are bound with the same resource, a copy of the resource will be created, and the given path name will be bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn’t exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.
UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```sql
DBMS_XDB_VERSION.UNCHECKOUT(
    pathname    VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. UNCHECKOUT Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn’t exist.
The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

See Also:
- Oracle Database Administrator’s Guide
- Oracle Database Upgrade Guide

This chapter contains the following topics:
- Using DBMS_TTS
  - Security Model
  - Exceptions
  - Operational Notes
- Summary of DBMS_TTS Subprograms
Using DBMS_TTS

- Security Model
- Exceptions
- Operational Notes

Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

Exceptions

```plaintext
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.
Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 110–1  DBMS_TTS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNGRADE Procedure on page 110-4</td>
<td>Downgrades transportable tablespace related data</td>
</tr>
<tr>
<td>TRANSPORT_SET_CHECK Procedure on page 110-5</td>
<td>Checks if a set of tablespaces (to be transported) is self-contained</td>
</tr>
</tbody>
</table>
**DOWNGRADE Procedure**

This procedure downgrades transportable tablespace related data.

**Syntax**

```
DBMS_TTS.DOWNGRADE;
```
TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

DBMS_TTS.TRANSPORT_SET_CHECK (  
   ts_list IN VARCHAR2,  
   incl_constraints IN BOOLEAN DEFAULT FALSE,  
   full_check IN BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ts_list</td>
<td>List of tablespace, separated by comma.</td>
</tr>
<tr>
<td>incl_constraints</td>
<td>TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)</td>
</tr>
<tr>
<td>full_check</td>
<td>Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.</td>
</tr>
</tbody>
</table>

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index.

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: Oracle XML DB Developer’s Guide

This chapter contains the following topics:

- Using DBMS_XDBT
  - Overview
  - Operational Notes
- Summary of DBMS_XDBT Subprograms
Using DBMS_XDBT

- Overview
- Operational Notes

Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Drop any existing index preferences using the DROPREFERENCES Procedure procedure.
- Create new index preferences using the CREATEPREFERENCES Procedure procedure.
- Create the CONTEXT index using the CREATEINDEX Procedure procedure.
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedure procedure.

Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.
### Table 111–1  General Indexing Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IndexName</td>
<td>XDB$CI</td>
<td>The name of the CONTEXT index.</td>
</tr>
<tr>
<td>IndexSpace</td>
<td>XDB$RESINFO</td>
<td>Tablespace used by tables and indexes comprising the CONTEXT index.</td>
</tr>
<tr>
<td>IndexMemory</td>
<td>128M</td>
<td>Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).</td>
</tr>
<tr>
<td>LogFile</td>
<td>'XdbCtxLog'</td>
<td>The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.</td>
</tr>
</tbody>
</table>

### Table 111–2  Filtering Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SkipFilter</td>
<td>image/%, audio/%, video/%, model/%</td>
<td>List of mime types that should not be indexed.</td>
</tr>
<tr>
<td>NullFilter</td>
<td>text/plain, text/html, text/xml</td>
<td>List of mime types that do not need to use the INSO filter. Use this for text-based documents.</td>
</tr>
<tr>
<td>FilterPref</td>
<td>XDB$CI_FILTER</td>
<td>Name of the filter preference.</td>
</tr>
</tbody>
</table>

### Table 111–3  Stoplist Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StoplistPref</td>
<td>XDB$CI_STOPLIST</td>
<td>Name of the stoplist.</td>
</tr>
<tr>
<td>StopWords</td>
<td>0..9; 'a'..'z'; 'A'..'Z'</td>
<td>List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.</td>
</tr>
</tbody>
</table>

### Table 111–4  Sectioning and Section Group Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SectionGroup</td>
<td>HTML_SECTION_GROUP</td>
<td>Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.</td>
</tr>
<tr>
<td>SectionGroupPrefix</td>
<td>XDB$CI_SECTIONGROUP</td>
<td>Name of the section group.</td>
</tr>
</tbody>
</table>
### Table 111–5 Other Index Preference Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatastorePref</td>
<td>XDB$CI_DATASTORE</td>
<td>The name of the datastore preference.</td>
</tr>
<tr>
<td>StoragePref</td>
<td>XDB$CI_STORAGE</td>
<td>The name of the storage preference.</td>
</tr>
<tr>
<td>WordlistPref</td>
<td>XDB$CI_WORDLIST</td>
<td>The name of the wordlist preference.</td>
</tr>
<tr>
<td>Default LexerPref</td>
<td>XDB$CI_DEFAULT_LEXER</td>
<td>The name of the default lexer preference.</td>
</tr>
</tbody>
</table>

### Table 111–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoSyncPolicy</td>
<td>SYNC_BY_PENDING_COUNT</td>
<td>Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>MaxPendingCount</td>
<td>2</td>
<td>Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>CheckPendingCount</td>
<td>10 minutes</td>
<td>How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>SyncInterval</td>
<td>60 minutes</td>
<td>Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_XDBT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGUREAUTOSYNC Procedure</td>
<td>Configures the CONTEXT index for automatic maintenance, SYNC</td>
</tr>
<tr>
<td>CREATEDATASTOREPREF Procedure</td>
<td>Creates a USER datastore preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEFILTERPREF Procedure</td>
<td>Creates a filter preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEINDEX Procedure</td>
<td>Creates the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATELEXERPREF Procedure</td>
<td>Creates a lexer preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEPREFERENCES Procedure</td>
<td>Creates preferences required for the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATESECTIONGROUPPREF Procedure</td>
<td>Creates a storage preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTOPLISTPREF Procedure</td>
<td>Creates a section group for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTORAGEPREF Procedure</td>
<td>Creates a wordlist preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEWORLDLISTPREF Procedure</td>
<td>Creates a stoplist for the CONTEXT index</td>
</tr>
<tr>
<td>DROPREFERENCES Procedure</td>
<td>Drops any existing preferences</td>
</tr>
</tbody>
</table>
CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views.
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

<table>
<thead>
<tr>
<th>Sync Basis</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYNC_BY_PENDING_COUNT</td>
<td>The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting on page 111-4). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 111-4) to determine if the number of documents exceeds the threshold.</td>
</tr>
<tr>
<td>SYNC_BY_TIME</td>
<td>The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 111-4).</td>
</tr>
<tr>
<td>SYNC_BY_PENDING_COUNT_AND_TIME</td>
<td>A combination of both of the preceding options.</td>
</tr>
</tbody>
</table>
CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEDATASTOREPREF;

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
- The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
- All other documents use the INSO filter through the IFILTER API.
CREATEFILTERPREF Procedure

This procedure creates a NULL filter preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEFILTERPREF;

Usage Notes

- The name of the filter preference can be modified; see FilterPref configuration setting.
- The USER datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedure for more details.
CREATEINDEX Procedure

This procedure creates the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the IndexName configuration setting.
- Set the LogFile configuration parameter to enable ROWID logging during index creation.
- Set the IndexMemory configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.
CREATELEXERPREF Procedure

This procedure creates a BASIC lexer preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the lexer preference can be modified; see LexerPref configuration setting. No other configuration settings are provided.
- MultiLexer preferences are not supported.
- Base letter translation is turned on by default.
CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

DBMS_XDBT.CREATEPREFERENCES;
CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATESECTIONGROUPPREF;

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.
**CREATESTOPLISTPREF Procedure**

This procedure creates a stoplist for the CONTEXT index on the XML DB hierarchy.

**Syntax**

DBMS_XDBT.CREATESTOPLISTPREF;

**Usage Notes**

- The name of the stoplist can be modified; see the StoplistPref configuration setting.
- Numbers are not indexed.
- The StopWords array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in CTXSYS.DEFAULT_STOPLIST.
CREATESTORAGEPREF Procedure

This procedure creates a BASIC_STORAGE preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATESTORAGEPREF;

Usage Notes

- The name of the storage preference can be modified; see the StoragePref configuration setting.
- A tablespace can be specified for the tables and indexes comprising the CONTEXT index; see the IndexTablespace configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The I_INDEX_CLAUSE uses key compression.
CREATEWORLDLISTPREF Procedure

This procedure creates a wordlist preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORLDLISTPREF;
```

Usage Notes

- The name of the wordlist preference can be modified; see the WordlistPref configuration setting. No other configuration settings are provided.
- FUZZY_MATCH and STEMMER attributes are set to AUTO (auto-language detection)
This procedure drops any previously created preferences for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```
The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topic:

- Summary of DBMS_XDBZ Subprograms

See Also: Oracle XML DB Developer’s Guide
Summary of DBMS_XDBZ Subprograms

Table 112–1  DBMS_XDBZ Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_HIERARCHY Procedure on page 112-3</td>
<td>Disables repository support for the specified XMLType table or view</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY Procedure on page 112-4</td>
<td>Enables repository support for the specified XMLType table or view</td>
</tr>
<tr>
<td>GET_ACLOID Function on page 112-5</td>
<td>Retrieves the ACL Object ID for the specified resource</td>
</tr>
<tr>
<td>GET_USERID Function on page 112-6</td>
<td>Retrieves the user ID for the specified user</td>
</tr>
<tr>
<td>IS_HIERARCHY_ENABLED Function on page 112-7</td>
<td>Determines if repository support for the specified XMLType table or view is enabled</td>
</tr>
<tr>
<td>PURGELDAPCACHE Function on page 112-8</td>
<td>Purges the LDAP nickname cache</td>
</tr>
</tbody>
</table>
DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```sql
DBMS_XDBZ.DISABLE_HIERARCHY(
    object_schema IN VARCHAR2,
    object_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view.</td>
</tr>
</tbody>
</table>
**ENABLE_HIERARCHY Procedure**

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

**Syntax**

```sql
DBMS_XDBZ.ENABLE_HIERARCHY(
    object_schema   IN   VARCHAR2,
    object_name     IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view.</td>
</tr>
</tbody>
</table>
GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```sql
DBMS_XDBZ.GET_ACLOID(
    aclpath   IN   VARCHAR2,
    acloid    OUT  RAW)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aclpath</td>
<td>ACL resource path for the repository.</td>
</tr>
<tr>
<td>acloid</td>
<td>The returned Object ID.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.
GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

Syntax

```sql
DBMS_XDBZ.GET_USERID(
    username IN VARCHAR2,
    userid   OUT RAW,
    format   IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the database or LDAP user.</td>
</tr>
<tr>
<td>userid</td>
<td>Return parameter for the matching user id.</td>
</tr>
<tr>
<td>format</td>
<td>Format of the specified user name; valid options are:</td>
</tr>
<tr>
<td></td>
<td>DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</td>
</tr>
<tr>
<td></td>
<td>DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.</td>
</tr>
</tbody>
</table>

Return Values

Returns `TRUE` if successful.
IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
    object_schema IN VARCHAR2,
    object_name   IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if enabled.
PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns TRUE if successful.

**Syntax**

```sql
DBMS_XDBZ.PURGELDAPCACHE
RETURN BOOLEAN;
```
The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

See Also: Oracle XML Developer’s Kit Programmer’s Guide

This chapter contains the following topics:

- Using DBMS_XMLDOM
  - Overview
  - Constants
  - Types
  - Exceptions
- Subprogram Groups
- Summary of DBMS_XMLDOM Subprograms
Using DBMS_XMLDOM

Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the DBMS_XMLDOM package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the initialization.ORA file must be specified; for example: UTL_FILE_DIR=/mypath/insidemypath.
- Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:
Various DOM interfaces such as Node, Element, and others have equivalent PL/SQL types DOMNode, DOMElement, respectively.

Various DOMException codes such as WRONG_DOCUMENT_ERR, HIERARCHY_REQUEST_ERR, and others, have similarly named PL/SQL exceptions.

Various DOM Node type codes such as ELEMENT_NODE, ATTRIBUTE_NODE, and others, have similarly named PL/SQL constants.

Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a DOMNode n, the APPENDCHILD Function PL/SQL function on page 113-42 is provided.

To perform setAttribute on a DOMElement elem, use SETATTRIBUTE Procedures PL/SQL procedure on page 113-139.

DOM defines an inheritance hierarchy. For example, Document, Element, and Attr are defined to be subtypes of Node (see Figure 113–1). Thus, a method defined in the Node interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the MAKENODE function. Calling MAKENODE on various DOM types converts these types into a DOMNode. The appropriate functions or procedures that accept DOMNodes can then be called to operate on these types. If, subsequently, type specific functionality is desired, the DOMNode can be converted back into the original type by the makeXXX functions, where DOMXXX is the desired DOM type.

**Figure 113–1  Inheritance Diagram for DOM Types**
The implementation of this interface follows the REC-DOM-Level-1-19981001.

Constants

Defined constants of DBMS_XMLDOM are listed in Table 113–1.

Table 113–1 Defined Constants for DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTRIBUTE_NODE</td>
<td>The Node is an Attribute.</td>
</tr>
<tr>
<td>CDATA_SECTION_NODE</td>
<td>The Node is a CDataSection.</td>
</tr>
<tr>
<td>COMMENT_NODE</td>
<td>The Node is a Comment.</td>
</tr>
<tr>
<td>DOCUMENT_FRAGMENT_NODE</td>
<td>The Node is a Document fragment.</td>
</tr>
<tr>
<td>DOCUMENT_NODE</td>
<td>The Node is a Document.</td>
</tr>
<tr>
<td>DOCUMENT_TYPE_NODE</td>
<td>The Node is a Document Type Definition.</td>
</tr>
<tr>
<td>ELEMENT_NODE</td>
<td>The Node is an Element.</td>
</tr>
<tr>
<td>ENTITY_NODE</td>
<td>The Node is an Entity.</td>
</tr>
<tr>
<td>ENTITY_REFERENCE_NODE</td>
<td>The Node is an Entity Reference.</td>
</tr>
<tr>
<td>NOTATION_NODE</td>
<td>The Node is a Notation.</td>
</tr>
<tr>
<td>PROCESSING_INSTRUCTION_NODE</td>
<td>The Node is a Processing Instruction.</td>
</tr>
<tr>
<td>TEXT_NODE</td>
<td>The Node is a Text node.</td>
</tr>
</tbody>
</table>

Types

The following types for DBMS_XMLDOM.DOMTYPE are defined in Table 113–2:

Table 113–2 XDB_XMLDOM Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMATTR</td>
<td>Implements the DOM Attribute interface.</td>
</tr>
<tr>
<td>DOMCDATASECTION</td>
<td>Implements the DOM CDataSection interface.</td>
</tr>
<tr>
<td>DOMCHARACTERDATA</td>
<td>Implements the DOM Character Data interface.</td>
</tr>
<tr>
<td>DOMCOMMENT</td>
<td>Implements the DOM Comment interface.</td>
</tr>
</tbody>
</table>
**Exceptions**

The exceptions listed in Table 113–3 are defined for DBMS_XMLDOM:

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMSTRING_SIZE_ERR</td>
<td>If the specified range of text does not fit into a DOMString.</td>
</tr>
<tr>
<td>HIERARCHY_REQUEST_ERR</td>
<td>If any node is inserted somewhere it doesn’t belong.</td>
</tr>
<tr>
<td>INDEX_SIZE_ERR</td>
<td>If index or size is negative, or greater than the allowed value.</td>
</tr>
<tr>
<td>INUSE_ATTRIBUTE_ERR</td>
<td>If an attempt is made to add an attribute that is already in use elsewhere.</td>
</tr>
</tbody>
</table>

---

**Table 113–2 (Cont.) XDB_XMLDOM Types**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMDOCUMENT</td>
<td>Implements the DOM Document interface.</td>
</tr>
<tr>
<td>DOMDOCUMENT_FRAGMENT</td>
<td>Implements the DOM DocumentFragment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTTYPE</td>
<td>Implements the DOM Document Type interface.</td>
</tr>
<tr>
<td>DOMELEMENT</td>
<td>Implements the DOM Element interface.</td>
</tr>
<tr>
<td>DOMENTITY</td>
<td>Implements the DOM Entity interface.</td>
</tr>
<tr>
<td>DOMENTITYREFERENCE</td>
<td>Implements the DOM EntityReference interface.</td>
</tr>
<tr>
<td>DOMIMPLEMENTATION</td>
<td>Implements the DOM Implementation interface.</td>
</tr>
<tr>
<td>DOMNAMEDNODEMAP</td>
<td>Implements the DOM Named Node Map interface.</td>
</tr>
<tr>
<td>DOMNode</td>
<td>Implements the DOM Node interface.</td>
</tr>
<tr>
<td>DOMNodeLIST</td>
<td>Implements the DOM NodeList interface.</td>
</tr>
<tr>
<td>DOMNOTATION</td>
<td>Implements the DOM Notation interface.</td>
</tr>
<tr>
<td>DOMPROCESSINGINSTRUCTION</td>
<td>Implements the DOM Processing instruction interface.</td>
</tr>
<tr>
<td>DOMTEXT</td>
<td>Implements the DOM Text interface.</td>
</tr>
</tbody>
</table>
### Table 113–3 (Cont.) Exceptions for DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_CHARACTER_ERR</td>
<td>If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.</td>
</tr>
<tr>
<td>NO_DATA_ALLOWED_ERROR</td>
<td>If data is specified for a node that does not support data.</td>
</tr>
<tr>
<td>NO_FOUND_ERR</td>
<td>If an attempt is made to reference a node in a context where it does not exist.</td>
</tr>
<tr>
<td>NO_MODIFICATION_ALLOWED_ERR</td>
<td>If an attempt is made to modify an object where modifications are not allowed.</td>
</tr>
<tr>
<td>NOT_SUPPORTED_ERR</td>
<td>If the implementation does not support the requested type of object or operation.</td>
</tr>
<tr>
<td>WRONG_DOCUMENT_ERR</td>
<td>If a node is used in a different document than the one that created it (that doesn't support it).</td>
</tr>
</tbody>
</table>
Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms on page 113-8
- DOMAttr Subprograms on page 113-11
- DOMCDataSection Subprograms on page 113-12
- DOMCharacterData Subprograms on page 113-13
- DOMComment Subprograms on page 113-14
- DOMDocument Subprograms on page 113-15
- DOMDocumentFragment Subprograms on page 113-17
- DOMDocumentType Subprograms on page 113-18
- DOMElemnt Subprograms on page 113-19
- DOMEntity Subprograms on page 113-20
- DOMEntityReference Subprograms on page 113-21
- DOMImplementation Subprograms on page 113-22
- DOMNamedNodeMap Subprograms on page 113-23
- DOMNodeList Subprograms on page 113-24
- DOMNotation Subprograms on page 113-25
- DOMProcessingInstruction Subprograms on page 113-26
- DOMText Subprograms on page 113-27
### DOMNode Subprograms

**Table 113–4**  Summary of DOMNode Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADOPTNODE Procedure</strong> on page 113-41</td>
<td>Adopts a node from another document.</td>
</tr>
<tr>
<td><strong>APPENDCHILD Function</strong> on page 113-42</td>
<td>Appends a new child to the node.</td>
</tr>
<tr>
<td><strong>CLONENODE Function</strong> on page 113-44</td>
<td>Clones the node.</td>
</tr>
<tr>
<td><strong>FREEENODE Procedure</strong> on page 113-60</td>
<td>Frees all resources associated with the node.</td>
</tr>
<tr>
<td><strong>GETATTRIBUTES Function</strong> on page 113-62</td>
<td>Retrieves the attributes of the node.</td>
</tr>
<tr>
<td><strong>GETCHILDNODES Function</strong> on page 113-64</td>
<td>Retrieves the children of the node.</td>
</tr>
<tr>
<td><strong>GETEXPANDEDNAME Procedure and Functions</strong> on page 113-71</td>
<td>Retrieves the expanded name of the node.</td>
</tr>
<tr>
<td><strong>GETFIRSTCHILD Function</strong> on page 113-72</td>
<td>Retrieves the first child of the node.</td>
</tr>
<tr>
<td><strong>GETLASTCHILD Function</strong> on page 113-74</td>
<td>Retrieves the last child of the node.</td>
</tr>
<tr>
<td><strong>GETLOCALNAME Procedure and Functions</strong> on page 113-76</td>
<td>Retrieves the local part of the qualified name.</td>
</tr>
<tr>
<td><strong>GETNAMESPACE Procedure and Functions</strong> on page 113-79</td>
<td>Retrieves the node's namespace URI.</td>
</tr>
<tr>
<td><strong>GETNEXTSIBLING Function</strong> on page 113-80</td>
<td>Retrieves the next sibling of the node.</td>
</tr>
<tr>
<td><strong>GETNODENAME Function</strong> on page 113-81</td>
<td>Retrieves the Name of the Node.</td>
</tr>
<tr>
<td><strong>GETNODETYPE Function</strong> on page 113-82</td>
<td>Retrieves the Type of the node.</td>
</tr>
<tr>
<td><strong>GETNODEVALUE Function</strong> on page 113-83</td>
<td>Retrieves the Value of the Node.</td>
</tr>
<tr>
<td><strong>GETOWNERDOCUMENT Function</strong> on page 113-87</td>
<td>Retrieves the owner document of the node.</td>
</tr>
<tr>
<td><strong>GETPARENTNODE Function</strong> on page 113-89</td>
<td>Retrieves the parent of this node.</td>
</tr>
<tr>
<td><strong>GETPREFIX Function</strong> on page 113-90</td>
<td>Retrieves the namespace prefix.</td>
</tr>
<tr>
<td><strong>GETPREVIOUSSIBLING Function</strong> on page 113-91</td>
<td>Retrieves the previous sibling of the node.</td>
</tr>
</tbody>
</table>
### Table 113–4  (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETSCHEMANODE Function on page 113-94</td>
<td>Retrieves the associated schema URI.</td>
</tr>
<tr>
<td>HASATTRIBUTES Function on page 113-103</td>
<td>Tests if the node has attributes.</td>
</tr>
<tr>
<td>HASCHILDNODES Function on page 113-104</td>
<td>Tests if the node has child nodes.</td>
</tr>
<tr>
<td>IMPORTNODE Function on page 113-106</td>
<td>Imports a node from another document.</td>
</tr>
<tr>
<td>INSERTBEFORE Function on page 113-107</td>
<td>Inserts a child before the reference child.</td>
</tr>
<tr>
<td>ISNULL Functions on page 113-109</td>
<td>Tests if the node is NULL</td>
</tr>
<tr>
<td>MAKEATTR Function on page 113-114</td>
<td>Casts the node to an Attribute.</td>
</tr>
<tr>
<td>MAKECDATASECTION Function on page 113-115</td>
<td>Casts the node to a CData Section.</td>

<tr>
<td>MAKECHARACTERDATA Function on page 113-116</td>
<td>Casts the node to Character Data.</td>
</tr>
<tr>
<td>MAKECOMMENT Function on page 113-117</td>
<td>Casts the node to a Comment.</td>
</tr>
<tr>
<td>MAKEDOCUMENT Function on page 113-118</td>
<td>Casts the node to a DOM Document.</td>
</tr>
<tr>
<td>MAKEDOCUMENTFRAGMENT Function on page 113-119</td>
<td>Casts the node to a DOM Document Fragment.</td>
</tr>
<tr>
<td>MAKEDOCUMENTTYPE Function on page 113-120</td>
<td>Casts the node to a DOM Document Type.</td>
</tr>
<tr>
<td>MAKEELEMENT Function on page 113-121</td>
<td>Casts the node to a DOM Element.</td>
</tr>
<tr>
<td>MAKEENTITY Function on page 113-122</td>
<td>Casts the node to a DOM Entity.</td>
</tr>
<tr>
<td>MAKEENTITYREFERENCE Function on page 113-123</td>
<td>Casts the node to a DOM Entity Reference.</td>
</tr>
<tr>
<td>MAKENOTATION Function on page 113-127</td>
<td>Casts the node to a DOM Notation.</td>
</tr>
<tr>
<td>MAKEPROCESSINGINSTRUCTION Function on page 113-128</td>
<td>Casts the node to a DOM Processing Instruction.</td>
</tr>
<tr>
<td>MAKETEXT Function on page 113-129</td>
<td>Casts the node to a DOM Text.</td>
</tr>
</tbody>
</table>

<td><strong>WRITETOFILE Procedures</strong> on page 113-152</td>
<td>Writes the contents of the node to a file (see DOMNode Subprograms on page 113-8)</td>
</tr>
</tbody>
</table>
ADOPTNODE Procedure

This procedure adopts a node from another document; returns this new node.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc            IN   DOMDocument,
   importedNode   IN   DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Table 113–22</th>
<th>ADOPTNODE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>doc</td>
<td>Document that is adopting the node.</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to adopt.</td>
</tr>
</tbody>
</table>

APPENDCHILD Function

This function adds the node NEWCHILD to the end of the list of children of this node, and returns the newly added node. If the NEWCHILD is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.APPENDCHILD(
  n          IN    DOMNode,
  newChild   IN    DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>newChild</td>
<td>The child to be appended to the list of children of node n.</td>
</tr>
</tbody>
</table>
APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

**See Also:** DOMCharacterData Subprograms on page 113-13

Syntax

```sql
DBMS_XMLDOM.APPENDDATA(
    cd IN DOMCharacterData,
    arg IN VARCHAR2);
```

Parameters

### Table 113–24  APPENDDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData</td>
</tr>
<tr>
<td>arg</td>
<td>The data to append to the existing data.</td>
</tr>
</tbody>
</table>
CLONENODE Function

This function returns a duplicate of this node; serves as a generic copy constructor for nodes. The duplicate node has no parent; its parent node is NULL.

Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node. Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE). Cloning any other type of node simply returns a copy of this node.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.CLONENODE(
    n       IN    DOMNode,
    deep    IN    BOOLEAN)
RETURN DOMNode;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>deep</td>
<td>Determines if children are to be cloned.</td>
</tr>
</tbody>
</table>
CREATEATTRIBUTE Functions

This function creates a DOMAttr node.

**See Also:** DOMDocument Subprograms on page 113-15

**Syntax**

Creates a DOMAttr with the specified name:

```sql
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc IN DOMDocument,
    name IN VARCHAR2)
RETURN DOMAttr;
```

Creates a DOMAttr with the specified name and namespace URI:

```sql
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc IN DOMDocument,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMAttr;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>name</td>
<td>New attribute name.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
CREATECDATASECTION Function

This function creates a DOMCDATASection node.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```sql
DBMS_XMLDOM.CREATECDATASECTION(
    doc IN DOMDocument,
    data IN VARCHAR2)
RETURN DOMCDATASection;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMCDATASection node.</td>
</tr>
</tbody>
</table>
CREATECOMMENT Function

This function creates a DOMComment node.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
    doc  IN  DOMDocument,
    data IN  VARCHAR2)
RETURN DOMComment;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMComment node.</td>
</tr>
</tbody>
</table>
CREATEDOCUMENT Function

This function creates a DOMDocument with specified namespace URI, root element name, DTD.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
    namespaceURI      IN     VARCHAR2,
    qualifiedName     IN     VARCHAR2,
    doctype           IN     DOMType:=NULL)
RETURN DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespaceURI</td>
<td>Namespace URI.</td>
</tr>
<tr>
<td>qualifiedName</td>
<td>Root element name.</td>
</tr>
<tr>
<td>doctype</td>
<td>Document type.</td>
</tr>
</tbody>
</table>
CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDocumentFragment.

See Also: DOMDocument Subprograms on page 113-15

Syntax

DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT{
    doc IN DOMDocument}
RETURN DOMDocumentFragment;

Parameters

Table 113–30  CREATEDOCUMENTFRAGMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
CREATEELEMENT Functions

Creates a DOMElement.

See Also:  DOMDocument Subprograms on page 113-15

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
    doc        IN      DOMDocument,
    tagName    IN      VARCHAR2)
RETURN DOMElement;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
    doc        IN     DOMDocument,
    tagName    IN     VARCHAR2, 
    ns         IN     VARCHAR2)
RETURN DOMElement;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>tagName</td>
<td>Tagname for new DOMElement.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
**CREATEENTITYREFERENCE Function**

This function creates a DOMEntityReference node.

**Syntax**

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
    doc        IN     DOMDocument,
    name       IN     VARCHAR2)
RETURN DOMEntityReference;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>name</td>
<td>New entity reference name.</td>
</tr>
</tbody>
</table>

**See Also:** [DOMDocument Subprograms on page 113-15](#)
CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMProcessingInstruction node.

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
    doc IN DOMDocument,
    target IN VARCHAR2,
    data IN VARCHAR2)
RETURN DOMProcessingInstruction;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
<tr>
<td>target</td>
<td>Target of the new processing instruction.</td>
</tr>
<tr>
<td>data</td>
<td>Content data of the new processing instruction.</td>
</tr>
</tbody>
</table>
CREATETEXTNODE Function

This function creates a DOMText node.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```sql
DBMS_XMLDOM.CREATETEXTNODE(
    doc IN DOMDocument,
    data IN VARCHAR2)
RETURN DOMText;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMText node.</td>
</tr>
</tbody>
</table>
DELETEDATA Procedure

DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 113-13

Syntax

```sql
DBMS_XMLDOM.DELETEDATA(
    cd        IN     DOMCharacterData,
    offset    IN     NUMBER,
    cnt       IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>offset</td>
<td>The offset from which to delete the data.</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (starting from offset) to delete.</td>
</tr>
</tbody>
</table>
FINDENTITY Function

This function finds an entity in the given DTD; returns that entity if found.

See Also: DOMDocumentType Subprograms on page 113-18

Syntax

```
DBMS_XMLDOM.FINDENTITY(
    dt IN DOMDocumentType,
    name IN VARCHAR2,
    par IN BOOLEAN)
RETURN DOMEntity;
```

Parameters

```
Table 113–36 FINDENTITY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>name</td>
<td>Entity to find.</td>
</tr>
<tr>
<td>par</td>
<td>Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity.</td>
</tr>
</tbody>
</table>
```
FINDNOTATION Function

This function finds the notation in the given DTD; returns it, if found.

**See Also:** [DOMDocumentType Subprograms](#) on page 113-18

**Syntax**

```
DBMS_XMLDOM.FINDNOTATION(
    dt IN DOMDocumentType,
    name IN VARCHAR2)
RETURN DOMNotation;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>name</td>
<td>The notation to find.</td>
</tr>
</tbody>
</table>
**FREEDOCFRAG Procedure**

This procedure frees the specified document fragment.

*See Also:* [DOMDocument Subprograms](#) on page 113-15

**Syntax**

```
DBMS_XMLDOM.FREEDOCFRAG(
    df   IN   DOMDocumentFragment);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>df</td>
<td>DOM document fragment.</td>
</tr>
</tbody>
</table>
FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also: DOMDocumentFragment Subprograms on page 113-17

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
  df    IN   DOMDocumentFragment);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>df</td>
<td>DOM document fragment.</td>
</tr>
</tbody>
</table>
FREEDOCUMENT Procedure

This procedure frees DOMDocument object.

See Also: DOMDocument Subprograms on page 113-15

Syntax

DBMS_XMLDOM.FREEDOCUMENT(
  doc IN DOMDocument);

Parameters

Table 113–40  FREEDOCUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
FREENODE Procedure

This procedure frees all resources associated with a Node.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.FREENODE(
    n    IN    DOMNode);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETATTRIBUTE Functions

Returns the value of a DOMElement’s attribute by name.

**See Also:** [DOMElement Subprograms](#) on page 113-19

**Syntax**

Returns the value of a DOMElement’s attribute by name:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
    elem       IN      DOMElement,
    name       IN      VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a DOMElement’s attribute by name and namespace URI:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
    elem       IN      DOMElement,
    name       IN      VARCHAR2,
    ns         IN      VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
GETATTRIBUTES Function

This function retrieves a NamedNodeMap containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.GETATTRIBUTES(
    n    IN    DOMNode)
RETURN DOMNamedNodeMap;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETATTRIBUTENODE Functions

Returns an attribute node from the DOMElement by name.

See Also: DOMElement Subprograms on page 113-19

Syntax

Returns an attribute node from the DOMElement by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem   IN     DOMElement,
   name   IN     VARCHAR2)
RETURN DOMAttr;
```

Returns an attribute node from the DOMElement by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem   IN     DOMElement,
   name   IN     VARCHAR2,
   ns     IN     VARCHAR2)
RETURN DOMAttr;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
GETCHILDNODES Function

This function retrieves a NodeList that contains all children of this node. If there are no children, this is a NodeList containing no nodes.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
    n    IN    DOMNode)
RETURN DOMNodeList;
```

Parameters

```
Table 113–45 GETCHILDNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
```
GETCHILDRENBYTAGNAME Functions

Returns the children of the DOMElement.

See Also:  DOMElement Subprograms on page 113-19

Syntax

Returns children of the DOMElement given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem  IN  DOMElement,
    name  IN  VARCHAR2)
RETURN DOMNodeList;
```

Returns children of the DOMElement given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem  IN  DOMElement,
    name  IN  VARCHAR2,
    ns    IN  VARCHAR2)
RETURN DOMNodeList;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Tag name.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
GETDATA Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 113-13):

```sql
DBMS_XMLDOM.GETDATA(
    cd IN DOMCharacterData)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms on page 113-26):

```sql
DBMS_XMLDOM.GETDATA(
    pi IN DOMProcessingInstruction)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>pi</td>
<td>The DOMProcessingInstruction.</td>
</tr>
</tbody>
</table>
GETDOCTYPE Function

This function returns the DTD associated to the DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
    doc    IN    DOMDocument)
RETURN domdocumenttype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

DBMS_XMLDOM.GETDOCUMENTELEMENT(
    doc IN DOMDocument)
RETURN DOMElement;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns a DOMNodeList of all the elements with a given tagname (See Also: DOMDocument Subprograms on page 113-15):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    doc IN DOMDocument,
    tagname IN VARCHAR2)
RETURN DOMNodeList;
```

Returns the element children of the DOMElement given the tag name (See Also: DOMElement Subprograms on page 113-19):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem IN DOMElement,
    name IN VARCHAR2)
RETURN DOMNodeList;
```

Returns the element children of the DOMElement given the tag name and namespace (See Also: DOMElement Subprograms on page 113-19):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem IN DOMElement,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMNodeList;
```

Parameters

Table 113–50 GETELEMENTSBYTAGNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>tagname</td>
<td>Name of the tag to match on.</td>
</tr>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Tag name; using a wildcard(*) would match any tag.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
GETENTITIES Function

This function retrieves a NamedNodeMap containing the general entities, both external and internal, declared in the DTD.

See Also: DOMDocumentType Subprograms on page 113-18

Syntax

```sql
DBMS_XMLDOM.GETENTITIES(
    dt IN DOMDocumentType)
RETURN DOMNamedNodeMap;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDocumentType</td>
</tr>
</tbody>
</table>
GETEXPANDEDNAME Procedure and Functions

GETEXPANDEDNAME is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the expanded name of the Node if is in an Element or Attribute type; otherwise, returns NULL (See Also: DOMNode Subprograms on page 113-8)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    n       IN      DOMNode
    data    OUT     VARCHAR);
```

Returns the expanded name of the DOMAttr (See Also: DOMAttr Subprograms on page 113-11):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the DOMElement (See Also: DOMElement Subprograms on page 113-19):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    elem    IN    DOMElement)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>data</td>
<td>Returned expanded name of the Node.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement.</td>
</tr>
</tbody>
</table>
GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

```plsql
DBMS_XMLDOM.GETFIRSTCHILD(
    n      IN      DOMNode)
RETURN DOMNode;
```

Parameters

Table 113–53 GETFIRSTCHILD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETIMPLEMENTATION Function

This function returns the DOMImplementation object that handles this DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```sql
DBMS_XMLDOM.GETIMPLEMENTATION(
    doc IN DOMDocument)
RETURN DOMImplementation;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
    n IN DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
</tbody>
</table>
GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 113-13):

```sql
DBMS_XMLDOM.GETLENGTH(
    cd    IN    DOMCharacterData)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNamedNodeMap Subprograms on page 113-23):

```sql
DBMS_XMLDOM.GETLENGTH(
    nmm    IN    DOMNamedNodeMap)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNodeList Subprograms on page 113-24):

```sql
DBMS_XMLDOM.GETLENGTH(
    nl    IN    DOMNodeList)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>nmm</td>
<td>DOMNamedNodeMap.</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNodeList.</td>
</tr>
</tbody>
</table>
GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 113-8):

```sql
DBMS_XMLDOM.GETLOCALNAME(
    n       IN     DOMNode,
    data    OUT    VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: DOMAttr Subprograms on page 113-11):

```sql
DBMS_XMLDOM.GETLOCALNAME(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Returns the local name of the DOMElement (See Also: DOMElement Subprograms on page 113-19)

```sql
DBMS_XMLDOM.GETLOCALNAME(
    elem   IN     DOMElement)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>data</td>
<td>Returned local name.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement.</td>
</tr>
</tbody>
</table>
**GETNAME Functions**

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

**Syntax**

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 113-11):

```sql
DBMS_XMLDOM.GETNAME(
    a       IN     DOMAttr
) RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: DOMDocumentType Subprograms on page 113-18):

```sql
DBMS_XMLDOM.GETNAME(
    dt       IN     DOMDocumentType
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDocumentType.</td>
</tr>
</tbody>
</table>
GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also: DOMNamedNodeMap Subprograms on page 113-23

Syntax

Retrieves a node specified by name:

DBMS_XMLDOM.GETNAMEDITEM(
   nmn DOMNamedNodeMap,
   name IN VARCHAR2)
RETURN DOMNode;

Retrieves a node specified by name and namespace URI:

DBMS_XMLDOM.GETNAMEDITEM(
   nmn DOMNamedNodeMap,
   name IN VARCHAR2,
   ns IN VARCHAR2)
RETURN DOMNode;

Parameters

Table 113–59 GETNAMEDITEM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nmn</td>
<td>DOMNamedNodeMap.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the item to be retrieved.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
GETNAMESPACE Procedure and Functions

GETNAMESPACE is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 113-8):

```
DBMS_XMLDOM.GETNAMESPACE(
    n       IN     DOMNode,
    data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMAttr (See Also: DOMAttr Subprograms on page 113-11):

```
DBMS_XMLDOM.GETNAMESPACE(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMElement (See Also: DOMElement Subprograms on page 113-19):

```
DBMS_XMLDOM.GETNAMESPACE(
    elem       IN     DOMElement)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>data</td>
<td>Returned namespace URI.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement.</td>
</tr>
</tbody>
</table>
GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.GETNEXTSIBLING(
    n       IN     DOMNode)
RETURN DOMNode;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETNODENAME(
    n       IN     DOMNode)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.GETNODETYPE(
    n       IN     DOMNode)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
    n    IN    DOMNode)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETNOTATIONNAME Function

This function returns the notation name of the DOMEntity.

See Also: DOMEntity Subprograms on page 113-20

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent    IN    DOMEntity)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
</tbody>
</table>
**GETNOTATIONS Function**

This function retrieves a NamedNodeMap containing the notations declared in the DTD.

**See Also:** [DOMDocumentType Subprograms](#) on page 113-18

**Syntax**

```sql
DBMS_XMLDOM.GETNOTATIONS(
    dt IN DOMDocumentType)
RETURN DOMNamedNodeMap;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDocumentType.</td>
</tr>
</tbody>
</table>
GETTARGET Function

This function returns the target of the DOMProcessingInstruction.

See Also: DOMProcessingInstruction Subprograms on page 113-26

Syntax

```plsql
DBMS_XMLDOM.GETTARGET(
    pi IN DOMProcessingInstruction)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pi</td>
<td>DOMProcessingInstruction.</td>
</tr>
</tbody>
</table>
GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n       IN     DOMNode)
RETURN DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 113-11

Syntax

DBMS_XMLDOM.GETOWNERELEMENT(
   a    IN    DOMAttr)
RETURN DOMElement;

Parameters

Table 113–69  GETOWNERELEMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Attribute.</td>
</tr>
</tbody>
</table>
GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except Attr, Document, DocumentFragment, Entity, and Notation may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.GETPARENTNODE(
   n       IN     DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETPREFIX(
    n IN DOMNode)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
GETPREVIOUS_SIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.GETPREVIOUS_SIBLING(
  n       IN     DOMNode)
RETURN DOMNode;

Parameters

Table 113–72 GETPREVIOUS_SIBLING Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
</tbody>
</table>
GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the public identifier of the given DTD (See Also: DOMDocumentType Subprograms on page 113-18):

```sql
DBMS_XMLDOM.GETPUBLICID(
    dt       IN     DOMDocumentType)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMEntity (See Also: DOMEntity Subprograms on page 113-20):

```sql
DBMS_XMLDOM.GETPUBLICID(
    ent     IN     DOMEntity)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNotation (See Also: DOMNotation Subprograms on page 113-25):

```sql
DBMS_XMLDOM.GETPUBLICID(
    n       IN     DOMNotation)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation</td>
</tr>
</tbody>
</table>
GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the qualified name of the DOMAttr (See Also: DOMAttr Subprograms on page 113-11):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Returns the qualified name of the DOMElement (See Also: DOMElement Subprograms on page 113-19):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    elem       IN     DOMElement)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Table 113–74 GETQUALIFIEDNAME Functions Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>elem</td>
</tr>
</tbody>
</table>
GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
    n       IN     DOMNode)
RETURN DOMNode;
```

Parameters

```
Table 113–75  GETSCHEMANODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
```
GETSPECIFIED Function

If this attribute was explicitly given a value in the original document, this is true; otherwise, it is false.

See Also: DOMAttr Subprograms on page 113-11

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
    a    IN    DOMAttr)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMAttr</td>
</tr>
</tbody>
</table>
GETSTANDALONE Function

This function returns the standalone property associated with the DOMDocument.

**See Also:** [DOMDocument Subprograms on page 113-15](#)

**Syntax**

```sql
DBMS_XMLDOM.GETSTANDALONE(
    doc IN DOMDocument
)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
</tbody>
</table>
GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the system id of the given DTD (See Also: DOMDocumentType Subprograms on page 113-18):

```sql
DBMS_XMLDOM.GETSYSTEMID(  
    dt     IN     DOMDocumentType)  
RETURN VARCHAR2;
```

Returns the system identifier of the DOMEntity (See Also: DOMEntity Subprograms on page 113-20):

```sql
DBMS_XMLDOM.GETSYSTEMID(  
    ent     IN     DOMEntity)  
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNotation (See Also: DOMNotation Subprograms on page 113-25):

```sql
DBMS_XMLDOM.GETSYSTEMID(  
    n     IN     DOMNotation)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation.</td>
</tr>
</tbody>
</table>
GETTAGNAME Function

This function returns the name of the DOMElement.

See Also: DOMElement Subprograms on page 113-19

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
  elem       IN     DOMElement)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
</tbody>
</table>
GETVALUE Function

This function retrieves the value of the attribute.

See Also: DOMAttr Subprograms on page 113-11

Syntax

```
DBMS_XMLDOM.GETVALUE(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMAttr</td>
</tr>
</tbody>
</table>
GETVERSION Function

This function returns the version of the DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

```plsql
DBMS_XMLDOM.GETVERSION(
    doc IN DOMDocument)
RETURN VARCHAR2;
```

Parameters

<p>| Table 113–81  GETVERSION Function Parameters |
|-------------|---------------------------------------------|</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
</tbody>
</table>

GETXMLTYPE Function

This function returns the XMLType associated with the DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

DBMS_XMLDOM.GETXMLTYPE(
    doc IN   DOMDocument)
RETURN SYS.XMLType;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
HASATTRIBUTE Functions

HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMElement, or has a default value.

See Also: DOMElement Subprograms on page 113-19

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMElement; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 113–83  HASATTRIBUTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
HASATTRIBUTES Function

This function returns whether this node has any attributes.

**See Also:** [DOMNode Subprograms](#) on page 113-8

**Syntax**

```sql
DBMS_XMLDOM.HASATTRIBUTES(
    n IN DOMNode)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.HASCHILDNODES(
   n   IN   DOMNode)
RETURN BOOLEAN;

Parameters

Table 113–85 HASCHILDNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
</tbody>
</table>
HASFEATURE Function

This function tests if the DOMImplementation implements a specific feature.

See Also: DOMImplementation Subprograms on page 113-22

Syntax

```sql
DBMS_XMLDOM.HASFEATURE(
    di       IN     OMImplementation,
    feature  IN     VARCHAR2,
    version  IN     VARCHAR2
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>di</td>
<td>DOMImplementation.</td>
</tr>
<tr>
<td>feature</td>
<td>The feature to check for.</td>
</tr>
<tr>
<td>version</td>
<td>The version of the DOM to check in.</td>
</tr>
</tbody>
</table>
IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
    doc            IN     DOMDocument,
    importedNode   IN     DOMNode,
    deep           IN     BOOLEAN)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document from which the node is imported.</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to import.</td>
</tr>
<tr>
<td>deep</td>
<td>Setting for recursive import.</td>
</tr>
<tr>
<td></td>
<td>- If this value is TRUE, the entire subtree of the node will be imported</td>
</tr>
<tr>
<td></td>
<td>with the node.</td>
</tr>
<tr>
<td></td>
<td>- If this value is FALSE, only the node itself will be imported.</td>
</tr>
</tbody>
</table>
**INSERTBEFORE Function**

This function inserts the node `NEWCHILD` before the existing child node `REFCHILD`. If `REFCHILD` is `NULL`, insert `NEWCHILD` at the end of the list of children.

If `NEWCHILD` is a `DocumentFragment` object, all of its children are inserted, in the same order, before `REFCHILD`. If the `NEWCHILD` is already in the tree, it is first removed.

See Also: [DOMNode Subprograms](page 113-8)

**Syntax**

```sql
DBMS_XMLDOM.INSERTBEFORE(
    n          IN     DOMNode,
    newChild   IN     DOMNode,
    refChild   IN     DOMNode)
RETURN DOMNode;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>newChild</td>
<td>The child to be inserted in the DOMNode.</td>
</tr>
<tr>
<td>refChild</td>
<td>The reference node before which the <code>NEWCHILD</code> is to be inserted.</td>
</tr>
</tbody>
</table>
INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 113-13

Syntax

```plsql
DBMS_XMLDOM.INSERTDATA(
    cd IN DOMCharacterData,
    offset IN NUMBER,
    arg IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to insert the data.</td>
</tr>
<tr>
<td>arg</td>
<td>The value to be inserted.</td>
</tr>
</tbody>
</table>
ISNULL Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Checks if the given DOMNode is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 113-8):

```
DBMS_XMLDOM.ISNULL(
  n      IN     DOMNode)
RETURN BOOLEAN;
```

Checks that the given DOMAttr is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 113-11):

```
DBMS_XMLDOM.ISNULL(
  a      IN     DOMAttr)
RETURN BOOLEAN;
```

Checks that the given DOMCDataSection is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms on page 113-12):

```
DBMS_XMLDOM.ISNULL(
  cds    IN     DOMCDataSection)
RETURN BOOLEAN;
```

Checks that the given DOMCharacterData is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 113-13):

```
DBMS_XMLDOM.ISNULL(
  cd      IN     DOMCharacterData)
RETURN BOOLEAN;
```

Checks that the given DOMComment is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 113-14):

```
DBMS_XMLDOM.ISNULL(
  com    IN     DOMComment)
RETURN BOOLEAN;
```

Checks that the given DOMDocument is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 113-15):

```
DBMS_XMLDOM.ISNULL(
  doc     IN     DOMDocument)
```
ISNULL Functions

RETURN BOOLEAN;

Checks that the given DOMDocumentFragment is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 113-17):

DBMS_XMLDOM.ISNULL(
       df IN DOMDocumentFragment)
RETURN BOOLEAN;

Checks that the given DOMDocumentType is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 113-18):

DBMS_XMLDOM.ISNULL(
       dt IN DOMDocumentType)
RETURN BOOLEAN;

Checks that the given DOMElement is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 113-19):

DBMS_XMLDOM.ISNULL(
       elem IN DOMElement)
RETURN BOOLEAN;

Checks that the given DOMEntity is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 113-20):

DBMS_XMLDOM.ISNULL(
       ent IN DOMEntity)
RETURN BOOLEAN;

Checks that the given DOMEntityReference is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 113-21):

DBMS_XMLDOM.ISNULL(
       eref IN DOMEntityReference)
RETURN BOOLEAN;

Checks that the DOMImplementation is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 113-22):

DBMS_XMLDOM.ISNULL(
       di IN DOMImplementation)
RETURN BOOLEAN;
Checks that the given DOMNamedNodeMap is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms on page 113-23):

```sql
DBMS_XMLDOM.ISNULL(
    nmm       IN     DOMNamedNodeMap)
RETURN BOOLEAN;
```

Checks that the given DOMNodeList is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms on page 113-24):

```sql
DBMS_XMLDOM.ISNULL(
    nl       IN     DOMNodeList)
RETURN BOOLEAN;
```

Checks that the given DOMNotation is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 113-25):

```sql
DBMS_XMLDOM.ISNULL(
    n       IN     DOMNotation)
RETURN BOOLEAN;
```

Checks that the given DOMProcessingInstruction is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms on page 113-26):

```sql
DBMS_XMLDOM.ISNULL(
    pi       IN     DOMProcessingInstruction)
RETURN BOOLEAN;
```

Checks that the given DOMText is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 113-27):

```sql
DBMS_XMLDOM.ISNULL(
    t       IN     DOMText)
RETURN BOOLEAN;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to check.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr to check.</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDataSection to check.</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCharacterData to check.</td>
</tr>
</tbody>
</table>
### Table 113–90  (Cont.) ISNULL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com</td>
<td>DOMComment to check.</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDocument to check.</td>
</tr>
<tr>
<td>df</td>
<td>DOMDocumentFragment to check.</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDocumentType to check.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement to check.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity to check.</td>
</tr>
<tr>
<td>eref</td>
<td>DOMEntityReference to check.</td>
</tr>
<tr>
<td>di</td>
<td>DOMImplementation to check.</td>
</tr>
<tr>
<td>nmm</td>
<td>DOMNameNodeMap to check.</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNodeList to check.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation to check.</td>
</tr>
<tr>
<td>pi</td>
<td>DOMProcessingInstruction to check.</td>
</tr>
<tr>
<td>t</td>
<td>DOMText to check.</td>
</tr>
</tbody>
</table>
ITEM Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the item in the map which corresponds to the INDEX parameter. If INDEX is greater than or equal to the number of nodes in this map, this returns NULL (See Also: DOMNamedNodeMap Subprograms on page 113-23):

```
DBMS_XMLDOM.ITEM(
    nnm    IN     DOMNamedNodeMap,  
    index IN     NUMBER) 
RETURN DOMNode;
```

Returns the item in the collection which corresponds to the INDEX parameter. If index is greater than or equal to the number of nodes in the list, this returns NULL (See Also: DOMNodeList Subprograms on page 113-24):

```
DBMS_XMLDOM.ITEM(
    nl     IN     DOMNodeList,  
    index IN     NUMBER) 
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNamedNodeMap.</td>
</tr>
<tr>
<td>index</td>
<td>The index in the node map at which the item is to be retrieved.</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNodeList</td>
</tr>
<tr>
<td>index</td>
<td>The index in the NodeList used to retrieve the item.</td>
</tr>
</tbody>
</table>
MAKEATTR Function

This function casts a given DOMNode to a DOMAttr, and returns the DOMAttr.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKEATTR(
   n IN DOMNode)
RETURN DOMAttr;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast</td>
</tr>
</tbody>
</table>
MAKECDATASECTION Function

This function casts a given DOMNode to a DOMCDataSection.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKECDATASECTION(
  n       IN     DOMNode)
RETURN DOMCDataSection;

Parameters

Table 113-93  MAKECDATASECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKECHARACTERDATA Function

This function casts a given DOMNode to a DOMCharacterData, and returns the DOMCharacterData.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKECHARACTERDATA(
    n    IN    DOMNode)
RETURN DOMCharacterData;

Parameters

Table 113–94  MAKECHARACTERDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKECOMMENT Function

This function casts a given DOMNode to a DOMComment, and returns the DOMComment.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKECOMMENT(
   n IN DOMNode)
RETURN DOMComment;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKEDOCUMENT Function

This function casts a given DOMNode to a DOMDocument, and returns the DOMDocument.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKEDOCUMENT(
    n       IN     DOMNode)
RETURN DOMDocument;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKEDOCUMENTFRAGMENT Function

This function casts a given DOMNode to a DOMDocumentFragment, and returns the DOMDocumentFragment.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
    n       IN     DOMNode)
RETURN DOMDocumentFragment;
```

Parameters

<table>
<thead>
<tr>
<th>Table 113–97</th>
<th>MAKEDOCUMENTFRAGMENT Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKEDOCUMENTTYPE Function

This function casts a given DOMNode to a DOMDocumentType and returns the DOMDocumentType.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n       IN     DOMNode)
RETURN DOMDocumentType;

Parameters

Table 113–98  MAKEDOCUMENTTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
**MAKEELEMENT Function**

This function casts a given DOMNode to a DOMElement, and returns the DOMElement.

**See Also:** [DOMNode Subprograms](#) on page 113-8

**Syntax**

```sql
DBMS_XMLDOM.MAKEELEMENT(
    n       IN     DOMNode)
RETURN DOMElement;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKEENTITY Function

This function casts a given DOMNode to a DOMEntity, and returns the DOMEntity.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.MAKEENTITY(
    n       IN     DOMNode)
RETURN DOMEntity;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKEENTITYREFERENCE Function

This function casts a given DOMNode to a DOMEntityReference, and returns the DOMEntityReference.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
    n       IN     DOMNode)
RETURN DOMEntityReference;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast.</td>
</tr>
</tbody>
</table>
MAKENODE Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Casts given DOMAttr to a DOMNode, and returns the DOMNode (See Also: DOMAttr Subprograms on page 113-11):

DBMS_XMLDOM.MAKENODE(
    a        IN     DOMAttr)
RETURN DOMNode;

Casts the DOMCDataSection to a DOMNode, and returns that DOMNode (See Also: DOMCDataSection Subprograms on page 113-12):

DBMS_XMLDOM.MAKENODE(
    cds      IN     DOMCDataSection)
RETURN DOMNode;

Casts the given DOMCharacterData as a DOMNode, and returns that DOMNode (See Also: DOMCharacterData Subprograms on page 113-13):

DBMS_XMLDOM.MAKENODE(
    cd       IN     DOMCharacterData)
RETURN DOMNode;

Casts the given DOMComment to a DOMNode, and returns that DOMNode (See Also: DOMComment Subprograms on page 113-14):

DBMS_XMLDOM.MAKENODE(
    com      IN     DOMComment)
RETURN DOMNode;

Casts the DOMDocument to a DOMNode, and returns that DOMNode (See Also: DOMDocument Subprograms on page 113-15):

DBMS_XMLDOM.MAKENODE(
    doc      IN     DOMDocument)
RETURN DOMNode;

Casts the given DOMDocumentFragment to a DOMNode, and returns that DOMNode (See Also: DOMDocumentFragment Subprograms on page 113-17):

DBMS_XMLDOM.MAKENODE(
    df       IN     DOMDocumentFragment)
Summary of DBMS_XMLDOM Subprograms

RETURN DOMNode;

**Casts the given DOMDocumentType to a DOMNode, and returns that DOMNode (See Also: DOMDocumentType Subprograms on page 113-18):**

```
DBMS_XMLDOM.MAKENODE(
    dt       IN     DOMDocumentType)
RETURN DOMNode;
```

**Casts the given DOMElement to a DOMNode, and returns that DOMNode (See Also: DOMElement Subprograms on page 113-19):**

```
DBMS_XMLDOM.MAKENODE(
    elem       IN     DOMElement)
RETURN DOMNode;
```

**Casts given DOMEntity to a DOMNode, and returns that DOMNode (See Also: DOMEntity Subprograms on page 113-20):**

```
DBMS_XMLDOM.MAKENODE(
    ent       IN     DOMEntity)
RETURN DOMNode;
```

**Casts the DOMEntityReference to a DOMNode, and returns that DOMNode (See Also: DOMEntityReference Subprograms on page 113-21):**

```
DBMS_XMLDOM.MAKENODE(
    eref       IN     DOMEntityReference)
RETURN DOMNode;
```

**Casts the DOMNotation to a DOMNode, and returns that DOMNode (See Also: DOMNotation Subprograms on page 113-25):**

```
DBMS_XMLDOM.MAKENODE(
    n       IN     DOMNotation)
RETURN DOMNode;
```

**Casts the DOMProcessingInstruction to a DOMNode, and returns the DOMNode (See Also: DOMProcessingInstruction Subprograms on page 113-26):**

```
DBMS_XMLDOM.MAKENODE(
    pi       IN     DOMProcessingInstruction)
RETURN DOMNode;
```
MAKENODE Functions

Casts the DOMText to a DOMNode, and returns that DOMNode (See Also: DOMText Subprograms on page 113-27):

DBMS_XMLDOM.MAKENODE(
    t IN DOMText)
RETURN DOMNode;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMAttr to cast.</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDataSection to cast.</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCharacterData to cast.</td>
</tr>
<tr>
<td>com</td>
<td>DOMComment to cast.</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDocument to cast.</td>
</tr>
<tr>
<td>df</td>
<td>DOMDocumentFragment to cast.</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDocumentType to cast.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement to cast.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity to cast.</td>
</tr>
<tr>
<td>eref</td>
<td>DOMEntityReference to cast.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation to cast.</td>
</tr>
<tr>
<td>pi</td>
<td>DOMProcessingInstruction to cast.</td>
</tr>
<tr>
<td>t</td>
<td>DOMText to cast.</td>
</tr>
</tbody>
</table>
MAKENOTATION Function

This function casts a given DOMNode to a DOMNotation, and returns the DOMNotation.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.MAKENOTATION(
       n IN DOMNode)
RETURN DOMNotation;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast</td>
</tr>
</tbody>
</table>
MAKEPROCESSINGINSTRUCTION Function

This function casts a given DOMNode to a DOMProcessingInstruction, and returns the DOMProcessingInstruction.

See Also:  DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
  n       IN     DOMNode)
RETURN DOMProcessingInstruction;

Parameters

Table 113–104  MAKEPROCESSINGINSTRUCTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast</td>
</tr>
</tbody>
</table>
MAKETEXT Function

This function casts a given DOMNode to a DOMText, and returns the DOMText.

**See Also:** DOMNode Subprograms on page 113-8

**Syntax**

```
DBMS_XMLDOM.MAKETEXT(
    n IN DOMNode)
RETURN DOMText;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to cast</td>
</tr>
</tbody>
</table>
NEWDOMDOCUMENT Functions

Returns a new DOMDocument instance.

See Also: DOMDocument Subprograms on page 113-15

Syntax

Returns a new DOMDocument instance:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDocument;
```

Returns a new DOMDocument instance created from the specified XMLType object:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc IN sys.XMLType)
RETURN DOMDocument;
```

Returns a new DOMDocument instance created from the specified CLOB:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl IN CLOB)
RETURN DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>XMLType source for the DOMDocument.</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB source for the DOMDocument.</td>
</tr>
</tbody>
</table>
NORMALIZE Procedure

This procedure normalizes the text children of the DOMElement.

**See Also:** DOMElement Subprograms on page 113-19

Syntax

```
DBMS_XMLDOM.NORMALIZE(
    elem    IN    DOMElement);
```

Parameters

**Table 113–107** NORMALIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
</tbody>
</table>
REMOVEATTRIBUTE Procedures

Removes an attribute from the DOMElement by name.

See Also: DOMElement Subprograms on page 113-19

Syntax

Removes the value of a DOMElement’s attribute by name:

```sql
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2);
```

Removes the value of a DOMElement’s attribute by name and namespace URI.

```sql
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2,
    ns IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
**REMOVEATTRIBUTENODE Function**

This function removes the specified attribute node from the DOMElement. The method returns the removed node.

**See Also:** [DOMElement Subprograms](#) on page 113-19

**Syntax**

```sql
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
    elem IN DOMElement,
    oldAttr IN DOMAttr)
RETURN DOMAttr;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>oldAttr</td>
<td>The old DOMAttr.</td>
</tr>
</tbody>
</table>
REMOVECHILD Function

This function removes the child node indicated by OLDCHILD from the list of children, and returns it.

See Also: DOMNode Subprograms on page 113-8

Syntax

DBMS_XMLDOM.REMOVECHILD(
  n          IN     DOMNode,
  oldChild   IN     DOMNode)
RETURN DOMNode;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>oldChild</td>
<td>The child of the node n to be removed.</td>
</tr>
</tbody>
</table>
REMOVENAMEITEM Function

This function removes from the map a node specified by name; returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 113-23

Syntax

Removes a node specified by name:

```sql
DBMS_XMLDOM.REMOVENAMEITEM(
    nmm IN DOMNamedNodeMap,
    name IN VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```sql
DBMS_XMLDOM.REMOVENAMEITEM(
    nmm IN DOMNamedNodeMap,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nmm</td>
<td>DOMNamedNodeMap</td>
</tr>
<tr>
<td>name</td>
<td>The name of the item to be removed from the map</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
REPLACECHILD Function

This function replaces the child node OLDCHILD with NEWCHILD in the list of children, and returns the OLDCHILD node. If NEWCHILD is a DocumentFragment object, OLDCHILD is replaced by all of the DocumentFragment children, which are inserted in the same order. If the NEWCHILD is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 113-8

Syntax

```sql
DBMS_XMLDOM.REPLACECHILD(
    n           IN     DOMNode,
    newChild    IN     DOMNode,
    oldChild    IN     DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>newChild</td>
<td>The new child which is to replace the old child.</td>
</tr>
<tr>
<td>oldChild</td>
<td>The child of the node n which is to be replaced.</td>
</tr>
</tbody>
</table>
REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and
length reflect the change.

See Also: DOMCharacterData Subprograms on page 113-13

Syntax

DBMS_XMLDOM.REPLACEDATA(
    cd        IN     DOMCharacterData,
    offset    IN     NUMBER,
    cnt       IN     NUMBER,
    arg       IN     VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to replace.</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters to replace.</td>
</tr>
<tr>
<td>arg</td>
<td>The value to replace with.</td>
</tr>
</tbody>
</table>
RESOLVENAMESPACEPREFIX Function

This function resolves the given namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 113-19

Syntax

```sql
DBMS_XMLEDOM.RESOLVENAMESPACEPREFIX(
   elem IN DOMElement,
   prefix IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>prefix</td>
<td>Namespace prefix.</td>
</tr>
</tbody>
</table>
SETATTRIBUTE Procedures

Sets the value of a DOMElement's attribute by name.

**See Also:** [DOMElement Subprograms](#) on page 113-19

Syntax

Sets the value of a DOMElement's attribute by name:

```sql
DBMS_XMLDOM.SETATTRIBUTE(
    elem DOMElement,
    name IN VARCHAR2,
    value IN VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```sql
DBMS_XMLDOM.SETATTRIBUTE(
    elem DOMElement,
    name IN VARCHAR2,
    value IN VARCHAR2,
    ns IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name.</td>
</tr>
<tr>
<td>value</td>
<td>Attribute value.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>
SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMElement.

See Also: DOMElement Subprograms on page 113-19

Syntax

Adds a new attribute node to the DOMElement:

DBMS_XMLDOM.SETATTRIBUTENODE(
   elem DOMElement,
   newAttr IN DOMAttr)
RETURN DOMAttr;

Adds a new attribute node to the DOMElement; namespace enabled:

DBMS_XMLDOM.SETATTRIBUTENODE(
   elem DOMElement,
   newAttr IN DOMAttr,
   ns IN VARCHAR2)
RETURN DOMAttr;

Parameters

Table 113–116 SETATTRIBUTENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement.</td>
</tr>
<tr>
<td>newAttr</td>
<td>The new DOMAttr.</td>
</tr>
<tr>
<td>ns</td>
<td>The namespace.</td>
</tr>
</tbody>
</table>
SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 113-13):

```sql
DBMS_XMLDOM.SETDATA(
    cd         IN     DOMCharacterData,
    data       IN     VARCHAR2);
```

Sets the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms on page 113-13):

```sql
DBMS_XMLDOM.SETDATA(
    pi         IN     DOMProcessingInstruction,
    data       IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>data</td>
<td>The data to which the node is set.</td>
</tr>
<tr>
<td>pi</td>
<td>DOMProcessingInstruction.</td>
</tr>
<tr>
<td>data</td>
<td>New processing instruction content data.</td>
</tr>
</tbody>
</table>
SETNAMEDITEM Function

This function adds a node using its NodeName attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: DOMNamedNodeMap Subprograms on page 113-23

Syntax

Adds a node using its NodeName attribute:

```sql
DBMS_XMLDOM.SETNAMEDITEM(
    nnm     IN     DOMNamedNodeMap,
    arg     IN     DOMNode)
RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```sql
DBMS_XMLDOM.SETNAMEDITEM(
    nnm     IN     DOMNamedNodeMap,
    arg     IN     DOMNode,
    ns      IN     VARCHAR2)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNamedNodeMap.</td>
</tr>
<tr>
<td>arg</td>
<td>The Node to be added using its NodeName attribute.</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace.</td>
</tr>
</tbody>
</table>

Table 113–118  SETNAMEDITEM Function Parameters
SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

**See Also:** DOMNode Subprograms on page 113-8

**Syntax**

```
DBMS_XMLDOM.SETNODEVALUE(
    n IN DOMNode,
    nodeValue IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>nodeValue</td>
<td>The value to which node is set.</td>
</tr>
</tbody>
</table>
SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the given value.

See Also: DOMNode Subprograms on page 113-8

Syntax

```
DBMS_XMLDOM.SETPREFIX(
    n       IN     DOMNode,
    prefix  IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>prefix</td>
<td>The value for the namespace prefix of the node.</td>
</tr>
</tbody>
</table>
**SETSTANDALONE Procedure**

This procedure sets the standalone property of the DOMDocument.

**See Also:** [DOMDocument Subprograms](#) on page 113-15

**Syntax**

```sql
DBMS_XMLDOM.SETSTANDALONE(
    doc     IN     DOMDocument,
    newvalue     IN     VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>newvalue</td>
<td>Value of the standalone property of the document.</td>
</tr>
</tbody>
</table>
SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 113-11

Syntax

```
DBMS_XMLDOM.SETVALUE(
    a IN DOMAttr,
    value IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMAttr</td>
</tr>
<tr>
<td>value</td>
<td>The value to set the attribute to.</td>
</tr>
</tbody>
</table>
SETVERSION Procedure

This procedure sets the version of the DOMDocument.

See Also: DOMDocument Subprograms on page 113-15

Syntax

DBMS_XMLDOM.SETVERSION(
   doc IN DOMDocument,
   version IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>version</td>
<td>The version of the document.</td>
</tr>
</tbody>
</table>
**SPLITTEXT Function**

This function breaks this DOMText node into two DOMText nodes at the specified offset.

**See Also:** DOMText Subprograms on page 113-27

**Syntax**

```plsql
DBMS_XMLDOM.SPLITTEXT(
    t IN DOMText,
    offset IN NUMBER)
RETURN DOMText;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>DOMText.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset at which to split.</td>
</tr>
</tbody>
</table>
SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:** [DOMCharacterData Subprograms](#) on page 113-13

**Syntax**

```sql
DBMS_XMLDOM.SUBSTRINGDATA(
    cd IN DOMCharacterData,
    offset IN NUMBER,
    cnt IN NUMBER)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCharacterData.</td>
</tr>
<tr>
<td>offset</td>
<td>The starting offset of the data from which to get the data.</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (from the offset) of the data to get.</td>
</tr>
</tbody>
</table>
WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 113-8):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    n        IN      DOMNode,
    buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 113-15):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    doc       IN      DOMDocument,
    buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 113-17):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    df        IN      DOMDocumentFragment,
    buffer    IN OUT  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to write to.</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
<tr>
<td>df</td>
<td>DOM document fragment.</td>
</tr>
</tbody>
</table>
**WRITETOCLOB Procedures**

This procedure is overloaded. The specific forms of functionality are described alongside the syntax declarations.

**Syntax**

Writes XML node to specified CLOB using the database character set (See Also: DOMNode Subprograms on page 113-8):

```
DBMS_XMLDOM.WRITETOCLOB(
    n     IN     DOMNode,
    cl    IN OUT  CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms on page 113-15):

```
DBMS_XMLDOM.WRITETOCLOB(
    doc   IN     DOMDocument,
    cl    IN OUT  CLOB);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to write to.</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
</tbody>
</table>
WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(  
n          IN      DOMNode,  
fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the given character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(  n DOMNode,  
fileName   IN      VARCHAR2,  
charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(  doc IN DOMDocument,  
fileName IN VARCHAR2);
```

Writes an XML document to a specified file using given character set (See Also: DOMDocument Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(  doc IN DOMDocument,  
fileName IN VARCHAR2,  
charset IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode.</td>
</tr>
<tr>
<td>fileName</td>
<td>File to write to.</td>
</tr>
<tr>
<td>charset</td>
<td>Given character set.</td>
</tr>
</tbody>
</table>
### Table 113–128  WRITETOFILE Procedure Parameters

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument.</td>
</tr>
<tr>
<td>charset</td>
<td>Character set.</td>
</tr>
</tbody>
</table>
WRITETofile Procedures
The DBMS.XMLGEN package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS.XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Summary of DBMS.XMLGEN Subprograms

See Also: Oracle XML DB Developer's Guide, for more information on XML support and on examples of using DBMS.XMLGEN

<td>Forces the use of the collection column name appended with the tag _ITEM for collection elements</td>
</tr>
</tbody>
</table>
### USENULLATTRIBUTEINDICATOR Procedure on page 114-19

Specified weather to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.
CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (  
    ctx  IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle to close.</td>
</tr>
</tbody>
</table>
CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```sql
DBMS_XMLGEN.CONVERT (  
    xmlData INVARCHAR2,  
    flag IN NUMBER := ENTITY_ENCODE)  
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```sql
DBMS_XMLGEN.CONVERT {  
    xmlData IN CLOB,  
    flag IN NUMBER := ENTITY_ENCODE)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The XML CLOB data to be encoded or decoded.</td>
</tr>
<tr>
<td>flag</td>
<td>The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.</td>
</tr>
</tbody>
</table>

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is &lt;. Unescaping is the reverse transformation.
**GETNUMROWSPROCESSED Function**

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

**Syntax**

```sql
DBMS_XMLGEN.GETNUMROWSPROCESSED (
    ctx IN ctxHandle)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This function is used to determine the terminating condition if calling GETXML Functions in a loop.
GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functions call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    tmpclob      IN OUT NCOPY CLOB,  
    dtdOrSchema  IN number := NONE)  
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (  
    sqlQuery     IN VARCHAR2,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Table 114–5</th>
<th>GETXML Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>CTX</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>TPMPCLOB</td>
<td>The CLOB to which the XML document is appended.</td>
</tr>
</tbody>
</table>
**Usage Notes**

When the rows indicated by the `SETSKIPROWS Procedure` call are skipped, the maximum number of rows as specified by the `SETMAXROWS Procedure` call (or the entire result if not specified) is fetched and converted to XML. Use the `GETNUMROWSPROCESSED Function` to check if any rows were retrieved.
GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE(
    ctx           IN ctxhandle,
    dtdOrSchema   IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE(
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN sys.XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>
NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```sql
DBMS_XMLGEN.NEWCONTEXT (
    query     IN VARCHAR2)
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```sql
DBMS_XMLGEN.NEWCONTEXT (
    queryString  IN SYS_REFCURSOR)
RETURN ctxHandle;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>The query, in the form of a VARCHAR, the result of which must be converted to XML.</td>
</tr>
<tr>
<td>queryString</td>
<td>The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.</td>
</tr>
</tbody>
</table>
RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

DBMS_XMLGEN.RESTARTQUERY (  
  ctx IN ctxHandle); 

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the current query.</td>
</tr>
</tbody>
</table>
SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (  
    ctx    IN ctxHandle,  
    conv   IN BOOLEAN);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from one of the NEWCONTEXT Functions calls.</td>
</tr>
<tr>
<td>conv</td>
<td>TRUE indicates that conversion is needed.</td>
</tr>
</tbody>
</table>

SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the maxrows parameter.

Syntax

```sql
DBMS_XMLGEN.SETMAXROWS {
    ctx IN ctxHandle,
    maxRows IN NUMBER};
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>maxRows</td>
<td>The maximum number of rows to get for each call to GETXML Functions.</td>
</tr>
</tbody>
</table>
SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
    ctx  IN ctx,
    flag IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>flag</td>
<td>The NULL handling option set.</td>
</tr>
</tbody>
</table>

- DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements.
- NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true".
- EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>. |
### SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

#### Syntax

```sql
DBMS_XMLGEN.SETROWSETTAG (    ctx            IN ctxHandle,    rowSetTagName  IN VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the <code>NEWCONTEXT</code> call.</td>
</tr>
<tr>
<td>rowSetTagName</td>
<td>The name of the document element. Passing <code>NULL</code> indicates that you do not want the <code>ROWSET</code> element present.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The user can set the `ROWSETTAG` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```sql
DBMS_XMLGEN.SETROWTAG (  
    ctx        IN ctxHandle,  
    rowTagName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctx</code></td>
<td>The context handle obtained from the NEWCONTEXT Functions call.</td>
</tr>
<tr>
<td><code>rowTagName</code></td>
<td>The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
**SETSKIPROWS Procedure**

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set skiprows to zero. For the next set, set the skiprows to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 114-6.

### Syntax

```sql
DBMS_XMLGEN.SETSKIPROWS (
    ctx       IN ctxHandle,
    skipRows  IN NUMBER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctx</code></td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td><code>skipRows</code></td>
<td>The number of rows to skip for each call to getXML.</td>
</tr>
</tbody>
</table>
USEITEMTAGSFORCOLL Procedure

USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (  
   ctx IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle.</td>
</tr>
</tbody>
</table>

Usage Notes

Using this function, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.
USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
    ctx       IN   ctxType,
    attrind   IN   BOOLEAN := TRUE);

Parameters

Table 114–16  USENULLATTRIBUTEINDICATOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrind</td>
<td>Use attribute to indicate NULL?</td>
</tr>
</tbody>
</table>
Using DBMS_XMLPARSER, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

**FREEPARSER**

Frees a parser object.
Summary of DBMS_XMLPARSER Subprograms

Syntax
PROCEDURE FREEPARSER(
    P PARSER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax
FUNCTION GETDOCTYPE(
    P PARSER)
RETURN DOMDOCUMENTTYPE;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax
FUNCTION GETDOCUMENT(
    P PARSER)
RETURN DOMDOCUMENT;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

**Syntax**

```plsql
FUNCTION GETRELEASEVERSION
RETURN VARCHAR2;
```

GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

**Syntax**

```plsql
FUNCTION GETVALIDATIONMODE(
    P PARSER)
RETURN BOOLEAN;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

**Syntax**

```plsql
FUNCTION NEWPARSER
RETURN PARSER;
```

PARSE

 Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.
PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

**Syntax**

```sql
PROCEDURE PARSEBUFFER(
    P  PARSER,
    DOC VARCHAR2);
```

**Parameter** | **IN / OUT** | **Description**
---|---|---
P | (IN) | Parser instance.
DOC | (IN) | XML document buffer to parse.
PARSECLOB

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSECLOB(
    P     PARSER,
    DOC   CLOB);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>DOC</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>

PARSEDTD

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTD(
    P     PARSER,
    URL   VARCHAR2,
    ROOT  VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>Complete path of the URL or file to be parsed.</td>
</tr>
<tr>
<td>ROOT</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
PARSEDRTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDRTDBUFFER(
    P    PARSER,
    DTD  VARCHAR2,
    ROOT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>DTD</td>
<td>(IN)</td>
<td>DTD buffer to parse.</td>
</tr>
<tr>
<td>ROOT</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>

PARSEDRTDCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDRTDCLOB(
    P    PARSER,
    DTD  CLOB,
    ROOT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>DTD</td>
<td>(IN)</td>
<td>DTD Clob to parse.</td>
</tr>
<tr>
<td>ROOT</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
**SETBASEDIR**

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

**Syntax**

```sql
PROCEDURE SETBASEDIR(
    P    PARSER,
    DIR VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>DIR</td>
<td>(IN)</td>
<td>Directory used as a base directory.</td>
</tr>
</tbody>
</table>

**SETDOCTYPE**

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

**Syntax**

```sql
PROCEDURE SETDOCTYPE(
    P    PARSER,
    DTD DOMDOCUMENTTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>DTD</td>
<td>(IN)</td>
<td>DTD to set.</td>
</tr>
</tbody>
</table>

**SETERRORLOG**

Sets errors to be sent to the specified file.

**Syntax**

```sql
PROCEDURE SETERRORLOG(
    P    PARSER,
    FILENAME VARCHAR2);
```
## SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

**Syntax**

```sql
PROCEDURE SETPRESERVEWHITESPACE(
    P PARSER,
    YES BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>FILENAME</td>
<td>(IN)</td>
<td>Complete path of the file to use as the error log.</td>
</tr>
</tbody>
</table>

## SETVALIDATIONMODE

Sets validation mode.

**Syntax**

```sql
PROCEDURE SETVALIDATIONMODE(
    P PARSER,
    YES BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>YES</td>
<td>(IN)</td>
<td>Mode to set: TRUE - preserve, FALSE - don’t preserve.</td>
</tr>
</tbody>
</table>
SHOWWARNINGS

SHOWWARNINGS

Turns warnings on or off.

Syntax

PROCEDURE SHOWWARNINGS(
   P   PARSER,
   YES BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>YES</td>
<td>(IN)</td>
<td>Mode to set: TRUE - show warnings, FALSE - don’t show warnings.</td>
</tr>
</tbody>
</table>
DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

Summary of DBMS_XMLQUERY Subprograms

**GETDTD**

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

**Syntax**

```
FUNCTION GETDTD(
    CTXHDL IN CTXTYPE,
    WITHVER IN BOOLEAN := FALSE)
RETURN CLOB;

PROCEDURE GETDTD(
    CTXHDL IN CTXTYPE,
    XDOC IN CLOB,
    WITHVER IN BOOLEAN := FALSE);
```

**Description**

- Function that generates the DTD based on the SQL query used to initialize the context.
- Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output CLOB for XML document result.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>WITHVER</td>
<td>(IN)</td>
<td>Generate the version information? TRUE for yes.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>

**GETEXCEPTIONCONTENT**

Returns the thrown exception's SQL error code and error message through the procedure's OUT parameters. This procedure is a work around the JVM functionality.
that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

**Syntax**

```sql
PROCEDURE GETEXCEPTIONCONTENT(
   CTXHDL IN CTXTYPE,
   ERRNO OUT NUMBER,
   ERRMSG OUT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ERRNO</td>
<td>(OUT)</td>
<td>Error number.</td>
</tr>
<tr>
<td>ERRMSG</td>
<td>(OUT)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

**GETNUMROWSPROCESSED**

Return the number of rows processed for the query.

**Syntax**

```sql
FUNCTION GETNUMROWSPROCESSED(
   CTXHDL IN CTXTYPE
) RETURN NUMBER;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

**GETVERSION**

Prints the version of the XSU in use.
Summary of DBMS_XMLQUERY Subprograms

Syntax

PROCEDURE GETVERSION();

GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION GETXML( SQLQUERY IN VARCHAR2, METATYPE IN NUMBER := NONE) RETURN CLOB;</td>
<td>This function uses a SQL query in string form.</td>
</tr>
<tr>
<td>FUNCTION GETXML( SQLQUERY IN CLOB, METATYPE IN NUMBER := NONE) RETURN CLOB;</td>
<td>This function uses a SQL query in CLOB form.</td>
</tr>
<tr>
<td>FUNCTION GETXML( CTXHDL IN CTXTYPE, METATYPE IN NUMBER := NONE) RETURN CLOB;</td>
<td>This function generates the XML document based on a SQL query used to initialize the context.</td>
</tr>
<tr>
<td>PROCEDURE GETXML( CTXHDL IN CTXTYPE, XDOC IN CLOB, METATYPE IN NUMBER := NONE);</td>
<td>This procedure generates the XML document based on the SQL query used to initialize the context.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>

</tr>
<tr>
<td>SQLQUERY</td>
<td>(IN)</td>
<td>SQL query.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION NEWCONTEXT(  
  SQLQUERY IN VARCHAR2)  
RETURN CTXTYPE; | Creates a query context from a string. |
| FUNCTION NEWCONTEXT(  
  SQLQUERY IN CLOB)  
RETURN CTXTYPE; | Creates a query context from a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLQUERY</td>
<td>(IN)</td>
<td>SQL query, the results of which to convert to XML.</td>
</tr>
</tbody>
</table>

PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

Syntax

PROCEDURE propagateOriginalException(  
  CTXHDL IN CTXTYPE,  
  FLAG IN BOOLEAN);  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException.</td>
</tr>
</tbody>
</table>
REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

**Syntax**

```
PROCEDURE REMOVEXSLTPARAM(
    CTXHDL IN CTXTYPE,
    NAME IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>NAME</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
</tbody>
</table>

SETBINDVALUE

Sets a value for a particular bind name.

**Syntax**

```
PROCEDURE SETBINDVALUE(
    CTXHDL IN CTXTYPE,
    BINDNAME IN VARCHAR2,
    BINDVALUE IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>BINDNAME</td>
<td>(IN)</td>
<td>Bind name.</td>
</tr>
<tr>
<td>BINDVALUE</td>
<td>(IN)</td>
<td>Bind value.</td>
</tr>
</tbody>
</table>
SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element’s separator tag. Passing NULL or an empty string for the tag causes the row id attribute to be omitted.

Syntax

PROCEDURE SETCOLLIDATTRNAME(
  CTXHDL IN CTXTYPE,
  ATTRNAME IN VARCHAR2);

Parameter | IN / OUT | Description
--- | --- | ---
CTXHDL | (IN) | Context handle.
ATTRNAME | (IN) | Attribute name.

SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the rowset. The two entities are enclosed by the docTag argument. The last data header specified is used. Passing in NULL for the header parameter unsets the data header.

Syntax

PROCEDURE SETDATAHEADER(
  CTXHDL IN CTXTYPE,
  HEADER IN CLOB := NULL,
  TAG IN VARCHAR2 := NULL);

Parameter | IN / OUT | Description
--- | --- | ---
CTXHDL | (IN) | Context handle.
HEADER | (IN) | Header.
TAG | (IN) | Tag used to enclose the data header and the rowset.
**SETDATEFORMAT**

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to NULL or an empty string sets the default mask -- DEFAULT_DATE_FORMAT.

**Syntax**

```sql
PROCEDURE SETDATEFORMAT(
    CTXHDL IN CTXTYPE,
    MASK IN VARCHAR2);
```

**Parameter Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>MASK</td>
<td>(IN)</td>
<td>The date mask.</td>
</tr>
</tbody>
</table>

**SETENCODINGTAG**

Sets the encoding processing instruction in the XML document.

**Syntax**

```sql
PROCEDURE SETENCODINGTAG(
    CTXHDL IN CTXTYPE,
    ENC IN VARCHAR2 := DB_ENCODING);
```

**Parameter Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ENC</td>
<td>(IN)</td>
<td>The encoding to use.</td>
</tr>
</tbody>
</table>
### SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

**Syntax**

```sql
PROCEDURE SETERRORTAG(
    CTXHDL IN CTXTYPE,
    TAG IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>TAG</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

### SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

**Syntax**

```sql
PROCEDURE SETMAXROWS (
    CTXHDL IN CTXTYPE,
    ROWS IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ROWS</td>
<td>(IN)</td>
<td>Maximum number of rows to generate.</td>
</tr>
</tbody>
</table>
**SETMETAHEADER**

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `HEADER` parameter unsets the meta header.

**Syntax**

```sql
PROCEDURE SETMETAHEADER(
    CTXHDL IN CTXTYPE,
    HEADER IN CLOB := NULL);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>HEADER</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
</tbody>
</table>

**SETRAISEEXCEPTION**

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `FLAG` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

**Syntax**

```sql
PROCEDURE SETRAISEEXCEPTION(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN:=TRUE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>Throw raised exceptions? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>
SETRAISENOROWSEXCEPTION

Specifies whether to throw an OracleXMLNoRowsException when the generated XML document is empty. By default, the exception is not thrown.

Syntax

PROCEDURE SETRAISENOROWSEXCEPTION(
  CTXHDL IN CTXTYPE,
  FLAG IN BOOLEAN:=FALSE);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>Throws an OracleXMLNoRowsException if set to TRUE.</td>
</tr>
</tbody>
</table>

SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing NULL or an empty string for the tag causes the row id attribute to be omitted.

Syntax

PROCEDURE SETROWIDATTRNAME(
  CTXHDL IN CTXTYPE,
  ATTRNAME IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ATTRNAME</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
**SETROWIDATTRVALUE**

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing NULL or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

**Syntax**

```sql
PROCEDURE SETROWIDATTRVALUE(
    CTXHDL IN CTXTYPE,
    COLNAME IN VARCHAR2);
```

---

**Parameter | IN / OUT | Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>COLNAME</td>
<td>(IN)</td>
<td>Column whose value is to be assigned to the row id attribute.</td>
</tr>
</tbody>
</table>

**SETROWSETTAG**

Sets the tag to be used to enclose the XML dataset.

**Syntax**

```sql
PROCEDURE SETROWSETTAG(
    CTXHDL IN CTXTYPE,
    TAG IN VARCHAR2);
```

---

**Parameter | IN / OUT | Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>TAG</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

**SETROWTAG**

Sets the tag to be used to enclose the XML element corresponding to a `db.record`. 
Sets the number of rows to skip. By default, 0 rows are skipped.

**Syntax**

```plaintext
PROCEDURE SETSKIPROWS(
    CTXHDL IN CTXTYPE,
    ROWS IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ROWS</td>
<td>(IN)</td>
<td>Maximum number of rows to skip.</td>
</tr>
</tbody>
</table>

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

**Syntax**

```plaintext
PROCEDURE SETSQLTOXMLNAMEESCAPING(
    CTXHDL IN CTXTYPE,
    Parameter IN / OUT Description
    CTXHDL (IN) Context handle.
    Tag (IN) Tag name.
    ROWS (IN) Maximum number of rows to skip.
```

**Syntax**

```plaintext
PROCEDURE SETSQLTOXMLNAMEESCAPING(
    CTXHDL IN CTXTYPE,
    Parameter IN / OUT Description
    CTXHDL (IN) Context handle.
    Tag (IN) Tag name.
    ROWS (IN) Maximum number of rows to skip.
```
Summary of DBMS_XMLQUERY Subprograms

FLAG IN BOOLEAN := TRUE);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>Turn on escaping? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>

**SETSTYLESHEETHEADER**

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

**Syntax**

```sql
PROCEDURE SETSTYLESHEETHEADER(
   CTXHDL IN CTXTYPE,
   URI IN VARCHAR2,
   TYPE IN VARCHAR2 := 'TEXT/XSL');
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>URI</td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td>TYPE</td>
<td>(IN)</td>
<td>Stylesheet type; defaults to &quot;text/xsl&quot;.</td>
</tr>
</tbody>
</table>

**SETTAGCASE**

Specifies the case of the generated XML tags.

**Syntax**

```sql
PROCEDURE SETTAGCASE(
   CTXHDL IN CTXTYPE,
   ...)
```
Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing NULL for the \texttt{uri} argument or an empty string for the \texttt{stylesheet} argument will unset the stylesheet header and type.

\begin{tabular}{lll}
\hline
\textbf{Parameter} & \textbf{IN / OUT} & \textbf{Description} \\
\hline
\texttt{CTXHDL} & (IN) & Context handle. \\
\texttt{TCASE} & (IN) & The tag's case: \\
& & \begin{itemize}
\item 0 for as are \\
\item 1 for lower case \\
\item 2 for upper case 
\end{itemize} \\
\hline
\end{tabular}

**Syntax**

\begin{verbatim}
PROCEDURE SETXSLT(
   CTXHDL IN CTXTYPE,
   URI IN VARCHAR2,
   REF IN VARCHAR2 := NULL);

PROCEDURE SETXSLT(
   CTXHDL IN CTXTYPE,
   STYLESHEET CLOB,
   REF IN VARCHAR2 := NULL);
\end{verbatim}

\begin{tabular}{lll}
\hline
\textbf{Parameter} & \textbf{IN / OUT} & \textbf{Description} \\
\hline
\texttt{CTXHDL} & (IN) & Context handle. \\
\texttt{URI} & (IN) & Stylesheet URI. \\
\texttt{STYLESHEET} & (IN) & Stylesheet. \\
\hline
\end{tabular}
Summary of DBMS_XMLQUERY Subprograms

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REF</td>
<td>(IN)</td>
<td>URL to include, imported and external entities.</td>
</tr>
</tbody>
</table>

**SETXSLTPARAM**

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

**Syntax**

PROCEDURE SETXSLTPARAM(
    CTXHDL IN CTXTYPE,
    NAME IN VARCHAR2,
    VALUE IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>NAME</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
<tr>
<td>VALUE</td>
<td>(IN)</td>
<td>Value to be assigned to the stylesheet parameter.</td>
</tr>
</tbody>
</table>

**USENULLATTRIBUTEINDICATOR**

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

**Syntax**

PROCEDURE SETNULLATTRIBUTEINDICATOR(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN);
USES TYPE FOR COLLELEMTAG

**Parameter** | **IN / OUT** | **Description**
--- | --- | ---
CTXHDL | (IN) | Context handle.
FLAG | (IN) | Sets attribute to NULL if TRUE, omits from XML document if FALSE.

USES TYPE FOR COLLELEMTAG

Specifies whether to use the collection element’s type name as its element tag name. By default, the tag name for elements of a collection is the collection’s tag name followed by _item.

**Syntax**

```plsql
PROCEDURE USETYPEFORCOLLELEMTAG(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN := TRUE);
```

**Parameter** | **IN / OUT** | **Description**
--- | --- | ---
CTXHDL | (IN) | Context handle.
FLAG | (IN) | Turn on use of the type name?
DBMS_XMLSAVE provides XML to database-type functionality.

<td>This methods adds a column to the key column list.</td>
</tr>
<tr>
<td>SETPRESERVEWHITESPACE on page 117-11</td>
<td>Tells the XSU whether to preserve whitespace or not.</td>
</tr>
<tr>
<td>SETROWTAG on page 117-11</td>
<td>Names the tag used in the XML document to enclose the XML elements corresponding to database.</td>
</tr>
</tbody>
</table>
### CLEARKEYCOLUMNLIST

Clears the key column list.

**Syntax**

```plsql
PROCEDURE CLEARKEYCOLUMNLIST(
    CTXHDL IN CTXTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

### CLEARUPDATECOLUMNLIST

Clears the update column list.

**Syntax**

```plsql
PROCEDURE CLEARUPDATECOLUMNLIST(
    CTXHDL IN CTXTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>UPDATEXML on page 117-14</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes/deallocates a particular save context.

**Syntax**

```sql
PROCEDURE CLOSECONTEXT(
    CTXHDL IN CTXTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

**Syntax**

```sql
FUNCTION DELETEXML(
    CTXHDL IN CTXTYPE,
    XDOC IN VARCHAR2)
RETURN NUMBER;
```

```sql
FUNCTION DELETEXML(
    CTXHDL IN CTXTYPE,
    XDOC IN CLOB)
RETURN NUMBER;
```

Uses a `VARCHAR2` type for the `XDOC` parameter.

Uses a `CLOB` type for the `XDOC` parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception’s error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

**Syntax**

```sql
PROCEDURE GETEXCEPTIONCONTENT(
    CTXHDL IN CTXTYPE,
    ERRNO OUT NUMBER,
    ERRMSG OUT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>ERRNO</td>
<td>(IN)</td>
<td>Error number.</td>
</tr>
<tr>
<td>ERRMSG</td>
<td>(IN)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

**INSERTXML**

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

**Syntax**

```sql
FUNCTION INSERTXML(
    CTXHDL IN CTXTYPE,
    XDOC IN VARCHAR2)
RETURN NUMBER;
```

```sql
FUNCTION INSERTXML(
    CTXHDL IN CTXTYPE,
    XDOC IN CLOB)
RETURN NUMBER;
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Passes in the XDOC parameter as a VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>Passes in the XDOC parameter as a CLOB.</td>
</tr>
</tbody>
</table>
**NEWCONTEXT**

Creates a save context, and returns the context handle.

**Syntax**

```sql
FUNCTION NEWCONTEXT(
    TARGETTABLE IN VARCHAR2)
RETURN CTXTYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>

**PROPAGATEORIGINALEXCEPTION**

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an `OracleXMLSQLEException`.

**Syntax**

```sql
PROCEDURE PROPAGATEORIGINALEXCEPTION(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>Propagate the original exception? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
**REMOVEXSLTPARAM**

Removes the value of a top-level stylesheet parameter.

**Syntax**

```plsql
PROCEDURE REMOVEXSLTPARAM(
    CTXHDL IN CTXTYPE,
    NAME IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>IN</td>
<td>Context handle.</td>
</tr>
<tr>
<td>NAME</td>
<td>IN</td>
<td>Parameter name.</td>
</tr>
</tbody>
</table>

**SETBATCHSIZE**

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

**Syntax**

```plsql
PROCEDURE SETBATCHSIZE(
    CTXHDL IN CTXTYPE,
    BATCHSIZE IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>IN</td>
<td>Context handle.</td>
</tr>
<tr>
<td>BATCHSIZE</td>
<td>IN</td>
<td>Batch size.</td>
</tr>
</tbody>
</table>
SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If \texttt{BATCHSIZE} is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, \texttt{COMMITBATCH} is 0.

Syntax

\begin{verbatim}
PROCEDURE SETCOMMITBATCH(
    CTXHDL IN CTXTYPE,
    BATCHSIZE IN NUMBER);
\end{verbatim}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>IN</td>
<td>Context handle.</td>
</tr>
<tr>
<td>BATCHSIZE</td>
<td>IN</td>
<td>Commit batch size.</td>
</tr>
</tbody>
</table>

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class \texttt{java.text.SimpleDateFormat}. Setting the mask to \texttt{null} or an empty string unsets the date mask.

Syntax

\begin{verbatim}
PROCEDURE SETDATEFORMAT(
    CTXHDL IN CTXTYPE,
    MASK IN VARCHAR2);
\end{verbatim}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>IN</td>
<td>Context handle.</td>
</tr>
<tr>
<td>MASK</td>
<td>IN</td>
<td>Syntax of the date format pattern.</td>
</tr>
</tbody>
</table>
**SETIGNORECASE**

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

**Syntax**

```plsql
PROCEDURE SETIGNORECASE(
    CTXHDL IN CTXTYPE,
    FLAG IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>

**SETKEYCOLUMN**

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```plsql
PROCEDURE SETKEYCOLUMN(
    CTXHDL IN CTXTYPE,
    COLNAME IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>COLNAME</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
### SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

**Syntax**

```sql
PROCEDURE SETPRESERVEWHITESPACE(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN := TRUE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Should XSU preserve whitespace?</td>
</tr>
</tbody>
</table>

### SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

**Syntax**

```sql
PROCEDURE SETROWTAG(
    CTXHDL IN CTXTYPE,
    TAG IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>TAG</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

### SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN

Syntax
PROCEDURE SETSQLTOXMLNAMEESCAPING(
    CTXHDL IN CTXTYPE,
    FLAG IN BOOLEAN := TRUE);

Parameter | IN / OUT | Description
----------|---------|-------------
CTXHDL     | (IN)    | Context handle.
FLAG       | (IN)    | Turn on escaping?

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax
PROCEDURE SETUPDATECOLUMN(
    CTXHDL IN CTXTYPE,
    COLNAME IN VARCHAR2);

Parameter | IN / OUT | Description
----------|---------|-------------
CTXHDL     | (IN)    | Context handle.
COLNAME    | (IN)    | Column to be added to the update column list.

SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.
### SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

#### Syntax

```sql
PROCEDURE SETXSLTPARAM(
    CTXHDL IN CTXTYPE,
    NAME IN VARCHAR2,
    VALUE IN VARCHAR2 := null);
```

#### Parameter IN / OUT Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>NAME</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>VALUE</td>
<td>(IN)</td>
<td>Parameter value as an XPath expression</td>
</tr>
</tbody>
</table>

### Syntax of DBMS_XMLSAVE Subprograms

**DBMS_XMLSAVE**

#### SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

**Syntax**

```sql
PROCEDURE SETXSLTPARAM(
    CTXHDL IN CTXTYPE,
    NAME IN VARCHAR2,
    VALUE IN VARCHAR2 := null);
```

**Parameter IN / OUT Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>NAME</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>VALUE</td>
<td>(IN)</td>
<td>Parameter value as an XPath expression</td>
</tr>
</tbody>
</table>

**Syntax**

- **PROCEDURE setXSLT**
  ```sql
  setXSLT(ctxHdl IN ctxType,
          uri IN VARCHAR2,
          ref IN VARCHAR2 := null);
  ```

  Passes in the stylesheet through a URI.

- **PROCEDURE setXSLT**
  ```sql
  setXSLT(ctxHdl IN ctxType,
          stylesheet IN CLOB,
          ref IN VARCHAR2 := null);
  ```

  Passes in the stylesheet through a CLOB.
UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION UPDATEXML(  
  CTXHDL IN CTXTYPE,  
  XDOC IN VARCHAR2)  
RETURN NUMBER; | Passes in the XDOC parameter as a VARCHAR2. |
| FUNCTION UPDATEXML(  
  CTXHDL IN CTXTYPE,  
  XDOC IN CLOB)  
RETURN NUMBER; | Passes in the XDOC parameter as a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
DBMS_XMLSCHEMA package provides procedures to register and delete XML schemas. It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- Constants of DBMS_XMLSCHEMA
- Summary of DBMS_XMLSCHEMA Subprograms
- Catalog Views of the DBMS_XMLSCHEMA

See Also: Oracle XML DB Developer's Guide
### Constants of DBMS_XMLSCHEMA

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESTRICT</td>
<td>CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td>DELETE_INVALIDATE</td>
<td>CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td>DELETE.CASCADE</td>
<td>CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td>DELETE.CASCADE_FORCE</td>
<td>CONSTANT NUMBER := 4;</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XMLSCHEMA Subprograms

### Table 118–2  DBMS_XMLSCHEMA Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILESCHEMA on page 118-4</td>
<td>Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.</td>
</tr>
<tr>
<td>COPYEVOLVE on page 118-5</td>
<td>Evolves registered schemas so that existing XML instances remain valid.</td>
</tr>
<tr>
<td>DELETESCHEMAD on page 118-8</td>
<td>Removes the schema from the database.</td>
</tr>
<tr>
<td>GENERATEBEAN on page 118-10</td>
<td>Generates the Java bean code corresponding to a registered XML schema</td>
</tr>
<tr>
<td>GENERATESCHEMAD on page 118-11</td>
<td>Generates an XML schema from an oracle type name.</td>
</tr>
<tr>
<td>GENERATESCHEMADAS on page 118-12</td>
<td>Generates several XML schemas from an oracle type name.</td>
</tr>
<tr>
<td>REGISTERSCHEMAD on page 118-13</td>
<td>Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.</td>
</tr>
<tr>
<td>REGISTERURI on page 118-16</td>
<td>Registers an XMLSchema specified by a URI name.</td>
</tr>
</tbody>
</table>
This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a ORA-31001 exception: invalid resource handle or path name.

**Syntax**

PROCEDURE COMPILESCHEMA(
    SCHEMAURL IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAURL</td>
<td>(IN)</td>
<td>URL identifying the schema.</td>
</tr>
</tbody>
</table>
COPYEVOLVE

Evolves registered schemas so that existing XML instances remain valid. You should back up all schemas and documents prior to invocation because COPYEVOLVE deletes all conforming documents prior to implementing the schema evolution.

This procedure is accomplished in accordance to the following basic scenario (alternative actions are controlled by the procedure's parameters):
- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:
- Schema Evolution chapter of the Oracle XML DB Developer’s Guide for examples on how to evolve existing schemas
- Oracle Database Error Messages for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax
PROCEDURE COPYEVOLVE(
    SCHEMAURLS IN XDB$STRUBG_LIST_T,
    NEWSCHEMAS IN XMLSEQUENCETYPE,
    TRANSFORMS IN XMLSEQUENCETYPE:=NULL,
    PRESERVEOLDDOCS IN BOOLEAN:=FALSE,
    MAPTABLENAME IN VARCHAR2:=NULL,
    GENERATETABLES IN BOOLEAN:=TRUE,
    FORCE IN BOOLEAN:=FALSE,
    SCHEMAOWNERS IN XDB$STRING_LIST_T:=NULL);
<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAURLS</td>
<td>(IN)</td>
<td>Varray of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.</td>
</tr>
<tr>
<td>NEWSCHEMAS</td>
<td>(IN)</td>
<td>Varray of new schema documents. Should be specified in same order as the corresponding URLs.</td>
</tr>
<tr>
<td>TRANSFORMS</td>
<td>(IN)</td>
<td>Varray of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.</td>
</tr>
<tr>
<td>PRESERVEOLDDOCS</td>
<td>(IN)</td>
<td>Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.</td>
</tr>
</tbody>
</table>
| MAPTABNAME    | (IN)     | Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are:  
  - SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms  
  - SCHEMA_OWNER - VARCHAR2(30) - Owner of the schema  
  - ELEMENT_NAME - VARCHAR2(256) - Element to which this table conforms  
  - TAB_NAME - VARCHAR2(65) - Qualified table name: \(<owner_name>\).<table_name>  
  - COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables)  
  - TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.                                                                 |
| GENERATETABLES | (IN)     | Default is TRUE, and new tables will be generated. If FALSE:  
  - new tables will not be generated after registration of new schemas  
  - PRESERVEOLDDOCS must be TRUE  
  - MAPTABNAME must be non-NULL                                                                                           |
<p>| FORCE         | (IN)     | Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAOWNERS</td>
<td>(IN)</td>
<td>Varray of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.</td>
</tr>
</tbody>
</table>
DELETESHEMA

DELETESHEMA

Deletes the XML Schema specified by the URL. Can result in an ORA-31001 exception: invalid resource handle or path name.
Syntax

PROCEDURE DELETESHEMA(
    SCHEMAURL IN VARCHAR2,
    DELETE_OPTION IN PLS_INTEGER := DELETE_RESTRICT);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAURL</td>
<td>(IN)</td>
<td>URL identifying the schema to be deleted.</td>
</tr>
<tr>
<td>DELETE_OPTION</td>
<td>(IN)</td>
<td>Option for deleting schema. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. The deletion fails if there are any stored instances conforming to this schema.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE, except that it does not check for any stored instances conforming to this schema. Also ignores any errors.</td>
</tr>
</tbody>
</table>
This procedure can be used to generate the Java bean code corresponding to a registered XML schema. Note that there is also an option to generate the beans as part of the registration procedure itself. Can result in a ORA-31001 exception: invalid resource handle or path name.

**Syntax**

```sql
PROCEDURE GENERATEBEAN(
    SCHEMAURL IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAURL</td>
<td>(IN)</td>
<td>Name identifying a registered XML schema.</td>
</tr>
</tbody>
</table>
GENERATESCHEMA

These functions generate XML schema(s) from an Oracle type name. Inlines all in one schema (XMLType). Can result in a ORA-31001 exception: invalid resource handle or path name.

Syntax

```
FUNCTION GENERATESCHEMA(
    SCHEMANAME IN VARCHAR2,
    TYPENAME IN VARCHAR2,
    ELEMENTNAME IN VARCHAR2 := NULL,
    RECURSE IN BOOLEAN := TRUE,
    ANNOTATE IN BOOLEAN := TRUE,
    EMBEDCOLL IN BOOLEAN := TRUE )
RETURN SYS.XMLTYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMANAME</td>
<td>(IN)</td>
<td>Name of the database schema containing the type.</td>
</tr>
<tr>
<td>TYPENAME</td>
<td>(IN)</td>
<td>Name of the Oracle type.</td>
</tr>
<tr>
<td>ELEMENTNAME</td>
<td>(IN)</td>
<td>The name of the top level element in the XML Schema defaults to TYPENAME.</td>
</tr>
<tr>
<td>RECURSE</td>
<td>(IN)</td>
<td>Whether or not to also generate schema for all types referred to by the type specified.</td>
</tr>
<tr>
<td>ANNOTATE</td>
<td>(IN)</td>
<td>Whether or not to put the SQL annotations in the XML Schema.</td>
</tr>
<tr>
<td>EMBEDCOLL</td>
<td>(IN)</td>
<td>Should the collections be embedded in the type which refers to them, or create a complexType? Cannot be FALSE if annotations are turned on.</td>
</tr>
</tbody>
</table>
These functions generate XML schema(s) from an Oracle type name. Returns a collection of XMLTypes, one XML Schema document for each database schema. Can result in an ORA-31001 exception: invalid resource handle or path name.

**Syntax**

```plsql
FUNCTION GENERATESCHEM((
    SCHEMANAME IN VARCHAR2,
    TYPENAME IN VARCHAR2,
    ELEMENTNAME IN VARCHAR2 := NULL,
    SCHEMAURL IN VARCHAR2 := NULL,
    ANNOTATE IN BOOLEAN := TRUE,
    EMBEDCOLL IN BOOLEAN := TRUE
) RETURN SYS.XMLTYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMANAME</td>
<td>(IN)</td>
<td>Name of the database schema containing the type.</td>
</tr>
<tr>
<td>TYPENAME</td>
<td>(IN)</td>
<td>Name of the Oracle type.</td>
</tr>
<tr>
<td>ELEMENTNAME</td>
<td>(IN)</td>
<td>The name of the top level element in the XML Schema defaults to TYPENAME.</td>
</tr>
<tr>
<td>SCHEMAURL</td>
<td>(IN)</td>
<td>Specifies base URL where schemas will be stored, needed by top level schema for import statement.</td>
</tr>
<tr>
<td>ANNOTATE</td>
<td>(IN)</td>
<td>Whether or not to put the SQL annotations in the XML Schema.</td>
</tr>
<tr>
<td>EMBEDCOLL</td>
<td>(IN)</td>
<td>Should the collections be embedded in the type which refers to them, or create a complexType? Cannot be FALSE if annotations are turned on.</td>
</tr>
</tbody>
</table>
REGISTERSCHEMMA

Registers the specified schema for use by the database.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROCEDURE REGISTERSCHEMMA(  \n  SCHEMAURL IN VARCHAR2,  \n  SCHEMADOC IN VARCHAR2,  \n  LOCAL IN BOOLEAN := TRUE,  \n  GENTYPES IN BOOLEAN := TRUE,  \n  GENBEAN IN BOOLEAN := FALSE,  \n  GENTABLES IN BOOLEAN := TRUE,  \n  FORCE IN BOOLEAN := FALSE,  \n  OWNER IN VARCHAR2 := NULL);</td>
<td>Registers a schema specified as a VARCHAR2.</td>
</tr>
<tr>
<td>PROCEDURE REGISTERSCHEMMA(  \n  SCHEMAURL IN VARCHAR2,  \n  SCHEMADOC IN BFILE,  \n  LOCAL IN BOOLEAN := TRUE,  \n  GENTYPES IN BOOLEAN := TRUE,  \n  GENBEAN IN BOOLEAN := FALSE,  \n  GENTABLES IN BOOLEAN := TRUE,  \n  FORCE IN BOOLEAN := FALSE,  \n  OWNER IN VARCHAR2 := NULL);</td>
<td>Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set.</td>
</tr>
<tr>
<td>PROCEDURE REGISTERSCHEMMA(  \n  SCHEMAURL IN VARCHAR2,  \n  SCHEMADOC IN BFILE,  \n  LOCAL IN BOOLEAN := TRUE,  \n  GENTYPES IN BOOLEAN := TRUE,  \n  GENBEAN IN BOOLEAN := TRUE,  \n  GENTABLES IN BOOLEAN := TRUE,  \n  FORCE IN BOOLEAN := TRUE,  \n  OWNER IN VARCHAR2 := '',  \n  CSID IN NUMBER);</td>
<td>Registers the schema specified as a BFILE and identifies the character set id of the schema document.</td>
</tr>
<tr>
<td>PROCEDURE REGISTERSCHEMMA(  \n  SCHEMAURL IN VARCHAR2,  \n  SCHEMADOC IN BLOB,  \n  LOCAL IN BOOLEAN := TRUE,  \n  GENTYPES IN BOOLEAN := TRUE,  \n  GENBEAN IN BOOLEAN := FALSE,  \n  GENTABLES IN BOOLEAN := TRUE,  \n  FORCE IN BOOLEAN := FALSE,  \n  OWNER IN VARCHAR2 := NULL);</td>
<td>Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set.</td>
</tr>
</tbody>
</table>
### Syntax

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
</table>
| `PROCEDURE REGISTERSCHEMA(  
  SCHEMAURL IN VARCHAR2,  
  SCHEMADOC IN BLOB,  
  LOCAL IN BOOLEAN := TRUE,  
  GENTYPES IN BOOLEAN := TRUE,  
  GENBEAN IN BOOLEAN := TRUE,  
  GENTABLES IN BOOLEAN := TRUE,  
  FORCE IN BOOLEAN := TRUE,  
  OWNER IN VARCHAR2 := '',  
  CSID IN NUMBER);` | Registers the schema specified as a BLOB and identifies the character set id of the schema document. |
| `PROCEDURE REGISTERSCHEMA(  
  SCHEMAURL IN VARCHAR2,  
  SCHEMADOC IN CLOB,  
  LOCAL IN BOOLEAN := TRUE,  
  GENTYPES IN BOOLEAN := TRUE,  
  GENBEAN IN BOOLEAN := FALSE,  
  FORCE IN BOOLEAN := FALSE,  
  OWNER IN VARCHAR2 := NULL);` | Registers the schema specified as a CLOB. |
| `PROCEDURE REGISTERSCHEMA(  
  SCHEMAURL IN VARCHAR2,  
  SCHEMADOC IN SYS.XMLTYPE,  
  LOCAL IN BOOLEAN := TRUE,  
  GENTYPES IN BOOLEAN := TRUE,  
  GENBEAN IN BOOLEAN := FALSE,  
  FORCE IN BOOLEAN := FALSE,  
  OWNER IN VARCHAR2 := NULL);` | Registers the schema specified as an XMLType. |
| `PROCEDURE REGISTERSCHEMA(  
  SCHEMAURL IN VARCHAR2,  
  SCHEMADOC IN SYS.URITYPE,  
  LOCAL IN BOOLEAN := TRUE,  
  GENTYPES IN BOOLEAN := TRUE,  
  GENBEAN IN BOOLEAN := FALSE,  
  FORCE IN BOOLEAN := FALSE,  
  OWNER IN VARCHAR2 := NULL);` | Registers the schema specified as a URIType. |
### Summary of DBMS_XMLSCHEMA Subprograms

#### Parameter | IN / OUT | Description
--- | --- | ---
SCHEMAURL | (IN) | URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside SCHEMALOCATION attribute of XML Schema import element.
SCHEMADOC | (IN) | A valid XML schema document.
LOCAL | (IN) | Is this a local or global schema?
  - By default, all schemas are registered as local schemas, under /sys/schemas/<username>/...
  - If a schema is registered as global, it is added under /sys/schemas/PUBLIC/...
You need write privileges on the directory to be able to register a schema as global.
GENTYPES | (IN) | Should the schema compiler generate object types? By default, TRUE.
GENBEAN | (IN) | Should the schema compiler generate Java beans? By default, FALSE.
GENTABLES | (IN) | Should the schema compiler generate default tables? By default, TRUE
FORCE | (IN) | If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
OWNER | (IN) | This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
CSID | (IN) | Identifies the character set of the input schema document; if this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
Registers an XML Schema specified by a URI name.

**Syntax**

```plsql
PROCEDURE REGISTERURI(
    SCHEMAURL IN VARCHAR2,
    SCHEMADOCURI IN VARCHAR2,
    LOCAL IN BOOLEAN := TRUE,
    GENTYPES IN BOOLEAN := TRUE,
    GENBEAN IN BOOLEAN := FALSE,
    GENTABLES IN BOOLEAN := TRUE,
    FORCE IN BOOLEAN := FALSE,
    OWNER IN VARCHAR2 := NULL);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMAURL</td>
<td>IN</td>
<td>Uniquely identifies the schema document. Can be used inside SCHEMALLOCATION attribute of XML Schema import element.</td>
</tr>
<tr>
<td>SCHEMADOCURI</td>
<td>IN</td>
<td>Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the URIFactory - and invokes the REGISTERSCHEMA function.</td>
</tr>
<tr>
<td>LOCAL</td>
<td>IN</td>
<td>Is this a local or global schema? By default, all schemas are registered as local schemas, under /sys/schemas/&lt;username&gt;/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.</td>
</tr>
<tr>
<td>GENTYPES</td>
<td>IN</td>
<td>Should the compiler generate object types? By default, TRUE.</td>
</tr>
<tr>
<td>GENBEAN</td>
<td>IN</td>
<td>Should the compiler generate Java beans? By default, FALSE.</td>
</tr>
<tr>
<td>GENTABLES</td>
<td>IN</td>
<td>Should the compiler generate default tables? TRUE by default.</td>
</tr>
<tr>
<td>FORCE</td>
<td>IN</td>
<td>TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
</tbody>
</table>
The parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
<table>

<td>All XMLType view columns in views owned by the current user.</td>
</tr>
<tr>
<td>ALL_XML_VIEW_COLS</td>
<td>All XMLType view columns in views usable by the current user.</td>
</tr>
</tbody>
</table>
USER_XML_SCHEMAS

Lists all schemas (local and global) belonging to the current user.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_URL</td>
<td>VARCHAR2</td>
<td>URL of XML schema</td>
</tr>
<tr>
<td>LOCAL</td>
<td>VARCHAR2</td>
<td>Local schema (YES/NO)</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>XMLTYPE</td>
<td>XML Schema document</td>
</tr>
</tbody>
</table>
**ALL_XML_SCHEMAS**

Lists all local schemas belonging to the current user and all global schemas.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>Database user owning XML schema</td>
</tr>
<tr>
<td>SCHEMA_URL</td>
<td>VARCHAR2</td>
<td>URL of XML schema</td>
</tr>
<tr>
<td>LOCAL</td>
<td>VARCHAR2</td>
<td>Local schema (YES/NO)</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>XMLTYPE</td>
<td>XML Schema document</td>
</tr>
</tbody>
</table>
DBA_XML_SCHEMAS

Lists all registered local and global schemas in the system.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>Database user owning XML schema</td>
</tr>
<tr>

<td>Creates a save context, and returns the context handle.</td>
</tr>
<tr>
<td>SETKEYCOLUMN</td>
<td>This method adds a column to the key column list.</td>
</tr>
<tr>
<td>SETROWTAG</td>
<td>Names the tag used in the XML document, to enclose the XML elements corresponding to the database.</td>
</tr>
<tr>
<td>SETUPDATECOLUMN</td>
<td>Adds a column to the &quot;update column list&quot;.</td>
</tr>
<tr>
<td>UPDATEXML</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
CLEARKEYCOLUMNLIST

CLEARKEYCOLUMNLIST

Clears the key column list.

**Syntax**

```plaintext
PROCEDURE CLEARKEYCOLUMNLIST(
    CTXHDL IN CTXTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

PROCEDURE CLEARUPDATECOLUMNLIST(
  CTXHDL IN CTXTYPE);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

PROCEDURE CLOSECONTEXT(
  CTXHDL IN CTXTYPE);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION DELETEXML( CTXHDL IN CTXPTYPE, XDOC IN VARCHAR2) RETURN NUMBER;</td>
<td>Uses a VARCHAR2 type for the XDOC parameter.</td>
</tr>
<tr>
<td>FUNCTION DELETEXML( CTXHDL IN CTXTYPE, XDOC IN CLOB) RETURN NUMBER;</td>
<td>Uses a CLOB type for the XDOC parameter.</td>
</tr>
<tr>
<td>FUNCTION DELETEXML( CTXHDL IN CTXTYPE, XDOC IN XMLTYPE) RETURN NUMBER;</td>
<td>Uses an XMLType type for the XDOC parameter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION INSERTXML(  
  CTXHDL IN CTXTYPE,  
  XDOC IN VARCHAR2)  
RETURN NUMBER; |
| Passes in the XDOC parameter as a VARCHAR2. |
| FUNCTION INSERTXML(  
  CTXHDL IN CTXTYPE,  
  XDOC IN CLOB)  
RETURN NUMBER; |
| Passes in the XDOC parameter as a CLOB. |
| FUNCTION INSERTXML(  
  CTXHDL IN CTXTYPE,  
  XDOC IN XMLTYPE)  
RETURN NUMBER; |
| Passes in the XDOC parameter as an XMLType. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

FUNCTION NEWCONTEXT(
    TARGETTABLE IN VARCHAR2)
RETURN CTXTYPE;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGETTABLE</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>
This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```sql
PROCEDURE SETKEYCOLUMN(
    CTXHDL IN CTXTYPE,
    COLNAME IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>COLNAME</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
**SETROWTAG**

Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

**Syntax**

```sql
PROCEDURE SETROWTAG(
    CTXHDL IN CTXTYPE,
    TAG IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>TAG</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```sql
PROCEDURE SETUPDATECOLUMN(
    CTXHDL IN CTXTYPE,
    COLNAME IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>COLNAME</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
**UPDATEXML**

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION UPDATEXML( 
  CTXHDL IN CTXTYPE, 
  XDOC IN VARCHAR2) 
RETURN NUMBER; | Passes in the XDOC parameter as a VARCHAR2. |
| FUNCTION UPDATEXML( 
  CTXHDL IN CTXTYPE, 
  XDOC IN CLOB) 
RETURN NUMBER; | Passes in the XDOC parameter as a CLOB. |
| FUNCTION UPDATEXML( 
  CTXHDL IN CTXTYPE, 
  XDOC IN XMLTYPE) 
RETURN NUMBER; | Passes in the XDOC parameter as a XMLType. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTXHDL</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>XDOC</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats. You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR). It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views.

For more information on the `EXPLAIN PLAN` command and the AWR, see Oracle Database Performance Tuning Guide. For more information on the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS` fixed views, see Oracle Database Reference.

This chapter contains the following topics:

- **Using DBMS_XPLAN**
  - **Overview**
  - **Security Model**
  - **Examples**
- **Summary of DBMS_XPLAN Subprograms**
Using DBMS_XPLAN

- Overview
- Security Model
- Examples

Overview

The DBMS_XPLAN package supplies three table functions:
- DISPLAY, to format and display the contents of a plan table
- DISPLAY_CURSOR, to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_AWR to format and display the contents of the execution plan of a stored SQL statement in the AWR.

Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires to have select privileges on the following fixed views: V$SQL_PLAN, V$SESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR function requires to have SELECT privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

All these privileges are automatically granted as part of the SELECT_CATALOG role.

Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
```
AND e.ename='benoit';

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
---------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU) | Time     |
---------------------------------------------------------------------------
| 0   | SELECT STATEMENT   |      | 1     | 57    | 6 (34)      | 00:00:01 |
|* 1  | HASH JOIN          |      | 1     | 57    | 6 (34)      | 00:00:01 |
|* 2  | TABLE ACCESS FULL | EMP  | 1     | 37    | 3 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4     | 80    | 3 (34)      | 00:00:01 |
---------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

Displaying a Cursor Execution Plan Using `DBMS_XPLAN.DISPLAY_CURSOR`

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
WHERE   e.deptno = d.deptno
        AND   e.empno=7369;
ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno = 7369

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>HASH JOIN</td>
<td></td>
<td>1</td>
<td>16</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>2</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>1</td>
<td>13</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>12</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):
---------------------------------------
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."EMPNO"=7369)

21 rows selected.

You can also use the table function DISPLAY_CURSOR to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);

Get sql_id and child_number for the preceding statement:
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID          CHILD_NUMBER
--------------   ----------------------------
gwp663cqh5qbf   0

Display the execution plan for the cursor:
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR((gwp663cqh5qbf, 0)));

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
Using DBMS_XPLAN

---

SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

---

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>SORT GROUP BY</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (43)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>*  2</td>
<td>HASH JOIN</td>
<td></td>
<td>14</td>
<td>224</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>44</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>4</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>14</td>
<td>70</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

---

2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE sql_text LIKE '%TOTO%';

---

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and display_cursor table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY on page 120-2, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;

Display the plan using the DBMS_XPLAN.DISPLAY table function

SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345

<table>
<thead>

</table>

Predicate Information (identified by operation id):

6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the statement_id parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no need to purge the plan table after each EXPLAIN PLAN. However, you should purge the plan table regularly (for example, by using the TRUNCATE TABLE command) to ensure good performance in the execution of the DISPLAY table function.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

**Using a View to Display Last Explain Plan**

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

Examples
# display the output of the last explain plan command
SELECT * FROM PLAN;
Summary of DBMS_XPLAN Subprograms

Table 120–1  DBMS_XPLAN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY_AWR Function on page 120-9</td>
<td>Displays the contents of an execution plan stored in the AWR</td>
</tr>
<tr>
<td>DISPLAY Function on page 120-11</td>
<td>Displays the contents of the plan table</td>
</tr>
<tr>
<td>DISPLAY_CURSOR Function on page 120-13</td>
<td>Displays the execution plan of any cursor in the cursor cache</td>
</tr>
</tbody>
</table>
DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
    sql_id            IN      VARCHAR2,
    plan_hash_value   IN      NUMBER DEFAULT NULL,
    db_id             IN      NUMBER DEFAULT NULL,
    format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function will return all stored execution plans for a given SQL_ID.</td>
</tr>
<tr>
<td>db_id</td>
<td>Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database will be used, as shown in V$DATABASE.</td>
</tr>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It has the same set of values than the table function DISPLAY, that is, BASIC, TYPICAL, SERIAL and ALL.</td>
</tr>
</tbody>
</table>

Usage Notes

To use the DISPLAY_AWR functionality, the calling user must have SELECT privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it will show an appropriate error message.

Examples

To display the execution plan of all children associated to the SQL ID 'atfwc98anrykp':
DISPLAY_AWR Function

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display the execution plan of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
  (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL')) tf
WHERE ht.sql_text like '%TOTO%';
```
DISPLAY Function

This table function displays the contents of the plan table.

Syntax

```sql
DBMS_XPLAN.DISPLAY(
  table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
  statement_id  IN  VARCHAR2  DEFAULT  NULL,
  format        IN  VARCHAR2  DEFAULT 'TYPICAL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function will show you the plan of the most recent explained statement.</td>
</tr>
</tbody>
</table>
| format       | Controls the level of details for the plan. It accepts four values:  
  - BASIC: Displays the minimum information in the plan—the operation ID, the object name, and the operation option.  
  - TYPICAL: This is the default. Displays the most relevant information in the plan. Partition pruning, parallelism, and predicates are displayed only when available.  
  - ALL: Maximum level. Includes information displayed with the TYPICAL level and adds projection information as well as SQL statements generated for parallel execution servers (only if parallel).  
  - SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. |

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:
Display Function

SELECT * FROM table(DBMS_XPLAN.DISPLAY);

To display from other than the default plan table, "my_plan_table":
SELECT * FROM table(DBMS_XPLAN.DISPLAY('my_plan_table'));

To display the minimum plan information:
SELECT * FROM table(DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));

To display the plan for a statement identified by 'foo', such as statement_id='foo':
SELECT * FROM table(DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
**DISPLAY_CURSOR Function**

This table function displays the explain plan of any cursor loaded in the cursor cache.

**Syntax**

```sql
DBMS_XPLAN.DISPLAY_CURSOR(
    sql_id        IN  VARCHAR2  DEFAULT  NULL,
    child_number  IN  NUMBER    DEFAULT  NULL,
    format        IN  VARCHAR2  DEFAULT  'TYPICAL');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session will be displayed.</td>
</tr>
<tr>
<td>child_number</td>
<td>Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.</td>
</tr>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It has the same set of values than the table function 'DISPLAY', that is, 'BASIC', 'TYPICAL', 'SERIAL' and 'ALL'. Two additional values are also supported to display run-time statistics for the cursor:</td>
</tr>
</tbody>
</table>

- **RUNSTATS_LAST**: Displays the runtime statistics for the last execution of the cursor.
- **RUNSTATS_TOT**: Displays the total aggregated runtime statistics for all executions of a specific SQL statement since the statement was first parsed and executed.

Format options 'RUNSTATS_LAST' and 'RUNSTATS_TOT' can only be used if the target cursor was compiled and executed with the initialization parameter 'statistics_level' set to 'ALL'.

DISPLAY_CURSOR Function

Usage Notes:

To use the DISPLAY_CURSOR functionality, the calling user must have SELECT privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it will show an appropriate error message.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated to the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', null, 'RUNSTATS_LAST'));
```
With DBMS_XSLPROCESSOR, you can access the contents and structure of XML documents. The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree. This PL/SQL implementation of the XSL processor followed the W3C XSLT working draft rev WD-xslt-19990813 and included the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM APIs is built
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

This chapter contains the following topics:

CLOB2FILE

Write content of a CLOB into a file.

Syntax

```plsql
PROCEDURE CLOB2FILE(
    CL CLOB;
    FLOCATION VARCHAR2,
    FNAME VARCHAR2,
```
Summary of DBMS_XSLPROCESSOR Subprograms

FREEPROCESSOR

Frees a Processor object.

**Syntax**

```sql
PROCEDURE FREEPROCESSOR(
    P PROCESSOR);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>(IN)</td>
<td>Processor.</td>
</tr>
</tbody>
</table>

FREESTYLESHEET

Frees a Stylesheet object.

**Syntax**

```sql
PROCEDURE FREESTYLESHEET(
    SS STYLESHEET);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>Character set id of the file</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If 0, content of the output file will be in the database character set.</td>
</tr>
</tbody>
</table>

Parameter IN / OUT Description

- CLOB - File directory
- FLOCATION - File directory
- FNAME - File name
- CSID (IN) - Character set id of the file
  - Must be a valid Oracle id; otherwise returns an error
  - If 0, content of the output file will be in the database character set.
NEWPROCESSOR

Returns a new Processor instance. This function must be called before the default behavior of Processor can be changed and if other processor methods need to be used.

Syntax

FUNCTION NEWPROCESSOR
RETURN PROCESSOR;

NEWSTYLESHEET

Creates and returns a new Stylesheet instance. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION NEWSTYLESHEET(
XMLDOC DOMDOCUMENT,
REF VARCHAR2)
RETURN STYLESHEET; | Creates and returns a new stylesheet instance using the given DOMDocument and reference URLs. |
| FUNCTION NEWSTYLESHEET(
INP VARCHAR2,
REF VARCHAR2)
RETURN STYLESHEET; | Creates and returns a new Stylesheet instance using the given input and reference URLs. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLDOC</td>
<td>(IN)</td>
<td>DOMDocument to use for construction.</td>
</tr>
<tr>
<td>INP</td>
<td>(IN)</td>
<td>Input URL to use for construction.</td>
</tr>
<tr>
<td>REF</td>
<td>(IN)</td>
<td>Reference URL</td>
</tr>
</tbody>
</table>
**PROCESSXSL**

Transforms input `XMLDocument`. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FUNCTION PROCESSXSL(</code>&lt;br&gt;<code>P PROCESSOR,&lt;br&gt;</code>SS STYLESHEET,&lt;br&gt;<code>XMLDOC DOMDOCUMENT),&lt;br&gt;</code>RETURN DOMDOCUMENTFRAGMENT;<code>&lt;br&gt;</code>)`</td>

</tbody>
</table>
READ2CLOB

Read content of a file into a CLOB.

Syntax

FUNCTION READ2CLOB(
  FLOCATION VARCHAR2,
  FNAME VARCHAR2,
  CSID IN NUMBER:=0)
RETURN CLOB;

Parameter | IN / OUT | Description
--- | --- | ---
FLOCATION | - | File directory
FNAME | - | File name
CSID | (IN) | Character set id of the file

- Must be a valid Oracle id; otherwise returns an error
- If 0, input file is assumed to be in the database character set.

REMOVEPARAM

Removes a top level stylesheet parameter.

Syntax

PROCEDURE REMOVEPARAM(
  SS STYLEISHEET,
  NAME VARCHAR2);

Parameter | IN / OUT | Description
--- | --- | ---
SS | (IN) | Stylesheet instance.
NAME | (IN) | Name of the parameter.
RESETPARAMS

Resets the top-level stylesheet parameters.

Syntax

PROCEDURE RESETPARAMS(
    SS STYLESHEET);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>(IN)</td>
<td>Stylesheet instance.</td>
</tr>
</tbody>
</table>

SELECTNODES

Selects nodes which match the given pattern from a DOM tree, and returns the result of the selection.

Syntax

FUNCTION SELECTNODES(
    N DOMNODE,
    PATTERN VARCHAR2)
RETURN DOMNODELIST;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>(IN)</td>
<td>Root DOMNode of the tree.</td>
</tr>
<tr>
<td>PATTERN</td>
<td>(IN)</td>
<td>Pattern to use.</td>
</tr>
</tbody>
</table>

SELECTSINGLENODE

Selects the first node from the tree that matches the given pattern, and returns that node.
Syntax
FUNCTION SELECTSINGLENODE(
    N DOMNODE,
    PATTERN VARCHAR2)
RETURN DOMNODE;

Parameter | IN / OUT | Description
---|---|---
N | (IN) | Root DOMNode of the tree.
PATTERN | (IN) | Pattern to use.

SETERRORLOG

Sets errors to be sent to the specified file.

Syntax
PROCEDURE SETERRORLOG(
    P PROCESSOR,
    FILENAME VARCHAR2);

Parameter | IN / OUT | Description
---|---|---
P | (IN) | Processor instance.
FILENAME | (IN) | complete path of the file to use as the error log.

SETPARAM

Sets a top level parameter in the stylesheet. The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax
PROCEDURE SETPARAM(
    SS STYLESHEET,
    NAME VARCHAR2,
    VALUE VARCHAR2);
SHOWWARNINGS

Turns warnings on (TRUE) or off (FALSE).

Syntax

```plsql
PROCEDURE SHOWWARNINGS(
    P PROCESSOR,
    YES BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SS</td>
<td>(IN)</td>
<td>Stylesheet instance.</td>
</tr>
<tr>
<td>NAME</td>
<td>(IN)</td>
<td>Name of the parameter.</td>
</tr>
<tr>
<td>VALUE</td>
<td>(IN)</td>
<td>Value of the parameter.</td>
</tr>
</tbody>
</table>

TRANSFORMNODE

Transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```plsql
FUNCTION TRANSFORMNODE(
    N DOMNODE,
    SS STYLESHEET)
RETURN DOMDOCUMENTFRAGMENT;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>(IN)</td>
<td>DOMNode to transform.</td>
</tr>
<tr>
<td>SS</td>
<td>(IN)</td>
<td>Stylesheet to use.</td>
</tr>
</tbody>
</table>
VALUEOF

Retrieves the value of the first node from the tree that matches the given pattern.

Syntax

PROCEDURE VALUEOF(
    N DOMNODE,
    PATTERN VARCHAR2,
    VAL OUT VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>(IN)</td>
<td>Node whose value is being retrieved.</td>
</tr>
<tr>
<td>PATTERN</td>
<td>(IN)</td>
<td>Pattern to use.</td>
</tr>
<tr>
<td>VAL</td>
<td>(OUT)</td>
<td>Retrieved value.</td>
</tr>
</tbody>
</table>
VALUEOF
The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Using DEBUG_EXTPROC
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms
Using DEBUG_EXTPROC

Security Model

Your Oracle account must have EXECUTE privileges on the package and CREATE LIBRARY privileges.

Operational Notes

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

Note: These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a brand new oracle session through SQL*Plus or OCI program by connecting to ORACLE.
Using DEBUG_EXTPROC

- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.

- Determine the PID of the extproc agent that was started up for this session.

- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.

- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.

- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT

- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. It's assumed that you had built the shared library with debugging symbols.

- Now proceed with your debugging.

Rules and Limits

---

**Note:** DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.

---
### Summary of DEBUG_EXTPROC Subprograms

</tbody>
</table>
STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```
STARTUP_EXTPROC_AGENT Procedure
The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, "<A>".

See Also: For more information about implementation of this package:
- *Oracle HTTP Server Administrator’s Guide*

This chapter contains the following topics:

- Using HTF
  - Operational Notes
  - Rules and Limits
  - Examples
- Summary of Tags
- Summary of HTF Subprograms
Using HTF

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the function.
Examples

The following commands generate a simple HTML document:

```sql
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.P (HTF.HTMLOPEN); -- generates <HTML>
  HTP.P (HTF.HEADOPEN); -- generates <HEAD>
  HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
  HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
  HTP.P (HTF.BODYOPEN); -- generates <BODY>
  HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
  HTP.P (HTF.BODYCLOSE); -- generates </BODY>
  HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```
Summary of Tags

**HTML, HEAD, and BODY Tags**
- **HTMLOpen Function, HTMLClose Function** - generate `<HTML>` and `</HTML>`
- **HEADOPEN Function, HEADCLOSE Function** - generate `<HEAD>` and `</HEAD>`
- **BODYOPEN Function, BODYCLOSE Function** - generate `<BODY>` and `</BODY>`

**Comment Tag**
- **COMMENT Function** - generates `<!--` and `-->`

**Tags in the `<HEAD>` Area**
- **BASE Function** - generates `<BASE>`
- **LINKREL Function** - generates `<LINK>` with the REL attribute
- **LINKREV Function** - generates `<LINK>` with the REV attribute
- **TITLE Function** - generates `<TITLE>`
- **META Function** - generates `<META>`
- **SCRIPT Function** - generates `<SCRIPT>`
- **STYLE Function** - generates `<STYLE>`
- **ISINDEX Function** - generates `<ISINDEX>`

**Applet Tags**
- **APPLETOPEN Function, APPLETCLOSE Function** - generate `<APPLET>` and `</APPLET>`
- **PARAM Function** - generates `<PARAM>`

**List Tags**
- **OLOPEN Function, OLSCLOSE Function** - generate `<OL>` and `</OL>`
- **ULOPEN Function, ULSCLOSE Function** - generate `<UL>` and `</UL>`
- **DLOPEN Function, DLSCLOSE Function** - generate `<DL>` and `</DL>`
- **DLTERM Function** - generates `<DT>`
### Summary of Tags

- **DLISTDEF Function** - generates `<DD>`
- **DIRLISTOPEN Function, DIRLISTCLOSE Function** - generate `<DIR>` and `<DIR>`
- **LISTHEADER Function** - generates `<LH>`
- **LISTINGOPEN Function, LISTINGCLOSE Function** - generate `<LISTING>` and `<LISTING>`
- **MENULISTOPEN Function** - generate `<MENU>` and `<MENU>`
- **LISTITEM Function** - generates `<LI>`

### Form Tags

- **FORMOPEN Function, FORMCLOSE Function** - generate `<FORM>` and `<FORM>`
- **FORMCHECKBOX Function** - generates `<INPUT TYPE="CHECKBOX">`
- **FORMHIDDEN Function** - generates `<INPUT TYPE="HIDDEN">`
- **FORMIMAGE Function** - generates `<INPUT TYPE="IMAGE">`
- **FORMPASSWORD Function** - generates `<INPUT TYPE="PASSWORD">`
- **FORMRADIO Function** - generates `<INPUT TYPE="RADIO">`
- **FORMSELECTOPEN Function, FORMSELECTCLOSE Function** - generate `<SELECT>` and `<SELECT>`
- **FORMSELECTOPTION Function** - generates `<OPTION>`
- **FORMTEXT Function** - generates `<INPUT TYPE="TEXT">`
- **FORMTEXTAREA Function** - generate `<TEXTAREA>`
- **FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function** - generate `<TEXTAREA>` and `<TEXTAREA>`
- **FORMRESET Function** - generates `<INPUT TYPE="RESET">`
- **FORMSUBMIT Function** - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

- **TABLEOPEN Function, TABLECLOSE Function** - generate `<TABLE>` and `<TABLE>`
- **TABLECAPTION Function** - generates `<CAPTION>`
Summary of Tags

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>
TABLEHEADER Function - generates <TH>
TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>
IMG Function, IMG2 Function - generate <IMG>
ANCHOR Function, ANCHOR2 Function - generate <A>
MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)
PARA Function, PARAGRAPh Function - generate <P>
PRN Functions, PRINT Functions - generate any text that is passed in
PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>
BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>
DIV Function - generates <DIV>
NL Function, BR Function - generate <BR>
NOBR Function - generates <NOBR>
WBR Function - generates <WBR>
PLAINTEXT Function - generates <PLAINTEXT>
ADDRESS Function - generates <ADDRESS>
MAILTO Function - generates <A> with the MAILTO attribute
AREA Function - generates <AREA>
BGSOUND Function - generates <BGSOUND>
Character Formatting Tags

BASEFONT Function - generates <BASEFONT>
BIG Function - generates <BIG>
BOLD Function - generates <B>
CENTER Function - generates <CENTER> and </CENTER>
CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>
CITE Function - generates <CITE>
CODE Function - generates <CODE>
DFN Function - generates <DFN>
EM Function, EMPHASIS Function - generate <EM>
FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>
ITALIC Function - generates <I>
KBD Function, KEYBOARD Function - generate <KBD> and </KBD>
S Function - generates <S>
SAMPLE Function - generates <SAMP>
SMALL Function - generates <SMALL>
STRIKE Function - generates <STRIKE>
STRONG Function - generates <STRONG>
SUB Function - generates <SUB>
SUP Function - generates <SUP>
TELETYPE Function - generates <TT>
UNDERLINE Function - generates <U>
VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>
FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate 
<NOFRAMES> and </NOFRAMES>
### Summary of HTF Subprograms

**Table 123–1 HTF Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Function on page 123-17</td>
<td>Generates the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>ANCHOR Function on page 123-18</td>
<td>Generates the <code>&lt;a&gt;</code> and <code>&lt;/a&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Function on page 123-19</td>
<td>Generates the <code>&lt;a&gt;</code> and <code>&lt;/a&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Function on page 123-20</td>
<td>Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag</td>
</tr>
<tr>
<td>APPLETOOPEN Function on page 123-21</td>
<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Function on page 123-23</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Function on page 123-24</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Function on page 123-25</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Function on page 123-26</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Function on page 123-27</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Function on page 123-28</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Function on page 123-29</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Function on page 123-30</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Function on page 123-31</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
</tbody>
</table>

<tr>
<td>STRIKE Function on page 123-121</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Function on page 123-122</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Function on page 123-123</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Function on page 123-124</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Function on page 123-125</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Function on page 123-126</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Function on page 123-127</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Function on page 123-128</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table.</td>
</tr>
</tbody>
</table>
### Table 123–1 (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLECLOSE Function on page 123-129</td>
<td>Generates the &lt;/TABLE&gt; tag which marks the end of an HTML table</td>
</tr>
<tr>
<td>TABLEOPEN Function on page 123-130</td>
<td>Generates the &lt;TABLE&gt; tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Function on page 123-131</td>
<td>Generates the &lt;/TR&gt; tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Function on page 123-132</td>
<td>Generates the &lt;TR&gt; tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPE Function on page 123-133</td>
<td>Generates the &lt;TT&gt; and &lt;/TT&gt; tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Function on page 123-134</td>
<td>Generates the &lt;TITLE&gt; and &lt;/TITLE&gt; tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Function on page 123-135</td>
<td>Generates the &lt;/UL&gt; tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Function on page 123-136</td>
<td>Generates the &lt;UL&gt; tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Function on page 123-137</td>
<td>Generates the &lt;U&gt; and &lt;/U&gt; tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Function on page 123-138</td>
<td>Generates the &lt;VAR&gt; and &lt;/VAR&gt; tags which direct the browser to render the text they surround in italics or however “variable” is defined stylistically.</td>
</tr>
<tr>
<td>WBR Function on page 123-139</td>
<td>Generates the &lt;WBR&gt; tag, which inserts a soft line break within a section of NOBR text</td>
</tr>
</tbody>
</table>
**ADDRESS Function**

This function generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

**Syntax**

```
HTF.ADDRESS (  
cvalue IN VARCHAR2 
cnowrap IN VARCHAR2 DEFAULT NULL 
cclear IN VARCHAR2 DEFAULT NULL 
cattributes IN VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is included in the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the <code>CLEAR</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```
ANCHOR Function

This function and the ANCHOR2 Function functions generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR ( 
    curl IN VARCHAR2,
    ctext IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Function

This function and the ANCHOR Function generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (  
  curl IN VARCHAR2,  
  ctext IN VARCHAR2,  
  cname IN VARCHAR2 DEFAULT NULL,  
  ctarget in VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETOPEN Function on page 123-21

Syntax

HTF.APPLETCLOSE
RETURN VARCHAR2;
APPLETOPEN Function

This function generates the `<APPLET>` tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 123-20 which generates the `</APPLET>` tag.

Syntax

```
HTF.APPLETOPEN {
    ccode IN VARCHAR2,
    cheight IN NUMBER,
    cwidth IN NUMBER,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
```

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
Usage Notes

- Specify parameters to the Java applet using the `PARAM Function` function on page 123-111.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.
AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
  ccoords IN VARCHAR2,
  cshape IN VARCHAR2 DEFAULT NULL,
  chref IN VARCHAR2 DEFAULT NULL,
  cnohref IN VARCHAR2 DEFAULT NULL,
  ctarget IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```
BASE Function

This function generates the `<BASE>` tag which records the URL of the document.

Syntax

```plsql
HTF.BASE (  
    ctarget IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Base HREF="<current URL>" TARGET="ctarget" cattributes/>
```
**BASEFONT Function**

This function generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

**Syntax**

```sql
HTF.BASEFONT (
    nsize    IN    INTEGER)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<BASEFONT SIZE="nsize">
```
BGSOUND Function

This function generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (  
csrc IN VARCHAR2,  
cloop IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>clloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BGSOUND SRC="csrc" LOOP="clloop" cattributes>
```
BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```sql
HTF.BIG (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BIG cattributes>ctext</BIG>
```
BLOCKQUOTECLOSE Function

This function generates the \texttt{</BLOCKQUOTE>} tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the \texttt{BLOCKQUOTEBASEOPEN} Function.

Syntax

\begin{verbatim}
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
\end{verbatim}

Examples

This function generates

\begin{verbatim}
</BLOCKQUOTE>
\end{verbatim}
BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
    cnwrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

</BODY>
BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
    cbackground  IN  VARCHAR2  DEFAULT NULL,
    cattributes  IN  VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
    RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```
BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<B cattributes>ctext</B>
```
BR Function

This function generates the \texttt{<BR>} tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

\begin{verbatim}
HTF.BR(
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
cclear & The value for the CLEAR attribute. \\
cattributes & The other attributes to be included as-is in the tag. \\
\hline
\end{tabular}
\caption{BR Function Parameters}
\end{table}

Examples

This function generates

\texttt{<BR CLEAR="cclear" cattributes>
CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (ctext IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CENTER>ctext</CENTER>
```
CENTERCLOSE Function

This function generates the \(</CENTER>\) tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Function.

Syntax

```sql
HTF.CENTERCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```
**CENTEROPEN Function**

This function generates the `<CENTER>` tag which marks the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the `CENTERCLOSE` Function.

**Syntax**

```
HTF.CENTEROPEN
RETURN VARCHAR2;
```

**Examples**

This function generates

```
<CENTER>
```
CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```sql
HTF.CITE (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<CITE cattributes>ctext</CITE>
```
CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```sql
HTF.CODE (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<CODE cattributes>ctext</CODE>
```
COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT ( 
    ctext    IN    VARCHAR2) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<!-- ctext -->
```
DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```sql
HTF.DFN (ctext IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<DFN>ctext</DFN>
```
**DIRLISTCLOSE Function**

This function generates the \textless /DIR\textgreater tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

**Syntax**

```
HTF.DIRLISTCLOSE
RETURN VARCHAR2;
```

**Usage Notes**

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the \textless LI\textgreater tag directly or invoke the LISTITEM Function so that the \textless LI\textgreater tag appears directly after the \textless /DIR\textgreater tag to define the items as a list.

**Examples**

This function generates

\textless /DIR\textgreater
DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE Function`.

Syntax

```
HTF.DIRLISTOPEN
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the `LISTITEM Function` so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
<DIR>
```
DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
  calign IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```
DLISTCLOSE Function

This function generates the \(</DL>\) tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```sql
HTF.DLISTCLOSE
   RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

\(</DL>\)
**DLISTOPEN Function**

This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

**Syntax**

```
HTF.DLISTOPEN (
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

**Examples**

This function generates

```html
<DL CLEAR="cclear" cattributes>
```
DLISTDEF Function

This function generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```sql
HTF.DLISTDEF (
    ctext IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<DD CLEAR="cclear" cattributes>ctext
```
**DLISTTERM Function**

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

**Syntax**

```sql
HTF.DLISTTERM (
  ctext IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<DT CLEAR="cclear" cattributes>ctext
```
EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```sql
HTF.EM(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```sql
<EM cattributes>ctext</EM>
```
EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```sql
HTF.EMPHASIS(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<EM cattributes>ctext</EM>
```
ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:
- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This function performs the same operation as HTP.PRINTS Procedure and HTP.PS Procedure.

Syntax

```sql
HTF.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
ESCAPE_URL Function

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

Syntax

```
HTF.ESCAPE_URL(
    p_url IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_url</td>
<td>The string to convert.</td>
</tr>
</tbody>
</table>
FONTCLOSE Function

This function generates the </FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

HTF.FONTCLOSE
   RETURN VARCHAR2;

Examples

This function generates

</FONT>
FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
    ccolor IN VARCHAR2 DEFAULT NULL,
    cface IN VARCHAR2 DEFAULT NULL,
    csize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>`
FORMAT CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```sql
HTF.FORMAT_CELL(
    columnValue IN VARCHAR2,
    format_numbers IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValue</td>
<td>The value that needs to be formatted in an HTML table.</td>
</tr>
<tr>
<td>format_numbers</td>
<td>The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TD >columnValue</TD>
```
FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```sql
HTF.FORMCHECKBOX(  
cname    IN    VARCHAR2,  
cvalue   IN    VARCHAR2 DEFAULT 'ON',  
cchecked IN    VARCHAR2 DEFAULT NULL,  
cattributes IN  VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Input TYPE="checkbox" NAME="cfname" VALUE="cvalue" CHECKED cattributes>  
```
FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```plaintext
HTF.FORMCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```plaintext</FORM>
```
**FORMFILE Function**

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

**Syntax**

```
HTF.FORMFILE(
    cname IN VARCHAR2,
    caccept IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```
FORMHIDDEN Function

This function generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```sql
HTF.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```sql
HTF.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```sql
HTF.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cenctype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<form action="curl" method="cmethod" target="ctarget" enctype="cenctype"
cattributes>
</form>
```
FORMPASSWORD Function

This function generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```sql
HTF.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 123–35  FORMPASSWORD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMRADIO Function

This function generates the `<INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```sql
HTF.FORMRADIO(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2,
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
  cvalue IN VARCHAR2 DEFAULT 'Reset',
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```
FORMSELECTCLOSE Function

This function generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```plsql
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</SELECT>

as shown under Examples of the FORMSELECTOPEN Function.
FORMSELECTOPEN Function

This function generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
   cname IN VARCHAR2,
   cprompt IN VARCHAR2 DEFAULT NULL,
   nsize IN INTEGER DEFAULT NULL,
   cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
   Pick the greatest player:
   'Messier'
   'Howe'
   'Gretzky'
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
   'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```
generates

Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
FORMSELECTOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
  cvalue IN VARCHAR2,
  cselected IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.
FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```sql
HTF.FORMSUBMIT(
    cname IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT 'Submit',
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Input TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```
FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

**Table 123-41** FORMTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>csize</code></td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td><code>cmmaxlength</code></td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td><code>cvalue</code></td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```
FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```sql
HTF.FORMTEXTAREA(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes> </TEXTAREA>
```
FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
  cname IN VARCHAR2,
  nrows IN INTEGER,
  ncolumns IN INTEGER,
  calign IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<T Extarea NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes> </T Extarea>
```
FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

HTF.FORMTEXTAREACLOSE
    RETURN VARCHAR2;

Examples

This function generates

</TEXTAREA>
FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```sql
HTF.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```
FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
  cname IN VARCHAR2,
  nrows IN INTEGER,
  ncolumns IN INTEGER,
  calign IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>
```
FRAME Function

This function generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```sql
HTF.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</FRAMESET>
FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```sql
HTF.FRAMESETOPEN(
    crows IN VARCHAR2 DEFAULT NULL,
    ccols IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```sql
HTF.HEADCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</HEAD>
```
HEADOPEN Function

This function generates the `<HEAD>` tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```
This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (<H1> to </H6>).

**Syntax**

```
HTF.HEADER(
    nsize IN INTEGER,
    cheader IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

```
HTF.header (1,'Overview')
RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```
HR Function

This function generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
  cclear  IN  VARCHAR2  DEFAULT  NULL,
  csrc   IN  VARCHAR2  DEFAULT  NULL,
  cattributes  IN  VARCHAR2  DEFAULT  NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<HR CLEAR="cclear" SRC="cs" cattributes>
```
HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

</HTML>
**HTMLOPEN Function**

This function generates the `<HTML>` tag which marks the beginning of an HTML document. You use the HTMLCLOSE Function to mark the end of the an HTML document.

**Syntax**

```
HTF.HTMLOPEN
    RETURN VARCHAR2;
```

**Examples**

This function generates

```
<HTML>
```
IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```sql
HTF.IMG(
  curl IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL,
  calt IN VARCHAR2 DEFAULT NULL,
  cismap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Function performs the same operation but does not use the cusemap parameter.

Syntax

```
HTF.IMG2(
  curl IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL,
  calt IN VARCHAR2 DEFAULT NULL,
  cismap IN VARCHAR2 DEFAULT NULL,
  cusemap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side image map.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
ISINDEX Function

This function creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```sql
HTF.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<ISINDEX PROMPT="cprompt" HREF="curl">  
```
ITALIC Function

This function generates the `<i>` and `</i>` tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<i cattributes>ctext</i>
```
KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```sql
HTF.KBD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<KBD cattributes>ctext</KBD>
```
KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
    ctext    IN     VARCHAR2,
    cattributes    IN     VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<KBD cattributes>ctext</KBD>`
LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
    cclear IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
LINKREL Function

This function generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```sql
HTF.LINKREL(
    crel IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```
LINKREV Function

This function generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
    crev IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```
LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

**Syntax**

```
HTF.LISTHEADER(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code>.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

</LISTING>
LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```
LISTITEM Function

This function generates the `<LI>` tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
    ctext IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrcc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrcc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrcc" cattributes>ctext
```
MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
    caddress IN VARCHAR2,
    ctext  IN VARCHAR2,
    cname  IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```
MAPCLOSE Function

MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

</MAP>
MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```
MENULISTCLOSE Function

This function generates the */MENU* tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```plsql
HTF.MENULISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</MENU>
```
MENULISTOPEN Function

This function generates the `<MENU>` tag which creates a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

**Syntax**

```sql
HTF.MENULISTOPEN
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
<MENU>
```
META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
    chttp_equiv IN VARCHAR2,
    cname IN VARCHAR2,
    ccontent IN VARCHAR2
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
**NL Function**

This function generates the `<BR>` tag which begins a new line of text. It performs the same operation as the **BR Function**.

**Syntax**

```
HTF.NL(
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<BR CLEAR="cclear" cattributes>
```
NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
  ctext        IN        VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<NOBR>ctext</NOBR>
```
**NOFRAMESCLOSE Function**

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

**Syntax**

```
HTF.NOFRAMESCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

`</NOFRAMES>`
NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

HTF.NOFRAMESOPEN
RETURN VARCHAR2;

Examples

This function generates

`<NOFRAMES>`
OLISTCLOSE Function

This function generates the </ol> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```
</ol>
```
OLISTOPEN Function

This function generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
PARA Function

This function generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
    RETURN VARCHAR2;
```

Examples

This function generates

`<P>`
PARAGRAPH Function

You can use this function to add attributes to the `<p>` tag created by the `PARAGRAPH` Function.

Syntax

```sql
HTF.PARAGRAPH(
    calign IN VARCHAR2 DEFAULT NULL,
    cnwrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the <code>CLEAR</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```
PARAM Function

This function generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname IN VARCHAR2
   cvalue IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<PARAM NAME="cname" VALUE="cvalue">
```
PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```plsql
HTF.PLAINTEXT(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctext</code></td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```plaintext
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
PRECLOSE Function

This function generates the \</PRE\> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

\</PRE\>
PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
  cclear IN VARCHAR2 DEFAULT NULL,
  cwidth IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```
PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

HTF.PRINT (  
cbuf      IN       VARCHAR2)  
RETURN VARCHAR2;

HTF.PRINT (  
dbuf      IN       DATE)  
RETURN VARCHAR2;

HTF.PRINT (  
nbuf      IN       NUMBER)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as \<BR\>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use \<BR\> to control how the browser renders the HTML source.
- These functions do not have function equivalents.
PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (      
cbuf      IN       VARCHAR2) 
      RETURN VARCHAR2; 

HTF.PRN (      
dbuf      IN       DATE) 
      RETURN VARCHAR2; 

HTF.PRN (      
nbuf      IN       NUMBER) 
      RETURN VARCHAR2; 
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These functions do not have function equivalents.
S Function

This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<S cattributes>ctext</S>
```
**SAMPLE Function**

This function generates the `<samp>` and `</samp>` tags which direct the browser to render the text they surround in monospace font or however “sample” is defined stylistically.

**Syntax**

```
HTF.SAMPLE (      
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<samp cattributes>ctext</samp>
```
SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
  cscript   IN   VARCHAR2,
  clanguage IN   VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```
STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

Syntax

```sql
STRIKE (ctext IN VARCHAR2, cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```
STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```sql
HTF.STRONG(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<STRONG cattributes>ctext</STRONG>
```
**STYLE Function**

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at [http://www.w3.org](http://www.w3.org). This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

**Syntax**

```sql
HTF.STYLE(
    cstyle IN VARCHAR2
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<STYLE>cstyle</STYLE>
```
This function generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

**Syntax**

```
HTF.SUB(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```
SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```
TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
    ccaption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```
TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```sql
HTF.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cvalue</code></td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cdp</code></td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td><code>cnowrap</code></td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td><code>crowspan</code></td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td><code>ccolspan</code></td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>"cvalue"</TD>
```
TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
  cvalue IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL,
  cdp IN VARCHAR2 DEFAULT NULL,
  cnowrap IN VARCHAR2 DEFAULT NULL,
  crowspan IN VARCHAR2 DEFAULT NULL,
  ccolspan IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TH>
```
TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function.

Syntax

HTF.TABLECLOSE
RETURN VARCHAR2;

Examples

This function generates

</TABLE>
TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
  cborder IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL, 
  cnowrap IN VARCHAR2 DEFAULT NULL, 
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cborder</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```sql
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</TABLE>
```
TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>>
```
TELETYPE Function

This function generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```sql
HTF.TELETYPE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TT cattributes>ctext</TT>
```
TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```sql
HTF.TITLE(
    ctitle IN VARCHAR2
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<TITLE>ctitle</TITLE>
**ULISTCLOSE Function**

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

**Syntax**

```
HTF.ULISTCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

</UL>
ULISTOPEN Function

This function generates the `<ul>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```sql
HTF.ULISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csr IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csr</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csr" cattributes>

Table 123–89 ULISTOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csr</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```sql
HTF.UNDERLINE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<U cattributes>ctext</U>
```
VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```
WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
    RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```
The HTMLDB_CUSTOM_AUTH package provides an interface for authentication and session management.

- Documentation of HTMLDB_CUSTOM_AUTH
Documentation of HTMLDB_CUSTOM_AUTH

For a complete description of this package within the context of HTMLDB, see HTMLDB_CUSTOM_AUTH in the Oracle HTML DB User’s Guide.
The HTMLDB_APPLICATION package enables users to take advantage of global variables.

- Documentation of HTMLDB_APPLICATION
Documentation of HTMLDB_APPLICATION

For a complete description of this package within the context of HTMLDB, see HTMLDB_APPLICATION in the Oracle HTML DB User’s Guide.
The HTMLDB_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- Documentation of HTMLDB_ITEM
For a complete description of this package within the context of HTMLDB, see HTMLDB_ITEM in the Oracle HTML DB User’s Guide.
The HTMLDB_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- Documentation of HTMLDB_UTIL
For a complete description of this package within the context of HTMLDB, see HTMLDB_UTIL in the Oracle HTML DB User’s Guide.
The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

**See Also:** For more information about implementation of this package:

  - Examples
- **Summary of Tags**
- **Summary of HTP Subprograms**
Using HTP

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PRINT procedure. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.
Examples

The following commands generate a simple HTML document:

CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.HTMLOPEN; -- generates <HTML>
  HTP.HEADOPEN; -- generates <HEAD>
  HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
  HTP.HEADCLOSE; -- generates </HEAD>
  HTP.BODYOPEN; -- generates <BODY>
  HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
  HTP.BODYCLOSE; -- generates </BODY>
  HTP.HTMLCLOSE; -- generates </HTML>
END;
Summary of Tags

**HTML, HEAD, and BODY Tags**

- HTMLOPEN Procedure, HTMLCLOSE Procedure - generate `<HTML>` and `</HTML>`
- HEADOPEN Procedure, HEADCLOSE Procedure - generate `<HEAD>` and `</HEAD>`
- BODYOPEN Procedure, BODYCLOSE Procedure - generate `<BODY>` and `</BODY>`

**Comment Tag**

- COMMENT Procedure - generates `<!--` and `-->`

**Tags in the <HEAD> Area**

- BASE Procedure - generates `<BASE>`
- LINKREL Procedure - generates `<LINK>` with the REL attribute
- LINKREV Procedure - generates `<LINK>` with the REV attribute
- TITLE Procedure - generates `<TITLE>`
- META Procedure - generates `<META>`
- SCRIPT Procedure - generates `<SCRIPT>`
- STYLE Procedure - generates `<STYLE>`
- ISINDEX Procedure - generates `<ISINDEX>`

**Applet Tags**

-APPLETOPEN Procedure, APPLETCLOSE Procedure - generate `<APPLET>` and `</APPLET>`
- PARAM Procedure - generates `<PARAM>`

**List Tags**

- OLSTOPEN Procedure, OLSTCLOSE Procedure - generate `<OL>` and `</OL>`
- ULISTOPEN Procedure, ULISTCLOSE Procedure - generate `<UL>` and `</UL>`
- DLISTOPEN Procedure, DLISTCLOSE Procedure - generate `<DL>` and `</DL>`
- DLISTTERM Procedure - generates `<DT>`
DLISTDEF Procedure - generates <DD>
DIRECTORY Procedure, DIRLISTCLOSE Procedure - generate <DIR> and 
</DIR>
LISTHEADER Procedure - generates <LH>
LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate <LISTING> and 
</LISTING>
MENULISTOPEN Procedure - generate <MENU> and </MENU>
LISTITEM Procedure - generates <LI>

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate <FORM> and </FORM>
FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX">
FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN">
FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE">
FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD">
FORMRADIO Procedure - generates <INPUT TYPE="RADIO">
FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate 
SELECT> and </SELECT>
FORMSELECTOPTION Procedure - generates <OPTION>
FORMTEXT Procedure - generates <INPUT TYPE="TEXT">
FORMTEXTAREA Procedure - generate <TEXTAREA>
FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate 
<TEXTAREA> and </TEXTAREA>
FORMRESET Procedure - generates <INPUT TYPE="RESET">
FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and 
</TABLE>
TABLECAPTION Procedure - generates <CAPTION>
Summary of Tags

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>
TABLEHEADER Procedure - generates <TH>
TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>
IMG Procedure, IMG2 Procedure - generate <IMG>
ANCHOR Procedure, ANCHOR2 Procedure - generate <A>
MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)
PARA Procedure, PARAGRAPH Procedure - generate <P>
PRN Procedures, PRINT Procedures - generate any text that is passed in
PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>
BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>
DIV Procedure - generates <DIV>
NL Procedure, BR Procedure - generate <BR>
NOBR Procedure - generates <NOBR>
WBR Procedure - generates <WBR>
PLAINTEXT Procedure - generates <PLAINTEXT>
ADDRESS Procedure - generates <ADDRESS>
MAILTO Procedure - generates <A> with the MAILTO attribute
AREA Procedure - generates <AREA>
BGSOUND Procedure - generates <BGSOUND>
Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>
BIG Procedure - generates <BIG>
BOLD Procedure - generates <B>
CENTER Procedure - generates <CENTER> and </CENTER>
CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>
CITE Procedure - generates <CITE>
CODE Procedure - generates <CODE>
DFN Procedure - generates <DFN>
EM Procedure, EMPHASIS Procedure - generate <EM>
FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>
ITALIC Procedure - generates <I>
KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>
S Procedure - generates <S>
SAMPLE Procedure - generates <SAMP>
SMALL Procedure - generates <SMALL>
STRIKE Procedure - generates <STRIKE>
STRONG Procedure - generates <STRONG>
SUB Procedure - generates <SUB>
SUP Procedure - generates <SUP>
TELETYPE Procedure - generates <TT>
UNDERLINE Procedure - generates <U>
VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>
FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate
<NOFRAMES> and </NOFRAMES>
## Summary of HTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Procedure on page 128-17</td>
<td>Generates the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>ANCHOR Procedure on page 128-18</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Procedure on page 128-19</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Procedure on page 128-20</td>
<td>Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag</td>
</tr>
<tr>
<td>APPLETOPEN Procedure on page 128-21</td>
<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Procedure on page 128-23</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Procedure on page 128-24</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Procedure on page 128-25</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Procedure on page 128-26</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Procedure on page 128-27</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Procedure on page 128-28</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Procedure on page 128-29</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Procedure on page 128-30</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Procedure on page 128-31</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>

<td><strong>CITE Procedure</strong> on page 128-37</td>
<td>Generates the <code>&lt;CITE&gt;</code> and <code>&lt;/CITE&gt;</code> tags which direct the browser to render the text as a citation</td>
</tr>
<tr>
<td><strong>CODE Procedure</strong> on page 128-38</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
<tr>
<td><strong>COMMENT Procedure</strong> on page 128-39</td>
<td>Generates This procedure generates the comment tags <code>&lt;!-- ctext --&gt;</code></td>
</tr>
<tr>
<td><strong>DFN Procedure</strong> on page 128-40</td>
<td>Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however &quot;definition&quot; is defined stylistically</td>
</tr>
<tr>
<td><strong>DIRLISTCLOSE Procedure</strong> on page 128-41</td>
<td>Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section</td>
</tr>
<tr>
<td><strong>DIRLISTOPEN Procedure</strong> on page 128-42</td>
<td>Generates the <code>&lt;DIR&gt;</code> which starts a directory list section</td>
</tr>
<tr>
<td><strong>DIV Procedure</strong> on page 128-43</td>
<td>Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions</td>
</tr>
<tr>
<td><strong>DLISTCLOSE Procedure</strong> on page 128-44</td>
<td>Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list</td>
</tr>
<tr>
<td><strong>DLISTOPEN Procedure</strong> on page 128-45</td>
<td>Generates the <code>&lt;DL&gt;</code> tag which starts a definition list</td>
</tr>
<tr>
<td><strong>DLISTDEF Procedure</strong> on page 128-46</td>
<td>Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms</td>
</tr>
<tr>
<td><strong>DLISTTERM Procedure</strong> on page 128-47</td>
<td>Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code></td>
</tr>
<tr>
<td><strong>EM Procedure</strong> on page 128-48</td>
<td>Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized</td>
</tr>

Summary of HTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMG Procedure on page 128-82</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Procedure on page 128-83</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute</td>
</tr>
<tr>
<td>ISINDEX Procedure on page 128-84</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Procedure on page 128-85</td>
<td>Generates the <code>&lt;I&gt;</code> and <code>&lt;/I&gt;</code> tags which direct the browser to render the text in italics</td>
</tr>
<tr>
<td>KBD Procedure on page 128-86</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Procedure on page 128-87</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Procedure on page 128-88</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Procedure on page 128-89</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Procedure on page 128-90</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Procedure on page 128-91</td>
<td>Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Procedure on page 128-92</td>
<td>Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Procedure on page 128-93</td>
<td>Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Procedure on page 128-94</td>
<td>Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Procedure on page 128-95</td>
<td>Generates the <code>&lt;A&gt;</code> tag with the <code>HREF</code> set to 'mailto' prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Procedure on page 128-96</td>
<td>Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map</td>

<tr>
<td>MAPOPEN Procedure on page 128-97</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which marks the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Procedure on page 128-98</td>
<td>Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Procedure on page 128-99</td>
<td>Generates the <code>&lt;MENU&gt;</code> tag which create a list that presents one line for each item</td>
</tr>
<tr>
<td>META Procedure on page 128-100</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Procedure on page 128-101</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Procedure on page 128-102</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Procedure on page 128-103</td>
<td>Generates the <code>&lt;/NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Procedure on page 128-104</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Procedure on page 128-105</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLSTOPEN Procedure on page 128-106</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Procedure on page 128-107</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Procedure on page 128-108</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Procedure on page 128-109</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Procedure on page 128-110</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Procedure on page 128-111</td>
<td>Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Procedure on page 128-112</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Procedures on page 128-113</td>
<td>Generates the specified parameter as a string terminated with the <code>\n</code> newline character</td>
</tr>
</tbody>
</table>
### Table 128–1  (Cont.) HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRINTS Procedure on page 128-114</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>PRN Procedures on page 128-115</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>PS Procedure on page 128-116</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence.</td>
</tr>
<tr>
<td>S Procedure on page 128-117</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Procedure on page 128-118</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however “sample” is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Procedure on page 128-119</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Procedure on page 128-120</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Procedure on page 128-121</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround using strikethrough type</td>
</tr>
<tr>
<td>STRONG Procedure on page 128-122</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however “strong” is defined stylistically</td>
</tr>
<tr>
<td>STYLE Procedure on page 128-123</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Procedure on page 128-124</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Procedure on page 128-125</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Procedure on page 128-126</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Procedure on page 128-127</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Procedure on page 128-128</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table.</td>
</tr>
</tbody>
</table>
### Table 128–1  (Cont.) HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<tr>
<td>TABLEOPEN Procedure on page 128-130</td>
<td>Generates the &lt;TABLE&gt; tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Procedure on page 128-131</td>
<td>Generates the &lt;/TR&gt; tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Procedure on page 128-132</td>
<td>Generates the &lt;TR&gt; tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYP Procedure on page 128-133</td>
<td>Generates the &lt;TT&gt; and &lt;/TT&gt; tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Procedure on page 128-134</td>
<td>Generates the &lt;TITLE&gt; and &lt;/TITLE&gt; tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Procedure on page 128-135</td>
<td>Generates the &lt;/UL&gt; tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Procedure on page 128-136</td>
<td>Generates the &lt;UL&gt; tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Procedure on page 128-137</td>
<td>Generates the &lt;U&gt; and &lt;/U&gt; tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Procedure on page 128-138</td>
<td>Generates the &lt;VAR&gt; and &lt;/VAR&gt; tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Procedure on page 128-139</td>
<td>Generates the &lt;WBR&gt; tag, which inserts a soft line break within a section of NOBR text</td>
</tr>
</tbody>
</table>
**ADDRESS Procedure**

This procedure generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

**Syntax**

```
HTP.ADDRESS (cvalue IN VARCHAR2,
cnowrap IN VARCHAR2 DEFAULT NULL,
cclear IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```
ANCHOR Procedure

This procedure and the ANCHOR2 Procedure procedures generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```sql
HTP.ANCHOR (
  curl IN VARCHAR2,
  ctext IN VARCHAR2,
  cname IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedure provides a target and therefore can be used for a frame.

Syntax

```sql
HTP.ANCHOR2 ( curl IN VARCHAR2, ctext IN VARCHAR2, cname IN VARCHAR2 DEFAULT NULL, ctarget in varchar2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETOPEN Procedure on page 128-21

Syntax

HTP.APPLETCLOSE;
APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure on page 128-20 which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
    ccode IN VARCHAR2,
    cheight IN NUMBER,
    cwidth IN NUMBER,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
Usage Notes

- Specify parameters to the Java applet using the `PARAM Procedure` procedure on page 128-109.

- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.
AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```sql
HTP.AREA (  
  ccoords IN VARCHAR2  
  cshape IN VARCHAR2 DEFAULT NULL,  
  chref IN VARCHAR2 DEFAULT NULL,  
  cnohref IN VARCHAR2 DEFAULT NULL,  
  ctarget IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The the value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```
BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (ctarget IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Base HREF="<current URL>" TARGET="ctarget" cattributes>
```
### BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

#### Syntax

```
HTP.BASEFONT (nsize IN INTEGER);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

#### Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```
BGSOUND Procedure

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```sql
HTP.BGSOUND (csrc IN VARCHAR2,
cloop IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```
BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (  
    ctext    IN    VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BIG cattributes>ctext</BIG>
```
BLOCKQUOTECLOSE Procedure

This procedure generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```html
</BLOCKQUOTE>
```
**BLOCKQUOTEOPEN Procedure**

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the `BLOCKQUOTECLOSE Procedure`.

**Syntax**

```
HTP.BLOCKQUOTEOPEN (
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
BODYCLOSE Procedure

This procedure generates the \</BODY> tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

HTP.BODYCLOSE;

Examples

This procedure generates

\</BODY>
BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```sql
HTP.BODYOPEN (  
cbackground IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```
**BOLD Procedure**

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

**Syntax**

```plsql
HTP.BOLD (ctext IN VARCHAR2,
cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<B cattributes>ctext</B>
```
BR Procedure

This procedure generates the `<BR>` tag which begins a new line of text. It performs the same operation as the NL Procedure.

Syntax

HTP.BR(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BR CLEAR="cclear" cattributes>
```
CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```sql
HTP.CENTER (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
< CENTER > ctext </ CENTER >
```
**CENTERCLOSE Procedure**

This procedure generates the `<CENTER>` tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Procedure.

**Syntax**

```htp
HTP.CENTERCLOSE;
```

**Examples**

This procedure generates

```
</CENTER>
```
**CENTEROPEN Procedure**

This procedure generates the `<CENTER>` tag which marks the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the `CENTERCLOSE Procedure`.

**Syntax**

```sql
HTP.CENTEROPEN;
```

**Examples**

This procedure generates

```html
<CENTER>
```
CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
  ctext       IN       VARCHAR2,
  cattributes IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<CITE cattributes>ctext</CITE>
```
CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```plsql
HTP.CODE (  
  ctext IN VARCHAR2,  
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```
COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT(
    ctext IN VARCHAR2);
```

Parameters

Table 128–18  COMMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<!-- ctext -->
```
DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (  
    ctext    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<DFN>ctext</DFN>
DIRLISTCLOSE Procedure

This procedure generates the \texttt{</DIR>} tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

\texttt{HTP.DIRLISTCLOSE;}

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the \texttt{<LI>} tag directly or invoke the LISTITEM Procedure so that the \texttt{<LI>} tag appears directly after the \texttt{</DIR>} tag to define the items as a list.

Examples

This procedure generates

\texttt{</DIR>}

DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

HTP.DIRLISTOPEN;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

<DIR>
DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```sql
HTP.DIV (  
calign IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<DIV ALIGN="calign" cattributes>
```
DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

HTP.DLISTCLOSE;

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

</DL>
DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a
definition list by means of the DLISTCLOSE Procedure.

Syntax

```sql
HTP.DLISTOPEN (cclear IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are
inserted using the DLISTTERM Procedure and definitions are inserted using the
DLISTDEF Procedure.

Examples

This procedure generates

```html
<DL CLEAR="cclear" cattributes>
```
DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```
HTP.DLISTDEF (     
  ctext IN VARCHAR2 DEFAULT NULL, 
  cclear IN VARCHAR2 DEFAULT NULL, 
  ctributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 128–22 DLISTDEF Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>ctributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<DD CLEAR="cclear" ctributes>ctext
```
DLISTTERM Procedure

This procedure generates the `<DT>` tag which defines a term in a definition list `<DL>`.

Syntax

```sql
HTP.DLISTTERM ( ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<DT CLEAR="cclear" cattributes>ctext
```
EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

HTP.EM(
   ctext     IN     VARCHAR2,
   cattributes     IN     VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<EM cattributes>ctext</EM>
**EMPHASIS Procedure**

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the **EM Procedure**.

**Syntax**

```sql
HTP.EMPHASIS(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```xml
<EM cattributes>ctext</EM>
```
ESCAPE_SC Procedure

ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```sql
HTP.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```
FONTOPEN Procedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
    ccolor IN VARCHAR2 DEFAULT NULL,
    cface IN VARCHAR2 DEFAULT NULL,
    csize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```
FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
  cname IN VARCHAR2,
  cvalue IN VARCHAR2 DEFAULT 'ON',
  cchecked IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

HTP.FORMCLOSE;

Examples

This procedure generates

</FORM>
FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cencetype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Table 128–29  FORMOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cencetype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cencetype"
cattributes>
```
FORMFILE Procedure

This procedure generates the `<INPUT>` tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
    cname IN VARCHAR2,
    caccept IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>caccept</code></td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```
FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```sql
HTP.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```plsql
HTP.FORMRADIO(
  cname IN VARCHAR2,
  cvalue IN VARCHAR2,
  cchecked IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
**FORMRESET Procedure**

This procedure generates the `<INPUT>` tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

**Syntax**

```
HTP.FORMRESET(
    cvalue IN VARCHAR2 DEFAULT 'Reset',
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```
FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure. The values are inserted using FORMSELECTOPTION Procedure.

Syntax

HTP.FORMSELECTCLOSE;

Examples

This procedure generates

</SELECT>

as shown under Examples of the FORMSELECTOPEN Procedure.
FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure. The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
  cname IN VARCHAR2,
  cprompt IN VARCHAR2 DEFAULT NULL,
  nsize IN INTEGER DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SELECT NAME="cname" SIZE="nsize" cattributes>
  <option value="Messier">Messier</option>
  <option value="Howe">Howe</option>
  <option value="Gretzky">Gretzky</option>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates
Pick the greatest player:
<Select NAME="greatest_player">
<Option>Messier
<Option>Howe
<Option>Gretzky
</Select>
FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

HTP.FORMSELECTOPTION(
  cvalue IN VARCHAR2,
  cselected IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

Table 128–37 FORMSELECTOPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<OPTION SELECTED cattributes>cvalue

as shown under Examples of the FORMSELECTOPEN Procedure.
FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
  cname IN VARCHAR2 DEFAULT NULL,
  cvalue IN VARCHAR2 DEFAULT 'Submit',
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```
FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
  cname IN VARCHAR2,
  nrows IN INTEGER,
  ncolumns IN INTEGER,
  calign IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes"></TEXTAREA>
```
FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes>...</TEXTAREA>
```
FORMTEXTAREACLOSE Procedure

This procedure generates the \</TEXTAREA\> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```sql
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```html
</TEXTAREA>
```
**FORMTEXTAREAOPEN Procedure**

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

**Syntax**

```sql
HTP.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```
FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2 ( 
    cname IN VARCHAR2, 
    nrows IN INTEGER, 
    ncolumns IN INTEGER, 
    calign IN VARCHAR2 DEFAULT NULL, 
    cwrap IN VARCHAR2 DEFAULT NULL, 
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cwrap</code></td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>
```
FRAME Procedure

This procedure generates the `<FRAME>` tag which defines the characteristics of a frame created by a `<FRAMESET>` tag.

Syntax

```
HTP.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 128–44  FRAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

HTP.FRAMESETCLOSE;

Examples

This procedure generates

</FRAMESET>
FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which defines a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
  crows IN VARCHAR2 DEFAULT NULL,
  ccols IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

HTP.HEADCLOSE;

Examples

This procedure generates

</HEAD>
HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```plaintext
HTP.HEADOPEN;
```

Examples

This procedure generates

```plaintext
<HEAD>
```
This procedure generates opening heading tags (\texttt{<H1> to \texttt{<H6>}}) and their corresponding closing tags (\texttt{</H1> to \texttt{</H6>}).

**Syntax**

\begin{verbatim}
HTP.HEADER(
    nsize IN INTEGER,
    cheader IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
\end{verbatim}

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The the heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the \texttt{ALIGN} attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the \texttt{NOWRAP} attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the \texttt{CLEAR} attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

\begin{verbatim}
HTP.header (1,'Overview');
\end{verbatim}

produces:

\begin{verbatim}
<H1>Overview</H1>
\end{verbatim}
HR Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the LINE Procedure.

Syntax

```sql
HTP.HR(
    cclear IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

HTP.HTMLCLOSE;

Examples

This procedure generates

</HTML>
HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Procedure to mark the end of the HTML document.

Syntax

HTP.HTMLOPEN;

Examples

This procedure generates

<HTML>
IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
  curl IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL,
  calt IN VARCHAR2 DEFAULT NULL,
  cismap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

```sql
HTP.IMG2(
   curl IN VARCHAR2 DEFAULT NULL,
   calign IN VARCHAR2 DEFAULT NULL,
   calt IN VARCHAR2 DEFAULT NULL,
   cismap IN VARCHAR2 DEFAULT NULL,
   cusemap IN VARCHAR2 DEFAULT NULL,
   cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side image map.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl"> 
```
ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<I cattributes>ctext</I>
```
KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the `KEYBOARD Procedure`.

Syntax

```sql
HTP.KBD(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<KBD cattributes>ctext</KBD>
```
KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```sql
HTP.KEYBOARD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<KBD cattributes>ctext</KBD>
```
LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```sql
HTP.LINE(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 128–54  LINE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
    crel IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Link REL="crel" HREF="curl" TITLE="ctitle">
```
LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
  crev IN VARCHAR2,
  curl IN VARCHAR2,
  ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```
LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between &lt;LH&gt; and &lt;/LH&gt;.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

HTP.LISTINGCLOSE;

Examples

This procedure generates

</LISTING>
LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```
LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
    ctext IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrcc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrcc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrcc" cattributes>ctext
```
MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
    caddress IN VARCHAR2,
    ctext IN VARCHAR2,
    cname IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```html
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```
MAPCLOSE Procedure

This procedure generates the \</MAP\> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

HTP.MAPCLOSE;

Examples

This procedure generates

\</MAP\>
MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```
MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTCLOSE;

Examples

This procedure generates

</MENU>
**MENULISTOPEN Procedure**

This procedure generates the `<MENU>` tag which creates a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

**Syntax**

```
HTP.MENULISTOPEN;
```

**Examples**

This procedure generates

```
<MENU>
```
META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
    chttp_equiv IN VARCHAR2,
    cname IN VARCHAR2,
    ccontent IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
**NL Procedure**

This procedure generates the `<BR>` tag which begins a new line of text. It performs the same operation as the BR Procedure.

**Syntax**

```sql
HTP.NL(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<BR CLEAR="cclear" cattributes>
```
NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
    ctext        IN        VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```
NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

HTP.NOFRAMESCLOSE;

Examples

This procedure generates

</NOFRAMES>
NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

HTP.NOFRAMESOPEN;

Examples

This procedure generates

<NOFRAMES>
OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

HTP.OLISTCLOSE;

Examples

This procedure generates

</OL>
OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the `OLISTCLOSE Procedure`. Numbered items are added using `LISTITEM Procedure`.

Syntax

```
HTP.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
**PARA Procedure**

This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the **PARAGRAPH Procedure**.

**Syntax**

```
HTP.PARA;
```

**Examples**

This procedure generates

```
<P>
```
PARAGRAPh Procedure

You can use this procedure to add attributes to the `<P>` tag created by the PARA Procedure.

Syntax

```plsql
HTP.PARAGRAPH(
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```
PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```sql
HTP.PARAM(
    cname   IN   VARCHAR2
    cvalue  IN   VARCHAR2
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<PARAM NAME="cname" VALUE="cvalue">
```
PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
PRECLOSE Procedure

This procedure generates the </pre> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```plaintext
HTP.PRECLOSE;
```

Examples

This procedure generates

```plaintext
</pre>
```
PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```sql
HTP.PREOPEN(
cclear IN VARCHAR2 DEFAULT NULL,
cwidth IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```
PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
    cbuf      IN       VARCHAR2);
HTP.PRINT (
    dbuf      IN       DATE);
HTP.PRINT (
    nbuf      IN       NUMBER);
```

Parameters

```
Table 128–69 PRINT Procedure Parameters
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.
PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 128-2 for the HTF implementation).
PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (cbuf IN VARCHAR2);
HTP.PRN (dbuf IN DATE);
HTP.PRN (nbuf IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These procedures do not have function equivalents.
PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 128-2 for the HTF implementation).
S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

HTP.S (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<S cattributes>ctext</S>
SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```sql
HTP.SAMPLE (  
  ctext IN VARCHAR2, 
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<SAMP cattributes>ctext</SAMP>
```
SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
  cscript IN VARCHAR2,
  clanguage IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```sql
HTP.SMALL ( ctext IN VARCHAR2,
            cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<SMALL cattributes>ctext</SMALL>
```
STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as `S Procedure`.

Syntax

```
HTP.STRIKE (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```
STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```sql
HTP.STRONG(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<STRONG cattributes>ctext</STRONG>
```
STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
  cstyle   IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```
This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

Syntax

```sql
HTP.SUB(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<SUB ALIGN="calign" cattributes>ctext</SUB>
```
SUP Procedure

This procedure generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```
TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```sql
HTP.TABLECAPTION(
    ccaption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```
TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TD>
```
TABLEHEADER Procedure

This procedure generates the \(<\text{TH}>\) and \(<\text{/TH}>\) tags which insert a header cell in an HTML table. The \(<\text{TH}>\) tag is similar to the \(<\text{TD}>\) tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>colspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```
TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

HTP.TABLECLOSE;

Examples

This procedure generates

</TABLE>
TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
  cborder IN VARCHAR2 DEFAULT NULL,
  calign IN VARCHAR2 DEFAULT NULL,
  cnowrap IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```
TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```sql
HTP.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>>
```
TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
    ctext    IN    VARCHAR2,
    cattributes    IN    VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```
TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```sql
HTP.TITLE(
    ctitle IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```
ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

HTP.ULISTCLOSE;

Examples

This procedure generates

</TABLE>
ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```sql
HTP.ULISTOPEN(
  cclear IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cdingbat IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```
UNDERLINE Procedure

This procedure generates the <u> and </u> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<u cattributes>ctext</u>
```
This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

**Syntax**

```
HTP.VARIABLE(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<VAR cattributes>ctext</VAR>
```
WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of `NOBR` text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```
The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications.

**See Also:** For more information about implementation of this package:
- Oracle HTTP Server Administrator’s Guide
- Oracle HTTP Server mod_plsql User’s Guide

The chapter contains the following topics:
- Using OWA_CACHE
- Summary of OWA_CACHE Subprograms
Using OWA_CACHE

## Constants

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`
Summary of OWA_CACHE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure on page 129-4</td>
<td>Disables the cache for this particular request</td>
</tr>
<tr>
<td>GET_ETAG Function on page 129-5</td>
<td>Returns the tag associated with the cached content (used in the Validation technique model only)</td>
</tr>
<tr>
<td>GET_LEVEL Function on page 129-6</td>
<td>Returns the caching level (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_CACHE Procedure on page 129-7</td>
<td>Sets up the cache headers for validation model cache type</td>
</tr>
<tr>
<td>SET_EXPIRES Procedure on page 129-8</td>
<td>Sets up the cache headers for expires model cache type</td>
</tr>
<tr>
<td>SET_NOT_MODIFIED Procedure on page 129-9</td>
<td>Sets up the headers for a not modified cache hit (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_SURROGATE_CONTROL Procedure on page 129-10</td>
<td>Sets up the headers for a surrogate-control header for web cache</td>
</tr>
</tbody>
</table>
DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

OWA_CACHE.DISABLE;
GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```sql
OWA_CACHE.GET_ETAG
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.
GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
RETURN VARCHAR2;
```

Return Values

The caching level string (’USER’ or ’SYSTEM’) for cache hit, otherwise NULL.
**SET_CACHE Procedure**

This sets up the cache headers for validation model cache type.

**Syntax**

```sql
OWA_CACHE.SET_CACHE(
    p_etag    IN     VARCHAR2,
    p_level   IN     VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_etag</td>
<td>The etag associated with this content</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

**Exceptions**

VALUE_ERROR is thrown if
- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'
SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```plsql
OWA_CACHE.SET_EXPIRES(
    p_expires IN NUMBER,
    p_level   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_expires</td>
<td>The number of minutes this content is valid.</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)
SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

OWA_CACHE.SET_NOT_MODIFIED;

Exceptions

VALUE_ERROR is thrown if the etag was not passed in
SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for web cache

**Syntax**

```sql
OWA_CACHE.SET_SURROGATE_CONTROL(
    p_value    IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_value</td>
<td>The value to be passed as the Surrogate-Control header.</td>
</tr>
</tbody>
</table>

**Exceptions**

`VALUE_ERROR` is thrown if `p_value` is greater than 55 in length.
The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

**See Also:** For more information about implementation of this package:
- Oracle HTTP Server Administrator’s Guide
- Oracle HTTP Server mod_plsql User’s Guide

The chapter contains the following topics:
- Using OWA_COOKIE
  - Overview
  - Types
  - Rules and Limits
- Summary of OWA_COOKIE Subprograms
Using OWA_COOKIE

Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

Types

This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
    name VARCHAR2(4000),
    vals vc_arr,
    num_vals INTEGER);
```

Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.
## Summary of OWA_COOKIE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET Function on page 130-4</td>
<td>Gets the value of the specified cookie</td>
</tr>
<tr>
<td>GET_ALL Procedure on page 130-5</td>
<td>Gets all cookie name-value pairs</td>
</tr>
<tr>
<td>REMOVE Procedure on page 130-6</td>
<td>Removes the specified cookie</td>
</tr>
<tr>
<td>SEND procedure on page 130-7</td>
<td>Generates a “Set-Cookie” line in the HTTP header</td>
</tr>
</tbody>
</table>
GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```sql
OWA_COOKIE.GET(
    name           IN       VARCHAR2)
RETURN COOKIE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
</tbody>
</table>

Return Values

OWA_COOKIE.COOKIE DATA TYPE.
GET_ALL Procedure

This procedure returns all cookie names and their values from the client’s browser. The values appear in the order in which they were sent from the browser.

Syntax

```sql
OWA_COOKIE.GET_ALL(
    names OUT vc_arr,
    vals OUT vc_arr,
    num_vals OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>The names of the cookies.</td>
</tr>
<tr>
<td>vals</td>
<td>The values of the cookies.</td>
</tr>
<tr>
<td>num_vals</td>
<td>The number of cookie-value pairs.</td>
</tr>
</tbody>
</table>
REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
    name IN VARCHAR2,
    val IN VARCHAR2,
    path IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie to expire.</td>
</tr>
<tr>
<td>val</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>path</td>
<td>[Currently unused]</td>
</tr>
</tbody>
</table>
SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
    name in varchar2,
    value in varchar2,
    expires in date DEFAULT NULL,
    path in varchar2 DEFAULT NULL,
    domain in varchar2 DEFAULT NULL,
    secure in varchar2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>expires</td>
<td>The date at which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The value for the path field.</td>
</tr>
<tr>
<td>domain</td>
<td>The value for the domain field.</td>
</tr>
<tr>
<td>secure</td>
<td>If the value of this parameter is not NULL, the &quot;secure&quot; field is added to the line.</td>
</tr>
</tbody>
</table>
SEND procedure
The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

**See Also:** For more information about implementation of this package:

  - Variables
  - Examples
- **Summary of OWA_IMAGE Subprograms**
Using OWA_IMAGE

Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

Types

This data type (point) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

Variables

This package variable (null_point) of TYPE POINT is used to default point parameters. Both the X and the Y fields of this variable are NULL.

Examples

```sql
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```
Summary of OWA_IMAGE Subprograms

Table 132–1  OWA_IMAGE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_X Function</td>
<td>Gets the X value of a point type</td>
</tr>
<tr>
<td>GET_Y Function</td>
<td>Gets the Y value of a point type</td>
</tr>
</tbody>
</table>
GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```sql
OWA_IMAGE.GET_X(
    p   IN   point
)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The X coordinate as an integer.
GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```plaintext
OWA_IMAGE.GET_Y(
    p   IN   point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The Y coordinate as an integer.
GET_Y Function
The **`OWA_OPT_LOCK`** package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

**See Also:** For more information about implementation of this package:
- *Oracle HTTP Server Administrator’s Guide*
- *Oracle HTTP Server mod_plsql User’s Guide*

This chapter contains the following topics:
- **Using OWA_OPT_LOCK**
  - Overview
  - Types
  - Summary of OWA_OPT_LOCK Subprograms
Using OWA_OPT_LOCK

### Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.

- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

### Types

This data type is a PL/SQL table intended to hold ROWIDs.

```sql
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.
## Summary of OWA_OPT_LOCK Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CHECKSUM Functions</strong> on page 133-4</td>
<td>Returns the checksum value</td>
</tr>
<tr>
<td><strong>GET_ROWID Function</strong> on page 133-5</td>
<td>Returns the ROWID value</td>
</tr>
<tr>
<td><strong>STORE_VALUES Procedure</strong> on page 133-6</td>
<td>Stores unmodified values in hidden fields for later verification</td>
</tr>
<tr>
<td><strong>VERIFY_VALUES Function</strong> on page 133-7</td>
<td>Verifies the stored values against modified values</td>
</tr>
</tbody>
</table>
CHECKSUM Functions

This function returns a checksum value for a specified string, or for a row in a table. For a row in a table, the function calculates the checksum value based on the values of the columns in the row. This function comes in two versions.

The first version returns a checksum based on the specified string. This is a "pure" 32-bit checksum executed by the database and based on the Internet 1 protocol.

The second version returns a checksum based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```sql
OWA_OPT_LOCK.CHECKSUM(
    p_buff IN VARCHAR2
) RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
    p_owner IN VARCHAR2,
    p_tname IN VARCHAR2,
    p_rowid IN ROWID
) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_buff</td>
<td>The nstring where you want to calculate the checksum.</td>
</tr>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The table name.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.</td>
</tr>
</tbody>
</table>
GET_ROWID Function

This function returns the ROWID data type from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

OWA_OPT_LOCK.GET_ROWID(
    p_old_values      IN      vcarray)
RETURN ROWID;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>This parameter is usually passed in from an HTML form.</td>
</tr>
</tbody>
</table>
STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```plsql
OWA_OPT_LOCK.STORE_VALUES(
    p_owner IN VARCHAR2,
    p_tname IN VARCHAR2,
    p_rowid IN ROWID);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row where you want to store values.</td>
</tr>
</tbody>
</table>

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.
**VERIFY_VALUES Function**

This function verifies whether values in the specified row have been updated since the last query. Use this function with the `STORE_VALUES Procedure`.

**Syntax**

```sql
OWA_OPT_LOCK.VERIFY_VALUES(
  p_old_values IN vcarray)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>A PL/SQL table containing the following information:</td>
</tr>
<tr>
<td></td>
<td>- p_old_values(1) specifies the owner of the table.</td>
</tr>
<tr>
<td></td>
<td>- p_old_values(2) specifies the table.</td>
</tr>
<tr>
<td></td>
<td>- p_old_values(3) specifies the rowid of the row to verify.</td>
</tr>
<tr>
<td></td>
<td>The remaining indexes contain values for the columns in the table.</td>
</tr>
<tr>
<td></td>
<td>Typically, this parameter is passed in from the HTML form,</td>
</tr>
<tr>
<td></td>
<td>where you have previously called the <code>STORE_VALUES Procedure</code> to store the</td>
</tr>
<tr>
<td></td>
<td>row values on hidden form elements.</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if no other update has been performed, otherwise FALSE.
The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

**See Also:** For more information about implementation of this package:

- *Oracle HTTP Server Administrator’s Guide*
- *Oracle HTTP Server mod_plsql User’s Guide*

The chapter contains the following topics:

- **Using OWA_PATTERN**
  - Types
  - Operational Notes
- **Summary of OWA_PATTERN Subprograms**
Using OWA_PATTERN

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

- OWA_PATTERN.PATTERN

Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- line - This is the target to be examined for a match. It can be more than one line of text or an owa_text.multi_line data type.
- pat - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called from_str.
- flags - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards
- Quantifiers
- Flags

Wildcards

Wildcard tokens match something other than themselves:
Table 134–1  Wildcard tokens recognized by OWA_PATTERN package

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches newline or the beginning of the target</td>
</tr>
<tr>
<td>$</td>
<td>Matches newline or the end of the target</td>
</tr>
<tr>
<td>\n</td>
<td>Matches newline</td>
</tr>
<tr>
<td>.</td>
<td>Matches any character except newline</td>
</tr>
<tr>
<td>\t</td>
<td>Matches tab</td>
</tr>
<tr>
<td>\d</td>
<td>Matches digits [0-9]</td>
</tr>
<tr>
<td>\D</td>
<td>Matches non-digits [not 0-9]</td>
</tr>
<tr>
<td>\w</td>
<td>Matches word characters (0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\W</td>
<td>Matches non-word characters (not 0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\s</td>
<td>Matches whitespace characters (blank, tab, or newline).</td>
</tr>
<tr>
<td>\S</td>
<td>Matches non-whitespace characters (not blank, tab, or newline)</td>
</tr>
<tr>
<td>\b</td>
<td>Matches &quot;word&quot; boundaries (between \w and \W)</td>
</tr>
<tr>
<td>\x&lt;HEX&gt;</td>
<td>Matches the value in the current character set of the two hexadecimal digits</td>
</tr>
<tr>
<td>&lt;OCT&gt;</td>
<td>Matches the value in the current character set of the two or three octal digits</td>
</tr>
<tr>
<td>\</td>
<td>Followed by any character not covered by another case matches that character</td>
</tr>
<tr>
<td>&amp;</td>
<td>Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures.</td>
</tr>
</tbody>
</table>

Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

Table 134–2  Quantifiers

<table>
<thead>
<tr>
<th>Quantifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>0 or 1 occurrence(s)</td>
</tr>
<tr>
<td>*</td>
<td>0 or more occurrences</td>
</tr>
<tr>
<td>+</td>
<td>1 or more occurrence(s)</td>
</tr>
</tbody>
</table>
Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>This indicates a case-insensitive search.</td>
</tr>
<tr>
<td>g</td>
<td>This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.</td>
</tr>
</tbody>
</table>
### Summary of OWA_PATTERN Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AMATCH Function</strong> on page 134-6</td>
<td>Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur.</td>
</tr>
<tr>
<td><strong>CHANGE Functions and Procedures</strong> on page 134-8</td>
<td>Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced.</td>
</tr>
<tr>
<td><strong>GETPAT Procedure</strong> on page 134-10</td>
<td>Generates a pattern data type from a VARCHAR2 type.</td>
</tr>
<tr>
<td><strong>MATCH Function</strong> on page 134-11</td>
<td>Determines if a string contains the specified pattern.</td>
</tr>
</tbody>
</table>
AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the backrefs parameters in the third and fourth versions). The difference between the first and second versions is the pat parameter, which can be a VARCHAR2 or a pattern data type.

- The third and fourth versions of the function save the matched tokens in the backrefs parameter. The difference between the third and fourth versions is the pat parameter, which can be a VARCHAR2 or a pattern data type.

---

**Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

---

Syntax

```sql
OWA_PATTERN.AMATCH(  
    line IN VARCHAR2,  
    from_loc IN INTEGER,  
    pat IN VARCHAR2,  
    flags IN VARCHAR2 DEFAULT NULL)  
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(  
    line IN VARCHAR2,  
    from_loc IN INTEGER,  
    pat IN OUT PATTERN,  
    flags IN VARCHAR2 DEFAULT NULL)  
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(  
    line IN VARCHAR2  
    from_loc IN INTEGER  
    pat in varchar2  
    backrefs OUT owa_text.vc_arr  
    flags IN VARCHAR2 DEFAULT NULL)  
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(  
    line IN VARCHAR2
)
```
Summary of OWA_PATTERN Subprograms

```sql
from_loc  IN  INTEGER
pat       IN OUT PATTERN
backrefs  OUT  owa_text.vc_arr
flags     IN  VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in.</td>
</tr>
<tr>
<td>from_loc</td>
<td>The location (in number of characters) in line where the search is to begin.</td>
</tr>
<tr>
<td>pat</td>
<td>The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.</td>
</tr>
<tr>
<td>backrefs</td>
<td>The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive. If the value of this parameter is &quot;i&quot;, the search is case-insensitive. Otherwise the search is case-sensitive.</td>
</tr>
</tbody>
</table>

Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.
CHANGE Functions and Procedures

This function or procedure searches and replaces a string or multi_line data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
    line IN OUT VARCHAR2,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
    line IN OUT VARCHAR2,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL);
```

```
owa_pattern.change(
    mline IN OUT owa_text.multi_line,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
    mline IN OUT owa_text.multi_line,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in. The output value of this parameter is the altered string.</td>
</tr>
</tbody>
</table>
Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

Example 1:

OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red". If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
    num_found INTEGER;
    BEGIN
        theline := 'what is the goal?';
        num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
        HTP.PRINT(num_found); -- num_found is 1
        HTP.PRINT(theline); -- theline is 'what is the idea?'
    END;
/
SHOW ERRORS
GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

OWA_PATTERN.GETPAT(
    arg      IN          VARCHAR2,
    pat      IN OUT      pattern);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>pat</td>
<td>the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.</td>
</tr>
</tbody>
</table>
MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```sql
owa_pattern.match(
    line IN VARCHAR2,
    pat IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    line IN VARCHAR2,
    pat IN OUT PATTERN,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    line IN VARCHAR2,
    pat IN VARCHAR2,
    backrefs OUT owa_text.vc_arr,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    line IN VARCHAR2,
    pat IN OUT PATTERN,
    backrefs OUT owa_text.vc_arr,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    mline IN owa_text.multi_line,
    pat IN VARCHAR2,
    rlist OUT owa_text.row_list,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    mline IN owa_text.multi_line,
    pat IN OUT pattern,
    )
```
MATCH Function

```sql
rlist OUT owa_text.row_list,
flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The line to search in.</td>
</tr>
<tr>
<td>mline</td>
<td>The text to search in. This is a owa_text.multi_line data type.</td>
</tr>
<tr>
<td>pat</td>
<td>The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. If it is a pattern, the output value of this parameter is the pattern matched.</td>
</tr>
<tr>
<td>backrefs</td>
<td>The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.</td>
</tr>
<tr>
<td>rlist</td>
<td>An output parameter containing a list of matches.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive. If the value of this parameter is 'i', the search is case-insensitive. Otherwise the search is case-sensitive.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```sql
boolean foundMatch;
```
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

sometext VARCHAR2(256);
pat VARCHAR2(256);

sometext := 'what is the goal?'
pat := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.

- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a multi_line, you can add an optional output parameter called backrefs. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
The OWA_SEC package provides an interface for custom authentication.

  - Operational Notes
- Summary of OWA_SEC Subprograms
Using OWA_SEC

- Operational Notes

Operational Notes

Parameters that have default values are optional.
## Summary of OWA_SEC Subprograms

### Table 135–1  OWA_SEC Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_CLIENT_HOSTNAME Function</td>
<td>Returns the client's hostname</td>
</tr>
<tr>
<td>GET_CLIENT_IP Function</td>
<td>Returns the client's IP address</td>
</tr>
<tr>
<td>GET_PASSWORD Function</td>
<td>Returns the password that the user entered</td>
</tr>
<tr>
<td>GET_USER_ID Function</td>
<td>Returns the username that the user entered</td>
</tr>
<tr>
<td>SET_AUTHORIZATION Procedure</td>
<td>Enables the PL/SQL application to use custom authentication</td>
</tr>
<tr>
<td>SET_PROTECTION_REALM Procedure</td>
<td>Defines the realm that the page is in</td>
</tr>
</tbody>
</table>
GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;
```

Return Values

The hostname.
GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
    RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` data type is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the `owa_util.ip_address` data type, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```
GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.
GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```sql
OWA_SEC.GET_USER_ID
RETURN VARCHAR2;
```

Return Values

The username.
This procedure, called in the initialization portion of the `OWA_CUSTOM` package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

**Syntax**

```
OWA_SEC.SET_AUTHORIZATION(scheme IN INTEGER);
```
Parameters

**Table 135–2  SET_AUTHORIZATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheme</td>
<td>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</td>
</tr>
<tr>
<td></td>
<td>- <code>OWA_SEC.NO_CHECK</code> - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- <code>OWA_SEC.GLOBAL</code> - Defines an authorize function that is called for all users and all procedures. This is the <code>OWA_CUSTOM.AUTHORIZE</code> Function in the &quot;sys&quot; schema.</td>
</tr>
<tr>
<td></td>
<td>- <code>OWA_SEC.PER_PACKAGE</code> - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the <code>package.AUTHORIZE</code> function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called.</td>
</tr>
<tr>
<td></td>
<td>- <code>OWA_SEC.CUSTOM</code> - Implements different authorize functions for each user. The function <code>OWA_CUSTOM.AUTHORIZE</code> Function in the user's schema is called to authorize the user. If the user's schema does not contain an <code>OWA_CUSTOM.AUTHORIZE</code> Function, the PL/SQL Gateway looks for it in the &quot;sys&quot; schema.</td>
</tr>
</tbody>
</table>

The custom authorize function has the following signature:

```
FUNCTION AUTHORIZE
    RETURN BOOLEAN;
```

If the function returns `TRUE`, authentication succeeded. If it returns `FALSE`, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.
SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```plsql
OWA_SEC.SET_PROTECTION_REALM(
    realm     IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm</td>
<td>The realm where the page belongs. This string is displayed to the user.</td>
</tr>
</tbody>
</table>
The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

**See Also:** For more information about implementation of this package:

- *Oracle HTTP Server Administrator’s Guide*
- *Oracle HTTP Server mod_plsql User’s Guide*

The chapter contains the following topics:

- Using `OWA_TEXT`
  - Types
- Summary of `OWA_TEXT` Subprograms
Using OWA_TEXT

Types

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

MULTI_LINE DATA TYPE

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
  rows vc_arr,
  num_rows INTEGER,
  partial_row BOOLEAN);
```

ROW_LIST DATA TYPE

This is the data type for holding data to be processed.

```
TYPE row_list IS RECORD (
  rows int_arr,
  num_rows INTEGER);
```

int_arr IS DEFINED AS:

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
Summary of OWA_TEXT Subprograms

Table 136–1  OWA_TEXT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD2MULTI Procedure on page 136-4</td>
<td>Adds text to an existing multi_line type</td>
</tr>
<tr>
<td>NEW_ROW_LIST Function and Procedure on page 136-5</td>
<td>Creates a new row_list</td>
</tr>
<tr>
<td>PRINT_MULTI Procedure on page 136-6</td>
<td>Prints out the contents of a multi_list</td>
</tr>
<tr>
<td>PRINT_ROW_LIST Procedure on page 136-7</td>
<td>Prints out the contents of a row_list</td>
</tr>
<tr>
<td>STREAM2MULTI Procedure on page 136-8</td>
<td>Converts a varchar2 to a multi_line type</td>
</tr>
</tbody>
</table>
ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```sql
OWA_TEXT.ADD2MULTI(
    stream IN VARCHAR2,
    mline IN OUT multi_line,
    continue IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The text to add.</td>
</tr>
<tr>
<td>mline</td>
<td>The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <code>stream</code>.</td>
</tr>
<tr>
<td>continue</td>
<td>If TRUE, the procedure appends <code>stream</code> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <code>stream</code> in a new row.</td>
</tr>
</tbody>
</table>
NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list data type as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>This is an output parameter containing the new row_list data type</td>
</tr>
</tbody>
</table>

Return Values

The function version returns the new row_list data type.
PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

OWA_TEXT.PRINT_MULTI(
    mline       IN       multi_line);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mline</td>
<td>The multi_line data type to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the multi_line.
PRINT_ROW_LIST Procedure

This procedure uses PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.ROW_LIST DATA TYPE.

Syntax

OWA_TEXT.PRINT_ROW_LIST(
    rlist       IN       multi_line);

Parameters

Table 136–5 PRINT_ROW_LIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>The row_list data type to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the row_list.
STREAM2MULTI Procedure

This procedure converts a string to a multi_line data type.

Syntax

```plsql
OWA_TEXT.STREAM2MULTI(
    stream IN VARCHAR2,
    mline OUT multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>mline</td>
<td>The stream in OWA_TEXT.MULTI_LINE DATA_TYPE format</td>
</tr>
</tbody>
</table>
The **OWA_UTIL** package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

**See Also:** For more information about implementation of this package:
- *Oracle HTTP Server Administrator’s Guide*
- *Oracle HTTP Server mod_plsql User’s Guide*

This chapter contains the following topics:
- **Using OWA_UTIL**
  - **Overview**
  - **Types**
- **Summary of OWA_UTIL Subprograms**
Using OWA_UTIL

- Overview
- Types

Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.

Types

- DATETYPE Data Type
- IDENT_ARR Data Type
- IP_ADDRESS Data Type

DATETYPE Data Type

The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```sql
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Data Type

This data type is used for an array.

```sql
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```
**IP_ADDRESS Data Type**

This data type is used by the **GET_CLIENT_IP Function** in the **OWA_SEC** package.

```sql
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```
## Summary of OWA_UTIL Subprograms

</tr>
</tbody>
</table>
BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
    theQuery IN VARCHAR2 DEFAULT NULL,
    bv1Name IN VARCHAR2 DEFAULT NULL,
    bv1Value IN VARCHAR2 DEFAULT NULL,
    bv2Name IN VARCHAR2 DEFAULT NULL,
    bv2Value IN VARCHAR2 DEFAULT NULL,
    bv3Name IN VARCHAR2 DEFAULT NULL,
    bv3Value IN VARCHAR2 DEFAULT NULL,
    ...
    bv25Name IN VARCHAR2 DEFAULT NULL,
    bv25Value IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>theQuery</td>
<td>The SQL query statement which must be a SELECT statement</td>
</tr>
<tr>
<td>bv1Name</td>
<td>The name of the variable</td>
</tr>
<tr>
<td>bv1Value</td>
<td>The value of the variable</td>
</tr>
</tbody>
</table>

Return Values

An integer identifying the opened cursor.
CALENDARPRINT Procedures

These procedures create a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

OWA_UTIL.CALENDARPRINT(
    p_query IN VARCHAR2,
    p_mf_only IN VARCHAR2 DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
    p_cursor IN INTEGER,
    p_mf_only IN VARCHAR2 DEFAULT 'N');

Parameters

Table 137–3  CALENDARPRINT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
<tr>
<td>p_cursor</td>
<td>A PL/SQL cursor containing the same format as p_query.</td>
</tr>
<tr>
<td>p_mf_only</td>
<td>If &quot;N&quot; (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.</td>
</tr>
</tbody>
</table>

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.
CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the HTF package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```sql
OWA_UTIL.CELLSPRINT(
  p_colCnt IN INTEGER,
  p_resultTbl IN vc_arr,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
  p_theCursor IN NUMBER,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL,
  p_skip_rec IN NUMBER DEFAULT 0,
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
</tbody>
</table>
Table 137–4  (Cont.)  CELLSPRINT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_colCnt</td>
<td>The number of columns in the table.</td>
</tr>
<tr>
<td>p_theQuery</td>
<td>A SQL SELECT statement.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>A cursor ID. This can be the return value from the BIND_VARIABLES Function.</td>
</tr>
<tr>
<td>p_max_rows</td>
<td>The maximum number of rows to print.</td>
</tr>
<tr>
<td>p_format_numbers</td>
<td>If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.</td>
</tr>
<tr>
<td>p_skip_rec</td>
<td>The number of rows to exclude from the HTML table.</td>
</tr>
<tr>
<td>p_more_data</td>
<td>TRUE if there are more rows in the query or cursor, FALSE otherwise.</td>
</tr>
<tr>
<td>p_reccnt</td>
<td>The number of rows that have been returned by the query. This value does not include skipped rows (if any).</td>
</tr>
<tr>
<td>p_resultTbl</td>
<td>The index table which will contain the result of the query. Each entry in the query will correspond to one column value.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<tr><td>QueryResultItem</td><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
**CHOOSE_DATE Procedure**

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

**Syntax**

```sql
OWA_UTIL.CHOOSE_DATE(
p_name IN VARCHAR2,
p_date IN DATE DEFAULT SYSDATE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_name</td>
<td>The name of the form elements.</td>
</tr>
<tr>
<td>p_date</td>
<td>The initial date that is selected when the HTML page is displayed.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The parameter in the procedure that receives the data from these elements must be a `GET_CGI_ENV Function`.
- Use the `TODATE Function` to convert the `GET_CGI_ENV Function` value to the standard Oracle DATE data type.

**Examples**

```html
<Select NAME="p_name" SIZE="1">
    <Option value="01">1
    ...
    <Option value="31">31
</Select>

<Select NAME="p_name" SIZE="1">
    <Option value="01">JAN
    ...
    <Option value="12">DEC
</Select>
```
<SELECT NAME="p_name" SIZE="1">
  <OPTION value="1992">1992
  ...
  <OPTION value="2002">2002
</SELECT>
GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```sql
OWA_UTIL.GET_CGI_ENV(
    param_name       IN      VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param_name</td>
<td>The name of the CGI environment variable. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.
GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```sql
OWA_UTIL.GET_OWA_SERVICE_PATH
RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.
GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```sql
OWA_UTIL.GET_PROCEDURE
RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.
HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as `MIME_HEADER Procedure`, `REDIRECT_URL Procedure`, or `STATUS_LINE Procedure`.
- The HTTP header must be closed before any `HTTP.PRINT` or `HTTP.PRNT` calls.
LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```sql
OWA_UTIL.LISTPRINT(
    p_theQuery   IN    VARCHAR2,
    p_cname      IN    VARCHAR2,
    p_nsize      IN    NUMBER,
    p_multiple   IN    BOOLEAN    DEFAULT FALSE);
```

```sql
OWA_UTIL.LISTPRINT(
    p_theCursor   IN    INTEGER,
    p_cname      IN    VARCHAR2,
    p_nsize      IN    NUMBER,
    p_multiple   IN    BOOLEAN    DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_theQuery</td>
<td>The SQL query.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>The cursor ID. This can be the return value from the BIND_VARIABLES Function.</td>
</tr>
<tr>
<td>p_cname</td>
<td>The name of the HTML form element.</td>
</tr>
<tr>
<td>p_nsize</td>
<td>The size of the form element (this controls how many items the user can see without scrolling).</td>
</tr>
<tr>
<td>p_multiple</td>
<td>Whether multiple selection is permitted.</td>
</tr>
</tbody>
</table>

Usage Notes

The columns in the output of the query are handled in the following manner:
The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.

The second column specifies the values that the user sees.

The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```xml
<SELECT NAME="p_cname" SIZE="p_nsize">
  <OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column</OPTION>
  <OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
  ...
</SELECT>
```
MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```sql
OWA_UTIL.MIME_HEADER(
  ccontent_type   IN   VARCHAR2   DEFAULT 'text/html',
  bclose_header   IN   BOOLEAN    DEFAULT TRUE,
  ccharset   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ccontent_type</code></td>
<td>The MIME type to generate</td>
</tr>
<tr>
<td><code>bclose_header</code></td>
<td>Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
<tr>
<td><code>ccharset</code></td>
<td>The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.</td>
</tr>
</tbody>
</table>

Examples

Content-type: `<ccontent_type>`; charset=`<ccharset>`

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

Content-type: text/plain; charset=ISO-8859-4\n
PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

OWA_UTIL.PRINT_CGI_ENV;

Examples

This procedure generates a list in the following format:

cgi_env_var_name = value

**REDIRECT_URL Procedure**

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a web page to return or a program to execute.

**Syntax**

```plsql
OWA_UTIL.REDIRECT_URL(
    curl IN VARCHAR2,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL to visit.</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure must come before any HTTP or HTF procedure or function call.

**Examples**

This procedure generates

```
Location: <curl>
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

OWA_UTIL.SHOWPAGE;

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses DBMS_OUTPUT and is limited to 255 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.
SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```sql
OWA_UTIL.SHOWSOURCE (    
cname      IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>
SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (cname \n   INVARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>

Examples

Without a parameter, the procedure generates a line that looks like the following:

This page was produced by the PL/SQL Agent on August 9, 2001 09:30.

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

This page was produced by the PL/SQL Agent on 8/09/01 09:30

View PL/SQL Source
STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any htp.print or htp.prn calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
    nstatus IN INTEGER,
    creason IN VARCHAR2 DEFAULT NULL,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nstatus</td>
<td>The status code.</td>
</tr>
<tr>
<td>creason</td>
<td>The string for the status code.</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
Status: <nstatus> <creason>
```

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user’s browser) from database tables.

Syntax

OWA_UTIL.TABLEPRINT(
    ctable IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL,
    ntable_type IN INTEGER DEFAULT HTML_TABLE,
    ccolumns IN VARCHAR2 DEFAULT '*',
    cclauses IN VARCHAR2 DEFAULT NULL,
    ccol_aliases IN VARCHAR2 DEFAULT NULL,
    nrow_min IN NUMBER DEFAULT 0,
    nrow_max IN NUMBER DEFAULT NULL)
RETURN BOOLEAN;

Parameters

Table 137–13  TABLEPRINT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctable</td>
<td>The database table.</td>
</tr>
<tr>
<td>cattributes</td>
<td>Other attributes to be included as-is in the tag.</td>
</tr>
<tr>
<td>ntable_type</td>
<td>How to generate the table. Specify &quot;HTML_TABLE&quot; to generate the table using &lt;TABLE&gt; tags or &quot;PRE_TABLE&quot; to generate the table using the &lt;PRE&gt; tags.</td>
</tr>
<tr>
<td>ccolumns</td>
<td>A comma-delimited list of columns from ctable to include in the generated table.</td>
</tr>
<tr>
<td>cclauses</td>
<td>WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.</td>
</tr>
<tr>
<td>ccol_aliases</td>
<td>A comma-delimited list of headings for the generated table.</td>
</tr>
<tr>
<td>nrow_min</td>
<td>The first row, of those retrieved, to display.</td>
</tr>
<tr>
<td>nrow_max</td>
<td>The last row, of those retrieved, to display.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.
### Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `attributes` is the second rather than the last parameter.

### Examples

For browsers that do not support HTML tables, create the following procedure:

```sql
CREATE OR REPLACE PROCEDURE showemps IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

http://myhost:7777/pls/hr/showemps

returns to the following to the client:

```html
<pre>
<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>MGR</th>
<th>HIREDATE</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPTNO</th>
</tr>
</thead>
<tbody>
<tr>
<td>7369</td>
<td>SMITH</td>
<td>CLERK</td>
<td>7902</td>
<td>17-DEC-80</td>
<td>800</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7499</td>
<td>ALLEN</td>
<td>SALESMAN</td>
<td>7698</td>
<td>20-FEB-81</td>
<td>1600</td>
<td>300</td>
<td>30</td>
</tr>
<tr>
<td>7521</td>
<td>WARD</td>
<td>SALESMAN</td>
<td>7698</td>
<td>22-FEB-81</td>
<td>1250</td>
<td>500</td>
<td>30</td>
</tr>
<tr>
<td>7566</td>
<td>JONES</td>
<td>MANAGER</td>
<td>7839</td>
<td>02-APR-81</td>
<td>2975</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7654</td>
<td>MARTIN</td>
<td>SALESMAN</td>
<td>7698</td>
<td>28-SEP-81</td>
<td>1250</td>
<td>1400</td>
<td>30</td>
</tr>
<tr>
<td>7698</td>
<td>BLAKE</td>
<td>MANAGER</td>
<td>7839</td>
<td>01-MAY-81</td>
<td>2850</td>
<td></td>
<td>30</td>
</tr>
<tr>
<td>7782</td>
<td>CLARK</td>
<td>MANAGER</td>
<td>7839</td>
<td>09-JUN-81</td>
<td>2450</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>7788</td>
<td>SCOTT</td>
<td>ANALYST</td>
<td>7566</td>
<td>09-DEC-82</td>
<td>3000</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7839</td>
<td>KING</td>
<td>PRESIDENT</td>
<td>17-NOV-81</td>
<td>5000</td>
<td></td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>7844</td>
<td>TURNER</td>
<td>SALESMAN</td>
<td>7698</td>
<td>08-SEP-81</td>
<td>1500</td>
<td></td>
<td>30</td>
</tr>
<tr>
<td>7876</td>
<td>ADAMS</td>
<td>CLERK</td>
<td>7788</td>
<td>12-JAN-83</td>
<td>1100</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7900</td>
<td>JAMES</td>
<td>CLERK</td>
<td>7698</td>
<td>03-DEC-81</td>
<td>950</td>
<td></td>
<td>30</td>
</tr>
<tr>
<td>7902</td>
<td>FORD</td>
<td>ANALYST</td>
<td>7566</td>
<td>03-DEC-81</td>
<td>3000</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7934</td>
<td>MILLER</td>
<td>CLERK</td>
<td>7782</td>
<td>23-JAN-82</td>
<td>1300</td>
<td></td>
<td>10</td>
</tr>
</tbody>
</table>
</pre>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:
CREATE OR REPLACE PROCEDURE showemps_10 IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT
        ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
         'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
         'Employee Number, Name, Salary');
END;

A request for a URL like
http://myhost:7777/pls/hr/showemps_10

would return the following to the client:

<pre>
<table>
<thead>
<tr>
<th>Employee Number</th>
<th>Name</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>7782</td>
<td>CLARK</td>
<td>2450</td>
</tr>
<tr>
<td>7839</td>
<td>KING</td>
<td>5000</td>
</tr>
<tr>
<td>7934</td>
<td>MILLER</td>
<td>1300</td>
</tr>
</tbody>
</table>
</pre>

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

CREATE OR REPLACE PROCEDURE showdept IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;

A request for a URL like
http://myhost:7777/pls/hr/showdept

would return the following to the client:

<table border>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>
</table>
A Web browser would format this to look like the following table:

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
</tr>
</tbody>
</table>
TODATE Function

This function converts the DATETYPE Data Type to the standard Oracle DATE type.

Syntax

```sql
OWA_UTIL.TODATE(
    p_dateArray    IN     dateType)
RETURN DATE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_dateArray</td>
<td>The value to convert.</td>
</tr>
</tbody>
</table>
WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```plsql
OWA_UTIL.WHO_CALLED_ME(
    owner OUT VARCHAR2,
    name OUT VARCHAR2,
    lineno OUT NUMBER,
    caller_t OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The owner of the program unit.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.</td>
</tr>
<tr>
<td>lineno</td>
<td>The line number within the program unit where the call was made.</td>
</tr>
<tr>
<td>caller_t</td>
<td>The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.</td>
</tr>
</tbody>
</table>
The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- Documentation of SDO_CS
For a complete description of this package within the context of Oracle Spatial, see SDO_CS in the Oracle Spatial User’s Guide and Reference.
The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- Documentation of SDO_GCDR
Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in Oracle Spatial User's Guide and Reference.
The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories:

- **Relationship (True/False) between two objects:** RELATE, WITHIN_DISTANCE
- **Validation:** VALIDATE_GEOMETRY, VALIDATE_LAYER
- **Single-object operations:** SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- **Two-object operations:** SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- **Documentation of SDO_GEOM**
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the Oracle Spatial User’s Guide and Reference.
The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- Documentation of SDO_GEOR
Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR in the Oracle Spatial GeoRaster.
The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- Documentation of SDO_GEOR_UTL
For complete description of this package within the context of Oracle Spatial, see SDO_GEOR_UTL in the Oracle Spatial GeoRaster.
The **SDO_LRS** package contains functions that create, modify, query, and convert linear referencing elements.

- **Documentation of SDO_LRS**
For a complete description of this package within the context of Oracle Spatial, see
The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE
For a complete description of this package within the context of Oracle Spatial, see SDO_MIGRATE in the Oracle Spatial User’s Guide and Reference.
The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET
For a complete description of this package within the context of Oracle Spatial, see SDO_NET in the Oracle Spatial Topology and Network Data Models.
The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- Documentation of SDO_SAM
For a complete description of this package within the context of Oracle Spatial, see SDO_SAM in the Oracle Spatial User’s Guide and Reference.
The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- Documentation of SDO_TOPO
Documentation of SDO_TOPO

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO in the Oracle Spatial Topology and Network Data Models.
The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- Documentation of SDO_TOPO_MAP
For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO_MAP in the Oracle Spatial Topology and Network Data Models.
The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE
For complete description of this package within the context of Oracle Spatial, see SDO_TUNE in the Oracle Spatial User’s Guide and Reference.
The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

- Documentation of `SDO_UTIL`
For complete description of this package within the context of Oracle Spatial, see SDO_UTIL in the Oracle Spatial User’s Guide and Reference.
The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms
Summary of UTL_COLL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_LOCATOR Function</td>
<td>Determines whether a collection item is actually a locator or not</td>
</tr>
</tbody>
</table>
IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```sql
UTL_COLL.IS_LOCATOR (  coln IN STANDARD)  
RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coln</td>
<td>Nested table or varray item.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Collection item is indeed a locator.</td>
</tr>
<tr>
<td>0</td>
<td>Collection item is not a locator.</td>
</tr>
</tbody>
</table>

Examples

```sql
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT {
  pno  number,
  ph   list_t);
/

CREATE TABLE phone_book OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph;
```
CREATE TABLE phone_book1 OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;
END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
The UTL_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- Using UTL_COMPRESS
  - Constants
  - Exceptions
  - Operational Notes
- Summary of UTL_COMPRESS Subprograms
Using UTL_COMPRESS

- Constants
- Exceptions
- Operational Notes

Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE  CONSTANT  PLS_INTEGER := 5;
```

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>The compressed representation is too big.</td>
</tr>
<tr>
<td>DATA_ERROR</td>
<td>The input or output data stream was found to be an invalid format.</td>
</tr>
<tr>
<td>INVALID_ARGUMENT</td>
<td>One of the arguments was an invalid type or value.</td>
</tr>
<tr>
<td>INVALID_HANDLE</td>
<td>Invalid handle for piecewise compress or uncompress.</td>
</tr>
<tr>
<td>STREAM_ERROR</td>
<td>An error occurred during compression or uncompression of the data stream</td>
</tr>
</tbody>
</table>

Operational Notes

- It is the caller’s responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.
- A BFILE passed into LZ_COMPRESS* or LZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.
The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.
## Summary of UTL_COMPRESS Subprograms

### Table 152–2  UTL_COMPRESS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ISOPEN Function</strong> on page 152-5</td>
<td>Checks to see if the handle to a piecewise (un)compress context is open or closed</td>
</tr>
<tr>

<td>Initializes a piecewise context that maintains the compress state and data</td>
</tr>
<tr>
<td><strong>LZ_UNCOMPRESS Functions and Procedures</strong> on page 152-11</td>
<td>Accepts compressed input, verifies it to be a valid and uncompresses it</td>
</tr>
<tr>
<td><strong>LZ_UNCOMPRESS_EXTRACT Procedure</strong> on page 152-13</td>
<td>Extracts a piece of uncompressed data</td>
</tr>
<tr>
<td><strong>LZ_UNCOMPRESS_OPEN Function</strong> on page 152-14</td>
<td>Initializes a piecewise context that maintains the uncompress state and data</td>
</tr>
<tr>
<td><strong>LZ_UNCOMPRESS_CLOSE Procedure</strong> on page 152-15</td>
<td>Closes and finishes the piecewise uncompress</td>
</tr>
</tbody>
</table>
ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

UTL_COMPRESS.ISOPEN(
    handle in binary_integer)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;

Alternatively:

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
   src   IN     RAW,  
   quality   IN     BINARY_INTEGER DEFAULT 6)  
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
   src   IN     BLOB,  
   quality   IN     BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
   src   IN     BFILE,  
   dst   IN OUT NOCOPY BLOB,  
   quality   IN     BINARY_INTEGER DEFAULT 6);  
```

This function returns a temporary BLOB for the compressed data:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
   src   IN     BFILE,  
   quality   IN     BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
   src   IN     BFILE,  
   dst   IN OUT NOCOPY BLOB,  
   quality   IN     BINARY_INTEGER DEFAULT 6);  
```
Parameters

Table 152-4  LZ_COMPRESS Function and Procedures Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Data (RAW, BLOB or BFILE) to be compressed.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for compressed data</td>
</tr>
<tr>
<td>quality</td>
<td>An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6</td>
</tr>
</tbody>
</table>

Usage Notes

- quality is an optional compression tuning value. It allows the UTL_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default ‘quality’ value is 6.
LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
    handle IN     BINARY_INTEGER,
    dst   IN OUT NOCOPY  BLOB,
    src   IN    RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
<tr>
<td>src</td>
<td>The input data to be compressed.</td>
</tr>
</tbody>
</table>

Exceptions

- invalid_handle - out of range invalid or unopened handle.
- invalid_argument - NULL handle, src, dst, or invalid dst.
LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```sql
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
    handle IN       BINARY_INTEGER,
    dst    IN OUT NOCOPY BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle, dst, or invalid dst.
LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```sql
UTL_COMPRESS.LZ_COMPRESS_OPEN (
    dst       IN OUT NOCOPY BLOB,
    quality   IN            BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>User supplied LOB to store compressed data.</td>
</tr>
<tr>
<td>quality</td>
<td>Speed versus efficiency of resulting compressed output.</td>
</tr>
<tr>
<td></td>
<td>• Valid values are the range 1..9, with a default value of 6.</td>
</tr>
<tr>
<td></td>
<td>• 1=fastest compression, 9=slowest compression and best compressed file size.</td>
</tr>
</tbody>
</table>

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL dst or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB,
    dst  IN  OUT  NOCOPY  BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE,
    dst  IN  OUT  NOCOPY  BLOB);
```
Parameters

Table 152–8  LZ_UNCOMPRESS Function and Procedures Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Compressed data.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for uncompressed data.</td>
</tr>
</tbody>
</table>
LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```sql
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
    handle  IN          BINARY_INTEGER,
    dst     OUT NOCOPY  RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The uncompressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.
**LZ_UNCOMPRESS_OPEN Function**

This function initializes a piecewise context that maintains the uncompress state and data.

**Syntax**

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
    src  IN  BLOB)
RETURN BINARY_INTEGER;
```

**Parameters**

*Table 152–10  LZ_UNCOMPRESS_OPEN Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The input data to be uncompressed.</td>
</tr>
</tbody>
</table>

**Return Values**

A handle to an initialized piecewise compress context.

**Exceptions**

- invalid_handle  - invalid handle, too many open handles.
- invalid_argument - NULL src.

**Usage Notes**

Close the opened handle with **LZ_UNCOMPRESS_CLOSE**

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
    handle  IN   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.
LZ_UNCOMPRESS_CLOSE Procedure
The UTL_DBWS package provides database web services.

This chapter contains the following topics:

- Using UTL_DBWS
  - Supported Keys and Default Settings for Standard Call Properties
- Summary of UTL_DBWS Subprograms
## Supported Keys and Default Settings for Standard Call Properties

<table>
<thead>
<tr>
<th>Key</th>
<th>Explanation of Value, Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'USERNAME'</td>
<td>User name for authentication.</td>
</tr>
<tr>
<td>'PASSWORD'</td>
<td>Password for authentication.</td>
</tr>
<tr>
<td>'ENCODINGSTYLE_URI'</td>
<td>Encoding style specified as a namespace URI. The default value is the SOAP 1.1 encoding <a href="http://schemas.xmlsoap.org/soap/encoding/">http://schemas.xmlsoap.org/soap/encoding/</a>.</td>
</tr>
<tr>
<td>'OPERATION_STYLE'</td>
<td>Standard property for operation style. Set to 'RPC' if the operation style is RPC, 'DOCUMENT' if the operation style is document.</td>
</tr>
<tr>
<td>'SESSION_MAINTAIN'</td>
<td>This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint. If this property is set to 'TRUE', the service client indicates that it wants the session to be maintained. If set to 'FALSE', the session is not maintained. The default value for this property is 'FALSE'.</td>
</tr>
<tr>
<td>'SOAPACTION_USE'</td>
<td>This boolean property indicates whether or not SOAPAction is to be used. The default value of this property is 'FALSE'.</td>
</tr>
<tr>
<td>'SOAPACTION_URI'</td>
<td>Indicates the SOAPAction URI if the SOAPACTION_USE property is set to 'TRUE'.</td>
</tr>
</tbody>
</table>
## Summary of UTL_DBWS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<td>Sets the value of a particular property on a Call</td>
</tr>
</tbody>
</table>
CREATE_CALL Function

This procedure creates a Call instance.

Syntax

```sql
UTL_DBWS.CREATE_CALL (  
    service_handle   SERVICE,  
    port_name        QNAME,  
    operation_name   QNAME)  
RETURN CALL;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_handle</td>
<td>The Service instance to be called.</td>
</tr>
<tr>
<td>port_name</td>
<td>The qualified name for the port. Use the first port if this is NULL.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The qualified name for the operation.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL</td>
<td>Returns a handle to the Call instance.</td>
</tr>
</tbody>
</table>
CREATE_SERVICE Function

This procedure creates a Service instance.

Syntax

```
UTL_DBWS.CREATE_SERVICE(
    wsdl_document_location  URITYPE,
    service_name            QName)
RETURN SERVICE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wsdl_document_location</td>
<td>The URL for the WSDL document location for the service</td>
</tr>
<tr>
<td>service_name</td>
<td>The qualified name for the service. Use the first service if this is NULL.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE</td>
<td>Returns a handle to the Service instance.</td>
</tr>
</tbody>
</table>
GET_IN_PARAMETER_TYPES Function

This procedure lists the XML type of the input parameters of the Call that is returned.

Syntax

```
UTL_DBWS.GET_IN_PARAMETER_TYPES(
    call_handle    CALL)
RETURN QNAME_LIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Service instance whose input types are returned.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QNAME_LIST</td>
<td>The list of the XML type of the input parameters of the Call that is returned.</td>
</tr>
</tbody>
</table>
GET_OUT_PARAMETER_TYPES Function

This procedure lists the XML type of the output parameters of the Call that is returned.

Syntax

```sql
UTL_DBWS.GET_OUT_PARAMETER_TYPES(
    call_handle  CALL
) RETURN QNAME_LIST;
```

Parameters

Table 153–9 GET_OUT_PARAMETER_TYPES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Service instance whose output types are returned.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QNAME_LIST</td>
<td>The list of the XML type of the input parameters of the Call that is returned.</td>
</tr>
</tbody>
</table>
GET_OUTPUT_VALUES Function

This procedure obtains the output arguments after a Call invocation.

Syntax

```
UTL_DBWS.GET_OUTPUT_VALUES(
   call_handle   CALL)
RETURN ANYDATA_LIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The instance of the Call.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANYDATA_LIST</td>
<td>Returns the output arguments in order.</td>
</tr>
</tbody>
</table>
GET_PORTS Function

This procedure lists the qualified names of all of the ports in a service.

Syntax

UTL_DBWS.GET_PORTS(
   service_handle    SERVICE)
RETURN QNAME_LIST;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_handle</td>
<td>The service instance whose ports are returned</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QNAME_LIST</td>
<td>Returns a list of the qualified names of all ports in a service</td>
</tr>
</tbody>
</table>
**GET_PROPERTY Function**

This procedure returns the value of a particular property on a Call.

**Syntax**

```
UTL_DBWS.GET_PROPERTY(
    call_handle    CALL,
    key            VARCHAR2)
RETURN value VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The the instance of the Call</td>
</tr>
<tr>
<td>key</td>
<td>The key for the property (see Using UTL_DBWS on page 153-2)</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Returns the value of a particular property on a Call.</td>
</tr>
</tbody>
</table>
GET_RETURN_TYPE Function

This procedure lists the XML type that is returned by the given Call.

Syntax

```plaintext
UTL_DBWS.GET_RETURN_TYPE (  
    call_handle CALL)  
RETURN QNAME;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Service instance whose return type is returned.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QNAME</td>
<td>The type that is returned.</td>
</tr>
</tbody>
</table>

GET_SERVICES Function

This function lists the qualified names of the services defined in a WSDL document.

Syntax

```
UTL_DBWS.GET_SERVICES(
    wsdl_document_location  URITYPE)
RETURN QNAME_LIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wsdl_document_location</td>
<td>The Service instance whose return type is returned.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QNAME_LIST</td>
<td>A list of the qualified names of the services defined in the WSDL document.</td>
</tr>
</tbody>
</table>
INVOKED Function

This procedure invokes a specific operation using a synchronous request-response interaction mode.

Syntax

```
UTL_DBWS.INVOKE(
    call_handle CALL,
    input_params ANYDATA_LIST)
RETURN ANYDATA;
```

Parameters

Table 153-21  INVOKED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Service instance whose return type is returned.</td>
</tr>
<tr>
<td>input_params</td>
<td>The input parameters for this invocation.</td>
</tr>
</tbody>
</table>

Return Values

Table 153-22  INVOKED Function Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANYDATA</td>
<td>Returns the return value or NULL.</td>
</tr>
</tbody>
</table>
**RELEASE_ALL_SERVICES Procedure**

This procedure releases all Service instances.

**Syntax**

```sql
UTL_DBWS.RELEASE_ALL_SERVICES;
```
RELEASE_CALL Procedure

This procedure releases a particular Call instance.

Syntax

```
UTL_DBWS.RELEASE_CALL(
    call_handle    CALL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Call instance that is to be released.</td>
</tr>
</tbody>
</table>
RELEASESERVICE Procedure

This procedure releases a particular Service instance.

Syntax

UTL_DBWS.RELEASE_SERVICE (  
    service_handle  SERVICE);

Parameters

Table 153–24  RELEASESERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_handle</td>
<td>The Service instance that is to be released.</td>
</tr>
</tbody>
</table>

Usage Notes

This will implicitly release all Call instances that have been created for this Service instance.
REMOVEPROPERTY Procedure

This procedure clears the value of a particular property on a Call.

Syntax

UTL_DBWS.REMOVE_PROPERTY(
    call_handle CALL,
    key VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The Call instance.</td>
</tr>
<tr>
<td>key</td>
<td>The key for the property (see Using UTL_DBWS on page 153-2).</td>
</tr>
</tbody>
</table>
SET_PROPERTY Procedure

This procedure sets the value of a particular property on a Call.

Syntax

```sql
UTL_DBWS.SET_PROPERTY(
    call_handle    CALL,
    key            VARCHAR2,
    value          VARCHAR2);
```

Parameters

Table 153–26  SET_PROPERTY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_handle</td>
<td>The instance of the Call.</td>
</tr>
<tr>
<td>key</td>
<td>The key for the property (see Using UTL_DBWS on page 153-2).</td>
</tr>
<tr>
<td>value</td>
<td>The value for the property.</td>
</tr>
</tbody>
</table>
The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms
# Summary of UTL_ENCODE Subprograms

</tr>
</tbody>
</table>
BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```plaintext
UTL_ENCODE.BASE64_DECODE (r IN RAW) RETURN RAW;
```

Pragmas

```plaintext
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing base 64-encoded data. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the decoded string</td>
</tr>
</tbody>
</table>
BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```sql
UTL_ENCODE.BASE64_ENCODE (r IN RAW) RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW value to be encoded. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the encoded base 64 elements</td>
</tr>
</tbody>
</table>
MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

`=?<charset>?<encoding>?<encoded text>?=`

`=?ISO-8859-1?Q?Here is some encoded text?=`

The `<encoded text>` is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the `<encoded text>` is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the `<encoding>` metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```sql
UTL_ENCODE.MIMEHEADER_DECODE (  
    buf    IN   VARCHAR2 CHARACTER SET ANY_CS)  
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data with mime header format tags.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>The encoded text data with mime header format tags</td>
</tr>
</tbody>
</table>
Examples

```sql
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```
MIMEHEADER_ENCODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or NULL. If NULL, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If NULL, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (  
  buf IN VARCHAR2 CHARACTER SET ANY_CS,  
  encode_charset IN VARCHAR2 DEFAULT NULL,  
  encoding IN PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>buf</code></td>
<td>The text data.</td>
</tr>
</tbody>
</table>
MIMEHEADER_ENCODE Function

</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>
QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```sql
UTL_ENCODE.QUOTED_PRINTABLE_DECODE ( r  IN RAW) RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing a quoted printable data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded string</td>
</tr>
</tbody>
</table>
**QUOTED_PRINTABLE_ENCODE Function**

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

**Syntax**

```sql
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (    r  IN RAW)
RETURN RAW;
```

**Pragmas**

```sql
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the quoted printable string</td>
</tr>
</tbody>
</table>
TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each `encoding` parameter. If NULL, quoted-printable is selected as a default decoding format. If `encode_charset` is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```sql
UTL_ENCODE.TEXT_DECODE(
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN  VARCHAR2 DEFAULT NULL,
    encoding       IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The source character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 decoded text string.</td>
</tr>
</tbody>
</table>
Examples

v2:=UTL_ENCODE.TEXT_DECODE(
    'Here is some text',
    WE8ISO8859P1,
    UTL_ENCODE.BASE64);
TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```sql
UTL_ENCODE.TEXT_ENCODE (  
   buf           IN  VARCHAR2 CHARACTER SET ANY_CS,  
   encode_charset IN  VARCHAR2 DEFAULT NULL,  
   encoding      IN  PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The target character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64,</td>
</tr>
<tr>
<td></td>
<td>UTL_ENCODE.QUOTED_PRINTABLE and NULL</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>
TEXT_ENCODE Function

Examples

```plsql
v2:=utl_encode.text_encode(
    'Here is some text',
    'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```
**UUDECODE Function**

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "UUENCODE Function" on page 154-16 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

**Syntax**

```
UTL_ENCODE.UUDECODE (r IN RAW)
RETURN RAW;
```

**Pragmas**

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

*Table 154–18  UUDECODE Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing the uuencoded data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

**Return Values**

*Table 154–19  UUDECODE Function Return Values*

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded RAW string</td>
</tr>
</tbody>
</table>
UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTILITY.UUENCODE (  
    r          IN RAW,  
    type       IN PLS_INTEGER DEFAULT 1,  
    filename   IN VARCHAR2 DEFAULT NULL,  
    permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW string</td>
</tr>
</tbody>
</table>
| type      | Optional number parameter containing the type of uuencoded output. Options:  
            | complete—a defined PL/SQL constant with a value of 1. (default)  
            | header_piece ...middle_piece ...end_piece |
| filename  | Optional VARCHAR2 parameter containing the uuencode filename; the default is uuencode.txt |
| permission| Optional VARCHAR2 parameter containing the permission mode; the default is 0 (a text string zero). |

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the uuencode format string</td>
</tr>
</tbody>
</table>
With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Using `UTL_FILE`
  - Security Model
  - Types
  - Operational Notes
  - Rules and Limits
  - Exceptions
  - Examples
- Summary of `UTL_FILE` Subprograms
Using UTL_FILE

Security Model

UTL_FILE is available for both client-side and server-side PL/SQL. Both the client (text I/O) and server implementations are subject to server-side file system permission checking.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is not recommended. It is recommended that you use the CREATE DIRECTORY feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms, but non privileged users who need to read these files outside of PL/SQL may need access from a system administrator.
Caution:

- The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.
- Attempting to apply invalid options will give rise to unpredictable results.

Types

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
    id BINARY_INTEGER,
    datatype BINARY_INTEGER);
```

Operational Notes

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle
supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW len parameter.

When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should be the same as the database character set.

Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

Exceptions

Table 155–1  UTL_FILE Package Exceptions

<table>
<thead>
<tr>
<th>Exception Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_PATH</td>
<td>File location is invalid.</td>
</tr>
<tr>
<td>INVALID_MODE</td>
<td>The open_mode parameter in FOPEN is invalid.</td>
</tr>
<tr>
<td>INVALID_FILEHANDLE</td>
<td>File handle is invalid.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File could not be opened or operated on as requested.</td>
</tr>
<tr>
<td>READ_ERROR</td>
<td>Operating system error occurred during the read operation.</td>
</tr>
</tbody>
</table>
Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

**Examples**

**Example 1**

Given the following:

```sql
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> CREATE DIRECTORY out_dir AS '/appl/gl/user';
```
Examples

```
SQL> GRANT READ ON DIRECTORY user_dir TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>Accessible By</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log</td>
<td>L12345.log</td>
<td>Users with DBA privilege</td>
</tr>
<tr>
<td>/appl/gl/user</td>
<td>u12345.tmp</td>
<td>All users</td>
</tr>
</tbody>
</table>

The following file locations and filenames are invalid:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>Invalid Because</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log/backup</td>
<td>L12345.log</td>
<td># subdirectories are not accessible</td>
</tr>
<tr>
<td>/APPL/gl/log</td>
<td>L12345.log</td>
<td># directory strings must follow case sensitivity rules as required by the O/S</td>
</tr>
<tr>
<td>/appl/gl/log</td>
<td>backup/L1234.log</td>
<td># filenames may not include portions of directory paths</td>
</tr>
<tr>
<td>/user/tmp</td>
<td>L12345.log</td>
<td># no corresponding CREATE DIRECTORY command has been issued</td>
</tr>
</tbody>
</table>

**Example 2**

DECLARE
    V1 VARCHAR2(32767);
    F1 UTL_FILE.FILE_TYPE;
BEGIN
    -- In this example MAX_LINESIZE is less than GET_LINE's length request
    -- so the number of bytes returned will be 256 or less if a line terminator is seen.
    F1 := UTL_FILE.FOPEN('MYDIR', 'MYFILE', 'R', 256);
    UTL_FILE.GET_LINE(F1, V1, 32767);
    UTL_FILE.FCLOSE(F1);
    
    -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
    -- so the number of bytes returned will be 1024 or less if a line terminator is seen.
    F1 := UTL_FILE.FOPEN('MYDIR', 'MYFILE', 'R');
    UTL_FILE.GET_LINE(F1, V1, 32767);
    UTL_FILE.FCLOSE(F1);

155-6  PL/SQL Packages and Types Reference
-- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
-- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
-- defaults to 1024.
-- So the number of bytes returned will be 1024 or less if a line terminator
-- is seen.
F1 := UTL_FILE.FOPEN('MYDIR','MYFILE','R');
UTL_FILE.GET_LINE(F1,V1);
UTL_FILE.FCLOSE(F1);
END;

</tbody>
</table>
FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

UTL_FILE.FCLOSE (  
    file IN OUT FILE_TYPE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call.</td>
</tr>
</tbody>
</table>

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

WRITE_ERROR
INVALID_FILEHANDLE
FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

---

**Note:** FCLOSE_ALL does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an FCLOSE_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE_ALL.
---

Exceptions

```
WRITE_ERROR
```
FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```sql
UTL_FILE.FCOPY (
    location   IN VARCHAR2,
    filename   IN VARCHAR2,
    dest_dir   IN VARCHAR2,
    dest_file  IN VARCHAR2,
    start_line IN PLS_INTEGER DEFAULT 1,
    end_line   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>The directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>The source file to be copied</td>
</tr>
<tr>
<td>dest_dir</td>
<td>The destination directory where the destination file is created.</td>
</tr>
<tr>
<td>dest_file</td>
<td>The destination file created from the source file.</td>
</tr>
<tr>
<td>start_line</td>
<td>The line number at which to begin copying. The default is 1 for the first line.</td>
</tr>
<tr>
<td>end_line</td>
<td>The line number at which to stop copying. The default is NULL, signifying end of file.</td>
</tr>
</tbody>
</table>
**FFLUSH Procedure**

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

**Syntax**

```plaintext
UTL_FILE.FFLUSH (  
  file  IN FILE_TYPE);  
invalid_maxlinesize  EXCEPTION;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>file</code></td>
<td>Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call.</td>
</tr>
</tbody>
</table>

**Exceptions**

- `INVALID_FILEHANDLE`
- `INVALID_OPERATION`
- `WRITE_ERROR`
FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```sql
UTL_FILE.FGETATTR(
    location    IN VARCHAR2,
    filename    IN VARCHAR2,
    exists      OUT BOOLEAN,
    file_length OUT NUMBER,
    blocksize   OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive).</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file to be examined.</td>
</tr>
<tr>
<td>exists</td>
<td>A BOOLEAN for whether or not the file exists.</td>
</tr>
<tr>
<td>file_length</td>
<td>The length of the file in bytes. NULL if file does not exist.</td>
</tr>
<tr>
<td>blocksize</td>
<td>The file system block size in bytes. NULL if the file does not exist.</td>
</tr>
</tbody>
</table>
FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```plsql
UTL_FILE.FGETPOS (
    fileid IN file_type
) RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileid</td>
<td>The directory location of the source file</td>
</tr>
</tbody>
</table>

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.
FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also "FOPEN_NCHAR Function" on page 155-18.

Syntax

```sql
UTL_FILE.FOPEN (  
  location IN VARCHAR2,  
  filename IN VARCHAR2,  
  open_mode IN VARCHAR2,  
  max_linesize IN BINARY_INTEGER)  
RETURN file_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file. This string is a directory object name and is case sensitive. The default is uppercase. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.</td>
</tr>
<tr>
<td>filename</td>
<td>File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with ./</td>
</tr>
<tr>
<td>open_mode</td>
<td>Specifies how the file is opened. Modes include: r -- read text, w -- write text, a -- append text, rb -- read byte mode, wb -- write byte mode, ab -- append byte mode. If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.</td>
</tr>
</tbody>
</table>
Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

Exceptions

INVALID_PATH: File location or name was invalid.
INVALID_MODE: The open_mode string was invalid.
INVALID_OPERATION: File could not be opened as requested.
INVALID_MAXLINESIZE: Specified max_linesize is too large or too small.
FOPEN_NCHAR Function

This function opens a file in Unicode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database charset. See also FOPEN Function on page 155-16.

Syntax

```
UTL_FILE.FOPEN_NCHAR (    location IN VARCHAR2,    filename IN VARCHAR2,    open_mode IN VARCHAR2,    max_linesize IN BINARY_INTEGER) RETURN file_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file.</td>
</tr>
<tr>
<td>filename</td>
<td>File name (including extension).</td>
</tr>
<tr>
<td>open_mode</td>
<td>Open mode (r,w,a,rb,wb,ab).</td>
</tr>
<tr>
<td>max_linesize</td>
<td>Maximum number of characters for each line, including the newline character, for this file. (minimum value 1, maximum value 32767).</td>
</tr>
</tbody>
</table>
FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```sql
UTL_FILE.FREMOVE {
    location IN VARCHAR2,
    filename IN VARCHAR2};
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>The directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file to be deleted</td>
</tr>
</tbody>
</table>

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.
FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

Syntax

```sql
UTL_FILE.FRENAME (  
  location  IN VARCHAR2,  
  filename  IN VARCHAR2,  
  dest_dir  IN VARCHAR2,  
  dest_file IN VARCHAR2,  
  overwrite IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>The directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive).</td>
</tr>
<tr>
<td>filename</td>
<td>The source file to be renamed.</td>
</tr>
<tr>
<td>dest_dir</td>
<td>The destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive).</td>
</tr>
<tr>
<td>dest_file</td>
<td>The new name of the file.</td>
</tr>
<tr>
<td>overwrite</td>
<td>The default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

Permission on both the source and destination directories must be granted. You can use the `overwrite` parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.
**FSEEK Procedure**

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

**Syntax**

```plsql
UTL_FILE.FSEEK (
    fid             IN utl_file.file_type,
    absolute_offset IN PL_INTEGER DEFAULT NULL,
    relative_offset IN PLS_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fid</code></td>
<td>The file ID.</td>
</tr>
<tr>
<td><code>absolute_offset</code></td>
<td>The absolute location to which to seek; default = NULL</td>
</tr>
<tr>
<td><code>relative_offset</code></td>
<td>The number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

Using **FSEEK**, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.

If `relative_offset`, the procedure seeks forward. If `relative_offset` > 0, or backward, if `relative_offset` < 0, the procedure seeks through the file by the number of `relative_offset` bytes specified.

If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an **INVALID_OFFSET** error is raised.

If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the len parameter. It cannot exceed the max_linesize specified in FOPEN.

Syntax

```
UTL_FILE.GET_LINE (  
    file        IN  FILE_TYPE,  
    buffer      OUT VARCHAR2,  
    len         IN  PLS_INTEGER DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call. The file must be open for reading (mode r); otherwise an INVALID_OPERATION exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Data buffer to receive the line read from the file.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>

Usage Notes

If the line does not fit in the buffer, a VALUE_ERROR exception is raised. If no text was read due to end of file, the NO_DATA_FOUND exception is raised. If the file is opened for byte mode operations, the INVALID_OPERATION exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 155-24.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
READ_ERROR
NO_DATA_FOUND
VALUE_ERROR
GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database charset. See also "GET_LINE_NCHAR Procedure" on page 155-24.

Syntax

```plsql
UTL_FILE.GET_LINE_NCHAR (  
  file    IN  FILE_TYPE,  
  buffer  OUT NVARCHAR2,  
  len     IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Data buffer to receive the line read from the file.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>
GET_RAW Function

This function reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW.len parameter.

Syntax

UTL_FILE.GET_RAW (
    fid IN utl_file.file_type,
    r OUT NOCOPY RAW,
    len IN PLS_INTEGER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fid</td>
<td>The file ID.</td>
</tr>
<tr>
<td>r</td>
<td>The RAW data.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.</td>
</tr>
</tbody>
</table>
IS_OPEN Function

This function tests a file handle to see if it identifies an open file. IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```sql
UTL_FILE.IS_OPEN (
    file  IN FILE_TYPE
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call.</td>
</tr>
</tbody>
</table>

Return Values

TRUE or FALSE
**NEW_LINE Procedure**

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

**Syntax**

```
UTL_FILE.NEW_LINE (  
    file    IN FILE_TYPE,  
    lines   IN NATURAL := 1);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call.</td>
</tr>
<tr>
<td>lines</td>
<td>Number of line terminators to be written to the file.</td>
</tr>
</tbody>
</table>

**Exceptions**

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR
PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 155-31.

Syntax

```sql
UTL_FILE.PUT (  
    file     IN FILE_TYPE,  
    buffer   IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. You must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited printf(). See also "PUTF_NCHAR Procedure" on page 155-35.

Syntax

```
UTL_FILE.PUTF (
    file    IN FILE_TYPE,
    format  IN VARCHAR2,
    [arg1   IN VARCHAR2  DEFAULT NULL,
    . . .
    arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

**Table 155–20**  PUTF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call.</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s.</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>From one to five operational argument strings.</td>
</tr>
<tr>
<td></td>
<td>Argument strings are substituted, in order, for the %s formatters in the format string.</td>
</tr>
<tr>
<td></td>
<td>If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</td>
</tr>
</tbody>
</table>

Usage Notes

The format string can contain any text, but the character sequences %s and \n have special meaning.

<table>
<thead>
<tr>
<th>Character Sequence</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>%s</td>
<td>Substitute this sequence with the string value of the next argument in the argument list.</td>
</tr>
<tr>
<td>\n</td>
<td>Substitute with the appropriate platform-specific line terminator.</td>
</tr>
</tbody>
</table>
Examples

The following example writes the lines:

Hello, world!
I come from Zork with greetings for all earthlings.

my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!
I come from %s with %s.
my_world,
  'greetings for all earthlings');

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database charset. See also "PUT Procedure" on page 155-28.

Syntax

```
UTL_FILE.PUT_NCHAR (
    file    IN FILE_TYPE,
    buffer  IN NVARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. You must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
PUT_RAW Function

This function accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```sql
UTL_FILE.PUT_RAW (
    fid       IN utl_file.file_type,
    r         IN RAW,
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fid</td>
<td>The file ID.</td>
</tr>
<tr>
<td>r</td>
<td>The RAW data written to the buffer.</td>
</tr>
<tr>
<td>autoflush</td>
<td>If TRUE, performs a flush after writing the value to the output buffer; default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `OPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure" on page 155-34.

Syntax

```sql
UTL_FILE.PUT_LINE (
    file      IN FILE_TYPE,
    buffer    IN VARCHAR2,
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call.</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file.</td>
</tr>
<tr>
<td>autoflush</td>
<td>Flushes the buffer to disk after the WRITE.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database charset. See also "PUT_LINE Procedure" on page 155-33.

Syntax

```sql
UTL_FILE.PUT_LINE_NCHAR (  
    file    IN FILE_TYPE,  
    buffer  IN NVARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
PUTF_NCHAR Procedure

This procedure is a formatted PUT_NCHAR procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database charset. See also "PUTF_NCHAR Procedure" on page 155-35 and "PUT_LINE Procedure" on page 155-33.

Syntax

```
UTL_FILE.PUTF_NCHAR (  
  file    IN FILE_TYPE,  
  format  IN NVARCHAR2,  
  [arg1   IN NVARCHAR2  DEFAULT NULL,  
    . . .  
    arg5    IN NVARCHAR2  DEFAULT NULL];
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s.</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
PUTF_NCHAR Procedure
The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager to set up an Oracle wallet. Non-HTTPS fetches do not require an Oracle wallet.

**See Also:**
- Chapter 166, "UTL_URL"
- Chapter 164, "UTL_SMTP"
- *Oracle Advanced Security Administrator’s Guide* for more information on Wallet Manager

This chapter contains the following topics:
- **Using UTL_HTTP**
  - Overview
  - Constants
  - Types
  - Exceptions
  - Examples
- Subprogram Groups
- Summary of UTL_HTTP Subprograms
Using UTL_HTTP

- Overview
- Constants
- Types
- Exceptions
- Examples

Overview

With UTL_HTTP, you can write PL/SQL programs that communicate with Web (HTTP) servers. UTL_HTTP also contains a function that can be used in SQL queries. The package also supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS, directly or through an HTTP proxy. Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

Constants

<table>
<thead>
<tr>
<th>Constant and Syntax</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_VERSION_1_0 CONSTANT VARCHAR2(10) := 'HTTP/1.0';</td>
<td>Denotes HTTP version 1.0 that can be used in the function begin_request.</td>
</tr>
<tr>
<td>HTTP_VERSION_1 CONSTANT VARCHAR2(10) := 'HTTP/1.1';</td>
<td>Denotes HTTP version 1.1 that can be used in the function begin_request.</td>
</tr>
<tr>
<td>DEFAULT_HTTP_PORT CONSTANT PLS_INTEGER := 80;</td>
<td>The default TCP/IP port (80) at which a Web server or proxy server listens</td>
</tr>
<tr>
<td>DEFAULT_HTTPS_PORT CONSTANT PLS_INTEGER := 443;</td>
<td>The default TCP/IP port (443) at which an HTTPS Web server listens</td>
</tr>
<tr>
<td>Constant and Syntax</td>
<td></td>
</tr>
<tr>
<td>----------------------</td>
<td></td>
</tr>
<tr>
<td>HTTP_VERSION_1_0 CONSTANT VARCHAR2(10) := 'HTTP/1.0';</td>
<td></td>
</tr>
<tr>
<td>HTTP_VERSION_1 CONSTANT VARCHAR2(10) := 'HTTP/1.1';</td>
<td></td>
</tr>
<tr>
<td>DEFAULT_HTTP_PORT CONSTANT PLS_INTEGER := 80;</td>
<td></td>
</tr>
<tr>
<td>DEFAULT_HTTPS_PORT CONSTANT PLS_INTEGER := 443;</td>
<td></td>
</tr>
</tbody>
</table>

The following denote all the HTTP 1.1 status codes:

| HTTP_CONTINUE CONSTANT PLS_INTEGER := 100; |
| HTTP_SWITCHING_PROTOCOLS CONSTANT PLS_INTEGER := 101; |
| HTTP_OK CONSTANT PLS_INTEGER := 200; |
| HTTP_CREATED CONSTANT PLS_INTEGER := 201; |
| HTTP_ACCEPTED CONSTANT PLS_INTEGER := 202; |
| HTTP_NON_AUTHORITATIVE_INFO CONSTANT PLS_INTEGER := 203; |
| HTTP_NO_CONTENT CONSTANT PLS_INTEGER := 204; |
| HTTP_RESET_CONTENT CONSTANT PLS_INTEGER := 205; |
| HTTP_PARTIAL_CONTENT CONSTANT PLS_INTEGER := 206; |
| HTTP_MULTIPLE_CHOICES CONSTANT PLS_INTEGER := 300; |
| HTTP_MOVED_PERMANENTLY CONSTANT PLS_INTEGER := 301; |
| HTTP_FOUND CONSTANT PLS_INTEGER := 302; |
| HTTP_SEE_OTHER CONSTANT PLS_INTEGER := 303; |
| HTTP_NOT_MODIFIED CONSTANT PLS_INTEGER := 304; |
| HTTP_USE_PROXY CONSTANT PLS_INTEGER := 305; |
| HTTP_TEMPORARY_REDIRECT CONSTANT PLS_INTEGER := 307; |
| HTTP_BAD_REQUEST CONSTANT PLS_INTEGER := 400; |
| HTTP_UNAUTHORIZED CONSTANT PLS_INTEGER := 401; |
| HTTP_PAYMENT_REQUIRED CONSTANT PLS_INTEGER := 402; |
| HTTP_FORBIDDEN CONSTANT PLS_INTEGER := 403; |
| HTTP_NOT_FOUND CONSTANT PLS_INTEGER := 404; |
| HTTP_NOT_ACCEPTABLE CONSTANT PLS_INTEGER := 406; |

</tbody>
</table>

Types

- REQ Type
- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type

REQ Type

Use this PL/SQL record type to represent an HTTP request.
Using UTL_HTTP

Syntax

TYPE req IS RECORD {
  url VARCHAR2(32767),
  method VARCHAR2(64),
  http_version VARCHAR2(64));

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request. It is set after the request is created by begin_request.</td>
</tr>
<tr>
<td>method</td>
<td>The method to be performed on the resource identified by the URL. It is set after the request is created by begin_request.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version used to send the request. It is set after the request is created by begin_request.</td>
</tr>
</tbody>
</table>

Usage Notes

The information returned in REQ from the interface begin_request is for read only. Changing the field values in the record has no effect on the request.

There are other fields in REQ record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

TYPE resp IS RECORD {
  status_code PLS_INTEGER,
  reason_phrase VARCHAR2(256),
  http_version VARCHAR2(64));
Types

Parameters

Table 156–4  RESP Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status_code</td>
<td>The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by get_response.</td>
</tr>
<tr>
<td>reason_phrase</td>
<td>The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by get_response.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version used in the HTTP response. It is set after the response is processed by get_response.</td>
</tr>
</tbody>
</table>

Usage Notes

The information returned in RESP from the interface get_response is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```sql
TYPE cookie IS RECORD ( 
  name VARCHAR2(256),
  value VARCHAR2(1024),
  domain VARCHAR2(256),
  expire TIMESTAMP WITH TIME ZONE,
  path VARCHAR2(1024),
  secure BOOLEAN,
  version PLS_INTEGER,
  comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```
Fields of COOKIE Record Type
Table 156–5 shows the fields for the COOKIE and COOKIE_TABLE record types.

Table 156–5  Fields of COOKIE and COOKIE_TABLE Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the HTTP cookie</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie</td>
</tr>
<tr>
<td>domain</td>
<td>The domain for which the cookie is valid</td>
</tr>
<tr>
<td>expire</td>
<td>The time by which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The subset of URLs to which the cookie applies</td>
</tr>
<tr>
<td>secure</td>
<td>Should the cookie be returned to the Web server using secured means only.</td>
</tr>
<tr>
<td>version</td>
<td>The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.</td>
</tr>
</tbody>
</table>

Usage Notes
PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using get_cookies, store them persistently in a database table, and re-store the cookies back in the package using add_cookies in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 156-18.

CONNECTION Type
Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.
For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `ssl` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

**Syntax**

```
TYPE connection IS RECORD (  
    host  VARCHAR2(256),  
    port  PLS_INTEGER,  
    proxy_host  VARCHAR2(256),  
    proxy_port  PLS_INTEGER,  
    ssl  BOOLEAN);  
```

```
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;  
```
Operational Flow

The UTL_HTTP package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 156–1, or an exception will be raised.
Figure 156–1  Flow of the Core UTL_HTTP Package
The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET_COOKIE_COUNT
  - GET_COOKIES
  - ADD_COOKIES
  - CLEAR_COOKIES

- Persistent connections
  - GET_PERSISTENT_CONN_COUNT
  - GET_PERSISTENT_CONNS
  - CLOSE_PERSISTENT_CONN
  - CLOSE_PERSISTENT_CONNS

- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
- GET_DETAIL_SQNCODE
- GET_DETAIL_SQLERRM

**NOTE:** Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

---

**Simple HTTP Fetches**

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.

**Note:** UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable http_proxy to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable no_proxy to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

**See Also:** Simple HTTP Fetches in a Single Call Subprograms on page 156-22
Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: Session Settings Subprograms on page 156-23

HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 156-25

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 156-26

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 156-27

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.
The UTL_HTTP package provides subprograms to retrieve error information. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by read_text, read_line, and read_raw regardless of the setting).

### Table 156–6 UTL_HTTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
<th>Where Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_failed</td>
<td>29273</td>
<td>The request fails to execute</td>
<td>Any HTTP request or response interface when detailed_exception is disabled</td>
</tr>
<tr>
<td>bad_argument</td>
<td>29261</td>
<td>The argument passed to the interface is bad</td>
<td>Any HTTP request or response interface when detailed_exception is enabled</td>
</tr>
<tr>
<td>bad_url</td>
<td>29262</td>
<td>The requested URL is badly formed</td>
<td>begin_request, when detailed_exception is enabled</td>
</tr>
<tr>
<td>protocol_error</td>
<td>29263</td>
<td>An HTTP protocol error occurs when communicating with the Web server</td>
<td>set_header, get_response, read_raw, read_text, and read_line, when detailed_exception is enabled</td>
</tr>
<tr>
<td>unknown_scheme</td>
<td>29264</td>
<td>The scheme of the requested URL is unknown</td>
<td>begin_request and get_response, when detailed_exception is enabled</td>

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
<th>Where Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>end_of_body</td>
<td>29266</td>
<td>The end of HTTP response body is reached</td>
<td>read_raw, read_text, and read_line, when detailed_exception is enabled</td>
</tr>
<tr>
<td>illegal_call</td>
<td>29267</td>
<td>The call to UTL_HTTP is illegal at the current state of the HTTP request</td>
<td>set_header, set_authentication, and set_persistent_conn_support, when detailed_exception is enabled</td>
</tr>
<tr>
<td>http_client_error</td>
<td>29268</td>
<td>From get_response, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.</td>
<td>get_response, begin_request when detailed_exception is enabled</td>
</tr>
<tr>
<td>http_server_error</td>
<td>29269</td>
<td>From get_response, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.</td>
<td>get_response, begin_request when detailed_exception is enabled</td>
</tr>
<tr>
<td>too_many_requests</td>
<td>29270</td>
<td>Too many requests or responses are open</td>
<td>begin_request, when detailed_exception is enabled</td>
</tr>
<tr>
<td>partial_multibyte_exception</td>
<td>29275</td>
<td>No complete character is read and a partial multibyte character is found at the end of the response body</td>
<td>read_text and read_line, when detailed_exception is enabled</td>
</tr>
<tr>
<td>transfer_timeout</td>
<td>29276</td>
<td>No data is read and a read timeout occurred</td>
<td>read_text and read_line, when detailed_exception is enabled</td>
</tr>
</tbody>
</table>
Examples

NOTE: The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUESTPieces`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

Examples

The following examples demonstrate how to use `UTL_HTTP`.

- General Usage
- Handling HTTP Authentication
- Retrieving and Restoring Cookies

General Usage

```
SET serveroutput ON SIZE 40000

DECLARE
  req   utl_http.req;
  resp  utl_http.resp;
  value VARCHAR2(1024);
BEGIN
  utl_http.set_proxy('proxy.my-company.com', 'corp.my-company.com');
  req := utl_http.begin_request('http://www-hr.corp.my-company.com');
  utl_http.set_header(req, 'User-Agent', 'Mozilla/4.0');
  resp := utl_http.get_response(req);
  LOOP
    utl_http.read_line(resp, value, TRUE);
    dbms_output.put_line(value);
  END LOOP;
  utl_http.end_response(resp);
```
Using UTL_HTTP

Retrieving HTTP Response Headers

SET serveroutput ON SIZE 40000

DECLARE
    req    utl_http.req;
    resp   utl_http.resp;
    name   VARCHAR2(256);
    value  VARCHAR2(1024);
BEGIN
    utl_http.set_proxy('proxy.my-company.com', 'corp.my-company.com');

    req := utl_http.begin_request('http://www-hr.corp.my-company.com');
    utl_http.set_header(req, 'User-Agent', 'Mozilla/4.0');
    resp := utl_http.get_response(req);

    dbms_output.put_line('HTTP response status code: ' || resp.status_code);
    dbms_output.put_line('HTTP response reason phrase: ' || resp.reason_phrase);

    FOR i IN 1..utl_http.get_header_count(resp) LOOP
        utl_http.get_header(resp, i, name, value);
        dbms_output.put_line(name || ': ' || value);
    END LOOP;
    utl_http.end_response(resp);
END;

Handling HTTP Authentication

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url IN VARCHAR2, username IN VARCHAR2 DEFAULT NULL, password IN VARCHAR2 DEFAULT NULL, realm IN VARCHAR2 DEFAULT NULL) AS

    req    utl_http.req;
    resp   utl_http.resp;
    my_scheme VARCHAR2(256);
    my_realm VARCHAR2(256);
    my_proxy BOOLEAN;

    my_scheme := substr(url, 1, INSTR(url, '/') - 1);
    my_realm := substr(url, INSTR(url, '/') + 1, LENGTH(url) - INSTR(url, '/') - 1);
BEGIN
    utl_http.set_proxy(NULL, NULL);
    utl_http.set_header(req, 'User-Agent', 'Mozilla/4.0');

    IF username IS NOT NULL THEN
        utl_http.set_header(req, 'Authorization', 'Basic ' || utl_http.get_base64(username || ':' || password));
    END IF;

    resp := utl_http.get_response(req);
    dbms_output.put_line('HTTP response status code: ' || resp.status_code);
    dbms_output.put_line('HTTP response reason phrase: ' || resp.reason_phrase);

    FOR i IN 1..utl_http.get_header_count(resp) LOOP
        utl_http.get_header(resp, i, name, value);
        dbms_output.put_line(name || ': ' || value);
    END LOOP;
    utl_http.end_response(resp);
END;
BEGIN

-- Turn off checking of status code. We will check it by ourselves.
utl_http.http_response_error_check(FALSE);

req := utl_http.begin_request(url);
IF (username IS NOT NULL) THEN
    utl_http.set_authentication(req, username, password); -- Use HTTP Basic Authe. Scheme
END IF;

resp := utl_http.get_response(req);
IF (resp.status_code = utl_http.HTTP_UNAUTHORIZED) THEN
    utl_http.get_authentication(resp, my_scheme, my_realm, my_proxy);
    IF (my_proxy) THEN
        dbms_output.put_line('Web proxy server is protected.');
        dbms_output.put('Please supplied the required ' || my_scheme || ' authentication username/password for realm ' || my_realm || ' for the proxy server.');</n    ELSE
        dbms_output.put_line('Web page ' || url || ' is protected.');
        dbms_output.put('Please supplied the required ' || my_scheme || ' authentication username/password for realm ' || my_realm || ' for the Web page.');
    END IF;
    utl_http.end_response(resp);
RETURN;
END IF;

FOR i IN 1..utl_http.get_header_count(resp) LOOP
    utl_http.get_header(resp, i, name, value);
    dbms_output.put_line(name || ': ' || value);
END LOOP;
utl_http.end_response(resp);

END;

Retrieving and Restoring Cookies

CREATE TABLE my_cookies (
    session_id INTEGER,
    name VARCHAR2(256),
    value VARCHAR2(1024),
    domain VARCHAR2(256),
    expire DATE,
Using UTL_HTTP

```sql
CREATE SEQUENCE session_id;

SET serveroutput ON SIZE 40000

REM Retrieve cookies from UTL_HTTP

CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
cookies    utl_http.cookie_table;
my_session_id PLS_INTEGER;
secure      VARCHAR2(1);
BEGIN

/* assume that some cookies have been set in previous HTTP requests. */

utl_http.get_cookies(cookies);
select session_id.nextval into my_session_id from dual;

FOR i in 1..cookies.count LOOP
  IF (cookies(i).secure) THEN
    secure := 'Y';
  ELSE
    secure := 'N';
  END IF;
  insert into my_cookies
  values (my_session_id, cookies(i).name, cookies(i).value,
          cookies(i).domain,
          cookies(i).expire, cookies(i).path, secure, cookies(i).version);
END LOOP;

RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP

CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER) AS
cookies    utl_http.cookie_table;
cookie     utl_http.cookie;
```
Examples

DECLARE
  i          PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name   := r.name;
    cookie.value  := r.value;
    cookie.domain := r.domain;
    cookie.expire := r.expire;
    cookie.path   := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  utl_http.clear_cookies;
  utl_http.add_cookies(cookies);
END;

<tr>
<td><strong>SET_PROXY Procedure on page 156-90</strong></td>
<td>Sets the proxy to be used for requests of HTTP or other protocols (see Session Settings on page 156-13 and Session Settings Subprograms on page 156-23)</td>
</tr>
</tbody>
</table>
### Table 156–14  (Cont.) UTL_HTTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_RESPONSE_ERROR_CHECK Procedure on page 156-92</td>
<td>Sets whether or not get_response raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges (see Session Settings on page 156-13 and Session Settings Subprograms on page 156-23)</td>
</tr>
<tr>
<td>SET_TRANSFER_TIMEOUT Procedure on page 156-93</td>
<td>Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server (see Session Settings on page 156-13 and Session Settings Subprograms on page 156-23)</td>
</tr>
<tr>
<td>SET_WALLET Procedure on page 156-94</td>
<td>Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS (see Session Settings on page 156-13 and Session Settings Subprograms on page 156-23)</td>
</tr>
<tr>
<td>WRITE_LINE Procedure on page 156-96</td>
<td>Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP) (see HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25)</td>
</tr>
<tr>
<td>WRITE_RAW Procedure on page 156-98</td>
<td>Writes some binary data in the HTTP request body (see HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25)</td>
</tr>
<tr>
<td>WRITE_TEXT Procedure on page 156-99</td>
<td>Writes some text data in the HTTP request body (see HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25)</td>
</tr>
</tbody>
</table>
ADD_COOKIES Procedure

This procedure adds the cookies maintained by UTL_HTTP.

See Also: HTTP Cookies on page 156-13 and HTTP Cookies Subprograms on page 156-27

Syntax

```
UTL_HTTP.ADD_COOKIES {
  cookies IN cookie_table);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies to be added.</td>
</tr>
</tbody>
</table>

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.
BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[[:password]@[host[:port]]/[...]
```

**See Also:** [HTTP Requests on page 156-13](#) and [HTTP Requests](#) Subprograms on page 156-25

**Syntax**

```
UTL_HTTP.BEGIN_REQUEST (    
    url           IN VARCHAR2,    
    method        IN VARCHAR2 DEFAULT 'GET',    
    http_version  IN VARCHAR2 DEFAULT NULL)    
RETURN req;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request.</td>
</tr>
<tr>
<td>method</td>
<td>The method performed on the resource identified by the URL.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should
BEGIN REQUEST Function

escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 166, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

An Oracle wallet must be set before accessing Web servers over HTTPS. See the set_wallet procedure on how to set up an Oracle wallet.
CLEAR_COOKIES Procedure

This procedure clears all cookies maintained by the UTL_HTTP package.

See Also:  HTTP Cookies on page 156-13 and HTTP Cookies Subprograms on page 156-27

Syntax

UTL_HTTP.CLEAR_COOKIES;
CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also: HTTP Persistent Connections on page 156-13 and HTTP Persistent Connections Subprograms on page 156-28

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
    conn   IN connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conn</td>
<td>The HTTP persistent connection to close</td>
</tr>
</tbody>
</table>
CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                 proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

See Also: HTTP Persistent Connections on page 156-13 and HTTP Persistent Connections Subprograms on page 156-28

Syntax

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
    host        IN VARCHAR2 DEFAULT NULL,
    port        IN PLS_INTEGER DEFAULT NULL,
    proxy_host  IN VARCHAR2 DEFAULT NULL,
    proxy_port  IN PLS_INTEGER DEFAULT NULL,
    ssl         IN BOOLEAN DEFAULT NULL);
```
CLOSE_PERSISTENT_CONNS Procedure

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>port</td>
<td>The port number for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_host</td>
<td>The proxy host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_port</td>
<td>The proxy port for which persistent connections are to be closed</td>
</tr>
<tr>
<td>ssl</td>
<td>Close persistent SSL connection</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the close_persistent_conn procedure that closes a specific persistent connection.
END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

Syntax

UTL_HTTP.END_REQUEST (  
    r IN OUT NOCOPY req);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>
This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:**  HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

### Syntax

```plsql
UTL_HTTP.END_RESPONSE (
    r  IN OUT NOCOPY resp);
```

### Parameters

*Table 156–20  END_RESPONSE Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
</tbody>
</table>
GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
    r          IN OUT NOCOPY resp,
    scheme     OUT VARCHAR2,
    realm      OUT VARCHAR2,
    for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>scheme</td>
<td>The scheme for the required HTTP authentication</td>
</tr>
<tr>
<td>realm</td>
<td>The realm for the required HTTP authentication</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling get_authentication. The Web client makes the second request and supplies the required authentication information with set_authorization. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the
required authentication information in the first request, thus saving an extra request.
GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

**See Also:** Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

```sql
UTL_HTTP.GET_BODY_CHARSET (
    charset  OUT NOCOPY VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>The default character set of the body of all future HTTP requests</td>
</tr>
</tbody>
</table>
GET_COOKIE_COUNT Function

This function returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers.

See Also: HTTP Cookies on page 156-13 and HTTP Cookies Subprograms on page 156-27

Syntax

UTL_HTTP.GET_COOKIE_COUNT
RETURN PLS_INTEGER;
GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also:  Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.GET_COOKIE_SUPPORT (  
  enable          OUT BOOLEAN,  
  max_cookies     OUT PLS_INTEGER,  
  max_cookies_per_site  OUT PLS_INTEGER);  

Parameters

Table 156–23  GET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Indicates the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Indicates the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>
GET_COOKIES Function

This function returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers.

See Also: HTTP Cookies on page 156-13 and HTTP Cookies Subprograms on page 156-27

Syntax

UTL_HTTP.GET_COOKIES (  
    cookies  IN OUT NOCOPY cookie_table);

Parameters

Table 156–24 GET_COOKIES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies returned</td>
</tr>
</tbody>
</table>
GETDetalleD_EXCP_Support Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.GETDetalleD_EXCP_Support {
    enable OUT BOOLEAN);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

See Also: Error Conditions on page 156-14 and Error Conditions Subprograms on page 156-29

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```
GETDETAILDSQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

See Also: Error Conditions on page 156-14 and Error Conditions Subprograms on page 156-29

Syntax

```
UTL_HTTP.GETDETAILDSQLERRM
RETURN VARCHAR2;
```
GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.GET_FOLLOW_REDIRECT (  
  max_redirects OUT PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirections for all future HTTP requests.</td>
</tr>
</tbody>
</table>
GET_HEADER Procedure

This procedure returns the n\textsuperscript{th} HTTP response header name and value returned in the response.

**See Also:**  HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

**Syntax**

```sql
UTL_HTTP.GET_HEADER(
  r  IN OUT NOCOPY resp,
  n  IN PLS_INTEGER,
  name  OUT NOCOPY VARCHAR2,
  value  OUT NOCOPY VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>n</td>
<td>The n\textsuperscript{th} header to return.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header for which the value is to return</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header.</td>
</tr>
<tr>
<td>n</td>
<td>The n&lt;sup&gt;th&lt;/sup&gt; occurrence of an HTTP response header by the specified name to return. The default is 1.</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

```plsql
UTL_HTTP.GET_HEADER_COUNT (r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

**See Also:** HTTP Persistent Connections on page 156-13 and HTTP Persistent Connections Subprograms on page 156-28

**Syntax**

```sql
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

**Usage Notes**

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
### GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:
- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

**See Also:** Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

#### Syntax

```sql
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (enable OUT BOOLEAN,
                                 max_conns OUT PLS_INTEGER);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if persistent connection support is enabled; otherwise FALSE</td>
</tr>
<tr>
<td>max_conns</td>
<td>the maximum number of persistent connections maintained in the current session.</td>
</tr>
</tbody>
</table>

---

**UTL_HTTP**

156-59
GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 156-13 and HTTP Persistent Connections Subprograms on page 156-28

Syntax

UTL_HTTP.get_persistent_conns (  
   connections  IN OUT NOCOPY connection_table);  

Parameters

Table 156–31  GET_PERSISTENT_CONNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connections</td>
<td>The network connections kept persistent</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

```sql
UTL_HTTP.GET_PROXY (  
    proxy OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) currently used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy is used for all requests.</td>
</tr>
</tbody>
</table>
GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

UTL_HTTP.GET_RESPONSE (  
    r IN OUT NOCOPY req)  
RETURN resp;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>
GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also:  Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.GET_RESPONSE_ERROR_CHECK ( enable  OUT BOOLEAN);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if the response error check is set; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also:  Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout  OUT PLS_INTEGER);

Parameters

Table 156–35  GET_TRANSFER_TIMEOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds.</td>
</tr>
</tbody>
</table>
READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function read_line of UTL_TCP. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

```
UTL_HTTP.READ_LINE(
    r            IN OUT NOCOPY resp,
    data         OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>Removes the newline characters if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_line waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
READ_LINE Procedure

If a partial multibyte character is found at the end of the response body, **read_line** stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the **partial_multibyte_char** exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the **read_raw** procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the **transfer_timeout** exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the **READ_RAW** procedure, or set the character set of the response body explicitly using the **SET_BODY_CHARSET** procedure and read the response body as text again.
**READ_RAW Procedure**

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

**Syntax**

```
UTL_HTTP.READ_RAW(
    r     IN OUT NOCOPY resp,
    data  OUT NOCOPY RAW,
    len   IN PLS_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>The HTTP response.</td>
</tr>
<tr>
<td><code>data</code></td>
<td>The HTTP response body in binary form</td>
</tr>
<tr>
<td><code>len</code></td>
<td>The number of bytes of data to read. If <code>len</code> is <code>NULL</code>, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code>. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is <code>NULL</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

**See Also:** HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26
READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26

Syntax

```plsql
UTL_HTTP.READ_TEXT(
    r     IN OUT NOCOPY resp,
    data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>len</td>
<td>The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_text waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read...
successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_text stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.
REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port]/[
```

**See Also:** Simple HTTP Fetches on page 156-12 and Simple HTTP Fetches in a Single Call Subprograms on page 156-22

**Syntax**

```
UTL_HTTP.REQUEST (  
  url              IN VARCHAR2,  
  proxy            IN VARCHAR2 DEFAULT NULL,  
  wallet_path      IN VARCHAR2 DEFAULT NULL,  
  wallet_password  IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Pragmas**

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

**Parameters**

**Table 156–39  REQUEST Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator.</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
</tbody>
</table>
Summary of UTL_HTTP Subprograms

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

**INIT_FAILED**  
**REQUEST_FAILED**

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function set_wallet on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<HTML>
<HEAD>
```
REQUEST Function

<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
</BODY>
</HTML>

Examples

SQLPLUS> SELECT utl_http.request('http://www.my-company.com/') FROM dual;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
If you are behind a firewall, include the proxy parameter. For example, from within the Oracle firewall, where there might be a proxy server named
www-proxy.my-company.com:
SQLPLUS> SELECT
FROM dual;
REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

[http://][user[:password]@]host[:port][/]

See Also: Simple HTTP Fetches on page 156-12 and Simple HTTP Fetches in a Single Call Subprograms on page 156-22

Syntax

type html_pieces is table of varchar2(2000) index by binary_integer;

UTL_HTTP.REQUEST_PIECES (  
    url IN VARCHAR2,  
    max_pieces IN NATURAL DEFAULT 32767,  
    proxy IN VARCHAR2 DEFAULT NULL,  
    wallet_path IN VARCHAR2 DEFAULT NULL,  
    wallet_password IN VARCHAR2 DEFAULT NULL)  
RETURN html_pieces;

Pragmas

pragma restrict_references (request_pieces, wnds, rnds, wnps, rnps);

Parameters

Table 156–40  REQUEST_PIECES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator.</td>
</tr>
<tr>
<td>max_pieces</td>
<td>(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
</tbody>
</table>
REQUEST_PIECES Function

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles&lt;username&gt;\WALLETS, and in Unix is, for example, file:/home/&lt;username&gt;/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See set_wallet for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet.</td>
</tr>
</tbody>
</table>

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the “pieces”) returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous “piece” is totally full.
Please see the documentation of the function set_wallet on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<html>
<head>
<title>Error Message</title>
</head>
<body>
<h1>Fatal Error 500</h1>
<p>
Reason: Can't locate remote host: home.nothing.comm.
</p>
</body>
</html>
```

**Examples**

```sql
SET SERVEROUTPUT ON

DECLARE
  x  utl_http.html_pieces;
  len PLS_INTEGER;
BEGIN
  x := utl_http.request_pieces('http://www.oracle.com/', 100);
  dbms_output.put_line(x.count || ' pieces were retrieved.');
  dbms_output.put_line('with total length ');
  IF x.count < 1 THEN
    dbms_output.put_line('0');
  ELSE
    len := 0;
    FOR i in 1..x.count LOOP
      len := len + length(x(i));
    END LOOP;
    dbms_output.put_line(i);
  END IF;
END;
```
REQUEST_PIECES Function

/  
-- Output  
Statement processed.  
4 pieces were retrieved.  
with total length  
7687
**SET_AUTHENTICATION Procedure**

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

**See Also:** HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

**Syntax**

```sql
UTL_HTTP.SET_AUTHENTICATION(
    r         IN OUT NOCOPY req,
    username  IN VARCHAR2,
    password  IN VARCHAR2,
    scheme    IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN  DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>username</td>
<td>The username for the HTTP authentication</td>
</tr>
<tr>
<td>password</td>
<td>The password for the HTTP authentication</td>
</tr>
<tr>
<td>scheme</td>
<td>The HTTP authentication scheme. The default, BASIC, denotes the HTTP Basic Authentication scheme.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Only the HTTP Basic Authentication scheme is supported.
This procedure is overloaded. The description of different functionalities is located alongside the syntax declarations.

See Also:
- HTTP Responses on page 156-13 and HTTP Responses Subprograms on page 156-26
- Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is text and the character set is not specified in the Content-Type header. Following the HTTP protocol standard specification, if the media type of a request or a response is text, but the character set information is missing in the Content-Type header, the character set of the request or response body should default to ISO-8859-1. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other SET_BODY_CHARSET procedure that operates on a request:

```plsql
UTL_HTTP.SET_BODY_CHARSET (charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the Content-Type header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```plsql
UTL_HTTP.SET_BODY_CHARSET (r IN OUT NOCOPY req,
    charset  IN VARCHAR2 DEFAULT NULL);
```
Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the "Content-Type" header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```sql
UTL_HTTP.SET_BODY_CHARSET(
    r IN OUT NOCOPY resp,
    charset IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>charset</td>
<td>The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code>, the database character set is assumed.</td>
</tr>
</tbody>
</table>
SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionalities is located alongside the syntax declarations.

This procedure

See Also:
- HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25
- Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```plsql
UTL_HTTP.SET_COOKIE_SUPPORT(
    r       IN OUT NOCOPY REQ,
    enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```plsql
UTL_HTTP.SET_COOKIE_SUPPORT (
    enable   IN BOOLEAN,
    max_cookies IN PLS_INTEGER DEFAULT 300,
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>The HTTP request.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Set enable to TRUE to enable HTTP cookie support; FALSE to disable.</td>
</tr>
<tr>
<td><code>max_cookies</code></td>
<td>Sets the maximum total number of cookies maintained in the current session.</td>
</tr>
</tbody>
</table>
Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other set_cookie_support procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 156-16 for how to use get_cookies and add_cookies to retrieve, save, and restore cookies.
SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLCODE and GET_DETAILED_SQLEERR for more detailed information about the error.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable IN BOOLEAN DEFAULT FALSE);

Parameters

Table 156–44 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE</td>
</tr>
</tbody>
</table>
SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:
- HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25
- Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

Use this procedure to set the maximum number of redirections:

```lisp
UTL_HTTP.SET_FOLLOW_REDIRECT (  
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```lisp
UTL_HTTP.SET_FOLLOW_REDIRECT(  
    r              IN OUT NOCOPY req,  
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirects. Set to zero to disable redirects.</td>
</tr>
</tbody>
</table>

Usage Notes

If max_redirects is set to a positive number, the GET_RESPONSE Function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for
the status code 303) at the new location. It follows the redirection until the final,
non-redirect location is reached, or an error occurs, or the maximum number of
redirections has been reached (to prevent an infinite loop). The URL and method
fields in the REQ record will be updated to the last redirected URL and the method
used to access the URL. Set the maximum number of redirects to zero to disable
automatic redirection.

While it is set not to follow redirect automatically in the current session, it is
possible to specify individual HTTP requests to follow redirect instructions the
function follow_redirect and vice versa.

The default maximum number of redirections in a database user session is 3. The
default value affects only future requests and has no effect on existing requests.

The SET_FOLLOW_REDIRECT procedure must be called before GET_RESPONSE
for any redirection to take effect.
**SET_HEADER Procedure**

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

*See Also*: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

**Syntax**

```
UTL_HTTP.SET_HEADER (r      IN OUT NOCOPY req,
                      name   IN VARCHAR2,
                      value  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP request header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP request header</td>
</tr>
</tbody>
</table>

**Usage Notes**

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the set_body_charset procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers
or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.
SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

See Also: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

Syntax

UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r       IN OUT NOCOPY req,
    enable  IN BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE to keep the network connection persistent. FALSE otherwise.</td>
</tr>
</tbody>
</table>

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection
support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in 'Examples' on page 156-88.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

**Examples**

**Using SET_PERSISTENT_CONN_SUPPORT in HTTP Requests**

```sql
DECLARE
    TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY binary_integer;
    paths vc2_table;

UTL_HTTP.fetch_pages(paths IN vc2_table) AS
    url_prefix VARCHAR2(256) := 'http://www.my-company.com/';
    req   utl_http.req;
    resp  utl_http.resp;
    data  VARCHAR2(1024);
BEGIN
    FOR i IN 1..paths.count LOOP
        req := utl_http.begin_request(url_prefix || paths(i));
        -- Use persistent connection except for the last request
        IF (i < paths.count) THEN
            utl_http.set_persistent_conn_support(req, TRUE);
        END IF;
    END LOOP;
END;
```
resp := utl_http.get_response(req);

BEGIN
  LOOP
    utl_http.read_text(resp, data);
    -- do something with the data
  END LOOP;
END EXCEPTION
  WHEN utl_http.end_of_body THEN
    NULL;
END;
  utl_http.end_response(resp);
END LOOP;
END;

BEGIN
  utl_http.set_persistent_conn_support(FALSE, 1);
  paths(1) := '...';
  paths(2) := '...';
  ...
  fetch_pages(paths);
END;
SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in no_proxy_domains. no_proxy_domains is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.SET_PROXY (  
    proxy             IN VARCHAR2,  
    no_proxy_domains  IN VARCHAR2);  

Parameters

Table 156–48  SET_PROXY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) to be used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy should be used for all requests.</td>
</tr>
</tbody>
</table>

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is [http://]host[:port][/], for example, www-proxy.my-company.com:80. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, corp.my-company.com, eng.my-company.com:80. When no_proxy_domains is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.
You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.
SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not get_response raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

**See Also:** Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

```sql
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to check for response errors; otherwise FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, get_response will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, get_response will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The get_response function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.
SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

See Also: Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout  IN PLS_INTEGER DEFAULT 60);

Parameters

Table 156–50  SET_TRANSFER_TIMEOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

The default value of the time out is 60 seconds.
SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

See Also:  Session Settings on page 156-13 and Session Settings Subprograms on page 156-23

Syntax

UTL_HTTP.SET_WALLET (  
    path      IN VARCHAR2,  
    password  IN VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The directory path that contains the Oracle wallet. The format is file:&lt;directory-path&gt;. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles&lt;username&gt;\WALLETS, and in Unix is, for example, file:/home/&lt;username&gt;/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</td>
</tr>
<tr>
<td>password</td>
<td>The password needed to open the wallet. A second copy of a wallet in a wallet directory that may be opened without a password. That second copy of the wallet is read-only. If the password is NULL, the UTL_HTTP package will open the second, read-only copy of the wallet instead.</td>
</tr>
</tbody>
</table>
Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager.

See Also: Oracle Advanced Security Administrator’s Guide for more information on Wallet Manager.
WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

Syntax

UTL_HTTP.WRITE_LINE(
  r     IN OUT NOCOPY req,
  data  IN VARCHAR2 CHARACTER SET ANY_CS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text line to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the set_header procedure for details.
If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the write_raw procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.
WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

Syntax

```sql
UTL_HTTP.WRITE_RAW(
    r     IN OUT NOCOPY req,
    data  IN RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The binary data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the set_header procedure for details.
WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 156-13 and HTTP Requests Subprograms on page 156-25

Syntax

```sql
UTL_HTTP.WRITE_TEXT(
    r     IN OUT NOCOPY req,
    data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the set_header procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted...
from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the \texttt{write\_raw} procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where \texttt{UTL\_HTTP} handles the length of the chunks transparently.
UTL_IL18N is a set of services that help developers build multilingual applications. The Globalization Development Kit provides a set of tools that are designed to help developers with minimal experience in internationalization development effectively write multilingual applications.

See Also: Oracle Database Globalization Support Guide

The chapter contains the following topics:

- Using UTL_IL18n
  - Overview
  - Constants
  - Flags
- Summary of UTL_IL18N Subprograms
Using UTL_I18n

Overview

The UTL_I18n PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes
- Escape and unescape sequences for predefined characters and multibyte characters used by HTML and XML documents
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and ISO languages and territories
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets
- A function that returns the Oracle character set name from an Oracle language name

Constants

```
SHIFT_IN   CONSTANT PLS_INTEGER := 0;
SHIFT_OUT  CONSTANT PLS_INTEGER := 1;
```

Flags

```
ORACLE_TO_IANA      CONSTANT PLS_INTEGER := 0;
IANA_TO_ORACLE      CONSTANT PLS_INTEGER := 1;
MAIL_GENERIC        CONSTANT PLS_INTEGER := 0;
MAIL_WINDOWS        CONSTANT PLS_INTEGER := 1;
GENERIC_CONTEXT     CONSTANT PLS_INTEGER := 0;
MAIL_CONTEXT        CONSTANT PLS_INTEGER := 1;
```
# Summary of UTL_I18N Subprograms

<td>Returns a string from an input string that contains escape sequences.</td>
</tr>
</tbody>
</table>
ESCAPE_REFERENCE Function

This function provides a way to specify an escape sequence for predefined characters and multibyte characters that cannot be converted to the character set used by an HTML or XML document.

For example, `< (less than symbol) has a special meaning in HTML. To display `< as a character, encode it as the escape sequence `&lt;`. In the same way, you can specify how multibyte characters are displayed when they are not part of the character set encoding of an HTML or XML document. For example, if you encode a page in the ZHT16BIG5 character set, then this function checks every character. If it finds a character that is not a Chinese character, then it returns an escape character.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE( str           IN VARCHAR2 CHARACTER SET ANY_CS,
                         page_cs_name   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
<tr>
<td>page_cs_name</td>
<td>Specifies the character set encoding of the HTML or XML document. If <code>page_cs_name</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('ab'||chr(170),'us7ascii')
```

This returns `ab&amp;#xa;`. 
**GET_DEFAULT_CHARSET Function**

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

*See Also:* ["MAP_CHARSET Function" on page 157-7](#) for an explanation of an e-mail safe character set

**Syntax**

```sql
UTL_I18N.GET_DEFAULT_CHARSET( language  IN VARCHAR2,
context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: Return the default character set for general cases</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: Return the default e-mail safe character set name</td>
</tr>
<tr>
<td>iswindows</td>
<td>If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.</td>
</tr>
<tr>
<td></td>
<td>iswindows has no effect if context is set as GENERIC_CONTEXT.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.
Examples

**GENERIC_CONTEXT, iswindows=FALSE**

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

**MAIL_CONTEXT, iswindows=TRUE**

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

**MAIL_CONTEXT, iswindows=FALSE**

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAP_CHARSET Function

This function:
- Maps an Oracle character set name to an IANA character set name
- Maps an IANA character set name to an Oracle character set name
- Maps an Oracle character set to an e-mail safe character set name

Syntax

```sql
UTL_I18N.MAP_CHARSET( charset   IN VARCHAR2,
context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Specifies the character set name to be mapped. The mapping is case-insensitive.</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>MAILCONTEXT: The mapping is between an Oracle character set name and an e-mail safe character set name.</td>
</tr>
</tbody>
</table>
Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted. The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

---

**Note:** Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

---

**Examples**

**Generic Context**

```sql
UTL_I18N.MAP_CHARSET('iso-8859-1', UTL_I18N.GENERIC_CONTEXT, UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

**Context**

```sql
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets
MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```plsql
UTL_I18N.MAP_LANGUAGE_FROM_ISO( isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en_ instead of en_US), then the function returns the default language name for the specified language (for example, American).

Examples

```plsql
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle languages
MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```sql
UTL_I18N.MAP_LOCALE_TO_ISO( ora_language   IN VARCHAR2,
               ora_territory  IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ora_language</td>
<td>Specifies an Oracle language name. It is case-insensitive.</td>
</tr>
<tr>
<td>ora_territory</td>
<td>Specifies an Oracle territory name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

```sql
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle languages and territories
MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO( isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, _fr instead of fr_fr), then the function returns the default territory name for the specified territory (for example, French).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle territories
RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```sql
UTL_I18N.RAW_TO_CHAR( data          IN RAW,
                        src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```sql
UTL_I18N.RAW_TO_CHAR( data            IN RAW,
                        src_charset     IN VARCHAR2 DEFAULT NULL,
                        scanned_length  OUT PLS_INTEGER,
                        shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to a VARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from.</td>
</tr>
<tr>
<td></td>
<td>If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
</tbody>
</table>
Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

**Buffer Conversion**

```sql
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

'abcde'||chr(170)

**Piecewise Conversion**

```sql
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```sql
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
```
converted_len  PLS_INTEGER;
rtemp  RAW(10) = '';
conn  utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);
LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
  rvalue := utl_raw.concat(rtemp, rvalue);
  nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
  if (converted_len < utl_raw.length(rvalue) )
    then
      rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
      rtemp := '';  
    end if;
  /* do anything you want with nvalue */
  /* e.g htp.prn(nvalue); */
END LOOP;
  utl_tcp.close_connection(conn);
END;
RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

### Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR( data      IN RAW,
                        src_charset IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

### Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR( data            IN RAW,
                        src_charset      IN VARCHAR2 DEFAULT NULL,
                        scanned_length   OUT PLS_INTEGER,
                        shift_status     IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

Parameters

**Table 157–9 RAW_TO_NCHAR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to an NVARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
<tr>
<td>shift_status</td>
<td></td>
</tr>
</tbody>
</table>
Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

**Buffer Conversion**

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

'abcde'||chr(170)

**Piecewise Conversion**

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
```
conversation_state  PLS_INTEGER = 0;
converted_len   PLS_INTEGER;
rttemp  RAW(10) = '';
conn   utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
    remote_port => 2000);
LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
  rvalue := utl_raw.concat(rttemp, rvalue);
  nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len, conversion_stat);
  if (converted_len < utl_raw.length(rvalue) )
    then
      rttemp := utl_raw.substr(rvalue, converted_len+1);
    else
      rttemp := '';  
    end if;
  /* do anything you want with nvalue */
  /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;
STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW( data          IN VARCHAR2 CHARACTER SET ANY_CS,
                         dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the VARCHAR2 or NVARCHAR2 string to convert</td>
</tr>
<tr>
<td>dst_charset</td>
<td>Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
  r raw(50);
  s varchar2(20);
BEGIN
  s:='abcdef'||chr(170);
  r:=utl_i18n.string_to_raw(s,'utf8');
  dbms_output.put_line(rawtohex(r));
END;
/
```

This returns a hex value of '616263646566C2AA'.
UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains escape sequences. It decodes each escape sequence to the corresponding character value.

See Also: "ESCAPE_REFERENCE Function" on page 157-4 for more information about escape sequences

Syntax

UTL_I18N.UNESCAPE_REFERENCE( str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

Examples

UTL_I18N.UNESCAPE_REFERENCE('ab#xa;')

This returns 'ab'||chr(170).
The **UTL_INADDR** package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- **Using UTL_INADDR**
  - Exceptions
  - Examples
- **Summary of UTL_INADDR Subprograms**
Exceptions

Table 158–1 Exception from Internet Address Package

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNKNOWN_HOST</td>
<td>The host is unknown.</td>
</tr>
</tbody>
</table>

Examples

Retrieve the local host name and IP address.

```sql
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/```
## Summary of UTL_INADDR Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_HOST_ADDRESS Function on page 158-4</td>
<td>Retrieves the IP address of the local or remote host given its name</td>
</tr>
<tr>
<td>GET_HOST_NAME Function on page 158-5</td>
<td>Retrieves the name of the local or remote host given its IP address</td>
</tr>
</tbody>
</table>
GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

UTL_INADDR.GET_HOST_ADDRESS (  
    host  IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the host to retrieve the IP address.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_address</td>
<td>The IP address of the specified host, or that of the local host if host is NULL.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown.
GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```sql
UTL_INADDR.GET_HOST_NAME (  
ip  IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>The name of the local or remote host of the specified IP address.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown.
GET_HOST_NAME Function
UTL_LMS retrieves and formats error messages in different languages.

  - Security Model
- Summary of UTL_LMS Subprograms
Using UTL_LMS

- Security Model

**Security Model**

This package must be created as the user SYS.
## Summary of UTL_LMS Subprograms

### Table 159–1  UTL_LMS Package Subprograms

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMAT_MESSAGE Function</td>
<td>Formats a retrieved error message</td>
</tr>
<tr>
<td>GET_MESSAGE Function</td>
<td>Retrieves an error message based on error number, product, facility, language, and message specified</td>
</tr>
</tbody>
</table>

FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

<table>
<thead>
<tr>
<th>Special Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'%s'</td>
<td>Substitute the next string argument</td>
</tr>
<tr>
<td>'%d'</td>
<td>Substitute the next integer argument</td>
</tr>
<tr>
<td>'%%'</td>
<td>Represents the special character %</td>
</tr>
</tbody>
</table>

Syntax

```sql
UTL_LMS.FORMAT_MESSAGE( format IN VARCHAR2 CHARACTER SET ANY_CS,
                         args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

**Table 159–2  FORMAT_MESSAGE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Specifies the string to format</td>
</tr>
<tr>
<td>args</td>
<td>Specifies the list of arguments</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
  i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
  dbms_output.put_line('before format, message is: '||s);
  dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
                          'my_column_name');
END;
/
```

The following is an unformatted message:
Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the lmsgen utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also: Oracle Database Globalization Support Guide for more information about the lmsgen utility

Syntax

```
UTL_LMS.GET_MESSAGE( errnum    IN PLS_INTEGER,
                    product   IN VARCHAR2,
                    facility  IN VARCHAR2,
                    language  IN VARCHAR2,
                    message   OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 159–3  GET_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum</td>
<td>Specifies the error number.</td>
</tr>
<tr>
<td>product</td>
<td>Specifies the product to which the error message applies</td>
</tr>
<tr>
<td>facility</td>
<td>Specifies the error message prefix</td>
</tr>
<tr>
<td>language</td>
<td>Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.</td>
</tr>
<tr>
<td>message</td>
<td>Specifies the output buffer for the retrieved message</td>
</tr>
</tbody>
</table>

Usage Notes

If the language parameter is set to NULL, then the value of the NLS_LANGUAGE session parameter is used as the default.
Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
  i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
  dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

OCI--00601 is: Echec du processus de nettoyage.
The UTL_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt.

This chapter contains the following topics:

- Using UTL_MAIL
  - Security Model
  - Operational Notes
- Summary of UTL_MAIL Subprograms
Using UTL_MAIL

## Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions.

## Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

  ```sql
  sqlplus sys/<pwd>
  SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
  SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.sql
  ```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.
## Summary of UTL_MAIL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEND Procedure on page 160-4</td>
<td>Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients</td>
</tr>
<tr>
<td>SEND_ATTACH_RAW Procedure on page 160-5</td>
<td>Represents the SEND Procedure overloaded for RAW attachments</td>
</tr>
<tr>
<td>SEND_ATTACH_VARCHAR2 Procedure on page 160-7</td>
<td>Represents the SEND Procedure overloaded for VARCHAR2 attachments</td>
</tr>
</tbody>
</table>
SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (  
  sender      IN    VARCHAR2 CHARACTER SET ANY_CS,  
  recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,  
  cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  message     IN    VARCHAR2 CHARACTER SET ANY_CS,  
  mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',  
  priority    IN    PLS_INTEGER DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>The email address of the sender.</td>
</tr>
<tr>
<td>recipients</td>
<td>The email addresses of the recipient(s), separated by commas.</td>
</tr>
<tr>
<td>cc</td>
<td>The email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>The email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>A string to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>A text message body.</td>
</tr>
<tr>
<td>mime_type</td>
<td>The mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>The message priority, default is NULL.</td>
</tr>
</tbody>
</table>
**SEND_ATTACH_RAW Procedure**

This procedure is the `SEND` Procedure overloaded for `RAW` attachments.

**Syntax**

```sql
UTL_MAIL SEND_ATTACH_RAW (  
  sender           IN    VARCHAR2 CHARACTER SET ANY_CS,  
  recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,  
  cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  message          IN    VARCHAR2 CHARACTER SET ANY_CS,  
  mime_type        IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',  
  priority         IN    PLS_INTEGER DEFAULT NULL  
  attachment       IN    RAW,  
  att_inline   IN    BOOLEAN DEFAULT TRUE,  
  att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT  
                      'application/octet',  
  att_filename     IN    VARCHAR2 DEFAULT NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>The email address of the sender.</td>
</tr>
<tr>
<td>recipients</td>
<td>The email addresses of the recipient(s), separated by commas.</td>
</tr>
<tr>
<td>cc</td>
<td>The email addresses of the CC recipient(s), separated by commas, default is NULL.</td>
</tr>
<tr>
<td>bcc</td>
<td>The email addresses of the BCC recipient(s), separated by commas, default is NULL.</td>
</tr>
<tr>
<td>subject</td>
<td>A string to be included as email subject string, default is NULL.</td>
</tr>
<tr>
<td>message</td>
<td>A text message body.</td>
</tr>
<tr>
<td>mime_type</td>
<td>The mime type of the message, default is 'text/plain; charset=us-ascii'.</td>
</tr>
<tr>
<td>priority</td>
<td>The message priority, the default is NULL.</td>
</tr>
<tr>
<td>attachment</td>
<td>A RAW attachment.</td>
</tr>
</tbody>
</table>
Table 160–3  (Cont.) SEND_ATTACH_RAW Procedure Parameters

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>att_inline</td>
<td>Specifies whether the attachment is viewable inline with the message body, default is TRUE.</td>
</tr>
<tr>
<td>att_mime_type</td>
<td>The mime type of the attachment, default is 'application/octet'.</td>
</tr>
<tr>
<td>att_filename</td>
<td>The string specifying a filename containing the attachment, default is NULL.</td>
</tr>
</tbody>
</table>
SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```sql
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
    sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message           IN    VARCHAR2 CHARACTER SET ANY_CS,
    mime_type         IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
    priority          IN    PLS_INTEGER DEFAULT NULL
    attachment        IN    RAW,
    att_inline        IN    BOOLEAN DEFAULT TRUE,
    att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'application/octet',
    att_filename      IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>The email address of the sender.</td>
</tr>
<tr>
<td>recipients</td>
<td>The email addresses of the recipient(s), separated by commas.</td>
</tr>
<tr>
<td>cc</td>
<td>The email addresses of the CC recipient(s), separated by commas, default is NULL.</td>
</tr>
<tr>
<td>bcc</td>
<td>The email addresses of the BCC recipient(s), separated by commas, default is NULL.</td>
</tr>
<tr>
<td>subject</td>
<td>A string to be included as email subject string, default is NULL.</td>
</tr>
<tr>
<td>message</td>
<td>A text message body.</td>
</tr>
<tr>
<td>mime_type</td>
<td>The mime type of the message, default is 'text/plain; charset=us-ascii'.</td>
</tr>
<tr>
<td>priority</td>
<td>The message priority, the default is NULL.</td>
</tr>
<tr>
<td>attachment</td>
<td>A text attachment.</td>
</tr>
</tbody>
</table>

The UTL_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- Using UTL_RAW
  - Overview
  - Operational Notes
- Summary of UTL_RAW Subprograms
Using UTL_RAW

- Overview
- Operational Notes

Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.
## Summary of UTL_RAW Subprograms

<table>
<thead>
<tr>
<th>Table 161–1</th>
<th>UTL_RAW Package Subprograms</th>
</tr>
</thead>
<tbody>

### Summary of UTL_RAW Subprograms

#### Table 161–1 (Cont.) UTL_RAW Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CAST_TO_NVARCHAR2 Function</strong> on page 161-23</td>
<td>Converts a <code>RAW</code> represented using <code>n</code> data bytes into <code>NVARCHAR2</code> with <code>n</code> data bytes</td>
</tr>
<tr>
<td><strong>COMPARE Function</strong> on page 161-24</td>
<td>Compares <code>RAW r1</code> against <code>RAW r2</code></td>
</tr>
<tr>
<td><strong>CONCAT Function</strong> on page 161-25</td>
<td>Concatenates up to <code>12 </code> <code>RAWS</code> into a single <code>RAW</code></td>
</tr>
<tr>
<td><strong>CONVERT Function</strong> on page 161-26</td>
<td>Converts <code>RAW r</code> from character set <code>from_charset</code> to character set <code>to_charset</code> and returns the resulting <code>RAW</code></td>
</tr>
<tr>
<td><strong>COPIES Function</strong> on page 161-28</td>
<td>Returns <code>n</code> copies of <code>r</code> concatenated together</td>
</tr>
<tr>
<td><strong>LENGTH Function</strong> on page 161-29</td>
<td>Returns the length in bytes of a <code>RAW r</code></td>
</tr>
<tr>
<td><strong>OVERLAY Function</strong> on page 161-30</td>
<td>Overlays the specified portion of target <code>RAW</code> with overlay <code>RAW</code>, starting from byte position <code>pos</code> of target and proceeding for <code>len</code> bytes</td>
</tr>
<tr>
<td><strong>REVERSE Function</strong> on page 161-32</td>
<td>Reverses a byte sequence in <code>RAW r</code> from end to end</td>
</tr>
<tr>
<td><strong>SUBSTR Function</strong> on page 161-33</td>
<td>Returns <code>len</code> bytes, starting at <code>pos</code> from <code>RAW r</code></td>
</tr>
<tr>
<td><strong>TRANSLATE Function</strong> on page 161-35</td>
<td>Translates the bytes in the input <code>RAW r</code> according to the bytes in the translation <code>RAWS from_set</code> and <code>to_set</code></td>
</tr>
<tr>
<td><strong>TRANSLITERATE Function</strong> on page 161-37</td>
<td>Converts the bytes in the input <code>RAW r</code> according to the bytes in the transliteration <code>RAWS from_set</code> and <code>to_set</code></td>
</tr>
<tr>
<td><strong>XRANGE Function</strong> on page 161-39</td>
<td>Returns a <code>RAW</code> containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code></td>
</tr>
</tbody>
</table>
**BIT_AND Function**

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

**Syntax**

```plaintext
UTL_RAW.BIT_AND (  
    r1 IN RAW,  
    r2 IN RAW)  
RETURN RAW;
```

**Pragmas**

```plaintext
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;and&quot; with r2.</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;and&quot; with r1.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;and&quot; of r1 and r2.</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW r and returns the complement'ed result RAW. The result length equals the input RAW r length.

Syntax

```sql
UTL_RAW.BIT_COMPLEMENT (r IN RAW) RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to perform &quot;complement&quot; operation.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The &quot;complement&quot; of r.</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL.</td>
</tr>
</tbody>
</table>
**BIT_OR Function**

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or’d result RAW.

**Syntax**

```sql
UTL_RAW.BIT_OR (r1 IN RAW, r2 IN RAW) RETURN RAW;
```

**Pragmas**

```sql
pragma restrict_references(bit_or, WNDs, RNDS, WNPs, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;or&quot; with r2.</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;or&quot; with r1.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;or&quot; of r1 and r2.</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (  
    r1 IN RAW,
    r2 IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;xor&quot; with r2.</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;xor&quot; with r1.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;xor&quot; of r1 and r2.</td>
</tr>
<tr>
<td>NULL</td>
<td>If either r1 or r2 input parameter was NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
CAST_FROM_BINARY_DOUBLE Function

This function returns the binary representation of a BINARY_DOUBLE (in RAW).

Syntax

```plaintext
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
    n          IN BINARY_DOUBLE,
    endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```plaintext
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>The BINARY_DOUBLE value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  byte 0: bit 63 ~ bit 56
  byte 1: bit 55 ~ bit 48
  byte 2: bit 47 ~ bit 40
  byte 3: bit 39 ~ bit 32
  byte 4: bit 31 ~ bit 24
  byte 5: bit 23 ~ bit 16
  byte 6: bit 15 ~ bit 8
  byte 7: bit  7 ~ bit  0
The parameter endianess describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, \( rb0 \sim rb7 \) refer to the bytes in `raw` and \( db0 \sim db7 \) refer to the bytes in `BINARY_DOUBLE`.

<table>
<thead>
<tr>
<th></th>
<th>( rb0 )</th>
<th>( rb1 )</th>
<th>( rb2 )</th>
<th>( rb3 )</th>
<th>( rb4 )</th>
<th>( rb5 )</th>
<th>( rb6 )</th>
<th>( rb7 )</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>big_endian</strong></td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td><strong>little_endian</strong></td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>

In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.
CAST_FROM_BINARY_FLOAT Function

This function returns the binary representation of a BINARY_FLOAT (in RAW).

Syntax

```sql
UTL_RAW.CAST_FROM_BINARY_FLOAT(
    n          IN BINARY_FLOAT,
    endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>The BINARY_FLOAT value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  
  byte 0: bit 31 ~ bit 24  
  byte 1: bit 23 ~ bit 16  
  byte 2: bit 15 ~ bit 8   
  byte 3: bit 7 ~ bit 0    

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.
In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fb0</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_FROM_BINARY_INTEGER Function

This function returns the binary representation of a BINARY_INTEGER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (  
  n          IN BINARY_INTEGER  
  endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>The BINARY_INTEGER value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_INTEGER value.
CAST_FROM_NUMBER Function

This function returns the binary representation of a NUMBER (in RAW).

Syntax

```plsql
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
RETURN RAW;
```

Pragmas

```plsql
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>The NUMBER value.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the NUMBER value.
CAST_TO_BINARY_DOUBLE Function

This function casts the binary representation of a BINARY_DOUBLE (in RAW) into a BINARY_DOUBLE.

Syntax

```plsql
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```plsql
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The binary representation of a BINARY_INTEGER.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
CAST_TO_BINARY_DOUBLE Function

byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>big_endian</strong></td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td><strong>little_endian</strong></td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY_DOUBLE return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_FLOAT Function

This function casts the binary representation of a BINARY_FLOAT (in RAW) into a BINARY_FLOAT.

Syntax

UTL_RAW.CAST_TO_BINARY_FLOAT (  
  r          IN RAW  
  endianess  IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_FLOAT;

Pragmas

pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The binary representation of a BINARY_FLOAT.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  byte 0: bit 31 ~ bit 24
  byte 1: bit 23 ~ bit 16
  byte 2: bit 15 ~ bit 8
The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fb0</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_INTEGER Function

This function casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
    r          IN RAW
    ,
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 161-16  CAST_TO_BINARY_INTEGER Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The binary representation of a BINARY_INTEGER.</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_INTEGER value
CAST_TO_NUMBER Function

This function casts the binary representation of a NUMBER (in RAW) into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER ( 
    r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The binary representation of a NUMBER</td>
</tr>
</tbody>
</table>

Return Values

The NUMBER value.
CAST_TO_RAW Function

This function converts a VARCHAR2 represented using n data bytes into a RAW with n data bytes. The data is not modified in any way; only its datatype is recast to a RAW datatype.

Syntax

```sql
UTL_RAW.CAST_TO_RAW (
    c  IN VARCHAR2
) RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>VARCHAR2 to be changed to a RAW</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field.</td>
</tr>
<tr>
<td>NULL</td>
<td>If c input parameter was NULL.</td>
</tr>
</tbody>
</table>
CAST_TO_VARCHAR2 Function

This function converts a RAW represented using n data bytes into VARCHAR2 with n data bytes.

---

**Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

---

**Syntax**

```sql
UTL_RAW.CAST_TO_VARCHAR2 (r IN RAW) RETURN VARCHAR2;
```

**Pragmas**

```sql
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a VARCHAR2.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR2</td>
<td>Containing having the same data as the input RAW.</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL.</td>
</tr>
</tbody>
</table>
CAST_TO_NVARCHAR2 Function

This function converts a RAW represented using \( n \) data bytes into NVARCHAR2 with \( n \) data bytes.

**Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2.

**Syntax**

```
UTL_RAW.CAST_TO_NVARCHAR2 (r IN RAW) RETURN NVARCHAR2;
```

**Pragmas**

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 161–22  CAST_TO_NVARCHAR2 Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a NVARCHAR2.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 161–23  CAST_TO_NVARCHAR2 Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVARCHAR2</td>
<td>Containing having the same data as the input RAW.</td>
</tr>
<tr>
<td>NULL</td>
<td>If ( r ) input parameter was NULL.</td>
</tr>
</tbody>
</table>
COMPARE Function

This function compares RAW r1 against RAW r2. If r1 and r2 differ in length, then
the shorter RAW is extended on the right with pad if necessary.

Syntax

```sql
UTL_RAW.COMPARE (   r1 IN RAW,
    r2 IN RAW,
    pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>1st RAW to be compared, may be NULL or 0 length.</td>
</tr>
<tr>
<td>r2</td>
<td>2nd RAW to be compared, may be NULL or 0 length.</td>
</tr>
<tr>
<td>pad</td>
<td>This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
</table>
| NUMBER | Equals 0 if RAW byte strings are both NULL or identical; or,  
         Equals position (numbered from 1) of the first mismatched byte. |

161-24   PL/SQL Packages and Types Reference
CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned.

Syntax

```sql
UTL_RAW.CONCAT (  
  r1  IN RAW DEFAULT NULL,  
  r2  IN RAW DEFAULT NULL,  
  r3  IN RAW DEFAULT NULL,  
  r4  IN RAW DEFAULT NULL,  
  r5  IN RAW DEFAULT NULL,  
  r6  IN RAW DEFAULT NULL,  
  r7  IN RAW DEFAULT NULL,  
  r8  IN RAW DEFAULT NULL,  
  r9  IN RAW DEFAULT NULL,  
  r10 IN RAW DEFAULT NULL,  
  r11 IN RAW DEFAULT NULL,  
  r12 IN RAW DEFAULT NULL)  
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```
 r1....r12 are the RAW items to concatenate.
```

Return Values

<table>
<thead>
<tr>
<th>Table 161–26 CONCAT Function Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return</strong></td>
</tr>
<tr>
<td>RAW</td>
</tr>
</tbody>
</table>

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.
CONVERT Function

This function converts RAW \( r \) from character set \( \text{from charset} \) to character set \( \text{to charset} \) and returns the resulting RAW.

Both \( \text{from charset} \) and \( \text{to charset} \) must be supported character sets defined to the Oracle server.

Syntax

\[
\text{UTL_RAW.CONVERT (}
\quad \text{r} \quad \text{IN RAW,}
\quad \text{to charset} \quad \text{IN VARCHAR2,}
\quad \text{from charset} \quad \text{IN VARCHAR2)}
\quad \text{RETURN RAW;}
\]

Pragmas

\text{pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);}

Parameters

Table 161–27 CONVERT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{r}</td>
<td>RAW byte-string to be converted.</td>
</tr>
<tr>
<td>\text{to charset}</td>
<td>Name of Globalization Support character set to which ( \text{r} ) is converted.</td>
</tr>
<tr>
<td>\text{from charset}</td>
<td>Name of Globalization Support character set in which ( \text{r} ) is supplied.</td>
</tr>
</tbody>
</table>

Return Values

Table 161–28 CONVERT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Byte string ( \text{r} ) converted according to the specified character sets.</td>
</tr>
</tbody>
</table>
### Exceptions

**Table 161–29 CONVERT Function Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- r missing, NULL, or 0 length</td>
</tr>
<tr>
<td></td>
<td>- from_charset or to_charset missing, NULL, or 0 length</td>
</tr>
<tr>
<td></td>
<td>- from_charset or to_charset names invalid or unsupported</td>
</tr>
</tbody>
</table>
COPIES Function

This function returns \( n \) copies of \( r \) concatenated together.

Syntax

\[
\text{UTL_RAW.COPIES (}
\begin{align*}
  r & \text{ IN RAW,} \\
  n & \text{ IN NUMBER)} \\
\end{align*}
\]

\[
\text{RETURN RAW;} \]

Pragmas

\[
\text{pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);} \]

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>RAW to be copied</td>
</tr>
<tr>
<td>( n )</td>
<td>Number of times to copy the RAW (must be positive).</td>
</tr>
</tbody>
</table>

Return Values

This returns the RAW copied \( n \) times.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- ( r ) is missing, NULL or 0 length</td>
</tr>
<tr>
<td></td>
<td>- ( n &lt; 1 )</td>
</tr>
<tr>
<td></td>
<td>- Length of result exceeds maximum length of a RAW</td>
</tr>
</tbody>
</table>
LENGTH Function

This function returns the length in bytes of a RAW `r`.

Syntax

```plsql
UTL_RAW.LENGTH (
    r  IN RAW)
RETURN NUMBER;
```

Pragmas

`pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>The RAW byte stream to be measured.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>The current length of the RAW.</td>
</tr>
</tbody>
</table>
OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```
UTL_RAW.OVERLAY (  
    overlay_str IN RAW,  
    target IN RAW,  
    pos IN BINARY_INTEGER DEFAULT 1,  
    len IN BINARY_INTEGER DEFAULT NULL,  
    pad IN RAW DEFAULT NULL)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overlay_str</td>
<td>Byte-string used to overlay target.</td>
</tr>
<tr>
<td>target</td>
<td>Byte-string which is to be overlaid.</td>
</tr>
<tr>
<td>pos</td>
<td>Position in target (numbered from 1) to start overlay.</td>
</tr>
<tr>
<td>len</td>
<td>The number of target bytes to overlay.</td>
</tr>
<tr>
<td>pad</td>
<td>Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length.</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>1</td>
</tr>
<tr>
<td>len</td>
<td>To the length of overlay_str</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'</td>
</tr>
</tbody>
</table>
Summary of UTL_RAW Subprograms

Return Values

Table 161–36    OVERLAY Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The target byte_string overlaid as specified.</td>
</tr>
</tbody>
</table>

Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

Table 161–37    OVERLAY Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- Overlay_str is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- Target is missing or undefined</td>
</tr>
<tr>
<td></td>
<td>- Length of target exceeds maximum length of a RAW</td>
</tr>
<tr>
<td></td>
<td>- len &lt; 0</td>
</tr>
<tr>
<td></td>
<td>- pos &lt; 1</td>
</tr>
</tbody>
</table>
REVERSE Function

This function reverses a byte sequence in RAW \( r \) from end to end. For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'. The result length is the same as the input RAW length.

Syntax

```sql
UTL_RAW.REVERSE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>RAW to reverse.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;reverse&quot; of ( r ).</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>( r ) is NULL or has 0 length.</td>
</tr>
</tbody>
</table>
**SUBSTR Function**

This function returns \texttt{len} bytes, starting at \texttt{pos} from \texttt{RAW} \texttt{r}.

**Syntax**

\begin{verbatim}
UTL_RAW.SUBSTR (  
   r   IN RAW,  
   pos IN BINARY_INTEGER,  
   len IN BINARY_INTEGER DEFAULT NULL)  
RETURN RAW;
\end{verbatim}

**Pragmas**

\begin{verbatim}
pragma restrict_references(substr, WNDs, RNDS, WNPs, RNPS);
\end{verbatim}

**Parameters**

\begin{table}[h]
\centering
\caption{SUBSTR Function Parameters}
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
\texttt{r} & The \texttt{RAW} byte-string from which a portion is extracted. \\
\texttt{pos} & The byte position in \texttt{r} at which to begin extraction. \\
\texttt{len} & The number of bytes from \texttt{pos} to extract from \texttt{r} (optional). \\
\hline
\end{tabular}
\end{table}

**Defaults and Optional Parameters**

\begin{table}[h]
\centering
\caption{SUBSTR Function Exceptions}
\begin{tabular}{ll}
\hline
Optional Parameter & Description \\
\hline
\texttt{len} & Position \texttt{pos} through to the end of \texttt{r}. \\
\hline
\end{tabular}
\end{table}

**Return Values**

\begin{table}[h]
\centering
\caption{SUBSTR Function Return Values}
\begin{tabular}{ll}
\hline
Return & Description \\
\hline
\texttt{portion of r} & Beginning at \texttt{pos} for \texttt{len} bytes long. \\
\texttt{NULL} & \texttt{r} input parameter was \texttt{NULL}. \\
\hline
\end{tabular}
\end{table}
Usage Notes

If `pos` is positive, then `SUBSTR` counts from the beginning of `r` to find the first byte. If `pos` is negative, then `SUBSTR` counts backward from the end of the `r`. The value `pos` cannot be 0.

If `len` is omitted, then `SUBSTR` returns all bytes to the end of `r`. The value `len` cannot be less than 1.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>VALUE_ERROR is returned if:</td>
</tr>
<tr>
<td></td>
<td>• <code>pos</code> = 0 or &gt; length of <code>r</code></td>
</tr>
<tr>
<td></td>
<td>• <code>len</code> &lt; 1 or &gt; length of <code>r</code> - (pos-1)</td>
</tr>
</tbody>
</table>
TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
    r IN RAW,
    from_set IN RAW,
    to_set IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW source byte-string to be translated.</td>
</tr>
<tr>
<td>from_set</td>
<td>RAW byte-codes to be translated, if present in r.</td>
</tr>
<tr>
<td>to_set</td>
<td>RAW byte-codes to which corresponding from_set bytes are translated.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Translated byte-string.</td>
</tr>
</tbody>
</table>
TRANSLATE Function

Usage Notes

If `to_set` is shorter than `from_set`, then the extra `from_set` bytes have no translation correspondence and any bytes in `r` matching.

---

**Note:** Difference from `TRANSLITERATE`:
- Translation `RAWs` have no defaults.
- `r` bytes undefined in the `to_set` translation `RAW` are deleted.
- Result `RAW` may be shorter than input `RAW r`.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- <code>r</code> is <code>NULL</code> or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- <code>from_set</code> is <code>NULL</code> or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- <code>to_set</code> is <code>NULL</code> or has 0 length</td>
</tr>
</tbody>
</table>
**TRANSLITERATE Function**

This function converts the bytes in the input RAW `r` according to the bytes in the transliteration RAWs `from_set` and `to_set`. Successive bytes in `r` are looked up in the `from_set`, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the `to_set`, or the pad byte when no correspondence exists.

Bytes in `r`, but undefined in `from_set`, are copied to the result. Only the first (leftmost) occurrence of a byte in `from_set` is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as `r`.

**Syntax**

```sql
UTL_RAW.TRANSLITERATE (  
  r        IN RAW,  
  to_set   IN RAW DEFAULT NULL,  
  from_set IN RAW DEFAULT NULL,  
  pad      IN RAW DEFAULT NULL)  
RETURN RAW;
```

**Pragmas**

```sql
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>RAW input byte-string to be converted.</td>
</tr>
<tr>
<td><code>from_set</code></td>
<td>RAW byte-codes to be converted, if present in <code>r</code> (any length).</td>
</tr>
<tr>
<td><code>to_set</code></td>
<td>RAW byte-codes to which corresponding <code>from_set</code> bytes are converted (any length).</td>
</tr>
<tr>
<td><code>pad</code></td>
<td>1 byte used when <code>to_set</code> is shorter than the <code>from_set</code>.</td>
</tr>
</tbody>
</table>
Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_set</td>
<td>x'00' through x'ff'</td>
</tr>
<tr>
<td>to_set</td>
<td>To the NULL string and effectively extended with pad to the length of from_set as necessary.</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Converted byte-string.</td>
</tr>
</tbody>
</table>

Usage Notes

If the to_set is shorter than the from_set, then the pad byte is placed in the result RAW when a selected from_set byte has no corresponding to_set byte (as if the to_set were extended to the same length as the from_set with pad bytes).

Note: Difference from TRANSLATE:
- r bytes undefined in to_set are padded.
- Result RAW is always same length as input RAW r.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>R is NULL or has 0 length.</td>
</tr>
</tbody>
</table>
XRANGE Function

This function returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte. If start_byte is greater than end_byte, then the succession of resulting bytes begins with start_byte, wraps through x fFF f to x f00 f, and ends at end_byte. If specified, start_byte and end_byte must be single-byte RAWs.

Syntax

UTL_RAW.XRANGE (  
    start_byte IN RAW DEFAULT NULL, 
    end_byte   IN RAW DEFAULT NULL)  
RETURN RAW;

Pragmas

pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_byte</td>
<td>Beginning byte-code value of resulting sequence.</td>
</tr>
<tr>
<td>end_byte</td>
<td>Ending byte-code value of resulting sequence.</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

start_byte - x f00 f
end_byte   - x fFF f

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing succession of 1-byte hexadecimal encodings.</td>
</tr>
</tbody>
</table>
XRANGE Function
The UTL_RECOMP package recompiles invalid PL/SQL modules, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- Using UTL_RECOMP
  - Overview
  - Operational Notes
  - Examples
- Summary of UTL_RECOMP Subprograms
Using UTL_RECOMP

Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

Operational Notes

- This package uses the job queue for parallel recompilation. It temporarily disables existing jobs (by marking them broken) so that recompile jobs can be run instead.
- This package must be run using SQL*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS_STANDARD (dbmsstdx.sql)
Using UTL_RECOMP

- DBMS_JOB (dbmsjob.sql)
- DBMS_RANDOM (dbmsrand.sql)

There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

Examples

Recompile all objects sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL();

Recompile objects in schema SCOTT sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');

Recompile all objects using 4 parallel threads:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
# Summary of UTL_RECOMP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECOMP_PARALLEL</td>
<td>Recompiles invalid objects in the database, or in a given</td>
</tr>
<tr>
<td>Procedure on page 162-5</td>
<td>schema, in parallel in dependency order</td>
</tr>
<tr>
<td>RECOMP_SERIAL</td>
<td>Recompiles invalid objects in a given schema or all invalid</td>
</tr>
<tr>
<td>Procedure on page 162-6</td>
<td>objects in the database</td>
</tr>
</tbody>
</table>
RECOMP_PARALLEL Procedure

This procedure is the main driver that recompiles invalid objects in the database, or in a given schema, in parallel in dependency order. It uses information in dependency$ to order recompilation of dependents after parents.

Syntax

```sql
UTL_RECOMP.RECOMP_PARALLEL(
    threads IN   PLS_INTEGER DEFAULT NULL,
    schema   IN   VARCHAR2    DEFAULT NULL,
    flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.
RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```sql
UTL_RECOMP.RECOMP_SERIAL(
    schema   IN   VARCHAR2    DEFAULT NULL,
    flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>
The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Using UTL_REF
  - Overview
  - Security Model
  - Types
  - Exceptions
- Summary of UTL_REF Subprograms
Using UTL_REF

Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

Security Model

The procedural option is needed to use this package. This package must be created under SYS (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

**Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer’s privileges, where the package owner must have the appropriate privileges to perform the desired operations.
Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type employee_type using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
    name VARCHAR2(20),
    id NUMBER,

    member function GET_ID
    {name VARCHAR2
    RETURN MEMBER};
```

The object type employee_type is a user-defined type that contains two attributes, name and id, and a member function, GET_ID().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.
The `UTL_REF` package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

<table>
<thead>
<tr>
<th>Exceptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>errnum == 942</code></td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td><code>errnum == 1031</code></td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td><code>errnum == 8177</code></td>
<td>Unable to serialize, if in a serializable transaction.</td>
</tr>
<tr>
<td><code>errnum == 60</code></td>
<td>Deadlock detected.</td>
</tr>
<tr>
<td><code>errnum == 1403</code></td>
<td>No data found (if the REF is NULL, and so on.).</td>
</tr>
</tbody>
</table>
# Summary of UTL_REF Subprograms

## Table 163–2  UTL_REF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_OBJECT Procedure</td>
<td>Deletes an object given a reference</td>
</tr>
<tr>
<td>page 163-6</td>
<td></td>
</tr>
<tr>
<td>LOCK_OBJECT Procedure</td>
<td>Locks an object given a reference</td>
</tr>
<tr>
<td>page 163-9</td>
<td></td>
</tr>
<tr>
<td>SELECT_OBJECT Procedure</td>
<td>Selects an object given a reference</td>
</tr>
<tr>
<td>page 163-10</td>
<td></td>
</tr>
<tr>
<td>UPDATE_OBJECT Procedure</td>
<td>Updates an object given a reference</td>
</tr>
<tr>
<td>page 163-11</td>
<td></td>
</tr>
</tbody>
</table>
DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (  
    reference IN REF "<typename>";
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to delete.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

```
... declarations of Address_t and others...

CREATE OR REPLACE TYPE Person_t (  
    name VARCHAR2(64),
    gender CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)  
)  

CREATE OR REPLACE TYPE BODY Person_t (  
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
```
BEGIN
    address := addr;
END;
);

CREATE OR REPLACE TYPE Employee_t {
    Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.
    
    thePerson REF Person_t,
    empno NUMBER(5),
    deptREF Department_t,
    mgrREF Employee_t,
    reminders StringArray_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t),
    MEMBER procedure addReminder(reminder VARCHAR2);
};

CREATE TYPE BODY Employee_t {
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
    BEGIN

        Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

        UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
        meAsPerson setAddress(addr);

        Delegate to thePerson:

        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN

        Give the manager a reminder:

        UTL_REF.LOCK_OBJECT(mgr);
        UTL_REF.SELECT_OBJECT(mgr, myMgr);
        myMgr.addReminder ('Update address in the employee directory for ' || thePerson.name || ', new address: ' || addr.asString);
        UTL_REF.UPDATE_OBJECT(mgr, myMgr);
        END IF;
        EXCEPTION
    }
}
WHEN OTHERS THEN
  errnum := SQLCODE;
  errmsg := SUBSTR(SQLERRM, 1, 200);
LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```sql
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```sql
UTL_REF.LOCK_OBJECT (reference IN REF "<typename>");
UTL_REF.LOCK_OBJECT (reference IN REF "<typename>",
                      object    IN OUT "<typename>");
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to lock.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```sql
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```sql
UTL_REF.SELECT_OBJECT (    
    reference IN REF "<typename>",    
    object    IN OUT "<typename>");  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference to the object to select or retrieve.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
**UPDATE_OBJECT Procedure**

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

**Syntax**

```
UTL_REF.UPDATE_OBJECT (  
    reference IN REF "<typename>",
    object    IN     "<typename>");
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to update.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.</td>
</tr>
</tbody>
</table>

**Exceptions**

May be raised.
UPDATE_OBJECT Procedure
The **UTL_SMTP** package is designed for sending electronic mails (emails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

**See Also:** How to use the SMTP package to send email in *Oracle Database Application Developer’s Guide - Fundamentals*

This chapter contains the following topics:

- **Using UTL_SMTP**
  - Overview
  - Types
  - Reply Codes
  - Exceptions
  - Rules and Limits
  - Examples
- **Summary of UTL_SMTP Subprograms**
Using UTL_SMTP

Overview

The protocol consists of a set of commands for an email client to dispatch emails to a SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and will raise an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) will be converted to US7ASCII before it is sent over the wire to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command may be transferred in full 8 bits, but the rest of the SMTP command and response should be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an email clients to send emails using SMTP.
Note: RFC documents are "Request for Comments" documents that describe proposed standards for public review on the Internet. For the actual RFC documents, please refer to: http://www.ietf.org/rfc/

Types

- CONNECTION Record Type
- REPLY, REPLAYS Record Types

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```plsql
TYPE connection IS RECORD (
    host              VARCHAR2(255),      -- remote host name
    port              PLS_INTEGER,        -- remote port number
    tx_timeout        PLS_INTEGER,        -- Transfer time out (in seconds)
    private_tcp_con   utl_tcp.connection, -- private, for implementation use
    private_state     PLS_INTEGER         -- private, for implementation use
);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>port</td>
<td>The port number of the remote SMTP server connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>The time in seconds that the UTL_SMTP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>
Usage Notes
The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with `open_connection()`. Changing the values of these fields has no effect on the connection. The fields `private_xxx` are for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types
These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax
```plsql
TYPE reply IS RECORD (
    code    PLS_INTEGER, -- 3-digit reply code
    text    VARCHAR2(508)   -- text message
);
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;   -- multiple reply lines
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>The 3-digit reply code.</td>
</tr>
<tr>
<td>text</td>
<td>The text message of the reply.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>private_tcp_con</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
<tr>
<td>private_state</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
</tbody>
</table>
Reply Codes

The following is a list of the SMTP reply codes.

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>211</td>
<td>System status, or system help reply</td>
</tr>
<tr>
<td>214</td>
<td>Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]</td>
</tr>
<tr>
<td>220</td>
<td>&lt;domain&gt; Service ready</td>
</tr>
<tr>
<td>221</td>
<td>&lt;domain&gt; Service closing transmission channel</td>
</tr>
<tr>
<td>250</td>
<td>Requested mail action okay, completed</td>
</tr>
<tr>
<td>251</td>
<td>User not local; will forward to &lt;forward-path&gt;</td>
</tr>
<tr>
<td>252</td>
<td>OK, pending messages for node &lt;node&gt; started. Cannot VRFY user (for example, info is not local), but will take message for this user and attempt delivery.</td>
</tr>
<tr>
<td>253</td>
<td>OK, &lt;messages&gt; pending messages for node &lt;node&gt; started</td>
</tr>
<tr>
<td>354</td>
<td>Start mail input; end with &lt;CRLF&gt;,&lt;CRLF&gt;</td>
</tr>
<tr>
<td>355</td>
<td>Octet-offset is the transaction offset</td>
</tr>
<tr>
<td>421</td>
<td>&lt;domain&gt; Service not available, closing transmission channel (This may be a reply to any command if the service knows it must shut down.)</td>
</tr>
<tr>
<td>450</td>
<td>Requested mail action not taken: mailbox unavailable [for example, mailbox busy]</td>
</tr>
<tr>
<td>451</td>
<td>Requested action terminated: local error in processing</td>
</tr>
<tr>
<td>452</td>
<td>Requested action not taken: insufficient system storage</td>
</tr>
<tr>
<td>453</td>
<td>You have no mail.</td>
</tr>
<tr>
<td>454</td>
<td>TLS not available due to temporary reason. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>458</td>
<td>Unable to queue messages for node &lt;node&gt;</td>
</tr>
<tr>
<td>459</td>
<td>Node &lt;node&gt; not allowed: reason</td>
</tr>
<tr>
<td>500</td>
<td>Syntax error, command unrecognized (This may include errors such as command line too long.)</td>
</tr>
</tbody>
</table>
Exceptions

Table 164–3  (Cont.) SMTP Reply Codes

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>501</td>
<td>Syntax error in parameters or arguments</td>
</tr>
<tr>
<td>502</td>
<td>Command not implemented</td>
</tr>
<tr>
<td>503</td>
<td>Bad sequence of commands</td>
</tr>
<tr>
<td>504</td>
<td>Command parameter not implemented</td>
</tr>
<tr>
<td>521</td>
<td>&lt;Machine&gt; does not accept mail.</td>
</tr>
<tr>
<td>530</td>
<td>Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>534</td>
<td>Authentication mechanism is too weak.</td>
</tr>
<tr>
<td>538</td>
<td>Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>550</td>
<td>Requested action not taken: mailbox unavailable [for, mailbox not found, no access]</td>
</tr>
<tr>
<td>551</td>
<td>User not local; please try &lt;forward-path&gt;</td>
</tr>
<tr>
<td>552</td>
<td>Requested mail action terminated: exceeded storage allocation</td>
</tr>
<tr>
<td>553</td>
<td>Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]</td>
</tr>
<tr>
<td>554</td>
<td>Transaction failed</td>
</tr>
</tbody>
</table>

Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 164–4  UTL_SMTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_OPERATION</td>
<td>Raised when an invalid operation is made. In other words, calling API other than write_data(), write_raw_data() or close_data() after open_data() is called, or calling write_data(), write_raw_data() or close_data() without first calling open_data().</td>
</tr>
<tr>
<td>TRANSIENT_ERROR</td>
<td>Raised when receiving a reply code in 400 range.</td>
</tr>
<tr>
<td>PERMANENT_ERROR</td>
<td>Raised when receiving a reply code in 500 range.</td>
</tr>
</tbody>
</table>
Rules and Limits

No limitation or range-checking is imposed by the API. However, you should be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

<table>
<thead>
<tr>
<th>Element</th>
<th>Size Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>The maximum total length of a user name is 64 characters.</td>
</tr>
<tr>
<td>domain</td>
<td>The maximum total length of a domain name or number is 64 characters.</td>
</tr>
<tr>
<td>path</td>
<td>The maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators).</td>
</tr>
<tr>
<td>command line</td>
<td>The maximum total length of a command line including the command word and the \textbackslash CR\textbackslash LF\textbackslash LF is 512 characters.</td>
</tr>
<tr>
<td>reply line</td>
<td>The maximum total length of a reply line including the reply code and the \textbackslash CR\textbackslash LF\textbackslash LF is 512 characters.</td>
</tr>
<tr>
<td>text line</td>
<td>The maximum total length of a text line including the \textbackslash CR\textbackslash LF\textbackslash LF is 1000 characters (but not counting the leading dot duplicated for transparency).</td>
</tr>
<tr>
<td>recipients buffer</td>
<td>The maximum total number of recipients that must be buffered is 100 recipients.</td>
</tr>
</tbody>
</table>

Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```sql
DECLARE
  c UTL_SMTP.CONNECTION;

PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
BEGIN
  UTL_SMTP.WRITE_DATA(c, name || ': ' || header || ' ' || UTL_TCP.CRLF);
END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
```
Examples

UTL_SMTP.HELO(c, 'foo.com');
UTL_SMTP.MAIL(c, 'sender@foo.com');
UTL_SMTP.RCPT(c, 'recipient@foo.com');
UTL_SMTP.OPEN_DATA(c);
send_header('From', "Sender" <sender@foo.com'>);
send_header('To', "Recipient" <recipient@foo.com'>);
send_header('Subject', 'Hello');
UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
UTL_SMTP.CLOSE_DATA(c);
UTL_SMTP.QUIT(c);
EXCEPTION
WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
BEGIN
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
    NULL; -- When the SMTP server is down or unavailable, we don't have
    -- a connection to the server. The QUIT call will raise an
    -- exception that we can ignore.
END;
raise_application_error(-20000,
  'Failed to send mail due to the following error: ' || sqlerrm);
END;
### Summary of UTL_SMTP Subprograms

</tbody>
</table>
## Summary of UTL_SMTP Subprograms

Table 164–6  UTL_SMTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRFY Function on page 164-36</td>
<td>Verifies the validity of a destination e-mail address</td>
</tr>
<tr>
<td>WRITE_DATA Procedure on page 164-37</td>
<td>Writes a portion of the e-mail message</td>
</tr>
<tr>
<td>WRITE_RAW_DATA Procedure on page 164-39</td>
<td>Writes a portion of the e-mail message with RAW data</td>
</tr>
</tbody>
</table>
CLOSE_DATA Function and Procedure

The CLOSE_DATA call ends the e-mail message by sending the sequence
<CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

UTL_SMTP.CLOSE_DATA (c IN OUT NOCOPY connection);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.
CLOSE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.
COMMAND Function and Procedure

This function/procedure performs a generic SMTP command.

Syntax

```sql
UTL_SMTP.COMMAND (
  c     IN OUT NOCOPY    connection,
  cmd   IN               VARCHAR2,
  arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>cmd</td>
<td>The SMTP command to send to the server.</td>
</tr>
<tr>
<td>arg</td>
<td>The optional argument to the SMTP argument. A space will be inserted between <code>cmd</code> and <code>arg</code>.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.
For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
**COMMAND_REPLIES Function**

This function performs a generic SMTP command.

**Syntax**

```sql
UTL_SMTP.COMMAND_REPLIES (
    c IN OUT NOCOPY connection,
    cmd IN VARCHAR2,
    arg IN VARCHAR2 DEFAULT NULL
) RETURN replies;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>cmd</td>
<td>The SMTP command to send to the server.</td>
</tr>
<tr>
<td>arg</td>
<td>The optional argument to the SMTP argument. A space will be inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types).</td>
</tr>
</tbody>
</table>

**Usage Notes**

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
DATA Function and Procedure

This function/procedure specifies the body of an e-mail message.

Syntax

```sql
UTL_SMTP.DATA (
    c     IN OUT NOCOPY connection
    body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```sql
UTL_SMTP.DATA (
    c     IN OUT NOCOPY connection
    body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP Connection.</td>
</tr>
<tr>
<td>body</td>
<td>The text of the message to be sent, including headers, in [RFC822] format.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>.<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
The DATA call should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command will not be returned to the caller.
EHLO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting, with extended information returned.

Syntax

```
UTL_SMTP.EHLO (  
  c       IN OUT NOCOPY connection,  
  domain  IN)  
RETURN replies;
```

```
UTL_SMTP.EHLO (  
  c       IN OUT NOCOPY connection,  
  domain  IN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>domain</td>
<td>The domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types).</td>
</tr>
</tbody>
</table>

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.
Related Functions

HELO
HELO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting.

Syntax

UTL_SMTP.HELO (  
c       IN OUT NOCOPY   connection,  
domain  IN              VARCHAR2)  
RETURN reply;

UTL_SMTP.HELO (  
c       IN OUT NOCOPY   connection,  
domain  IN              VARCHAR2);

Parameters

Table 164–17 HELO Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>domain</td>
<td>The domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

Table 164–18 HELO Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.
Related Functions

EHLO
HELP Function

This function sends the HELP command.

Syntax

```sql
UTL_SMTP.HELP (  
    c         IN OUT NOCOPY   connection,  
    command   IN              VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>command</td>
<td>The command to get the help message.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types).</td>
</tr>
</tbody>
</table>
MAIL Function and Procedure

This function/procedure initiates a mail transaction with the server. The destination is a mailbox.

Syntax

```sql
UTL_SMTP.MAIL (  
  c           IN OUT NOCOPY   connection,  
  sender      IN              VARCHAR2,  
  parameters  IN              VARCHAR2 DEFAULT NULL)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>sender</td>
<td>The e-mail address of the user sending the message.</td>
</tr>
</tbody>
</table>
| parameters | The additional parameters to MAIL command as defined in Section 6 of [RFC1869]. It should follow the format of “XXX=XXX (XXX=XXX ....)”.

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>
Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.
NOOP Function and Procedure

The null command.

Syntax

```plaintext
UTL_SMTP.NOOP (c IN OUT NOCOPY connection)
RETURN reply;
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.

This command will always reply with a single line beginning with status code 250.
OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (  
    host        IN  VARCHAR2,  
    port        IN  PLS_INTEGER DEFAULT 25,  
    c           OUT connection,  
    tx_timeout  IN  PLS_INTEGER DEFAULT NULL)  
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (  
    host        IN  VARCHAR2,  
    port        IN  PLS_INTEGER DEFAULT 25,  
    tx_timeout  IN  PLS_INTEGER DEFAULT NULL)  
RETURN connection;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the SMTP server host</td>
</tr>
<tr>
<td>port</td>
<td>The port number on which SMTP server is listening (usually 25).</td>
</tr>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>The time in seconds that the UTL_SMTP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>
Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If a user is interested in examining the reply, he or she can invoke the version of OPEN_CONNECTION that returns REPLY.
- A timeout on the WRITE operations feature is not supported in the current release of this package.
OPEN_DATA Function and Procedure

OPEN_DATA Function and Procedure

OPEN_DATA sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (    
    c IN OUT NOCOPY connection)    
RETURN reply;

UTL_SMTP.OPEN_DATA (    
    c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>data</td>
<td>The portion of the text of the message to be sent, including headers, in [RFC822] format.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.
OPEN_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
QUIT Function and Procedure

This function terminates an SMTP session and disconnects from the server.

Syntax

```plsql
UTL_SMTP.QUIT (  
    c IN OUT NOCOPY connection) 
RETURN reply;

UTL_SMTP.QUIT (  
    c IN OUT NOCOPY connection);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The QUIT command informs the SMTP server of the client’s intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is abandoned in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.
Related Functions

RSET
RCPT Function

This function/procedure specifies the recipient of an e-mail message.

Syntax

```sql
UTL_SMTP.RCPT (
  c           IN OUT NOCOPY     connection,
  recipient   IN                VARCHAR2,
  parameters  IN                VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```sql
UTL_SMTP.RCPT (
  c           IN OUT NOCOPY     connection,
  recipient   IN                VARCHAR2,
  parameters  IN                VARCHAR2 DEFAULT NULL);
```

**Table 164–31 RCPT Function and Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>recipient</td>
<td>The e-mail address of the user to which the message is being sent.</td>
</tr>
</tbody>
</table>
| parameters    | The additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It should follow the format of “XXX=XXX (XXX=XXX ....)”.

**Return Values**

**Table 164–32 RCPT Function and Procedure Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to MAIL, and the connection to the mail server
must have been opened and initialized by prior calls to \texttt{OPEN\_CONNECTION} and \texttt{HELO} or \texttt{EHLO} respectively.

The expected response from the server is a message beginning with status code 250 or 251.
RSET Function and Procedure

This function terminates the current mail transaction.

Syntax

```sql
UTL_SMTP.RSET (c  IN OUT NOCOPY connection)
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This command allows the client to abandon a mail message it was in the process of composing. No mail will be sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the email data has been sent, it will be too late to prevent the email from being sent.

The server will always respond to RSET with a message beginning with status code 250.
Related Functions

QUIT
VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (  
c          IN OUT NOCOPY connection  
recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>recipient</td>
<td>The e-mail address to be verified.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The server attempts to resolve the destination address recipient. If successful, it returns the recipient’s full name and fully qualified mailbox path. The connection to the server must have already been established by means of OPEN_CONNECTION and HELO or EHLO before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.
WRITE_DATA Procedure

Use WRITE_DATA to write a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```sql
UTL_SMTP.WRITE_DATA (c IN OUT NOCOPY connection,
                      data IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>data</td>
<td>The portion of the text of the message to be sent, including headers, in [RFC822] format.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a `<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of `<CR><LF>` (single period) in the body to `<CR><LF><CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```sql
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('. ' || chr(13) || chr(10));
```
Since the sequence `<CR><LF>.<CR><LF>` is split between two calls to `WRITE_DATA`, the implementation of `WRITE_DATA` will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

`WRITE_DATA` should be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a `?' character. If 8BITMIME extension is negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to `RAW` using the `UTL_RAW` package, and then sending the `RAW` data using `WRITE_RAW_DATA`. 
WRITE_RAW_DATA Procedure

Use WRITE_RAW_DATA to write a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (  
  c     IN OUT NOCOPY connection  
  data  IN RAW);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The SMTP connection.</td>
</tr>
<tr>
<td>data</td>
<td>The portion of the text of the message to be sent, including headers, in [RFC822] format.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a `<CR>`<LF>..<CR>`<LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of `<CR>`<LF>..<CR>`<LF> (single period) in the body to `<CR>`<LF>..<CR>`<LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));  
UTL_SMTP.WRITE_DATA('. ' || chr(13) || chr(10));  
```
Since the sequence `<CR>`<LF>.<CR><LF> is split between two calls to `WRITE_DATA`, the implementation of `WRITE_DATA` will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

`XXX_DATA` should be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a `?` character. If 8BITMIME extension is negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to `RAW` using the `UTL_RAW` package, and then sending the `RAW` data using `WRITE_RAW_DATA`. 
With the UTL_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- Using UTL_TCP
  - Overview
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_TCP Subprograms
Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

Types

- CONNECTION Type
- CRLF

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```plsql
TYPE connection IS RECORD (  
  remote_host   VARCHAR2(255),  
  remote_port   PLS_INTEGER,  
  local_host    VARCHAR2(255),  
  local_port    PLS_INTEGER,  
  charset       VARCHAR2(30),  
  newline       VARCHAR2(2),  
  tx_timeout    PLS_INTEGER,  
  private_sd    PLS_INTEGER);
```
Using UTL_TCP

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>The name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>remote_port</td>
<td>The port number of the remote host connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_host</td>
<td>The name of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_port</td>
<td>The port number of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network.</td>
</tr>
<tr>
<td>newline</td>
<td>The newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>A time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using OPEN_CONNECTION. Changing the values of those fields has no effect on the connection. The fields private_XXXX are for implementation use only. You should not modify the values.

In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields will not be set in the connection record returned by the function.
Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used many communication standards.

Syntax

CRLF varchar2(10);

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for WRITE_LINE, specified when a connection is opened. While such protocols use <CR><LF> to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

This CRLF package variable is intended to be a constant that denotes the carriage-return line-feed character sequence. Do not modify its value. Modification may result in errors in other PL/SQL applications.

Exceptions

The exceptions raised by the TCP/IP package are listed in Table 165–2.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>Buffer is too small for input that requires look-ahead.</td>
</tr>
<tr>
<td>END_OF_INPUT</td>
<td>Raised when no more data is available to read from the connection.</td>
</tr>
<tr>
<td>NETWORK_ERROR</td>
<td>Generic network error.</td>
</tr>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument passed in an API call (for example, a negative buffer size).</td>
</tr>
<tr>
<td>TRANSFER_TIMEOUT</td>
<td>No data is read and a read time out occurred.</td>
</tr>
<tr>
<td>PARTIAL_MULTI_BYTE_CHAR</td>
<td>No complete character is read and a partial multibyte character is found at the end of the input.</td>
</tr>
</tbody>
</table>
Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```plsql
DECLARE
  c utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                             remote_port => 80,
                             charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
      END LOOP;
      EXCEPTION
      WHEN utl_tcp.end_of_input THEN
        NULL;  -- end of input
      END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```plsql
PROCEDURE send_mail (sender    IN VARCHAR2,
                      recipient IN VARCHAR2,

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```plsql
UTL_TCP.AVAILABLE (  
    c        IN OUT NOCOPY connection,  
    timeout  IN PLS_INTEGER DEFAULT 0)  
RETURN num_bytes PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to determine the amount of data that is available to be read from.</td>
</tr>
<tr>
<td>timeout</td>
<td>A time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_bytes</td>
<td>The number of bytes available for reading without blocking.</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program will not be blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may less than than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of...
your application, assume that this function returns a positive value when data is available for reading, and 0 when no data is available. The following example illustrates using this function in a portable manner:

DECLARE
  c   utl_tcp.connection
  data VARCHAR2(256);
  len  PLS_INTEGER;
BEGIN
  c := utl_tcp.open_connection(...);
  LOOP
    IF (utl_tcp.available(c) > 0) THEN
      len := utl_tcp.read_text(c, data, 256);
    ELSE
      ---do some other things
      ....
    END IF
  END LOOP;
END;

Related Functions

READ_RAW, READ_TEXT, READ_LINE
CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

UTL_TCP.CLOSE_ALL_CONNECTIONS;

Usage Notes

This call is provided to close all connections before a PL/SQL program avoid dangling connections.

Related Functions

OPEN_CONNECTION, CLOSE_CONNECTION.
CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

UTL_TCP.CLOSE_CONNECTION (  
  c IN OUT NOCOPY connection);

Parameters

Table 165–6  CLOSE_CONNECTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to close.</td>
</tr>
</tbody>
</table>

Usage Notes

Connection must have been opened by a previous call to OPEN_CONNECTION. The fields remote_host, remote_port, local_host, local_port and charset of c will be reset after the connection is closed.

An open connection must be closed explicitly. An open connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
FLUSH Procedure

This procedure transmits all data in the output buffer, if a buffer is used, to the server immediately.

Syntax

```sql
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to send data to.</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

Related Functions

WRITE_RAW, WRITE_TEXT, WRITE_LINE
GET_LINE Function

This function returns the data read instead of the amount of data read.

Syntax

```sql
UTL_TCP.GET_LINE (
  c           IN OUT NOCOPY connection,
  remove_crlf IN            BOOLEAN DEFAULT FALSE,
  peek        IN            BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to receive data from.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, the trailing CR/LF character(s) are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

Related Functions

GET_RAW, GET_TEXT, READ_LINE
GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```plsql
UTL_TCP.GET_RAW (    c     IN OUT NOCOPY connection,    len   IN            PLS_INTEGER DEFAULT 1,    peek  IN            BOOLEAN     DEFAULT FALSE) RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to receive data from.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
Related Functions

GET_RAW, GET_TEXT, READ_RAW, READ_TEXT, READ_LINE
GET_TEXT Function

This function returns the data read instead of the amount of data read.

Syntax

```plsql
UTL_TCP.GET_TEXT (  
c    IN OUT NOCOPY connection,  
len  IN            PLS_INTEGER DEFAULT 1,  
peek IN            BOOLEAN     DEFAULT FALSE)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to receive data from.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
Related Functions

  READ_RAW, READ_TEXT, READ_LINE
OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (
   remote_host IN VARCHAR2,
   remote_port IN PLS_INTEGER,
   local_host  IN VARCHAR2 DEFAULT NULL,
   local_port  IN PLS_INTEGER DEFAULT NULL,
   in_buffer_size IN PLS_INTEGER DEFAULT NULL,
   out_buffer_size IN PLS_INTEGER DEFAULT NULL,
   charset     IN VARCHAR2 DEFAULT NULL,
   newline     IN VARCHAR2 DEFAULT CRLF,
   tx_timeout  IN PLS_INTEGER DEFAULT NULL)
RETURN connection;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>The name of the host providing the service. When remote_host is NULL, it connects to the local host.</td>
</tr>
<tr>
<td>remote_port</td>
<td>The port number on which the service is listening for connections.</td>
</tr>
<tr>
<td>local_host</td>
<td>The name of the host providing the service. NULL means don't care.</td>
</tr>
<tr>
<td>local_port</td>
<td>The port number on which the service is listening for connections. NULL means don't care.</td>
</tr>
<tr>
<td>in_buffer_size</td>
<td>The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.</td>
</tr>
</tbody>
</table>
Table 165–11 (Cont.) OPEN_CONNECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_buffer_size</td>
<td>The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.</td>
</tr>
<tr>
<td>newline</td>
<td>The newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>A time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Return Values

Table 165–12 OPEN_CONNECTION Function Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connection</td>
<td>A connection to the targeted TCP/IP service.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL
program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields will not be set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL_TCP package.

Related Functions

CLOSE_CONNECTION, CLOSE_ALL_CONNECTIONS
## READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

### Syntax

```
UTL_TCP.READ_LINE (  
  c           IN OUT NOCOPY connection,  
  data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
  peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN num_chars PLS_INTEGER;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to receive data from.</td>
</tr>
<tr>
<td>data</td>
<td>The data received.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, the trailing CR/LF character(s) are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

### Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_chars</td>
<td>The actual number of characters of data received.</td>
</tr>
</tbody>
</table>
READ_LINE Function

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

Related Functions

READ_RAW, READ_TEXT, AVAILABLE
READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (    
c     IN OUT NOCOPY connection,    
data  IN OUT NOCOPY RAW,    
len   IN            PLS_INTEGER DEFAULT 1,    
peek  IN            BOOLEAN     DEFAULT FALSE)    
RETURN num_bytes PLS_INTEGER;
```

Parameters

READ_RAW Function

**Usage Notes**

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

**Related Functions**

READ_TEXT, READ_LINE, AVAILABLE
READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (    
    c    IN OUT NOCOPY connection,    
    data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,   
    len  IN            PLS_INTEGER DEFAULT 1,    
    peek IN            BOOLEAN     DEFAULT FALSE)    
RETURN num_chars PLS_INTEGER;
```

Parameters

<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_chars</td>
<td>The actual number of characters of data received.</td>
</tr>
</tbody>
</table>
READ_TEXT Function

Usage Notes

The connection must have already been opened through a call to \texttt{OPEN\_CONNECTION}. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a \texttt{VARCHAR2} buffer is specified in terms of bytes, while the parameter \texttt{len} refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the \texttt{VARCHAR2} buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the \texttt{transfer\_timeout} exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the \texttt{partial\_multibyte\_char} exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the \texttt{READ\_RAW} function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, the \texttt{transfer\_timeout} exception is raised instead. The exception can be handled and the read operation can be retried later.

Related Functions

\texttt{READ\_RAW}, \texttt{READ\_LINE}, \texttt{AVAILABLE}
WRITE_LINE Function

This function transmits a text line to a service on an open connection. The newline character sequence will be appended to the message before it is transmitted.

Syntax

```sql
UTL_TCP.WRITE_LINE (    c    IN OUT NOCOPY connection,    data IN VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)    RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to send data to.</td>
</tr>
<tr>
<td>data</td>
<td>The buffer containing the data to be sent.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_chars</td>
<td>The actual number of characters of data transmitted.</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

Related Functions

WRITE_RAW, WRITE_TEXT, FLUSH
WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```sql
UTL_TCP.WRITE_RAW (    c IN OUT NOCOPY connection,
  data IN RAW,
  len IN PLS_INTEGER DEFAULT NULL)
RETURN num_bytes PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>The TCP connection to send data to.</td>
</tr>
<tr>
<td>data</td>
<td>The buffer containing the data to be sent.</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to transmit. When <code>len</code> is NULL, the whole length of data is written.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_bytes</td>
<td>The actual number of bytes of data transmitted.</td>
</tr>

</table>

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

WRITE_TEXT Function
The **UTL_URL** package has two functions: **ESCAPE** and **UNESCAPE**.

**See Also:** Chapter 156, "UTL_HTTP"

This chapter contains the following topics:

- **Using UTL_URL**
  - Overview
  - Exceptions
  - Examples
- **Summary of UTL_URL Subprograms**
Using UTL_URL

Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle’s Web site is:

http://www.oracle.com

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the unreserved characters. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the reserved characters. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent (’), left parenthesis ( ( ), right parenthesis ( )

The reserved characters are:

- Semi-colon (;), slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma ( ,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the
Using UTL_URL

x-www-form-urlencoded encoding mechanism described in the HTML specification:
http://www.w3.org/TR/html

Exceptions

Table 166–1 lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 166–1   UTL_URL Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_URL</td>
<td>29262</td>
<td>The URL contains badly formed escape code sequences</td>
</tr>
<tr>
<td>BAD_FIXED_WIDTH_CHARSET</td>
<td>29274</td>
<td>Fixed-width multibyte character set is not allowed as a URL character set.</td>
</tr>
</tbody>
</table>

Examples

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

CREATE OR REPLACE FUNCTION form_url_encode (data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

CREATE OR REPLACE FUNCTION form_url_decode(data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(replace(data, '+', ' '), charset);
END;
### Summary of UTL_URL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ESCAPE Function on page 166-5</strong></td>
<td>Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format</td>
</tr>
<tr>
<td><strong>UNESCAPE Function on page 166-7</strong></td>
<td>Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters</td>
</tr>
</tbody>
</table>
ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```sql
UTL_URL.ESCAPE (  
    url                   IN VARCHAR2 CHARACTER SET ANY_CS,  
    escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,  
    url_charset           IN VARCHAR2 DEFAULT  utl_http.body_charset)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The original URL</td>
</tr>
<tr>
<td>escape_reserved_chars</td>
<td>Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.</td>
</tr>
<tr>
<td>url_charset</td>
<td>When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the utl_http package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:
ESCAPE Function

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair $logon=scott/tiger into the query string of a URL, escape the $ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
url := 'http://www.acme.com/a url with space.html'
```

Returns:
```
http://foo.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with escape_reserved_chars set to TRUE) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign ($), and space characters in 'Is the use of the "$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using US7ASCII so that a space is escaped as %20 (hex code of a space in ASCII) instead of %40 (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.
UNESCOAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the %XX escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (url IN VARCHAR2 CHARACTER SET ANY_CS,
                   url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL to unescape</td>
</tr>
<tr>
<td>url_charset</td>
<td>After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is &quot;ISO-8859-1&quot;. The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that %20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.
UNESCAPE Function
The **WPG_DOCLOAD** package provides an interface to download files, BLOBs and BFILES.

**See Also:** For more information about implementation of this package:
- *Oracle HTTP Server Administrator’s Guide*

Using **WPG_DOCLOAD**

- **Constants**

**Constants**

- **NAME_COL_LEN**
- **MIMET_COL_LEN**
- **MAX_DOCTABLE_NAME_LEN**

**NAME_COL_LEN**

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```plsql
name_col_len CONSTANT pls_integer := 64;
```

**MIMET_COL_LEN**

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```plsql
mimet_col_len CONSTANT pls_integer := 48;
```

**MAX_DOCTABLE_NAME_LEN**

The name length of your document table must be less than `max_doctable_name_len`.

```plsql
max_doctable_name_len CONSTANT pls_integer := 256;
```
## Summary of WPG_DOCLOAD Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNLOAD_FILE</td>
<td>Downloads files, BLOBS and BFILES</td>
</tr>
<tr>
<td>Procedures on page</td>
<td>167-4</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```sql
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_filename      IN             VARCHAR2,
  p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
  p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
  p_bfile         IN OUT         BFILE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_filename</code></td>
<td>The file to download from the document table.</td>
</tr>
<tr>
<td><code>p_blob</code></td>
<td>The BLOB to download.</td>
</tr>
<tr>
<td><code>p_bfile</code></td>
<td>The BFILE to download (see Usage Notes).</td>
</tr>
<tr>
<td><code>p_bcaching</code></td>
<td>Whether browser caching is enabled (see Usage Notes).</td>
</tr>
</tbody>
</table>

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the
browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the p_bcaching parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- p_bfile and p_blob are declared as IN OUT because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.
An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- Using ANYDATA TYPE
  - Restrictions
  - Operational Notes
- Summary of ANYDATA Subprograms
Using ANYDATA TYPE

Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILEs is not currently supported.

Operational Notes

- Construction
- Access

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

- STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
- STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
- STATIC FUNCTION ConvertBFloat(f1 IN BINARY_FLOAT) return ANYDATA,
- STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
- STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
- STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
- STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
- STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
- STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
- STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
- STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
- STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
- STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
- STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
- STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
- STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
- STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
- STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
- STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
- STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return ANYDATA,
The second way to construct an ANYDATA is a piece by piece approach. The 
BEGINCREATE Static Procedure call begins the construction process and 
ENDCREATE Member Procedure call finishes the construction process. In between 
these two calls, the individual attributes of an object type or the elements of a 
collection can be set using SET* calls. For piece by piece access of the attributes of 
objects and elements of collections, the PIECEWISE Member Procedure should be 
invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its 
first attribute (or collection element). The BEGINCREATE call automatically begins 
the construction in a piece-wise mode. There is no need to call PIECEWISE 
immediately after BEGINCREATE. ENDCREATE should be called to finish the 
construction process (before which any access calls can be made).

**Access**

Access functions are available based on SQL. These functions do not throw 
exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA 
does not correspond to the type of access. If you wish to use only ANYDATA 
fuctions of the appropriate types returned in a query, you should use a WHERE 
clause which uses GETTYPENAME and choose the type you are interested in (say 
"SYS.NUMBER"). Each of these functions returns the value of a specified datatype 
inside a SYS.ANYDATA wrapper.

MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE 
DETERMINISTIC, 
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE, 
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT 
DETERMINISTIC, 
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB, 
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR, 
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB, 
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE, 
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH, 
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND, 
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR, 
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB 
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER, 
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2, 
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
### Summary of ANYDATA Subprograms

#### Table 168–1 ANYDATA Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGINCREATE Static Procedure</td>
<td>Begins creation process on a new ANYDATA</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure</td>
<td>Ends creation of an ANYDATA</td>
</tr>
<tr>
<td>GET* Member Functions</td>
<td>Gets the current data value (which should be of appropriate type)</td>
</tr>
<tr>
<td>GETTYPE Member Function</td>
<td>Gets the Type of the ANYDATA</td>
</tr>
<tr>
<td>GETTYPENAME Member Function</td>
<td>Get the fully qualified type name for the ANYDATA</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure</td>
<td>Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)</td>
</tr>
<tr>
<td>SET* Member Procedures</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata          OUT NOCOPY ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtype</td>
<td>The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)</td>
</tr>
<tr>
<td>adata</td>
<td>ANYDATA being constructed.</td>
</tr>
</tbody>
</table>

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.
**ENDCREATE Member Procedure**

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

**Syntax**

```haskell
MEMBER PROCEDURE EndCreate(
    self IN OUT NOCOPY ANYDATA);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA</td>
</tr>
</tbody>
</table>
GET* Member Functions

These functions get the current data value (which should be of appropriate type). The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

MEMBER FUNCTION GetBDouble(
    self         IN ANYDATA,
    dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self         IN ANYDATA,
    b            OUT NOCOPY BFILE)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self         IN ANYDATA,
    fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self         IN ANYDATA,
    b            OUT NOCOPY BLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self         IN ANYDATA,
    c            OUT NOCOPY CHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self         IN ANYDATA,
    c            OUT NOCOPY CLOB)
RETURN       PLS_INTEGER;
MEMBER FUNCTION GetCollection(
    self  IN ANYDATA,
    col   OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self  IN ANYDATA,
    dat   OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self  IN ANYDATA,
    inv   OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
    self  IN ANYDATA,
    inv   OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self  IN ANYDATA,
    nc    OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self  IN ANYDATA,
    nc    OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self  IN ANYDATA,
    num   OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNVarChar2(
    self  IN ANYDATA,
    nc    OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self  IN ANYDATA,
    obj   OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;
MEMBER FUNCTION GetRaw(
    self         IN ANYDATA,
    r            OUT NOCOPY RAW)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self         IN ANYDATA,
    rf           OUT NOCOPY REF "<object_type>")
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR2)
RETURN       PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number to be obtained.</td>
</tr>
</tbody>
</table>
Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

MEMBER FUNCTION GETTYPE(
    self          IN ANYDATA,
    typ           OUT NOCOPY AnyType)
RETURN        PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>typ</td>
<td>The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return schema_name.type_name, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

MEMBER FUNCTION GETTYPENAME(
    self         IN ANYDATA)
RETURN       VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATA.
PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
    self    IN OUT NOCOPY ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The current data value.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.
SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

MEMBER PROCEDURE SETBDOUBLE{
    self     IN OUT NOCOPY ANYDATA,
    dbl      IN BINARY_DOUBLE,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETBFILE{
    self     IN OUT NOCOPY ANYDATA,
    b        IN BFILE,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETBFLOAT{
    self     IN OUT NOCOPY ANYDATA,
    fl       IN BINARY_FLOAT,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETBLOB{
    self     IN OUT NOCOPY ANYDATA,
    b        IN BLOB,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETCHAR{
    self     IN OUT NOCOPY ANYDATA,
    c        IN CHAR,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETCLOB{
    self     IN OUT NOCOPY ANYDATA,
    c        IN CLOB,
    last_elem IN boolean DEFAULT FALSE};

MEMBER PROCEDURE SETCOLLECTION{
    self     IN OUT NOCOPY ANYDATA,
    col      IN "<collection_type>",
    last_elem IN boolean DEFAULT FALSE};
MEMBER PROCEDURE SETDATE(
    self        IN OUT NOCOPY ANYDATA,
    dat         IN DATE,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self        IN OUT NOCOPY ANYDATA,
    inv         IN INTERVAL DAY TO SECOND,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(

    c           IN VARCHAR,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(    self        IN OUT NOCOPY ANYDATA,
    c           IN VARCHAR2,
    last_elem   IN boolean DEFAULT FALSE);

Parameters

Table 168–8  SET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>
Exceptions

- **DBMS_TYPES.INVALID_PARAMETERS**: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- **DBMS_TYPES.INCORRECT_USAGE**: Incorrect usage.
- **DBMS_TYPES.TYPE_MISMATCH**: When the expected type is different from the passed in type.

Usage Notes

When **BEGINCREATE** is called, construction has already begun in a piece-wise fashion. Subsequent calls to **SET*** will set the successive attribute values.

If the **ANYDATA** is a standalone collection, the **SET*** call will set the successive collection elements.
An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms
The \texttt{ANYDATASET} needs to be constructed value by value, sequentially. For each data instance (of the type of the \texttt{ANYDATASET}), the \texttt{ADDITIONSTANCE} function must be invoked. This adds a new data instance to the \texttt{ANYDATASET}. Subsequently, \texttt{SET*} can be called to set each value in its entirety.

The \texttt{MODE} of construction/access can be changed to attribute/collection element wise by making calls to \texttt{PIECEWISE}.

- If the type of the \texttt{ANYDATASET} is \texttt{TYPECODE_OBJECT}, individual attributes will be set with subsequent \texttt{SET*} calls. Likewise on access.

- If the type of the current data value is a collection type individual collection elements will be set with subsequent \texttt{SET*} calls. Likewise on access. This call is very similar to \texttt{ANYDATA.PIECEWISE} call defined for the type \texttt{ANYDATA}.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

\texttt{ENDCREATE} should be called to finish the construction process (before which no access calls can be made).
### Summary of ANYDATASET TYPE Subprograms

#### Table 169–1  ANYDATASET Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDINSTANCE Member Procedure on page 169-4</td>
<td>Adds a new data instance to an ANYDATASET.</td>
</tr>
<tr>
<td>BEGINC CREATE Static Procedure on page 169-5</td>
<td>Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure on page 169-6</td>
<td>Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td>GET* Member Functions on page 169-7</td>
<td>Gets the current data value (which should be of appropriate type).</td>
</tr>
<tr>
<td>GETCOUNT Member Function on page 169-11</td>
<td>Gets the number of data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>GETINSTANCE Member Function on page 169-12</td>
<td>Gets the next instance in an ANYDATASET.</td>
</tr>
<tr>
<td>GETTYPE Member Function on page 169-13</td>
<td>Gets the ANYTYPE describing the type of the data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>GETTYPENAME Member Function on page 169-14</td>
<td>Gets the AnyType describing the type of the data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure on page 169-15</td>
<td>Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).</td>
</tr>
<tr>
<td>SET* Member Procedures on page 169-16</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>
ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

MEMBER PROCEDURE AddInstance(
    self          IN OUT NOCOPY ANYDATASET);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.
BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```plsql
STATIC PROCEDURE BeginCreate(
    typecode    IN PLS_INTEGER,
    rtype       IN OUT NOCOPY AnyType,
    aset        OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>The typecode for the type of the ANYDATASET.</td>
</tr>
<tr>
<td>dtype</td>
<td>The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.</td>
</tr>
<tr>
<td>aset</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)
**ENDCREATE Member Procedure**

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

**Syntax**

```plsql
MEMBER PROCEDURE ENDCREATE(
    self              IN OUT NOCOPY ANYDATASET);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>
**GET* Member Functions**

These functions get the current data value (which should be of appropriate type). The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

**Syntax**

```plaintext
MEMBER FUNCTION GETBDOUBLE(
    self        IN ANYDATASET,
    dbl         OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self        IN ANYDATASET,
    fl          OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self        IN ANYDATASET,
    b           OUT NOCOPY BFILE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self        IN ANYDATASET,
    b           OUT NOCOPY BLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY CHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self        IN ANYDATASET,
    c           OUT NOCOPY CLOB)
RETURN PLS_INTEGER;
```
GET* Member Functions

MEMBER FUNCTION GETCOLLECTION(
  self    IN ANYDATASET,
  col     OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETDATE(
  self    IN ANYDATASET,
  dat     OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
  self    IN ANYDATASET,
  inv     IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALYM(
  self    IN ANYDATASET,
  inv     IN OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
  self    IN ANYDATASET,
  nc      OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
  self    IN ANYDATASET,
  nc      OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
  self    IN ANYDATASET,
  num     OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
  self    IN ANYDATASET,
  nc      OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
  self    IN ANYDATASET,
  obj     OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;
MEMBER FUNCTION GETRAW(
    self IN ANYDATASET,
    r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
    self IN ANYDATASET,
    rf OUT NOCOPY REF "<object_type>"
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
    self IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPLTZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
    self IN ANYDATASET,
    rid OUT NOCOPY UROWID)
RETURN PLS_INTEGER

MEMBER FUNCTION GETVARCHAR(
    self IN ANYDATASET,
    c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
    self IN ANYDATASET,
    c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;
Parameters

Table 169–5  GET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GetCount(
    self        IN ANYDATASET)
RETURN      PLS_INTEGER;

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

The number of data instances.
GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(
    self           IN OUT NOCOPY ANYDATASET)
RETURN         PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

- DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA
- DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.
GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GETTYPE{
   self           IN ANYDATASET,
   typ            OUT NOCOPY AnyType)
RETURN         PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET.</td>
</tr>
<tr>
<td>typ</td>
<td>The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return schema_name.type_name, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

MEMBER FUNCTION GETTYPENAME(
    self           IN ANYDATASET)
RETURN         VARCHAR2;

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATASET.
PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

MEMBER PROCEDURE PIECEWISE(
    self         IN OUT NOCOPY ANYDATASET);

Parameters

Table 169–10  PIECEWISE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.
DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collectyon type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.
This procedure sets the current data value.

The type of the current data value depends on the **MODE** with which we are constructing (depending on how we have invoked the **PIECEWISE** call). The type of the current data should be the type of the **ANYDATASET** if **PIECEWISE** has NOT been called. The type should be the type of the attribute at the current position if **PIECEWISE** has been called.

**Syntax**

MEMBER PROCEDURE SETBDOUBLE(
    self              IN OUT NOCOPY ANYDATASET,
    dbl               IN BINARY_DOUBLE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self              IN OUT NOCOPY ANYDATASET,
    fl                IN BINARY_FLOAT,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BFILE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BLOB,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CLOB,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self              IN OUT NOCOPY ANYDATASET,
col               IN "<collection_type>",
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self              IN OUT NOCOPY ANYDATASET,
    dat               IN DATE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALSDS(
    self              IN OUT NOCOPY ANYDATASET,
    inv               IN INTERVAL DAY TO SECOND,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self              IN OUT NOCOPY ANYDATASET,
    inv               IN INTERVAL YEAR TO MONTH,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    nc                IN NCHAR,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self              IN OUT NOCOPY ANYDATASET,
    nc                IN NClob,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self              IN OUT NOCOPY ANYDATASET,
    num               IN NUMBER,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self              IN OUT NOCOPY ANYDATASET,
    nc                IN NVarchar2,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self              IN OUT NOCOPY ANYDATASET,
    obj               IN "<object_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self              IN OUT NOCOPY ANYDATASET,
MEMBER PROCEDURE SETRAW(
    r IN RAW,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self IN OUT NOCOPY ANYDATASET,
    rf IN REF "<object_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self IN OUT NOCOPY ANYDATASET,

Exceptions

- **DBMS_TYPES.INVALID_PARAMETERS:** Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- **DBMS_TYPES.INCORRECT_USAGE:** Incorrect usage.
- **DBMS_TYPES.TYPE_MISMATCH:** When the expected type is different from the passed in type.
An ANYTYPE TYPE can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the CREATE TYPE statement. Only new transient types can be constructed using the ANYTYPE interfaces.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms
## Summary of ANYTYPE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BEGINCREATE</strong> Static Procedure on page 170-3</td>
<td>Creates a new instance of ANYTYPE which can be used to create a transient type description.</td>
</tr>
<tr>
<td><strong>SETINFO</strong> Member Procedure on page 170-4</td>
<td>Sets any additional information required for constructing a COLLECTION or built-in type.</td>
</tr>
<tr>
<td><strong>ADDAATTR</strong> Member Procedure on page 170-6</td>
<td>Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYP CODE_OBJECT).</td>
</tr>
<tr>
<td><strong>ENDCREATE</strong> Member Procedure on page 170-8</td>
<td>Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td><strong>GETPERSISTENT</strong> Static Function on page 170-9</td>
<td>Returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.</td>
</tr>
<tr>
<td><strong>GETINFO</strong> Member Function on page 170-10</td>
<td>Gets the type information for the ANYTYPE.</td>
</tr>
<tr>
<td><strong>GETATTRELEMINFO</strong> Member Function on page 170-12</td>
<td>Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection’s element type if the self parameter is of a collection type.</td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```plaintext
STATIC PROCEDURE BEGINCREATE(
    typecode       IN PLS_INTEGER,
    atype          OUT NOCOPY ANYTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>Use a constant from DBMS_TYPES package. Typecodes for user-defined type: can be DBMS_TYPES.TYPECODE_OBJECT or DBMS_TYPES.TYPECODE_VARRAY or DBMS_TYPES.TYPECODE_TABLE. Typecodes for builtin types: DBMS_TYPES.TYPECODE_NUMBER, and similar types.</td>
</tr>
<tr>
<td>atype</td>
<td>ANYTYPE for a transient type</td>
</tr>
</tbody>
</table>
SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```plsql
MEMBER PROCEDURE SETINFO(
    self          IN OUT NOCOPY ANYTYPE,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    atype         IN ANYTYPE DEFAULT NULL,
    elem_tc       IN PLS_INTEGER DEFAULT NULL,
    elem_count    IN PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.</td>
</tr>
<tr>
<td>atype</td>
<td>Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.</td>
</tr>
</tbody>
</table>
Summary of ANYTYPE Subprograms

Table 170–3 (Cont.) SETINFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem_tc</td>
<td>Must be of the collection element’s typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>elem_count</td>
<td>Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.
ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```sql
MEMBER PROCEDURE ADDATTR(
    self          IN OUT NOCOPY ANYTYPE,
    aname         IN VARCHAR2,
    typecode      IN PLS_INTEGER,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.</td>
</tr>
<tr>
<td>aname</td>
<td>Optional. Attribute's name. Could be NULL.</td>
</tr>
<tr>
<td>typecode</td>
<td>Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.</td>
</tr>
<tr>
<td>csid</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.</td>
</tr>
</tbody>
</table>
Table 170–4 (Cont.) ADDATTR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_type</td>
<td>Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)
**ENDCREATE Member Procedure**

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

**Syntax**

```sql
MEMBER PROCEDURE ENDCREATE(
    self IN OUT NOCOPY ANYTYPE);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
</tbody>
</table>
GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

 STATIC FUNCTION GETPERSISTENT(
     schema_name    IN VARCHAR2,
     type_name      IN VARCHAR2,
     version        IN VARCHAR2 DEFAULT NULL)
 RETURN           ANYTYPE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the type.</td>
</tr>
<tr>
<td>type_name</td>
<td>Type name.</td>
</tr>
<tr>
<td>version</td>
<td>Type version.</td>
</tr>
</tbody>
</table>

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.
GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

MEMBER FUNCTION GETINFO (   
  self IN ANYTYPE,   
  prec OUT PLS_INTEGER,   
  scale OUT PLS_INTEGER,   
  len OUT PLS_INTEGER,   
  csid OUT PLS_INTEGER,   
  csfrm OUT PLS_INTEGER,   
  schema_name OUT VARCHAR2,   
  type_name OUT VARCHAR2,   
  version OUT VARCHAR2,   
  count OUT PLS_INTEGER)   
RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>prec</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.</td>
</tr>
<tr>
<td>csfrm</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Type's schema (if persistent).</td>
</tr>
<tr>
<td>type_name</td>
<td>Type's typename.</td>
</tr>
<tr>
<td>version</td>
<td>Type's version.</td>
</tr>
</tbody>
</table>
Return Values

The typecode of self.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

---

**Table 170–7 (Cont.) GETINFO Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>If self is a VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.</td>
</tr>
</tbody>
</table>
GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection’s element type if the self parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
    self           IN ANYTYPE,
    pos            IN PLS_INTEGER,
    prec           OUT PLS_INTEGER,
    scale          OUT PLS_INTEGER,
    len            OUT PLS_INTEGER,
    csid           OUT PLS_INTEGER,
    csfrm          OUT PLS_INTEGER,
    attr_elt_type  OUT ANYTYPE
    aname          OUT VARCHAR2
) RETURN         PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>pos</td>
<td>If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.</td>
</tr>
<tr>
<td>prec</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid, csfrm</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE. Gives character set ID, character set form.</td>
</tr>
<tr>
<td>attr_elt_type</td>
<td>If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the attr_elt_type.</td>
</tr>
</tbody>
</table>
Table 170–8  (Cont.) GETATTRELEMINFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aname</td>
<td>Attribute name (if it is an attribute of an object type, NULL otherwise).</td>
</tr>
</tbody>
</table>

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).
This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, DBMS_AQ, and DBMS_AQADM.

See Also: *Oracle Streams Advanced Queuing User’s Guide and Reference* for information about using Oracle Streams AQ.

This chapter contains the following topics:

- Summary of Types
Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$__DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type
AQ$_AGENT Type

Identifies a producer or a consumer of a message.

Syntax

```sql
TYPE SYS.AQ$_AGENT IS OBJECT (  
    name       VARCHAR2(30),
    address    VARCHAR2(1024),
    protocol   NUMBER  DEFAULT 0);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a producer or consumer of a message. The name must follow object name guidelines in the Oracle Database SQL Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>address</td>
<td>Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form [schema.]queue[@dblink]. For example, a queue named emp_messages in the hr queue at the site dbs1.net has the address: <a href="mailto:hr.emp_messages@dbs1.net">hr.emp_messages@dbs1.net</a></td>
</tr>
<tr>
<td>protocol</td>
<td>Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.</td>
</tr>
</tbody>
</table>
AQ$_AGENT_LIST_T Type

Identifies the list of agents for which DBMS_AQ.LISTEN listens.

See Also: "AQ$_AGENT Type" on page 171-3

Syntax

```sql
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY INTEGER;
```
**AQ$_DESCRIPTOR Type**

Specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:**  "MESSAGE_PROPERTIES_T Type" on page 171-18

**Syntax**

```sql
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT {
    queue_name    VARCHAR2(61),
    consumer_name VARCHAR2(30),
    msg_id        RAW(16),
    msg_prop      MSG_PROP_T;
}
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue in which the message was enqueued which resulted in the notification</td>
</tr>
<tr>
<td>consumer_name</td>
<td>Name of the consumer for the multiconsumer queue</td>
</tr>
<tr>
<td>msg_id</td>
<td>Identification number of the message</td>
</tr>
<tr>
<td>msg_prop</td>
<td>Message properties specified by the MSG_PROP_T type</td>
</tr>
</tbody>
</table>
AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```sql
TYPE SYS.AQ$_POST_INFO IS OBJECT (  
  name     VARCHAR2(128),
  namespace NUMBER,
  payload   RAW(2000)  DEFAULT NULL);
```

Attributes

**Table 171–3  AQ$_POST_INFO Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the anonymous subscription to which you want to post</td>
</tr>
<tr>
<td>namespace</td>
<td>To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ_NAMESPACE_ANONYMOUS</td>
</tr>
<tr>
<td>payload</td>
<td>The payload to be posted to the anonymous subscription</td>
</tr>
</tbody>
</table>
**AQ$$_POST_INFO_LIST Type**

Identifies the list of anonymous subscriptions to which you want to post messages.

See Also:  "AQ$$_POST_INFO Type" on page 171-6

**Syntax**

```sql
TYPE SYS.AQ$$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$$_POST_INFO;
```
AQ$_PURGE_OPTIONS_T Type

Specifies the options available for purging a queue table.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is
RECORD (block boolean DEFAULT FALSE);
```

Usage Notes

If `block` is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if `block` is TRUE.

The default for `block` is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.

See Also: "PURGE_QUEUE_TABLE Procedure" on page 17-42.
AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: "AQ$_AGENT Type" on page 171-3

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```
AQ$_REG_INFO Type

Specifies the information regarding the registrant for notification on a queue.

Syntax

```sql
TYPE SYS.AQ$_REG_INFO IS OBJECT (
  name VARCHAR2(128),
  namespace NUMBER,
  callback VARCHAR2(4000),
  context RAW(2000) DEFAULT NULL);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name of the subscription. The subscription name is of the form <code>schema.queue</code> if the registration is for a single consumer queue or <code>schema.queue:consumer_name</code> if the registration is for a multiconsumer queues.</td>
</tr>
<tr>
<td>namespace</td>
<td>Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be <code>DBMS_AQ_NAMESPACE_AQ</code>. To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code>, the namespace must be <code>DBMS_AQ_NAMESPACE_ANONYMOUS</code>.</td>
</tr>
<tr>
<td>callback</td>
<td>Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code>. For e-mail notifications, use <code>mailto://xyz@company.com</code>. For raw message payload for the PLSQLCALLBACK procedure, use <code>plsql://schema.procedure?PR=0</code>. For user-defined type message payload converted to XML for the PLSQLCALLBACK procedure, use <code>plsql://schema.procedure?PR=1</code>.</td>
</tr>
<tr>
<td>context</td>
<td>Specifies the context that is to be passed to the callback function</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback
Table 171–5 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 171–6 shows the actions performed when XML presentation is specified.

### Table 171–5 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

<table>
<thead>
<tr>
<th>Queue Payload Type</th>
<th>OCI Callback</th>
<th>E-mail</th>
<th>PL/SQL Callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>OCI callback receives the RAW data in the payload.</td>
<td>Not supported</td>
<td>PL/SQL callback receives the RAW data in the payload.</td>
</tr>
<tr>
<td>Oracle object type</td>
<td>Not supported</td>
<td>Not supported</td>
<td>Not supported</td>
</tr>
</tbody>
</table>

### Table 171–6 Actions Performed for Nonpersistent Queues When XML Presentation Specified

<table>
<thead>
<tr>
<th>Queue Payload Type</th>
<th>OCI Callback</th>
<th>E-mail</th>
<th>PL/SQL Callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>OCI callback receives the XML data in the payload.</td>
<td>XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.</td>
<td>PL/SQL callback receives the XML data in the payload.</td>
</tr>
<tr>
<td>Oracle object type</td>
<td>OCI callback receives the XML data in the payload.</td>
<td>XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.</td>
<td>PL/SQL callback receives the XML data in the payload.</td>
</tr>
</tbody>
</table>
AQ$$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: "AQ$$_REG_INFO Type" on page 171-10

Syntax

TYPE SYS.AQ$$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$$_REG_INFO;
AQ$$_SUBSCRIBER$$LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

**See Also:** "AQ$$_AGENT Type" on page 171-3

**Syntax**

```plaintext
TYPE SYS.AQ$$_SUBSCRIBER$$LIST_T IS TABLE OF SYS.AQ$$_AGENT
INDEX BY BINARY_INTEGER;
```
DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```plsql
TYPE DEQUEUE_OPTIONS_T IS RECORD (  
    consumer_name     VARCHAR2(30)    DEFAULT NULL,  
    dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,  
    navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,  
    visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,  
    wait              BINARY_INTEGER  DEFAULT FOREVER,  
    msgid             RAW(16)         DEFAULT NULL,  
    correlation       VARCHAR2(128)   DEFAULT NULL,  
    deq_condition     VARCHAR2(4000)  DEFAULT NULL,  
    transformation    VARCHAR2(61)    DEFAULT NULL);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_name</td>
<td>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call.</td>
</tr>
<tr>
<td>dequeue_mode</td>
<td>Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</td>
</tr>
<tr>
<td>navigation</td>
<td>(default)</td>
</tr>
<tr>
<td>visibility</td>
<td>(default)</td>
</tr>
<tr>
<td>wait</td>
<td>(default)</td>
</tr>
<tr>
<td>msgid</td>
<td>(default)</td>
</tr>
<tr>
<td>correlation</td>
<td>(default)</td>
</tr>
<tr>
<td>deq_condition</td>
<td>(default)</td>
</tr>
<tr>
<td>transformation</td>
<td>(default)</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>navigation</td>
<td>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</td>
</tr>
<tr>
<td></td>
<td>FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</td>
</tr>
<tr>
<td></td>
<td>FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</td>
</tr>
<tr>
<td></td>
<td>NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</td>
</tr>
<tr>
<td>visibility</td>
<td>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</td>
</tr>
</tbody>
</table>
DEQUEUE_OPTIONS_T Type

Table 171–7 (Cont.) DEQUEUE_OPTIONS_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wait</td>
<td>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>FOREVER: Wait forever. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>NO_WAIT: Do not wait.</td>
</tr>
<tr>
<td></td>
<td>number: Wait time in seconds.</td>
</tr>
<tr>
<td>msgid</td>
<td>Specifies the message identifier of the message to be dequeued.</td>
</tr>
<tr>
<td>correlation</td>
<td>Specifies the correlation identifier of the message to be dequeued.</td>
</tr>
<tr>
<td></td>
<td>Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</td>
</tr>
<tr>
<td>deq_condition</td>
<td>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</td>
</tr>
<tr>
<td></td>
<td>A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table.</td>
</tr>
<tr>
<td></td>
<td>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.</td>
</tr>
</tbody>
</table>
ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```sql
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
    visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
    relative_msgid        RAW(16)         DEFAULT NULL,
    sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
    transformation        VARCHAR2(61)    DEFAULT NULL);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>Specifies the transactional behavior of the enqueue request. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.</td>
</tr>
<tr>
<td>relative_msgid</td>
<td>Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.</td>
</tr>
<tr>
<td>sequence_deviation</td>
<td>Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>BEFORE: The message is enqueued ahead of the message specified by relative_msgid.</td>
</tr>
<tr>
<td></td>
<td>TOP: The message is enqueued ahead of any other messages.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.</td>
</tr>
</tbody>
</table>
MESSAGE_PROPERTIES_T Type

Describes the information that AQ uses to manage individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: "AQ$_RECIPIENT_LIST_T Type" on page 171-9

Syntax

```sql
TYPE message_properties_t IS RECORD (
    priority       BINARY_INTEGER  DEFAULT 1,
    delay          BINARY_INTEGER  DEFAULT NO_DELAY,
    expiration     BINARY_INTEGER  DEFAULT NEVER,
    correlation    VARCHAR2(128)   DEFAULT NULL,
    attempts       BINARY_INTEGER,
    recipient_list AQ$_RECIPIENT_LIST_T,
    exception_queue VARCHAR2(61)    DEFAULT NULL,
    enqueue_time   DATE,
    state          BINARY_INTEGER,
    sender_id      sys.aq$_agent   DEFAULT NULL,
    original_msgid RAW(16)         DEFAULT NULL,
    transaction_group VARCHAR2(30) DEFAULT NULL,
    user_property  SYS.ANYDATA     DEFAULT NULL);
```
Attributes

Table 171–9  MESSAGE_PROPERTIES_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeueing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However, the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
<tr>
<td>expiration</td>
<td>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However, the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</td>
</tr>
<tr>
<td>correlation</td>
<td>Returns the identifier supplied by the producer of the message at enqueue time.</td>
</tr>
<tr>
<td>attempts</td>
<td>Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.</td>
</tr>
<tr>
<td>recipient_list</td>
<td>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the &quot;AQ$_AGENT Type&quot; on page 171-3.</td>
</tr>
</tbody>
</table>
MESSAGE_PROPERTIES_T Type

Table 171–9 (Cont.) MESSAGE_PROPERTIES_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| exception_queue   | Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:  
  - RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.  
  - For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.  
  - If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION or SHUTDOWN ABORT on the instance), then RETRY_COUNT is not incremented.  
  - A message was not dequeued before the expiration time elapsed.  
  - Message propagation to the specified destination queue failed with one of the following errors:  
    * There were no recipients for the multiconsumer destination queue.  
    * Recipients were specified for a single-consumer destination queue.  
    * Destination queue was an exception queue  
    * There was an error when applying transformation.  
  The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert file. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time. |
| enqueue_time      | Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time. |
### Summary of Types

#### Oracle Streams AQ TYPES

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| state         | Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:  
  - `dbmsaq.READY`: The message is ready to be processed.  
  - `dbmsaq.WAITING`: The message delay has not yet been reached.  
  - `dbmsaq.PROCESSED`: The message has been processed and is retained.  
  - `dbmsaq.EXPIRED`: The message has been moved to the exception queue. |
| sender_id     | The application-sender identification specified at enqueue time by the message producer. Sender id is of type `aq$_agent`.  
  Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through `dbms_aqadm.enable_db_access` procedure call. Sender address and protocol should not be specified.  
  The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the `source_queue`, source database name if it was a remote database [format `source_queue@source_database_name`]. |
| original_msgid| This parameter is used by Oracle Streams AQ for propagating messages. |
| transaction_group | Specifies the `transaction_group` for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the `DBMS_AQ.DEQUEUE_ARRAY`. This attribute cannot be used to set the transaction group of a message through `DBMS_AQ.ENQUEUE` or `DBMS_AQ.ENQUEUE_ARRAY` calls. |
| user_property | This optional attribute is used to store additional information about the payload. |
MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by dbms_aq.enqueue_array and dbms_aq.dequeue_array calls to hold the set of message properties. Each element in the payload_array should have a corresponding element in the MESSAGE_PROPERTIES_ARRAY_T VARRAY.

See Also: "MESSAGE_PROPERTIES_T Type" on page 171-18

Syntax

TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647) OF MESSAGE_PROPERTIES_T;
MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```plaintext
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```
MSGID_ARRAY_T Type
Oracle supports the UriType family of types that can be used to store and query Uri-refs inside the database. The UriType itself is an abstract object type and the HTTPURITYPE, XDBURITYPE and DBURITYPE are subtypes of it.

You can create a UriType column and store instances of the DBURITYPE, XDBURITYPE or the HTTPURITYPE inside of it. You can also define your own subtypes of the UriType to handle different URL protocols.

Oracle also provides a UriFactory package that can be used as a factory method to automatically generate various instances of these UriTypes by scanning the prefix, such as http:// or /oradb. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix gopher:// to be handled by your subtype. The UriFactory will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprograms
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

- Oracle XML DB Developer’s Guide
Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URL. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETBLOB on page 172-3</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCLOB on page 172-4</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 172-5</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 172-6</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL on page 172-7</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML on page 172-8</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
**GETBLOB**

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETBLOB() RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETBLOB( CONTENT OUT VARCHAR2) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION GETBLOB( CSID IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETCLOB() RETURN CLOB;</td>
<td>This function returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETCLOB( CONTENT OUT VARCHAR2) RETURN CLOB;</td>
<td>This function returns the CLOB located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

MEMBER FUNCTION GETCONTENTTYPE() RETURN VARCHAR2;
This function returns the URL, in escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

**Syntax**

```plsql
MEMBER FUNCTION GETEXTERNALURL()
RETURN VARCHAR2;
```
GETURL

This function returns the URL, in non-escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

MEMBER FUNCTION GETURL()
RETURN VARCHAR2;
GETXML

This function returns the `XMLType` located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETXML() RETURN XMLTYPE;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETXML( CONTENT OUT VARCHAR2) RETURN XMLTYPE;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

**Table 172–2**  HTTPURITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 172-10</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>

</tbody>
</table>
CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax
STATIC FUNCTION CREATEURI(
    URL IN VARCHAR2
) RETURN HTTPURITYPE;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL; escaped format.</td>
</tr>
</tbody>
</table>
GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETBLOB() RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETBLOB( CONTENT OUT VARCHAR2) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION GETBLOB( CSID IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETCLOB() RETURN CLOB;</td>
<td>Returns the CLOB located at the address specified by the HTTP URL.</td>
</tr>
</tbody>
</table>
| MEMBER FUNCTION GETCLOB(  
  CONTENT OUT VARCHAR2)  
RETURN CLOB; | Returns the CLOB located at the address specified by the HTTP URL and the content type. |

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax

MEMBER FUNCTION GETCONTENTTYPE()
RETURN VARCHAR2;
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function. The HTTPURITYPE function does not store the prefix http://, but generates it for the external URL.

Syntax

MEMBER FUNCTION GETEXTERNALURL()
RETURN VARCHAR2;
GETRUL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

MEMBER FUNCTION GETURL()
RETURN VARCHAR2;
This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETXML() RETURN XMLTYPE;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETXML( CONTENT OUT VARCHAR2) RETURN XMLTYPE;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

CONSTRUCTOR FUNCTION HTTPURITYPE(
    URL IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
Summary of DBURITYPE Subtype Subprograms

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 172-19</td>
<td>Constructs a DBURITYPE instance.</td>
</tr>
<tr>
<td>DBURITYPE on page 172-20</td>
<td>Creates an instance of DBURITYPE from the given URI.</td>
</tr>
<tr>
<td>GETBLOB on page 172-21</td>
<td>Returns the BLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCLOB on page 172-22</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 172-23</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 172-24</td>
<td>Returns the URL, in escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETURL on page 172-25</td>
<td>Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETXML on page 172-26</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

STATIC FUNCTION CREATEURI(
    URL IN VARCHAR2)
RETURN DBURITYPE;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid DBURITYPE.</td>
</tr>
</tbody>
</table>
This constructs a DBURITYPE instance.

**Syntax**

```plsql
CONSTRUCTOR FUNCTION DBURITYPE(
    URL IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
**GETBLOB**

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETBLOB() RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETBLOB( CONTENT OUT VARCHAR2) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION GETBLOB( CSID IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETCLOB() RETURN CLOB;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETCLOB( CONTENT OUT VARCHAR2) RETURN CLOB;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION GETCONTENTTYPE()
RETURN VARCHAR2;
```
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBUri servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in web pages.

Syntax

MEMBER FUNCTION GETEXTERNALURL()
RETURN VARCHAR2;
GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax
MEMBER FUNCTION GETURL()
RETURN VARCHAR2;
GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETXML() RETURN XMLTYPE;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
| MEMBER FUNCTION GETXML( 
  CONTENT OUT VARCHAR2) RETURN XMLTYPE; | This function returns the XMLType located at the address specified by the URL and the content type. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 172-28</td>
<td>Returns the UriType corresponding to the specified URL.</td>
</tr>
<tr>
<td>GETBLOB on page 172-29</td>
<td>Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETCLOB on page 172-22</td>
<td>Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 172-31</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 172-24</td>
<td>Returns the URL, in escaped format, stored inside the XDBURITYPE instance.</td>

<tr>
<td>FUNCTION GETBLOB( CSID IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETCLOB() RETURN CLOB;</td>
<td>Returns the CLOB located at the address specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETCLOB( CONTENT OUT VARCHAR2) RETURN CLOB;</td>
<td>Returns the CLOB located at the address specified by the XDBURITYPE instance and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

Syntax

MEMBER FUNCTION GETCONTENTTYPE()
RETURN VARCHAR2;
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURITYPE instance.

Syntax
MEMBER FUNCTION GETEXTERNALURL()
RETURN VARCHAR2;
**GETURL**

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

**Syntax**

```sql
MEMBER FUNCTION GETURL()
RETURN VARCHAR2;
```
GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION GETXML() RETURN XMLTYPE;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION GETXML( CONTENT OUT VARCHAR2) RETURN XMLTYPE;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

CONSTRUCTOR FUNCTION XDBURITYPE(
   URL IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string containing a valid XDBUirType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>GETURL</code> on page 172-37</td>
<td>Returns the correct URL handler for the given URL string.</td>
</tr>
<tr>
<td><code>ESCAPEURI</code> on page 172-38</td>
<td>Returns a URL in escaped format.</td>
</tr>
<tr>
<td><code>UNESCAPEURI</code> on page 172-39</td>
<td>Returns a URL in unescaped format.</td>
</tr>
<tr>
<td><code>REGISTERURLHANDLER</code> on page 172-40</td>
<td>Registers a particular type name for handling a particular URL.</td>
</tr>
<tr>
<td><code>UNREGISTERURLHANDLER</code> on page 172-41</td>
<td>Unregisters a URL handler.</td>
</tr>
</tbody>
</table>
GETURL

This factory method returns the correct URL handler for the given URL string. It returns a subtype instance of the UriType that can handle the protocol. By default, it always creates an XDBURITYPE instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURL would then use that subtype.

Syntax

FUNCTION GETURL(    
    URL IN VARCHAR2)    
RETURN URITYPE;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid HTTP URL.</td>
</tr>
</tbody>
</table>
ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURL function to get to the URL value instead of using the attribute present in the UriType.

Syntax

```plsql
MEMBER FUNCTION ESCAPEURI ()
RETURN VARCHAR2;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string to be returned in escaped format.</td>
</tr>
</tbody>
</table>
UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax
FUNCTION UNESCAPEURI()
RETURN VARCHAR2;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>(IN)</td>
<td>The URL string to be returned in unescaped format.</td>
</tr>
</tbody>
</table>
**REGISTERURLHANDLER**

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the UriType or one of its subtypes. It must also implement the createUri static member function. This function is called by the GETURL function to generate an instance of the type. The stripprefix parameter indicates that the prefix must be stripped off before calling this function.

**Syntax**

```sql
PROCEDURE REGISTERURLHANDLER(
    PREFIX IN VARCHAR2,
    SCHEMANAME IN VARCHAR2,
    TYPENAME IN VARCHAR2,
    IGNORECASE IN BOOLEAN := TRUE,
    STRIPPREFIX IN BOOLEAN := TRUE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREFIX</td>
<td>(IN)</td>
<td>The prefix to handle; for example, http://.</td>
</tr>
<tr>
<td>SCHEMANAME</td>
<td>(IN)</td>
<td>Name of the schema where the type resides; case sensitive.</td>
</tr>
<tr>
<td>TYPENAME</td>
<td>(IN)</td>
<td>The name of the type to handle the URL; case sensitive.</td>
</tr>
<tr>
<td>IGNORECASE</td>
<td>(IN)</td>
<td>Ignore case when matching prefixes.</td>
</tr>
<tr>
<td>STRIPPREFIX</td>
<td>(IN)</td>
<td>Strip prefix before generating the instance of the type.</td>
</tr>
</tbody>
</table>
UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as http://.

Syntax

PROCEDURE UNREGISTERURLHANDLER(
    PREFIX IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREFIX</td>
<td>(IN)</td>
<td>The prefix to be unregistered.</td>
</tr>
</tbody>
</table>
UNREGISTERURLHANDLER
PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- **Using JMS Types**
  - Overview
  - Java Versus PL/SQL Data Types
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - `CONVERT_JMS_SELECTOR`
- Summary of JMS Types
Using JMS Types

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the DBMS_AQ package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- \texttt{aq\_jms\_header}
- \texttt{aq\_jms\_message}
- \texttt{aq\_jms\_text\_message}
- \texttt{aq\_jms\_bytes\_message}
- \texttt{aq\_jms\_map\_message}
- \texttt{aq\_jms\_stream\_message}

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:
Using JMS Types

- Casting between aq$_jms_message and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules

Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java.

Some Java types, such as BYTE and SHORT, are not present in PL/SQL. PL/SQL type INT was chosen to represent these types. If a PL/SQL INT value intended to hold a Java BYTE or SHORT value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both VARCHAR2 and CLOB, but VARCHAR2 has a maximum limit of 4000 bytes. When retrieving TEXT data from map, stream, and bytes message types, a CLOB is always returned. When updating the map, stream and bytes message types, users can submit either a VARCHAR2 or CLOB.

Similarly, a Java BYTE ARRAY can be represented by both RAW and BLOB, with RAW having a maximum size of 32767. When retrieving BYTE ARRAY data from map, stream, and bytes message types, a BLOB is always returned. When updating the map, stream and bytes message types, users can submit either a RAW or BLOB.

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new AQ$_JMS_VALUE ADT has been added in the SYS schema for OJMS PL/SQL users. It is specifically used to implement the read_object procedure of aq$_jms_stream_message and get_object procedure of aq$_jms_map_message, to mimic the Java general object class Object. AQ$_JMS_VALUE ADT can represent any data type that JMS StreamMessage and MapMessage can hold.

The collection ADT AQ$_JMS_NAMEARRAY was added for the getNames method of MapMessage. It holds an array of names.

In this release the ADT AQ$_JMS_EXCEPTION was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now
you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of AQ$_MAP_MESSAGE, AQ$_JMS_STREAM_MESSAGE, and AQ$_JMS_BYTES_MESSAGE types. These types have some common functionalities that are different from AQ$_JMS_TEXT_MESSAGE type. This section discusses these common functionalities.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- AQ$_JMS_BYTES_MESSAGE
- AQ$_JMS_MAP_MESSAGE
- AQ$_JMS_STREAM_MESSAGE
**Initialize the Jserv Static Variable**

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

---

**Note:** It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

---

**Get the Payload Data Back to PL/SQL**

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

**Garbage Collect the Static Variable**

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

**Use a Message Store: A Static Variable Collection**

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$jms_bytes_message`,

---

**Using JMS Types**

---

**JMS Types  173-5**
Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages:

1. Call `prepare` for a message.
   This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.
   For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages
  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages
  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the
middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the prepare procedure initializes the message payload in read-only mode. Calling the clear_body procedure initializes the message payload in write-only mode.

Calling the reset procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The reset procedure keeps the updates made to the message payload in the Jserv static variable.

The prepare procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

Oracle provides member function get_mode for users to query the mode.

**Differences Between Bytes and Stream Messages**

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java ObjectOutputStream and bytes messages are encoded using Java DataOutputStream. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of DataOutputStream.

For stream messages, the read_bytes method works on a stream of bytes to the end of the byte array field written by the corresponding write_bytes method. The read_bytes method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the read_bytes member procedure of aq$_bytes_message also requires a length parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods get_unsigned_byte and get_unsigned_short are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods read_string and write_string methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods read_utf and write_utf which support utf-8 encoding.

---

**Note:** All data written by bytes messages use DataOutputStream as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.
Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```plaintext
set_bytes(payload IN BLOB)
sset_bytes(payload IN RAW)
gget_bytes(payload OUT BLOB)
gget_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field.

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.
## JMS Types Error Reporting

Table 173–1 lists Oracle JMS types related errors.

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms.jms.plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24190</td>
<td>ERROR_DATA_OVERFLOW</td>
<td>The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$.jms_text_message or get_bytes procedure with a RAW parameter of aq$.jms_bytes_message.</td>
</tr>
<tr>
<td>ORA-24191</td>
<td>ERROR_PROP_NAME_EXIST</td>
<td>Setting a property that is previous set</td>
</tr>
<tr>
<td>ORA-24192</td>
<td>ERROR_PROP_NAME_NULL</td>
<td>Occurs when setting a property with null property name.</td>
</tr>
<tr>
<td>ORA-24193</td>
<td>ERROR_EXCEED_RANGE</td>
<td>PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$.jms_head ADT; set_byte and set_short of aq$.jms_map_message ADT; write_byte and write_short of aq$.jms_stream_message and aq$.jms_bytes_message ADT.</td>
</tr>
<tr>
<td>ORA-24194</td>
<td>ERROR_TYPE_MISMATCH</td>
<td>The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.</td>
</tr>
<tr>
<td>ORA-24195</td>
<td>ERROR_MAP_TOO_LARGE</td>
<td>The size of the map exceeds the aq$.jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.</td>
</tr>
<tr>
<td>ORA-24196</td>
<td>ERROR_WRONG_MODE</td>
<td>The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.</td>
</tr>
</tbody>
</table>
Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

**DBMS_AQ Package Constants**

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

**SYS.DBMS_JMS_PLSQL Package Constants**

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

---

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms_jms_plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24197</td>
<td>ERROR_JAVA_EXCEPTION</td>
<td>ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.</td>
</tr>
<tr>
<td>ORA-24198</td>
<td>ERROR_INVALID_ID</td>
<td>An invalid operation ID is being provided to access a message.</td>
</tr>
<tr>
<td>ORA-24199</td>
<td>ERROR_STORE_OVERFLOW</td>
<td>The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.</td>
</tr>
</tbody>
</table>
These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```plsql
MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

```plsql
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```plsql
DATA_TYPE_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER CONSTANT PLS_INTEGER;
DATA_TYPE_LONG CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER CONSTANT PLS_INTEGER;
DATA_TYPE_STRING CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```plsql
ERROR_DATA_OVERFLOW CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;
```
Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in ADD_SUBSCRIBER operations as subscriber rules or in DEQUEUE operations as dequeue conditions. These procedures are in the SYS.dbms_jms_plsql package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is dbms_jms_plsql.DESTPLOAD_JMSTYPE and also assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: dest_pload_type. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if dest_pload_type parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
Returns
The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions
ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified
The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax
Function convert_jms_selector(
   selector         IN  VARCHAR2,
   dest_pload_type  IN  PLS_INTEGER,
   compliant        IN  BOOLEAN )

Returns
The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions
ORA-24197 if the Java stored procedure throws an exception during execution.
Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMESARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type
SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:
- **CONSTRUCT Static Functions**
- **Cast Methods**
- **JMS Header Methods**
- **System Properties Methods**
- **User Properties Methods**
- **Payload Methods**

**Syntax**

```sql
TYPE AQ$_JMS_MESSAGE AS OBJECT(
  header        aq$_jms_header,
  senderid      varchar2(100),
  message_type  INT,
  text_len      INT,
  bytes_len     INT,
  text_vc       varchar2(4000),
  bytes_raw     raw(2000),
  text_lob      clob,
  bytes_lob     blob,
  STATIC FUNCTION  construct (mtype      IN  INT)

MEMBER PROCEDURE get_bytes (payload OUT RAW),
MEMBER PROCEDURE get_bytes (payload OUT BLOB));

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of aq$_jms_message, which can hold a specific type of JMS
type (TextMessage, BytesMessage, MapMessage, StreamMessage or
ObjectMessage). The message type of the created aq$_jms_message instance
depends on the mtype parameter passed to the construct method. Once a message
has been constructed, it can be used to store JMS messages of the type it has been
constructed to hold.

The mtype parameter must be one of the following constants described in "Oracle
JMS Type Constants" on page 173-10:

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_

jms_message
Creates an aq$_jms_message from an aq$_jms_text_message.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN
aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message)
RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN
aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN
SYS.AQ$_JMS_MESSAGE Type

aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.
JMS Header Methods

**set_replyto (replyto IN sys.aq$_agent)**
Sets the `replyto` parameter, which corresponds to `JMSReplyTo`.

**get_replyto RETURN sys.aq$_agent**
Returns `replyto`, which corresponds to `JMSReplyTo`.

**set_type (type IN VARCHAR)**
Sets the JMS type, which can be any text and corresponds to `JMSType`.

**get_type RETURN VARCHAR**
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

**set_userid (userid IN VARCHAR)**
Sets `userid`, which corresponds to `JMSXUserID`.

**set_appid (appid IN VARCHAR)**
Sets `appid`, which corresponds to `JMSXAppID`.

**set_groupid (groupid IN VARCHAR)**
Sets `groupid`, which corresponds to `JMSXGroupID`.

**set_groupseq (groupseq IN INT)**
Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

**get_userid RETURN VARCHAR**
Returns `userid`, which corresponds to `JMSXUserID`.

**get_appid RETURN VARCHAR**
Returns `appid`, which corresponds to `JMSXAppID`.

**get_groupid RETURN VARCHAR**
Returns `groupid`, which corresponds to `JMSXGroupID`.

**get_groupseq RETURN VARCHAR**
Returns `groupseq`, which corresponds to `JMSXGroupSeq`. 
User Properties Methods

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.
Summary of JMS Types

Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION**
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.
**get_long_property** (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

**get_short_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

**get_string_property** (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set_text** (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

**set_text** (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

**set_bytes** (payload IN RAW)
Sets the payload, a RAW value, to an internal representation.

**set_bytes** (payload IN BLOB)
Sets the payload, a BLOB value, to an internal representation.

**get_text** (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

**get_text** (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.

**get_bytes** (payload OUT RAW)
Puts the internal representation of the payload into a RAW variable payload.

**get_bytes** (payload OUT BLOB)
Puts the internal representation of the payload into a BLOB variable payload.
SYS.AQ$ _JMS_TEXT_MESSAGE Type

This type is the ADT used to store a TextMessage in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

TYPE AQ$ _JMS_TEXT_MESSAGE AS OBJECT(
    header    aq$ _jms_header,
    text_len  INT,

MEMBER PROCEDURE get_text            (payload  OUT CLOB)));

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty aq$_jms_text_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.
Summary of JMS Types

System Properties Methods

`set_userid (userid IN VARCHAR)`
Sets userid, which corresponds to JMSXUserID in JMS.

`set_appid (appid IN VARCHAR)`
Sets appid, which corresponds to JMSAppID in JMS.

`set_groupid (groupid IN VARCHAR)`
Sets groupid, which corresponds to JMSXGroupID in JMS.

`set_groupseq (groupseq IN INT)`
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

`get_userid RETURN VARCHAR`  
Returns userid, which corresponds to JMSXUserID.

`get_appid RETURN VARCHAR`  
Returns appid, which corresponds to JMSAppID.

`get_groupid RETURN VARCHAR`  
Returns groupid, which corresponds to JMSXGroupID.

`get_groupseq RETURN INT`  
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

`clear_properties`  
Clears all user properties. This procedure does not affect system properties.

`set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)`  
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

`set_byte_property (property_name IN VARCHAR, property_value IN INT)`  
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception
ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
**get_boolean_property** *(property_name IN VARCHAR) RETURN BOOLEAN*

If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property** *(property_name IN VARCHAR) RETURN INT*

If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property** *(property_name IN VARCHAR) RETURN DOUBLE PRECISION*

If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property** *(property_name IN VARCHAR) RETURN FLOAT*

If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property** *(property_name IN VARCHAR) RETURN INT*

If the property with the corresponding property name passed in exists, and if it is an Integer property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property** *(property_name IN VARCHAR) RETURN NUMBER*

If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

**get_short_property** *(property_name IN VARCHAR) RETURN INT*

If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

**get_string_property** *(property_name IN VARCHAR) RETURN VARCHAR)*

If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.
Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.
SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a BytesMessage in an Oracle Streams AQ queue.

This section contains these topics:

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty aq$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

<tr>
<td>set_byte_property</td>
<td>Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.</td>
</tr>
<tr>
<td>set_double_property</td>
<td>Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.</td>
</tr>
</tbody>
</table>
**Summary of JMS Types**

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE**
**SYS.AQ$_JMS_BYTES_MESSAGE** Type

**PRECISION**
If the property with the corresponding property name passed in exists, and if it is a **DOUBLE** property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a **FLOAT** property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a **Integer** property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property (property_name IN VARCHAR) RETURN NUMBER**
If the property with the corresponding property name passed in exists, and if it is a **long** property, then this function returns the value of the property. Otherwise it returns a null.

**get_short_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a **short** property, then this function returns the value of the property. Otherwise it returns a null.

**get_string_property (property_name IN VARCHAR) RETURN VARCHAR**
If the property with the corresponding property name passed in exists, and if it is a **STRING** property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set_bytes (payload in RAW)**
Sets the payload, a **RAW** value, to an internal representation.

**set_bytes (payload in BLOB)**
Sets the payload, a **BLOB** value, to an internal representation.

**get_bytes (payload out RAW)**
Puts the internal representation of the payload into a **RAW** variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of **RAW** in PL/SQL).
Summary of JMS Types

get_bytes (payload out BLOB)
Put the internal representation of the payload into a BLOB variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the aq$_jms_bytes_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object.

Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.
SYS.AQ$_JMS_BYTES_MESSAGE Type

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN**
Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_bytes (id IN PLS_INTEGER, value OUT NO COPYBLOB, length IN PLS_**
**read_length (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN INT**
Reads an INT from the bytes message and returns the INT read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, **PLS_INTEGER** is used to represent a **BYTE**. Although PL/SQL users get
an **PLS_INTEGER**, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter offset is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter offset is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an INT to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Streams AQ queue.

This section contains these topics:

- **CONSTRUCT Function**
- **JMS Header Methods**
- **System Properties Methods**
- **User Properties Methods**
- **Payload Methods**

**Syntax**

```sql
TYPE aq$_jms_map_message AS object(
  header aq$_jms_header,
  bytes_len int,
  bytes_raw raw(2000),
  bytes_lob blob,
  STATIC FUNCTION construct RETURN aq$_jms_map_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type (type IN VARCHAR),

**MEMBER FUNCTION get_names** (id IN PLS_INTEGER) RETURN aq$_jms_namearray,

**MEMBER FUNCTION get_names** (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER,

**MEMBER PROCEDURE get_object** (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE),

**MEMBER FUNCTION get_size** (id IN PLS_INTEGER) RETURN PLS_INTEGER,

**MEMBER FUNCTION item_exists** (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN);

### CONSTRUCT Function

**STATIC FUNCTION construct** RETURN aq$_jms_map_message

Creates an empty aq$_jms_map_message object.

### JMS Header Methods

**set_replyto (replyto IN sys.aq$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.
SYS.AQ$_JMS_MAP_MESSAGE Type

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN
**BOOLEAN**
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises
exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property** (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property** (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property** (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property** (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a INTEGER property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property** (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a LONG property, then this function returns the value of the property. Otherwise it returns a null.

**get_short_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a SHORT property, then this function returns the value of the property. Otherwise it returns a null.
get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of aq$ _ jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of aq$ _ jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of aq$ _ jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of aq$ _ jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$ _ jms_map_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.
SYS.AQ$ _JMS_MAP MESSAGE Type

**flush (id IN PLS_INTEGER)**
Takes the static variable in Jserv and synchronizes the content back to aq$ _jms_ map_message. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear_body (id IN PLS_INTEGER)**
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the BYTE value with the specified name in the map. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW))**
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset ... offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset ... offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_MAP_MESSAGE Type

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID isinvalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the BYTE value with the specified name. If there is no item by this name, then null is returned. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a byte. Although the PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a set_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL RAW type, a BLOB is always returned here. The BLOB returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the INT value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no short type in PL/SQL, INT is used to represent a short. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a set_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because aq$_jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because aq$_jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a length parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter offset is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT AQ$_JMS_VALUE. If there is no item by this name, then null is returned. Users can use the type attribute of this ADT to interpret the data. See the map in the AQ$_JMS_VALUE ADT for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other get member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific get member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning TRUE. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a StreamMessage in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```sql
TYPE aq$_jms_stream_message AS object(
    header   aq$_jms_header,
    bytes_len int,
    bytes_raw raw(2000),
    bytes_lob blob,
    STATIC FUNCTION construct RETURN aq$_jms_stream_message,
    MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
    MEMBER PROCEDURE set_type     (type    IN VARCHAR),
    MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,
    MEMBER FUNCTION get_type     RETURN VARCHAR,
    MEMBER PROCEDURE set_userid   (userid   IN VARCHAR),
    MEMBER PROCEDURE set_appid    (appid    IN VARCHAR),
    MEMBER PROCEDURE set_groupid  (groupid  IN VARCHAR),
    MEMBER PROCEDURE set_groupseq (groupseq IN INT),
    MEMBER FUNCTION get_userid   RETURN VARCHAR,
    MEMBER FUNCTION get_appid    RETURN VARCHAR,
    MEMBER FUNCTION get_groupid  RETURN VARCHAR,
    MEMBER FUNCTION get_groupseq RETURN INT,
    MEMBER PROCEDURE clear_properties,
    MEMBER PROCEDURE set_boolean_property(property_name IN VARCHAR,
                                            property_value IN BOOLEAN),
    MEMBER PROCEDURE set_byte_property   (property_name IN VARCHAR,
                                            property_value IN INT),
    MEMBER PROCEDURE set_double_property (property_name IN VARCHAR,
                                            property_value IN DOUBLE PRECISION),
    MEMBER PROCEDURE set_float_property  (property_name IN VARCHAR,
                                            property_value IN FLOAT),
```
### Summary of JMS Types

</tbody>
</table>
**SYS.AQ$_JMS_STREAM_MESSAGE Type**

```plsql
MEMBER PROCEDURE write_bytes    (id IN PLS_INTEGER, value IN RAW,
                                offset IN INT, length IN INT),
MEMBER PROCEDURE write_bytes    (id IN PLS_INTEGER, value IN BLOB),
MEMBER PROCEDURE write_bytes    (id IN PLS_INTEGER, value IN BLOB,
                                offset IN INT, length IN INT),
MEMBER PROCEDURE write_char     (id IN PLS_INTEGER, value IN CHAR),
MEMBER PROCEDURE write_double   (id IN PLS_INTEGER, value IN DOUBLE PRECISION),
MEMBER PROCEDURE write_float    (id IN PLS_INTEGER, value IN FLOAT),
MEMBER PROCEDURE write_int      (id IN PLS_INTEGER, value IN PLS_INTEGER),
MEMBER PROCEDURE write_long     (id IN PLS_INTEGER, value IN NUMBER),
MEMBER PROCEDURE write_short    (id IN PLS_INTEGER, value IN PLS_INTEGER),
MEMBER PROCEDURE write_string   (id IN PLS_INTEGER, value IN VARCHAR2),
MEMBER PROCEDURE write_string   (id IN PLS_INTEGER, value IN CLOB));
```

**CONSTRUCT Function**

```
STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty aq$._jms_stream_message object.
```

**JMS Header Methods**

- **set_replyto (replyto IN sys.aq$._agent)**
  Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

- **set_type (type IN VARCHAR)**
  Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

- **get_replyto RETURN sys.aq$._agent**
  Returns replyto, which corresponds to JMSReplyTo.

- **get_type RETURN VARCHAR**
  Returns type, which corresponds to JMSType.

**System Properties Methods**

- **set_userid (userid IN VARCHAR)**
  Sets userid, which corresponds to JMSXUserID in JMS.

- **set_appid (appid IN VARCHAR)**
  Sets appid, which corresponds to JMSXAppID in JMS.
set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
SYS.AQ$_JMS_STREAM_MESSAGE Type

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE
SUMMARY OF JMS TYPES

1. **get_float_property (property_name IN VARCHAR) RETURN FLOAT**
   - If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

2. **get_int_property (property_name IN VARCHAR) RETURN INT**
   - If the property with the corresponding property name passed in exists, and if it is an Integer property, then this function returns the value of the property. Otherwise it returns a null.

3. **get_long_property (property_name IN VARCHAR) RETURN NUMBER**
   - If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

4. **get_short_property (property_name IN VARCHAR) RETURN INT**
   - If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

5. **get_string_property (property_name IN VARCHAR) RETURN VARCHAR**
   - If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

1. **get_bytes (payload OUT RAW)**
   - Puts the internal payload into a RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

2. **get_bytes (payload OUT BLOB)**
   - Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database.
set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_stream_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in MESSAGE_ACCESS_READONLY mode.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to aq$_jms_stream_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.
This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either SYS.dbms_aqjms.READ_ONLY or SYS.dbms_aqjms.WRITE_ONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_STREAM_MESSAGE Type

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_bytes (id IN PLS_INTEGER) RETURN BLOB**
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)**
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns an INT from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, INT is used to represent a byte. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_string RETURN CLOB**
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.
**read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See Table 173–2 on page 173-69 for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Risises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN INT)**
Writes a byte to the stream message. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW)**
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)**
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter offset is the initial offset within the byte array, and
Summary of JMS Types

Parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB)**
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)**
Writes a portion of a byte array as a byte array field to the stream message. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_char (id IN PLS_INTEGER, value IN CHAR)**
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)**
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_float (id IN PLS_INTEGER, value IN FLOAT)**
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an INT to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**SYS.AQ$_JMS_OBJECT_MESSAGE Type**

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

**Syntax**

```sql
TYPE aq$_jms_object_message AS object(
  header aq$_jms_header,
  bytes_len int,
  bytes_raw raw(2000),
  bytes_lob blob);
```
SYS.AQ$_JMS_NAMESARRAY Type

This type represents the name array returned by the get_names procedure of aq$_jms_map_message. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. Table 173–2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```sql
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
    type      number(2),
    num_val   number,
    char_val  char(1),
    text_val  clob,
    bytes_val blob);
```

<td>bytes_val</td>
</tr>
</tbody>
</table>
SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The id field is reserved for future use. The exp_name stores the Java exception name, the err_msg field stores the Java exception error message, and the stack field stores the stack trace of the Java exception.

Syntax

CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT {
    id         number, -- Reserved and not used. Right now always return 0.
    exp_name   varchar(200),
    err_msg    varchar(500),
    stack      varchar(4000));

This chapter describes the logical change record (LCR) types. In Streams, LCRs are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

**See Also:** *Oracle Streams Concepts and Administration* for more information about LCRs

This chapter contains these topics:

- **Summary of Logical Change Record Types**
- **Common Subprograms for LCR$\_DDL\_RECORD and LCR$\_ROW\_RECORD**
These LCR types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM
LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL LCR, then make sure the ddl_text is consistent with the base_table_name, base_table_owner, object_type, object_owner, object_name, and command_type attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_DDL_RECORD Constructor
- Summary of LCR$_DDL_RECORD Subprograms, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 174-33

**Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.

- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
LCR$_DDL_RECORD Type

LCR$_DDL_RECORD Constructor

Creates a SYS.LCR$_DDL_RECORD object with the specified information.

STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type  IN  VARCHAR2,
    object_owner   IN  VARCHAR2,
    object_name    IN  VARCHAR2,

<tr>
<td>base_table_owner</td>
<td>If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.</td>
</tr>
</tbody>
</table>
Table 174–2 (Cont.) Constructor Function Parameters for LCR$_DDL$ RECORD

| Parameter         | Description                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------|}
| base_table_name   | If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL. |
| tag               | A binary tag that enables tracking of the LCR. For example, this tag may be used to determine the original source database of the DDL statement if apply forwarding is used.                                               |
| See Also:        | Oracle Streams Replication Administrator’s Guide for more information about tags                                                               |
| transaction_id    | The identifier of the transaction                                                                                                            |
| scn               | The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.                                                                                                      |

Table 174–3 LCR$_DDL$ RECORD Type Subprograms

| Subprogram               | Description                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------|}
| "EXECUTE Member Procedure" on page 174-8 | Executes the LCR under the security domain of the current user                                                                 |
| "GET_BASE_TABLE_NAME Member Function" on page 174-8 | Returns the base (dependent) table name                                                                       |
| "GET_BASE_TABLE_OWNER Member Function" on page 174-9 | Returns the base (dependent) table owner                                                                 |
| "GET_CURRENT_SCHEMA Member Function" on page 174-9 | Returns the default schema (user) name                                                                 |
| "GET_DDL_TEXT Member Procedure" on page 174-9 | Gets the DDL text in a CLOB                                                                 |
| "GET_LOGON_USER Member Function" on page 174-10 | Returns the logon user name                                                                               |
| "GET_OBJECTTYPE Member Function" on page 174-10 | Returns the type of the object involved for the DDL                                                         |
| "SET_BASE_TABLE_NAME Member Procedure" on page 174-10 | Sets the base (dependent) table name                                                                        |
LCR$_DDL_RECORD Type

**EXECUTE Member Procedure**

Executes the DDL LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

**Syntax**

```plsql
MEMBER PROCEDURE EXECUTE();
```

**GET_BASE_TABLE_NAME Member Function**

Returns the base (dependent) table name.

**Syntax**

```plsql
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```
GET_BASE_TABLE_OWNER Member Function

Returns the base (dependent) table owner.

Syntax
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;

GET_CURRENT_SCHEMA Member Function

Returns the current schema name.

Syntax
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

The following is an example of a PL/SQL procedure that uses this procedure to get the DDL text in a DDL LCR:

```sql
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text   CLOB;
BEGIN
  DBMS_OUTPUT.PUT_LINE( '  -----------------------------------------' );
  DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( '  -----------------------------------------' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/```

**Note:** GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.
Syntax
MEMBER FUNCTION GET_DDL_TEXT
   ddl_text  IN/OUT  CLOB);

Parameter

| Table 174–4  GET_DDL_TEXT Procedure Parameter |
|-----------------|-----------------------------|
| Parameter       | Description                |
| ddl_text        | The DDL text in the DDL LCR |

GET_LOGON_USER Member Function
Returns the logon user name.

Syntax
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;

GET_OBJECT_TYPE Member Function
Returns the type of the object involved for the DDL.

Syntax
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;

SET_BASE_TABLE_NAME Member Procedure
Sets the base (dependent) table name.

Syntax
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name  IN  VARCHAR2);

Parameter

| Table 174–5  SET_BASE_TABLE_NAME Procedure Parameter |
|-----------------|-----------------------------|
| Parameter       | Description                |
| base_table_name | The name of the base table  |
**SET_BASE_TABLE_OWNER Member Procedure**

Sets the base (dependent) table owner.

**Syntax**

MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner  IN  VARCHAR2);

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_table_owner</td>
<td>The name of the base owner</td>
</tr>
</tbody>
</table>

**SET_CURRENT_SCHEMA Member Procedure**

Sets the default schema (user) name.

**Syntax**

MEMBER PROCEDURE SET_CURRENT_SCHEMA(
    current_schema  IN  VARCHAR2);

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_schema</td>
<td>The name of the schema to set as the current schema. This parameter should be set to a non-NULL value.</td>
</tr>
</tbody>
</table>
**SET_DDL_TEXT Member Procedure**

Sets the DDL text.

**Syntax**

MEMBER PROCEDURE SET_DDL_TEXT(
   ddl_text  IN  CLOB);

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_text</td>
<td>The DDL text. This parameter should be set to a non-NULL value.</td>
</tr>
</tbody>
</table>

**SET_LOGON_USER Member Procedure**

Sets the logon user name.

**Syntax**

MEMBER PROCEDURE SET_LOGON_USER(
   logon_user  IN  VARCHAR2);

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logon_user</td>
<td>The name of the schema to set as the logon user.</td>
</tr>
</tbody>
</table>
**SET_OBJECT_TYPE Member Procedure**

Sets the object type.

**Syntax**

```sql
MEMBER PROCEDURE SET_OBJECT_TYPE(
    object_type  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The object type.</td>
</tr>
</tbody>
</table>

The following are valid object types:

- CLUSTER
- FUNCTION
- INDEX
- LINK
- OUTLINE
- PACKAGE
- PACKAGE BODY
- PROCEDURE
- SEQUENCE
- SYNONYM
- TABLE
- TRIGGER
- TYPE
- USER
- VIEW

LINK represents a database link.

NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.
LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR$_ROW_LIST type.

If you create or modify a row LCR, then make sure the command_type attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_ROW_RECORD Constructor
- Summary of LCR$_ROW_RECORD Subprograms, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

**Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.

- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

**See Also:**  "LCR$_ROW_LIST Type" on page 174-44
LCR$_ROW_RECORD Constructor

Creates a SYS.LCR$_ROW_RECORD object with the specified information.

```sql
STATIC FUNCTION CONSTRUCT(
    source_database_name   IN  VARCHAR2,
    command_type           IN  VARCHAR2,
    object_owner           IN  VARCHAR2,
    object_name            IN  VARCHAR2,
    tag                    IN  RAW                DEFAULT NULL,
    transaction_id         IN  VARCHAR2           DEFAULT NULL,
    scn                    IN  NUMBER             DEFAULT NULL,
    old_values             IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    new_values             IN  SYS.LCR$_ROW_LIST  DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```
LCR$_ROW_RECORD Constructor Function Parameters

Table 174–11  Constructor Function Parameters for LCR$_ROW_RECORD

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The database where the row change occurred. If you do not include the domain name, then the local domain is appended to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then DBS1.NET is specified automatically. This parameter should be set to a non-NULL value.</td>
</tr>
<tr>
<td>command_type</td>
<td>The type of command executed in the DML statement. This parameter should be set to a non-NULL value. Valid values are the following: INSERT, UPDATE, DELETE, LOB ERASE, LOB WRITE, LOB TRIM</td>
</tr>
<tr>
<td></td>
<td>If INSERT, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection.</td>
</tr>
<tr>
<td></td>
<td>If UPDATE, then an LCR should have a new_values collection that is not empty and an old_values collection that is not empty.</td>
</tr>
<tr>
<td></td>
<td>If DELETE, then an LCR should have a NULL or empty new_values collection and an old_values collection that is not empty.</td>
</tr>
<tr>
<td></td>
<td>If LOB ERASE, LOB WRITE, or LOB TRIM, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection.</td>
</tr>
<tr>
<td>object_owner</td>
<td>The user who owns the table on which the row change occurred. This parameter should be set to a non-NULL value.</td>
</tr>
<tr>
<td>object_name</td>
<td>The table on which the DML statement was executed. This parameter should be set to a non-NULL value.</td>
</tr>
<tr>
<td>tag</td>
<td>A binary tag that enables tracking of the LCR. For example, this tag may be used to determine the original source database of the DML change when apply forwarding is used.</td>
</tr>
</tbody>
</table>

### Logical Change Record TYPES

#### Table 174–11 (Cont.) Constructor Function Parameters for LCR$\_ROW\_RECORD

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transaction_id</td>
<td>The identifier of the transaction</td>
</tr>
<tr>
<td>scn</td>
<td>The SCN at the time when the change record was written to the redo log. The SCN value is meaningless for a user-created LCR.</td>
</tr>
<tr>
<td>old_values</td>
<td>The column values for the row before the DML change. If the DML statement is an UPDATE or a DELETE statement, then the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.</td>
</tr>
<tr>
<td>new_values</td>
<td>The column values for the row after the DML change. If the DML statement is an UPDATE or an INSERT statement, then the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then the supplementally logged columns and any relevant LOB information.</td>
</tr>
</tbody>
</table>

<td>Replaces the existing old or new values for the LCR, depending on the value type specified</td>
</tr>
</tbody>
</table>

**Common Subprograms**

See "Common Subprograms for LCR\$_DDL\_RECORD and LCR\$_ROW\_RECORD" on page 174-33 for a list of subprograms common to the SYS.LCR\$_ROW\_RECORD and SYS.LCR\$_DDL\_RECORD types.
ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column. To set a column value that already exists, run SET_VALUE.

---

**Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on a LOB column.

---

**See Also:** "SET_VALUE Member Procedure" on page 174-31

**Syntax**

```sql
MEMBER PROCEDURE ADD_COLUMN(
  value_type    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  column_value  IN  SYS.AnyData);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to add for the column. Specify old to add the old value of the column. Specify new to add the new value of the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name. This name is not validated. An error may be raised during application of the LCRs if an invalid name is specified.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the column. If NULL, then an error is raised. A NULL column value can be specified by encapsulating the NULL value in a SYS.AnyData wrapper.</td>
</tr>
</tbody>
</table>
CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure may change the operation code from LONG_WRITE to LOB_WRITE for the row LCR.

This procedure may be used in rule-based transformations and apply handlers.

The following restrictions apply to this member procedure:

- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data may be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by capture process. That is, this procedure does not support user-enqueued row LCRs.

Syntax

MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK();

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

MEMBER PROCEDURE DELETE_COLUMN(
    column_name  IN  VARCHAR2,
    value_type   IN  VARCHAR2  DEFAULT '*');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The column name. An error is raised if the column does not exist in the LCR.</td>
</tr>
</tbody>
</table>
EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

**Note:** The EXECUTE member procedure can be invoked only in an apply handler for an apply process.

### Syntax

```sql
MEMBER PROCEDURE EXECUTE(
    conflict_resolution IN BOOLEAN);
```

### Parameters

**Table 174–15  EXECUTE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to delete for the column. Specify <strong>old</strong> to delete the old value of the column. Specify <strong>new</strong> to delete the new value of the column. If * is specified, then both the old and new values are deleted.</td>
</tr>
<tr>
<td>conflict_resolution</td>
<td>If <strong>true</strong>, then any conflict resolution defined for the table using the <strong>SET_UPDATE_CONFLICT_HANDLER</strong> procedure in the <strong>DBMS_APPLY_ADM</strong> package is used to resolve conflicts resulting from the execution of the LCR. If <strong>false</strong>, then conflict resolution is not used.</td>
</tr>
</tbody>
</table>
GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

- `DBMS_LCR.NOT_A_LOB`: CONSTANT NUMBER := 1;
- `DBMS_LCR.NULL_LOB`: CONSTANT NUMBER := 2;
- `DBMS_LCR.INLINE_LOB`: CONSTANT NUMBER := 3;
- `DBMS_LCR.EMPTY_LOB`: CONSTANT NUMBER := 4;
- `DBMS_LCR.LOB_CHUNK`: CONSTANT NUMBER := 5;
- `DBMS_LCR.LAST_LOB_CHUNK`: CONSTANT NUMBER := 6;

Returns NULL if the specified column does not exist.

If the command type of the row LCR is 'UPDATE', then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of the columns.

**Syntax**

```sql
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value_type</code></td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td><code>column_name</code></td>
<td>The name of the column</td>
</tr>
<tr>
<td><code>use_old</code></td>
<td>If Y and <code>value_type</code> is new, and no new value exists, then returns the corresponding old value. If N and <code>value_type</code> is new, then does not return the old value if no new value exists. If <code>value_type</code> is old or if the command_type of the row LCR is not UPDATE, then the value of the <code>use_old</code> parameter is ignored. NULL is not a valid specification for the <code>use_old</code> parameter.</td>
</tr>
</tbody>
</table>
**GET_LOB_OFFSET Member Function**

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

**Syntax**

```sql
GET_LOB_OFFSET(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column. Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

**GET_LOB_OPERATION_SIZE Member Function**

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.
Syntax
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER,

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column. Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>
**GET_LONG_INFORMATION Member Function**

Gets the LONG information for the column.

The return value can be one of the following:

- DBMS_LCR.NOT_A_LONG CONSTANT NUMBER := 1;
- DBMS_LCR.NULL_LONG CONSTANT NUMBER := 2;
- DBMS_LCR.INLINE_LONG CONSTANT NUMBER := 3;
- DBMS_LCR.LONG_CHUNK CONSTANT NUMBER := 4;
- DBMS_LCR.LAST_LONG_CHUNK CONSTANT NUMBER := 5;

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

**Syntax**

```sql
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then returns the corresponding old value. If N and value_type is new, then does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the value of the use_old parameter is ignored. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

**GET_VALUE Member Function**

Returns the old or new value for the specified column, depending on the value type specified.
If the command type of the row LCR is `UPDATE`, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of a column.

**Syntax**

```sql
MEMBER FUNCTION GET_VALUE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.AnyData;
```

### Parameters

**Table 174–20  GET_VALUE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value_type</code></td>
<td>The type of value to return for the column. Specify <code>old</code> to get the old value for the column. Specify <code>new</code> to get the new value for the column.</td>
</tr>
<tr>
<td><code>column_name</code></td>
<td>The column name. If the column is present and has a NULL value, returns a SYS.AnyData instance containing a NULL value. If the column value is absent, then returns a NULL.</td>
</tr>
<tr>
<td><code>use_old</code></td>
<td>If <code>Y</code> and <code>value_type</code> is <code>new</code>, and no new value exists, then returns the corresponding old value. If <code>N</code> and <code>value_type</code> is <code>new</code>, then returns NULL if no new value exists. If <code>value_type</code> is <code>old</code> or if the command_type of the row LCR is not <code>UPDATE</code>, then the value of the <code>use_old</code> parameter is ignored. NULL is not a valid specification for the <code>use_old</code> parameter.</td>
</tr>
</tbody>
</table>

**GET_VALUES Member Function**

Returns a list of old or new values, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying 'Y' for the `use_old` parameter is a convenient way to get the values of all columns.

**Syntax**

```sql
MEMBER FUNCTION GET_VALUES(
    value_type   IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_.ROW_LIST;
```
### Parameter

**Table 174–21  GET_VALUES Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of values to return. Specify old to return a list of old values. Specify new to return a list of new values.</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, then returns a list of all new values in the LCR. If a new value does not exist in the list, then returns the corresponding old value. Therefore, the returned list contains all existing new values and old values for the new values that do not exist. If N and value_type is new, then returns a list of all new values in the LCR without returning any old values. If value_type is old or if the command_type of the row LCR is not UPDATE, then the value of the use_old parameter is ignored. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>
**LCRS_ROW_RECORD Type**

**RENAME_COLUMN Member Procedure**

Renames a column in an LCR.

Syntax

```plsql
MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name  IN  VARCHAR2,
    to_column_name    IN  VARCHAR2,
    value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_column_name</td>
<td>The existing column name</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new column name. An error is raised if a column with the specified name already exists.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to rename the column.</td>
</tr>
<tr>
<td></td>
<td>Specify <strong>old</strong> to rename the old value of the column. An error is raised if the old value does not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify <strong>new</strong> to rename the new value of the column. An error is raised if the new value does not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>If ***** is specified, then the column names for both old and new value are renamed. An error is raised if either column value does not exist in the LCR.</td>
</tr>
</tbody>
</table>

**SET_LOB_INFORMATION Member Procedure**

Sets LOB information for the column.

**Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```plsql
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    lob_information  IN  NUMBER);
```
Parameters

Table 174–23  SET_LOB_INFORMATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column, either old or new. Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column. An exception is raised if the column value does not exist. You may need to set this parameter for non-LOB columns.</td>
</tr>
<tr>
<td>lob_information</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB         CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB          CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB        CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB         CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK         CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK    CONSTANT NUMBER := 6;</td>
</tr>
</tbody>
</table>

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax
MEMBER PROCEDURE SET_LOB_OFFSET(
  value_type IN VARCHAR2,
  column_name IN VARCHAR2,
  lob_offset IN NUMBER);

Parameters

Table 174–24  SET_LOB_OFFSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column. Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name. An error is raised if the column value does not exist in the LCR.</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset number. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type IN VARCHAR2,
  column_name IN VARCHAR2,
  lob_operation_size IN NUMBER);
```
Parameters

Table 174–25  SET_LOB_OPERATION_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column. Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column. An exception is raised if the column value does not exist in the LCR.</td>
</tr>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then can be set to either a valid LOB_ERASE value or a valid LOB_TRIM value. A LOB_ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB_TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.</td>
</tr>
</tbody>
</table>

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason you may want to overwrite an old value for a column is to resolve an error that resulted from a conflict.

---

**Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on a LONG, LONG RAW, or LOB column.

---

Syntax

```sql
MEMBER PROCEDURE SET_VALUE(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  SYS.AnyData);
```
LCR$_ROW_RECORD Type

Parameters

Table 174–26  SET_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set. Specify old to set the old value of the column. Specify new to set the new value of the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name. An error is raised if the specified column_value does not exist in the LCR for the specified column_type.</td>
</tr>
<tr>
<td>column_value</td>
<td>The new value of the column. If NULL is specified, then an error is raised. To set the value to NULL, encapsulate the NULL in a SYS.AnyData instance.</td>
</tr>
</tbody>
</table>

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

**Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on a LONG, LONG RAW, or LOB column.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
    value_type IN VARCHAR2,
    value_list IN SYS.LCR$_ROW_LIST);
```

Parameters

Table 174–27  SET_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of values to replace. Specify old to replace the old values. Specify new to replace the new values.</td>
</tr>
<tr>
<td>value_list</td>
<td>List of values to replace the existing list. Use a NULL or an empty list to remove all values.</td>
</tr>
</tbody>
</table>
Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

The following functions and procedures are common to both the LCR$_DDL_RECORD and LCR$_ROW_RECORD type.

See Also: For descriptions of the subprograms for these types that are exclusive to each type:

- "Summary of LCR$_DDL_RECORD Subprograms" on page 174-7
- "Summary of LCR$_ROW_RECORD Subprograms" on page 174-17

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GET_COMMAND_TYPE Member Function&quot; on page 174-34</td>
<td>Returns the command type of the LCR</td>
</tr>
<tr>
<td>&quot;GET_COMMIT_SCN Member Function&quot; on page 174-35</td>
<td>Returns the commit system change number (SCN) of the transaction to which the current LCR belongs</td>
</tr>
<tr>
<td>&quot;GET_COMPATIBLE Member Function&quot; on page 174-35</td>
<td>Returns the minimal database compatibility required to support the LCR</td>
</tr>
<tr>
<td>&quot;GET_EXTRA_ATTRIBUTE Member Function&quot; on page 174-36</td>
<td>Returns the value for the specified extra attribute in the LCR</td>
</tr>
<tr>

<td>Returns the name of the object that is changed by the LCR</td>
</tr>
<tr>
<td>&quot;GET_OBJECT_OWNER Member Function&quot; on page 174-38</td>
<td>Returns the owner of the object that is changed by the LCR</td>
</tr>
<tr>
<td>&quot;GET_SCN Member Function&quot; on page 174-38</td>
<td>Returns the system change number (SCN) of the LCR</td>
</tr>
<tr>
<td>&quot;GET_SOURCE_DATABASE_NAME Member Function&quot; on page 174-38</td>
<td>Returns the source database name.</td>
</tr>
<tr>
<td>&quot;GET_TAG Member Function&quot; on page 174-38</td>
<td>Returns the tag for the LCR</td>
</tr>
<tr>
<td>&quot;GET_TRANSACTION_ID Member Function&quot; on page 174-39</td>
<td>Returns the transaction identifier of the LCR</td>
</tr>
</tbody>
</table>
**GET_COMMAND_TYPE Member Function**

Returns the command type of the LCR.

*See Also:* The "SQL Command Codes" table in the *Oracle Call Interface Programmer’s Guide* for a complete list of command types

**Syntax**

```sql
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```
GET_COMMIT_SCN Member Function

Returns the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a DML handler, DDL handler, or error handler. Such a handler may use the SCN obtained by this procedure to flashback to the transaction commit time for an LCR. In this case, the flashback must be performed at the source database for the LCR.

The commit SCN may not be available for an LCR that is part of an incomplete transaction. For example, user-enqueued LCRs may not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

Syntax

MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;

GET_COMPATIBLE Member Function

Returns the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>COMPATIBLE Initialization Parameter Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_9_2</td>
<td>9.2.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_10_1</td>
<td>10.0.0</td>
</tr>
</tbody>
</table>

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You may use the following functions for constant compatibility return values:

- The DBMS_STREAMS.COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The DBMS_STREAMS.COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

**Note:** You can determine which database objects in a database are not supported by Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

**See Also:**
- Oracle Streams Concepts and Administration for examples of rules that discard changes that are not supported by Streams
- Chapter 95, "DBMS_STREAMS" and Chapter 96, "DBMS_STREAMS_ADM"
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

**Syntax**
```sql
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

**GET_EXTRA_ATTRIBUTE Member Function**

Returns the value for the specified extra attribute in the LCR. The returned extra attribute is contained within a SYS.AnyData instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

**See Also:** "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 19-25

**Syntax**
```sql
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name  IN  VARCHAR2)
RETURN SYS.AnyData;
```
Parameters

Table 174–29  GET_EXTRA_ATTRIBUTE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the extra attribute to return. Valid names are:</td>
</tr>
<tr>
<td></td>
<td>■ row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</td>
</tr>
<tr>
<td></td>
<td>■ serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in a Real Application Clusters environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ username</td>
</tr>
<tr>
<td></td>
<td>The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</td>
</tr>
</tbody>
</table>

An error is raised if the specified attribute_name is not valid.

If no value exists for the specified extra attribute, then returns a NULL.
GET_OBJECT_NAME Member Function

Returns the name of the object that is changed by the LCR.

Syntax
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;

GET_OBJECT_OWNER Member Function

Returns the owner of the object that is changed by the LCR.

Syntax
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;

GET_SCN Member Function

Returns the system change number (SCN) of the LCR.

Syntax
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;

GET_SOURCE_DATABASE_NAME Member Function

Returns the global name of the source database name. The source database is the
database where the change occurred.

Syntax
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;

GET_TAG Member Function

Returns the tag for the LCR. An LCR tag is a binary tag that enables tracking of the
LCR. For example, this tag may be used to determine the original source database
of the DML or DDL change when apply forwarding is used.

See Also: Oracle Streams Replication Administrator’s Guide for more
information about tags

Syntax
MEMBER FUNCTION GET_TAG()
RETURN RAW;
GET_TRANSACTION_ID Member Function
Returns the transaction identifier of the LCR.

Syntax
MEMBER FUNCTION GET_TRANSACTION_ID() 
RETURN VARCHAR2;

IS_NULL_TAG Member Function
Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax
MEMBER FUNCTION IS_NULL_TAG() 
RETURN VARCHAR2;
**SET_COMMAND_TYPE Member Procedure**

Sets the command type in the LCR. If the command type specified cannot be interpreted, then an error is raised. For example, changing `INSERT` to `GRANT` would raise an error.

**See Also:**
- The description of the `command_type` parameter in "LCR$_DDL_RECORD Constructor Function Parameters" on page 174-5
- The description of the `command_type` parameter in "LCR$_ROW_RECORD Constructor Function Parameters" on page 174-16
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer’s Guide* for a complete list of command types

**Syntax**

```sql
MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Table 174–30 SET_COMMAND_TYPE Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>command_type</td>
</tr>
</tbody>
</table>

**SET_EXTRA_ATTRIBUTE Member Procedure**

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

**See Also:** "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 19-25

**Syntax**

```sql
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN SYS.AnyData);
```
Parameters

Table 174–31  SET_EXTRA_ATTRIBUTE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>

<td>NULL, then the specified extra attribute is removed from the</td>
</tr>
<tr>
<td></td>
<td>LCR. To set to NULL, encapsulate the NULL in a SYS.AnyData</td>
</tr>
<tr>
<td></td>
<td>instance.</td>
</tr>
</tbody>
</table>

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_OBJECT_NAME(/
Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

```
object_name  IN  VARCHAR2);
```

Parameter

### Table 174–32  SET_OBJECT_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
</tbody>
</table>

### SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

#### Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner  IN  VARCHAR2);
```

Parameter

### Table 174–33  SET_OBJECT_OWNER Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema that contains the object</td>
</tr>
</tbody>
</table>

### SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

#### Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name  IN  VARCHAR2);
```

Parameter

### Table 174–34  SET_SOURCE_DATABASE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The source database of the change. If you do not include the domain name, then the local domain is appended to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then DBS1.NET is specified automatically. This parameter should be set to a non-NULL value.</td>
</tr>
</tbody>
</table>
**SET_TAG Member Procedure**

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag may be used to determine the original source database of the change when apply forwarding is used.

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags

**Syntax**

```sql
MEMBER PROCEDURE SET_TAG(
    tag IN RAW);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for the LCR. The size limit for a tag value is two kilobytes.</td>
</tr>
</tbody>
</table>
LCR$_ROW_LIST Type

Identifies a list of column values for a row in a table.

This type uses the LCR$_ROW_UNIT type and is used in the LCR$_ROW_RECORD type.

See Also:
- "LCR$_ROW_UNIT Type" on page 174-45
- "LCR$_ROW_RECORD Type" on page 174-14

Syntax

```sql
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/```
LCR$_ROW_UNIT Type

Identifies the value for a column in a row.
This type is used in the LCR$_ROW_LIST type.

See Also: "LCR$_ROW_LIST Type" on page 174-44

Syntax

CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name VARCHAR2(4000),
  data SYS.AnyData,
  lob_information NUMBER,
  lob_offset NUMBER,
  lob_operation_size NUMBER,
  long_information NUMBER);  
/

Attributes

Table 174–36  LCR$_ROW_UNIT Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>data</td>
<td>The data contained in the column</td>
</tr>
<tr>
<td>lob_information</td>
<td>Contains the LOB information for the column and contains one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
</tbody>
</table>
### lob_operation_size

If `lob_information` for the LOB is `DBMS_LCR.LAST_LOB_CHUNK`, then can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to `DBMS_LOB.LOBMAXSIZE`. A LOB TRIM value must be a nonnegative integer less than or equal to `DBMS_LOB.LOBMAXSIZE`.

If `lob_information` is not `DBMS_LCR.LAST_LOB_CHUNK` and for all other operations, is NULL.

### long_information

Contains the LONG information for the column and contains one of the following values:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_LCR.not_a_long</td>
<td>CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td>DBMS_LCR.null_long</td>
<td>CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td>DBMS_LCR.inline_long</td>
<td>CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td>DBMS_LCR.long_chunk</td>
<td>CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td>DBMS_LCR.last_long_chunk</td>
<td>CONSTANT NUMBER := 5;</td>
</tr>
</tbody>
</table>
The interMedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle interMedia ORDAudio can store and retrieve audio data of any data format. Oracle interMedia ORDAudio can automatically extract metadata from audio data of a variety of popular audio formats. Oracle interMedia ORDAudio can also extract application attributes and store them in the comments attribute of the object in XML form.

- Documentation of ORDAudio
For a complete description of this package within the context of Oracle interMedia, see ORDAudio in the Oracle interMedia Reference.
The interMedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle interMedia can store and retrieve media data of any data format. The interMedia ORDDoc data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. Note that you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc
For a complete description of this package within the context of Oracle interMedia, see ORDDoc in the Oracle interMedia Reference.
The interMedia ORDImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle interMedia ORDImage can store and retrieve image data of any data format. Oracle interMedia ORDImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, and automatically extract properties of images of a variety of popular data formats.

- Documentation of ORDImage
Documentation of ORDImage

For a complete description of this package within the context of Oracle interMedia, see ORDImage in the Oracle interMedia Reference.
interMedia ORDImageSignature TYPE

The interMedia ORDImageSignature object type supports content-based retrieval of images (image matching).

The interMedia ORDImageSignature object type supports the extraction of color, texture, and shape information from an image. This extracted information, referred to as the image signature, is stored in an ORDImageSignature object. You can then use object methods to find matching images based on their extracted signatures.

- Documentation of ORDImageSignature
Documentation of ORDImageSignature

For a complete description of this package within the context of Oracle interMedia, see ORDImageSignature in the Oracle interMedia Reference.
Oracle interMedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support: SI_StillImage, SI_AverageColor, SI_Color, SI_ColorHistogram, SIFeatureList, SIPositionalColor, and SI_Texture.

- Documentation of SQL/MM Still Image
Documentation of SQL/MM Still Image

For a complete description of this package within the context of Oracle interMedia, see SQL/MM Still Image in the Oracle interMedia Reference.
The interMedia ORDVideo object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so forth, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle interMedia ORDVideo can store and retrieve video data of any data format. Oracle interMedia ORDVideo can automatically extract metadata from video data of a variety of popular video formats. Oracle interMedia ORDVideo can also extract application attributes and store them in the comments attribute of the object in XML form identical to what is provided by the interMedia Annotator utility.

- Documentation of ORDVideo
Documentation of ORDVideo

For a complete description of this package within the context of Oracle interMedia, see ORDVideo in the Oracle interMedia Reference.
This chapter describes the types used with rules, rule sets, and evaluation contexts.

</tr>
<tr>
<td>&quot;RE$VARIABLE_TYPE Type&quot; on page 181-13</td>
<td>Provides the type of a variable used in a rule evaluation context</td>
</tr>
</tbody>
</table>
Rule types are used with the following Oracle-supplied PL/SQL packages:

- **DBMS_RULE**
- **DBMS_RULE_ADM**

You can use the **DBMS_RULE_ADM** package to create and administer rules, rule sets, and evaluation contexts, and you can use the **DBMS_RULE** package to evaluate rules.

When you use Streams, rules determine which changes are captured by a capture process, which events are propagated by a propagation, which events are applied by an apply process, and which events are dequeued by a messaging client. The following Streams packages use rules:

- **DBMS_APPLY_ADM**
- **DBMS_CAPTURE_ADM**
- **DBMS_PROPAGATION_ADM**
- **DBMS_STREAMS**
- **DBMS_STREAMS_ADM**
- **DBMS_STREAMS_AUTH**

**See Also:** *Oracle Streams Concepts and Administration*
RE$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

**Note:** The variable name and attribute name may be enclosed in double quotation marks (") if the name contains special characters.

**Syntax**

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
    variable_name VARCHAR2(32),
    attribute_name VARCHAR2(4000),
    attribute_value SYS.AnyData);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable used in a rule</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute name. The attribute name may be a multi-component name, such as a1.b2.c3.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the attribute value</td>
</tr>
</tbody>
</table>

RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

**Syntax**

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```
RE$COLUMN_VALUE Type

Specifies the value of a table column.

**Note:** The column name may be enclosed in double quotation marks (" ") if the name contains special characters.

**Syntax**

```sql
TYPE SYS.RE$COLUMN_VALUE (  
    table_alias VARCHAR2(32),
    column_name VARCHAR2(4000),
    column_value SYS.AnyData);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the column name</td>
</tr>
<tr>
<td>column_value</td>
<td>Specifies the column value</td>
</tr>
</tbody>
</table>
RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```sql
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

RE$NAME_ARRAY Type

Identifies a list of names.

Syntax

```sql
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```sql
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```sql
TYPE SYS.RE$NV_LIST AS OBJECT(
    actx_list SYS.RE$NV_ARRAY);
```
Attributes

Table 181–4  RES$NV_LIST Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actx_list</td>
<td>The list of name-value pairs</td>
</tr>
</tbody>
</table>

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- **ADD_PAIR Member Procedure**
- **GET_ALL_NAMES Member Function**
- **GET_VALUE Member Function**
- **REMOVE_PAIR Member Procedure**

**ADD_PAIR Member Procedure**

Adds a name-value pair to the list of name-value pairs.

**Note:** The name may be enclosed in double quotation marks (" ") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
    name   IN  VARCHAR2,
    value  IN  SYS.AnyData);
```

Parameters

Table 181–5  ADD_PAIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name in the name-value pair being added to the list. If the name already exists in the list, then an error is raised.</td>
</tr>
<tr>
<td>value</td>
<td>The value in the name-value pair being added to the list</td>
</tr>
</tbody>
</table>
RE$NV_LIST Type

GET_ALL_NAMES Member Function
Returns a list of all the names in the name-value pair list.

Syntax
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;

GET_VALUE Member Function
Returns the value for the specified name in a name-value pair list.

Note: The name may be enclosed in double quotation marks ("" if
the name contains special characters.

Syntax
MEMBER FUNCTION GET_VALUE(
    name  IN  VARCHAR2)
RETURN SYS.AnyData;

Parameters

Table 181–6  GET_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name whose value to return</td>
</tr>
</tbody>
</table>

REMOVE_PAIR Member Procedure
Removes the name-value pair with the specified name from the name-value pair list.

Note: The name may be enclosed in double quotation marks ("" if
the name contains special characters.

Syntax
MEMBER PROCEDURE REMOVE_PAIR(
    name  IN  VARCHAR2);
Parameters

Table 181–7  REMOVE_PAIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the pair to remove</td>
</tr>
</tbody>
</table>

RE$NV_NODE Type

Identifies a name-value pair.

Note: The name may be enclosed in double quotation marks (" ) if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (
    nvn_name VARCHAR2(30),
    nvn_value SYS.AnyData);
```

Attributes

Table 181–8  RE$NV_NODE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvn_name</td>
<td>Specifies the name in the name-value pair</td>
</tr>
<tr>
<td>nvn_value</td>
<td>Specifies the value in the name-value pair</td>
</tr>
</tbody>
</table>
RE$RULE_HIT Type

Specifies a rule found as a result of an evaluation.

See Also:
- "CREATE_RULE Procedure" on page 82-11
- "ALTER_RULE Procedure" on page 82-6

Syntax

```
TYPE SYS.RE$RULE_HIT (
  rule_name VARCHAR2(65),
  rule_action_context RE$NV_LIST);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The rule name in the form schema_name.rule_name. For example, a rule named employee_rule in the hr schema is returned in the form &quot;hr&quot;.&quot;employee_rule&quot;.</td>
</tr>
<tr>
<td>rule_action_context</td>
<td>The rule action context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package</td>
</tr>
</tbody>
</table>

RE$RULE_HIT_LIST Type

Identifies a list of rules found as a result of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```
RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

Note:  The table name may be enclosed in double quotation marks (") if the name contains special characters.

See Also:  Oracle Database SQL Reference for information about schema object naming rules

Syntax

```sql
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
    table_alias  VARCHAR2(32),
    table_name   VARCHAR2(194));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>The alias used for the table in a rule</td>
</tr>
</tbody>
</table>
| table_name  | The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following:  
  - `schema_name.table_name`
  - `table_name`

For example, if the `schema_name` is `hr` and the `table_name` is `employees`, then enter the following:

```sql
hr.employees
```
RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```sql
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

RE$TABLE_VALUE Type

Specifies the value of a table row using a ROWID.

Syntax

```sql
TYPE SYS.RE$TABLE_VALUE(
    table_alias  VARCHAR2(32),
    table_rowid  VARCHAR2(18));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>table_rowid</td>
<td>Specifies the rowid for the table row</td>
</tr>
</tbody>
</table>

Note: Each table alias in the list in the list must be unique.

Syntax

```sql
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```
RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

**Note:** The variable name may be enclosed in double quotation marks (""") if the name contains special characters.

**See Also:** Oracle Database SQL Reference for information about schema object naming rules

**Syntax**

```sql
TYPE SYS.RE$VARIABLE_TYPE (    variable_name VARCHAR2(32),    variable_type VARCHAR2(4000),    variable_value_function VARCHAR2(228),    variable_method_function VARCHAR2(228));
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>The variable name used in a rule</td>
</tr>
<tr>
<td>variable_type</td>
<td>The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the Oracle Database SQL Reference for more information about these types.</td>
</tr>
</tbody>
</table>
RE$VARIABLE_TYPE Type

Table 181–12 (Cont.) RE$VARIABLE_TYPE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_value_function</td>
<td>A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
<tr>
<td>variable_method_function</td>
<td>Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The functions for both the variable_value_function parameter and variable_method_function parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format may be omitted: `schema_name`, `package_name`, and `@dblink`.

For example, if the `schema_name` is hr, the `package_name` is var_pac, the `function_name` is func_value, and the `dblink` is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.
Signature for variable_value_function
The function must have the following signature:

```sql
FUNCTION variable_value_function_name(
    evaluation_context_schema  IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_name              IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function
This function must have the following signature:

```sql
FUNCTION variable_method_function_name(
    evaluation_context_schema  IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_value             IN SYS.RE$VARIABLE_VALUE,
    method_name                IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

**RE$VARIABLE_TYPE_LIST Type**

Identifies a list of variables and their types used in a rule evaluation context.

**Syntax**

```sql
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```
RE$VARIABLE_VALUE Type

Specifies the value of a variable.

Note: The variable name may be enclosed in double quotation marks (") if the name contains special characters.

Syntax

```sql
TYPE SYS.RE$VARIABLE_VALUE (
    variable_name VARCHAR2(32),
    variable_data SYS.AnyData);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable name used in a rule</td>
</tr>
<tr>
<td>variable_data</td>
<td>Specifies the data for the variable value</td>
</tr>
</tbody>
</table>

RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```sql
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```
XMLType is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of XMLType and insert XML documents into it. You can also generate XML documents as XMLType instances dynamically using the SYS_XMLGEN and SYS_XMLAGG SQL functions.

This chapter contains the following topics:

- Summary of XMLType Subprograms

See Also:

- Oracle XML DB Developer’s Guide
Table 182–1 summarizes functions and procedures of the XMLType.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENONSCHEMABASEDXML on page 182-4</td>
<td>Creates a non schema based XML from the input schema based instance.</td>
</tr>
<tr>
<td>CREATESCHEMABASEDXML on page 182-5</td>
<td>Creates a schema based XMLType instance from the non-schema based instance using the input schema URL.</td>
</tr>
<tr>
<td>CREATEXML on page 6</td>
<td>Static function for creating and returning an XMLType instance.</td>
</tr>
<tr>
<td>EXISTSNODE on page 182-9</td>
<td>Takes a XMLType instance and a XPath and returns 1 or 0 indicating if applying the XPath returns a non-empty set of nodes.</td>
</tr>
<tr>
<td>EXTRACT on page 182-10</td>
<td>Takes a XMLType instance and an XPath, applies the XPath expression and returns the results as an XMLType.</td>
</tr>
<tr>
<td>GETBLOBVAL on page 182-11</td>
<td>Returns the value of the XMLType instance as a BLOB.</td>
</tr>
<tr>
<td>GETCLOBVAL on page 182-12</td>
<td>Returns the value of the XMLType instance as a CLOB.</td>
</tr>
<tr>
<td>GETNAMESPACE on page 182-13</td>
<td>Returns the namespace for the top level element in a schema based document.</td>
</tr>
<tr>
<td>GETNUMBERVAL on page 182-14</td>
<td>Returns the value of the XMLType instance as a NUMBER.</td>
</tr>
<tr>
<td></td>
<td>This is only valid if the input XMLType instance contains a simple text node and is convertible to a number.</td>
</tr>
<tr>
<td>GETROOTELEMENT on page 182-15</td>
<td>Returns the root element of the input instance. Returns NULL if the instance is a fragment.</td>
</tr>
<tr>
<td>GETSCHEMAURL on page 182-16</td>
<td>Returns the XML schema URL if the input is an XML Schema based.</td>
</tr>
<tr>
<td>GETSTRINGVAL on page 182-17</td>
<td>Returns the value of the XMLType instance as a string.</td>
</tr>
<tr>
<td>ISFRAGMENT on page 182-18</td>
<td>Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.</td>
</tr>
<tr>
<td>ISSCHEMABASED on page 182-19</td>
<td>Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.</td>
</tr>
</tbody>
</table>
### Table 182–1  (Cont.) XMLTYPE Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ISSCHEMVALID</code> on page 182-20</td>
<td>Checks if the input instance is schema valid according to the given schema URL.</td>
</tr>
<tr>
<td><code>ISSCHEMAVALIDATED</code> on page 182-21</td>
<td>Checks if the instance has been validated against the schema.</td>
</tr>
<tr>
<td><code>SCHEMVALIDATE</code> on page 182-22</td>
<td>Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.</td>
</tr>
<tr>
<td><code>SETSCHEMVALIDATED</code> on page 182-23</td>
<td>Sets the schema valid flag to avoid costly schema validation.</td>
</tr>
<tr>
<td><code>TOOBJECT</code> on page 182-24</td>
<td>Converts the XMLType instance to an object type.</td>
</tr>
<tr>
<td><code>TRANSFORM</code> on page 182-25</td>
<td>Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.</td>
</tr>
<tr>
<td><code>XMLTYPE</code> on page 182-26</td>
<td>Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.</td>
</tr>
</tbody>
</table>
CREATENONSCHEMABASEDXML

CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```plsql
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```
**CREATESCHEMABASEDXML**

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

**Syntax**

```sql
MEMBER FUNCTION CREATESCHEMABASEDXML(  
    SCHEMA IN VARCHAR2 := NULL)  
RETURN XMLTYPE DETERMINISTIC;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>(IN)</td>
<td>Optional XMLSchema URL used to convert the value to the specified schema.</td>
</tr>
</tbody>
</table>
Static function for creating and returning an XMLType instance. The string and clob parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION CREATEXML( XMLDATA IN VARCHAR2) RETURN XMLTYPE DETERMINISTIC;</td>
<td>Creates the XMLType instance from a string.</td>
</tr>
<tr>
<td>STATIC FUNCTION CREATEXML( XMLDATA IN CLOB) RETURN XMLTYPE DETERMINISTIC;</td>
<td>Creates the XMLType instance from a CLOB.</td>
</tr>
<tr>
<td>STATIC FUNCTION CREATEXML ( XMLDATA IN CLOB, SCHEMA IN VARCHAR2, VALIDATED IN NUMBER := 0, WELLFORMED IN NUMBER := 0 ) RETURN XMLTYPE DETERMINISTIC;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION CREATEXML ( XMLDATA IN VARCHAR2, SCHEMA IN VARCHAR2, VALIDATED IN NUMBER := 0, WELLFORMED IN NUMBER := 0) RETURN XMLTYPE DETERMINISTIC;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION CREATEXML ( XMLDATA IN &quot;&lt;ADT_1&gt;&quot;, SCHEMA IN VARCHAR2 := NULL, ELEMENT IN VARCHAR2 := NULL, VALIDATED IN NUMBER := 0) RETURN XMLTYPE DETERMINISTIC;</td>
<td>Creates an XML instance from an instance of an user-defined type.</td>
</tr>
<tr>
<td>STATIC FUNCTION CREATEXML ( XMLDATA IN SYS_REFCURSOR, SCHEMA IN VARCHAR2 := NULL, ELEMENT IN VARCHAR2 := NULL, VALIDATED IN NUMBER := 0) RETURN XMLTYPE DETERMINISTIC;</td>
<td>Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.</td>
</tr>
</tbody>
</table>
## Summary of XMLType Subprograms

### Syntax

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLDATA</td>
<td>(IN)</td>
<td>The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>(IN)</td>
<td>Optional Schema URL to be used to make the input conform to the given schema.</td>
</tr>
<tr>
<td>VALIDATED</td>
<td>(IN)</td>
<td>Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)</td>
</tr>
<tr>
<td>WELLFORMED</td>
<td>(IN)</td>
<td>Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)</td>
</tr>
<tr>
<td>ELEMENT</td>
<td>(IN)</td>
<td>Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)</td>
</tr>
<tr>
<td>CSID</td>
<td>(IN)</td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
</table>

### Description

**STATIC FUNCTION CREATEXML (**

XMLDATA IN ANYDATA,
SCHEMA IN VARCHAR2 := NULL,
ELEMENT IN VARCHAR2 := NULL,
VALIDATED IN NUMBER := 0)
RETURN SYS.XMLTYPE DETERMINISTIC
PARALLEL_ENABLE

**STATIC FUNCTION CREATEXML (**

XMLDATA IN BLOB,
CSID IN NUMBER,
SCHEMA IN VARCHAR2,
VALIDATED IN NUMBER := 0,
WELLFORMED IN NUMBER := 0)
RETURN SYS.XMLTYPE DETERMINISTIC

**STATIC FUNCTION CREATEXML (**

XMLDATA IN BFILE,
CSID IN NUMBER,
SCHEMA IN VARCHAR2,
VALIDATED IN NUMBER := 0,
WELLFORMED IN NUMBER := 0)
RETURN SYS.XMLTYPE DETERMINISTIC

- Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.

- Creates an XML instance from a BLOB.

- Creates an XML instance from a BFILE.
CREATEXML
EXISTSNODE

Member function. Checks if the node exists. If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION EXISTSNODE(XPATH IN VARCHAR2) RETURN NUMBER DETERMINISTIC;</td>
<td>Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.</td>
</tr>
<tr>
<td>MEMBER FUNCTION EXISTSNODE(XPATH IN VARCHAR2, NSMAP IN VARCHAR2) RETURN NUMBER DETERMINISTIC;</td>
<td>This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPATH</td>
<td>(IN)</td>
<td>The XPath expression to test.</td>
</tr>
<tr>
<td>NSMAP</td>
<td>(IN)</td>
<td>Optional namespace mapping.</td>
</tr>
</tbody>
</table>
Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns NULL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION EXTRACT( XPATH IN VARCHAR2) RETURN XMLTYPE DETERMINISTIC;</td>
<td>Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.</td>
</tr>
<tr>
<td>MEMBER FUNCTION EXTRACT( XPATH IN VARCHAR2, NSMAP IN VARCHAR2) RETURN XMLTYPE DETERMINISTIC;</td>
<td>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPATH</td>
<td>(IN)</td>
<td>The XPath expression to apply.</td>
</tr>
<tr>
<td>NSMAP</td>
<td>(IN)</td>
<td>Optional prefix to namespace mapping information.</td>
</tr>
</tbody>
</table>
GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the returns is a temporary BLOB, then it must be freed after use.

Syntax

MEMBER FUNCTION GETBLOBVAL()
RETURN BLOB DETERMINISTIC;
GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the
returns is a temporary CLOB, then it must be freed after use.

Syntax
    MEMBER FUNCTION GETCLOBVAL()
    RETURN CLOB DETERMINISTIC;
GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns NULL if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION GETNAMESPACE
RETURN VARCHAR2 DETERMINISTIC;
```
GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

MEMBER FUNCTION GETNUMBERVAL()
RETURN NUMBER DETERMINISTIC;
GETROOTELEMENT

Member function. Gets the root element of the XMLType instance. Returns NULL if the instance is a fragment.

Syntax
MEMBER FUNCTION GETROOTELEMENT
RETURN VARCHAR2 DETERMINISTIC;
GETSCHEMAURL

GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise returns NULL.

Syntax
MEMBER FUNCTION GETSCHEMAURL
RETURN VARCHAR2 DETERMINISTIC;
**GETSTRINGVAL**

Member function. Returns the document as a string. Returns a string containing the serialized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `varchar2`, which is 4000, then an error is raised at runtime.

**Syntax**

```sql
MEMBER FUNCTION GETSTRINGVAL()
RETURN VARCHAR2 DETERMINISTIC;
```
ISFRAGMENT

Determines if the XMLType instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

MEMBER FUNCTION ISFRAGMENT()
RETURN NUMBER DETERMINISTIC;
ISSCHEMABASED

Member function. Determines whether the XMLType instance is schema-based or not. Returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

MEMBER FUNCTION ISSCHEMABASED
RETURN NUMBER DETERMINISTIC;
ISSCHEMAVALID

ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

Syntax

```
MEMBER FUNCTION ISSCHEMAVALID(
    SCHURL IN VARCHAR2 := NULL,
    ELEM IN VARCHAR2 := NULL)
RETURN NUMBER DETERMINISTIC;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHURL</td>
<td>(IN)</td>
<td>The URL of the XML Schema against which to check conformance.</td>
</tr>
<tr>
<td>ELEM</td>
<td>(IN)</td>
<td>Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.</td>
</tr>
</tbody>
</table>
**ISSCHEMAVALIDATED**

Member function. Returns the validation status of the XMLType instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

**Syntax**

```plaintext
MEMBER FUNCTION ISSCHEMAVALIDATED
RETURN NUMBER DETERMINISTIC;
```
Member procedure. Validates the XML instance against its schema if it hasn’t already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document’s status is changed to validated.

**Syntax**

```plsql
MEMBER PROCEDURE SCHEMAVALIDATE(
    SELF IF OUT NOCOPY XMLTYPE);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(OUT)</td>
<td>XML instance being validated against the schema.</td>
</tr>
</tbody>
</table>
SETSCHEMAVALIDATED

Member function. Sets the VALIDATION state of the input XML instance.

Syntax

MEMBER PROCEDURE SETSCHEMAVALIDATED(  
    SELF IF OUT NOCOPY XMLTYPE,  
    FLAG IN BINARY_INTEGER := 1);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(OUT)</td>
<td>XML instance.</td>
</tr>
<tr>
<td>FLAG</td>
<td>(IN)</td>
<td>0 - NOT VALIDATED; 1 - VALIDATED (Default)</td>
</tr>
</tbody>
</table>
**TOBJECT**

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

**See Also:**
- An in-depth discussion of this topic inside *Oracle XML DB Developer’s Guide*

**Syntax**

```plsql
MEMBER PROCEDURE TOOBJECT(
    SELF IN XMLTYPE,
    OBJECT OUT '<ADT_1>',
    SCHEMA IN VARCHAR2 := NULL,
    ELEMENT IN VARCHAR2 := NULL);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(IN)</td>
<td>Instance to be converted. Implicit if used as a member procedure.</td>
</tr>
<tr>
<td>OBJECT</td>
<td>(IN)</td>
<td>Converted object. An object instance of the required type may be passed in to this function</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>(IN)</td>
<td>Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema.</td>
</tr>
<tr>
<td>ELEMENT</td>
<td>(IN)</td>
<td>Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.</td>
</tr>
</tbody>
</table>
TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the `parammap` is `NULL`, then a `NULL` is returned.

**Syntax**

```sql
MEMBER FUNCTION TRANSFORM(
    XSL IN XMLTYPE,
    PARAMMAP IN VARCHAR2 := NULL)
RETURN XMLTYPE DETERMINISTIC;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSL</td>
<td>(IN)</td>
<td>The XSL stylesheet describing the transformation</td>
</tr>
<tr>
<td>PARAMMAP</td>
<td>(IN)</td>
<td>Top level parameters to the XSL - string of name=value pairs</td>
</tr>
</tbody>
</table>
XMLType constructor. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| CONSTRUCTOR FUNCTION XMLTYPE( 
  XMLDATA IN CLOB, 
  SCHEMA IN VARCHAR2 := NULL, 
  VALIDATED IN NUMBER := 0, 
  WELLFORMED IN NUMBER := 0) 
RETURN SELF AS RESULT DETERMINISTIC; | This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters. |
| CONSTRUCTOR FUNCTION XMLTYPE( 
  XMLDATA IN VARCHAR2, 
  SCHEMA IN VARCHAR2 := NULL, 
  VALIDATED IN NUMBER := 0, 
  WELLFORMED IN NUMBER := 0) 
RETURN SELF AS RESULT DETERMINISTIC; | This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters. |
| CONSTRUCTOR FUNCTION XMLTYPE ( 
  XMLDATA IN "W<ADT_1>", 
  SCHEMA IN VARCHAR2 := NULL, 
  ELEMENT IN VARCHAR2 := NULL, 
  VALIDATED IN NUMBER := 0) 
RETURN SELF AS RESULT DETERMINISTIC; | This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter. |
| CONSTRUCTOR FUNCTION XMLTYPE( 
  XMLDATA IN SYS_REFCURSOR, 
  SCHEMA IN VARCHAR2 := NULL, 
  ELEMENT IN VARCHAR2 := NULL, 
  VALIDATED IN NUMBER := 0) 
RETURN SELF AS RESULT DETERMINISTIC; | This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter. |
| CONSTRUCTOR FUNCTION XMLTYPE( 
  XMLDATA IN ANYDATA, 
  SCHEMA IN VARCHAR2 := NULL, 
  ELEMENT IN VARCHAR2 := NULL, 
  VALIDATED IN NUMBER := 0) 
RETURN SELF AS RESULT DETERMINISTIC 
PARALLEL_ENABLE | This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not. |
### Summary of XMLType Subprograms

**CONSTRUCTOR FUNCTION XMLTYPE**

```sql
CONSTRUCTOR FUNCTION XMLTYPE(
    XMLDATA IN BLOB, CSID IN NUMBER,
    SCHEMA IN VARCHAR2 := NULL,
    VALIDATED IN NUMBER := 0,
    WELLFORMED IN NUMBER := 0)
RETURN SELF AS RESULT DETERMINISTIC
```

This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.

```sql
CONSTRUCTOR FUNCTION XMLTYPE(
    XMLDATA IN BFILE,
    CSID IN NUMBER,
    SCHEMA IN VARCHAR2 := NULL,
    VALIDATED IN NUMBER := 0,
    WELLFORMED IN NUMBER := 0)
RETURN SELF AS RESULT DETERMINISTIC
```

This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLDATA</td>
<td>(IN)</td>
<td>The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>(IN)</td>
<td>Optional Schema URL to be used to make the input conform to the given schema.</td>
</tr>
<tr>
<td>VALIDATED</td>
<td>(IN)</td>
<td>Indicates that the instance is valid to the given XML Schema.</td>
</tr>
<tr>
<td>WELLFORMED</td>
<td>(IN)</td>
<td>Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.</td>
</tr>

STYLE procedure
  of HTP package, 128-123
SUB procedure
  of HTP package, 128-124
SUBMIT procedure, 41-14
SUBMIT_PENDING_AREA procedure, 76-29
subscribers
  drop the subscription, 21-2
  extend the window to create a new view, 21-2
  purging the subscription window, 21-2
  retrieve change data from the subscriber views, 21-2
subscription window
  purging, 21-2
SUBSTR function, 161-33
SUBSTRINGDATA function, 113-149
SUMMARY procedure, 92-6
SUP function
  of HTF package, 123-125
SUP procedure
  of HTP package, 128-125
SWITCH_CONSUMER_GROUP_FOR_SESS
  procedure, 76-30
SWITCH_CONSUMER_GROUP_FOR_USER
procedure, 76-31
SWITCH_PLAN procedure, 76-32
SYNC_INTERIM_TABLE procedure, 68-13
SYNCHRONIZE function, 27-57

T

TABLE_TO_COMMA procedures, 104-40
TABLECAPTION function
of HTF package, 123-126
TABLECAPTION procedure
of HTF package, 128-126
TABLECLOSE function
of HTF package, 123-129
TABLECLOSE procedure
of HTF package, 128-129
TABLEDATA function
of HTF package, 123-127
TABLEDATA procedure
of HTF package, 128-127
TABLEHEADER function
of HTF package, 123-128
TABLEHEADER procedure
of HTF package, 128-128
TABLEOPEN function
of HTF package, 123-130
TABLEOPEN procedure
of HTF package, 128-130
TABLEPRINT function, 137-27
TABLEROCCLOSE function
of HTF package, 123-131
TABLEROCCLOSE procedure
of HTF package, 128-131
TABLEROWOPEN function
of HTF package, 123-132
TABLEROWOPEN procedure
of HTF package, 128-132
tables
  table items as arrays, 90-28, 90-32
TABLESPACE_FIX_BITMAPS procedure, 89-10
TABLESPACE_FIX_SEGMENT_STATES procedure, 89-11
TABLESPACE_MIGRATE_FROM_LOCAL procedure, 89-12
TABLESPACE_MIGRATE_TO_LOCAL procedure, 89-13
TABLESPACE_REBUILD_BITMAPS procedure, 89-15
TABLESPACE_REBUILD_QUOTAS procedure, 89-16
TABLESPACE_RELOCATE_BITMAPS procedure, 89-17
TABLESPACE_SET type, 99-4
TABLESPACE_VERIFY procedure, 89-19
tables spaces
  change tables and, 20-25
tags
  GET_TAG function, 95-11
  SET_TAG procedure, 95-12
TARGET_PROGRAM_RUNNING procedure, 27-58
TELETYPE function
of HTF package, 123-133
TELETYPE procedure
of HTF package, 128-133
TERMINATE procedure, 66-9
TEXT_DECODE function, 154-11
TEXT_ENCODE function, 154-13
TIMESTAMP_TO_SCN function, 36-14
TITLE function
of HTF package, 123-134
TITLE procedure
of HTF package, 128-134
TODATE function, 137-31
TOOBJECT procedure, 182-24
top-N frequency binning, 24-3
TRACETAB.SQL, 100-4
transform definition table, 24-5
TRANSFORM function, 182-25
transformation methodology, 24-6
transformations
  binning, 24-3
equi-width binning, 24-3
normalization, 24-4
Oracle Streams
  setting, 96-105
  rule-based
